As MPLS packets enter or exit a network, edge switches might be required to alter the class-of-service (CoS) settings of the packets. EXP rewrite rules set the value of the EXP CoS bits within the header of the outgoing MPLS packet on **family mpls** interfaces. Each rewrite rule reads the current forwarding class and loss priority associated with the packet, locates the chosen CoS value from a table, and writes that CoS value into the packet header, replacing the old CoS value. EXP rewrite rules apply only to MPLS traffic.

EXP rewrite rules apply only to logical interfaces. You cannot apply EXP rewrite rules to physical interfaces.

There are no default EXP rewrite rules. If you want to rewrite the EXP value in MPLS packets, you must configure EXP rewrite rules and apply them to logical interfaces. If no rewrite rules are applied, all MPLS labels that are pushed have a value of zero (0). The EXP value remains unchanged on MPLS labels that are swapped.

You can configure as many EXP rewrite rules as you want, but you can only apply 16 EXP rewrite rules at any time on the switch. On a given logical interface, all pushed MPLS labels have the same EXP rewrite rule applied to them. You can apply different EXP rewrite rules to different logical interfaces on the same physical interface.

You can apply an EXP rewrite rule to an interface that has a DSCP, DSCP IPv6, or IEEE 802.1p rewrite rule. Only MPLS traffic uses the EXP rewrite rule. MPLS traffic does not use DSCP or DSCP IPv6 rewrite rules.

If the switch is performing penultimate hop popping (PHP), EXP rewrite rules do not take effect. If both an EXP classifier and an EXP rewrite rule are configured on the switch, then the EXP value from the last popped label is copied into the inner label. If either an EXP classifier or an EXP rewrite rule (but not both) is configured on the switch, then the inner label EXP value is sent unchanged.

**NOTE:** On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

## Schedulers

The schedulers for using CoS with MPLS are the same as for the other CoS configurations on the switch. Default schedulers are provided only for the best-effort, fcoe, no-loss, and network-control forwarding classes. If you configure a custom forwarding class for MPLS traffic, you need to configure a scheduler to support that forwarding class and provide bandwidth to that forwarding class. See “[Understanding CoS Output Queue Schedulers](#)” on page 5868 and “[Example: Configuring Queue Schedulers](#)” on page 6081 for more information.

## Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces

At ingress interfaces, classifiers group incoming traffic into classes based on the IEEE 802.1p, DSCP, or MPLS EXP class of service (CoS) code point bits in the packet header. At egress interfaces, you can use rewrite rules to change (re-mark) the code point bits before the interface forwards the packets. At ingress interfaces, classifiers group incoming traffic into classes based on the IEEE 802.1p, DSCP, or MPLS EXP CoS code point bits in the packet header. At egress interfaces, rewrite rules can change (re-mark) the code point bits before the interface forwards the packets.

You can apply classifiers and rewrite rules to interfaces to control the level of CoS applied to each packet as it traverses the system and the network. This topic describes:

### Supported Classifier and Rewrite Rule Types

Table 491 on page 5820 shows the supported types of classifiers and rewrite rules supports:

**Table 491: Supported Classifiers and Rewrite Rules**

| Classifier or Rewrite Rule Type  | Description   |
|--|---|
| Fixed classifier   | Classifies all ingress traffic on a physical interface into one fixed forwarding class, regardless of the CoS bits in the packet header.  |
| DSCP and DSCP IPv6 unicast classifiers                                       | Classifies IP and IPv6 traffic into forwarding classes and assigns loss priorities to the traffic.  |
| IEEE 802.1p unicast classifier   | Classifies Ethernet traffic into forwarding classes and assigns loss priorities to the traffic.   |
| MPLS EXP classifier  | Classifies MPLS traffic into forwarding classes and assigns loss priorities to the traffic on interfaces configured as <b>family mpls</b> . The system uses one global EXP classifier on all <b>family mpls</b> switch interfaces.        |
| DSCP multdestination classifier (also used for IPv6 multdestination traffic) | Classifies IP and IPv6 multicast, broadcast, and destination lookup fail (DLF) traffic into multdestination forwarding classes. Multdestination classifiers are applied to all interfaces and cannot be applied to individual interfaces. |

Table 491: Supported Classifiers and Rewrite Rules (*continued*)

| Classifier or Rewrite Rule Type        | Description  |
|--|--|
| IEEE 802.1p multdestination classifier | Classifies Ethernet multicast, broadcast, and destination lookup fail (DLF) traffic into multdestination forwarding classes. Multdestination classifiers are applied to all interfaces and cannot be applied to individual interfaces. |
| DSCP and DSCP IPv6 rewrite rules       | Re-marks the DSCP code points of IP and IPv6 packets before forwarding the packets.  |
| IEEE 802.1p rewrite rule               | Re-marks the IEEE 802.1p code points of Ethernet packets before forwarding the packets.  |
| MPLS EXP rewrite rule                  | Re-marks the EXP code points of MPLS packets before forwarding the packets on interfaces configured as <b>family mpls</b> .  |

**NOTE:** On native Fibre Channel (FC) interfaces (NP\_Ports) only, you can specify a rewrite value to set the IEEE 802.1p code point of incoming FC traffic when the NP\_Port encapsulates the FC packet in Ethernet before forwarding it to the FCoE network (see *Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway*).

DSCP, IEEE 802.1p, and MPLS EXP classifiers are behavior aggregate (BA) classifiers. Unlike DSCP and IEEE 802.1p classifiers, EXP classifiers are global and apply only to all interfaces that are configured as **family mpls**. Also unlike DSCP and IEEE 802.1p classifiers, for MPLS traffic only, EXP classifiers overwrite fixed classifiers. (An interface that has a fixed classifier uses the EXP classifier for MPLS traffic, not the fixed classifier.)

Multdestination classifiers are global and apply to all interfaces; you cannot apply a multdestination classifier to individual interfaces.

Classifying packets into forwarding classes assigns packets to the output queues associated with the forwarding classes. Classifying traffic into a forwarding class associates the CoS scheduling for the forwarding class with that traffic.

**NOTE:** In addition to BA classifiers and fixed classifiers, which classify traffic based on the CoS field in the packet header, you can use firewall filters to configure multifield (MF) classifiers. MF classifiers classify traffic based on more than one field in the packet header and take precedence over BA and fixed classifiers.

### Ethernet Interfaces Supported for Classifier and Rewrite Rule Configuration

To apply a classifier to incoming traffic or a rewrite rule to outgoing traffic, you need to apply the classifier or rewrite rule to one or more interfaces. When you apply a classifier or rewrite rule to an interface, the interface uses the classifier to group incoming traffic

into forwarding classes and uses the rewrite rule to re-mark the CoS code point value of each packet before it leaves the system.

Not all interfaces types support all types of CoS configuration. This section describes:

- [Interface Types That Support Classifier and Rewrite Rule Configuration on page 5822](#)
- [Classifier and Rewrite Rule Physical and Logical Ethernet Interface Support on page 5822](#)
- [Routed VLAN Interfaces \(RVIs\) and Integrated Routing and Bridging \(IRB\) Interfaces on page 5823](#)

### ***Interface Types That Support Classifier and Rewrite Rule Configuration***

You can apply classifiers to all Ethernet interfaces. For Layer 3 LAGs, configure BA or fixed classifiers on the LAG (ae) interface. The classifier configured on the LAG is valid on all of the LAG member interfaces.

You can apply fixed classifiers to native FC interfaces (NP\_Ports). You cannot apply other types of classifiers or rewrite rules to native FC interfaces. You can rewrite the value of the IEEE 802.1p code point of incoming FC traffic when the interface encapsulates it in Ethernet before forwarding it to the FCoE network as described in *Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway*.

### ***Classifier and Rewrite Rule Physical and Logical Ethernet Interface Support***

The Ethernet ports can function as:

- Layer 2 physical interfaces (family ethernet-switching)
- Layer 2 logical interfaces (family ethernet-switching)
- Layer 3 physical interfaces (family inet/inet6)
- Layer 3 logical interfaces (family inet/inet6)

You can apply CoS classifiers and rewrite rules only to the following interfaces:

- Layer 2 logical interfaces
- Layer 3 physical interfaces if at least one logical Layer 3 interface is configured on the physical interface

**NOTE:** The CoS you configure on a Layer 3 physical interface is applied to all of the Layer 3 logical interfaces on that physical interface. This means that each Layer 3 interface uses the same classifiers and rewrite rules for all of the Layer 3 traffic on that interface.

---

You cannot apply classifiers or rewrite rules to Layer 2 physical interfaces or to Layer 3 logical interfaces. [Table 492 on page 5823](#) shows on which interfaces you can configure and apply classifiers and rewrite rules.

Table 492: Ethernet Interface Support for Classifier and Rewrite Rule Configuration

| CoS Classifiers and Rewrite Rules | Layer 2 Physical Interfaces   | Layer 2 Logical Interfaces | Layer 3 Physical Interfaces (If at Least One Logical Layer 3 Interface Is Defined) | Layer 3 Logical Interfaces |
|-----------------------------------|---|----------------------------|--|----------------------------|
| Fixed classifier                  | No  | Yes                        | Yes  | No                         |
| DSCP classifier                   | No  | Yes                        | Yes  | No                         |
| DSCP IPv6 classifier              | No  | Yes                        | Yes  | No                         |
| IEEE 802.1p classifier            | No  | Yes                        | Yes  | No                         |
| EXP classifier                    | Global classifier, applies only to all switch interfaces that are configured as <b>family mpls</b> . Cannot be configured on individual interfaces. |                            |  |                            |
| DSCP rewrite rule                 | No  | Yes                        | Yes  | No                         |
| DSCP IPv6 rewrite rule            | No  | Yes                        | Yes  | No                         |
| IEEE 802.1p rewrite rule          | No  | Yes                        | Yes  | No                         |
| EXP rewrite rule                  | No  | Yes                        | Yes  | No                         |

**NOTE:** IEEE 802.1p multidestination and DSCP multidestination classifiers are applied to all interfaces and cannot be applied to individual interfaces. No DSCP IPv6 multidestination classifier is supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.

### ***Routed VLAN Interfaces (RVIs) and Integrated Routing and Bridging (IRB) Interfaces***

You cannot apply classifiers and rewrite rules directly to routed VLAN interfaces (RVIs) or integrated routing and bridging (IRB) interfaces because the members of RVIs and IRBs are VLANs, not ports. However, you can apply classifiers and rewrite rules to the VLAN port members of an RVI or an IRB. You can also apply MF classifiers to RVIs and IRBs.

### **Default Classifiers**

If you do not explicitly configure classifiers on an Ethernet interface, default classifiers are applied (see [“Understanding Default CoS Settings” on page 5796](#)) so that the traffic receives basic CoS treatment. The factors that determine the default classifier applied to the interface include the interface type (Layer 2 or Layer 3), the port mode (trunk, tagged-access, or access), and whether logical interfaces have been configured. The system applies a default classifier using the following rules:

- If the physical interface has at least one Layer 3 logical interface configured, it uses the default DSCP classifier.
- If the physical interface has a Layer 2 logical interface in trunk mode or tagged-access mode, it uses the default trusted classifier.
- If the physical interface has a Layer 2 logical interface in access mode, it uses the default untrusted classifier.
- If the physical interface has no logical interface configured, no default classifier is applied.
- The default multidestination classifier is the IEEE 802.1p multidestination classifier.
- There is no default MPLS EXP classifier. If you want to classify traffic using EXP bits, you must configure an EXP classifier and configure it as the global system default EXP classifier.

---

### Default Rewrite Rules

No default rewrite rules are applied to interfaces. If you want to re-mark packets at the egress interface, you must explicitly configure a rewrite rule.

---

### Classifier Precedence

You can apply multiple unicast classifiers (MF, fixed, IEEE 802.1p, DSCP, or EXP) to a physical or logical Ethernet interface to handle different types of traffic. (EXP classifiers are global and apply only to all MPLS traffic on all **family mpls** interfaces.) When you apply more than one classifier to an interface, the system uses an order of precedence to determine which classifier to use on physical and logical interfaces:

- [Unicast Classifier Precedence on Physical Ethernet Interfaces on page 5824](#)
- [Unicast Classifier Precedence on Logical Ethernet Interfaces on page 5825](#)

#### *Unicast Classifier Precedence on Physical Ethernet Interfaces*

The precedence of unicast classifiers on physical interfaces, from the highest-priority classifier to the lowest-priority classifier, is:

- MF classifier on a logical interface (no classifier has a higher priority than MF classifiers)
- Fixed classifier on the physical interface
- DSCP or DSCP IPv6 classifier on the physical interface
- IEEE 802.1p classifier on the physical interface

**NOTE:** If an EXP classifier is configured, MPLS traffic uses the EXP classifier on all **family mpls** interfaces, even if an MF or fixed classifier is applied to the interface. If an EXP classifier is not configured, then if a fixed classifier is applied to the interface, the MPLS traffic uses the fixed classifier. If no EXP classifier and no fixed classifier is applied to the interface, MPLS traffic is treated as best-effort traffic. DSCP classifiers are not applied to MPLS traffic.

---

You can apply a DSCP classifier, an IEEE 802.1p classifier, and an EXP classifier on a physical interface. When all three classifiers are on an interface, IP traffic uses the DSCP classifier, MPLS traffic uses the EXP classifier, and all other traffic uses the IEEE classifier.

**NOTE:** You cannot apply a fixed classifier and a DSCP or IEEE classifier to the same interface. If a DSCP classifier, an IEEE classifier, or both are on an interface, you cannot apply a fixed classifier to that interface unless you first delete the DSCP and IEEE classifiers. If a fixed classifier is on an interface, you cannot apply a DSCP classifier or an IEEE classifier unless you first delete the fixed classifier.

### ***Unicast Classifier Precedence on Logical Ethernet Interfaces***

The precedence of unicast classifiers on logical interfaces, from the highest priority classifier to the lowest priority classifier, is:

- MF classifier on a logical interface (no classifier has a higher priority than MF classifiers)
- Fixed classifier on the logical interface
- DSCP or DSCP IPv6 classifier on the physical interface
- IEEE 802.1p classifier on the physical interface

**NOTE:** If an EXP classifier is configured, MPLS traffic uses the EXP classifier on all family mpls interfaces, even if a fixed classifier is applied to the interface. If an EXP classifier is not configured, then if a fixed classifier is applied to the interface, the MPLS traffic uses the fixed classifier. If no EXP classifier and no fixed classifier is applied to the interface, MPLS traffic is treated as best-effort traffic.

You can apply both a DSCP classifier and an IEEE 802.1p classifier on a logical interface. When both a DSCP and an IEEE classifier are on an interface, IP traffic uses the DSCP classifier, and all other traffic uses the IEEE classifier. If an MPLS EXP classifier is also applied to the interface, only MPLS traffic uses the EXP classifier.

### **Classifier Behavior and Limitations**

Consider the following behaviors and constraints when you apply classifiers to physical and logical Ethernet interfaces:

- You can configure only one DSCP classifier (IP or IPv6) on a physical interface. You cannot configure both types of DSCP classifier on one physical interface. Both IP and IPv6 traffic use whichever DSCP classifier is configured on the interface.
- When you configure a DSCP or a DSCP IPv6 classifier on a physical interface and the physical interface has at least one logical Layer 3 interface, all packets (IP, IPv6, and non-IP) use that classifier.

- An interface with both a DSCP classifier (IP or IPv6) and an IEEE 802.1p classifier uses the DSCP classifier for IP and IPv6 packets, and uses the IEEE classifier for all other packets.
- Fixed classifiers and BA classifiers (DSCP and IEEE classifiers) are not permitted simultaneously on an interface. If you configure a fixed classifier on an interface, you cannot configure a DSCP or an IEEE classifier on that interface. If you configure a DSCP classifier, an IEEE classifier, or both classifiers on an interface, you cannot configure a fixed classifier on that interface.
- When you configure an IEEE 802.1p classifier on a physical interface and a DSCP classifier is not explicitly configured on that interface, the interface uses the IEEE classifier for all types of packets. No default DSCP classifier is applied to the interface. (In this case, if you want a DSCP classifier on the interface, you must explicitly configure it.)
- The system does not apply a default classifier to a physical interface until you create a logical interface on that physical interface. If you configure a Layer 3 logical interface, the system uses the default DSCP classifier. If you configure a Layer 2 logical interface, the system uses the default IEEE 802.1p trusted classifier if the port is in trunk mode or tagged-access mode, or the default IEEE 802.1p untrusted classifier if the port is in access mode.
- MF classifiers configured on logical interfaces take precedence over BA and fixed classifiers, with the exception of the global EXP classifier, which is always used for MPLS traffic on **family mpls** interfaces. (Use firewall filters to configure MF classifiers.) When BA or fixed classifiers are present on an interface, you can still configure an MF classifier on that interface.
- There is no default EXP classifier for MPLS traffic.
- You can configure as many EXP classifiers as you want, but the switch uses only one MPLS EXP classifier as a global classifier on all **family mpls** interfaces. After you configure an MPLS EXP classifier, you can configure it as the global EXP classifier by including the EXP classifier in the **[edit class-of-service system-defaults classifiers exp]** hierarchy. All **family mpls** switch interfaces use the EXP classifier specified using this configuration statement to classify MPLS traffic, even on interfaces that have a fixed classifier. No other traffic uses the EXP classifier.

---

### Rewrite Rule Precedence and Behavior

The following rules apply on both physical and logical Ethernet interfaces for rewrite rules:

- If you configure both one DSCP (or DSCP IPv6) rewrite rule and one IEEE 802.1p rewrite rule on an interface, both rewrite rules take effect. Traffic with IP and IPv6 headers use the DSCP rewrite rule, and traffic with a VLAN tag uses the IEEE rewrite rule.
- If you do not explicitly configure a rewrite rule, there is no default rewrite rule, so the system does not apply any rewrite rule to the interface.
- You can apply a DSCP rewrite rule or a DSCP IPv6 rewrite rule to an interface, but you cannot apply both a DSCP and a DSCP IPv6 rewrite rule to the same interface. Both

IP and IPv6 packets use the same DSCP rewrite rule, regardless if the configured rewrite rule is DSCP or DSCP IPv6.

- MPLS EXP rewrite rules apply only to logical interfaces on **family mpls** interfaces. You cannot apply to an EXP rewrite rule to a physical interface. You can configure as many EXP rewrite rules as you want, but you can only use 16 EXP rewrite rules at any time on the switch.
- A logical interface can use both DSCP (or DSCP IPv6) and EXP rewrite rules.
- DSCP and DSCP IPv6 rewrite rules are not applied to MPLS traffic.
- If the switch is performing penultimate hop popping (PHP), EXP rewrite rules do not take effect. If both an EXP classifier and an EXP rewrite rule are configured on the switch, then the EXP value from the last popped label is copied into the inner label. If either an EXP classifier or an EXP rewrite rule (but not both) is configured on the switch, then the inner label EXP value is sent unchanged.

### Classifier and Rewrite Rule Configuration Interaction with Ethernet Interface Configuration

You can apply classifiers and rewrite rules only on Layer 2 logical interfaces and Layer 3 physical interfaces (if the Layer 3 physical interface has at least one defined logical interface). This section focuses on BA classifiers, but the interaction between BA classifiers and interfaces described in this section also applies to fixed classifiers and rewrite rules.

**NOTE:** Multidestination classifiers, and EXP classifiers (only on **family mpls** interfaces), are global and apply to all switch interfaces. See [“Defining CoS Unicast BA Classifiers \(DSCP, DSCP IPv6, IEEE 802.1p\)” on page 6160](#) for how to configure multidestination classifiers and see [“Defining CoS Unicast BA Classifiers \(DSCP, DSCP IPv6, IEEE 802.1p\)” on page 6160](#) for how to configure EXP classifiers.

There are two components to applying classifiers or rewrite rules to interfaces:

1. Setting the interface family (inet, inet6, or ethernet-switching; ethernet-switching is the default interface family) in the **[edit interfaces]** configuration hierarchy.
2. Applying a classifier or rewrite rule to the interface in the **[edit class-of-service]** hierarchy.

These are separate operations that can be set and committed at different times. Because the type of classifier or rewrite rule you can apply to an interface depends on the interface family configuration, the system performs checks to ensure that the configuration is valid. The method the system uses to notify you of an invalid configuration depends on the **set** operation that causes the invalid configuration.

When applying the classifier or rewrite rule to the interface in the **[edit class-of-service]** hierarchy causes an invalid configuration, the system rejects the configuration and returns a commit check error.

When setting the interface family in the **[edit interfaces]** configuration hierarchy causes an invalid configuration, the system creates a syslog error message. When you receive the error message, you need to remove the classifier or rewrite rule configuration from the logical interface and apply it to the physical interface, or remove the classifier or rewrite rule configuration from the physical interface and apply it to the logical interface. For classifiers, if you do not take action to correct the error, the system programs the default classifier for the interface family on the interface. (There are no default rewrite rules. If the commit check fails, no rewrite rule is applied to the interface.)

Two scenarios illustrate these situations:

- [Scenario 1: Applying a Classifier to an Ethernet Interface Causes a Commit Check Error on page 5828](#)
- [Scenario 2: Configuring the Ethernet Interface Family Causes a Syslog Error on page 5829](#)

**NOTE:** Both of these scenarios also apply to fixed classifiers and rewrite rules.

---

### ***Scenario 1: Applying a Classifier to an Ethernet Interface Causes a Commit Check Error***

In Scenario 1, we set the interface family, and then specify an invalid classifier.

1. Set and commit the interface as a Layer 3 (family **inet**) interface:

```
[edit interfaces]
user@switch# set xe-0/0/20 unit 0 family inet
user@switch# commit
```

This commit operation succeeds.

2. Set and commit a DSCP classifier on the logical interface (this example uses a DSCP classifier named **dscp1**):

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers dscp dscp1
user@switch# commit
```

This configuration is not valid, because it attempts to apply a classifier to a Layer 3 logical interface. Because the failure is caused by the class-of-service configuration and not by the interface configuration, the system rejects the commit operation and issues a commit error, not a syslog message.

Note that the commit operation succeeds if you apply the classifier to the physical Layer 3 interface as follows:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 classifiers dscp dscp1
user@switch# commit
```

Because the logical unit is not specified, the classifier is applied to the physical Layer 3 interface in a valid configuration, and the commit check succeeds.

### Scenario 2: Configuring the Ethernet Interface Family Causes a Syslog Error

In Scenario 2, we set the classifier first, then set an invalid interface type.

1. Set and commit a DSCP classifier on a Layer 3 logical interface, assuming that the interface has no existing configuration:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers dscp dscp1
user@switch# commit
```

This commit succeeds. Because no explicit configuration existed on the interface, it is by default a Layer 2 (**family ethernet-switching**) interface. Layer 2 logical interfaces support BA classifiers, so applying the classifier is a valid configuration.

2. Set and commit the interface as a Layer 3 interface (family **inet**) interface:

```
[edit interfaces]
user@switch# set xe-0/0/20 unit 0 family inet
user@switch# commit
```

This configuration is not valid because it attempts to change an interface from Layer 2 (**family ethernet-switching**) to Layer 3 (**family inet**) when a classifier has already been applied to a logical interface. Layer 3 logical interfaces do not support classifiers. Because the failure is caused by the interface configuration and not by the class-of-service configuration, the system does not issue a commit error, but instead issues a syslog message.

When the system issues the syslog message, it programs the default classifier for the interface type on the interface. In this scenario, the interface has been configured as a Layer 3 interface, so the system applies the default DSCP profile to the physical Layer 3 interface.

In this scenario, to install a configured DSCP classifier, you remove the misconfigured classifier from the Layer 3 logical interface and apply it to the Layer 3 physical interface. For example:

```
[edit]
user@switch# delete class-of-service interfaces xe-0/0/20 unit 0 classifiers dscp dscp1
user@switch# commit
user@switch# set class-of-service interfaces xe-0/0/20 classifiers dscp dscp1
user@switch# commit
```

## Understanding CoS Forwarding Classes

Forwarding classes group traffic and assign the traffic to output queues. Each forwarding class is mapped to an output queue. Classification identifies the output queue for each incoming packet by mapping the packet code point bits to forwarding classes. The forwarding class to queue mapping defines the output queue used for the packet.

A classifier must associate each packet with one of the following five default forwarding classes or with a user-configured forwarding class in order to assign an output queue to the packet:

- **fcoe**—Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic.
- **no-loss**—Guaranteed delivery for TCP lossless traffic.
- **best-effort**—Provides best-effort delivery without a service profile. Loss priority is typically not carried in a class-of-service (CoS) value.
- **network-control**—Supports protocol control and is typically high priority.
- **mcast**—Provides no service profile for multidestination (multicast, broadcast, and destination lookup fail) packets.

The switch supports up to 12 forwarding classes, thus enabling flexible, differentiated, packet classification. For example, you can configure multiple classes of best-effort traffic such as **best-effort**, **best-effort1**, and **best-effort2**.

The switch supports up to 12 output queues: 8 output queues for unicast traffic (queues 0 through 7) and 4 output queues for multidestination traffic (queues 8 through 11). Forwarding classes mapped to unicast queues are associated with unicast traffic, and forwarding classes mapped to multidestination queues are associated with multidestination traffic. You cannot map unicast and multidestination traffic to the same queue. You cannot map a strict-high priority queue to a multidestination forwarding class (queues 8 through 11 do not support strict-high priority configuration).

- [Default Forwarding Classes on page 5831](#)
- [Forwarding Class Configuration Rules on page 5832](#)
- [Lossless Transport Support on page 5833](#)

## Default Forwarding Classes

Table 493 on page 5831 shows the four default forwarding classes defined for unicast traffic, and Table 494 on page 5832 shows the four default forwarding classes defined for multicast traffic.

If desired, you can rename the forwarding classes associated with the queues supported on your switch. Assigning a new class name to an output queue does not alter the default classification or scheduling that is applicable to that queue. CoS configurations can be quite complicated, so unless it is required by your scenario, we recommend that you not alter the default class names or queue number associations.

**Table 493: Default Forwarding Classes for Unicast Packets**

| Forwarding Class Name | Default Queue Mapping | Comments   |
|-----------------------|-----------------------|--|
| best-effort (be)      | 0                     | <p>The software does not apply any special CoS handling to packets with 000000 in the DiffServ field. This is a backward compatibility feature. These packets are usually dropped under congested network conditions.</p> <p>By default, this is a lossy forwarding class with a packet drop attribute of <b>drop</b>.</p>   |
| fcoe                  | 3                     | <p>By default, the <b>fcoe</b> forwarding class is a lossless forwarding class designed to handle Fibre Channel over Ethernet (FCoE) traffic. The <b>no-loss</b> packet drop attribute is applied by default.</p> <p><b>NOTE:</b> By convention, deployments with converged server access typically use IEEE 802.1p priority 3 (011) for FCoE traffic. The default mapping of the <b>fcoe</b> forwarding class is to queue 3. Apply priority-based flow control (PFC) to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE requires.</p> <p>We recommend that you use priority 3 for FCoE traffic unless your network architecture requires that you use a different priority.</p> |
| no-loss               | 4                     | <p>By default, this is a lossless forwarding class with a packet drop attribute of <b>no-loss</b>.</p>   |
| network-control (nc)  | 7                     | <p>The software delivers packets in this service class with a high priority. (These packets are not delay-sensitive.)</p> <p>Typically, these packets represent routing protocol hello or keepalive messages. Because loss of these packets jeopardizes proper network operation, packet delay is preferable to packet discard.</p> <p>By default, this is a lossy forwarding class with a packet drop attribute of <b>drop</b>.</p>   |

Table 494: Default Forwarding Classes for Multicast Packets

| Forwarding Class Name | Default Queue Mapping | Comments  |
|-----------------------|-----------------------|---|
| mcast                 | 8                     | <p>The software does not apply any special CoS handling to the multidestination packets. These packets are usually dropped under congested network conditions.</p> <p>By default, this is a lossy forwarding class with a packet drop attribute of <b>drop</b>.</p> |

**NOTE:** Mirrored traffic is always sent to the queue that corresponds to the multidestination forwarding class. The switched copy of the mirrored traffic is forwarded with the priority determined by the behavior aggregate classification process.

### Forwarding Class Configuration Rules

Take the following rules into account when you configure forwarding classes:

- [Queue Assignment Rules on page 5832](#)
- [Scheduling Rules on page 5833](#)
- [Rewrite Rules on page 5833](#)

#### Queue Assignment Rules

The following rules govern queue assignment:

- CoS configurations that specify more queues than the switch can support are not accepted. The commit operation fails with a detailed message that states the total number of queues available.
- All default CoS configurations are based on queue number. The name of the forwarding class that appears in the default configuration is the forwarding class currently associated with that queue.
- Only unicast forwarding classes can be mapped to unicast queues (0 through 7), and only multidestination forwarding classes can be mapped to multidestination queues (8 through 11).
- Strict-high priority queues cannot be mapped to multidestination forwarding classes. (Strict-high priority traffic cannot be mapped to queues 8 through 11).
- If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

In addition, if you configure a strict-high priority queue, we recommend that you always apply a shaping rate to prevent the strict-high priority queue from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority

queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.

### ***Scheduling Rules***

When you define a forwarding class that is used on the switch (the behavior aggregate classifier has a forwarding class and you expect traffic for the forwarding class), you must also define a scheduling policy for the forwarding class. Defining a scheduling policy means:

- Mapping a scheduler to the forwarding class in a scheduler map
- Including the forwarding class in a forwarding class set
- Associating the scheduler map with a traffic control profile
- Attaching the traffic control profile to a forwarding class set and an interface

### ***Rewrite Rules***

On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

### **Lossless Transport Support**

---

The switch supports up to six lossless forwarding classes. For lossless transport, you must enable PFC on the IEEE 802.1p code point of lossless forwarding classes. The following limitations apply to support lossless transport:

- The external cable length from the switch or QFabric system Node device to other devices cannot exceed 300 meters.
- The internal cable length from the QFabric system Node device to the QFabric system Interconnect device cannot exceed 150 meters.
- For FCoE traffic, the interface maximum transmission unit (MTU) must be at least 2180 bytes to accommodate the packet payload, headers, and checks.
- Changing any portion of a PFC configuration on a port blocks the entire port until the change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Changing the PFC configuration means any change to a congestion notification profile that is configured on a port (enabling or disabling PFC on a code point, changing the MRU or cable-length value, or specifying an output flow control queue). Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

.....

**NOTE:** Junos OS Release 12.2 introduces changes to the way lossless forwarding classes (the `fcoe` and `no-loss` forwarding classes) are handled.

In Junos OS Release 12.1, both explicitly configuring the `fcoe` and `no-loss` forwarding classes, and using the default configuration for these forwarding classes, resulted in the same lossless behavior for traffic mapped to those forwarding classes.

However, in Junos OS Release 12.2, if you explicitly configure the `fcoe` or the `no-loss` forwarding class, that forwarding class is no longer treated as a lossless forwarding class. Traffic mapped to these forwarding classes is treated as lossy (best-effort) traffic. This is true even if the explicit configuration is exactly the same as the default configuration.

If your CoS configuration from Junos OS Release 12.1 or earlier includes the explicit configuration of the `fcoe` or the `no-loss` forwarding class, then when you upgrade to Junos OS Release 12.2, those forwarding classes are not lossless. To preserve the lossless treatment of these forwarding classes, delete the explicit `fcoe` and `no-loss` forwarding class configuration before you upgrade to Junos OS Release 12.2.

See *Overview of CoS Changes Introduced in Junos OS Release 12.2* for detailed information about this change and how to delete an existing lossless configuration.

In Junos OS Release 12.3, the default behavior of the `fcoe` and `no-loss` forwarding classes is the same as in Junos OS Release 12.2. However, in Junos OS Release 12.3, you can configure up to six lossless forwarding classes. All explicitly configured lossless forwarding classes must include the new `no-loss` packet drop attribute or the forwarding class is lossy.

## Understanding CoS Forwarding Class Sets (Priority Groups)

A forwarding class set is the Junos OS configuration construct that equates to a priority group in enhanced transmission selection (ETS, described in IEEE 802.1Qaz). The switch implements ETS using a two-tier hierarchical scheduler.

A priority group is a group of queues (priorities). Mapping a forwarding class to a queue defines the traffic for that queue, so a priority equates to a queue (forwarding class). The queues in a priority group share the port bandwidth allocated to that priority group. The traffic for queues in one priority group usually share similar traffic-handling requirements.

You can configure up to three unicast forwarding class sets and one multicast forwarding class set. Only unicast forwarding classes can belong to unicast forwarding class sets. Only multicast forwarding classes can belong to the multicast forwarding class set.

If you configure a strict-high priority queue, you must observe the following rules when configuring forwarding class sets:

- You must create a separate forwarding class set for the strict-high priority queue.
- Only one forwarding class set can contain strict-high priority queues.
- Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
- A strict-high priority queue cannot belong to a multidestination forwarding class set.
- You cannot configure a guaranteed minimum bandwidth (guaranteed rate) for a forwarding class set that includes a strict-high priority queue. (You also cannot configure a guaranteed minimum bandwidth for a strict-high queue.)
- We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.

You must use hierarchical scheduling to define CoS for output queues. The two-tier hierarchical scheduler defines bandwidth resources for the priority group, and then allocates those resources among the priorities that belong to the priority group.

If you do not explicitly configure forwarding class sets, the system automatically creates a default forwarding class set that contains all of the forwarding classes on the switch. The system assigns 100 percent of the port output bandwidth to the default forwarding class set. Ingress traffic is classified based on the default classifier settings. The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default scheduler settings. Forwarding classes that are not part of the default scheduler receive no bandwidth. The default priority group is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange Protocol (DCBX) advertisement.

When you explicitly configure forwarding class sets and map them to an interface, any forwarding class that you do not map to a forwarding class set receives no guaranteed

bandwidth on that interface. Forwarding classes that belong to the default forwarding class set might receive bandwidth if the other forwarding class sets are not using all of the port bandwidth. However, the amount of bandwidth forwarding classes that are not in explicitly configured forwarding class sets receive is not guaranteed. The bandwidth for the default forwarding class depends on whether extra port bandwidth is available and therefore is not deterministic.

To guarantee bandwidth for forwarding classes in a predictable manner, be sure to map all forwarding classes that you expect to carry traffic on an interface to a forwarding class set and map the forwarding class set to the interface.

## Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows

Junos OS Release 12.3 increased support for lossless priorities from two lossless forwarding classes to up to six lossless forwarding classes. Each forwarding class is mapped to an IEEE 802.1p code point (priority).

**NOTE:** Junos OS Release 13.1 introduced support for up to six lossless forwarding classes on QFabric systems. Throughout this document, features introduced on standalone switches in Junos OS Release 12.3 are introduced on QFabric systems in Junos OS Release 13.1 unless otherwise noted.

Junos OS Release 13.2 is the first QFX5100 switch release, and Junos OS 13.2X51-D25 is the first EX4600 switch release. The QFX5100 and EX4600 switches also support up to six lossless forwarding classes. However, because the QFX5100 and EX4600 switches have no native Fibre Channel (FC) interfaces, these switches do not support native FC traffic and does not support configuration as an FCoE-FC gateway. Throughout this document, features that pertain to native FC traffic and to FCoE-FC gateway configuration do not apply to QFX5100 and EX4600 switches.

Earlier Junos OS software releases supported two lossless forwarding classes, the default *fc* and *no-loss* forwarding classes, which are mapped by default to IEEE 802.1p priorities 3 (code point 011) and 4 (code point 100), respectively. Junos OS Release 12.3 also introduced a new output stanza in the congestion notification profile (CNP) to configure priority-based flow control (PFC) on output queues.

**Video:** [Why Use PFC in a Data Center Network?](#)

The default configuration is the same as the default configuration in Junos OS Release 12.2 and is backward-compatible. If you need only two (or fewer) lossless forwarding classes, use the default configuration. If you need more than two lossless forwarding classes, you can use the two default forwarding classes and configure additional lossless forwarding classes. If you do not want to use the default lossless forwarding classes, you can change them or use only the lossless forwarding classes that you explicitly configure.

### Lossless Transport Features Introduced in Junos OS Release 12.3

---

Support for lossless transport introduced in Junos OS Release 12.3 includes:

- Configuring up to six lossless forwarding classes.
- Configuring PFC pause on output queues to program the output queues that can respond to PFC pause messages received from the connected peer. The priorities you pause on output queues must match the priorities on which you enable PFC on the corresponding ingress interfaces. For example, if you program output queues to pause priorities 3 (011) and 5 (101), then you must also enable pause on priorities 3 and 5 on the corresponding ingress interfaces. Configuring flow control on the output queues and enabling PFC on the corresponding input queues allows you to pause up to six priorities (forwarding classes).
- Controlling the headroom buffer on Ethernet interfaces by configuring the maximum receive unit (MRU) size for the traffic mapped to an IEEE 802.1p priority (configured per priority) and the length of the attached cable (configured per interface). The MRU size can range up to full jumbo packet size (9216 bytes).
- Remapping (rewriting) IEEE 802.1p priorities on native Fibre Channel (FC) interfaces when the system is acting as an FCoE-FC gateway. If the Ethernet (FCoE) network uses a different IEEE 802.1p priority than priority 3 (011) for FCoE traffic, then you can use priority remapping to classify FCoE traffic into a lossless forwarding class mapped to that different priority (see *Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway*).

Lossless transport still requires configuring previously existing features, including enabling PFC on the lossless priorities on ingress interfaces, and configuring classifiers to classify incoming traffic into lossless forwarding classes based on the IEEE 802.1p priority tag of the packet.

**NOTE:** If you expect a large amount of lossless traffic on your network and configure multiple lossless traffic classes, ensure that you reserve enough scheduling resources (bandwidth) and lossless headroom buffer space to support the lossless flows. (“[Understanding CoS Buffer Configuration](#)” on [page 5891](#) describes how to configure buffers and provides a recommended buffer configuration for networks with larger amounts of lossless traffic.)

---

### Default Lossless Priority Configuration

---

If you do not explicitly configure forwarding classes, the system uses the default forwarding class configuration, which provides two default lossless forwarding classes (*fcoe* and *no-loss*). (If you change the forwarding class configuration, the changes apply to all traffic on that device because forwarding classes are global to a particular device.)

If you do not explicitly configure classifiers, and you do not explicitly configure flow control to pause output queues (configured in the output stanza of the CNP), the default classifier and the default output queue pause configuration are applied to all Ethernet interfaces on the switches (or Node devices). You can override the default classifier and the default

output queue pause configuration on a per-interface basis by applying an explicit configuration to an Ethernet interface. The default configuration is used on all Ethernet interfaces that do not have an explicit configuration.

**NOTE:** If you do not configure flow control on output queues, the default configuration uses a one-to-one mapping of IEEE 802.1p code points (priorities) to output queues by number. For example, priority 0 (code point 000) is mapped to queue 0, priority 1 (code point 001) is mapped to queue 1, and so on. If you do not use the default configuration, you must explicitly configure flow control on each output queue that you want to enable for PFC pause in the output stanza of the CNP.

In the default configuration, only queue 3 and queue 4 are enabled to respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza of the CNP. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza of the CNP.

The default configuration is the same as the default configuration in software releases earlier than Junos OS Release 12.3, and provides the same lossless behavior:

- There are two default lossless forwarding classes (the no-loss packet drop attribute is applied automatically):  
fcoe—Mapped to output queue 3  
no-loss—Mapped to output queue 4
- The default classifier maps the fcoe forwarding class to IEEE 802.1p priority 3 (011) and the no-loss forwarding class to IEEE 802.1p priority 4 (100)
- Priority-based flow control (PFC) is enabled on Ethernet interface output queues 3 and 4 when those queues carry lossless traffic (traffic that is mapped to the fcoe and no-loss forwarding classes, respectively). In Junos OS software releases earlier than Release 12.3, output queue flow control was not user-configurable.

On native FC interfaces (NP\_Ports), default flow control is enabled on output queue 3 (IEEE 802.1p priority 3) for FCoE/FC traffic.

- PFC must be enabled explicitly on the lossless IEEE 802.1p priorities (code points) on ingress Ethernet interfaces; no default PFC configuration is applied at ingress interfaces. If you do not enable PFC on lossless priorities, those priorities might experience packet loss during periods of congestion. For example, if you want lossless FCoE traffic and you are using the default fcoe forwarding class, you use a CNP to enable PFC on priority 3 (code point 011), and apply that CNP to all ingress interfaces that carry FCoE traffic.
- On Ethernet ports, PFC buffer calculations use the following default values to determine the headroom buffer size:  
Cable length—100 meters (approximately 328 feet)  
MRU for priority 3 traffic—2500 bytes  
MRU for priority 4 traffic—9216 bytes  
Maximum transmission unit (MTU)—1522 (or the configured MTU value for the interface)

**NOTE:** If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not configure an MRU value, the default MRU value is 2500 bytes.

- DCBX is enabled on all interfaces in autonegotiation mode, and automatically exchanges FCoE application protocol type, length, and values (TLVs) on interfaces that carry FCoE traffic. However, if you explicitly configure DCBX protocol TLV exchange for any application, then you must explicitly configure protocol TLV exchange for every application for which you want DCBX to exchange TLVs, including FCoE.

The default CoS configuration is backward-compatible with the *default* CoS configuration of software releases before Junos OS Release 12.3. If you explicitly configure lossless transport, ensure that the input and output queues corresponding to the lossless forwarding classes are explicitly configured for PFC pause.

**NOTE:** If you *explicitly* configured the lossless fcoe or no-loss forwarding classes before upgrading from a release earlier than Junos OS Release 12.3, those forwarding classes are *not* lossless after the upgrade to Junos OS Release 12.3 or later. To regain lossless behavior, you can delete the explicit configuration and use the default lossless forwarding classes, or you can use the no-loss packet drop attribute introduced in Junos OS Release 12.3 to configure the forwarding classes for lossless behavior.

Table 495 on page 5840 summarizes the default unicast forwarding classes and their mapping to output queues, IEEE 802.1p priorities, and drop attributes.

**Table 495: Mapping of Default Unicast Forwarding Class to Queue, IEEE 802.1p Priority, and Drop Attribute**

| Forwarding Class Name | Output Queue | Priority | Drop Attribute |
|-----------------------|--------------|----------|----------------|
| best-effort           | 0            | 0        | drop           |
| fcoe                  | 3            | 3        | no-loss        |
| no-loss               | 4            | 4        | no-loss        |
| network-control       | 7            | 7        | drop           |

There is one default multidestination forwarding class named *mcast* for multicast, broadcast, and destination lookup fail (DLF) traffic that is mapped to output queue 8 with a drop attribute of drop. (Incoming multidestination traffic on all IEEE 802.1p priorities is mapped to the mcast forwarding class by default.)

## Configuring Lossless Priorities

Configuring more than two lossless priorities (forwarding classes), or changing the default mapping of lossless forwarding classes to priorities and paused output queues, requires explicit configuration. Configuring lossless priorities includes:

- Configuring forwarding classes with the no-loss packet drop attribute
- Using a CNP to configure PFC on ingress interfaces and flow control (PFC) on egress interfaces
- Configuring a classifier to map IEEE 802.1p priorities (code points) to the correct forwarding classes (the forwarding classes for which you want lossless transport)

In addition, on Ethernet interfaces, DCBX must exchange the appropriate application protocol TLVs for the lossless traffic, and when the switch acts as an FCoE-FC gateway, you need to remap the FCoE priority on native FC interfaces if your network uses a priority other than 3 (IEEE code point 011) for FCoE traffic. This section describes:

- [Configuring Lossless Forwarding Classes \(Packet Drop Attribute\) on page 5841](#)
- [Congestion Notification Profiles \(PFC Configuration\) on page 5843](#)
- [Configuring DCBX \(Application Protocol TLV Exchange\) on page 5849](#)
- [Fate Sharing Among Traffic Classes on page 5849](#)
- [Transit Switch Configuration Versus FCoE-FC Gateway Configuration on page 5851](#)
- [Configuration Results and Commit Checks on page 5851](#)

### Configuring Lossless Forwarding Classes (Packet Drop Attribute)

Junos OS Release 12.3 introduced the *no-loss* parameter for forwarding class configuration. (Although it uses the same name, this is not the no-loss default forwarding class. It is a packet drop attribute you can specify to configure any unicast forwarding class as a lossless forwarding class.)

You can configure up to six forwarding classes (depending on system architecture and the availability of system resources) as lossless forwarding classes by including the **no-loss** drop attribute at the **[edit class-of-service forwarding-classes class forwarding-class-name queue-num queue-number]** hierarchy level.

If you use the default fcoe or no-loss forwarding classes, they include the no-loss drop attribute by default. If you explicitly configure the fcoe or no-loss forwarding classes and you want to retain their lossless behavior, you *must* include the no-loss drop attribute in the configuration.

**NOTE:** All forwarding classes mapped to the same output queue must have the same packet drop attribute. (All forwarding classes mapped to the same output queue must be either lossy or lossless. You cannot map both a lossy and a lossless forwarding class to the same queue.)

To avoid fate sharing (different flows receiving the same CoS treatment), use a one-to-one mapping of lossless forwarding classes to IEEE 802.1p code points (priorities) and queues. (Each forwarding class should be mapped to a different queue and classified into a different priority.) The classifier attached to the interface determines the forwarding class to priority mapping.

The fcoe and no-loss forwarding classes are special cases, because in the default configuration, they are configured for lossless behavior (providing that you also enable PFC on the priorities mapped to the fcoe and no-loss forwarding classes in the CNP input stanza).

[Table 496 on page 5842](#) summarizes the possible configurations of the fcoe and no-loss forwarding classes in Junos OS Release 12.3 and later, and the result of those configurations in terms of lossless traffic behavior. It is assumed that PFC, DCBX, and classifiers are properly configured.

**Table 496: FCoE and No-Loss Forwarding Class Configuration in Junos OS Release 12.3**

| Explicit (User-Configured) or Default Forwarding Class Configuration | Packet Drop Attribute  | Result and Notes  |
|--|--|---|
| Default  | Default  | The fcoe and no-loss forwarding classes are lossless.<br><br><b>NOTE:</b> Even if you explicitly configure other forwarding classes (lossy or lossless forwarding classes), the fcoe and no-loss forwarding classes remain lossless because they are not explicitly configured.   |
| Explicit   | Not specified in the explicit forwarding class configuration                         | The fcoe and no-loss forwarding classes are lossy because they do not include the no-loss drop attribute.   |
| Explicit   | No-loss  | The fcoe and no-loss forwarding classes are lossless.   |
| Explicit, configured in Junos OS Release 12.2 or earlier             | Not specified (packet drop attribute was not available before Junos OS Release 12.3) | The fcoe and no-loss forwarding classes are lossy in Junos OS Release 12.3 and later because they do not include the no-loss drop attribute.<br><br><b>NOTE:</b> To retain lossless behavior, before you upgrade to Junos OS Release 12.3, delete the explicit configuration so that the system uses the default configuration. Alternatively, you can reconfigure the forwarding classes with the no-loss packet drop attribute after upgrading to Junos OS Release 12.3 or later. |

For all other forwarding classes, you must explicitly configure lossless transport by specifying the no-loss packet drop attribute, because the default configuration for all other forwarding classes is lossy.

### ***Congestion Notification Profiles (PFC Configuration)***

Use CNPs to configure lossless PFC characteristics on input and output interfaces.

The input stanza of a CNP enables PFC on specified IEEE 802.1p priorities (code points) and fine-tunes headroom buffer settings by configuring the maximum receive unit (MRU) value and cable length on ingress interfaces.

The output stanza of a CNP enables PFC (flow control) on output queues for specified IEEE 802.1p priorities so that the queues can respond to PFC pause messages from the connected peer on the priority of your choice. (By default, output queues 3 and 4 respond to received PFC messages when those queues carry lossless traffic in the fcoe and no-loss forwarding classes, respectively.)

To achieve lossless transport, the priority paused at the ingress interfaces must match the priority paused at the egress interfaces for a given traffic flow. For example, if you configure ingress interfaces to pause traffic tagged with IEEE 802.1p priority 5 (code point 101) and priority 5 traffic is mapped to output queue 5, then you must also configure the corresponding output interfaces to pause priority 5 on queue 5. In addition, the forwarding class mapped to queue 5 must be configured as a lossless forwarding class (using the no-loss drop attribute).

**CAUTION:** Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

A change to the PFC configuration means any change to a CNP, including changing the input portion of the CNP (enabling or disabling PFC on a priority, or changing the MRU or cable-length values) or changing the output portion the CNP that enables or disables output flow control on a queue. A PFC configuration change only affects ports that use the changed CNP.

The following actions change the PFC configuration:

- Deleting or disabling a PFC configuration (input or output) in a CNP that is in use on one or more interfaces. For example:
  1. An existing CNP with an input stanza that enables PFC on priorities 3, 5, and 6 is configured on interfaces xe-0/0/20 and xe-0/0/21.
  2. We disable the PFC configuration for priority 6 in the input CNP, and then commit the configuration.

3. The PFC configuration change causes all traffic on interfaces xe-0/0/20 and xe-0/0/21 to stop until the PFC change has been implemented. When the PFC change has been implemented, traffic resumes.

- Configuring a CNP on an interface. (This changes the PFC state by enabling PFC on one or more priorities.)
- Deleting a CNP from an interface. (This changes the PFC state by disabling PFC on one or more priorities.)

---

### ***Configuring Input Interface Flow Control (PFC and Headroom Buffer Calculation)***

On Ethernet interfaces, the input stanza of the CNP enables PFC on specified priorities so that the ingress interface can send a pause message to the connected peer during periods of congestion. Input CNPs also fine-tune the headroom buffers used for PFC support by allowing you to configure the MRU value and cable length (if you do not want to use the default configuration).

Headroom buffers support lossless transport by storing the traffic that arrives at an interface after the interface sends a PFC flow control message to pause incoming traffic. Until the connected peer receives the flow control message and pauses traffic, the interface continues to receive traffic and must buffer it (and the traffic that is still on the wire after the peer pauses) to prevent packet loss.

The system uses the MRU and the length of the attached physical cable to calculate buffer headroom allocation. The default configuration values are:

- MRU for priority 3 traffic—2500 bytes
- MRU for priority 4 traffic—9216 bytes
- Cable length—100 meters (approximately 328 feet)

**NOTE:** If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not explicitly configure an MRU value, the default MRU value is 2500 bytes.

---

You can fine-tune the MRU and the cable length to adjust the size of the headroom buffer on an interface. The switch has a shared global buffer pool and dynamically allocates headroom buffer space to lossless queues as needed.

A lower MRU or a shorter cable length reduces the amount of headroom buffer required on an interface and leaves more headroom buffer space for other interfaces. A higher MRU or a longer cable length increases the amount of headroom buffer space required on an interface and leaves less headroom buffer space for other interfaces.

In many cases, you can better utilize the headroom buffers by reducing the MRU value (for example, an MRU of 2180 is sufficient for most FCoE networks) and by reducing the cable length value if the physical cable is less than 100 meters long.

**NOTE:** When you configure the headroom buffers by changing the MRU or the cable length, and commit the configuration, the system performs a commit check and rejects the configuration if sufficient headroom buffer space is not available.

However, the system does not perform a commit check but instead returns a syslog error if:

- The buffers are configured on a LAG interface.
- The default classifier is used on the interface (instead of a user-configured classifier).
- The interface has not been created yet.

### ***Configuring Output Interface Flow Control (PFC)***

On Ethernet interfaces, you can use the output stanza of the CNP to configure flow control on unicast output queues and enable PFC pause response on specified IEEE 802.1p priorities. By default, output queues 3 and 4 are enabled for PFC pause on priorities 3 (IEEE 802.1p code point 011) and 4 (IEEE 802.1p code point 100). The default PFC pause response supports the default lossless forwarding class configuration, which maps the fcoe forwarding class to queue 3 and priority 3, and maps the no-loss forwarding class to queue 4 and priority 4.

Configuring PFC on output queues enables you to pause any priority on any unicast output queue on any Ethernet interface. Output flow control enables you to use more than two output queues to support lossless traffic flows (you can configure up to six lossless forwarding classes and map them to different output queues that are enabled for PFC pause). Output queue flow control also enables you to support multiple lossless forwarding classes (each mapped to a different priority and output queue) for one class of traffic.

**NOTE:** Output flow control only works when PFC is enabled in the CNP input stanza on the corresponding priorities on the interface.

For example, if the converged Ethernet network uses two different priorities for FCoE traffic (for example, priority 3 and priority 5), then you can classify those priorities into different lossless forwarding classes that are mapped to different output queues by:

1. Configuring two lossless forwarding classes for FCoE traffic, with each forwarding class mapped to a different output queue. For example, you could use the default fcoe forwarding class, which is mapped to queue 3, and you could configure a second lossless forwarding class called fcoe1 and map it to queue 5. The fcoe forwarding class is for priority 3 FCoE traffic (code point 011), and the fcoe1 forwarding class is for priority 5 (code point 101) FCoE traffic.
2. Configuring a classifier that maps each forwarding class to the desired IEEE 802.1p code point (priority). If FCoE traffic on both priorities uses one interface, the classifier

must classify both forwarding classes to the correct priorities. If FCoE traffic of different priorities uses different interfaces, the classifier configuration on each interface must map the correct priority to the corresponding lossless forwarding class.

3. Applying the classifier to the interfaces that carry FCoE traffic. The classifier determines the mapping of forwarding classes to priorities on each interface.

To configure lossless transport for these forwarding classes, you also need to:

- Enable PFC on the two priorities (3 and 5 in this example) at the ingress interfaces in the CNP input stanza.
- Configure PFC on the output queues and priorities for the forwarding classes in the CNP output stanza so that the interface can respond to pause messages received from the connected peer.

**NOTE:** When you configure the CNP on an interface, all ingress and egress traffic is blocked until the configuration is implemented, then the interface is unblocked and traffic resumes. During the time the interface is blocked, all queues on the interface experience packet loss.

- Configure DCBX to exchange application protocol TLVs on both FCoE priorities.

**NOTE:** If you do not configure flow control to pause output queues, the default configuration uses a one-to-one mapping of IEEE 802.1p code points (priorities) to output queues by number. For example, priority 0 (code point 000) is mapped to queue 0, priority 1 (code point 001) is mapped to queue 1, and so on. By default, only queues 3 and 4 are enabled to respond to pause messages from the connected peer, and you must explicitly enable PFC on the corresponding priorities in the CNP input stanza to achieve lossless behavior.

If you do not use the default configuration, you must explicitly configure flow control on each output queue that you want to enable for PFC pause. For example, if you explicitly configure flow control on output queue 5, the default configuration is no longer valid, and only output queue 5 is enabled for PFC pause. Output queues 3 and 4 are no longer enabled for PFC pause, so traffic using those queues no longer responds to PFC pause messages even if the corresponding forwarding class is configured with the no-loss drop attribute. To retain the pause configuration on output queues 3 and 4 and configure flow control on queue 5, you need to explicitly configure flow control on queues 3, 4, and 5.

You cannot configure flow control to pause a multidestination output queue. You can configure flow control to pause only unicast output queues.

### Output Interface Flow Control Profiles

Configuring the CNP output stanza creates an output flow control profile that tells egress ports the queues on which the Ethernet interface should respond to PFC pause messages. Although you can create an unlimited number of CNPs that contain input stanzas only, the number of CNPs that you can configure with output stanzas is limited:

- For standalone switches that are not part of a QFabric system, you can configure up to two output interface flow control profiles. (You can configure up to two CNPs with output stanzas.)
- For QFabric systems, you can configure one output interface flow control profile per Node device. (You can configure one CNP with an output stanza per Node device.)

There are a total of four output flow control profiles.

The system has a default output flow control profile that is applied to all Ethernet interfaces when the CNP attached to the interface has only an input stanza and does not include an output stanza. The default profile responds to PFC pause messages received on queue 3 (for priority 3, for the default fcoe forwarding class) and on queue 4 (for priority 4, for the default no-loss forwarding class), and is effective only if PFC is configured on those priorities in the CNP input stanza.

Additionally, the system has two internal output flow control profiles that it applies automatically to fabric (FTE) ports and to native FC interfaces (NP\_Ports). When the switch is not part of a QFabric system, the profile normally used for FTE ports is available for user configuration and provides a second user-configurable profile. (That is why standalone switches have two user-configurable output flow control profiles, but Node devices on a QFabric system have only one user-configurable output flow control profile.)

Because one output CNP can configure PFC pause response on multiple output queues (priorities), one user-configurable output CNP is usually flexible enough to specify the desired PFC response on all programmed interfaces.

**NOTE:** Each port can use one output flow control profile. You cannot apply more than one profile to one port.

Output flow control profiles can be expressed in table format. For example, [Table 497 on page 5847](#) shows the default output flow control profile that pauses priorities 3 and 4 on queues 3 and 4 (remember that PFC must also be enabled on code points 3 and 4 in the CNP input stanza in order for PFC to work):

**Table 497: Default Output Flow Control Profile**

| IEEE 802.1p Priority Specified in Received PFC Frame | Paused Output Queue |
|--|---------------------|
| 0 (000)  | —                   |
| 1 (001)  | —                   |

**Table 497: Default Output Flow Control Profile (*continued*)**

| IEEE 802.1p Priority Specified in Received PFC Frame | Paused Output Queue |
|--|---------------------|
| 2 (010)  | —                   |
| 3 (011)  | 3                   |
| 4 (100)  | 4                   |
| 5 (101)  | —                   |
| 6 (110)  | —                   |
| 7 (111)  | —                   |

Table 498 on page 5848 is an example of a user-configured output flow control profile. Using the example from the preceding section, the CNP output stanza configures flow control on output queue 5, and also explicitly configures output flow control on queues 3 and 4 for the fcoe and no-loss forwarding classes. (If you explicitly configure an output CNP, you must explicitly configure every output queue that you want to respond to PFC messages, because the user-configured profile overrides the default profile. If this example did not include queues 3 and 4, those queues would no longer respond to received PFC messages.)

**Table 498: User-Configured Output Flow Control Profile**

| IEEE 802.1p Priority Specified in Received PFC Frame | Paused Output Queue |
|--|---------------------|
| 0 (000)  | —                   |
| 1 (001)  | —                   |
| 2 (010)  | —                   |
| 3 (011)  | 3                   |
| 4 (100)  | 4                   |
| 5 (101)  | 5                   |
| 6 (110)  | —                   |
| 7 (111)  | —                   |

Remember that you must also enable PFC on code points 3, 4, and 5 in the CNP input stanza for this configuration to work. When you configure the CNP on an interface, all ingress and egress traffic is blocked until the configuration is implemented, then the interface is unblocked and traffic resumes. During the time the interface is blocked, all queues on the interface experience packet loss.

### ***Configuring PFC Across Layer 3 Interfaces on QFX5100 and EX4600 Switches***

Enabling PFC on traffic flows is based on the IEEE 802.1p code point (priority) in the priority code point (PCP) field of the Ethernet frame header (sometimes known as the CoS bits). To enable PFC on traffic that crosses Layer 3 interfaces, the traffic must be classified by its IEEE 802.1p code point, not by its DSCP (or DSCP IPv6) code point.

See [“Understanding PFC Functionality Across Layer 3 Interfaces” on page 5950](#) for a conceptual overview of how to enable PFC on traffic across Layer 3 interfaces. See [“Example: Configuring PFC Across Layer 3 Interfaces” on page 6138](#) for an example of how to configure PFC on traffic that traverses Layer 3 interfaces.

### ***Configuring DCBX (Application Protocol TLV Exchange)***

For applications that require lossless transport, DCBX exchanges application protocol TLVs with the connected peer interface. By default, DCBX advertises FCoE application protocol TLVs on all interfaces that are enabled for DCBX, and by default, DCBX is enabled on all interfaces. DCBX advertises no other applications by default.

For each application (for example, iSCSI) that you want to configure for lossless transport, you must enable the interfaces which carry that application traffic to exchange DCBX protocol TLVs with the connected peer. The TLV exchange allows the peer interfaces to negotiate a compatible configuration to support the application.

If you configure DCBX to advertise any application, the default DCBX advertisement is overridden, and DCBX advertises only the configured applications. If you want an interface to advertise only the FCoE application, you do not have to configure DCBX application protocol TLV exchange; instead, you can use the default configuration.

If you want DCBX to advertise other applications, you must explicitly configure an application map and apply it to the interfaces on which you want to exchange protocol TLVs for those applications. If you want to exchange FCoE application protocol TLVs in addition to other application protocol TLVs, you must also explicitly configure the FCoE application in the application map. [“Understanding DCBX Application Protocol TLV Exchange” on page 5589](#) describes how application mapping works.

**NOTE:** Lossless transport also requires that you enable PFC on the correct priority (IEEE 802.1p code point) on the ingress interfaces using an input CNP. If the priority you pause at the ingress interfaces is not mapped to queue 3 or queue 4 (the two output queues that are enabled for PFC pause flow control by default), then you must also enable the output queues that correspond to paused input priorities to pause using the output stanza of the CNP.

### ***Fate Sharing Among Traffic Classes***

You can configure different lossless (or lossy) traffic flows to share fate—that is, to receive the same CoS treatment.

Fate sharing is not desirable for I/O convergence. Instead of independent control of the fate of each type of flow, different types of flows receive the same treatment. Fate sharing is particularly undesirable for lossless flows. If one lossless flow experiences congestion and must be paused, that affects flows that share fate with the congested flow even if the other flows are not experiencing congestion, and also can cause ingress port congestion. If your network requires that all 802.1p priorities be lossless, you can achieve that by allowing some fate sharing among the eight priorities by spreading them across up to six lossless forwarding classes.

If the number of lossless priorities is less than or equal to the number of configured lossless forwarding classes, then you can avoid fate sharing by configuring a one-to-one mapping of forwarding classes to IEEE 802.1p code points (priorities) and output queues. (Each forwarding class should be mapped to a different output queue and classified to a different priority.)

If you want to configure different traffic flows to share fate, two fate-sharing configurations are supported: mapping one forwarding class to more than one IEEE 802.1p code point (priority), and mapping two forwarding classes to the same output queue:

1. If you map one lossless forwarding class to more than one priority, the traffic tagged with each of the priorities uses the same CoS properties associated (the CoS properties associated with the forwarding class). For example, configuring a forwarding class called `fc1`, mapping it to queue 1, and mapping it to code points 101 and 110 using a classifier named `classify1` results in the traffic tagged with priorities 101 and 110 sharing fate:

```
user@switch# set class-of-service forwarding-classes class fc1 queue-num 1 no-loss
user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1
loss-priority low code-points 101
user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1
loss-priority low code-points 110
```

In this case, if the traffic mapped to either priority experiences congestion, both priorities are paused because they are mapped to the same forwarding class and are therefore treated similarly.

2. If you map multiple lossless forwarding classes to the same output queue, the traffic mapped to the forwarding classes uses the same output queue. This increases the amount of traffic the queue needs to buffer and forward, and can create congestion that affects all of the traffic flows that are mapped to the queue. For example, configuring two forwarding classes called `fc1` and `fc2`, mapping both forwarding classes to queue 1, and mapping the forwarding classes to code points 101 and 110 (respectively) using a classifier named `classify1` results in the traffic tagged with priorities 101 and 110 sharing fate on the same output queue:

```
user@switch# set class-of-service forwarding-classes class fc1 queue-num 1 no-loss
user@switch# set class-of-service forwarding-classes class fc2 queue-num 1 no-loss
user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1
loss-priority low code-points 101
user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc2
loss-priority low code-points 110
```

in this case, even though the two forwarding classes use different IEEE 802.1p priorities, if one forwarding class experiences congestion, it affects the other forwarding class. The reason is that if the output queue is paused because of congestion on either forwarding class, all traffic that uses that queue is paused. Since both forwarding classes are mapped to the queue, the traffic mapped to both forwarding classes is paused.

**NOTE:** If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

### ***Transit Switch Configuration Versus FCoE-FC Gateway Configuration***

On a transit switch (all Ethernet ports, no native FC ports) that forwards FCoE traffic (or other traffic that requires lossless transport across the Ethernet network), the configuration of classifiers, lossless forwarding classes, DCBX, and PFC on ingress and egress interfaces to support lossless transport is as described in this document.

When the QFX3500 switch acts as an FCoE-FC gateway, the system uses native FC interfaces (NP\_Ports) to connect to the FC switch (or FCoE forwarder) at the FC network edge. You cannot apply CNPs or DCBX to native FC interfaces, only to Ethernet interfaces.

On an FCoE-FC gateway, the Ethernet interface configuration of classifiers, DCBX, and PFC is the same as the Ethernet interface configuration on a transit switch. The configuration of lossless forwarding classes is also the same.

However, supporting lossless transport on native FC interfaces requires that you rewrite the IEEE 802.1p priority value *if* your network uses any priority other than 3 (IEEE code point 011) for FCoE traffic. If your network uses priority 3 for FCoE traffic, you can and should use the default configuration on native FC interfaces.

By default, native FC interfaces tag packets with priority 3 when they encapsulate the incoming FC packets in Ethernet. If your FCoE network uses a different priority than 3 for FCoE traffic, you need to rewrite the priority value to the value that your network uses on the FC interface, classify the FCoE traffic to the correct priority on the Ethernet interfaces, and enable PFC on the correct priority on the Ethernet interfaces, as described in *Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway*.

### ***Configuration Results and Commit Checks***

Different configurations of forwarding classes and their drop attributes, classifiers, CNPs (PFC flow control), and Ethernet PAUSE (IEEE 802.3X flow control) result in different system behaviors.

[Table 499 on page 5852](#) describes the results of the possible lossless transport configurations in each case. The assumption in the *Result* column is that the system's buffer headroom calculation resulted in a successful configuration.

However, if the system calculates that there is insufficient buffer space to support the configuration, a commit check prevents you from committing the configuration on an individual Ethernet interface. For LAG interfaces, the system does not issue a commit check error but instead issues a syslog message.

**NOTE:** After you configure lossless transport for a LAG interface, be sure to check the syslog messages to confirm that the commit was successful.

**Table 499: Results of Lossless Priority Configuration**

| Classifier Configuration                               | Congestion Notification Profile Configuration                                 | Ethernet PAUSE (IEEE 802.3X) Configuration | Result  |
|--|---|--|---|
| None (default classifier)                              | None  | None                                       | System default configuration. No flows are lossless. To achieve lossless behavior for the default fcoe and no-loss forwarding classes, you must configure a CNP to enable PFC on their IEEE 802.1p code points (011 and 100 respectively).  |
| Classifier with no lossless forwarding classes         | None  | None                                       | No lossless traffic flows are configured; all traffic is best effort.   |
| Classifier with at least one lossless forwarding class | None  | None                                       | Because no CNP is attached to interfaces, PFC is not enabled on the code point of the lossless traffic and no headroom buffer is allocated to the lossless queue, so packets can drop during periods of congestion. This configuration does not achieve lossless behavior.        |
| None (default classifier)                              | PFC enabled on the fcoe and no-loss forwarding class code points (priorities) | None                                       | The default classifier classifies traffic into two lossless forwarding classes, fcoe and no-loss. The CNP enables PFC on the priorities mapped to both lossless forwarding classes, resulting in lossless behavior for traffic mapped to the fcoe and no-loss forwarding classes. |

Table 499: Results of Lossless Priority Configuration (*continued*)

| Classifier Configuration                               | Congestion Notification Profile Configuration                         | Ethernet PAUSE (IEEE 802.3X) Configuration   | Result   |
|--|---|--|--|
| None (default classifier)                              | None  | Flow control enabled   | The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length. The system does not calculate buffer headroom for individual output queues. Because Ethernet PAUSE is enabled on the link instead of PFC being enabled on the lossless priorities, the entire link is paused during periods of congestion. This configuration results in lossless behavior for all of the forwarding classes on the link, but because all traffic is paused, this can cause greater overall network congestion. |
| Classifier with at least one lossless forwarding class | PFC enabled on the lossless forwarding class code points (priorities) | None   | Headroom buffer allocated only to priorities that are mapped to the lossless forwarding classes and on which PFC is enabled. This configuration achieves lossless behavior for the lossless forwarding classes.  |
| Classifier with no lossless forwarding classes         | None  | Flow control enabled   | The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length, and it pauses all traffic on the link during periods of congestion.   |
| Classifier with at least one lossless forwarding class | None  | Flow control enabled   | The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length, and it pauses all traffic on the link during periods of congestion.   |
| Classifier with at least one lossless forwarding class | PFC enabled on the lossless forwarding class code points (priorities) | Flow control enabled on a <i>different</i> interface than the interface with the CNP | The system checks the available buffer space for both the PFC-enabled priorities and for the other link. If sufficient buffer space is available, the lossless forwarding classes configured with PFC on one interface and also all of the traffic on the link with Ethernet PAUSE enabled achieve lossless behavior.  |

**NOTE:** If you attempt to configure both PFC and Ethernet PAUSE on a link, the system returns a commit error. PFC and Ethernet PAUSE are mutually exclusive configurations on an interface.

### Backward Compatibility with Junos OS Releases Earlier Than Release 12.3

The addition of the no-loss packet drop attribute to forwarding class configuration means that when you upgrade from an earlier release to Junos OS Release 12.3, the new software might not preserve the lossless forwarding class configuration of the fcoe and no-loss forwarding classes.

If you used the default forwarding class configuration for the fcoe and no-loss forwarding classes, the CoS configuration is backward-compatible. You do not have to do anything to preserve the lossless behavior of traffic that uses those forwarding classes when you upgrade to Junos OS Release 12.3. (This is because the default configuration of these two forwarding classes includes the no-loss packet drop attribute.)

However, if you explicitly configured the fcoe or the no-loss forwarding class by including the **set forwarding-classes class forwarding-class-name queue-num queue-number** statement at the **[edit class-of-service]** hierarchy level, then those forwarding classes are no longer lossless, they are lossy. (They are lossy because explicit configuration in releases earlier than Junos OS Release 12.3 did not use the no-loss packet drop attribute.) In Junos OS Release 12.3 and later, you must include the no-loss packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

For example, before Junos OS Release 12.3, the following explicit configuration resulted in a lossless forwarding class:

```
user@switch# set class-of-service forwarding-classes class fcoe queue-num 3
```

However, in Junos OS Release 12.3, this configuration is lossy because it does not include the no-loss packet drop attribute. To preserve lossless behavior, after upgrading to Junos OS Release 12.3, you need to add the no-loss drop attribute:

```
user@switch# set class-of-service forwarding-classes class fcoe queue-num 3 no-loss
```

Alternatively, you can delete the explicit configuration before you upgrade to Junos OS Release 12.3 so that the system uses the default forwarding class, which is lossless:

```
user@switch# delete class-of-service forwarding-classes class fcoe queue-num 3
```

**NOTE:** The explicit configuration of other forwarding classes does not affect the lossless (or lossy) state of the fcoe and no-loss forwarding classes, because only the fcoe and no-loss forwarding classes were lossless forwarding classes before Junos OS Release 12.3. For example, if you explicitly configured the best-effort forwarding class but you used the default fcoe and no-loss forwarding classes in Junos OS Release 12.2, then when you upgrade to Junos OS Release 12.3, the fcoe and no-loss forwarding classes are still lossless (and the best-effort forwarding classes retains its explicit configuration).

**NOTE:** To achieve lossless behavior for the traffic belonging to any forwarding class, you must also use a CNP to enable PFC on the IEEE 802.1p priority mapped to the forwarding class and apply the CNP to the relevant interfaces, and ensure that DCBX exchanges the protocol TLVs for the application with the connected peer.

### Configuration Rules and Recommendations

Keep in mind the following configuration rules and recommendations when you configure lossless traffic flows:

- You can configure a maximum of six lossless forwarding classes (forwarding classes with the no-loss packet drop attribute).
- All forwarding classes that you map to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes must be lossless).
- You cannot configure flow control to pause a multidestination output queue. You can configure PFC flow control only to pause unicast output queues.
- Forwarding classes mapped to multidestination queues (queues 8 through 11) cannot have the no-loss packet drop attribute. (Multidestination forwarding classes cannot be configured as lossless forwarding classes.)
- Do not configure weighted random early detection (WRED) on lossless forwarding classes. (Do not associate a drop profile with a forwarding class that has the no-loss packet drop attribute.)

## Understanding Default CoS Scheduling and Classification

If you do not configure hierarchical scheduling on an interface, the switch uses the default classifiers for ingress traffic and the default schedulers for egress traffic. Default scheduling and classification handle all traffic types (best-effort, FCoE, no-loss, network-control, and multidestination traffic).

Hierarchical scheduling groups egress queues (priorities, configured as forwarding classes) into priority groups (forwarding class sets). If you use only the default traffic scheduling and classification, the switch automatically creates a default priority group that contains all of the priorities (forwarding classes, which represent output queues) and assigns 100 percent of the port output bandwidth to that priority group. The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default classifier settings. The default priority group is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange (DCBX) protocol advertisement.

**NOTE:** If you explicitly configure one or more priority groups on an interface, any forwarding class that is not assigned to a priority group on that interface receives *no bandwidth*. This means that if you configure hierarchical scheduling on an interface, every forwarding class (priority) that you want to forward traffic on that interface must belong to a forwarding class set (priority group).

The following sections describe:

- [Default Classification on page 5856](#)
- [Default Scheduling on page 5859](#)
- [Default DCBX Advertisement on page 5861](#)
- [Default Scheduling and Classification Summary on page 5862](#)

### Default Classification

---

The default classifiers assign unicast and multicast best-effort and network-control ingress traffic to forwarding classes and loss priorities. The switch applies default unicast IEEE 802.1, unicast DSCP, and multidestination classifiers to each interface that does not have explicitly configured classifiers. If you explicitly configure one type of classifier but not other types of classifiers, the system uses only the configured classifier and does not use default classifiers for other types of traffic. There are two different default unicast IEEE 802.1 classifiers, a trusted classifier for ports that are in trunk mode or tagged-access mode, and an untrusted classifier for ports that are in access mode.

Table 500 on page 5857 shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode.

**Table 500: Default IEEE 802.1 Unicast Classifiers for Ports in Trunk Mode or Tagged-Access Mode (Trusted Classifier)**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| be (000)   | best-effort      | low           |
| be1 (001)  | best-effort      | low           |
| ef (010)   | best-effort      | low           |
| ef1 (011)  | fcoe             | low           |
| af11 (100) | no-loss          | low           |
| af12 (101) | best-effort      | low           |
| nc1 (110)  | network-control  | low           |
| nc2 (111)  | network-control  | low           |

Table 501 on page 5857 shows the default mapping of IEEE 802.1p code-point values to unicast forwarding classes and loss priorities for ports in access mode (all incoming traffic is mapped to best-effort forwarding classes).

**Table 501: Default IEEE 802.1 Unicast Classifiers for Ports in Access Mode (Untrusted Classifier)**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| 000        | best-effort      | low           |
| 001        | best-effort      | low           |
| 010        | best-effort      | low           |
| 011        | best-effort      | low           |
| 100        | best-effort      | low           |
| 101        | best-effort      | low           |
| 110        | best-effort      | low           |
| 111        | best-effort      | low           |

Table 502 on page 5858 shows the default mapping of IEEE 802.1 code-point values to multdestination (multicast, broadcast, and destination lookup fail traffic) forwarding classes and loss priorities.

**Table 502: Default IEEE 802.1 Multidestination Classifiers**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| be (000)   | mcast            | low           |
| be1 (001)  | mcast            | low           |
| ef (010)   | mcast            | low           |
| ef1 (011)  | mcast            | low           |
| af11 (100) | mcast            | low           |
| af12 (101) | mcast            | low           |
| nc1 (110)  | mcast            | low           |
| nc2 (111)  | mcast            | low           |

Table 503 on page 5858 shows the default mapping of DSCP code-point values to unicast forwarding classes and loss priorities for DSCP IP and DCSP IPv6.

**Table 503: Default DSCP IP and IPv6 Unicast Classifiers**

| Code Point    | Forwarding Class | Loss Priority |
|---------------|------------------|---------------|
| ef (101110)   | best-effort      | low           |
| af11 (001010) | best-effort      | low           |
| af12 (001100) | best-effort      | low           |
| af13 (001110) | best-effort      | low           |
| af21 (010010) | best-effort      | low           |
| af22 (010100) | best-effort      | low           |
| af23 (010110) | best-effort      | low           |
| af31 (011010) | best-effort      | low           |
| af32 (011100) | best-effort      | low           |
| af33 (011110) | best-effort      | low           |

Table 503: Default DSCP IP and IPv6 Unicast Classifiers (*continued*)

| Code Point    | Forwarding Class | Loss Priority |
|---------------|------------------|---------------|
| af41 (100010) | best-effort      | low           |
| af42 (100100) | best-effort      | low           |
| af43 (100110) | best-effort      | low           |
| be (000000)   | best-effort      | low           |
| cs1 (001000)  | best-effort      | low           |
| cs2 (010000)  | best-effort      | low           |
| cs3 (011000)  | best-effort      | low           |
| cs4 (100000)  | best-effort      | low           |
| cs5 (101000)  | best-effort      | low           |
| nc1 (110000)  | network-control  | low           |
| nc2 (111000)  | network-control  | low           |

**NOTE:** There are no default DSCP IP or IPv6 multdestination classifiers for multdestination traffic. DSCP IPv6 multdestination classifiers are not supported for multdestination traffic.

### Default Scheduling

The default schedulers allocate egress bandwidth resources to unicast and multicast egress traffic as shown in [Table 504 on page 5859](#):

Table 504: Default Scheduler Configuration

| Default Scheduler and Queue Number  | Transmit Rate (Minimum Guaranteed Bandwidth) | Shaping Rate (Maximum Bandwidth) | Excess Bandwidth Sharing | Priority | Buffer Size |
|-------------------------------------|--|----------------------------------|--------------------------|----------|-------------|
| Best-effort scheduler (queue 0)     | 5%   | None                             | 5%                       | low      | 5%          |
| FCoE scheduler (queue 3)            | 35%  | None                             | 35%                      | low      | 35%         |
| No-loss scheduler (queue 4)         | 35%  | None                             | 35%                      | low      | 35%         |
| Network-control scheduler (queue 7) | 5%   | None                             | 5%                       | low      | 5%          |

Table 504: Default Scheduler Configuration (*continued*)

| Default Scheduler and Queue Number   | Transmit Rate (Minimum Guaranteed Bandwidth) | Shaping Rate (Maximum Bandwidth) | Excess Bandwidth Sharing | Priority | Buffer Size |
|--------------------------------------|--|----------------------------------|--------------------------|----------|-------------|
| Multidestination scheduler (queue 8) | 20%  | None                             | 20%                      | low      | 20%         |

**NOTE:** The minimum guaranteed bandwidth rate also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the minimum guaranteed bandwidth (transmit rate) of each queue.

By default, only the five default schedulers shown in [Table 504 on page 5859](#) have traffic mapped to them. Only the queues associated with the default schedulers receive default bandwidth, based on the default scheduler transmit rate. (You can configure schedulers and forwarding classes to allocate bandwidth to other queues or to change the default bandwidth of a default queue.) In addition, multidestination queue 11 receives enough bandwidth from the default multidestination scheduler to handle CPU-generated multidestination traffic.

Default hierarchical scheduling divides the total port bandwidth between two groups of traffic: unicast traffic and multidestination traffic. By default, unicast traffic consists of queue 0 (**best-effort** forwarding class), queue 3 (**fcoe** forwarding class), queue 4 (**no-loss** forwarding class), and queue 7 (**network-control** forwarding class). Unicast traffic receives and shares a total of 80 percent of the port bandwidth. By default, multidestination traffic (**mcast** queue 8) receives a total of 20 percent of the port bandwidth. So on a 10-Gigabit port, unicast traffic receives 8-Gbps of bandwidth and multidestination traffic receives 2-Gbps of bandwidth.

**NOTE:** Multidestination queue 11 also receives a small amount of default bandwidth from the multidestination scheduler. CPU-generated multidestination traffic uses queue 11, so you might see a small number of packets egress from queue 11. In addition, in the unlikely case that firewall filter match conditions map multidestination traffic to a unicast forwarding class, that traffic uses queue 11.

Default scheduling uses weighted round-robin (WRR) scheduling. Each queue receives a portion (weight) of the total available interface bandwidth. The scheduling weight is based on the transmit rate of the default scheduler for that queue. For example, queue 7 receives a default scheduling weight of 5 percent of the available bandwidth, and queue 4 receives a default scheduling weight of 35 percent of the available bandwidth. Queues are mapped to forwarding classes, so forwarding classes receive the default bandwidth for the queues to which they are mapped.

You should explicitly map traffic to non-default (unconfigured) queues and create schedulers to allocate bandwidth to those queues if you want to use them to forward traffic. By default, unicast queues 1, 2, 5, and 6 are unconfigured, and multidestination queues 9, 10, and 11 are unconfigured. Unconfigured queues have a default scheduling weight of 1 so that they can receive a small amount of bandwidth in case they need to forward traffic. (However, queue 11 can use more of the default multidestination scheduler bandwidth if necessary to handle CPU-generated multidestination traffic.)

**NOTE:** All four multidestination queues have a scheduling weight of 1. Because by default multidestination traffic goes to queue 8, queue 8 receives almost all of the multidestination bandwidth. (There is no traffic on queue 9 and queue 10, and very little traffic on queue 11, so there is almost no competition for multidestination bandwidth.)

However, if you explicitly configure queue 9, 10, or 11 (by mapping code points to the unconfigured multidestination forwarding classes using the multidestination classifier), the explicitly configured queues share the multidestination scheduler bandwidth equally with default queue 8, because all of the queues have the same scheduling weight (1). To ensure that multidestination bandwidth is allocated to each queue properly and that the bandwidth allocation to the default queue (8) is not reduced too much, we strongly recommend that you configure a scheduler if you explicitly classify traffic into queue 9, 10, or 11.

If you map traffic to an unconfigured queue, the queue receives only the amount of group bandwidth proportional to its default weight (1). The actual amount of bandwidth an unconfigured queue receives depends on how much bandwidth the other queues in the group are using.

If the other unicast queues use less than their allocated amount of bandwidth, the unconfigured queues can share the unused bandwidth. Sharing unused bandwidth is one of the key advantages of hierarchical port scheduling. Configured queues have higher priority for bandwidth than unconfigured queues, so if a configured queue needs more bandwidth, then less bandwidth is available for unconfigured queues. Unconfigured queues always receive a minimum amount of bandwidth based on their scheduling weight (1). If you map traffic to an unconfigured queue, to allocate bandwidth to that queue, configure a scheduler for the forwarding class that is mapped to the queue.

### Default DCBX Advertisement

When you configure hierarchical scheduling on an interface, DCBX advertises each priority group, the priorities in each priority group, and the bandwidth properties of each priority and priority group.

If you do not configure hierarchical scheduling on an interface, DCBX advertises the automatically created default priority group and its priorities. DCBX also advertises the default bandwidth allocation of the priority group, which is 100 percent of the port bandwidth.

## Default Scheduling and Classification Summary

---

If you do not configure hierarchical scheduling on an interface:

- Default classifiers classify ingress traffic.
- Default schedulers schedule egress traffic.
- DCBX advertises a single default priority group with 100 percent of the port bandwidth allocated to that priority group. All priorities (forwarding classes) are assigned to the default priority group and receive bandwidth based on their default schedulers. The default priority group is generated automatically and is not user-configurable.

## Understanding CoS Hierarchical Port Scheduling (ETS)

Scheduling defines the class-of-service (CoS) properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the queue priority, and the drop profiles associated with the queue.

Hierarchical port scheduling is a two-tier process that provides better port bandwidth utilization and greater flexibility to allocate resources to queues and to groups of queues. Hierarchical scheduling includes the Junos OS implementation of enhanced transmission selection (ETS, described in IEEE 802.1Qaz).

- [Strict-High Priority Queues and Hierarchical Scheduling on page 5866](#)
- [Default Hierarchical Scheduling on page 5866](#)

### Hierarchical Scheduling Tiers

The two tiers used in hierarchical scheduling are priorities and priority groups, as shown in [Table 505 on page 5863](#).

**Table 505: Hierarchical Scheduling Tiers**

| Junos OS Configuration Construct | Equivalent ETS Construct | Description  |
|----------------------------------|--------------------------|--|
| Forwarding class                 | Priority                 | <p>Think about priorities (forwarding classes) as output queues. You map forwarding classes to queues, so each forwarding class is in essence an output queue.</p> <p>When you use a classifier to map a forwarding class to an IEEE 802.1p code point, the code point identifies that traffic's priority for priority-based flow control (PFC). Thus the forwarding class, the queue mapped to the forwarding class, and the priority mapped to the forwarding class all identify the same traffic.</p> |
| Forwarding class set             | Priority group           | <p>Priority groups (forwarding class sets) are groups of priorities. Forwarding class membership in a forwarding class set defines the priority group to which each priority belongs.</p> <p>You can configure up to three unicast priority groups and one multicast forwarding class set.</p>   |

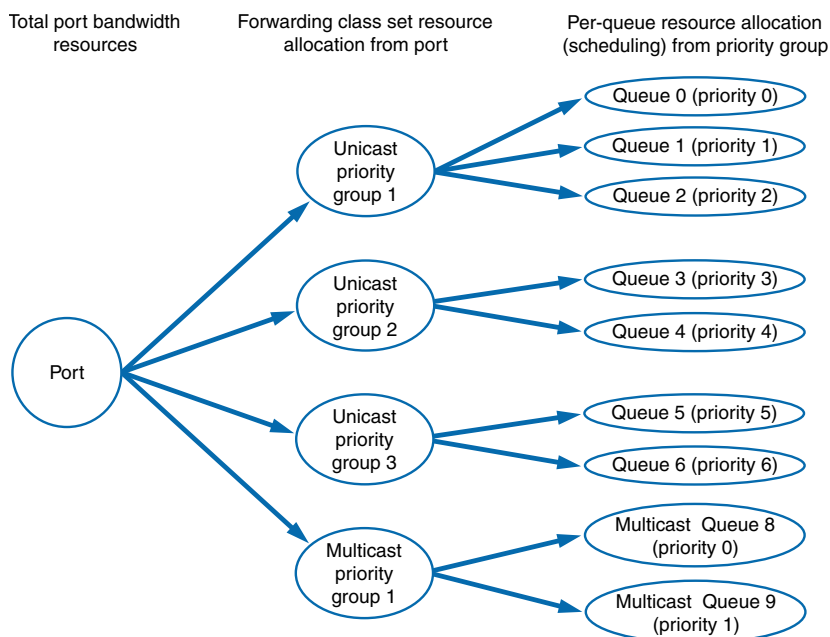

**NOTE:** If you explicitly configure one or more priority groups on an interface, any priority that is not assigned to a priority group on that interface is assigned to an automatically generated default priority group and receives *no bandwidth*. This means that if you configure hierarchical scheduling on an interface, every forwarding class that you want to forward traffic on that interface must belong to a forwarding class set.

### Hierarchical Scheduling and ETS

Two-tier hierarchical scheduling enables you to manage bandwidth efficiently by enabling you to define the CoS properties for each priority group and for each priority. One tier of the hierarchical scheduler allocates port bandwidth to a priority group. The other tier of the hierarchical scheduler determines the portion of the priority group bandwidth that a queue can use.

The CoS properties you configure for a priority group define the port bandwidth resources available to the queues in that priority group. The CoS properties you configure for each queue specify the portion or percentage of the total bandwidth configured for the priority group that is available to the queue. [Figure 204 on page 5864](#) shows the relationship of port resource allocation to priority groups and priority group resource allocation to queues (priorities).

**Figure 204: Hierarchical Scheduling Tiers**

If a queue is not using its allocated bandwidth, ETS shares the unused bandwidth among the other queues in the priority group. If link bandwidth is available or if a priority group on a link is not using its allocated bandwidth, ETS shares the unused bandwidth with other priority groups on the link. In this way ETS improves link bandwidth utilization and provides each queue with the maximum bandwidth. Priorities that consist of bursty traffic can share bandwidth during periods of low traffic transmission instead of consuming their entire bandwidth allocation when traffic loads are light.

**NOTE:** The available link bandwidth is the bandwidth remaining after servicing strict-high priority flows.

### ETS Advertisement in DCBX

When you configure hierarchical scheduling on a port, Data Center Bridging Capability Exchange Protocol (DCBX) advertises:

- Each priority group
- The priorities in each priority group
- The bandwidth properties of each priority group and priority

When you configure hierarchical scheduling on a port, any priority that is not part of an explicitly configured priority group is assigned to the automatically generated default priority group and receives no bandwidth. The default priority group is transparent. It does not appear in the configuration.

---

## Hierarchical Scheduling Process

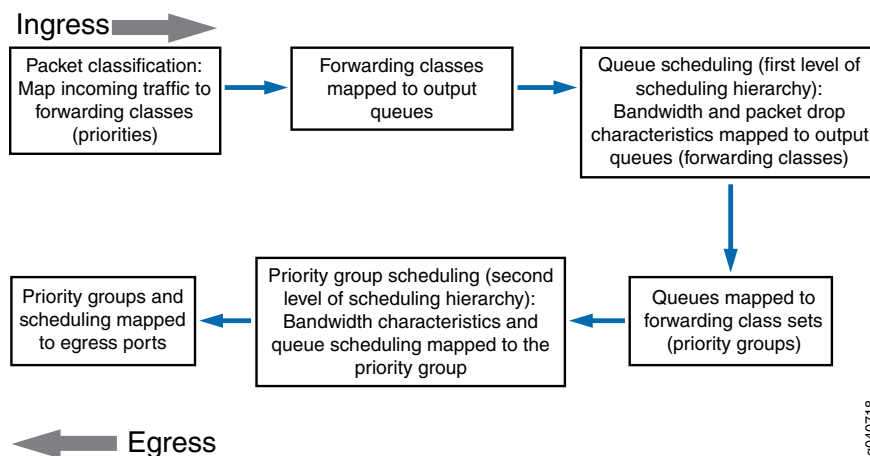

---

Hierarchical scheduling consists of multiple configuration steps that create the priorities and the priority groups, schedule their resources, and assign them to interfaces. The steps below correspond to the six blocks in the packet flow diagram shown in [Figure 205 on page 5866](#):

1. Packet classification:
  - Classify incoming traffic into priorities. This consists of either using the default classifiers or configuring classifiers to map IEEE 802.1p code points and loss priorities to the forwarding classes.
  - Apply the classifiers to ingress interfaces. This groups incoming traffic into forwarding classes (priorities) by mapping code points to forwarding classes and loss priorities on the specified interface.
2. Configure the output queues for the forwarding classes (priorities). This consists of either using the default forwarding classes and forwarding-class-to-queue mapping or creating your own forwarding classes and mapping them to queues.
3. Allocate resources to the forwarding classes:
  - Define resources for the priorities. This consists of configuring schedulers to set minimum guaranteed bandwidth, maximum bandwidth, drop profiles for Weighted Random Early Detection (WRED), and bandwidth priority to apply to a forwarding class. Extra bandwidth is shared among queues in proportion to the minimum guaranteed bandwidth of each queue.
  - Map resources to priorities. This consists of mapping forwarding classes to schedulers by using a scheduler map.
4. Configure priority groups. This consists of mapping forwarding classes (priorities) to forwarding class sets (priority groups) to define the priorities that belong to each priority group.
5. Define resources for the priority groups. This consists of configuring traffic control profiles to set minimum guaranteed bandwidth and maximum bandwidth for a priority group. Traffic control profiles also specify a scheduler map, which defines the resources (schedulers) for the priorities in the priority group. Extra port bandwidth is shared among priority groups in proportion to the minimum guaranteed bandwidth of each priority group.

The traffic control profile bandwidth settings determine the port resources available to the priority group, and the schedulers specified in the scheduler map determine the amount of the priority group resources that each priority receives.
6. Apply the hierarchical scheduling to a port. This consists of attaching one or more priority groups to a port interface. For each priority group, you also attach a traffic control profile. Different priority groups on the same port can use different traffic control profiles.

Figure 205: Hierarchical Scheduling Packet Flow

### Strict-High Priority Queues and Hierarchical Scheduling

If you configure a strict-high priority queue, you must observe the following rules:

- You must create a separate forwarding class set (priority group) for the strict-high priority queue.
- Only one forwarding class set can contain strict-high priority queues.
- Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
- A strict-high priority queue cannot belong to a multdestination forwarding class set.
- We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.

**NOTE:** On a QFabric system, if a fabric (fte) interface handles strict-high priority traffic, you must define a separate fc-set (priority group) for strict-high priority traffic. Strict-high priority traffic cannot be mixed with traffic of other priorities in an fc-set. For example, you might choose to create different fc-sets for best effort, lossless, strict-high priority, and multdestination traffic.

### Default Hierarchical Scheduling

If you do not explicitly configure hierarchical scheduling, the switch uses the default settings:

- The switch automatically creates a default forwarding class set that contains all of the forwarding classes on the switch. The switch assigns 100 percent of the port output bandwidth to the default forwarding class set. The default forwarding class set is

transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange Protocol (DCBX) advertisement.

- Ingress traffic is classified based on the default classifier settings.
- The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default scheduler settings.

## Understanding CoS Output Queue Schedulers

Output queue scheduling defines the class-of-service (CoS) properties of output queues (output queues are mapped to forwarding classes and IEEE 802.1p priorities). Queue scheduling works with priority group scheduling to create a two-tier hierarchical scheduler. The hierarchical scheduler allocates port bandwidth to a group of queues called a priority group (forwarding class set), and queue scheduling determines the portion of the priority group's bandwidth that a particular queue can use.

Scheduler maps associate queue schedulers with forwarding classes, which are mapped to output queues. You can associate each scheduler map with a traffic control profile, and then associate each traffic control profile with a forwarding class set (priority group) and a port interface. In conjunction with the priority group scheduling configured in the traffic control profile, queue scheduling configures the output queues, packet schedulers, and weighted random early detection (WRED) packet drop processes that operate according to this mapping.

**NOTE:** When you configure bandwidth for a queue (forwarding class) or a priority group (forwarding class set), the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

### Output Queue Scheduling Components

[Table 506 on page 5869](#) provides a quick reference to the scheduler components you can configure to determine the bandwidth properties of output queues, and [Table 507 on page 5869](#) provides a quick reference to some related scheduling configuration components.

Table 506: Output Queue Scheduler Components

| Output Queue Scheduler Component | Description  |
|----------------------------------|--|
| Buffer size                      | Sets the size of the queue buffer.   |
| Drop profile map                 | Maps a drop profile to a loss priority. Drop profile map components include: <ul style="list-style-type: none"> <li>Drop profile—Sets the probability of dropping packets as the queue fills up.</li> <li>Loss priority—Sets the traffic loss priority to which a drop profile applies.</li> </ul> |
| Explicit congestion notification | Enables explicit congestion notification (ECN) on the queue.   |
| Priority                         | Sets the scheduling priority applied to the queue.   |
| Shaping rate                     | Sets the maximum bandwidth the queue can consume.  |
| Transmit rate                    | Sets the minimum guaranteed bandwidth for the queue. Extra bandwidth is shared among queues in proportion to the minimum guaranteed bandwidth of each queue.   |

Table 507: Other Scheduling Components

| Other Scheduling Components | Description   |
|-----------------------------|---|
| Scheduler map               | Maps schedulers to forwarding classes (forwarding classes are mapped to queues, so a forwarding class represents a queue)   |
| Forwarding class            | Maps traffic to a queue. Classifiers map forwarding classes to IEEE 802.1p priorities. A forwarding class, an output queue, and an IEEE 802.1p priority are mapped to each other and identify the same traffic. (The IEEE 802.1p priority identifies incoming traffic, which is classified into the forwarding class, and the forwarding class is in turn mapped to an output queue for the traffic.) |
| Traffic control profile     | Configures scheduling for the forwarding class set (priority group), and associates a scheduler map with the forwarding class set to apply queue scheduling to the forwarding classes in the forwarding class set. Extra port bandwidth is shared among forwarding class sets in proportion to the minimum guaranteed bandwidth of each forwarding class set.   |
| Forwarding class set        | Name of a priority group. You map forwarding classes to forwarding class sets. A forwarding class set consists of one or more forwarding classes.   |

### Default Schedulers

Each forwarding class requires an associated scheduler. The default configuration uses only five forwarding classes, unicast best-effort (queue 0), fcoe (queue 3), no-loss (queue 4), network-control (queue 7), and multidestination (queue 8). You can use the default schedulers or you can define new schedulers for these five forwarding classes. For any other forwarding class, you must explicitly configure a scheduler.

[Table 508 on page 5870](#) shows the default schedulers.

Table 508: Default Schedulers

| Default Scheduler and Queue Number   | Guaranteed Rate (Minimum Bandwidth) | Shaping Rate (Maximum Bandwidth) | Excess Bandwidth Sharing | Priority | Buffer Size |
|--------------------------------------|-------------------------------------|----------------------------------|--------------------------|----------|-------------|
| Best-effort scheduler (queue 0)      | 5%                                  | None                             | 5%                       | Low      | 5%          |
| FCoE scheduler (queue 3)             | 35%                                 | None                             | 35%                      | Low      | 35%         |
| No-loss scheduler (queue 4)          | 35%                                 | None                             | 35%                      | Low      | 35%         |
| Network-control scheduler (queue 7)  | 5%                                  | None                             | 5%                       | Low      | 5%          |
| Multidestination scheduler (queue 8) | 20%                                 | None                             | 20%                      | Low      | 20%         |

**NOTE:** The minimum guaranteed bandwidth rate also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the minimum guaranteed bandwidth rate of each queue.

By default, only the five default schedulers shown in [Table 508 on page 5870](#) have traffic mapped to them. Only the queues associated with the default schedulers receive default bandwidth, based on the default scheduler transmit rate. (You can configure schedulers and forwarding classes to allocate bandwidth to other queues or to change the default bandwidth of a default queue.) In addition, multidestination queue 11 receives enough bandwidth from the default multidestination scheduler to handle CPU-generated multidestination traffic.

Default hierarchical scheduling divides the total port bandwidth between two groups of traffic: unicast traffic and multidestination traffic. By default, unicast traffic consists of queue 0 (**best-effort** forwarding class), queue 3 (**fcoe** forwarding class), queue 4 (**no-loss** forwarding class), and queue 7 (**network-control** forwarding class). Unicast traffic receives and shares a total of 80 percent of the port bandwidth. By default, multidestination traffic (**mcast** queue 8) receives a total of 20 percent of the port bandwidth. So on a 10-Gigabit port, unicast traffic receives 8-Gbps of bandwidth and multidestination traffic receives 2-Gbps of bandwidth.

**NOTE:** Multidestination queue 11 also receives a small amount of default bandwidth from the multidestination scheduler. CPU-generated multidestination traffic uses queue 11, so you might see a small number of packets egress from queue 11. In addition, in the unlikely case that firewall filter match conditions map multidestination traffic to a unicast forwarding class, that traffic uses queue 11.

Default scheduling uses weighted round-robin (WRR) scheduling. Each queue receives a portion (weight) of the total available interface bandwidth. The scheduling weight is based on the transmit rate of the default scheduler for that queue. For example, queue 7 receives a default scheduling weight of 5 percent of the available bandwidth, and queue 4 receives a default scheduling weight of 35 percent of the available bandwidth. Queues are mapped to forwarding classes, so forwarding classes receive the default bandwidth for the queues to which they are mapped.

You should explicitly map traffic to non-default (unconfigured) queues if you want to use them to forward traffic. By default, unicast queues 1, 2, 5, and 6 are unconfigured, and multidestination queues 9, 10, and 11 are unconfigured. Unconfigured queues have a default scheduling weight of 1 so that they can receive a small amount of bandwidth in case they need to forward traffic. (However, queue 11 can use more of the default multidestination scheduler bandwidth if necessary to handle CPU-generated multidestination traffic.)

**NOTE:** All four multidestination queues have a scheduling weight of 1. Because by default multidestination traffic goes to queue 8, queue 8 receives almost all of the multidestination bandwidth. (There is no traffic on queue 9 and queue 10, and very little traffic on queue 11, so there is almost no competition for multidestination bandwidth.)

However, if you explicitly configure queue 9, 10, or 11 (by mapping code points to the unconfigured multidestination forwarding classes using the multidestination classifier), the explicitly configured queues share the multidestination scheduler bandwidth equally with default queue 8, because all of the queues have the same scheduling weight (1). To ensure that multidestination bandwidth is allocated to each queue properly and that the bandwidth allocation to the default queue (8) is not reduced too much, we strongly recommend that you configure a scheduler if you explicitly classify traffic into queue 9, 10, or 11.

If you map traffic to an unconfigured queue, the queue receives only the amount of group bandwidth proportional to its default weight (1). The actual amount of bandwidth an unconfigured queue receives depends on how much bandwidth the other queues in the group are using.

If the other unicast queues use less than their allocated amount of bandwidth, the unconfigured queues can share the unused bandwidth. Sharing unused bandwidth is one of the key advantages of hierarchical port scheduling. Configured queues have higher priority for bandwidth than unconfigured queues, so if a configured queue needs more bandwidth, then less bandwidth is available for unconfigured queues. Unconfigured queues always receive a minimum amount of bandwidth based on their scheduling weight (1). If you map traffic to an unconfigured queue, to allocate bandwidth to that queue, configure a scheduler for the forwarding class that is mapped to the queue.

### Transmit Rate (Minimum Guaranteed Bandwidth)

---

The transmit rate determines the minimum guaranteed bandwidth for each forwarding class. It also determines how much excess (extra) bandwidth each low-priority queue can share; each queue shares extra bandwidth in proportion to its transmit rate. You specify the rate in bits per second as a fixed value such as 1 Mbps or as a percentage of the total forwarding class set minimum guaranteed bandwidth (the guaranteed rate set in the traffic control profile). Either the default scheduler or a scheduler you configure allocates a portion of the outgoing interface bandwidth to each forwarding class.

**NOTE:** For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.

You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

The allocated bandwidth can exceed the configured minimum rate if additional bandwidth is available from other queues in the forwarding class set. In case of congestion, the configured transmit rate is guaranteed for the queue. This property enables you to ensure that each queue receives the amount of bandwidth appropriate to its level of service.

**NOTE:** Configuring the minimum guaranteed bandwidth (transmit rate) for a forwarding class does not work unless you also configure the minimum guaranteed bandwidth (guaranteed rate) for the forwarding class set in the traffic control profile.

Additionally, the sum of the transmit rates of the queues in a forwarding class set should not exceed the guaranteed rate for the forwarding class set. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

### Sharing Extra Bandwidth

---

Extra bandwidth is available to low-priority queues when the minimum guaranteed bandwidth of the queues does not use the full amount of forwarding class set bandwidth. This extra bandwidth is shared among the forwarding classes in the set based on the minimum guaranteed bandwidth of each queue.

For example, in a forwarding class set, Queue A has a transmit rate of 1 Gbps, Queue B has a transmit rate of 1 Gbps, and Queue C has a transmit rate of 2 Gbps. After servicing the minimum guaranteed bandwidth of these queues, the forwarding class set has an extra 2 Gbps of bandwidth available, and all three queues still have packets to forward. The queues receive the extra bandwidth in proportion to their transmit rates, so Queue A

receives an extra 500 Mbps, Queue B receives an extra 500 Mbps, and Queue C receives an extra 1 Gbps.

### Shaping Rate (Maximum Bandwidth)

The shaping rate determines the maximum bandwidth each forwarding class can consume. You specify the rate in bits per second as a fixed value such as 3 Mbps or as a percentage of the total forwarding class set maximum bandwidth (the shaping rate set in the traffic control profile).

The maximum bandwidth for a queue depends on the total bandwidth available to the forwarding class set to which the queue belongs and how much bandwidth the other queues in the forwarding class set consume.

**NOTE:** On QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets. A strict-high priority queue (or several queues with higher priorities than the starved queue) can consume all of the port bandwidth and prevent another queue from transmitting packets. To prevent a queue from being starved for bandwidth, you can configure a shaping rate on the queue or queues to prevent them from consuming all of the port bandwidth.

**NOTE:** We recommend that you always configure a shaping rate in the scheduler for strict-high priority queues to prevent them from starving other queues.

### Scheduling Priority

Scheduling priority determines the order in which an output interface transmits traffic from the queues, thus ensuring that queues containing important traffic receive better access to the outgoing interface. The priority setting in the scheduler determines the priority for the queue.

Two levels of scheduling priority are supported:

- **Low**—Low-priority queues transmit traffic based on the weighted round robin (WRR) algorithm. The scheduler first determines if an individual queue is within its defined bandwidth profile. The scheduler then regularly reevaluates whether each individual queue is within its defined bandwidth profile and compares the amount of data the queue transmits to the amount of bandwidth the scheduler allocates to the queue. When the transmitted amount is less than the allocated amount, the queue is considered to be in profile. A queue is out of profile when its transmitted amount is larger than its allocated amount. Out of profile queue data is transmitted only if bandwidth is available. Otherwise, it is buffered if buffer space is available. If no buffer space is available, the traffic may be dropped.
- **Strict-high**—You can configure only one queue as **strict-high** priority. The other 11 queues are **low** priority.

The **strict-high** priority queue receives preferential treatment over the low-priority queues. The **strict-high** priority queue receives all of its configured bandwidth before low-priority queues are serviced. Low-priority queues do not transmit traffic until the strict-high priority queue is empty. Carefully consider how much bandwidth you want to allocate to the **strict-high** priority queue to avoid starving the low-priority queues.

If you configure a strict-high priority queue, you must observe the following rules:

- You must create a separate forwarding class set (priority group) for the strict-high priority queue.
- Only one forwarding class set can contain strict-high priority queues.
- Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
- A strict-high priority queue cannot belong to a multideestination forwarding class set.
- You cannot configure a minimum guaranteed bandwidth for a strict-high priority queue. (You cannot configure a transmit rate for a strict-high priority queue scheduler, and you cannot configure a guaranteed rate for a forwarding class set that has a strict-high priority queue.)
- We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.

Junos OS performs priority queueing using the following steps:

1. Services the strict-high priority queue before any other queues are served
2. Services the minimum bandwidth (transmit rate) of low-priority queues until the minimum is met or the queues are empty
3. Services all other low-priority queues and needs that exceed the minimum bandwidth

---

### Scheduler Drop-Profile Maps

Drop-profile maps associate drop profiles with a scheduler. A drop-profile map sets the drop profile for a specific packet loss priority (PLP) and protocol type:

- PLP—Low, medium-high, high. You configure the PLP during classifier configuration. When you use a scheduler map to associate a forwarding class with a scheduler, you can use a drop-profile map to map different drop profiles to the forwarding class for different PLPs.
- Protocol type—Drop profiles match all protocol types.

---

### Buffer Size

Most of the total system buffer space is divided into two buffer pools, shared buffers and dedicated buffers. Shared buffers are a global pool that the ports share dynamically as needed. Dedicated buffers are a reserved portion of the buffer pool that is distributed

evenly to all of the ports. Each port receives an equal allocation of dedicated buffer space. The dedicated buffer allocation to ports is not configurable because it is reserved for the ports.

The queue buffers are allocated from the dedicated buffer pool assigned to the port. By default, ports divide their allocation of dedicated buffers among the egress queues in the same proportion as the default scheduler sets the minimum guaranteed transmission rates (**transmit-rate**) for traffic. Only the queues included in the default scheduler receive dedicated buffers.

If you do not use the default configuration, you can explicitly configure the queue buffer size in either of two ways:

- As a percentage—The queue receives the specified percentage of dedicated port buffers when the queue is mapped to the scheduler and the scheduler is mapped to a port.
- As a remainder—After the port services the queues that have an explicit percentage buffer size configuration, the remaining port dedicated buffer space is divided equally among the other queues to which a scheduler is attached. (No default or explicit scheduler means no dedicated buffer allocation for the queue.) If you configure a scheduler and you do not specify a buffer size as a percentage, *remainder* is the default setting.

**NOTE:** The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

For a complete discussion about queue buffer configuration in the context of ingress and egress port buffer configuration, see [“Understanding CoS Buffer Configuration” on page 5891](#).

### Explicit Congestion Notification

ECN enables end-to-end congestion notification between two endpoints on TCP/IP based networks. The two endpoints are an ECN-enabled sender and an ECN-enabled receiver. ECN must be enabled on both endpoints and on all of the intermediate devices between the endpoints for ECN to work properly. Any device in the transmission path that does not support ECN breaks the end-to-end ECN functionality. ECN notifies networks about congestion with the goal of reducing packet loss and delay by making the sending device decrease the transmission rate until the congestion clears, without dropping packets.

ECN is disabled by default. Normally, you enable ECN only on queues that handle best-effort traffic because other traffic types use different methods of congestion notification—lossless traffic uses priority-based flow control (PFC) and strict-high priority traffic receives all of the port bandwidth it requires up to the point of a configured maximum rate.

## Scheduler Maps

---

A scheduler map associates a specified forwarding class with a scheduler configuration. After configuring a scheduler, you must include it in a scheduler map, associate the scheduler map with a traffic control profile, and then associate the traffic control profile with an interface and a forwarding class set.

You can associate up to four user-defined scheduler maps with traffic control profiles.

## Understanding CoS Priority Group Scheduling

Priority group scheduling defines the class-of-service (CoS) properties of a group of output queues (priorities). Priority group scheduling works with output queue scheduling to create a two-tier hierarchical scheduler. The hierarchical scheduler allocates bandwidth to a group of queues (a priority group, called a forwarding class set in Junos OS configuration). Queue scheduling determines the portion of the priority group bandwidth that the particular queue can use.

You configure priority group scheduling in a traffic control profile and then associate the traffic control profile with a forwarding class set and an interface. You attach a scheduler map to the traffic control profile to specify the queue scheduling characteristics.

**NOTE:** When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

### Priority Group Scheduling Components

[Table 509 on page 5877](#) provides a quick reference to the traffic control profile components you can configure to determine the bandwidth properties of priority groups, and [Table 510 on page 5878](#) provides a quick reference to some related scheduling configuration components.

**Table 509: Priority Group Scheduler Components**

| Traffic Control Profile Component | Description  |
|-----------------------------------|--|
| Guaranteed rate                   | Sets the minimum guaranteed port bandwidth for the priority group. Extra port bandwidth is shared among priority groups in proportion to the guaranteed rate of each priority group on the port. |
| Shaping rate                      | Sets the maximum port bandwidth the priority group can consume.  |
| Scheduler map                     | Maps schedulers to queues (forwarding classes, also called priorities). This determines the portion of the priority group bandwidth that a queue receives.                                       |

Table 510: Other Scheduling Components

| Other Scheduling Components | Description   |
|-----------------------------|---|
| Forwarding class            | Maps traffic to a queue (priority).   |
| Forwarding class set        | Name of a priority group. You map forwarding classes to priority groups. A forwarding class set consists of one or more forwarding classes. |
| Scheduler                   | Sets the bandwidth and scheduling priority of individual queues (forwarding classes).   |

### Default Traffic Control Profile

There is no default traffic control profile.

### Guaranteed Rate (Minimum Guaranteed Bandwidth)

The guaranteed rate determines the minimum guaranteed bandwidth for each priority group. It also determines how much excess (extra) port bandwidth the priority group can share; each priority group shares extra port bandwidth in proportion to its guaranteed rate. You specify the rate in bits per second as a fixed value such as 3 Mbps or as a percentage of the total port bandwidth.

The minimum transmission bandwidth can exceed the configured rate if additional bandwidth is available from other priority groups on the port. In case of congestion, the configured guaranteed rate is guaranteed for the priority group. This property enables you to ensure that each priority group receives the amount of bandwidth appropriate to its level of service.

**NOTE:** Configuring the minimum guaranteed bandwidth (transmit rate) for a forwarding class does not work unless you also configure the minimum guaranteed bandwidth (guaranteed rate) for the forwarding class set in the traffic control profile.

Additionally, the sum of the transmit rates of the queues in a forwarding class set should not exceed the guaranteed rate for the forwarding class set. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

You cannot configure a guaranteed rate for forwarding class sets that include strict-high priority queues.

### Sharing Extra Bandwidth

Extra bandwidth is available to priority groups when the priority groups do not use the full amount of available port bandwidth. This extra port bandwidth is shared among the priority groups based on the minimum guaranteed bandwidth of each priority group.

For example, Port A has three priority groups: fc-set-1, fc-set-2, and fc-set-3. Fc-set-1 has a guaranteed rate of 2 Gbps, fc-set-2 has a guaranteed rate of 2 Gbps, and fc-set-3 has a guaranteed rate of 4 Gbps. After servicing the minimum guaranteed bandwidth of these priority groups, the port has an extra 2 Gbps of available bandwidth, and all three priority groups have still have packets to forward. The priority groups receive the extra bandwidth in proportion to their guaranteed rates, so fc-set-1 receives an extra 500 Mbps, fc-set-2 receives an extra 500 Mbps, and fc-set-3 receives an extra 1 Gbps.

### Shaping Rate (Maximum Bandwidth)

The shaping rate determines the maximum bandwidth the priority group can consume. You specify the rate in bits per second as a fixed value such as 5 Mbps or as a percentage of the total port bandwidth.

The maximum bandwidth for a priority group depends on the total bandwidth available on the port and how much bandwidth the other priority groups on the port consume.

### Scheduler Maps

A scheduler map maps schedulers to queues. When you associate a scheduler map with a traffic control profile, then associate the traffic control profile with an interface and a forwarding class set, the scheduling defined by the scheduler map determines the portion of the priority group resources that each individual queue can use.

You can associate up to four user-defined scheduler maps with traffic control profiles.

## Understanding CoS Traffic Control Profiles

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) mapped to a forwarding class set share the bandwidth that you assign to the forwarding class set in the traffic control profile.

This two-tier hierarchical scheduling architecture provides flexibility in allocating resources among queues and:

- Assigns a portion of port bandwidth to a priority group. You define the port resources for the priority group in a traffic control profile.
- Allocates priority group bandwidth among the queues that belong to the priority group. A scheduler map attached to the traffic control profile defines the amount of the priority group's resources that each queue can use.

Attaching a priority group and traffic control profile to a port defines the hierarchical scheduling properties of the group and the queues that belong to the group.

The ability to create priority groups supports enhanced transmission selection (ETS, described in IEEE 802.1Qaz). When a priority group does not use its allocated port bandwidth, ETS shares the excess port bandwidth among other priority groups on the port in proportion to their guaranteed minimum bandwidth (guaranteed rate). This utilizes the port bandwidth better than scheduling schemes that require setting strict priorities that reserve bandwidth for all groups whether it is needed or not. ETS allows traffic groups that need extra bandwidth to use it if the bandwidth is available, while preserving the ability to specify the minimum guaranteed bandwidth for traffic groups.

Traffic control profiles define the following CoS properties for priority groups:

- Minimum guaranteed bandwidth—Also known as the committed information rate (CIR). This is the minimum amount of port bandwidth the priority group receives. Priorities in the priority group receive their minimum guaranteed bandwidth as a portion of the priority group's minimum guaranteed bandwidth. The **guaranteed-rate** statement defines the minimum guaranteed bandwidth.

**NOTE:** You cannot apply a traffic control profile with a minimum guaranteed bandwidth to a priority group that includes strict-high priority queues.

- Shared excess (extra) bandwidth—When the priority groups on a port do not consume the full amount of bandwidth allocated to them or there is unallocated link bandwidth available, priority groups can contend for that extra bandwidth if they need it. Priorities in the priority group contend for extra bandwidth as a portion of the priority group's extra bandwidth. The amount of extra bandwidth for which a priority group can contend is proportional to the priority group's guaranteed minimum bandwidth (guaranteed rate).

- **Maximum bandwidth**—Also known as peak information rate (PIR). This is the maximum amount of port bandwidth the priority group receives. Priorities in the priority group receive their maximum bandwidth as a portion of the priority group's maximum bandwidth. The **shaping-rate** statement defines the maximum bandwidth.
- **Queue scheduling**—Each traffic control profile includes a scheduler map. The scheduler map maps priorities (forwarding classes) to schedulers to define the scheduling characteristics of the individual priorities in the priority group. The resources scheduled for each priority represent portions of the resources that the traffic control profile schedules for the entire priority group, not portions of the total link bandwidth. The **scheduler-maps** statement defines the mapping of forwarding classes to schedulers.

## Understanding CoS Priority Group and Queue Guaranteed Rates (Minimum Bandwidth)

You can set a guaranteed minimum bandwidth for individual forwarding classes (queues) and for groups of forwarding classes called forwarding class sets (priority groups). Setting a minimum guaranteed bandwidth ensures that priority groups and queues receive the bandwidth required to support the expected traffic.

This topic covers:

- [Guaranteeing Bandwidth Using Hierarchical Scheduling on page 5881](#)
- [Priority Group Guaranteed Rate \(Minimum Bandwidth\) on page 5883](#)
- [Queue Transmit Rate \(Minimum Bandwidth\) on page 5883](#)

### Guaranteeing Bandwidth Using Hierarchical Scheduling

The **guaranteed-rate** value for the priority group defines the minimum amount of bandwidth allocated to a forwarding class set on a port, whereas the **transmit-rate** value of the queue defines the minimum amount of bandwidth allocated to a particular queue in a priority group. The queue bandwidth is a portion of the priority group bandwidth.

**NOTE:** You cannot configure a minimum guaranteed bandwidth (transmit rate) for a forwarding class that is mapped to a strict-high priority queue, and you cannot configure a minimum guaranteed bandwidth (guaranteed rate) for a priority group that includes strict-high priority queues.

Figure 206 on page 5882 shows how the total port bandwidth is allocated to priority groups (forwarding class sets) based on the guaranteed rate of each priority group. It also shows how the guaranteed bandwidth of each priority group is allocated to the queues in the priority group based on the transmit rate of each queue.

**Figure 206: Allocating Guaranteed Bandwidth Using Hierarchical Scheduling**

The sum of the priority group guaranteed rates cannot exceed the total port bandwidth. If you configure guaranteed rates whose sum exceeds the port bandwidth, the system sends a syslog message to notify you that the configuration is not valid. However, the system does not perform a commit check. If you commit a configuration in which the sum of the guaranteed rates exceeds the port bandwidth, the hierarchical scheduler behaves unpredictably.

The sum of the queue transmit rates cannot exceed the total guaranteed rate of the priority group to which the queues belong. If you configure transmit rates whose sum exceeds the priority group guaranteed rate, the commit check fails and the system rejects the configuration.

**NOTE:** You must set both the priority group **guaranteed-rate** value and the queue **transmit-rate** value in order to configure the minimum bandwidth for individual queues. If you set the **transmit-rate** value but do not set the **guaranteed-rate** value, the configuration fails.

You can set the **guaranteed-rate** value for a priority group without setting the **transmit-rate** value for individual queues in the priority group. However, queues that do not have a configured **transmit-rate** value can become starved for bandwidth if other higher-priority queues need the priority group's bandwidth. To avoid starving a queue, it is a good practice to configure a **transmit-rate** value for most queues.

If you configure the guaranteed rate of a priority group as a percentage, configure all of the transmit rates associated with that priority group as percentages. In this case, if any of the transmit rates are configured as absolute values instead of percentages, the configuration is not valid and the system sends a syslog message.

### Priority Group Guaranteed Rate (Minimum Bandwidth)

Setting a priority group **guaranteed-rate** enables you to reserve a portion of the port bandwidth for the forwarding classes (queues) in that forwarding class set. The minimum bandwidth (**guaranteed-rate**) that you configure for a priority group sets the minimum bandwidth available to all of the forwarding classes in the forwarding class set.

The combined **guaranteed-rate** value of all of the forwarding class sets associated with an interface cannot exceed the amount of bandwidth available on that interface.

You configure the priority group **guaranteed-rate** in the traffic control profile. You cannot apply a traffic control profile that has a guaranteed rate to a priority group that includes strict-high priority queues.

### Queue Transmit Rate (Minimum Bandwidth)

Setting a queue **transmit-rate** enables you to reserve a portion of the priority group bandwidth for the individual queue. For example, a queue that handles Fibre Channel over Ethernet (FCoE) traffic might require a minimum rate of 4 Gbps to ensure the class of service that storage area network (SAN) traffic requires.

The priority group **guaranteed-rate** sets the aggregate minimum amount of bandwidth available to the queues that belong to the priority group. The cumulative total minimum bandwidth the queues consume cannot exceed the minimum bandwidth allocated to the priority group to which they belong. (The combined transmit rates of the queues in a priority group cannot exceed the priority group's guaranteed rate.)

You must configure the **guaranteed-rate** value of the priority group in order to set a **transmit-rate** value for individual queues that belong to the priority group. The reason is that if there is no guaranteed bandwidth for a priority group, there is no way to guarantee bandwidth for queues in that priority group.

You configure the queue **transmit-rate** in the scheduler configuration. You cannot configure a transmit rate for strict-high priority queues.

## Understanding CoS Priority Group Shaping and Queue Shaping (Maximum Bandwidth)

If the amount of traffic on an interface exceeds the maximum bandwidth of the interface, it leads to congestion. You can use priority group (forwarding class set) shaping and queue shaping to manage the excess traffic and avoid congestion.

The maximum bandwidth sets the most bandwidth a priority group or a queue can use after all of the priority group and queue minimum bandwidth requirements are met, even if more bandwidth is available.

This topic covers:

- [Priority Group Shaping on page 5884](#)
- [Queue Shaping on page 5884](#)
- [Shaping Maximum Bandwidth Using Hierarchical Scheduling on page 5885](#)

### Priority Group Shaping

---

Priority group shaping enables you to shape the aggregate traffic of a forwarding class set on a port to a maximum rate that is less than the line or port rate. The maximum bandwidth (**shaping-rate**) that you configure for a priority group sets the maximum bandwidth available to all of the forwarding classes (queues) in the forwarding class set.

If a port has more than one priority group and the combined **shaping-rate** value of the priority groups is greater than the amount of port bandwidth available, the bandwidth is shared proportionally among the priority groups.

You configure the priority group **shaping-rate** in the traffic control profile.

### Queue Shaping

---

Queue shaping throttles the rate at which queues transmit packets. For example, using queue shaping, you can rate-limit a strict-high priority queue so that the strict-priority queue does not lock out (or starve) low-priority queues.

**NOTE:** We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.

Similarly, for any queue, you can configure queue shaping (**shaping-rate**) to set the maximum bandwidth for a particular queue.

The **shaping-rate** value of the priority group sets the aggregate maximum amount of bandwidth available to the queues that belong to the priority group. The cumulative total bandwidth the queues consume cannot exceed the maximum bandwidth of the priority group to which they belong on a port.

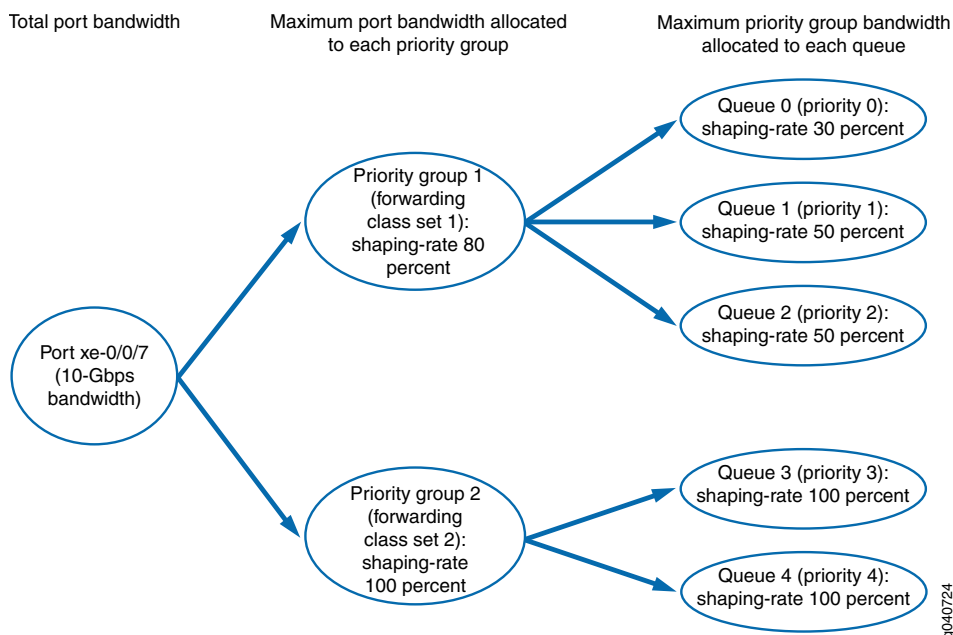

If a priority group has more than queue and the combined **shaping-rate** value of the queues is greater than the amount of bandwidth available to the priority group, the bandwidth is shared proportionally among the queues.

You configure the queue **shaping-rate** in the scheduler configuration.

### Shaping Maximum Bandwidth Using Hierarchical Scheduling

Priority group shaping defines the maximum bandwidth allocated to a forwarding class set on a port, whereas queue shaping defines a limit on maximum bandwidth usage per queue. The queue bandwidth is a portion of the priority group bandwidth.

[Figure 207 on page 5886](#) shows how the port bandwidth is allocated to priority groups (forwarding class sets) based on the shaping rate of each priority group, and how the bandwidth of each priority group is allocated to the queues in the priority group based on the shaping rate of each queue.

**Understanding CoS Scheduling Behavior and Configuration Considerations**

Many factors affect scheduling configuration and bandwidth requirements, including:

- When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.
- When you define a forwarding class that will be used on the switch (the behavior aggregate classifier has a forwarding class and you expect traffic for the forwarding class), you must also define a scheduling policy for the forwarding class. Defining a scheduling policy means:
  - Mapping a scheduler to the forwarding class in a scheduler map
  - Including the forwarding class in a forwarding class set

- Associating the scheduler map with a traffic control profile
- Attaching the traffic control profile to a forwarding class set and an interface
- On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.
- For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.
- Configuring the minimum guaranteed bandwidth (**transmit-rate**) for a queue (forwarding class) does not work unless you also configure the minimum guaranteed bandwidth (**guaranteed-rate**) for the priority group (forwarding class set) in the traffic control profile.

Additionally, the sum of the transmit rates of the queues in a forwarding class set should not exceed the guaranteed rate for the forwarding class set. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.) If you configure transmit rates whose sum exceeds the guaranteed rate of the forwarding class set, the commit check fails and the system rejects the configuration.

- The sum of the priority group guaranteed rates cannot exceed the total port bandwidth. If you configure guaranteed rates whose sum exceeds the port bandwidth, the system sends a syslog message to notify you that the configuration is not valid. However, the system does not perform a commit check. If you commit a configuration in which the sum of the guaranteed rates exceeds the port bandwidth, the hierarchical scheduler behaves unpredictably.
- If you configure the **guaranteed-rate** of a priority group as a percentage, configure all of the transmit rates associated with that priority group as percentages. In this case, if any of the transmit rates are configured as absolute values instead of percentages, the configuration is not valid and the system sends a syslog message.
- There are several factors to consider if you want to configure strict-high priority queues:
  - You cannot configure a minimum guaranteed bandwidth (**transmit-rate**) for a strict-high priority queue. You cannot configure a minimum guaranteed bandwidth (**guaranteed-rate**) for a forwarding class set that includes a strict-high priority queue.
  - You must create a separate forwarding class set for the strict-high priority queue.
  - Only one forwarding class set can contain strict-high priority queues.
  - Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
  - A strict-high priority queue cannot belong to a multidestination forwarding class set.
  - We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.

- In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets. Failure of a queue to transmit packets for 12 consecutive seconds may be due to:
  - A strict-high priority queue consuming all of the port bandwidth
  - Several queues consuming all of the port bandwidth
  - Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
  - Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

If the cause is a strict-high priority queue consuming all of the port bandwidth, use rate shaping to configure a maximum rate for the strict-high priority queue and prevent it from using all of the port bandwidth. To configure rate shaping, include the **shaping-rate (rate | percent percentage)** statement at the **[edit class-of-service schedulers scheduler-name]** hierarchy level and apply the shaping rate to the strict-high priority scheduler. We recommend that you always apply a shaping rate to strict-high priority traffic to prevent the strict-high priority queue from starving other queues.

If several queues consume all of the port bandwidth, you can use a scheduler to rate shape those queues and prevent them from using all of the port bandwidth.

- For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.
- When you set the maximum bandwidth for a queue or for a priority group (**shaping-rate**) at 100 Kbps or lower, the traffic shaping behavior is accurate only within +/– 20 percent of the configured **shaping-rate**.
- Ingress port congestion can occur during periods of egress port congestion if an ingress port forwards traffic to more than one egress port, and at least one of those egress ports experiences congestion. If this occurs, the congested egress port can cause the ingress port to exceed its fair allocation of ingress buffer resources. When the ingress port exceeds its buffer resource allocation, frames are dropped at the ingress. Ingress port frame drop affects not only the congested egress ports, but also all of the egress ports to which the congested ingress port forwards traffic.

If a congested ingress port drops traffic that is destined for one or more uncongested egress ports, configure a weighted random early detection (WRED) drop profile and apply it to the egress queue that is causing the congestion. The drop profile prevents the congested egress queue from affecting egress queues on other ports by dropping frames at the egress instead of causing congestion at the ingress port.

**NOTE:** Do not configure drop profiles for the **fcoe** and **no-loss** forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.

- On an ingress port, do not configure classifiers that map the same IEEE 802.1p code point to both a multdestination traffic flow and a lossless unicast traffic flow (such as the default lossless **fcoe** or **no-loss** forwarding classes). Any code point used for multdestination traffic on a port should not be used to classify unicast traffic into a lossless forwarding class on the same port.

If a multdestination traffic flow and a lossless unicast traffic flow use the same code point on a port, the multdestination traffic is treated the same way as the lossless traffic. For example, if priority-based flow control (PFC) is applied to the lossless traffic, the multdestination traffic of the same code point is also paused. During periods of congestion, treating multdestination traffic the same as lossless unicast traffic can create ingress port congestion for the multdestination traffic and affect the multdestination traffic on all of the egress ports the multdestination traffic uses.

For example, the following configuration can cause ingress port congestion for the multdestination flow:

1. For unicast traffic, IEEE 802.1p code point 011 is classified into the **fcoe** forwarding class:

```
user@switch# set class-of-service classifiers ieee-802.1 ucast-cl forwarding-class fcoe
loss-priority low code-points 011
```

2. For multdestination traffic, IEEE 802.1p code point 011 is classified into the **mcast** forwarding class:

```
user@switch# set class-of-service classifiers ieee-802.1 mcast-cl forwarding-class mcast
loss-priority low code-points 011
```

3. The unicast classifier that maps traffic with code point 011 to the **fcoe** forwarding class is mapped to interface **xe-0/0/1**:

```
user@switch# set class-of-service interfaces xe-0/0/1 unit 0 classifiers ieee-802.1 ucast-cl
```

4. The multdestination classifier that maps traffic with code point 011 to the **mcast** forwarding class is mapped to all interfaces (multdestination traffic maps to all interfaces and cannot be mapped to individual interfaces):

```
user@switch# set class-of-service multi-destination classifiers ieee-802.1 mcast-cl
```

Because the same code point (011) maps unicast traffic to a lossless traffic flow and also maps multdestination traffic to a multdestination traffic flow, the multdestination traffic flow might experience ingress port congestion during periods of congestion.

To avoid ingress port congestion, do not map the code point used by the multdestination traffic to lossless unicast traffic. For example:

1. Instead of classifying code point **011** into the **fcoe** forwarding class, classify code point **011** into the **best-effort** forwarding class:

```
user@switch# set class-of-service classifiers ieee-802.1 ucast-cl forwarding-class  
best-effort loss-priority low code-points 011
```

2. user@switch# set class-of-service classifiers ieee-802.1 mcast-cl forwarding-class mcast  
loss-priority low code-points 011

3. user@switch# set class-of-service interfaces xe-0/0/1 unit 0 classifiers ieee-802.1 ucast-cl

4. user@switch# set class-of-service multi-destination classifiers ieee-802.1 mcast-cl

Because the code point **011** does not map unicast traffic to a lossless traffic flow, the multidestination traffic flow does not experience ingress port congestion during periods of congestion.

The best practice is to classify unicast traffic with IEEE 802.1p code points that are also used for multidestination traffic into best-effort forwarding classes.

## Understanding CoS Buffer Configuration

Each QFX3500 and QFX3600 switch has 9 MB of Packet Forwarding Engine (PFE) wide common packet buffer memory that is used to store packets on interface queues. Each QFX5100 and EX4600 switch has 12 MB of PFE wide common packet buffer memory. The buffer memory has separate ingress and egress accounting to make accept, drop, or pause decisions. Because the switch has a single pool of memory with separate ingress and egress accounting, the full amount of buffer memory is available from both the ingress and the egress perspective. Packets are accounted for as they enter and leave the switch, but there is no concept of a packet arriving at an ingress buffer and then being moved to an egress buffer.

The buffers are divided into two pools from both an ingress and an egress perspective:

1. *Shared buffers* are a global memory pool that the switch allocates dynamically to ports as needed, so the buffers are shared among the switch ports.
2. *Dedicated buffers* are a memory pool divided equally among the switch ports. Each port receives a minimum guaranteed amount of buffer space, dedicated to each port, not shared among ports.

**NOTE:** Lossless traffic is traffic on which you enable priority-based flow control (PFC) to ensure lossless transport. Lossless traffic does not refer to best-effort traffic on a link enabled for Ethernet PAUSE (IEEE 802.3x).

The switch reserves nonconfigurable buffer space to ensure that ports and queues receive a minimum memory allocation. You can configure how the system uses the rest of the buffer space to optimize the allocation for your mix of network traffic. You can configure the percentage of available buffer space used as shared buffer space versus dedicated buffer space. You can also configure how shared buffer space is allocated to different types of traffic. You can optimize the buffer settings for the traffic on your network.

The default buffer configuration is designed for networks that have a balance of best-effort and lossless traffic.

The default class-of-service configuration provides two lossless forwarding classes (**fcoe** and **no-loss**), a best-effort unicast forwarding class, a network control traffic forwarding class, and one multidestination (multicast, broadcast, and destination lookup fail) forwarding class. Each default forwarding class maps to a different default output queue. The default configuration allocates the buffers in a manner that supports a moderate amount of lossless traffic while still providing the ability to absorb bursts in best-effort traffic transmission.

Changing the buffer settings changes the abilities of the buffers to absorb traffic bursts and handle lossless traffic. For example, networks with mostly best-effort traffic require allocating most of the shared buffer space to best-effort buffers. This provides deep, flexible buffers that can absorb traffic bursts with minimal packet loss, at the expense of buffer availability for lossless traffic.

Conversely, networks with mostly lossless traffic require allocating most of the shared buffer space to lossless headroom buffers. This prevents packet loss on lossless flows at the expense of absorbing bursty best-effort traffic efficiently.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

This topic describes the buffer architecture and settings:

---

## Buffer Pools

From both an ingress and an egress perspective, the PFE buffer is split into two main pools, a shared buffer pool and a dedicated buffer pool that ensures a minimum allocation to each port. You can configure the amount of buffer space allocated to each of the two pools. A portion of the buffer space is reserved so that there is always a minimum amount of shared and dedicated buffer space available to each port.

- **Shared buffer pool**—A global memory space that all of the ports on the switch share dynamically as they need buffers. The shared buffer pool is further partitioned into buffers for best-effort unicast, best-effort multdestination (broadcast, multicast, and destination lookup fail), and PFC (lossless) traffic types. You can allocate global shared memory space to buffer partitions to better support different mixes of network traffic. The larger the shared buffer pool, the better the switch can absorb traffic bursts because more shared memory is available for the traffic.
- **Dedicated buffer pool**—A reserved global memory space allocated equally to each port. The switch reserves a minimum dedicated buffer pool that is not user-configurable. You can divide the dedicated buffer allocation for a port among the port queues on a per-port, per-queue basis. (For example, this enables you to dedicate more buffer space to queues that transport lossless traffic.)

A larger dedicated buffer pool means a larger amount of dedicated buffer space for each port, so congestion on one port is less likely to affect traffic on another port because the traffic does not need to use as much shared buffer space. However, the larger the dedicated buffer pool, the less bursty traffic the switch can handle because there is less dynamic shared buffer memory.

You can configure the way the available unreserved portion of the buffer space is allocated to the global shared buffer pool and to the dedicated shared buffer pool by configuring the ingress and egress shared buffer percentages.

By default, 100 percent of the available unreserved buffer space is allocated to the shared buffer pool. If you change the percentage of space allocated to the shared buffer, the available buffer space that is not allocated to the shared buffer is allocated to the dedicated buffer. For example, if you configure the ingress shared buffer pool as 80 percent, the remaining 20 percent of the available buffer space is allocated to the dedicated buffer pool and divided equally across the ports.

**NOTE:** When 100 percent of the available (user-configurable) buffers are allocated to the shared buffer pool, the switch still reserves a minimum dedicated buffer pool.

You can separately configure ingress and egress shared buffer pool allocations. You can also partition the ingress and egress shared buffer pool to allocate percentages of the shared buffer pool to specific types of traffic. If you do not use the default configuration or one of the recommended configurations, pay particular attention to the ingress configuration of the lossless and lossless headroom buffers (these buffers handle PFC pause during periods of congestion) and to the egress configuration of the best-effort buffers to handle incast congestion (multiple synchronized sources sending data to the same receiver in parallel).

In addition to the shared buffer pool and the dedicated buffer pool, there is also a small ingress global headroom buffer pool that is reserved and is not configurable.

When contention for buffer space occurs, the switch uses an internal algorithm to ensure that the buffer pools are distributed fairly among competing flows. When traffic for a given flow exceeds the amount of dedicated port buffer reserved for that flow, the flow begins to consume memory from the dynamic shared buffer pool. Competing flows compete for shared buffer memory with other flows that also have exhausted their dedicated buffers. When there is no congestion, there are no competing flows.

- [Trade-off Between Shared Buffer Space and Dedicated Buffer Space on page 5899](#)
- [Order of Buffer Consumption on page 5899](#)

### ***Buffer Handling of Lossless Flows (PFC) Versus Ethernet PAUSE***

When we discuss lossless buffers in the following sections, we mean buffers that handle traffic on which you enable PFC to ensure lossless transport. The lossless buffers are not used for best-effort traffic on a link on which you enable Ethernet PAUSE (IEEE 802.3x). The lossless ingress and egress shared buffers, and the ingress lossless headroom shared buffer, are used only for traffic on which you enable PFC.

**NOTE:** To support lossless flows, you must configure the appropriate data center bridging capabilities (PFC, DCBX, or ETS) and scheduling properties.

### ***Shared Buffer Pool and Partitions***

The shared buffer pool is a global memory space that all of the ports on the switch share dynamically as they need buffers. The switch uses the shared buffer pool to absorb traffic bursts after the dedicated buffer pool for a port is exhausted.

You can divide both the ingress shared buffer pool and the egress shared buffer pool into three partitions to allocate percentages of each buffer pool to different types of traffic. When you partition the ingress or egress shared buffer pool:

- If you explicitly configure one ingress shared buffer partition, you must explicitly configure all three ingress shared buffer partitions. (You either explicitly configure all three ingress partitions or you use the default setting for all three ingress partitions.)

If you explicitly configure one egress shared buffer partition, you must explicitly configure all three egress shared buffer partitions. (You either explicitly configure all three egress partitions or you use the default setting for all three egress partitions.)

The switch returns a commit error if you do not explicitly configure all three partitions when configuring the ingress or egress shared buffer partitions.

- The combined percentages of the three ingress shared buffer partitions must total exactly 100 percent.

The combined percentages of the three egress shared buffer partitions must total exactly 100 percent.

When you explicitly configure ingress or egress shared buffer partitions, the switch returns a commit error if the total percentage of the three partitions does not equal 100 percent.

- If you explicitly partition one set of shared buffers, you do not have to explicitly partition the other set of shared buffers. For example, you can explicitly configure the ingress shared buffer partitions and use the default egress shared buffer partitions. However, if you change the buffer partitions for the ingress buffer pool to match the expected types of traffic flows, you would probably also want to change the buffer partitions for the egress buffer pool to match those traffic flows.

You can configure the percentage of available unreserved buffer space allocated to the shared buffer pool. Space that you do not allocate to the shared buffer pool is added to the dedicated buffer pool and divided equally among the ports. The default configuration allocates 100 percent of the unreserved ingress and egress buffer space to the shared buffers.

Configuring the ingress and egress shared buffer pool partitions enables you to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic.

### ***Ingress Shared Buffer Pool Partitions***

You can configure three ingress buffer pool partitions:

- Lossless buffers—Shared buffer pool for all lossless ingress traffic. The recommended minimum value for lossless buffers is 5 percent.

- **Lossless headroom buffers**—Shared buffer pool for packets received while a pause is asserted. If PFC is enabled on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers for which the recommended value can be less than 5 percent.)
- **Lossy buffers**—Shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The recommended minimum value for best-effort buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and best-effort buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. If you explicitly configure an ingress shared buffer partition, you must explicitly configure all three ingress buffer partitions, even if the lossless headroom buffer partition has a value of 0 (zero) percent.

### ***Egress Shared Buffer Pool Partitions***

You can configure three egress buffer pool partitions:

- **Lossless buffers**—Shared buffer pool for all lossless egress queues. The recommended minimum value for lossless buffers is 5 percent.
- **Lossy buffers**—Shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The recommended minimum value for best-effort buffers is 5 percent.
- **Multicast buffers**—Shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The recommended minimum value for multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and should have a value of at least 5 percent. If you explicitly configure an egress shared buffer partition, you must explicitly configure all three egress buffer partitions, and each partition should have a value of at least 5 percent.

### ***Dedicated Port Buffer Pool and Buffer Allocation to Queues***

The global dedicated buffer pool is memory that is allocated equally to each port, so each port receives a guaranteed minimum amount of buffer space. Dedicated buffers are not shared among ports. Each port receives an equal proportion of the dedicated buffer pool.

The amount of dedicated buffer space is not user-configurable and depends on the percentage of available nonreserved buffers allocated to the shared buffers. (The dedicated buffer space is equal to the minimum reserved port buffers plus the remainder of the available nonreserved buffers that are not allocated to the shared buffer pool.)

When traffic enters and exits the switch, the switch ports use their dedicated buffers to store packets. If the dedicated buffers are not sufficient to handle the traffic, the switch uses shared buffers. The only way to increase the dedicated buffer pool is to decrease the shared buffer pool from its default value of 100 percent of available unreserved buffers.

**NOTE:** If 100 percent of the available unreserved buffers are allocated to the shared buffer pool, the switch still reserves a minimum dedicated buffer pool.

The larger the shared buffer pool, the better the burst absorption across the ports. The larger the dedicated buffer pool, the larger the amount of dedicated buffer space for each port. The greater the dedicated buffer space, the less likely that congestion on one port can affect traffic on another port, because the traffic does not need to use as much shared buffer space.

### *Allocating Dedicated Port Buffers to Queues*

You can divide the dedicated buffer allocation for an egress port among the port queues by including the **buffer-size** statement in the scheduler configuration. This enables you to control the egress port dedicated buffer allocation on a per-port, per-queue basis. (For example, this enables you to dedicate more buffer space to queues that transport lossless traffic, or to stop the port from reserving buffers for queues that do not carry traffic.) Egress dedicated port buffer allocation is a hierarchical structure that allocates a global dedicated buffer pool evenly among ports, and then divides the allocation for each port among the port queues.

By default, ports divide their allocation of dedicated buffers among their egress queues in the same proportion as the default scheduler sets the minimum guaranteed transmission rates (the **transmit-rate** option) for traffic. Only the queues included in the default scheduler receive bandwidth and dedicated buffers, in the proportions shown in [Table 511 on page 5896](#):

**Table 511: Default Dedicated Buffer Allocation to Egress Queues (Based on Default Scheduler)**

| Forwarding Class | Queue | Minimum Guaranteed Bandwidth (transmit-rate) | Proportion of Reserved Dedicated Port Buffers |
|------------------|-------|--|---|
| best-effort      | 0     | 5%   | 5%  |
| fcoe             | 3     | 35%  | 35%   |
| no-loss          | 4     | 35%  | 35%   |
| network-control  | 7     | 5%   | 5%  |
| mcast            | 8     | 20%  | 20%   |

In the default configuration, no egress queues other than the ones shown in [Table 511 on page 5896](#) receive an allocation of dedicated port buffers.

**NOTE:** The switch uses hierarchical scheduling to control port and queue bandwidth allocation, as described in “[Understanding CoS Hierarchical Port Scheduling \(ETS\)](#)” on page 5862 and shown in “[Example: Configuring CoS Hierarchical Port Scheduling \(ETS\)](#)” on page 5966. For egress queue buffer size configuration, when you attach a traffic control profile (includes the queue scheduler information) to a port, the dedicated egress buffers on the port are divided among the queues as configured in the scheduler.

If you do not want to use the default allocation of dedicated port buffers to queues, use the **buffer-size** option in the scheduler that is attached to the port to configure the queue allocation. You can configure the dedicated buffer allocation to queues in two ways:

- As a percentage—The queue receives the specified percentage of dedicated port buffers when the queue is mapped to the scheduler and the scheduler is attached to a port.
- As a remainder—After the port services the queues that have an explicit percentage buffer size configuration, the remaining dedicated port buffer space is divided equally among the other queues to which a scheduler is attached. (No default or explicit scheduler for a queue means no dedicated buffer allocation for that queue.) If you configure a scheduler and you do not specify a buffer size as a percentage, *remainder* is the default setting.

**NOTE:** The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

### ***Configuring Dedicated Port Buffer Allocation to Queues***

In a port configuration that includes multiple forwarding class sets, with multiple forwarding classes mapped to multiple schedulers, the allocation of port dedicated buffers to queues depends on the mix of queues with buffer sizes configured as explicit percentages and queues configured with (or defaulted to) the **remainder** option.

The best way to demonstrate how using the percentage and remainder options affects dedicated port buffer allocation to queues is by showing an example of queue buffer allocation, and then showing how the queue buffer allocation changes when you add another forwarding class (queue) to the port.

[Table 512 on page 5898](#) shows an initial configuration that includes four forwarding class sets, the five default forwarding classes (mapped to the five default queues for those forwarding classes), the **buffer-size** option configuration, and the resulting buffer allocation for each queue. [Table 513 on page 5898](#) shows the same configuration after we add another forwarding class (best-effort-2, mapped to queue 1) to the best-effort forwarding class set. Comparing the buffer allocations in each table shows you how adding another queue

affects buffer allocation when you use remainders and explicit percentages to configure the buffer allocation for different queues.

**Table 512: Egress Queue Dedicated Buffer Allocation (Example 1)**

| Forwarding Class Set (Priority Group) | Forwarding Class | Queue | Scheduler Buffer Size Configuration | Buffer Allocation per Queue (Percentage) |
|---------------------------------------|------------------|-------|-------------------------------------|--|
| fc-set-be                             | best-effort      | 0     | 10%                                 | 10%                                      |
| fc-set-lossless                       | fcoe             | 3     | 20%                                 | 20%                                      |
|                                       | no-loss          | 4     | 40%                                 | 40%                                      |
| fc-set-strict-high                    | network-control  | 7     | remainder                           | 15%                                      |
| fc-set-mcast                          | mcast            | 8     | remainder                           | 15%                                      |

In this first example, 70 percent of the egress port dedicated buffer pool is explicitly allocated to the best-effort, fcoe, and no-loss queues. The remaining 30 percent of the port dedicated buffer pool is split between the two queues that use the **remainder** option (network-control and mcast), so each queue receives 15 percent of the dedicated buffer pool.

Now we add another forwarding class (queue) to the best-effort priority group (fc-set-be) and configure it with a buffer size of *remainder* instead of configuring a specific percentage. Because a third queue now shares the remaining dedicated buffers, the queues that share the remainder receive fewer dedicated buffers, as shown in [Table 513 on page 5898](#). The queues with explicitly configured percentages receive the configured percentage of dedicated buffers.

**Table 513: Egress Queue Dedicated Buffer Allocation with Another Remainder Queue (Example 2)**

| Priority Group (fc-set) | Forwarding Class | Queue | Scheduler Buffer Size Configuration | Buffer Allocation per Queue (Percentage) |
|-------------------------|------------------|-------|-------------------------------------|--|
| fc-set-be               | best-effort      | 0     | 10%                                 | 10%                                      |
|                         | best-effort-2    | 1     | remainder                           | 10%                                      |
| fc-set-lossless         | fcoe             | 3     | 20%                                 | 20%                                      |
|                         | no-loss          | 4     | 40%                                 | 40%                                      |
| fc-set-strict-high      | network-control  | 7     | remainder                           | 10%                                      |
| fc-set-mcast            | mcast            | 8     | remainder                           | 10%                                      |

The two tables show how the port divides the dedicated buffer space that remains after servicing the queues that have an explicitly configured percentage of dedicated buffer space.

### ***Trade-off Between Shared Buffer Space and Dedicated Buffer Space***

The trade-off between shared buffer space and dedicated buffer space is:

- Shared buffers provide better absorption of traffic bursts because there is a larger pool of dynamic buffers that ports can use as needed to handle the bursts. However, all flows that exhaust their dedicated buffer space compete for the shared buffer pool. A larger shared buffer pool means a smaller dedicated buffer pool, and therefore more competition for the shared buffer pool because more flows exhaust their dedicated buffer allocation. Too much shared buffer space results in no single flow receiving very much shared buffer space, to maintain fairness when many flows contend for that space.
- Dedicated buffers provide guaranteed buffer space to each port. The larger the dedicated buffer pool, the less likely that congestion on one port affects traffic on another port, because the traffic does not need to use as much shared buffer space. However, less shared buffer space means less ability to dynamically absorb traffic bursts.

For optimal burst absorption, the switch needs enough dedicated buffer space to avoid persistent competition for the shared buffer space. When fewer flows compete for the shared buffers, the flows that need shared buffer space to absorb bursts receive more of the shared buffer because fewer flows exhaust their dedicated buffer space.

The default configuration and all of the recommended configurations allocate 100 percent of the user-configurable memory space to the global shared buffer pool because the amount of space reserved for dedicated buffers provides enough space to avoid persistent competition for dynamic shared buffers. This results in fewer flows competing for the shared buffers, so the competing flows receive more of the buffer space.

### ***Order of Buffer Consumption***

The total buffer pool is divided into ingress and egress shared buffer pools and dedicated buffer pools. When traffic flows through the switch, the buffer space is used in a particular order that depends on the type of traffic.

On ingress, the order of buffer consumption is:

- Best-effort unicast traffic:
  1. Dedicated buffers
  2. Shared buffers
  3. Global headroom buffers (very small)
- Lossless unicast traffic:
  1. Dedicated buffers
  2. Shared buffers

3. Lossless headroom buffers
  4. Global headroom buffers (very small)
- Multidestination traffic:
    1. Dedicated buffers
    2. Shared buffers
    3. Global headroom buffers (very small)

On egress, the order of buffer consumption is the same for unicast best-effort, lossless unicast, and multidestination traffic:

- Dedicated buffers
- Shared buffers

In all cases on all ports, the switch uses the dedicated buffer pool first and the shared buffer pool only after the dedicated buffer pool for the port or queue is exhausted. This reserves the maximum amount of dynamic shared buffer space to absorb traffic bursts.

### Default Buffer Pool Values

---

You can view the default or configured ingress and egress buffer pool values in KB units using the **show class-of-service shared-buffer** operational command. You can view the configured shared buffer pool values in percent units using the **show configuration class-of-service shared-buffer** operational command.

This section provides the default total buffer, shared buffer, and dedicated buffer values.

- [Total Buffer Pool Size on page 5900](#)
- [Shared Buffer Pool Default Values on page 5900](#)
- [Dedicated Buffer Pool Default Values on page 5902](#)

#### **Total Buffer Pool Size**

The total buffer pool is common memory that has separate ingress and egress accounting, so the full buffer pool is available from both the ingress and egress perspective. The total buffer pool consists of the dedicated buffer space and the shared buffer space. The size of the total buffer pool is not user-configurable, but the allocation of buffer space to the dedicated and shared buffer pools is user-configurable.

On QFX3500 and QFX3600 switches, the combined total size of the ingress and egress buffer pools is approximately 9 MB (exactly 9360 KB).

On QFX5100 and EX4600 switches, the combined total size of the ingress and egress buffer pools is approximately 12 MB (exactly 12480 KB).

#### **Shared Buffer Pool Default Values**

The QFX5100 and EX4600 switches have a larger shared buffer pool (12 MB) than QFX3500 and QFX3600 switches (9 MB). However, the allocation of shared buffer space to the individual ingress and egress buffer pools is the same on a percentage basis, even

though the absolute values are different. For example, the default ingress lossless buffer is 9 percent of the total shared ingress buffer space on QFX5100, EX4600, QFX3500, and QFX3600 switches, even though the default absolute value of the ingress lossless buffer is 861.05KB on QFX5100 and EX4600 switches, and 648.18KB on QFX3500 and QFX3600 switches.

This section describes the default values in percent and in KB for the shared ingress and shared egress buffers.

- [Shared Ingress Buffer Default Values on page 5901](#)
- [Shared Egress Buffer Default Values on page 5901](#)

#### **Shared Ingress Buffer Default Values**

The QFX5100 and EX4600 switches have a larger shared ingress buffer than the QFX3500 and QFX3600 switches. [Table 514 on page 5901](#) shows the default ingress shared buffer allocation values in KB units for QFX5100 and EX4600 switches.

**Table 514: QFX5100 and EX4600 Switch Default Shared Ingress Buffer Values (KB)**

| Total Shared Ingress Buffer | Lossless Buffer | Lossless-Headroom Buffer | Lossy Buffer |
|-----------------------------|-----------------|--------------------------|--------------|
| 9567.19 KB                  | 861.05 KB       | 4305.23 KB               | 4400.91 KB   |

[Table 515 on page 5901](#) shows the default ingress shared buffer allocation values in KB units for QFX3500 and QFX3600 switches.

**Table 515: QFX3500 and QFX3600 Switch Default Shared Ingress Buffer Values (KB)**

| Total Shared Ingress Buffer | Lossless Buffer | Lossless-Headroom Buffer | Lossy Buffer |
|-----------------------------|-----------------|--------------------------|--------------|
| 7202 KB                     | 648.18 KB       | 3240.9 KB                | 3312.92 KB   |

[Table 516 on page 5901](#) shows the default ingress shared buffer allocation values as percentages for QFX5100, EX4600, QFX3500, and QFX3600 switches. (If you change the default shared buffer allocation, you configure the change as a percentage.)

**Table 516: Default Shared Ingress Buffer Values (Percentage)**

| Total Shared Ingress Buffer | Lossless Buffer | Lossless-Headroom Buffer | Lossy Buffer |
|-----------------------------|-----------------|--------------------------|--------------|
| 100%                        | 9%              | 45%                      | 46%          |

#### **Shared Egress Buffer Default Values**

The QFX5100 and EX4600 switches have a larger shared egress buffer than the QFX3500 and QFX3600 switches. [Table 517 on page 5902](#) shows the default egress shared buffer allocation values in KB units for QFX5100 and EX4600 switches.

**Table 517: QFX5100 and EX4600 Switch Default Shared Egress Buffer Values (KB)**

| Total Shared Egress Buffer | Lossless Buffer | Lossy Buffer | Multicast Buffer |
|----------------------------|-----------------|--------------|------------------|
| 8736 KB                    | 4368 KB         | 2708.16 KB   | 1659.84 KB       |

Table 518 on page 5902 shows the default egress shared buffer allocation values in KB units.

**Table 518: QFX3500 and QFX3600 Switch Default Shared Egress Buffer Values (KB)**

| Total Shared Egress Buffer | Lossless Buffer | Lossy Buffer | Multicast Buffer |
|----------------------------|-----------------|--------------|------------------|
| 6656 KB                    | 3328 KB         | 2063.36 KB   | 1264.64 KB       |

Table 519 on page 5902 shows the default egress shared buffer allocation values as percentages.

**Table 519: Default Shared Egress Buffer Values (Percentage)**

| Total Shared Egress Buffer | Lossless Buffer | Lossy Buffer | Multicast Buffer |
|----------------------------|-----------------|--------------|------------------|
| 100%                       | 50%             | 31%          | 19%              |

#### ***Dedicated Buffer Pool Default Values***

The system reserves ingress and egress dedicated buffer pools that are divided equally among the switch ports. By default, the system allocates 100 percent of the available unreserved buffer space to the shared buffer pool. If you reduce the percentage of available unreserved buffer space allocated to the shared buffer pool, the remaining unreserved buffer space is added to the dedicated buffer pool allocation. You configure the amount of dedicated buffer pool space by reducing (or increasing) the percentage of buffer space allocated to the shared buffer pool. You do not directly configure the dedicated buffer pool allocation.

The default dedicated buffer pool values for QFX3500 and QFX3600 switches in KB units are:

- Ingress dedicated buffer—2158 KB
- Egress dedicated buffer—2704.0 KB

The default dedicated buffer pool values for QFX5100 switches in KB units are:

- Ingress dedicated buffer—2912.81 KB
- Egress dedicated buffer—3744 KB

## Shared Buffer Configuration Recommendations for Different Network Traffic Scenarios

The way you configure the shared buffer pool depends on the mix of traffic on your network. This section provides shared buffer configuration recommendations for five basic network traffic scenarios:

- **Balanced traffic**—The network carries a balanced mix of unicast best-effort, lossless, and multicast traffic. (This is the default configuration.)
- **Best-effort unicast traffic**—The network carries mostly unicast best-effort traffic.
- **Best-effort traffic with Ethernet PAUSE (IEEE 802.3X) enabled**—The network carries mostly best-effort traffic with Ethernet PAUSE enabled on the links.
- **Best-effort multicast traffic**—The network carries mostly multicast best-effort traffic.
- **Lossless traffic**—The network carries mostly lossless traffic (traffic on which PFC is enabled).

**NOTE:** Lossless traffic is defined as traffic on which you enable PFC to ensure lossless transport. Lossless traffic does not refer to best-effort traffic on a link on which you enable Ethernet PAUSE. Start with the recommended profiles for each network traffic scenario, and adjust them if necessary for your network traffic conditions.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete. This includes changing the default configuration to one of the recommended configurations.

Because you configure buffer allocations in percentages, the recommended allocations for each network traffic scenario are valid for all QFX Series switches and the EX4600 switch. Use one of the following recommended shared buffer configurations for your network traffic conditions. Start with a recommended configuration, then make small adjustments to the buffer allocations to fine-tune the buffers if necessary as described in [“Optimizing Buffer Configuration” on page 5906](#).

- [Balanced Traffic \(Default Configuration\) on page 5903](#)
- [Best-Effort Unicast Traffic on page 5904](#)
- [Ethernet PAUSE Traffic on page 5905](#)
- [Best-Effort Multicast \(Multidestination\) Traffic on page 5905](#)
- [Lossless Traffic on page 5906](#)

### ***Balanced Traffic (Default Configuration)***

The default shared buffer configuration is optimized for networks that carry a balanced mix of best-effort unicast, lossless, and multidestination (multicast, broadcast, and

destination lookup fail) traffic. The default class-of-service (CoS) configuration is also optimized for networks that carry a balanced mix of traffic.

We recommend that you use the default shared buffer configuration for networks that carry a balanced mix of traffic, especially if you are using the default CoS settings.

[Table 520 on page 5904](#) shows the default ingress shared buffer allocations:

**Table 520: Default Ingress Shared Buffer Configuration**

| Total Shared Ingress Buffer | Lossless Buffer | Lossless-Headroom Buffer | Lossy Buffer |
|-----------------------------|-----------------|--------------------------|--------------|
| 100%                        | 9%              | 45%                      | 46%          |

[Table 521 on page 5904](#) shows the default egress shared buffer allocations:

**Table 521: Default Egress Shared Buffer Configuration**

| Total Shared Egress Buffer | Lossless Buffer | Lossy Buffer | Multicast Buffer |
|----------------------------|-----------------|--------------|------------------|
| 100%                       | 50%             | 31%          | 19%              |

#### ***Best-Effort Unicast Traffic***

If your network carries mostly best-effort (lossy) unicast traffic, then the default shared buffer configuration allocates too much buffer space to support lossless transport. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see [Table 522 on page 5904](#)) and egress shared buffer settings (see [Table 523 on page 5904](#)):

**Table 522: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best-Effort Unicast Traffic**

| Total Shared Ingress Buffer | Lossless Buffer | Lossless-Headroom Buffer | Lossy Buffer |
|-----------------------------|-----------------|--------------------------|--------------|
| 100%                        | 5%              | 0%                       | 95%          |

**Table 523: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Unicast Traffic**

| Total Shared Egress Buffer | Lossless Buffer | Lossy Buffer | Multicast Buffer |
|----------------------------|-----------------|--------------|------------------|
| 100%                       | 5%              | 75%          | 20%              |

See “[Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic](#)” on page 6104 for an example that shows you how to configure the recommended buffer settings shown in [Table 522 on page 5904](#) and [Table 523 on page 5904](#).

**Ethernet PAUSE Traffic**

If your network carries mostly best-effort (lossy) traffic *and* enables Ethernet PAUSE on links, then the default shared buffer configuration allocates too much buffer space to the shared ingress buffer (Ethernet PAUSE traffic uses the dedicated buffers instead of shared buffers) and not enough space to the lossless-headroom buffers. We recommend that you use the following ingress shared buffer settings (see [Table 524 on page 5905](#)) and egress shared buffer settings (see [Table 525 on page 5905](#)):

**Table 524: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best-Effort Traffic and Ethernet PAUSE Enabled**

| Total Shared Ingress Buffer | Lossless Buffer | Lossless-Headroom Buffer | Lossy Buffer |
|-----------------------------|-----------------|--------------------------|--------------|
| 70%                         | 5%              | 80%                      | 15%          |

**Table 525: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Traffic and Ethernet PAUSE Enabled**

| Total Shared Egress Buffer | Lossless Buffer | Lossy Buffer | Multicast Buffer |
|----------------------------|-----------------|--------------|------------------|
| 100%                       | 5%              | 75%          | 20%              |

See “[Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links with Ethernet PAUSE Enabled](#)” on page 6110 for an example that shows you how to configure the recommended buffer settings shown in [Table 522 on page 5904](#) and [Table 523 on page 5904](#).

**Best-Effort Multicast (Multidestination) Traffic**

If your network carries mostly best-effort (lossy) multicast traffic, then the default shared buffer configuration allocates too much buffer space to support lossless transport. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see [Table 526 on page 5905](#)) and egress shared buffer settings (see [Table 527 on page 5906](#)):

**Table 526: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best-Effort Multicast Traffic**

| Total Shared Ingress Buffer | Lossless Buffer | Lossless-Headroom Buffer | Lossy Buffer |
|-----------------------------|-----------------|--------------------------|--------------|
| 100%                        | 5%              | 0%                       | 95%          |

**Table 527: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Multicast Traffic**

| Total Shared Egress Buffer | Lossless Buffer | Lossy Buffer | Multicast Buffer |
|----------------------------|-----------------|--------------|------------------|
| 100%                       | 5%              | 20%          | 75%              |

See “[Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic](#)” on page 6116 for an example that shows you how to configure the recommended buffer settings shown in [Table 526 on page 5905](#) and [Table 527 on page 5906](#).

#### ***Lossless Traffic***

If your network carries mostly lossless traffic, then the default shared buffer configuration allocates too much buffer space to support best-effort traffic. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see [Table 528 on page 5906](#)) and egress shared buffer settings (see [Table 529 on page 5906](#)):

**Table 528: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Lossless Traffic**

| Total Shared Ingress Buffer | Lossless Buffer | Lossless-Headroom Buffer | Lossy Buffer |
|-----------------------------|-----------------|--------------------------|--------------|
| 100%                        | 15%             | 80%                      | 5%           |

**Table 529: Recommended Egress Shared Buffer Configuration for Networks with Mostly Lossless Traffic**

| Total Shared Egress Buffer | Lossless Buffer | Lossy Buffer | Multicast Buffer |
|----------------------------|-----------------|--------------|------------------|
| 100%                       | 90%             | 5%           | 5%               |

See “[Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic](#)” on page 6122 for an example that shows you how to configure the recommended buffer settings shown in [Table 528 on page 5906](#) and [Table 529 on page 5906](#).

#### **Optimizing Buffer Configuration**

Starting from the default configuration or from a recommended buffer configuration, you can further optimize the buffer allocation to best support the mix of traffic on your network. Adjust the settings gradually to fine-tune the shared buffer allocation. Use caution when adjusting the shared buffer configuration, not just when you fine-tune the ingress and egress buffer partitions, but also when you fine-tune the total ingress and egress shared buffer percentage. (Remember that if you allocate less than 100 percent of the available buffers to the shared buffers, the remaining buffers are added to the dedicated buffers). Tuning the buffers incorrectly can cause problems such as ingress port congestion.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

The relationship between the sizes of the ingress buffer pool and the egress buffer pool affects when and where packets are dropped. The buffer pool sizes include the shared buffers and the dedicated buffers. In general, if there are more ingress buffers than egress buffers, the switch can experience ingress port congestion because egress queues fill before ingress queues can empty.

Use the `show class-of-service shared-buffer` operational command to see the sizes in kilobytes (KB) of the dedicated and shared buffers and of the shared buffer partitions.

For best-effort traffic (unicast and multideestination), the combined ingress lossy shared buffer partition and ingress dedicated buffers must be *less than* the combined egress lossy and multicast shared buffer partitions plus the egress dedicated buffers. This prevents ingress port congestion by ensuring that egress best-effort buffers are deeper than ingress best-effort buffers, and ensures that if packets are dropped, they are dropped at the egress queues. (Packets dropping at the ingress prevents the egress schedulers from working properly.)

For lossless traffic (traffic on which you enable PFC), the combined ingress lossless shared buffer partition and a reasonable portion of the ingress headroom buffer partition, plus the dedicated buffers, must be *less than* the total egress lossless shared buffer partition and dedicated buffers. (A reasonable portion of the ingress headroom buffer is approximately 20 to 25 percent of the buffer space, but this varies depending on how much buffer headroom is required to support the lossless traffic.) When these conditions are met, if there is ingress port congestion, the ingress port congestion triggers PFC on the ingress port to prevent packet loss. If the total lossless ingress buffers exceed the total lossless egress buffers, packets could be dropped at the egress instead of PFC being applied at the ingress to prevent packet loss.

**NOTE:** If you commit a buffer configuration for which the switch does not have sufficient resources, the switch might log an error instead of returning a commit error. After you commit a buffer configuration, check the syslog messages to ensure that the new buffer configuration did not fail to commit.

If the buffer configuration commits but you receive a syslog message that indicates the configuration cannot be implemented, you can:

- Reconfigure the buffers or reconfigure other parameters (for example, the PFC configuration, which affects the need for lossless headroom buffers and lossless buffers—the more priorities you pause, the more lossless and lossless headroom buffer space you need), then attempt the commit operation again.
- Roll back the switch to the last successful configuration.

If you receive a syslog message that says the buffer configuration cannot be implemented, you must take corrective action. If you do not fix the configuration or roll back to a previous successful configuration, the system behavior is unpredictable.

---

### General Buffer Configuration Rules and Considerations

---

Keep the following rules and considerations in mind when you configure the buffers:

- Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.
- If you configure the ingress or egress shared buffer percentages as less than 100 percent, the remaining percentage of buffer space is added to the dedicated buffer pool.
- The sum of all of the ingress shared buffer partitions must equal 100 percent. Each partition must be configured with a value of at least 5 percent except the lossless headroom buffer, which can have a value of 0 percent.
- The sum of all of the egress shared buffer partitions must equal 100 percent. Each partition must be configured with a value of at least 5 percent.
- Lossless and lossless headroom shared buffers serve traffic on which you enable PFC, and do not serve traffic subject to Ethernet PAUSE.
- The switch uses the dedicated buffer pool first and the shared buffer pool only after the dedicated buffer pool for a port or queue is exhausted.
- Too little dedicated buffer space results in too much competition for shared buffer space.
- Too much dedicated buffer space results in poorer burst absorption because there is less available shared buffer space.
- Always check the syslog messages after you commit a new buffer configuration.
- The optimal buffer configuration for your network depends on the types of traffic on the network. If your network carries less traffic of a certain type (for example, lossless

traffic), then you can reduce the size of the buffers allocated to that type of traffic (for example, you can reduce the sizes of the lossless and lossless headroom buffers).

## Understanding CoS WRED Drop Profiles

When the number of packets queued is greater than the ability of the switch to empty an output queue, the queue requires a method for determining which packets to drop to relieve the congestion. Weighted random early detection (WRED) drop profiles define the drop probability of packets as the output queue fills. During periods of congestion, as the output queue fills, the switch drops incoming packets as determined by a drop profile until the output queue becomes less congested.

Depending on the drop probabilities, a drop profile can drop many packets long before the buffer becomes full, or it can drop only a few packets even if the buffer is almost full.

You configure drop profiles in the drop profile section of the class-of-service (CoS) configuration hierarchy. You apply drop profiles using a drop profile map in each scheduler configuration. For each scheduler, you can configure separate drop profiles for each combination of loss priority (low, medium-high, and high) and protocol.

Drop profiles define the meaning of each of the loss priorities by setting the values for when to drop packets and the probability that packets will drop.

You can configure a maximum of 32 drop profiles.

**NOTE:** You cannot apply drop profiles to multidestination (multicast) queues.

Do not apply drop profiles to lossless flows such as FCoE traffic, because the corresponding queues require lossless behavior. Use priority-based flow control (PFC) to prevent packet drop.

- [Default Drop Profile on page 5911](#)
- [Packet Drop Method on page 5911](#)

- [Drop Profile Maps on page 5912](#)
- [Congestion Prevention on page 5912](#)
- [Configuring a WRED Drop Profile and Applying it to an Output Queue on page 5913](#)

### Drop Profile Parameters

Drop profiles specify two values:

- **Fill level**—The queue fullness value, which represents a percentage of the memory used to store packets in relation to the total amount of memory allocated to the queue.
- **Drop probability**—The percentage value that corresponds to the likelihood that an individual packet is dropped.

You set two queue fill levels and two drop probabilities in each drop profile. The two fill levels and the two drop probabilities create two pairs of values. The first fill level and the first drop probability create one value pair and the second fill level and the second drop probability create the second value pair.

The first fill level value specifies the percentage of queue fullness at which packets begin to drop, known as the drop start point. Until the queue reaches this level of fullness, no packets are dropped. The second fill level value specifies the percentage of queue fullness at which all packets are dropped, known as the drop end point.

The first drop probability value is always 0 (zero). This pairs with the drop start point and specifies that until the queue fullness level reaches the first fill level, no packets drop. When the queue fullness exceeds the drop start point, packets begin to drop until the queue exceeds the second fill level, when all packets drop. The second drop probability value, known as the maximum drop rate, specifies the likelihood of dropping packets when the queue fullness reaches the drop end point. As the queue fills from the drop start point to the drop end point, packets drop in a smooth, linear pattern (called an interpolated graph) as shown in [Figure 208 on page 5910](#). After the drop end point, all packets drop.

**Figure 208: WRED-Drop Profile Packet Drop**

The thick line in [Figure 208 on page 5910](#) shows the packet drop characteristics for a sample WRED profile. At the drop start point, the queue reaches a fill level of 30 percent. At the drop end point, the queue fill level reaches 50 percent, and the maximum drop rate is 80 percent.

No packets drop until the queue fill level reaches the drop start point of 30 percent. When the queue reaches the 30 percent fill level, packets begin to drop. As the queue fills, the percentage of packets dropped increases in a linear fashion. When the queue fills to the drop end point of 50 percent, the rate of packet drop has increased to the maximum drop rate of 80 percent. When the queue fill level exceeds the drop end point of 50 percent, all of the packets drop until the queue fill level drops below 50 percent.

### Default Drop Profile

If you do not configure default profiles and apply them to queue schedulers, the switch uses the default drop profile for lossy traffic classes. In the default drop profile, when the fill level is 0 percent, the drop probability is 0 percent. When the fill level is 100 percent, the drop probability is 100 percent. As soon as packets arrive on a queue, the default profile might begin to drop packets.

### Packet Drop Method

When a packet reaches the head of the queue, the switch generates a random number between 0 and 100. The switch plots the random number against the drop profile using the current fullness of the queue. When the random number falls above the graph line, the packet is transmitted. When the number falls below the graph line, the packet is dropped.

To create the linear drop pattern from the drop start point to the drop end point, the drop probabilities are derived using a linear approximation with eight sections, or steps, from the minimum queue fill level to the maximum queue fill level. The fill levels are divided into the eight sections equally, starting at the minimum fill level and ending at the maximum fill level. As the queue fills, the percentage of dropped packets increases. The percentage of packets dropped is based on the maximum drop rate.

For example, the default drop profile (which specifies a maximum drop rate of 100 percent) has the following drop probabilities at each section, or step, in the eight-section linear drop pattern:

- First section—The minimum drop probability is 6.25 percent of the maximum drop rate. The maximum drop probability is 12.5 percent of the maximum drop rate.
- Second section—The minimum drop probability is 18.75 percent of the maximum drop rate. The maximum drop probability is 25 percent of the maximum drop rate.
- Third section—The minimum drop probability is 30.25 percent of the maximum drop rate. The maximum drop probability is 37.5 percent of the maximum drop rate.
- Fourth section—The minimum drop probability is 43.75 percent of the maximum drop rate. The maximum drop probability is 50 percent of the maximum drop rate.
- Fifth section—The minimum drop probability is 56.25 percent of the maximum drop rate. The maximum drop probability is 62 percent of the maximum drop rate.

- Sixth section—The minimum drop probability is 68.75 percent of the maximum drop rate. The maximum drop probability is 75.5 percent of the maximum drop rate.
- Seventh section—The minimum drop probability is 81.25 percent of the maximum drop rate. The maximum drop probability is 87.5 percent of the maximum drop rate.
- Eighth section—The minimum drop probability is 92.75 percent of the maximum drop rate. The maximum drop probability is 100 percent of the maximum drop rate.

Packets drop even when there is no congestion, because packet drops begin at the drop start point regardless of whether congestion exists on the port. The default drop profile example represents the worst-case scenario, because the drop start point fill level is 0 percent, so packet drop begins when the queue starts to receive packets.

You can specify when packets begin to drop by configuring a drop start point at a fill level greater than 0 percent. For example, if you configure a drop profile that has a drop start point of 30 percent, packets do not drop until the queue is 30 percent full. We recommend that you configure drop profiles that are appropriate to your network traffic conditions.

The smaller the gap between the minimum drop rate (which is always 0) and the maximum drop rate, the smaller the gap between the minimum drop probability and the maximum drop probability at each section (step) of the linear drop pattern. The default drop profile, which has the maximum gap between the minimum drop rate (0 percent) and the maximum drop rate (100 percent), has the highest gap between the minimum drop probability and the maximum drop probability at each step. Configuring a lower maximum drop rate for a drop profile reduces the gap between the minimum drop probability and the maximum drop probability.

---

### Drop Profile Maps

Drop profile maps are part of scheduler configuration. A drop profile map maps a drop profile to a loss priority and a protocol. Specifying the drop profile map in a scheduler associates the drop profile with the queues (forwarding classes) that you map to the scheduler in a scheduler map.

You configure loss priority for a queue in the classifier section of the CoS configuration hierarchy, and the loss priority is applied to the queue at the ingress interface.

Each scheduler can have multiple drop profile maps, one for each combination of loss priority and protocol.

---

### Congestion Prevention

Configuring drop profiles on output queues prevents them from impacting other queues on the egress ports. If you do not configure drop profiles and map them to output queues, output queues without drop profiles can impact output queues on other egress ports, even if those queues are not experiencing congestion.

For example, if an ingress port forwards traffic to more than one egress port, and at least one of the egress ports experiences congestion, that can cause ingress port congestion. Ingress port congestion (ingress buffer exceeds its resource allocation) can cause frames to drop at the ingress port instead of at the egress port. Ingress port frame drop affects

all of the egress ports to which the congested ingress port forwards traffic, not just the congested egress port.

**NOTE:** Do not configure drop profiles for the `fcoe` and `no-loss` forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.

### Configuring a WRED Drop Profile and Applying it to an Output Queue

To configure a WRED packet drop profile and apply it to an output queue (using hierarchical scheduling):

1. Configure a drop profile using the statement **`set class-of-service drop-profiles profile-name interpolate fill-level drop-start-point fill-level drop-end-point drop-probability 0 drop-probability percentage`**.
2. Map the drop profile to a queue scheduler using the statement **`set class-of-service schedulers scheduler-name drop-profile-map loss-priority (low | medium-high | high) protocol any drop-profile profile-name`**. The name of the drop-profile is the name of the WRED profile configured in step 1.
3. Map the scheduler, which step 2 associates with the drop profile, to the output queue using the statement **`set class-of-service scheduler-maps map-name forwarding-class forwarding-class-name scheduler scheduler-name`**. The forwarding class identifies the output queue. Forwarding classes are mapped to output queues by default, and can be remapped to different queues by explicit user configuration. The scheduler name is the scheduler configured in step 2.
4. Associate the scheduler map with a traffic control profile using the statement **`set class-of-service traffic-control-profiles tcp-name scheduler-map map-name`**. The scheduler map name is the name configured in step 3.
5. Associate the traffic control profile with an interface using the statement **`set class-of-service interface interface-name forwarding-class-set forwarding-class-set-name output-traffic-control-profile tcp-name`**. The output traffic control profile name is the name of the traffic control profile configured in step 4.

The interface uses the scheduler map in the traffic control profile to apply the drop profile (and other attributes) to the output queue (forwarding class) on that interface. Because you can use different traffic control profiles to map different schedulers to different interfaces, the same queue number on different interfaces can handle traffic in different ways.

## Understanding CoS Rewrite Rules

As packets enter or exit a network, edge switches might be required to alter the class-of-service (CoS) settings of the packets. Rewrite rules set the value of the CoS bits within the header of the outgoing packet. Each rewrite rule reads the current forwarding class and loss priority associated with the packet, locates the chosen CoS value from a table, and writes this CoS value into the packet header, replacing the old CoS value. Rewrite rules must be assigned to an interface for rewrites to be activated.

You can apply (bind) one DSCP or DSCP IPv6 rewrite rule and one IEEE 802.1p rewrite rule to each interface as described in [“Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces” on page 5820](#). You can also bind EXP rewrite rules to **family mpls** logical interfaces to rewrite the CoS bits of MPLS traffic.

You cannot apply both a DSCP and a DSCP IPv6 rewrite rule to the same interface. Each interface supports only one DSCP rewrite rule. Both IP and IPv6 packets use the same DSCP rewrite rule, regardless if the configured rewrite rule is DSCP or DSCP IPv6. You can apply an EXP rewrite rule on an interface that has DSCP or IEEE rewrite rules. Only MPLS traffic on **family mpls** interfaces uses the EXP rewrite rule.

**NOTE:** There are no default rewrite rules.

---

You can look at behavior aggregate (BA) classifiers and rewrite rules as two sides of the same coin. A BA classifier reads the CoS bits of incoming packets and classifies the packets into forwarding classes, then the system applies the CoS configured for the forwarding class to those packets. Rewrite rules change (rewrite) the CoS bits just before the packets leave the system so that the next switch or router can apply the appropriate level of CoS to the packets. When you apply a rewrite rule to an interface, the rewrite rule is the last CoS action performed on the packet before it is forwarded.

Rewrite rules alter CoS values in outgoing packets on the outbound interfaces of an edge switch to accommodate the policies of a targeted peer. This allows the downstream switch in a neighboring network to classify each packet into the appropriate service group.

**NOTE:** On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

---

The switch does not have default rewrite rules. If you want to apply a rewrite rule to outgoing packets, you must explicitly configure the rewrite rule.

**NOTE:** Rewrite rules are applied *before* the egress filter is matched to traffic. Because the code point rewrite occurs before the egress filter is matched to traffic, the egress filter match is based on the rewrite value, not on the original code point value in the packet.

For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.

MPLS EXP rewrite rules apply only to **family mpls** logical interfaces. You cannot apply to an EXP rewrite rule to a physical interface. You can configure as many EXP rewrite rules as you want, but you can only use 16 EXP rewrite rules at any time on the switch. On a given logical interface, all pushed MPLS labels have the same EXP rewrite rule applied to them. You can apply different EXP rewrite rules to different logical interfaces on the same physical interface.

**NOTE:** If the switch is performing penultimate hop popping (PHP), EXP rewrite rules do not take effect. If both an EXP classifier and an EXP rewrite rule are configured on the switch, then the EXP value from the last popped label is copied into the inner label. If either an EXP classifier or an EXP rewrite rule (but not both) is configured on the switch, then the inner label EXP value is sent unchanged.

## Understanding CoS Flow Control (Ethernet PAUSE and PFC)

Flow control supports lossless transmission by regulating traffic flows to avoid dropping frames during periods of congestion. Flow control stops and resumes the transmission of network traffic between two connected peer nodes on a full-duplex Ethernet physical link. Controlling the flow by pausing and restarting it prevents buffers on the nodes from overflowing and dropping frames. You configure flow control on a per-interface basis.

Two methods of peer-to-peer flow control are supported:

- IEEE 802.3X Ethernet PAUSE
- IEEE 802.1Qbb priority-based flow control (PFC)

Ethernet PAUSE and PFC are link-level flow control mechanisms.

**NOTE:** For end-to-end congestion control, see [“Understanding CoS Explicit Congestion Notification” on page 5926](#).

Ethernet PAUSE pauses transmission of all traffic on a physical Ethernet link.

PFC decouples the pause function from the physical Ethernet link and enables you to divide traffic on one link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that are mapped to forwarding classes and output queues. Each priority is mapped to a 3-bit IEEE 802.1p CoS code point flag in the VLAN header. You can enable PFC on one or more priorities (IEEE 802.1p code points) on a link. When PFC-enabled traffic is paused on a link, traffic that is not PFC-enabled continues to flow (or is dropped if congestion is severe enough).

**Video:** [Why Use PFC in a Data Center Network?](#)

Use Ethernet PAUSE when you want to prevent packet loss on all of the traffic on a link. Use PFC to prevent traffic loss only on specified types of traffic (for example, Fibre Channel over Ethernet traffic).

**NOTE:** Depending on the amount of traffic on a link or assigned to a priority, pausing traffic can cause ingress port congestion and spread congestion through the network.

Attempting to configure both Ethernet PAUSE and PFC on a link causes a commit error. Ethernet PAUSE and PFC are mutually exclusive configurations on an interface.

By default, all forms of flow control are disabled. You must explicitly enable flow control on interfaces to pause traffic.

- [Ethernet PAUSE on page 5917](#)

- [PFC on page 5921](#)
- [Lossless Transport Support Summary on page 5924](#)

## Ethernet PAUSE

Ethernet PAUSE is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends Ethernet PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to Ethernet PAUSE messages it receives from the connected peer to stop sending traffic. Ethernet PAUSE also works on aggregated Ethernet interfaces. For example, if the connected peer interfaces are called Node A and Node B:

- When the receive buffers on interface Node A reach a certain level of fullness, the interface generates and sends an Ethernet PAUSE message to the connected peer (interface Node B) to tell the peer to stop sending frames. The Node B buffers store frames until the time period specified in the Ethernet PAUSE frame elapses; then Node B resumes sending frames to Node A.
- When interface Node A receives an Ethernet PAUSE message from interface Node B, interface Node A stops transmitting frames until the time period specified in the Ethernet PAUSE frame elapses; then Node A resumes transmission. (The Node A transmit buffers store frames until Node A resumes sending frames to Node B.)

In this scenario, if Node B sends an Ethernet PAUSE frame with a time value of 0 to Node A, the 0 time value indicates to Node A that it can resume transmission. This happens when the Node B buffer empties to below a certain threshold and the buffer can once again accept traffic.

*Symmetric flow control* means an interface has the same Ethernet PAUSE configuration in both directions. The Ethernet PAUSE generation and Ethernet PAUSE response functions are both configured as enabled, or they are both disabled. You configure symmetric flow control by including the **flow-control** statement at the **[edit interfaces interface-name ether-options]** hierarchy level.

*Asymmetric flow control* allows you to configure the Ethernet PAUSE functionality in each direction independently on an interface. The configuration for generating Ethernet PAUSE messages and for responding to Ethernet PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction. You configure asymmetric flow control by including the **configured-flow-control** statement at the **[edit interfaces interface-name ether-options]** hierarchy level.

On any particular interface, symmetric and asymmetric flow control are mutually exclusive. Asymmetric flow control overrides and disables symmetric flow control. (If PFC is configured on an interface, the PFC configuration overrides Ethernet PAUSE flow control.) Both symmetric and asymmetric flow control are supported.

- [Symmetric Flow Control on page 5918](#)
- [Asymmetric Flow Control on page 5918](#)

### ***Symmetric Flow Control***

Symmetric flow control configures both the receive and transmit buffers in the same state. The interface can both send Ethernet PAUSE messages and respond to them (flow control is enabled), or the interface cannot send Ethernet PAUSE messages or respond to them (flow control is disabled).

When you enable symmetric flow control on an interface, the Ethernet PAUSE behavior depends on the configuration of the connected peer. With symmetric flow control enabled, the interface can perform any Ethernet PAUSE functions that the connected peer can perform. (When symmetric flow control is disabled, the interface does not send or respond to Ethernet PAUSE messages.)

### ***Asymmetric Flow Control***

Asymmetric flow control enables you to specify independently whether or not the interface receive buffer generates and sends Ethernet PAUSE messages to stop the connected peer from transmitting traffic, and whether or not the interface transmit buffer responds to Ethernet PAUSE messages it receives from the connected peer and stops transmitting traffic. The receive buffer configuration determines if the interface transmits Ethernet PAUSE messages, and the transmit buffer configuration determines if the interface receives and responds to Ethernet PAUSE messages:

- Receive buffers on—Enable Ethernet PAUSE transmission (generate and send Ethernet PAUSE frames)
- Transmit buffers on—Enable Ethernet PAUSE reception (respond to received Ethernet PAUSE frames)

You must explicitly set the flow control for both the receive buffer and the transmit buffer (**on** or **off**) to configure asymmetric Ethernet PAUSE. [Table 449 on page 5561](#) describes the configured flow control state when you set the receive (Rx) and transmit (Tx) buffers on an interface:

**Table 530: Asymmetric Ethernet PAUSE Flow Control Configuration**

| Receive (Rx) Buffer | Transmit (Tx) Buffer | Configured Flow Control State   |
|---------------------|----------------------|---|
| On                  | Off                  | Interface generates and sends Ethernet PAUSE messages. Interface does not respond to Ethernet PAUSE messages (interface continues to transmit even if peer requests that the interface stop sending traffic).         |
| Off                 | On                   | Interface responds to Ethernet PAUSE messages received from the connected peer, but does not generate or send Ethernet PAUSE messages. (The interface does not request that the connected peer stop sending traffic.) |
| On                  | On                   | Same functionality as symmetric Ethernet PAUSE. Interface generates and sends Ethernet PAUSE messages and responds to received Ethernet PAUSE messages.   |
| Off                 | Off                  | Ethernet PAUSE flow control is disabled.  |

The configured flow control is the Ethernet PAUSE state configured on the interface.

On 1-Gigabit Ethernet interfaces, autonegotiation of Ethernet PAUSE with the connected peer is supported. (Autonegotiation on 10-Gigabit Ethernet interfaces is not supported.) Autonegotiation enables the interface to exchange state advertisements with the connected peer so that the two devices can agree on the Ethernet PAUSE configuration. Each interface advertises its flow control state to the connected peer using a combination of the Ethernet PAUSE and ASM\_DIR bits, as described in [Table 450 on page 5562](#):

**Table 531: Flow Control State Advertised to the Connected Peer (Autonegotiation)**

| Rx Buffer State | Tx Buffer State | PAUSE Bit | ASM_DIR Bit | Description  |
|-----------------|-----------------|-----------|-------------|--|
| Off             | Off             | 0         | 0           | The interface advertises no Ethernet PAUSE capability. This is equivalent to disabling flow control on an interface.   |
| On              | On              | 1         | 0           | The interface advertises symmetric flow control (both the transmission of Ethernet PAUSE messages and the ability to receive and respond to Ethernet PAUSE messages).  |
| On              | Off             | 0         | 1           | The interface advertises asymmetric flow control (the transmission of Ethernet PAUSE messages, but not the ability to receive and respond to Ethernet PAUSE messages).   |
| Off             | On              | 1         | 1           | The interface advertises both symmetric and asymmetric flow control. Although the interface does not generate and send Ethernet PAUSE requests to the peer, the interface supports both symmetric and asymmetric Ethernet PAUSE configuration on the peer because the peer is not affected if the peer does not receive Ethernet PAUSE requests. (If the interface responds to the peer's Ethernet PAUSE requests, that is sufficient to support either symmetric or asymmetric flow control on the peer.) |

The flow control configuration on each switch interface interacts with the flow control configuration of the connected peer. Each peer advertises its state to the other peer. The interaction of the flow control configuration of the peers determines the flow control behavior (resolution) between them, as shown in [Table 451 on page 5563](#). The first four columns show the Ethernet PAUSE configuration on the local QFX Series or EX4600 switch and on the connected peer (also known as the link partner). The last two columns show the Ethernet PAUSE resolution that results from the local and peer configurations

on each interface. This illustrates how the Ethernet PAUSE configuration of each interface affects the Ethernet PAUSE behavior on the other interface.

**NOTE:** In the Resolution columns of the table, disabling Ethernet PAUSE transmit means that the interface receive buffers do not generate and send Ethernet PAUSE messages to the peer. Disabling Ethernet PAUSE receive means that the interface transmit buffers do not respond to Ethernet PAUSE messages received from the peer.

**Table 532: Asymmetric Ethernet PAUSE Behavior on Local and Peer Interfaces**

| Local Interface (QFX Series or EX4600 Switch) |             | Peer Interface |             | Local Resolution  | Peer Resolution   |
|---|-------------|----------------|-------------|---|---|
| PAUSE Bit                                     | ASM_DIR Bit | PAUSE Bit      | ASM_DIR Bit |   |   |
| 0   | 0           | Don't care     | Don't care  | Disable Ethernet PAUSE transmit and receive                       | Disable Ethernet PAUSE transmit and receive                       |
| 0   | 1           | 0              | Don't care  | Disable Ethernet PAUSE transmit and receive                       | Disable Ethernet PAUSE transmit and receive                       |
| 0   | 1           | 1              | 0           | Disable Ethernet PAUSE transmit and receive                       | Disable Ethernet PAUSE transmit and receive                       |
| 0   | 1           | 1              | 1           | Enable Ethernet PAUSE transmit and disable Ethernet PAUSE receive | Disable Ethernet PAUSE transmit and enable Ethernet PAUSE receive |
| 1   | 0           | 0              | Don't care  | Disable Ethernet PAUSE transmit and receive                       | Disable Ethernet PAUSE transmit and receive                       |
| 1   | 0           | 1              | Don't care  | Enable Ethernet PAUSE transmit and receive                        | Enable Ethernet PAUSE transmit and receive                        |
| 1   | 1           | 0              | 0           | Disable Ethernet PAUSE transmit and receive                       | Disable Ethernet PAUSE transmit and receive                       |
| 1   | 1           | 0              | 1           | Enable Ethernet PAUSE receive and disable Ethernet PAUSE transmit | Enable Ethernet PAUSE transmit and disable Ethernet PAUSE receive |
| 1   | 1           | Don't care     | Don't care  | Enable Ethernet PAUSE transmit and receive                        | Enable Ethernet PAUSE transmit and receive                        |

**NOTE:** For your convenience, [Table 451 on page 5563](#) replicates Table 28B-3 of Section 2 of the IEEE 802.X specification.

## PFC

PFC is a lossless transport and congestion relief feature that works by providing granular link-level flow control for each IEEE 802.1p code point (priority) on a full-duplex Ethernet link. When the receive buffer on a switch interface fills to a threshold, the switch transmits a pause frame to the sender (the connected peer) to temporarily stop the sender from transmitting more frames. The buffer threshold must be low enough so that the sender has time to stop transmitting frames and the receiver can accept the frames already on the wire before the buffer overflows. The switch automatically sets queue buffer thresholds to prevent frame loss.

When congestion forces one priority on a link to pause, all of the other priorities on the link continue to send frames. Only frames of the paused priority are not transmitted. When the receive buffer empties below another threshold, the switch sends a message that starts the flow again.

You configure PFC using a congestion notification profile (CNP). A CNP has two parts:

- **Input**—Specify the code point (or code points) on which to enable PFC, and optionally specify the maximum receive unit (MRU) and the cable length between the interface and the connected peer interface.
- **Output**—Specify the output queue or output queues that respond to pause messages from the connected peer.

You apply a PFC configuration by configuring a CNP on one or more interfaces. Each interface that uses a particular CNP is enabled to pause traffic with the priorities (code points) specified in that CNP. You can configure one CNP on an interface, and you can configure different CNPs on different interfaces. When you configure a CNP on an interface, ingress traffic that is mapped to a priority that the CNP enables for PFC is paused whenever the queue buffer fills to the pause threshold. (The pause threshold is not user-configurable.)

Configure PFC for a priority end to end along the entire data path to create a lossless lane of traffic on the network. You can selectively pause the traffic in any queue without pausing the traffic for other queues on the same link. You can create lossless lanes for traffic such as Fibre Channel over Ethernet (FCoE), LAN backup, or management, while using standard frame-drop congestion management for IP traffic on the same link.

Potential consequences of link-level flow control are:

- Ingress port congestion (configuring too many lossless flows can cause ingress port congestion)
- A paused priority that causes upstream devices to pause the same priority, thus spreading congestion back through the network

By definition, PFC supports symmetric pause only (as opposed to Ethernet PAUSE, which supports symmetric and asymmetric pause). With symmetric pause, a device can:

- Transmit pause frames to pause incoming traffic. (You configure this using the input stanza of a congestion notification profile.)

- Receive pause frames and stop sending traffic to a device whose buffer is too full to accept more frames. (You configure this using the output stanza of a congestion notification profile.)

Receiving a PFC frame from a connected peer pauses traffic on egress queues based on the IEEE 802.1p priorities that the PFC pause frame identifies. The priorities are 0 through 7. By default, the priorities map to queue numbers 0 through 7, respectively, and to specific forwarding classes, as shown in [Table 452 on page 5565](#):

**Table 533: Default PFC Priority to Queue and Forwarding Class Mapping**

| IEEE 802.1p Priority (Code Point) | Queue | Forwarding Class |
|-----------------------------------|-------|------------------|
| 0 (000)                           | 0     | best-effort      |
| 1 (001)                           | 1     | best-effort      |
| 2 (010)                           | 2     | best-effort      |
| 3 (011)                           | 3     | fcoe             |
| 4 (100)                           | 4     | no-loss          |
| 5 (101)                           | 5     | best-effort      |
| 6 (110)                           | 6     | network-control  |
| 7 (111)                           | 7     | network-control  |

For example, a received PFC pause frame that pauses priority 3 pauses output queue 3. If you do not want to use the default configuration, you can configure customized mapping of priorities to queues and forwarding classes.

**NOTE:** By convention, deployments with converged server access typically use IEEE 802.1p priority 3 for FCoE traffic. The default forwarding class configuration sets the fcoe forwarding class as a lossless forwarding class that is mapped to queue 3. The default classifier maps incoming priority 3 traffic to the fcoe forwarding class. *However, you must apply PFC to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE traffic requires.*

If your network uses priority 3 for FCoE traffic, we recommend that you use the default configuration. If your network uses a priority other than 3 for FCoE traffic, you can configure lossless FCoE transport on any IEEE 802.1p priority as described in [“Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows” on page 5837](#) and [Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway](#).

You enable PFC on a priority by:

1. Specifying the IEEE 802.1p code point to pause in the input stanza of a CNP
2. Applying the CNP to the ingress interfaces on which you want to pause the traffic

**CAUTION:** Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

A change to the PFC configuration means any change to a CNP, including changing the input portion of the CNP (enabling or disabling PFC on a priority, or changing the MRU or cable-length values) or changing the output portion of the CNP that enables or disables output flow control on a queue. A PFC configuration change only affects ports that use the changed CNP.

The following actions change the PFC configuration:

- Deleting or disabling a PFC configuration (input or output) in a CNP that is in use on one or more interfaces. For example:
  1. An existing CNP with an input stanza that enables PFC on priorities 3, 5, and 6 is configured on interfaces xe-0/0/20 and xe-0/0/21.
  2. We disable the PFC configuration for priority 6 in the input CNP, and then commit the configuration.
  3. The PFC configuration change causes all traffic on interfaces xe-0/0/20 and xe-0/0/21 to stop until the PFC change has been implemented. When the PFC change has been implemented, traffic resumes.
- Configuring a CNP on an interface. (This changes the PFC state by enabling PFC on one or more priorities.)
- Deleting a CNP from an interface. (This changes the PFC state by disabling PFC on one or more priorities.)

When you associate the CNP with an interface, the interface uses PFC to send pause requests when the output queue buffer for the lossless traffic fills to the pause threshold.

Although unicast traffic and multideestination (multicast, broadcast, and destination lookup fail) traffic must use different classifiers, you can map a unicast queue (queue 0 through 7) and a multideestination queue (queue 8, 9, 10, or 11) to the same PFC priority so that both unicast and multicast traffic use that priority. Do not map multideestination traffic to lossless priorities. Starting with Junos OS Release 12.3, you can map one priority to multiple output queues.

**NOTE:** You can attach a maximum of one CNP to an interface, but you can create an unlimited number of CNPs that explicitly configure only the input stanza and use the default output stanza.

The output stanza of the CNP maps to a profile that interfaces use to respond to pause messages received from the connected peer. On standalone switches, you can create two CNPs with an explicitly configured output stanza.

When a switch is a Node device in a QFabric system, you can create one CNP with an explicitly configured output stanza. (One fewer profile is available on QFabric systems because the system needs a default profile for fabric interfaces, which are not used as fabric interfaces when the switches are not part of a QFabric system. “[Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows](#)” on page 5837 describes configuring output flow control.

---

### Lossless Transport Support Summary

---

The switch supports up to six lossless forwarding classes. For lossless transport, you must enable PFC on the IEEE 802.1p priorities (code points) mapped to lossless forwarding classes.

**CAUTION:** Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

The following limitation applies to support lossless transport on QFabric systems only:

- The internal fiber cable length from the QFabric system Node device to the QFabric system Interconnect device cannot exceed 150 meters.

The default CoS configuration provides two lossless forwarding classes, *fcoe* and *no-loss*. If you explicitly configure lossless forwarding classes, you must include the **no-loss** packet drop attribute to enable lossless behavior, or the traffic is not lossless. For both default and explicit lossless forwarding class configuration, you must configure CNP input stanzas to enable PFC on the priority of the lossless traffic and apply the CNPs to ingress interfaces.

**NOTE:** Junos OS Release 12.2 introduced changes to the way the switch handles lossless forwarding classes (including the default fcoe and no-loss forwarding classes).

In Junos OS Release 12.1, either explicitly configuring the fcoe and no-loss forwarding classes or using the default configuration for these forwarding classes resulted in the same lossless behavior for traffic mapped to those forwarding classes.

However, in Junos OS Release 12.2, if you explicitly configure the fcoe or the no-loss forwarding class, that forwarding class is no longer treated as a lossless forwarding class. Traffic mapped to these forwarding classes is treated as lossy (best-effort) traffic. This is true even if the explicit configuration is exactly the same as the default configuration.

If your CoS configuration from Junos OS Release 12.1 or earlier includes the explicit configuration of the fcoe or the no-loss forwarding class, then when you upgrade to Junos OS Release 12.2, those forwarding classes are not lossless. To preserve the lossless treatment of these forwarding classes, delete the the explicit fcoe and no-loss forwarding class configuration before you upgrade to Junos OS Release 12.2.

See *Overview of CoS Changes Introduced in Junos OS Release 12.2* for detailed information about this change and how to delete an existing lossless configuration.

In Junos OS Release 12.3, the default behavior of the fcoe and no-loss forwarding classes is the same as in Junos OS Release 12.2. However, in Junos OS Release 12.3, you can configure up to six lossless forwarding classes. All explicitly configured lossless forwarding classes must include the new no-loss packet drop attribute or the forwarding class is lossy.

[“Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows” on page 5837](#) provides detailed information about the explicit configuration of lossless priorities and about the default configuration of lossless priorities, including the input and output stanzas of the CNP.

**NOTE:** PFC and Ethernet PAUSE are used only on Ethernet interfaces. Fabric (fte) ports on QFabric systems (Node device fabric ports and Interconnect device fabric ports) use link-layer flow control (LLFC) to ensure the appropriate treatment of lossless traffic.

## Understanding CoS Explicit Congestion Notification

Explicit congestion notification (ECN) enables end-to-end congestion notification between two endpoints on TCP/IP based networks. The two endpoints are an ECN-enabled sender and an ECN-enabled receiver. ECN must be enabled on both endpoints and on all of the intermediate devices between the endpoints for ECN to work properly. Any device in the transmission path that does not support ECN breaks the end-to-end ECN functionality.

ECN notifies networks about congestion with the goal of reducing packet loss and delay by making the sending device decrease the transmission rate until the congestion clears, without dropping packets. RFC 3168, *The Addition of Explicit Congestion Notification (ECN) to IP*, defines ECN.

ECN is disabled by default. Normally, you enable ECN only on queues that handle best-effort traffic because other traffic types use different methods of congestion notification—lossless traffic uses priority-based flow control (PFC) and strict-high priority traffic receives all of the port bandwidth it requires up to the point of a configured maximum rate.

You enable ECN on individual output queues (as represented by forwarding classes) by enabling ECN in the queue scheduler configuration, mapping the scheduler to forwarding classes (queues), and then applying the scheduler to interfaces. For ECN to work on a queue, you must also apply a weighted random early detection (WRED) packet drop profile to the queue.

---

### How ECN Works

Without ECN, switches respond to network congestion by dropping TCP/IP packets. Dropped packets signal the network that congestion is occurring. Devices on the IP network respond to TCP packet drops by reducing the packet transmission rate in order to allow the congestion to clear. However, the packet drop method of congestion notification and management has some disadvantages. For example, packets are dropped and must be retransmitted. And bursty traffic can cause the network to reduce the transmission rate too much, resulting in inefficient bandwidth utilization.

Instead of dropping packets to signal network congestion, ECN marks packets to signal network congestion, without dropping the packets. For ECN to work, all of the switches in the path between two ECN-enabled endpoints must have ECN enabled. ECN is negotiated during the establishment of the TCP connection between the endpoints.

ECN-enabled switches determine the queue congestion state based on the WRED packet drop profile configuration applied to the queue, so each ECN-enabled queue must also have a WRED drop profile. If a queue fills to the level that the WRED profile uses to begin dropping non-ECN-capable best-effort packets, the switch may mark a packet as experiencing congestion.

ECN communicates whether or not congestion is experienced by marking the two least-significant bits in the differentiated services (DiffServ) field in the IP header. The most significant six bits in the DiffServ field contain the differentiated services code point (DSCP bits). The state of the two ECN bits signals whether or not the packet is an ECN-capable packet and whether or not congestion has been experienced.

ECN-capable senders mark packets as ECN-capable. If a sender is not ECN-capable, it marks packets as not not ECN-capable. If an ECN-capable packet experiences congestion at the egress queue of a switch, the switch marks the packet as experiencing congestion. When the packet reaches the ECN-capable receiver (destination endpoint), the receiver echoes the congestion indicator to the sender (source endpoint) by sending a packet marked to indicate congestion.

After receiving the congestion indicator from the receiver, the source endpoint reduces the transmission rate to relieve the congestion. This is similar to the result of TCP congestion notification and management, but instead of dropping the packet to signal network congestion, ECN marks the packet and the receiver echoes the congestion notification to the sender. Because the packet is not dropped, the packet does not need to be retransmitted.

- [ECN Bits in the DiffServ Field on page 5927](#)
- [End-to-End ECN Behavior on page 5928](#)
- [ECN Compared to PFC and Ethernet PAUSE on page 5930](#)

#### ***ECN Bits in the DiffServ Field***

The two ECN bits in the DiffServ field provide four codes that determine if a packet is an ECN-capable transport (ECT) packet and if there is congestion experienced (CE), as shown in [Table 534 on page 5927](#):

**Table 534: ECN Bit Codes**

| ECN Bits (Code) | Meaning                             |
|-----------------|-------------------------------------|
| 00              | Non-ECT—Packet does not support ECN |
| 01              | ECT(1)—Packet supports ECN          |
| 10              | ECT(0)—Packet supports ECN          |
| 11              | CE—Congestion experienced           |

Codes 01 and 10 have the same meaning: ECN is supported and the packet is ECN-capable (ECT is set). There is no difference between these codes.

### End-to-End ECN Behavior

After the sending and receiving endpoints negotiate ECN, the sending endpoint marks packets as ECN-capable by setting the DiffServ ECN field to ECT(1) (01) or ECT(0) (10). Every intermediate switch between the endpoints must have ECN enabled or it does not work.

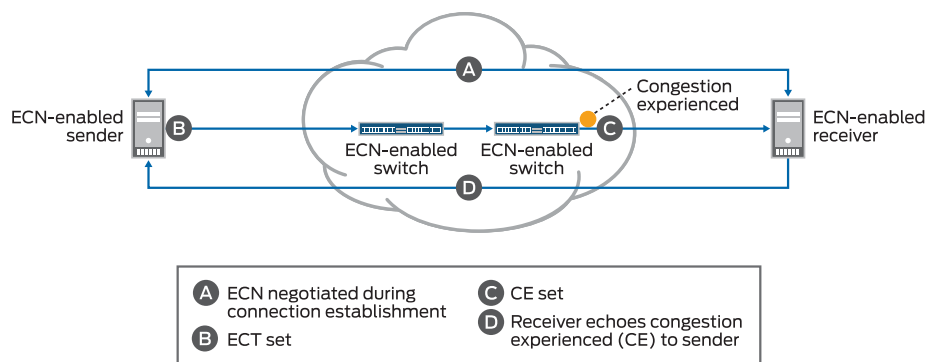

When a packet traverses a switch and experiences congestion at an output queue that uses the WRED packet drop mechanism, the switch marks the packet as experiencing congestion by setting the DiffServ ECN field to CE (11). Instead of dropping the packet (as with TCP congestion notification), the switch forwards the packet.

**NOTE:** At the egress queue, the WRED algorithm determines whether or not a packet is drop eligible based on the queue fill level (how full the queue is). If a packet is drop eligible and marked as ECN-capable, the packet can be marked CE and forwarded. If a packet is drop eligible and is not marked as ECN-capable, it might be dropped. See [“WRED Drop Profile Control of ECN Thresholds” on page 5931](#) for more information about the WRED algorithm.

When the packet reaches the receiver endpoint, the CE mark tells the receiver that there is network congestion. The receiver then sends (echoes) a message to the sender that indicates there is congestion on the network. The sender acknowledges the congestion notification message and reduces its transmission rate. [Figure 209 on page 5928](#) summarizes how ECN works to mitigate network congestion:

**Figure 209: Explicit Congestion Notification**

8042495

End-to-end ECN behavior includes:

1. The ECN-capable sender and receiver negotiate ECN capability during the establishment of their connection.
2. After successful negotiation of ECN capability, the ECN-capable sender sends IP packets with the ECT field set to the receiver.

**NOTE:** All of the intermediate devices in the path between the sender and the receiver must be ECN-enabled.

3. If the WRED algorithm on a switch egress queue determines that the queue is experiencing congestion and the packet is drop eligible, the switch can mark the packet as “congestion experienced” (CE) to indicate to the receiver that there is congestion on the network. If the packet has already been marked CE (congestion has already been experienced at the egress of another switch), the switch forwards the packet with CE marked.

If there is no congestion at the switch egress queue, the switch forwards the packet and does not change the ECT-enabled marking of the ECN bits, so the packet is still marked as ECN-capable but not as experiencing congestion.

Packets that are not marked as ECN-capable (ECT) are treated according to the WRED drop profile configuration and may be dropped during periods of congestion.

4. The receiver receives a packet marked CE to indicate that congestion was experienced along the congestion path.
5. The receiver echoes (sends) a packet back to the sender with the ECE bit (bit 9) marked in the flag field of the TCP header. The ECE bit is the ECN echo flag bit, which notifies the sender that there is congestion on the network.
6. The sender reduces the data transmission rate and sends a packet to the receiver with the CWR bit (bit 8) marked in the flag field of the TCP header. The CWR bit is the congestion window reduced flag bit, which acknowledges to the receiver that the congestion experienced notification was received.
7. When the receiver receives the CWR flag, the receiver stops setting the ECE bit in replies to the sender.

Table 535 on page 5929 summarizes the behavior of traffic on ECN-enabled queues.

**Table 535: Traffic Behavior on ECN-Enabled Queues**

| Incoming IP Packet Marking of ECN Bits | ECN Configuration on the Output Queue | Action if WRED Algorithm Determines Packet is Drop Eligible        | Outgoing Packet Marking of ECN Bits           |
|--|---------------------------------------|--|---|
| Non-ECT (00)                           | Does not matter                       | Drop   | Packet dropped—no ECN bits marked             |
| ECT (10 or 01)                         | ECN disabled                          | Drop   | Packet dropped—no ECN bits marked             |
| ECT (10 or 01)                         | ECN enabled                           | Do not drop. Mark packet as experiencing congestion (CE, bits 11). | Packet marked ECT (11) to indicate congestion |
| CE (11)                                | ECN disabled                          | Drop   | Packet dropped—no ECN bits marked             |

Table 535: Traffic Behavior on ECN-Enabled Queues (*continued*)

| Incoming IP Packet Marking of ECN Bits | ECN Configuration on the Output Queue | Action if WRED Algorithm Determines Packet is Drop Eligible  | Outgoing Packet Marking of ECN Bits           |
|--|---------------------------------------|--|---|
| CE (11)                                | ECN enabled                           | Do not drop. Packet is already marked as experiencing congestion, forward packet without changing the ECN marking. | Packet marked ECT (11) to indicate congestion |

When an output queue is not experiencing congestion as defined by the WRED drop profile mapped to the queue, all packets are forwarded, and no packets are dropped.

#### ***ECN Compared to PFC and Ethernet PAUSE***

ECN is an end-to-end network congestion notification mechanism for IP traffic. Priority-based flow control (PFC; IEEE 802.1Qbb) and Ethernet PAUSE (IEEE 802.3X) are different types of congestion management mechanisms. ECN requires that an output queue must also have an associated WRED packet drop profile. Output queues used for traffic on which PFC is enabled should not have an associated WRED drop profile. Interfaces on which Ethernet PAUSE is enabled should not have an associated WRED drop profile.

PFC is a peer-to-peer flow control mechanism to support lossless traffic. PFC enables connected peer devices to pause flow transmission during periods of congestion. PFC enables you to pause traffic on a specified type of flow on a link instead of on all traffic on a link. For example, you can (and should) enable PFC on lossless traffic classes such as the **fcoe** forwarding class. Ethernet PAUSE is also a peer-to-peer flow control mechanism, but instead of pausing only specified traffic flows, Ethernet PAUSE pauses all traffic on a physical link.

With PFC and Ethernet PAUSE, the sending and receiving endpoints of a flow do not communicate congestion information to each other across the intermediate switches. Instead, PFC controls flows between two PFC-enabled peer devices (for example, switches) that support data center bridging (DCB) standards. PFC works by sending a pause message to the connected peer when the flow output queue becomes congested. Ethernet PAUSE simply pauses all traffic on a link during periods of congestion and does not require DCB.

PFC works this way: if a switch output queue fills to a certain threshold, the switch sends a PFC pause message to the connected peer device that is transmitting data. The pause message tells the transmitting switch to pause transmission of the flow. When the congestion clears, the switch sends another PFC message to tell the connected peer to resume transmission. (If the output queue of the transmitting switch also reaches a certain threshold, that switch can in turn send a PFC pause message to the connected peer that is transmitting to it. In this way, PFC can propagate a transmission pause back through the network.)

See [“Understanding CoS Flow Control \(Ethernet PAUSE and PFC\)” on page 5559](#) for more information. For QFX5100 and EX4600 switches only, you can also refer to [“Understanding PFC Functionality Across Layer 3 Interfaces” on page 5950](#).

### WRED Drop Profile Control of ECN Thresholds

WRED drop profiles applied to output queues control how the switch marks ECN-capable packets. Drop profiles contain four configurable parameters that control when packets drop and the rate of packet drop:

- Drop start point—The queue fill level (threshold) at which the queue begins to drop packets.
- Drop end point—The queue fill level (threshold) at which the queue drops all packets that are not ECN-capable packets.

**NOTE:** Lossless and strict-high priority queues do not use drop profiles. Lossless queues use PFC to control the flow of traffic. Strict-high priority queues receive all of the port bandwidth they require up to the configured maximum bandwidth limit (scheduler shaping-rate).

- Drop probability at drop start point—The probability that a packet is dropped when the queue fill level reaches the drop start point. This is always zero (0) percent because until the queue fills to the drop start point, no packets are scheduled to drop.
- Drop probability at drop end point—The probability that a non-ECN packet is dropped when the queue fill level reaches the drop end point. All non-ECN packets are dropped after a queue reaches the drop end point.

As a queue fills from the drop start point to the drop end point, the probability of non-ECN packets being dropped increases. The more full a queue becomes, the greater the probability that non-ECN packets are dropped. (See [“Understanding CoS WRED Drop Profiles” on page 5909](#) for detailed information about how packet drop probabilities are calculated and applied to a queue.) However, ECN packets are not dropped unless the queue becomes completely full.

The drop profile configuration affects ECN packets as follows:

- Drop start point—ECN-capable packets might be marked as congestion experienced (CE).
- Drop end point—ECN-capable packets are always marked CE.

As a queue fills from the drop start point to the drop end point, the probability that an ECN packet is marked CE is the same as the probability that a non-ECN packet is dropped. As the queue fills, the probability of an ECN packet being marked CE increases, just as the probability of a non-ECN packet being dropped increases.

At the drop end point, all ECN packets are marked CE, but the ECN packets are not dropped. When the queue fill level exceeds the drop end point, all ECN packets are marked CE and all non-ECN packets are dropped. ECN packets are only dropped if the queue fills completely.

To configure a WRED packet drop profile and apply it to an output queue (using hierarchical scheduling):

1. Configure a drop profile using the statement **set class-of-service drop-profiles *profile-name* interpolate fill-level *drop-start-point* fill-level *drop-end-point* drop-probability 0 drop-probability *percentage***.
2. Map the drop profile to a queue scheduler using the statement **set class-of-service schedulers *scheduler-name* drop-profile-map loss-priority (low | medium-high | high) protocol any drop-profile *profile-name***. The name of the drop-profile is the name of the WRED profile configured in step 1.
3. Map the scheduler, which step 2 associates with the drop profile, to the output queue using the statement **set class-of-service scheduler-maps *map-name* forwarding-class *forwarding-class-name* scheduler *scheduler-name***. The forwarding class identifies the output queue. Forwarding classes are mapped to output queues by default, and can be remapped to different queues by explicit user configuration. The scheduler name is the scheduler configured in step 2.
4. Associate the scheduler map with a traffic control profile using the statement **set class-of-service traffic-control-profiles *tcp-name* scheduler-map *map-name***. The scheduler map name is the name configured in step 3.
5. Associate the traffic control profile with an interface using the statement **set class-of-service interface *interface-name* forwarding-class-set *forwarding-class-set-name* output-traffic-control-profile *tcp-name***. The output traffic control profile name is the name of the traffic control profile configured in step 4.

The interface uses the scheduler map in the traffic control profile to apply the drop profile (and other attributes, including the enable ECN attribute) to the output queue (forwarding class) on that interface. Because you can use different traffic control profiles to map different schedulers to different interfaces, the same queue number on different interfaces can handle traffic in different ways.

---

### Support, Limitations, and Notes

If the WRED algorithm that is mapped to a queue does not find a packet drop eligible, then the ECN configuration and ECN bits marking does not matter. The packet transport behavior is the same as when ECN is not enabled.

ECN is disabled by default. Normally, you enable ECN only on queues that handle best-effort traffic, and you do not enable ECN on queues that handle lossless traffic or strict-high priority traffic.

ECN supports the following:

- IPv4 and IPv6 packets
- Untagged, single-tagged, and double-tagged packets
- The outer IP header of IP tunneled packets (but not the inner IP header)

ECN does not support the following:

- IP packets with MPLS encapsulation
- The inner IP header of IP tunneled packets (however, ECN works on the outer IP header)
- Multicast, broadcast, and destination lookup fail (DLF) traffic
- Non-IP traffic

## Understanding DCB Features and Requirements

Data center bridging (DCB) is a set of enhancements to the IEEE 802.1 bridge specifications. DCB modifies and extends Ethernet behavior to support I/O convergence in the data center. I/O convergence includes but is not limited to the transport of Ethernet LAN traffic and Fibre Channel (FC) storage area network (SAN) traffic on the same physical Ethernet network infrastructure.

Video: [What is Data Center Bridging?](#)

A converged architecture saves cost by reducing the number of networks and switches required to support both types of traffic, reducing the number of interfaces required, reducing cable complexity, and reducing administration activities.

The Juniper Networks QFX Series and EX4600 switch support the DCB features required to transport converged Ethernet and FC traffic while providing the class-of-service (CoS) and other characteristics FC requires for transmitting storage traffic. To accommodate FC traffic, DCB specifications provide:

- A flow control mechanism called priority-based flow control (PFC, described in IEEE 802.1Qbb) to help provide lossless transport.
- A discovery and exchange protocol for conveying configuration and capabilities among neighbors to ensure consistent configuration across the network, called Data Center Bridging Capability Exchange protocol (DCBX), which is an extension of Link Layer Data Protocol (LLDP, described in IEEE 802.1AB).
- A bandwidth management mechanism called enhanced transmission selection (ETS, described in IEEE 802.1Qaz).
- A congestion management mechanism called quantized congestion notification (QCN, described in IEEE 802.1Qau).

The switch supports the PFC, DCBX, and ETS standards but does not support QCN. The switch also provides the high-bandwidth interfaces (10-Gbps minimum) required to support DCB and converged traffic.

This topic describes the DCB standards and requirements the switch supports:

- [Lossless Transport on page 5934](#)
- [ETS on page 5935](#)
- [DCBX on page 5936](#)

---

### Lossless Transport

FC traffic requires lossless transport (defined as no frames dropped because of congestion). Standard Ethernet does not support lossless transport, but the DCB extensions to Ethernet along with proper buffer management enable an Ethernet network to provide the level of class of service (CoS) necessary to transport FC frames encapsulated in Ethernet over an Ethernet network.

This section describes these factors in creating lossless transport over Ethernet:

- [PFC on page 5935](#)
- [Buffer Management on page 5935](#)
- [Physical Interfaces on page 5935](#)

### ***PFC***

PFC is a link-level flow control mechanism similar to Ethernet PAUSE (described in IEEE 802.3x). Ethernet PAUSE stops all traffic on a link for a period of time. PFC enables you to divide traffic on a link into eight priorities and stop the traffic of a selected priority without stopping the traffic assigned to other priorities on the link.

Pausing the traffic of a selected priority enables you to provide lossless transport for traffic assigned that priority and at the same time use standard lossy Ethernet transport for the rest of the link traffic.

### ***Buffer Management***

Buffer management is critical to the proper functioning of PFC, because if buffers are allowed to overflow, frames are dropped and transport is not lossless.

For each lossless flow priority, the switch requires sufficient buffer space to:

- Store frames sent during the time it takes to send the PFC pause frame across the cable between devices.
- Store the frames that are already on the wire when the sender receives the PFC pause frame.

The propagation delay due to cable length and speed, as well as processing speed, determines the amount of buffer space needed to prevent frame loss due to congestion.

The switch automatically sets the threshold for sending PFC pause frames to accommodate delay from cables as long as 150 meters (492 feet) and to accommodate large frames that might be on the wire when the switch sends the pause frame. This ensures that the switch sends pause frames early enough to allow the sender to stop transmitting before the receive buffers on the switch overflow.

### ***Physical Interfaces***

The switch supports 10-Gbps, full-duplex interfaces. The switch enables DCB capability only on 10-Gbps (or faster) Ethernet interfaces.

### ***ETS***

---

PFC divides traffic into up to eight separate streams (priorities, configured on the switch as forwarding classes) on a physical link. ETS enables you to manage the link bandwidth by:

- Grouping the priorities into priority groups (configured on the switch as forwarding class sets).
- Specifying the bandwidth available to each of the priority groups as a percentage of the total available link bandwidth.

- Allocating the bandwidth to the individual priorities in the priority group.

The available link bandwidth is the bandwidth remaining after servicing strict-high priority flows. We recommend that you always configure a shaping rate to limit the amount of bandwidth a strict-high priority flow can consume by including the [shaping-rate](#) statement in the [\[edit class-of-service schedulers\]](#) hierarchy on the strict-high priority scheduler. This prevents a strict-high priority from starving other queues on the port.

Managing link bandwidth with ETS provides several advantages:

- There is uniform management of all types of traffic on the link, both congestion-managed traffic and standard Ethernet traffic.
- When a priority group does not use all of its allocated bandwidth, other priority groups on the link can use that bandwidth as needed.

When a priority in a priority group does not use all of its allocated bandwidth, other priorities in the group can use that bandwidth.

The result is better bandwidth utilization, because priorities that consist of bursty traffic can share bandwidth during periods of low traffic transmission instead of consuming their entire bandwidth allocation when traffic loads are light.

- You can assign traffic types with different service needs to different priorities so that each traffic type receives appropriate treatment.
- Strict priority traffic retains its allocated bandwidth.

---

## DCBX

DCB devices use DCBX to exchange configuration information with directly connected peers (switches and endpoints such as servers). DCBX is an extension of LLDP. If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit fails.

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for PFC, ETS, and for Layer 2 and Layer 4 applications such as FCoE and iSCSI. DCBX is enabled or disabled on a per-interface basis.

## Understanding DCBX

Data Center Bridging Capability Exchange protocol (DCBX) is an extension of Link Layer Data Protocol (LLDP). If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails. Data center bridging (DCB) devices use DCBX to exchange configuration information with directly connected peers.

Video: [What is DCBX Protocol?](#)

This topic describes:

- [DCBX Basics on page 5937](#)
- [DCBX Modes and Support on page 5938](#)
- [DCBX Attribute Types on page 5941](#)
- [DCBX Application Protocol TLV Exchange on page 5942](#)
- [DCBX and PFC on page 5943](#)
- [DCBX and ETS on page 5943](#)

### DCBX Basics

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for priority-based flow control (PFC), Layer 2 and Layer 4 applications such as FCoE and iSCSI, and ETS. DCBX is enabled or disabled on a per-interface basis.

By default, for PFC and ETS, DCBX automatically negotiates administrative state and configuration with each interface's connected peer. To enable DCBX negotiation for applications, you must configure the applications, map them to IEEE 802.1p code points in an application map, and apply the application map to interfaces.

The FCoE application only needs to be included in an application map when you want an interface to exchange type, length, and values (TLVs) for other applications in addition to FCoE. If FCoE is the only application you want an interface to advertise, then you do not need to use an application map. For ETS, DCBX pushes the switch configuration to peers if they are set to learn the configuration from the switch (unless you disable sending the ETS recommendation TLV on interfaces in IEEE DCBX mode).

You can override the default behavior for PFC, for ETS, or for all applications mapped to an interface by turning off autonegotiation to force an interface to enable or disable that

feature. You can also disable DCBX autonegotiation for applications on an interface by excluding those applications from the application map you apply to that interface or by deleting the application map from the interface.

The default autonegotiation behavior for applications that are mapped to an interface is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

During negotiation of capabilities, the switch can push the PFC configuration to an attached peer if the peer is configured as “willing” to learn the PFC configuration from other peers. The Juniper Networks switch does not support self autoprovisioning and does not change its configuration during autonegotiation to match the peer configuration. (The Juniper switch is not “willing” to learn the PFC configuration from peers.)

**NOTE:** When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors, so that the switch can interoperate with a wider variety of converged network adapters (CNAs) and Layer 2 switches that support DCBX.

---

## DCBX Modes and Support

This section describes DCBX support:

- [DCBX Modes \(Versions\) on page 5938](#)
- [Autonegotiation on page 5940](#)
- [CNA Support for DCBX Modes on page 5941](#)
- [Interface Support for DCBX on page 5941](#)

### ***DCBX Modes (Versions)***

The two most common DCBX modes are supported:

- IEEE DCBX—The newest DCBX version. Different TLVs have different subtypes (for example, the subtype for the ETS configuration TLV is 9); the IEEE DCBX Organizationally Unique Identifier (OUI) is 0x0080c2.
- DCBX version 1.01—The Converged Enhanced Ethernet (CEE) version of DCBX. It has a subtype of 2 and an OUI of 0x001b21.

IEEE DCBX and DCBX version 1.01 differ mainly in frame format. DCBX version 1.01 uses one TLV that includes all DCBX attribute information, which is sent as sub-TLVs. IEEE DCBX uses a unique TLV for each DCB attribute.

**NOTE:** The switch does not support pre-CEE (pre-DCB) DCBX versions. Unsupported older versions of DCBX have a subtype of 1 and an OUI of 0x001b21. The switch drops LLDP frames that contain pre-CEE DCBX TLVs.

Table 454 on page 5582 summarizes the differences between IEEE DCBX and DCBX version 1.01, including show command output:

**Table 536: Summary of Differences Between IEEE DCBX and DCBX Version 1.01**

| Characteristic   | IEEE DCBX  | DCBX Version 1.01  |
|--|--|--|
| OUI  | 0x0080c2   | 0x001b21   |
| Frame Format   | Sends a separate, unique TLV for each DCBX attribute. For example, IEEE DCBX uses separate TLVs for ETS, PFC, and each application. Configuration and Recommendation information is sent in different TLVs   | Sends one TLV that includes all DCBX attribute information organized in sub-TLVs. The “willing” bit determines whether or not an interface can change its configuration to match the connected peer.   |
| Symmetric/asymmetric configuration with peer                                     | Asymmetric or symmetric  | Symmetric only   |
| Differences in the <b>show dcbx interface interface-name</b> operational command | <ul style="list-style-type: none"> <li>• Synchronization information is not shown because symmetric configuration is not required.</li> <li>• Operational state information is not shown because the operational states do not have to be symmetric.</li> <li>• TLV type is shown because unique TLVs are sent for each DCBX attribute.</li> <li>• ETS peer Configuration TLV and Recommendation TLV information is shown separately because they are different TLVs.</li> </ul> | <ul style="list-style-type: none"> <li>• Synchronization information is shown because symmetric configuration is required.</li> <li>• Operational state information is shown because the operational states do have to be symmetric.</li> <li>• TLV type is not shown because one TLV is used for all attribute information.</li> <li>• Recommendation TLV is not sent (DCBX Version 1.01 uses the “willing” bit to determine whether or not an interface uses the peer interface configuration).</li> </ul> |

For more information about how each DCBX mode exchanges TLVs, see the following specifications:

- For DCBX version 1.01—<http://www.ieee802.org/1/files/public/docs2008/az-wedekar-dcbx-capability-exchange-discovery-protocol-1108-v1.01.pdf>
- For IEEE DCBX—<http://www.ieee802.org/1/files/private/az-drafts/d2/802-1az-d2-4.pdf>

**NOTE:** As of Junos OS Release 12.2, this document is located in a private area of the IEEE website, and access requires a password from the IEEE organization. If you are not an IEEE member, you might not be able to access this document until it moves to the public area of the IEEE website.

You can configure interfaces to use the following DCBX modes:

- IEEE DCBX—The interface uses IEEE DCBX regardless of the configuration on the connected peer.
- DCBX version 1.01—The interface uses DCBX version 1.01 regardless of the configuration on the connected peer.
- Autonegotiation—The interface automatically negotiates with the connected peer to determine the DCBX version the peers use. Autonegotiation is the default DCBX mode.

If you configure a DCBX mode on an interface, the interface ignores DCBX protocol data units (PDUs) it receives from the connected peer if the PDUs do not match the DCBX version configured on the interface. For example, if you configure an interface to use IEEE DCBX and the connected peer sends DCBX version 1.01 LLDP PDUs, the interface ignores the version 1.01 PDUs. If you configure an interface to use DCBX version 1.01 and the peer sends IEEE DCBX LLDP PDUs, the interface ignores the IEEE DCBX PDUs.

**NOTE:** On interfaces that use the IEEE DCBX mode, the `show dcbx neighbors interface interface-name` operational command does not include application, PFC, or ETS operational state in the output.

---

### ***Autonegotiation***

Autonegotiation is the default DCBX mode. Each interface automatically negotiates with its connected peer to determine the DCBX version that both interfaces use to exchange DCBX information.

When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives one IEEE DCBX PDU from the peer, the interface sets the DCBX mode as IEEE DCBX. If the interface receives three DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.

Autonegotiation works slightly differently on standalone switches compared to QFabric systems:

- Standalone switches—When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives an IEEE DCBX TLV from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.
- QFabric system—When an interface connects to its peer interface, the interface advertises DCBX version 1.01 TLVs to the peer. If the interface receives an IEEE DCBX TLVs from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface retains DCBX version 1.01 as the DCBX mode.

**NOTE:** If the link flaps or the LLDP process restarts, the interface starts the autonegotiation process again. The interface does not use the last received DCBX communication mode.

### **CNA Support for DCBX Modes**

Different CNA vendors support different versions and capabilities of DCBX. The DCBX configuration you use on switch interfaces depends on the DCBX features that the CNAs in your network support.

### **Interface Support for DCBX**

You can configure DCBX on 10-Gigabit Ethernet interfaces and on link aggregation group (LAG) interfaces whose member interfaces are all 10-Gigabit Ethernet interfaces.

### **DCBX Attribute Types**

DCBX has three attribute types:

- **Informational**—These attributes are exchanged using LLDP, but do not affect DCBX state or operation; they only communicate information to the peer. For example, application priority TLVs are informational TLVs.
- **Asymmetric**—The values for these types of attributes do not have to be the same on the connected peer interfaces. Peers exchange asymmetric attributes when the attribute values can differ on each peer interface. The peer interface configurations might match or they might differ. For example, ETS Configuration and Recommendation TLVs are asymmetric TLVs.
- **Symmetric**—The intention is that the values for these types of attributes should be the same on both of the connected peer interfaces. Peer interfaces exchange symmetric attributes to ensure symmetric DCBX configuration for those attributes. For example, PFC Configuration TLVs are symmetric TLVs.

The following sections describe asymmetric and symmetric DCBX attributes:

- [Asymmetric Attributes on page 5941](#)
- [Symmetric Attributes on page 5942](#)

### **Asymmetric Attributes**

DCBX passes asymmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features). The resulting configuration for an attribute might be different on each peer, so the parameters configured on one interface might not match the parameters on the connected peer interface.

There are two types of asymmetric attribute TLVs:

- **Configuration TLV**—Configuration TLVs communicate the current operational state and the state of the “willing” bit. The “willing” bit communicates whether or not the interface is willing to accept and use the configuration from the peer interface. If an interface is “willing,” the interface uses the configuration it receives from the peer interface. (The peer interface configuration can override the configuration on the “willing” interface.) If an interface is “not willing,” the configuration on the interface cannot be overridden by the peer interface configuration.
- **Recommendation TLV**—Recommendation TLVs communicate the parameters the interface recommends that the connected peer interface should use. When an interface

sends a Recommendation TLV, if the connected peer is “willing,” the connected peer changes its configuration to match the parameters in the Recommendation TLV.

### ***Symmetric Attributes***

DCBX passes symmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features), with the objective that both interfaces should use the same configuration. The intent is that the parameters configured on one interface should match the parameters on the connected peer interface.

There is one type of symmetric attribute TLV, the Configuration TLV. As with asymmetric attributes, symmetric attribute Configuration TLVs communicate the current operational state and the state of the “willing” bit. “Willing” interfaces use the peer interface parameter values for the attribute. (The attribute configuration of the peer overrides the configuration on the “willing” interface.)

### **DCBX Application Protocol TLV Exchange**

---

DCBX advertises the switch’s capabilities for Layer 2 applications such as FCoE and Layer 4 applications such as iSCSI:

- [Application Protocol TLV Exchange on page 5942](#)
- [FCoE Application Protocol TLV Exchange on page 5942](#)
- [Disabling Application Protocol TLV Exchange on page 5943](#)

### ***Application Protocol TLV Exchange***

For all applications, DCBX advertises the application’s state and IEEE 802.1p code points on the interfaces to which the application is mapped. If an application is not mapped to an interface, that interface does not advertise the application’s TLVs. There is an exception for FCoE application protocol TLV exchange when FCoE is the only application you want DCBX to advertise on an interface.

### ***FCoE Application Protocol TLV Exchange***

Protocol TLV exchange for the FCoE application depends on whether FCoE is the only application you want the interface to advertise or whether you want the interface to exchange other application TLVs in addition to FCoE TLVs.

If FCoE is the only application you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

**NOTE:** If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

---

If you want DCBX to advertise FCoE and other applications on an interface, you must specify all of the applications, including FCoE, in an application map, and apply the application map to the desired interfaces.

**NOTE:** If an application map is applied to an interface, the FCoE application must be explicitly configured in the application map, or the interface does not exchange FCoE TLVs.

When DCBX advertises the FCoE application, it advertises the FCoE state and IEEE 802.1p code points. If a peer device connected to a switch interface does not support FCoE, DCBX uses autonegotiation to mark the interface as “FCoE down,” and FCoE is disabled on that interface.

### ***Disabling Application Protocol TLV Exchange***

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface *interface-name* applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

## **DCBX and PFC**

After you enable PFC on a switch interface, DCBX uses autonegotiation to control the operational state of the PFC functionality.

If the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled. (PFC must be symmetrical.)

If the peer advertises that it is “willing” to learn its PFC configuration from the switch, DCBX pushes the switch’s PFC configuration to the peer and does not check the peer’s administrative state.

You can manually override DCBX control of the PFC operational state on a per-interface basis by disabling autonegotiation. If you disable autonegotiation on an interface on which you have configured PFC, then PFC is enabled on that interface regardless of the peer configuration. To disable PFC on an interface, do not configure PFC on that interface.

## **DCBX and ETS**

This section describes:

- [Default DCBX ETS Advertisement on page 5944](#)
- [ETS Advertisement and Peer Configuration on page 5944](#)
- [ETS Recommendation TLV on page 5944](#)

### ***Default DCBX ETS Advertisement***

If you do not configure ETS on an interface, the switch automatically creates a default priority group that contains all of the priorities (forwarding classes, which represent output queues) and assigns 100 percent of the port output bandwidth to that priority group. The default priority group is transparent. It does not appear in the configuration and is used for DCBX advertisement. DCBX advertises the default priority group, its priorities, and the assigned bandwidth.

If you configure ETS on an interface, DCBX advertises:

- Each priority group on the interface
- The priorities in each priority group
- The bandwidth properties of each priority group and priority

Any priority on that interface that is not part of an explicitly configured priority group (forwarding class set) is assigned to the automatically generated default priority group and receives no bandwidth. If you configure ETS on an interface, every forwarding class (priority) on that interface for which you want to forward traffic must belong to a forwarding class set (priority group).

### ***ETS Advertisement and Peer Configuration***

DCBX does not control the switch's ETS (hierarchical scheduling) operational state. If the connected peer is configured as "willing," DCBX pushes the switch's ETS configuration to the switch's peers if the ETS Recommendation TLV is enabled (it is enabled by default). If the peer does not support ETS or is not consistently provisioned with the switch, DCBX does not change the ETS operational state on the switch. The ETS operational state remains enabled or disabled based only on the switch hierarchical scheduling configuration and is enabled by default.

When ETS is configured, DCBX advertises the priority groups, the priorities in the priority groups, and the bandwidth configuration for the priority groups and priorities. Any priority (essentially a forwarding class or queue) that is not part of a priority group has no scheduling properties and receives no bandwidth.

You can manually override whether DCBX advertises the ETS state to the peer on a per-interface basis by disabling autonegotiation. This does not affect the ETS state on the switch or on the peer, but it does prevent the switch from sending the Recommendation TLV or the Configuration TLV to the connected peer. To disable ETS on an interface, do not configure priority groups (forwarding class sets) on the interface.

### ***ETS Recommendation TLV***

The ETS Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is "willing," it changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV by including the **no-recommendation-tlv** statement at the **[edit protocols dcbx interface *interface-name* enhanced-transmission-selection]** hierarchy level.

**NOTE:** You can disable the ETS Recommendation TLV only when the DCBX mode on the interface is IEEE DCBX. Disabling the ETS Recommendation TLV has no effect if the DCBX mode on the interface is DCBX version 1.01. (IEEE DCBX uses separate application attribute TLVs, but DCBX version 1.01 sends all application attributes in the same TLV and uses sub-TLVs to separate the information.)

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is “willing,” the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

For example, if you want a CNA connected to a switch interface to have different bandwidth allocations than the switch ETS configuration, you can disable the ETS Recommendation TLV and configure the CNA for the desired bandwidth. The switch interface and the CNA exchange configuration parameters, but the CNA does not change its configuration to match the switch interface configuration.

## Understanding DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers. DCBX also advertises the capabilities of applications on interfaces by exchanging application protocol information through application type, length, and value (TLV) elements. DCBX is an extension of Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

---

Setting up application protocol exchange consists of:

- Defining applications
- Mapping the applications to IEEE 802.1p code points in an *application map*
- Configuring classifiers to prioritize incoming traffic and map the incoming traffic to the application by the traffic code points
- Applying the application maps and classifiers to interfaces

You need to explicitly define the applications that you want an interface to advertise. The FCoE application is a special case (see [“Applications” on page 5590](#)) and only needs to be defined on an interface if you want DCBX to exchange application protocol TLVs for other applications in addition to FCoE on that interface.

You also need to explicitly map all defined applications that you want an interface to advertise to IEEE 802.1p code points in an application map. The FCoE application is a special case (see [“Application Maps” on page 5590](#)) and only requires inclusion in an application map when you want an interface to use DCBX for other applications in addition to FCoE, as described later in this topic.

This topic describes:

- [Applications on page 5946](#)
- [Application Maps on page 5947](#)
- [Classifying and Prioritizing Application Traffic on page 5948](#)
- [Enabling Interfaces to Exchange Application Protocol Information on page 5949](#)
- [Disabling DCBX Application Protocol Exchange on page 5949](#)

---

### Applications

Before an interface can exchange application protocol information, you need to define the applications that you want to advertise, except FCoE if FCoE is the only application that you want the interface to advertise.

**NOTE:** If FCoE is the only application that you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class and applied to the interface)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

If you apply an application map to an interface, then all applications that you want DCBX to advertise must be defined and configured in the application map, including the FCoE application.

If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

You can define:

- Layer 2 applications by EtherType
- Layer 4 applications by a combination of protocol (TCP or UDP) and destination port number

The EtherType is a two-octet field in the Ethernet frame that denotes the protocol encapsulated in the frame. For a list of common EtherTypes, see <http://standards.ieee.org/develop/regauth/ethertype/eth.txt> on the IEEE standards organization website. For a list of port numbers and protocols, see the *Service Name and Transport Protocol Port Number Registry* at <http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml> on the Internet Assigned Numbers Authority (IANA) website.

You must explicitly define each application that you want to advertise, except FCoE. The FCoE application is defined by default (EtherType 0x8906).

### Application Maps

An application map maps defined applications to one or more IEEE 802.1p code points. Each application map contains one or more applications. DCBX includes the configured application code points in the protocol TLVs exchanged with the connected peer.

To exchange protocol TLVs for an application, you must include the application in an application map. The FCoE application is a special case:

- If you want DCBX to exchange application protocol TLVs for more than one application on a particular interface, you must configure the applications, define an application map to map the applications to code points, and apply the application map to the interface. In this case, you must also define the FCoE application and add it to the application map.

This is the same process and treatment required for all other applications. In addition, for DCBX to exchange FCoE application TLVs, you must enable priority-based flow control (PFC) on the FCoE priority (the FCoE IEEE 802.1p code point) on the interface.

- If FCoE is the only application that you want DCBX to advertise on an interface, then you do not need to configure an application map and apply it to the interface. By default, when an interface has no application map, and the interface carries traffic mapped to the FCoE forwarding class, and PFC is enabled on the FCoE priority, the interface advertises FCoE TLVs (autonegotiation mode). DCBX exchanges FCoE application protocol TLVs by default until you apply an application map to the interface, remove the FCoE traffic from the interface (you can do this by removing the or editing the classifier for FCoE traffic), or disable PFC on the FCoE priority.

If you apply an application map to an interface that did not have an application map and was exchanging FCoE application TLVs, and you do not include the FCoE application in the application map, the interface stops exchanging FCoE TLVs. Every interface that has an application map must have FCoE included in the application map (and PFC enabled on the FCoE priority) in order for DCBX to exchange FCoE TLVs.

Mapping an application to code points does two things:

- Maps incoming traffic with the same code points to that application
- Allows you to configure classifiers that map incoming application traffic, by code point, to a forwarding class and a loss priority, in order to apply class of service (CoS) to application traffic and prioritize application traffic

You apply an application map to an interface to enable DCBX application protocol exchange on that interface for each application specified in the application map. All of the applications that you want an interface to advertise must be configured in the application map that you apply to the interface, with the previously noted exception for the FCoE application when FCoE is the only application for which you want DCBX to exchange protocol TLVs on an interface.

---

### Classifying and Prioritizing Application Traffic

---

When traffic arrives at an interface, the interface classifies the incoming traffic based on its code points. Classifiers map code points to loss priorities and forwarding classes. The loss priority prioritizes the traffic. The forwarding class determines the traffic output queue and CoS service level.

When you map an application to an IEEE 802.1p code point in an application map and apply the application map to an interface, incoming traffic on the interface that matches the application code points is mapped to the appropriate application. The application receives the loss priority and the CoS associated with the forwarding class for those code points, and is placed in the output queue associated with the forwarding class.

You can use the default classifier or you can configure a classifier to map the application code points defined in the application map to forwarding classes and loss priorities.

### Enabling Interfaces to Exchange Application Protocol Information

Each interface with the **fcoe** forwarding class and PFC enabled on the FCoE code point is enabled for FCoE application protocol exchange by default until you apply an application map to the interface. If you apply an application map to an interface and you want that interface to exchange FCoE application protocol TLVs, you must include the FCoE application in the application map. (In all cases, to achieve lossless transport, you must also enable PFC on the FCoE code point or code points.)

Except when FCoE is the only protocol you want DCBX to advertise on an interface, interfaces on which you want to exchange application protocol TLVs must include the following two items:

- The application map that contains the application(s)
- A classifier

**NOTE:** You must also enable PFC on the code point of any traffic for which you want to achieve lossless transport.

### Disabling DCBX Application Protocol Exchange

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface *interface-name* applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable sending the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers.

## QFX5100 Switches Only

---

- [Understanding PFC Functionality Across Layer 3 Interfaces on page 5950](#)

### Understanding PFC Functionality Across Layer 3 Interfaces

Priority-based flow control (PFC) allows you to select traffic flows within a link and pause them, so that the output queues associated with the flows do not overflow and drop packets. (PFC is more granular than Ethernet PAUSE, which pauses all traffic on a physical link.) PFC helps you configure lossless transport for traffic flows across a data center bridging network.

However, you might want to create a traffic flow that losslessly traverses the Layer 2 data center bridging network *and* also losslessly traverses a Layer 3 network that connects Ethernet hosts in different Layer 2 networks. On a QFX5100 or EX4600 switch running the Enhanced Layer 2 Software (ELS) CLI, in addition to configuring PFC on Layer 2 (bridging) interfaces, you can configure PFC on traffic that traverses Layer 3 interfaces. This enables you to preserve the lossless characteristics that PFC provides on traffic, even when the traffic crosses Layer 3 interfaces that connect two Layer 2 networks.

Video: [Preserving Lossless Behavior on an SDN or Overlay Network](#)

PFC works the same way across Layer 3 interfaces as it works across Layer 2 interfaces. When an output queue buffer reaches a certain fill level threshold, the switch sends a PFC pause message to the connected peer to pause transmission of the traffic on which PFC is enabled. Pausing the incoming traffic prevents the queue buffer from overflowing and dropping packets, just as on Layer 2 interfaces. When the queue buffer fill level decreases below a certain threshold, the interface sends a message to the connected peer to restart traffic transmission.

Although PFC is a data center bridging technology, PFC also works on Layer 3 interfaces because PFC operates at the queue level. When you use an IEEE 802.1p classifier to classify incoming traffic (map incoming traffic to a forwarding class and a loss priority based on the IEEE 802.1p code point in the Ethernet frame header) and you enable PFC on the appropriate priority (IEEE 802.1p code point), PFC works on Layer 2 and Layer 3 interfaces.

**NOTE:** Lossless traffic on Layer 3 interfaces *must* use an IEEE 802.1p classifier to classify incoming traffic, because PFC does not use DSCP or DSCP IPv6 code points to identify traffic for flow control. PFC cannot pause traffic flows unless the incoming traffic is classified by an IEEE 802.1p classifier. Do not apply a DSCP (or a DSCP IPv6) classifier to Layer 3 traffic on which you want to enable PFC.

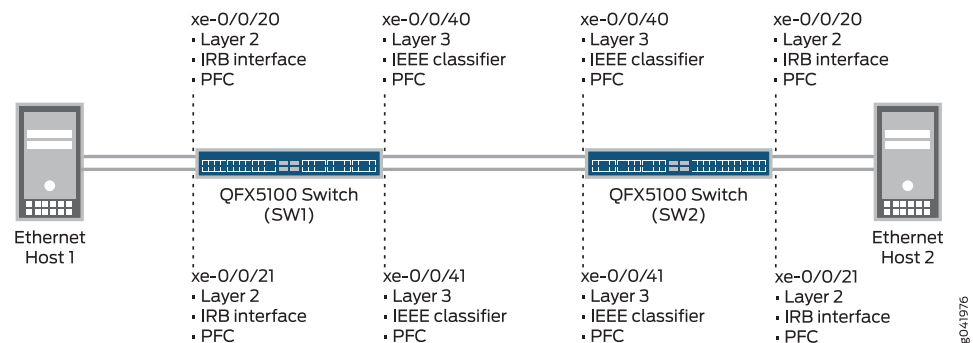

Because PFC functionality relies on the mapping (classifying) of traffic to IEEE 802.1p code points and on enabling PFC on the correct code point(s) at each interface, you must ensure that incoming traffic has the correct 3-bit IEEE 802.1p code point (priority) in the priority code point (PCP) field of the Ethernet frame header (sometimes known as the CoS bits).

**NOTE:** Layer 3 interfaces do not support FCoE traffic. FCoE traffic must use Layer 2 interfaces and cannot use Layer 3 interfaces. Therefore, you cannot enable PFC on FCoE traffic across Layer 3 interfaces.

Figure [Figure 210 on page 5951](#) shows a topology in which two Ethernet hosts in Layer 2 networks communicate across a Layer 3 network, with PFC enabled on all of the Layer 2 and Layer 3 switch interfaces.

**Figure 210: Enabling PFC Across Layer 3 Interface Hops**

The Ethernet host-facing interfaces (xe-0/0/20 and xe-0/0/21 on both switches) and the Layer 3 network-facing interfaces (interfaces xe-0/0/40 and xe-0/0/41 on both switches) require different interface configurations to enable PFC on the Layer 3 interfaces. In addition, the class of service (CoS) for each interface must be configured correctly, including enabling PFC on the traffic that you want to treat as lossless traffic:

Ethernet-host facing interfaces (xe-0/0/20 and xe-0/0/21) require the following configuration:

- Set interfaces as family ethernet-switching
- Set the interface mode as trunk mode
- Create VLANs to carry the traffic
- Create IRB interfaces to place the Layer 2 VLAN traffic on Layer 3 for transport between IP networks
- Create an IEEE 802.1p classifier to classify incoming traffic into the correct forwarding class, based on the IEEE 802.1p code point
- Create a congestion notification profile (CNP) to configure PFC on the IEEE 802.1p code point of the traffic that you want treat as lossless traffic

- Apply the classifier and the CNP to the Layer 2 interfaces
- Configure CoS: lossless forwarding classes, hierarchical port scheduling (also known as enhanced transmission selection) and apply it to the Layer 2 interfaces

Layer 3 IP network-facing interfaces (xe-0/0/40 and xe-0/0/41) require the following configuration:

- Set interfaces as family inet
- Set VLAN tagging on the interfaces
- Create VLANs to carry the traffic
- Create an IEEE 802.1p classifier to classify incoming traffic into the correct forwarding class, based on the IEEE 802.1p code point (do not use a DSCP or DSCP IPv6 classifier)
- Create a congestion notification profile (CNP) to configure PFC on the IEEE 802.1p code point of the traffic that you want treat as lossless traffic on the Layer 3 interfaces
- Apply the IEEE 802.1p classifier and the CNP to the Layer 3 interfaces
- Configure CoS: lossless forwarding classes, hierarchical port scheduling (enhanced transmission selection) and apply it to the Layer 3 interfaces

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

When you configure the Layer 2 and Layer 3 interfaces correctly, the switch enables PFC on the traffic between Ethernet Host 1 and Ethernet Host 2 across the entire path between the two hosts. If any output queue in the path on which PFC is enabled experiences congestion, PFC pauses the traffic and prevents packet loss for the flow.

## QFX3500 and QFX3600 Virtual Chassis Only

- [CoS on Virtual Chassis Switch Ports on page 5953](#)

## CoS on Virtual Chassis Switch Ports

QFX Series and EX4600 Virtual Chassis devices have access ports to connect to external peer devices. Virtual Chassis devices also have Virtual Chassis ports (VCPs) to interconnect members of the Virtual Chassis, in a similar way that QFabric system Node devices have fabric (fte) ports to connect to the QFabric system Interconnect device. VCPs are not used for external access.

Class of service (CoS) on Virtual Chassis access ports is the same as CoS on these devices when they are in standalone mode or used as QFabric system Node devices. However, CoS on VCPs differs in several ways from CoS on QFabric system Node device fabric ports.

This topic describes CoS support on Virtual Chassis access interfaces and on VCPs:

- [Access Interface CoS Support on page 5953](#)
- [VCP Interface CoS Support on page 5955](#)
- [CPU-Generated Host Outbound Traffic on page 5956](#)

### Access Interface CoS Support

CoS on Virtual Chassis access interfaces is the same as CoS on standalone device and Node device access interfaces, except for shared buffer settings. The documentation for QFX Series and EX4600 switch CoS on access interfaces applies to Virtual Chassis access interfaces, except some of the shared buffer documentation.

- [Similarities in CoS Support on Virtual Chassis Access Interfaces Compared to Standalone Device \(or QFabric system Node device\) Access Interfaces on page 5954](#)
- [Differences in CoS Support on Virtual Chassis Access Interfaces Compared to Standalone Device \(or QFabric system Node device\) Access Interfaces on page 5955](#)

***Similarities in CoS Support on Virtual Chassis Access Interfaces Compared to Standalone Device (or QFabric system Node device) Access Interfaces***

Virtual Chassis access interfaces support the following CoS features in the same way as access interfaces on standalone devices and QFabric system Node devices:

- Forwarding classes—The default forwarding classes, queue mapping, and packet drop attributes ([Table 537 on page 5954](#)) are the same:

**Table 537: Default Forwarding Class Configuration**

| Default Forwarding Class | Default Queue Mapping | Default Packet Drop Attribute |
|--------------------------|-----------------------|-------------------------------|
| best-effort (be)         | 0                     | drop                          |
| fcoe                     | 3                     | no-loss                       |
| no-loss                  | 4                     | no-loss                       |
| network-control (nc)     | 7                     | drop                          |
| mcast                    | 8                     | drop                          |

- Packet classification—Classifier default settings and configuration are the same. Support for behavior aggregate, multifield, multidestination, and fixed classifiers is the same.
- Enhanced transmission selection (ETS)—This data center bridging (DCB) feature that supports hierarchical scheduling has the same defaults and user configuration, including forwarding class set (priority group) and traffic control profile configuration.
- Priority-based flow control (PFC)—This DCB feature that supports lossless transport has the same defaults and user configuration, including support for six lossless priorities (forwarding classes).
- Ethernet PAUSE—This feature has the same defaults and configuration.
- Queue scheduling—This feature has the same defaults, configuration, and scheduler-to-forwarding-class mapping. Queue scheduling is a subset of hierarchical scheduling.
- Priority group (forwarding class set) scheduling—This feature has the same defaults and configuration. Priority group scheduling is a subset of hierarchical scheduling.
- WRED profiles—This feature has the same defaults and configuration.
- Code-point aliases—This feature has the same defaults and configuration.
- Rewrite rules—This feature has the same defaults and configuration (no default rewrite rules applied to egress traffic).
- Host outbound traffic—This feature has the same defaults and configuration.

### ***Differences in CoS Support on Virtual Chassis Access Interfaces Compared to Standalone Device (or QFabric system Node device) Access Interfaces***

The default shared buffer settings and the way in which you configure shared buffers are the same on Virtual Chassis access interfaces as on standalone and QFabric system Node devices. The difference is that on Virtual Chassis access interfaces, the shared buffer configuration is global and applies to all access ports on all members of the Virtual Chassis, while on standalone or QFabric system Node devices, you can configure different buffer settings on different access interfaces.

You cannot configure different shared buffer settings for different Virtual Chassis members. All members of a Virtual Chassis use the same shared buffer configuration.

### **VCP Interface CoS Support**

CoS on the VCP interfaces that connect the Virtual Chassis members is similar to CoS on the fabric interfaces of QFabric system Node devices, but there are several important differences:

- [Similarities in CoS Support on VCP Interfaces and QFabric System Node Device Fabric Interfaces on page 5955](#)
- [Differences in CoS Support on VCP Interfaces and QFabric System Node Device Fabric Interfaces on page 5956](#)

### ***Similarities in CoS Support on VCP Interfaces and QFabric System Node Device Fabric Interfaces***

VCP interfaces support full hierarchical scheduling (ETS). ETS includes the following CoS features. VCP interfaces support no other CoS features.

- Creating forwarding class sets (priority groups) and mapping forwarding classes to forwarding class sets.
- Scheduling individual output queues. The scheduler defaults and configuration are the same as the scheduler on access interfaces.
- Scheduling priority groups (forwarding class sets) using a traffic control profile. The defaults and configuration are the same as on access interfaces.

**NOTE:** You cannot attach classifiers, congestion notification profiles, or rewrite rules to VCP interfaces. Also, you cannot configure buffer settings on VCP interfaces. Similar to fabric interfaces on QFabric system Node devices, you can only attach forwarding class sets and traffic control profiles to VCP interfaces.

The behavior of lossless traffic across 40-Gigabit VCP interfaces is the same as the behavior of lossless traffic across QFabric system Node device fabric ports. The system automatically enables flow control for lossless forwarding classes (priorities). The system dynamically calculates buffer headroom that is allocated from the global lossless-headroom buffer for the lossless forwarding classes on each 40-Gigabit VCP interface. If there is not enough global lossless-headroom buffer space to support the

number of lossless flows on a 40-Gigabit VCP interface, the system generates a syslog message.

**NOTE:** After you configure lossless transport on a Virtual Chassis, check the syslog messages to ensure that there is sufficient buffer space to support the configuration.

**NOTE:** If you break out a 40-Gigabit VCP interface into 10-Gigabit VCP interfaces, lossless transport is not supported on the 10-Gigabit VCP interfaces. Lossless transport is supported only on 40-Gigabit VCP interfaces. (10-Gigabit access interfaces support lossless transport.)

---

### ***Differences in CoS Support on VCP Interfaces and QFabric System Node Device Fabric Interfaces***

Although most of the CoS behavior on VCP interfaces is similar to CoS behavior on the fabric ports of QFabric system Node devices, there are some important differences:

- Hierarchical scheduling (queue and priority group scheduling)—On QFabric system Node device fabric interfaces, you can apply a different hierarchical scheduler (traffic control profile) to different priority groups (forwarding class sets) on different interfaces. However, on VCP interfaces, the schedulers that you apply to priority groups are global to all VCP interfaces. One hierarchical scheduler controls scheduling for a priority group on all VCP interfaces.

You attach a scheduler to VCP interfaces using the global identifier (*vcp-\**) for VCP interfaces. For example, if you want to apply a traffic control profile (traffic control profiles contain both queue and priority group scheduling configuration) named *vcp-hpc-tcp* to a forwarding class set named *vcp-hpc-fcset*, you include the following statement in the configuration:

```
[edit]
user@switch# set class-of-service interfaces vcp-* forwarding-class-set vcp-hpc-fcset
output-traffic-control-profile vcp-hpc-tcp
```

The system applies the hierarchical scheduler *vcp-hpc-tcp* to the traffic mapped to the priority group *vcp-hpc-fcset* on all VCP interfaces.

- You cannot attach classifiers, congestion notification profiles, or rewrite rules to VCP interfaces. Also, you cannot configure buffer settings on VCP interfaces. Similar to QFabric system Node device fabric interfaces, you can only attach forwarding class sets and traffic control profiles to VCP interfaces.
- Lossless transport is supported only on 40-Gigabit VCP interfaces. If you break out a 40-Gigabit VCP interface into 10-Gigabit VCP interfaces, lossless transport is not supported on the 10-Gigabit VCP interfaces.

---

### **CPU-Generated Host Outbound Traffic**

CPU-generated host outbound traffic is forwarded on the network-control forwarding class, which is mapped to queue 7. If you use the default scheduler, the network-control

queue receives a guaranteed minimum bandwidth (transmit rate) of 5 percent of port bandwidth. The guaranteed minimum bandwidth is more than sufficient to ensure lossless transport of host outbound traffic.

However, if you configure and apply a scheduler instead of using the default scheduler, you must ensure that the network-control forwarding class (or whatever forwarding class you configure for host outbound traffic) receives sufficient guaranteed bandwidth to prevent packet loss.

**TIP:** If you configure a scheduler instead of using the default scheduler, we recommend that you configure the network-control queue (or the queue you configure for host outbound traffic if it is not the network-control queue) as a strict-high priority queue. Strict-high priority queues receive the bandwidth required to transmit their entire queues before other queues are served. To limit the amount of bandwidth a strict-high priority queue can consume (and to prevent the strict-high priority queue from starving other queues), apply a shaping rate to the strict-high priority traffic in the scheduler configuration.

As with all strict-high priority traffic, if you configure the network-control queue (or any other queue) as a strict-high priority queue, you must also create a separate forwarding class set (priority group) that contains only strict-high priority traffic, and apply the strict-high priority forwarding class set and its traffic control profile (hierarchical scheduler) to the VCP interfaces.

### Virtual Chassis Fabric Only

- [CoS on Virtual Chassis Fabric \(VCF\) EX4300 Leaf Devices \(Mixed Mode\) on page 5958](#)

## CoS on Virtual Chassis Fabric (VCF) EX4300 Leaf Devices (Mixed Mode)

A Virtual Chassis Fabric (VCF) uses QFX5100 switches as spine devices and can use QFX5100, QFX3500, QFX3600, and EX4300 switches as leaf devices. When a VCF includes more than one type of leaf device (mixed mode), the CoS feature support on the VCF depends on the capability of the lowest-featured device. In mixed mode, the supported CoS features are the “lowest common denominator” of the features supported by the leaf devices. If one leaf device does not support a particular feature, that feature is not supported on the VCF even if every other leaf device supports the feature.

**NOTE:** EX4300 leaf devices do not support several CoS features that are supported on QFX5100, QFX3600, and QFX3500 devices. However, even when a VCF includes an EX4300 leaf device, other leaf devices might support those CoS features.

- [VCF CoS in Mixed Mode with an EX4300 Leaf Device on page 5958](#)
- [Scheduling on an EX4300 VCF Leaf Device on page 5960](#)

### VCF CoS in Mixed Mode with an EX4300 Leaf Device

In mixed mode, if all of the leaf devices are QFX5100, QFX3500, and QFX3600 switches, the full QFX Series CoS feature set is available, including data center bridging (DCB) features such as enhanced transmission selection (ETS, IEEE 802.1Qaz), priority-based flow control (PFC, IEEE 802.1Qbb), and Data Center Bridging Exchange Protocol (DCBX, an extension of LLDP, IEEE 802.1AB).

However, the EX4300 leaf device does not support DCB standards (ETS, PFC, DCBX). The lack of support for DCB standards means that the EX4300 leaf device does not support lossless transport. So a VCF that includes an EX4300 as a leaf device does not support lossless storage traffic such as Fibre Channel over Ethernet (FCoE).

In addition, a VCF with an EX4300 leaf device either does not support or has limited support for some other CoS features that the QFX Series switches support, including some buffer configuration features, some packet rewrite features, and Ethernet PAUSE (IEEE 802.3X).

[Table 538 on page 5958](#) summarizes the CoS support on a VCF in mixed mode with one or more EX4300 leaf devices.

**Table 538: Support of QFX CoS Features on a VCF in Mixed Mode with an EX4300 Leaf Device**

| QFX Series CoS Feature | Support in Mixed Mode with an EX4300 Leaf Device   |
|------------------------|--|
| Forwarding Classes     | The EX4300 leaf device uses the QFX Series default forwarding classes, the default QFX Series forwarding class to queue mapping, and the QFX Series maximum number of supported forwarding classes (12). |

**Table 538: Support of QFX CoS Features on a VCF in Mixed Mode with an EX4300 Leaf Device (*continued*)**

| QFX Series CoS Feature                                   | Support in Mixed Mode with an EX4300 Leaf Device  |
|--|---|
| Lossless Forwarding Classes                              | <p>Not supported.</p> <p>For example, the QFX Series default lossless forwarding classes <b>fcoe</b> and <b>no-loss</b> are not treated as lossless forwarding classes. Traffic mapped to lossless forwarding classes (default lossless forwarding classes or user-defined lossless forwarding classes) is treated as best-effort traffic.</p>  |
| Shared buffer configuration                              | <p>Ingress shared buffer configuration is not supported. Egress shared buffer configuration does not support partitioning into three buffer pools.</p> <p>If there is a shared buffer configuration, only the total egress shared buffer configuration is used. Ingress shared buffer configuration and egress buffer partitioning configuration is ignored.</p>  |
| Classifier on a Layer 2 interface                        | One classifier per protocol is supported on a port. On a physical port, for a particular protocol, the same Layer 2 classifier is used on all of the logical interfaces.  |
| Classifier on a Layer 3 interface                        | Supported.  |
| Multi-destination classifier                             | <p>Supported.</p> <p>The EX4300 leaf device uses the same default classifier as the QFX5100 spine device. As on QFX Series switches, a multi-destination classifier is global and is applied to all VCF interfaces. Multi-destination classifiers are valid only for multicast forwarding classes. You can configure two multi-destination classifiers, one for IEEE 802.1p traffic and one for DSCP traffic (the DSCP multi-destination classifier applies to both IPv4 and IPv6 traffic).</p>                                       |
| Congestion notification profile                          | <p>Not supported.</p> <p>If a congestion notification profile is configured on the QFX5100 spine device, it is ignored because the EX4300 leaf device does not support lossless transport, so end-to-end lossless behavior is not possible.</p>   |
| Ethernet PAUSE (IEEE 802.3X)                             | <p>Not supported.</p> <p>If Ethernet PAUSE is configured, it is ignored.</p>  |
| Hierarchical scheduling (ETS)                            | <p>Translated into port-based scheduling.</p> <p>The EX4300 device does not support ETS scheduling. A VCF translates ETS scheduling configured on a QFX5100 spine device into port scheduling on an EX4300 leaf device. The hierarchical structure of mapping forwarding classes into forwarding class sets (fc-sets) is ignored.</p> <p><a href="#">“Scheduling on an EX4300 VCF Leaf Device” on page 5960</a> provides details on how a VCF translates QFX Series ETS scheduling into port scheduling on an EX4300 leaf device.</p> |
| Hierarchical scheduling (ETS) on a spine device VCP port | On QFX5100 VCP ports, the hierarchical mapping of forwarding classes to forwarding class sets is supported. However, scheduling on an EX4300 leaf device is translated into port scheduling.  |

**Table 538: Support of QFX CoS Features on a VCF in Mixed Mode with an EX4300 Leaf Device** (*continued*)

| QFX Series CoS Feature               | Support in Mixed Mode with an EX4300 Leaf Device  |
|--------------------------------------|---|
| Drop profile (WRED)                  | <p>QFX Series drop profiles are supported. The EX4300 device as a standalone switch supports four packet loss priorities. However, as part of a mixed mode VCF, the EX4300 leaf device supports only the three packet loss priorities that the QFX Series switches support:</p> <ul style="list-style-type: none"> <li>• low</li> <li>• medium-high</li> <li>• high</li> </ul> <p>Supporting only three packet loss priorities means that the behavior of the EX4300 switch as a leaf device is different from the behavior as a standalone switch.</p> |
| Rewrite rules on a Layer 2 interface | Supported, but with a limit of one rewrite rule per physical interface. All traffic uses the same rewrite rule.   |
| Rewrite rules on a Layer 3 interface | Supported, but with a limit of one rewrite rule per physical interface. The same rewrite rule is used on all traffic on the interface.  |
| Rewrite value for FCoE traffic       | <p>Not supported.</p> <p>If a rewrite value for FCoE traffic, is configured, it is ignored. (A mixed mode VCF does not support lossless traffic.)</p>   |

In addition to the CoS limitations shown in [Table 538 on page 5958](#), using wild cards in a LAG configuration is not supported in mixed mode with one or more EX4300 leaf devices.

### Scheduling on an EX4300 VCF Leaf Device

Because the EX4300 leaf device does not support ETS, the VCF translates the ETS scheduling configuration into the port scheduling configuration that the EX4300 device supports. The QFX5100 spine device uses two-tier ETS scheduling, as described in detail in [“Understanding CoS Hierarchical Port Scheduling \(ETS\)” on page 5862](#).

Briefly, ETS allocates port bandwidth into forwarding class sets (priority groups) and forwarding classes (priorities) in a hierarchical manner. Each forwarding class set consists of individual forwarding classes, with each forwarding class mapped to an output queue.

Port bandwidth (minimum guaranteed bandwidth and maximum bandwidth) is allocated to each forwarding class set. Forwarding class set bandwidth is in turn allocated to the forwarding classes in the forwarding class set. If a forwarding class does not use its bandwidth allocation, other forwarding classes within the same forwarding class set can share the unused bandwidth. If the forwarding classes in a forwarding class set do not use the bandwidth allocated to that forwarding class set, other forwarding class sets on the port can share the unused bandwidth. (This is how ETS increases port bandwidth utilization, by sharing unused bandwidth among forwarding classes and forwarding class sets.)

However, the EX4300 leaf device supports port scheduling, not ETS. Port scheduling is a “flat” scheduling method that allocates bandwidth directly to forwarding classes in a non-hierarchical manner.

The VCF translates the two tiers of the ETS scheduling configuration (forwarding class sets and forwarding classes) into a single port scheduling configuration as follows:

- The bandwidth allocated to a forwarding class set is divided equally among the forwarding classes in the forwarding class set. (Traffic control profiles schedule bandwidth allocation to forwarding class sets.) The minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth limit (**shaping-rate**) of the forwarding class set determine the guaranteed minimum bandwidth and the maximum bandwidth the forwarding classes receive, *unless* those values are different in the forwarding class scheduler configuration.
- If there is an explicit forwarding class bandwidth scheduler configuration, it overrides the forwarding class set configuration. Bandwidth scheduling values that are not explicitly configured in a forwarding class scheduler use the values from the forwarding class set (the traffic control profile configuration). Forwarding class schedulers control the minimum guaranteed bandwidth (**transmit-rate**), the maximum bandwidth (**shaping-rate**), and the priority (**priority**) for each forwarding class (output queue). Because the priority value is not configured at the forwarding class set level, the priority configured in the forwarding class scheduler is always used.

The following two scenarios illustrate how a VCF translates an ETS configuration into a port scheduling configuration:

#### Scenario 1

A forwarding class set named **fc-set-1** has a configured guaranteed minimum bandwidth (**guaranteed-rate**) of 4G, and a configured maximum bandwidth (**shaping-rate**) of 5G.

Forwarding class set **fc-set-1** consists of two forwarding classes, named **fc-1** and **fc-2**:

- Forwarding class **fc-1** has a guaranteed minimum bandwidth (**transmit-rate**) of 2.5G. There is no configured maximum bandwidth (**shaping-rate**).
- Forwarding class **fc-2** has a guaranteed minimum bandwidth (**transmit-rate**) of 1.5G. There is no configured maximum bandwidth (**shaping-rate**).

On the EX4300 leaf device, the ETS configuration above is translated approximately to the following port scheduling configuration:

- Guaranteed minimum bandwidth—Because guaranteed minimum bandwidth has been explicitly configured in the forwarding class scheduler, forwarding class **fc-1** receives a transmit rate of 2.5G and forwarding class **fc-2** receives a transmit rate of 1.5G.

**NOTE:** If there had been no forwarding class scheduler **transmit-rate** configuration, then the forwarding class set minimum guaranteed bandwidth of 4G would have been split evenly between the forwarding classes, with each forwarding class receiving a minimum guaranteed bandwidth rate of 2G.

- Maximum bandwidth—Because there is no explicit maximum bandwidth (**shaping-rate**) configuration for the forwarding classes, the forwarding classes that belong to the

forwarding class set receive an equal share of the maximum bandwidth configured at the forwarding class set level in the traffic control profile. Because the forwarding class set maximum bandwidth is 5G, forwarding classes **fc-1** and **fc-2** each receive a maximum bandwidth of 2.5G.

In this scenario, the minimum guaranteed bandwidth and the maximum bandwidth configured at the forwarding class set hierarchy level are achieved on the forwarding classes that belong to the forwarding class set. (This does not always happen, as Scenario 2 shows.) However, unused bandwidth is not shared the same way. For example, if forwarding class **fc-1** experienced a burst of traffic at 3.5G, it would be limited to a maximum of 2.5G and traffic would be dropped. Using ETS, if forwarding class **fc-2** was not using its allocated maximum bandwidth, then **fc-1** could use (share) that unused bandwidth. But flat port scheduling does not share the unused bandwidth.

## Scenario 2

A forwarding class set named **fc-set-2** has a configured guaranteed minimum bandwidth (**guaranteed-rate**) of 6G, and a configured maximum bandwidth (**shaping-rate**) of 9G.

Forwarding class set **fc-set-2** consists of three forwarding classes, named **fc-3**, **fc-4**, and **fc-5**:

- Forwarding class **fc-3** has a guaranteed minimum bandwidth (**transmit-rate**) of 1G. There is no configured maximum bandwidth (**shaping-rate**).
- Forwarding class **fc-4** has a maximum bandwidth (**shaping-rate**) of 2G. There is no configured guaranteed minimum bandwidth (**transmit-rate**).
- Forwarding class **fc-5** has a guaranteed minimum bandwidth (**transmit-rate**) of 3G. There is no configured maximum bandwidth (**shaping-rate**).

On the EX4300 leaf device, the ETS configuration above is translated approximately to the following port scheduling configuration:

- Guaranteed minimum bandwidth—Two forwarding classes (**fc-3** and **fc-5**) have an explicitly configured transmit rate, and one forwarding class (**fc-4**) does not. Forwarding classes **fc-3** and **fc-5** receive the minimum guaranteed bandwidth configured in their schedulers, so forwarding class **fc-3** receives 1G guaranteed minimum bandwidth and forwarding class **fc-5** receives 3G guaranteed minimum bandwidth.

Forwarding class **fc-4** does not have an explicitly configured transmit rate, so the port derives the minimum guaranteed bandwidth from the forwarding class set guaranteed rate. Forwarding class set **fc-set-2** has a minimum guaranteed bandwidth (**guaranteed-rate**) of 6G, and there are three forwarding classes in the forwarding class set. Forwarding class **fc-4** receives an equal share (one third) of the forwarding class set minimum guaranteed bandwidth. So forwarding class **fc-4** is allocated a guaranteed minimum bandwidth (**transmit-rate**) of 2G (6G divided by 3 forwarding classes = 2G).

- Maximum bandwidth—Forwarding class **fc-4** has an explicitly configured shaping rate, and forwarding classes **fc-3** and **fc-5** do not. Forwarding class **fc-4** receives the maximum bandwidth configured in its scheduler, so forwarding class **fc-4** receives a maximum bandwidth of 2G.

Forwarding classes **fc-3** and **fc-5** do not have explicitly configured shaping rates, so the port derives the maximum bandwidth from the forwarding class set shaping rate. Forwarding class set **fc-set-2** has a maximum bandwidth (**shaping-rate**) of 9G, and there are three forwarding classes in the forwarding class set. Forwarding classes **fc-3** and **fc-5** each receive an equal share (one third) of the forwarding class set shaping rate. So forwarding classes **fc-3** and **fc-5** are allocated a maximum bandwidth of 3G each (9G divided by 3 forwarding classes = 3G).

Forwarding class **fc-4** receives less maximum bandwidth than forwarding classes **fc-3** and **fc-5** because the explicitly configured shaping rate for forwarding class **fc-4** is only 2G, and the explicit forwarding class configuration overrides the forwarding class set configuration.

**NOTE:** Scenario 2 shows that in some cases, the guaranteed minimum bandwidth (**guaranteed-rate**) and the maximum bandwidth (**shaping-rate**) configured for a forwarding class set might not be achieved at the forwarding class (queue) level. In Scenario 2, forwarding class set **fc-set-2** has a shaping rate of 9G, but the sum of the implemented forwarding class shaping rates is only 8G [(3G for **fc-3**) + (2G for **fc-4**) + (3G for **fc-5**)].

### Example: Configuring CoS Hierarchical Port Scheduling (ETS)

Hierarchical port scheduling defines the class-of-service (CoS) properties of output queues, which are mapped to forwarding classes (forwarding classes are mapped to IEEE 802.1p priorities, so mapping queues to forwarding classes also maps queues to priorities). Hierarchical port scheduling enables you to group priorities that require similar CoS resources into priority groups. You define the port bandwidth resources for a priority group, and you define the amount of the priority group's resources that each priority in the group can use.

Hierarchical port scheduling is the Junos OS implementation of enhanced transmission selection (ETS, described in IEEE 802.1Qaz). One major benefit of hierarchical port scheduling is greater port bandwidth utilization. If a priority group on a port does not use all of its allocated bandwidth, other priority groups on that port can use that bandwidth. Also, if a priority within a priority group does not use its allocated bandwidth, other priorities within that priority group can use that bandwidth.

Configuring hierarchical scheduling is a multistep procedure that includes:

- Mapping forwarding classes to queues
- Defining forwarding class sets (priority groups)
- Defining behavior aggregate classifiers
- Configuring priority-based flow control (PFC) for lossless priorities (queues)
- Applying classifiers and PFC configuration to ingress interfaces
- Defining drop profiles
- Defining schedulers
- Mapping forwarding classes to schedulers
- Defining traffic control profiles
- Assigning priority groups and traffic control profiles to egress ports

This example describes how to configure hierarchical scheduling:

- [Requirements on page 5967](#)
- [Overview on page 5967](#)

- [Configuration on page 5970](#)
- [Verification on page 5978](#)

---

## Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

---

## Overview

Keep the following considerations in mind when you plan the port bandwidth allocation for priority groups and for individual priorities:

- How much traffic and what types of traffic you expect to traverse the system.
- How you want to divide different types of traffic into priorities (forwarding classes, also called queues) to apply different CoS treatment to the traffic. Dividing traffic into priorities includes:
  - Mapping the code points of ingress traffic to forwarding classes using behavior aggregate (BA) classifiers. This classifies incoming traffic into the appropriate forwarding class.
  - Mapping forwarding classes to output queues. This defines the output queue for each type of traffic.
  - Attaching the BA classifier to the desired ingress interfaces so that incoming traffic maps to the desired forwarding classes and queues.
- How you want to organize priorities into priority groups (forwarding class sets).

Traffic that requires similar treatment usually belongs in the same priority group. To do this, place forwarding classes that require similar bandwidth, loss, and other characteristics in the same forwarding class set. For example, you can map all types of best-effort traffic forwarding classes into one forwarding class set.

- How much of the port bandwidth you want to allocate to each priority group and to each of the priorities in each priority group. The following considerations apply to bandwidth allocation:
  - Estimate how much traffic you expect in each forwarding class (output queue) and how much traffic you expect in each forwarding class set (the aggregate amount of traffic in the forwarding classes that belong to the forwarding class set).
  - The combined minimum guaranteed bandwidth of the priorities (forwarding classes) in a priority group should not exceed the minimum guaranteed bandwidth of the priority group. The transmit rate scheduler parameter defines the minimum guaranteed bandwidth for forwarding classes. Scheduler maps associate schedulers with forwarding classes.
  - The combined minimum guaranteed bandwidth of the priority groups (forwarding class sets) on a port should not exceed the port's total bandwidth. Traffic control profiles define the minimum bandwidth for a forwarding class set. Associating a

scheduler map with a traffic control profile sets the scheduling for the individual forwarding classes in the forwarding class set.

This example creates hierarchical port scheduling by defining priority groups for best effort, guaranteed delivery, and high-performance computing (HPC) traffic. Each priority group includes priorities that need to receive similar CoS treatment. Each priority group and each priority within each priority group receive the CoS resources needed to service their flows. Lossless priorities use PFC to prevent packet loss when the network experiences congestion.

### Topology

Table 539 on page 5968 shows the configuration components for this example.

**Table 539: Components of the Hierarchical Port Scheduling (ETS) Configuration Topology**

| Property   | Settings  |
|--|---|
| Hardware   | QFX3500 switch  |

### Configuration

#### CLI Quick Configuration

To quickly configure hierarchical port scheduling, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network

configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
[edit class-of-service]
set forwarding-classes class best-effort queue-num 0
set forwarding-classes class be2 queue-num 1
set forwarding-classes class hpc queue-num 5
set forwarding-classes class network-control queue-num 7
set forwarding-class-sets best-effort-pg class best-effort
set forwarding-class-sets best-effort-pg class be2
set forwarding-class-sets best-effort-pg class network-control
set forwarding-class-sets guar-delivery-pg class fcoe
set forwarding-class-sets guar-delivery-pg class no-loss
set forwarding-class-sets hpc-pg class hpc
set classifiers ieee-802.1 hsclassifier1 forwarding-class best-effort loss-priority low code-points 000
set classifiers ieee-802.1 hsclassifier1 forwarding-class be2 loss-priority high code-points 001
set classifiers ieee-802.1 hsclassifier1 forwarding-class fcoe loss-priority low code-points 011
set classifiers ieee-802.1 hsclassifier1 forwarding-class no-loss loss-priority low code-points 100
set classifiers ieee-802.1 hsclassifier1 forwarding-class hpc loss-priority low code-points 101
set classifiers ieee-802.1 hsclassifier1 forwarding-class network-control loss-priority low code-points 110
set congestion-notification-profile gd-cnp input ieee-802.1 code-point 011 pfc
set congestion-notification-profile gd-cnp input ieee-802.1 code-point 100 pfc

set interfaces xe-0/0/21 forwarding-class-set hpc-pg output-traffic-control-profile hpc-tcp

```

### Step-by-Step Procedure

To perform a step-by-step configuration of the forwarding classes (priorities), forwarding class sets (priority groups), classifiers, queue schedulers, PFC, traffic control profiles, and interfaces to set up hierarchical port scheduling (ETS):

1. Configure the forwarding classes (priorities) and map them to unicast output queues (do not explicitly map the **fcoe** and **no-loss** forwarding classes to output queues; use the default configuration):

```

[edit class-of-service]
user@switch# set forwarding-classes class best-effort queue-num 0
user@switch# set forwarding-classes class be2 queue-num 1
user@switch# set forwarding-classes class hpc queue-num 5
user@switch# set forwarding-classes class network-control queue-num 7

```

2. Configure forwarding class sets (priority groups) to group forwarding classes (priorities) that require similar CoS treatment:

```

[edit class-of-service]
user@switch# set forwarding-class-sets best-effort-pg class best-effort
user@switch# set forwarding-class-sets best-effort-pg class be2
user@switch# set forwarding-class-sets best-effort-pg class network-control
user@switch# set forwarding-class-sets guar-delivery-pg class fcoe
user@switch# set forwarding-class-sets guar-delivery-pg class no-loss
user@switch# set forwarding-class-sets hpc-pg class hpc

```

3. Configure a classifier to set the loss priority and IEEE 802.1 code points assigned to each forwarding class at the ingress:

```

[edit class-of-service]
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class best-effort
loss-priority low code-points 000
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class be2 loss-priority
high code-points 001
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class fcoe loss-priority
low code-points 011
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class no-loss loss-priority
low code-points 100
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class hpc loss-priority low
code-points 101
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class network-control
loss-priority low code-points 110

```

4. Configure a congestion notification profile to enable PFC on the FCoE and no-loss queue IEEE 802.1 code points:

```

[edit class-of-service]
user@switch# set congestion-notification-profile gd-cnp input ieee-802.1 code-point 011
pfc
user@switch# set congestion-notification-profile gd-cnp input ieee-802.1 code-point 100
pfc

```

5. Assign the classifier to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 hsclassifier1
user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 hsclassifier1
```

6. Apply the PFC configuration to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 congestion-notification-profile gd-cnp
user@switch# set interfaces xe-0/0/21 congestion-notification-profile gd-cnp
```

7. Configure the drop profile for the best-effort low loss-priority queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-be-low interpolate fill-level 25 fill-level 50
drop-probability 0 drop-probability 80
```

8. Configure the drop profile for the best-effort high loss-priority queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-be-high interpolate fill-level 10 fill-level 40
drop-probability 0 drop-probability 100
```

9. Configure the drop profile for the network-control queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-nc interpolate fill-level 80 fill-level 100 drop-probability
0 drop-probability 100
```

10. Configure the drop profile for the high-performance computing queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-hpc interpolate fill-level 75 fill-level 90 drop-probability
0 drop-probability 75
```

11. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profiles for the best-effort queue:

```
[edit class-of-service]
user@switch# set schedulers be-sched priority low transmit-rate 3g
user@switch# set schedulers be-sched shaping-rate percent 100
user@switch# set schedulers be-sched drop-profile-map loss-priority low protocol any
drop-profile dp-be-low
user@switch# set schedulers be-sched drop-profile-map loss-priority high protocol any
drop-profile dp-be-high
```

12. Define the minimum guaranteed bandwidth, priority, and maximum bandwidth for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 2500m
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

13. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profile for the high-performance computing queue:

```
[edit class-of-service]
user@switch# set schedulers hpc-sched priority low transmit-rate 2g
user@switch# set schedulers hpc-sched shaping-rate percent 100
user@switch# set schedulers hpc-sched drop-profile-map loss-priority low protocol any
drop-profile dp-hpc
```

14. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profile for the network-control queue:  

```
[edit class-of-service]
user@switch# set schedulers nc-sched priority low transmit-rate 500m
user@switch# set schedulers nc-sched shaping-rate percent 100
user@switch# set schedulers nc-sched drop-profile-map loss-priority low protocol any
drop-profile dp-nc
```
15. Define the minimum guaranteed bandwidth, priority, and maximum bandwidth for the no-loss queue:  

```
[edit class-of-service]
user@switch# set schedulers nl-sched priority low transmit-rate 2g
user@switch# set schedulers nl-sched shaping-rate percent 100
```
16. Map the schedulers to the appropriate forwarding classes (queues):  

```
[edit class-of-service]
user@switch# set scheduler-maps be-map forwarding-class best-effort scheduler be-sched
user@switch# set scheduler-maps be-map forwarding-class be2 scheduler be-sched
user@switch# set scheduler-maps be-map forwarding-class network-control scheduler
nc-sched
user@switch# set scheduler-maps gd-map forwarding-class fcoe scheduler fcoe-sched
user@switch# set scheduler-maps gd-map forwarding-class no-loss scheduler nl-sched
user@switch# set scheduler-maps hpc-map forwarding-class hpc scheduler hpc-sched
```
17. Define the traffic control profile for the best-effort priority group (queue scheduler to mapping, minimum guaranteed bandwidth, and maximum bandwidth):  

```
[edit class-of-service]
user@switch# set traffic-control-profiles be-tcp scheduler-map be-map guaranteed-rate
3500m
user@switch# set traffic-control-profiles be-tcp shaping-rate percent 100
```
18. Define the traffic control profile for the guaranteed delivery priority group (queue to scheduler mapping, minimum guaranteed bandwidth, and maximum bandwidth):  

```
[edit class-of-service]
user@switch# set traffic-control-profiles gd-tcp scheduler-map gd-map guaranteed-rate
4500m
user@switch# set traffic-control-profiles gd-tcp shaping-rate percent 100
```
19. Define the traffic control profile for the high-performance computing priority group (queue to scheduler mapping, minimum guaranteed bandwidth, and maximum bandwidth):  

```
[edit class-of-service]
user@switch# set traffic-control-profiles hpc-tcp scheduler-map hpc-map guaranteed-rate
2g
user@switch# set traffic-control-profiles hpc-tcp shaping-rate percent 100
```
20. Apply the three priority groups (forwarding class sets) and the appropriate traffic control profiles to the egress ports:  

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 forwarding-class-set best-effort-pg
output-traffic-control-profile be-tcp
user@switch# set interfaces xe-0/0/20 forwarding-class-set guar-delivery-pg
output-traffic-control-profile gd-tcp
user@switch# set interfaces xe-0/0/20 forwarding-class-set hpc-pg
output-traffic-control-profile hpc-tcp
```

```

user@switch# set interfaces xe-0/0/21 forwarding-class-set best-effort-pg
output-traffic-control-profile be-tcp
user@switch# set interfaces xe-0/0/21 forwarding-class-set guar-delivery-pg
output-traffic-control-profile gd-tcp
user@switch# set interfaces xe-0/0/21 forwarding-class-set hpc-pg
output-traffic-control-profile hpc-tcp

```

### Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** and **no-loss** lossless forwarding classes):

```

user@switch> show configuration class-of-service
classifiers {
  ieee-802.1 hsclassifier1 {
    forwarding-class best-effort {
      loss-priority low code-points 000;
    }
    forwarding-class be2 {
      loss-priority high code-points 001;
    }
    forwarding-class fcoe {
      loss-priority low code-points 011;
    }
    forwarding-class no-loss {
      loss-priority low code-points 100;
    }
    forwarding-class hpc {
      loss-priority low code-points 101;
    }
    forwarding-class network-control {
      loss-priority low code-points 110;
    }
  }
}
drop-profiles {

  }
}
```

**TIP:** To quickly configure the interfaces, issue the `load merge terminal` command, and then copy the hierarchy and paste it into the switch terminal window.

---

## Verification

---

To verify that the hierarchical port scheduling components have been created and are operating properly, perform these tasks:

- [Verifying That the Forwarding Classes \(Priorities\) Have Been Created on page 5979](#)
- [Verifying That the Forwarding Class Sets \(Priority Groups\) Have Been Created on page 5979](#)
- [Verifying That the Classifier Has Been Created on page 5980](#)
- [Verifying That Priority-Based Flow Control Has Been Enabled on page 5980](#)
- [Verifying That the Output Queue Schedulers Have Been Created on page 5981](#)
- [Verifying That the Drop Profiles Have Been Created on page 5984](#)

- [Verifying That the Priority Group Output Schedulers \(Traffic Control Profiles\) Have Been Created on page 5985](#)
- [Verifying the Interface Configuration on page 5986](#)

### *Verifying That the Forwarding Classes (Priorities) Have Been Created*

**Purpose** Verify that the forwarding classes have been created and mapped to the correct queues. (The system shows only the explicitly configured forwarding classes. It does not show default forwarding classes such as **fcoe** and **no-loss**.)

**Action** List the forwarding classes using the operational mode command **show class-of-service forwarding-class**:

```
user@switch> show class-of-service forwarding-class
```

| Forwarding class | ID | Queue | Policing priority | No-Loss  |
|------------------|----|-------|-------------------|----------|
| best-effort      | 0  | 0     | normal            | Disabled |
| be2              | 1  | 3     | normal            | Disabled |
| hpc              | 2  | 4     | normal            | Disabled |
| network-control  | 3  | 7     | normal            | Disabled |
| mcast            | 8  | 8     | normal            | Disabled |

**Meaning** The **show class-of-service forwarding-class** command lists all of the configured forwarding classes, the internal identification number of each forwarding class, the queues that are mapped to the forwarding classes, the policing priority, and whether the forwarding class is lossless (no-loss packet drop attribute enabled) or lossy forwarding class (no-loss packet drop attribute disabled). The command output shows that:

- Forwarding class **best-effort** maps to queue **0** and is lossy
- Forwarding class **be2** maps to queue **1** and is lossy
- Forwarding class **hpc** maps to queue **5** and is lossy
- Forwarding class **network-control** maps to queue **7** and is lossy

In addition, the command lists the default multicast (multidestination) forwarding class and the default queue to which it is mapped.

### *Verifying That the Forwarding Class Sets (Priority Groups) Have Been Created*

**Purpose** Verify that the priority groups have been created and that the correct priorities (forwarding classes) belong to the appropriate priority group.

**Action** List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set**:

```
user@switch> show class-of-service forwarding-class-set
```

```
Forwarding class set: best-effort-pg, Type: normal-type, Forwarding class set
index: 19907
```

| Forwarding class | Index |
|------------------|-------|
| best-effort      | 0     |

|                 |   |
|-----------------|---|
| be2             | 1 |
| network-control | 5 |

Forwarding class set: guar-delivery-pg, Type: normal-type, Forwarding class set index: 43700

|                  |       |
|------------------|-------|
| Forwarding class | Index |
| fcoe             | 2     |
| no-loss          | 3     |

Forwarding class set: hpc-pg, Type: normal-type, Forwarding class set index: 60758

|                  |       |
|------------------|-------|
| Forwarding class | Index |
| hpc              | 4     |

**Meaning** The **show class-of-service forwarding-class-set** command lists all of the configured forwarding class sets (priority groups), the forwarding classes (priorities) that belong to each priority group, and the internal index number of each priority group. The command output shows that:

- The forwarding class set **best-effort-pg** includes the forwarding classes **best-effort**, **be2**, and **network-control**.
- The forwarding class set **guar-delivery-pg** includes the forwarding classes **fcoe** and **no-loss**.
- The forwarding class set **hpc-pg** includes the forwarding class **hpc**.

#### *Verifying That the Classifier Has Been Created*

**Purpose** Verify that the classifier maps forwarding classes to the correct IEEE 802.1p code points and packet loss priorities.

**Action** List the classifier configured for hierarchical port scheduling using the operational mode command **show class-of-service classifier name hsclassifier1**:

```
user@switch> show class-of-service classifier name hsclassifier1
Classifier: hsclassifier1, Code point type: ieee-802.1, Index: 43607
Code point      Forwarding class      Loss priority
000             best-effort           low
001             be2                   high
011             fcoe                  low
100             no-loss               low
101             hpc                   low
110             network-control      low
```

**Meaning** The **show class-of-service classifier name hsclassifier1** command lists all of the IEEE 802.1p code points and the loss priorities mapped to all of the forwarding classes in the classifier. The command output shows that the forwarding classes **best-effort**, **be2**, **no-loss**, **fcoe**, **hpc**, and **network-control** have been created and mapped to IEEE 802.1p code points and loss priorities.

#### *Verifying That Priority-Based Flow Control Has Been Enabled*

**Purpose** Verify that PFC is enabled on the correct priorities for lossless transport.

**Action** List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
```

```
Type: Input, Name: gd-cnp, Index: 51687
```

```
Cable Length: 100 m
```

| Priority | PFC      | MRU  |
|----------|----------|------|
| 000      | Disabled |      |
| 001      | Disabled |      |
| 010      | Disabled |      |
| 011      | Enabled  | 2500 |
| 100      | Enabled  | 2500 |
| 101      | Disabled |      |
| 110      | Disabled |      |
| 111      | Disabled |      |

```
Type: Output
```

| Priority | Flow-Control-Queues |
|----------|---------------------|
| 000      | 0                   |
| 001      | 0                   |
| 010      | 1                   |
| 011      | 2                   |
| 100      | 3                   |
| 101      | 4                   |
| 110      | 5                   |
| 111      | 6                   |
|          | 7                   |

**Meaning** The **show class-of-service congestion-notification** command lists all of the congestion notification profiles and the IEEE 802.1p code points with PFC enabled. The command output shows that PFC is enabled for code points **011** (**fcoe** priority and queue) and **100** (**no-loss** priority and queue) for the **gd-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

#### *Verifying That the Output Queue Schedulers Have Been Created*

**Purpose** Verify that the output queue schedulers have been created with the correct bandwidth parameters and priorities, mapped to the correct queues, and mapped to the correct drop profiles.

**Action** List the scheduler maps using the operational mode command **show class-of-service scheduler-map**:

```
user@switch> show class-of-service scheduler-map
```

```
Scheduler map: be-map, Index: 64023
```

```
Scheduler: be-sched, Forwarding class: best-effort, Index: 13005
Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
```

Buffer Limit: none, Priority: low

Excess Priority: unspecified

Shaping rate: 100 percent,

drop-profile-map-set-type: mark

Drop profiles:

| Loss priority | Protocol | Index | Name                   |
|---------------|----------|-------|------------------------|
| Low           | any      | 55387 | dp-be-low              |
| Medium high   | any      | 1     | <default-drop-profile> |
| High          | any      | 4369  | dp-be-high             |

Scheduler: be-sched, Forwarding class: be2, Index: 13005

Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,

Buffer Limit: none, Priority: low

Excess Priority: unspecified

Shaping rate: 100 percent,

drop-profile-map-set-type: mark

Drop profiles:

| Loss priority | Protocol | Index | Name                   |
|---------------|----------|-------|------------------------|
| Low           | any      | 55387 | dp-be-low              |
| Medium high   | any      | 1     | <default-drop-profile> |
| High          | any      | 4369  | dp-be-high             |

Scheduler: nc-sched, Forwarding class: network-control, Index: 45740

Transmit rate: 5000000000 bps, Rate Limit: none, Buffer size: remainder,

Buffer Limit: none, Priority: low

Excess Priority: unspecified

Shaping rate: 100 percent,

drop-profile-map-set-type: mark

Drop profiles:

| Loss priority | Protocol | Index | Name                   |
|---------------|----------|-------|------------------------|
| Low           | any      | 44207 | dp-nc                  |
| Medium high   | any      | 1     | <default-drop-profile> |
| High          | any      | 1     | <default-drop-profile> |

Scheduler map: gd-map, Index: 61447

Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289

Transmit rate: 25000000000 bps, Rate Limit: none, Buffer size: remainder,

Buffer Limit: none, Priority: low

Excess Priority: unspecified

Shaping rate: 100 percent,

drop-profile-map-set-type: mark

Drop profiles:

Scheduler: nl-sched, Forwarding class: no-loss, Index: 29359

Transmit rate: 20000000000 bps, Rate Limit: none, Buffer size: remainder,

Buffer Limit: none, Priority: low

Excess Priority: unspecified

Shaping rate: 100 percent,

drop-profile-map-set-type: mark

Drop profiles:

| Loss priority | Protocol | Index | Name                   |
|---------------|----------|-------|------------------------|
| Low           | any      | 44207 | <default-drop-profile> |
| Medium high   | any      | 1     | <default-drop-profile> |
| High          | any      | 1     | <default-drop-profile> |

Scheduler map: hpc-map, Index: 56941

```
Scheduler: hpc-sched, Forwarding class: hpc, Index: 55900
Transmit rate: 2000000000 bps, Rate Limit: none, Buffer size: remainder,
Buffer Limit: none, Priority: low
Excess Priority: unspecified
Shaping rate: 100 percent,
drop-profile-map-set-type: mark
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           any       57716  dp-hpc
  Medium high   any       1      <default-drop-profile>
  High          any       1      <default-drop-profile>
```

**Meaning** The **show class-of-service scheduler-map** command lists all of the configured scheduler maps. For each scheduler map, the command output includes:

- The name of the scheduler map (**scheduler-map** field)
- The name of the scheduler (**scheduler** field)
- The forwarding classes mapped to the scheduler (**forwarding-class** field)
- The minimum guaranteed queue bandwidth (**transmit-rate** field)
- The scheduling priority (**priority** field)
- The maximum bandwidth in the priority group the queue can consume (**shaping-rate** field)
- The drop profile loss priority (**loss priority** field) for each drop profile name (**name** field)

The command output shows that:

- The scheduler map **be-map** has been created and has these properties:
  - There are two schedulers, **be-sched** and **nc-sched**.
  - The scheduler **be-sched** has two forwarding classes, **best-effort** and **be2**.
  - Scheduler **be-sched** forwarding classes **best-effort** and **be2** share a minimum guaranteed bandwidth of **3000000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and use the drop profile **dp-be-low** for low loss-priority traffic, the default drop profile for medium-high loss-priority traffic, and the drop profile **dp-be-high** for high loss-priority traffic.
  - The scheduler **nc-sched** has one forwarding class, **network-control**.
  - The **network-control** forwarding class has a minimum guaranteed bandwidth of **5000000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and uses the drop profile **dp-nc** for low loss-priority traffic and the default drop profile for medium-high and high loss priority traffic.
- The scheduler map **gd-map** has been created and has these properties:
  - There are two schedulers, **fcoe-sched** and **nl-sched**.
  - The scheduler **fcoe-sched** has one forwarding class, **fcoe**.

- The **fcoe** forwarding class has a minimum guaranteed bandwidth of **2500000000 bps**, and can consume a maximum of **100 percent** of the priority group bandwidth.
- The scheduler **nl-sched** has one forwarding class, **no-loss**.
- The **no-loss** forwarding class has a minimum guaranteed bandwidth of **2000000000 bps**, and can consume a maximum of **100 percent** of the priority group bandwidth.
- The scheduler map **hpc-map** has been created and has these properties:
  - There is one scheduler, **hpc-sched**.
  - The scheduler **hpc-sched** has one forwarding class, **hpc**.
  - The **hpc** forwarding class has a minimum guaranteed bandwidth of **2000000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and uses the drop profile **dp-hpc** for low loss-priority traffic and the default drop profile for medium-high and high loss-priority traffic.

#### *Verifying That the Drop Profiles Have Been Created*

**Purpose** Verify that the drop profiles **dp-be-high**, **dp-be-low**, **dp-hpc**, and **dp-nc** have been created with the correct fill levels and drop probabilities.

**Action** List the drop profiles using the operational mode command **show configuration class-of-service drop-profiles**:

```
user@switch> show configuration class-of-service drop-profiles
dp-be-low {
    interpolate {
        fill-level [ 25 50 ];
        drop-probability [ 0 80 ];
    }
}
dp-be-high {
    interpolate {
        fill-level [ 10 40 ];
        drop-probability [ 0 100 ];
    }
}
dp-hpc {
    interpolate {
        fill-level [ 75 90 ];
        drop-probability [ 0 75 ];
    }
}
dp-nc {
    interpolate {
        fill-level [ 80 100 ];
        drop-probability [ 0 100 ];
    }
}
```

**Meaning** The **show configuration class-of-service drop-profiles** command lists the drop profiles and their properties. The command output shows that there are four drop profiles configured, **dp-be-high**, **dp-be-low**, **dp-hpc**, and **dp-nc**. The output also shows that:

- For **dp-be-low**, the drop start point (the first fill level) is when the queue is 25 percent filled, the drop end point (the second fill level) occurs when the queue is 50 percent filled, and the drop probability at the drop end point is 80 percent.
- For **dp-be-high**, the drop start point (the first fill level) is when the queue is 10 percent filled, the drop end point (the second fill level) occurs when the queue is 40 percent filled, and the drop probability at the drop end point is 100 percent.
- For **dp-hpc**, the drop start point (the first fill level) is when the queue is 75 percent filled, the drop end point (the second fill level) occurs when the queue is 90 percent filled, and the drop probability at the drop end point is 75 percent.
- For **dp-nc**, the drop start point (the first fill level) is when the queue is 80 percent filled, the drop end point (the second fill level) occurs when the queue is 100 percent filled, and the drop probability at the drop end point is 100 percent.

***Verifying That the Priority Group Output Schedulers (Traffic Control Profiles) Have Been Created***

**Purpose** Verify that the traffic control profiles **be-tcp**, **gd-tcp**, and **hpc-tcp** have been created with the correct bandwidth parameters and scheduler mapping.

**Action** List the traffic control profiles using the operational mode command **show class-of-service traffic-control-profile**:

```
user@switch> show class-of-service traffic-control-profile
Traffic control profile: be-tcp, Index: 40535
  Shaping rate: 100 percent
  Scheduler map: be-map
  Guaranteed rate: 3500000000

Traffic control profile: gd-tcp, Index: 37959
  Shaping rate: 100 percent
  Scheduler map: gd-map
  Guaranteed rate: 4500000000

Traffic control profile: hpc-tcp, Index: 47661
  Shaping rate: 100 percent
  Scheduler map: hpc-map
  Guaranteed rate: 2000000000
```

**Meaning** The **show class-of-service traffic-control-profile** command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (**traffic-control-profile**)
- The maximum port bandwidth the priority group can consume (**shaping-rate**)
- The scheduler map associated with the traffic control profile (**scheduler-map**)
- The minimum guaranteed priority group port bandwidth (**guaranteed-rate**)

The command output shows that:

- The traffic control profile **be-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **be-map**, and has a minimum guaranteed bandwidth of **3500000000 bps**.
- The traffic control profile **gd-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **gd-map**, and has a minimum guaranteed bandwidth of **4500000000 bps**.
- The traffic control profile **hpc-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **hpc-map**, and has a minimum guaranteed bandwidth of **2000000000 bps**.

### *Verifying the Interface Configuration*

**Purpose** Verify that the classifier, the congestion notification profile, and the forwarding class sets are configured on interfaces **xe-0/0/20** and **xe-0/0/21**.

**Action** List the interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20** and **show configuration class-of-service interfaces xe-0/0/21**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
forwarding-class-set {
    best-effort-gp {
        output-traffic-control-profile be-tcp;
    }
    guar-delivery-pg {
        output-traffic-control-profile gd-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
congestion-notification-profile gd_cnp;
unit 0 {
    classifiers {
        ieee-802.1 hscclassifier1;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/21
forwarding-class-set {
    best-effort-gp {
        output-traffic-control-profile be-tcp;
    }
    guar-delivery-pg {
        output-traffic-control-profile gd-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
congestion-notification-profile gd_cnp;
unit 0 {
    classifiers {
        ieee-802.1 hscclassifier1;
    }
}
```

**Meaning** The `show configuration class-of-service interfaces interface-name` command shows that each interface includes the forwarding class sets **best-effort-pg**, **guar-delivery-pg**, and **hpc-pg**, congestion notification profile **gd-cnp**, and the IEEE 802.1p classifier **hsclassifier1**.

## Example: Configuring CoS PFC for FCoE Traffic

Priority-based flow control (PFC, described in IEEE 802.1Qbb) is a link-level flow control mechanism that you apply at ingress interfaces. PFC enables you to divide traffic on one physical link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that correspond to queues (forwarding classes). Each priority is mapped to a 3-bit IEEE 802.1p CoS flag in the VLAN header.

You can selectively apply PFC to the traffic in any queue without pausing the traffic in other queues on the same link. You must apply PFC to FCoE traffic to ensure lossless transport.

To configure PFC on FCoE traffic, use the default FCoE forwarding-class-to-queue mapping and:

- Configure a classifier that associates the FCoE forwarding class with FCoE traffic.
- Configure a congestion notification profile to apply PFC to the FCoE traffic.
- Apply the classifier and the PFC configuration to ingress interfaces.
- Configure the bandwidth scheduling for the FCoE forwarding class output queue.
- Create a forwarding class set (priority group) that includes the FCoE forwarding class; this is required to configure enhanced transmission selection (ETS) and support data center bridging (DCB).
- Configure the bandwidth scheduling for the FCoE priority group.
- Apply the scheduling to the egress interfaces.

**NOTE:** If you are using Junos OS Release 12.2 or later, use the default forwarding classes for the lossless fcoe forwarding class. If you explicitly configure default lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best-effort) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

This example describes how to configure PFC for FCoE traffic:

- [Requirements on page 5988](#)
- [Overview on page 5988](#)
- [Configuration on page 5990](#)
- [Verification on page 5993](#)

---

### Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

---

### Overview

FCoE traffic requires PFC to ensure lossless packet transport. This example shows you how to:

- Assign FCoE traffic to the FCoE priority at the ingress.
- Create and apply CoS for the FCoE traffic using ETS (hierarchical port scheduling).

- Apply PFC to the FCoE traffic.
- Apply the configuration to ingress and egress interfaces.

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

Each interface in this example is configured as both an ingress interface and an egress interface, so the classifier, congestion notification profile, and port scheduling are applied to all of the interfaces.

### Topology

Table 458 on page 5607 shows the configuration components for this example.

**Table 540: Components of the PFC for FCoE Traffic Configuration Topology**

| Component   | Settings  |
|---|---|
| Hardware  | QFX3500 switch  |

Figure 195 on page 5608 shows a block diagram of the configuration components and the configuration flow of the CLI statements used in the example.

Figure 213: PFC for FCoE Traffic Configuration Components Block Diagram

### Configuration

#### CLI Quick Configuration

To quickly configure PFC for FCoE traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
[edit class-of-service]
set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
set schedulers fcoe-sched priority low transmit-rate 3g
set schedulers fcoe-sched shaping-rate percent 100
set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set forwarding-class-sets fcoe-pg class fcoe
set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate 3g
set traffic-control-profiles fcoe-tcp shaping-rate percent 100
set interfaces xe-0/0/31 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/32 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/33 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/34 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
```

#### Step-by-Step Procedure

To configure the FCoE forwarding class (priority), ingress classifier, output queue scheduling, forwarding class set (priority group) and its output port scheduling, PFC application, and interfaces to set up PFC for FCoE traffic:

1. Configure a classifier to set the loss priority and IEEE 802.1 code point assigned to the FCoE forwarding class at the ingress:
 

```
[edit class-of-service]
user@switch# set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
```
2. Configure PFC on the FCoE queue by applying FCoE to the IEEE 802.1 code point 011:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```

3. Apply the PFC configuration to the ingress interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
```

4. Assign the classifier to the ingress interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
```

5. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

6. Map the FCoE forwarding class to the FCoE scheduler:

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

7. Configure the forwarding class set for the FCoE traffic:

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```

8. Define the traffic control profile for the FCoE forwarding class set:

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```

9. Apply the FCoE forwarding class set and traffic control profile to the egress ports:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/34 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```

## Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** lossless forwarding class):

```
user@switch> show configuration class-of-service
classifiers {
```

```
ieee-802.1 fcoe-classifier {
  forwarding-class fcoe {
    loss-priority low code-points 011;
  }
}
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 3000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
}
interfaces {
  xe-0/0/31 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-classifier;
      }
    }
  }
  xe-0/0/32 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-classifier;
      }
    }
  }
  xe-0/0/33 {
```

```

congestion-notification-profile fcoe-cnp;
forwarding-class-set {
    fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
    }
}
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}
}
xe-0/0/34 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    unit 0 {
        classifiers {
            ieee-802.1 fcoe-classifier;
        }
    }
}
}
scheduler-maps {
    fcoe-map {
        forwarding-class fcoe scheduler fcoe-sched;
    }
}
schedulers {
    fcoe-sched {
        transmit-rate 3000000000;
        shaping-rate percent 100;
        priority low;
    }
}
}

```

**TIP:** To quickly configure the interfaces, issue the `load merge terminal` command and then copy the hierarchy and paste it into the switch terminal window.

## Verification

To verify that the PFC configuration for FCoE traffic components has been created and is operating properly, perform these tasks:

- [Verifying That Priority-Based Flow Control Has Been Enabled on page 5994](#)
- [Verifying the Ingress Interface PFC Configuration on page 5994](#)

### *Verifying That Priority-Based Flow Control Has Been Enabled*

**Purpose** Verify that PFC is enabled on the FCoE queue to enable lossless transport.

**Action** List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
```

```
Type: Input, Name: fcoe-cnp, Index: 51697
```

```
Cable Length: 100 m
```

| Priority | PFC      | MRU  |
|----------|----------|------|
| 000      | Disabled |      |
| 001      | Disabled |      |
| 010      | Disabled |      |
| 011      | Enabled  | 2500 |
| 100      | Disabled |      |
| 101      | Disabled |      |
| 110      | Disabled |      |
| 111      | Disabled |      |

```
Type: Output
```

| Priority | Flow-Control-Queues |
|----------|---------------------|
| 000      |                     |
|          | 0                   |
| 001      |                     |
|          | 1                   |
| 010      |                     |
|          | 2                   |
| 011      |                     |
|          | 3                   |
| 100      |                     |
|          | 4                   |
| 101      |                     |
|          | 5                   |
| 110      |                     |
|          | 6                   |
| 111      |                     |
|          | 7                   |

**Meaning** The **show class-of-service congestion-notification** operational command lists all of the congestion notification profiles and which IEEE 802.1p code points have PFC enabled. The command output shows that PFC is enabled on code point **011** for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

### *Verifying the Ingress Interface PFC Configuration*

**Purpose** Verify that the classifier **fcoe-classifier** and the congestion notification profile **fcoe-cnp** are configured on ingress interfaces **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, and **xe-0/0/34**.

**Action** List the ingress interfaces using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
```

```

congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/33
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/34
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

```

**Meaning** The `show configuration class-of-service interfaces` commands list the congestion notification profile that is mapped to the interface (**fcoe-cnp**) and the IEEE 802.1p classifier associated with the interface (**fcoe-classifier**).

### Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG

Multichassis link aggregation groups (MC-LAGs) provide redundancy and load balancing between two switches, multihoming support for client devices such as servers, and a loop-free Layer 2 network without running Spanning Tree Protocol (STP).

**NOTE:** This example uses Junos OS without support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG” on page 5614](#).

You can use an MC-LAG to provide a redundant aggregation layer for Fibre Channel over Ethernet (FCoE) traffic in an *inverted-U* topology. To support lossless transport of FCoE traffic across an MC-LAG, you must configure the appropriate class of service (CoS) on both of the switches with MC-LAG port members. The CoS configuration must be the same on both of the MC-LAG switches because an MC-LAG does not carry forwarding class and IEEE 802.1p priority information.

**NOTE:** This example describes how to configure CoS to provide lossless transport for FCoE traffic across an MC-LAG that connects two switches. It also describes how to configure CoS on the FCoE transit switches that connect FCoE hosts to the two switches that form the MC-LAG.

This example does *not* describe how to configure the MC-LAG itself. For a detailed example of MC-LAG configuration, see [“Example: Configuring Multichassis Link Aggregation” on page 2471](#). However, this example includes a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

Ports that are part of an FCoE-FC gateway configuration (a virtual FCoE-FC gateway fabric) do not support MC-LAGs. Ports that are members of an MC-LAG act as FCoE passthrough transit switch ports.

QFX Series switches and EX4600 switches support MC-LAGs. QFabric system Node devices do not support MC-LAGs.

This topic describes:

- [Requirements on page 5996](#)
- [Overview on page 5997](#)
- [Configuration on page 6002](#)
- [Verification on page 6010](#)

---

## Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX3500 Switches that form an MC-LAG for FCoE traffic.
- Two Juniper Networks QFX3500 Switches that provide FCoE server access in transit switch mode and that connect to the MC-LAG switches. These switches can be standalone QFX3500 switches or they can be Node devices in a QFabric system.
- FCoE servers (or other FCoE hosts) connected to the transit switches.
- Junos OS Release 12.2 or later for the QFX Series.

## Overview

FCoE traffic requires lossless transport. This example shows you how to:

- Configure CoS for FCoE traffic on the two QFX3500 switches that form the MC-LAG, including priority-based flow control (PFC) and enhanced transmission selection (ETS; hierarchical scheduling of resources for the FCoE forwarding class priority and for the forwarding class set priority group).

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- Configure CoS for FCoE on the two FCoE transit switches that connect FCoE hosts to the MC-LAG switches and enable FIP snooping on the FCoE VLAN at the FCoE transit switch access ports.
- Disable IGMP snooping on the FCoE VLAN.

**NOTE:** This is only necessary if IGMP snooping is enabled on the VLAN. Before Junos OS Release 13.2, IGMP snooping was enabled by default on VLANs. Beginning with Junos OS Release 13.2, IGMP snooping is enabled by default only on the default VLAN.

- Configure the appropriate port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

## Topology

Switches that act as transit switches support MC-LAGs for FCoE traffic in an inverted-U network topology, as shown in [Figure 196 on page 5616](#).

Figure 214: Supported Topology for an MC-LAG on an FCoE Transit Switch

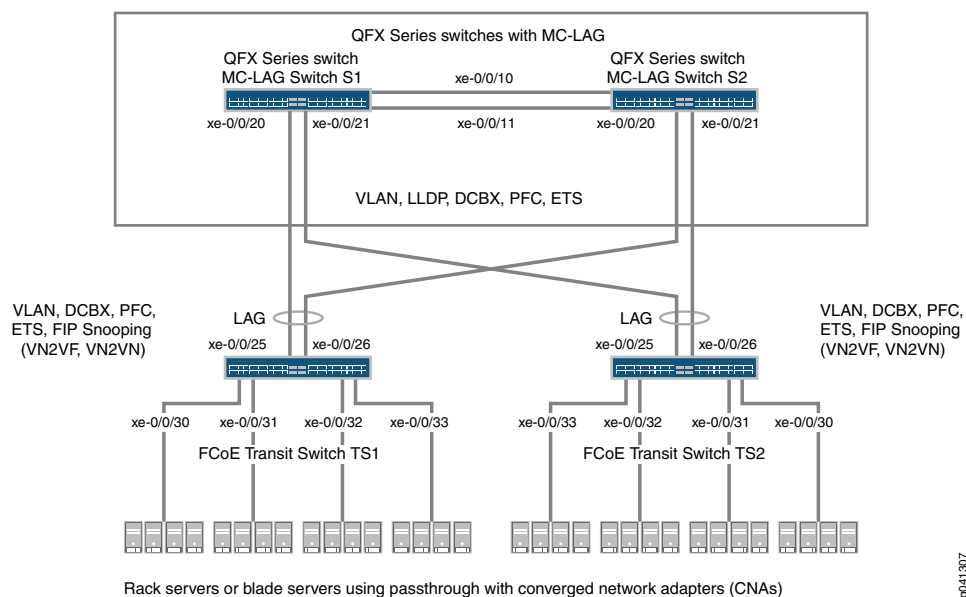

Table 459 on page 5616 shows the configuration components for this example.

Table 541: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology

| Component  | Settings   |
|--|--|
| Hardware   | Four QFX3500 switches (two to form the MC-LAG as passthrough transit switches and two transit switches for FCoE access). |
| Forwarding class (all switches)  | Default <b>fcoe</b> forwarding class.  |
| Classifier (forwarding class mapping of incoming traffic to IEEE priority) | Default IEEE 802.1p trusted classifier on all FCoE interfaces.   |

| FIP snooping                                       | Enable FIP snooping on Transit Switches TS1 and TS2 on the FCoE VLAN. Configure the LAG interfaces that connect to the MC-LAG switches as FCoE trusted interfaces so that they do not perform FIP snooping.<br><br>This example enables VN2VN_Port FIP snooping on the FCoE transit switch interfaces connected to the FCoE servers. The example is equally valid with VN2VF_Port FIP snooping enabled on the transit switch access ports. The method of FIP snooping you enable depends on your network configuration. |

**NOTE:** This example uses the default IEEE 802.1p trusted BA classifier, which is automatically applied to trunk mode and tagged access mode ports if you do not apply an explicitly configured classifier.

To configure CoS for FCoE traffic across an MC-LAG:

- Use the default FCoE forwarding class and forwarding-class-to-queue mapping (do not explicitly configure the FCoE forwarding class or output queue). The default FCoE forwarding class is **fcoe**, and the default output queue is queue 3.

**NOTE:** In Junos OS Release 12.2, traffic mapped to explicitly configured forwarding classes, even lossless forwarding classes such as **fcoe**, is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment. To receive lossless treatment in Release 12.2, traffic must use one of the default lossless forwarding classes (**fcoe** or **no-loss**).

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in the explicit forwarding class configuration to configure a lossless forwarding class.

- Use the default trusted BA classifier, which maps incoming packets to forwarding classes by the IEEE 802.1p code point (CoS priority) of the packet. The trusted classifier is the default classifier for interfaces in trunk and tagged-access port modes. The default trusted classifier maps incoming packets with the IEEE 802.1p code point 3 (011) to the FCoE forwarding class. If you choose to configure the BA classifier instead of using the default classifier, you must ensure that FCoE traffic is classified into forwarding classes in exactly the same way on both MC-LAG switches. Using the default classifier ensures consistent classifier configuration on the MC-LAG ports.
- Configure a congestion notification profile that enables PFC on the FCoE code point (code point 011 in this example). The congestion notification profile configuration must be the same on both MC-LAG switches.
- Apply the congestion notification profile to the interfaces.
- Configure enhanced transmission selection (ETS, also known as hierarchical scheduling) on the interfaces to provide the bandwidth required for lossless FCoE transport. Configuring ETS includes configuring bandwidth scheduling for the FCoE forwarding class, a forwarding class set (priority group) that includes the FCoE forwarding class, and a traffic control profile to assign bandwidth to the forwarding class set that includes FCoE traffic.
- Apply the ETS scheduling to the interfaces.
- Configure the port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

In addition, this example describes how to enable FIP snooping on the Transit Switch TS1 and TS2 ports that are connected to the FCoE servers and how to disable IGMP snooping on the FCoE VLAN. To provide secure access, FIP snooping must be enabled on the FCoE access ports.

This example focuses on the CoS configuration to support lossless FCoE transport across an MC-LAG. This example does not describe how to configure the properties of MC-LAGs and LAGs, although it does show you how to configure the port characteristics required

to support lossless transport and how to assign interfaces to the MC-LAG and to the LAGs.

Before you configure CoS, configure:

- The MC-LAGs that connect Switches S1 and S2 to Switches TS1 and TS2. ([“Example: Configuring Multichassis Link Aggregation” on page 2471](#) describes how to configure MC-LAGs.)
- The LAGs that connect the Transit Switches TS1 and TS2 to MC-LAG Switches S1 and S2. ([“Configuring Link Aggregation” on page 2593](#) describes how to configure LAGs.)
- The LAG that connects Switch S1 to Switch S2.

### Configuration

---

To configure CoS for lossless FCoE transport across an MC-LAG, perform these tasks:

- [Configuring MC-LAG Switches S1 and S2 on page 6004](#)
- [Configuring FCoE Transit Switches TS1 and TS2 on page 6005](#)
- [Results on page 6007](#)

#### CLI Quick Configuration

To quickly configure CoS for lossless FCoE transport across an MC-LAG, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI for MC-LAG Switch S1 and MC-LAG Switch S2 at the **[edit]** hierarchy level. The configurations on Switches S1 and S2 are identical because the CoS configuration must be identical, and because this example uses the same ports on both switches.

#### Switch S1 and Switch S2

```
set class-of-service schedulers fcoe-sched priority low transmit-rate 3g
set class-of-service schedulers fcoe-sched shaping-rate percent 100
set class-of-service scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set class-of-service forwarding-class-sets fcoe-pg class fcoe
set class-of-service traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate 3g
set class-of-service traffic-control-profiles fcoe-tcp shaping-rate percent 100
set class-of-service interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set class-of-service interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set class-of-service congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set class-of-service interfaces ae0 congestion-notification-profile fcoe-cnp
set class-of-service interfaces ae1 congestion-notification-profile fcoe-cnp
set vlans fcoe_vlan vlan-id 100
set protocols igmp-snooping vlan fcoe_vlan disable
set interfaces xe-0/0/10 ether-options 802.3ad ae0
set interfaces xe-0/0/11 ether-options 802.3ad ae0
set interfaces xe-0/0/20 ether-options 802.3ad ae1
set interfaces xe-0/0/21 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk vlan members fcoe_vlan
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan members fcoe_vlan
set interfaces ae0 mtu 2180
set interfaces ae1 mtu 2180
```

```
set ethernet-switching-options secure-access-port interface ae0 fcoe-trusted
set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

To quickly configure CoS for lossless FCoE transport across an MC-LAG, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI for Transit Switch TS1 and Transit Switch TS2 at the **[edit]** hierarchy level. The configurations on Switches TS1 and TS2 are identical because the CoS configuration must be identical, and because this example uses the same ports on both switches.

## Switch TS1 and Switch TS2

```

beacon-period 90000
```

### *Configuring MC-LAG Switches S1 and S2*

**Step-by-Step Procedure** To configure CoS resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG and MC-LAG interface membership and characteristics to support lossless FCoE transport across an MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:  

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```
2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):  

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```
3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:  

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```
4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:  

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```
5. Apply the FCoE forwarding class set and traffic control profile to the LAG and MC-LAG interfaces:  

```
[edit class-of-service]
user@switch# set interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
```
6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:  

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```
7. Apply the PFC configuration to the LAG and MC-LAG interfaces:  

```
[edit class-of-service]
user@switch# set interfaces ae0 congestion-notification-profile fcoe-cnp
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
```
8. Configure the VLAN for FCoE traffic (**fcoe\_vlan**):  

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```
9. Disable IGMP snooping on the FCoE VLAN:  

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```

10. Add the member interfaces to the LAG between the two MC-LAG switches:

```
[edit interfaces]
user@switch# set xe-0/0/10 ether-options 802.3ad ae0
user@switch# set xe-0/0/11 ether-options 802.3ad ae0
```

11. Add the member interfaces to the MC-LAG:

```
[edit interfaces]
user@switch# set xe-0/0/20 ether-options 802.3ad ae1
user@switch# set xe-0/0/21 ether-options 802.3ad ae1
```

12. Configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe\_vlan**) for the LAG (**ae0**) and for the MC-LAG (**ae1**):

```
[edit interfaces]
user@switch# set interfaces ae0 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and MC-LAG interfaces. 2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes:

```
[edit interfaces]
user@switch# set ae0 mtu 2180
user@switch# set ae1 mtu 2180
```

14. Set the LAG and MC-LAG interfaces as FCoE trusted ports. Ports that connect to other switches should be trusted and should not perform FIP snooping:

```
[edit]
user@switch# set ethernet-switching-options secure-access-port interface ae0 fcoe-trusted
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

### *Configuring FCoE Transit Switches TS1 and TS2*

#### **Step-by-Step Procedure**

The CoS configuration on FCoE Transit Switches TS1 and TS2 is similar to the CoS configuration on MC-LAG Switches S1 and S2. However, the port configurations differ, and you must enable FIP snooping on the Switch TS1 and Switch TS2 FCoE access ports.

To configure resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG interface membership and characteristics to support lossless FCoE transport across the MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:

- ```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```
4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:
 

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```
  5. Apply the FCoE forwarding class set and traffic control profile to the LAG interface and to the FCoE access interfaces:
 

```
[edit class-of-service]
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/30 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```
  6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point 011:
 

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```
  7. Apply the PFC configuration to the LAG interface and to the FCoE access interfaces:
 

```
[edit class-of-service]
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/30 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/31 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/32 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/33 congestion-notification-profile
fcoe-cnp
```
  8. Configure the VLAN for FCoE traffic (**fcoe\_vlan**):
 

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```
  9. Disable IGMP snooping on the FCoE VLAN:
 

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```
  10. Add the member interfaces to the LAG:
 

```
[edit interfaces]
user@switch# set xe-0/0/25 ether-options 802.3ad ae1
user@switch# set xe-0/0/26 ether-options 802.3ad ae1
```
  11. On the LAG (**ae1**), configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe\_vlan**):

```
[edit interfaces]
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
```

12. On the FCoE access interfaces (xe-0/0/30, xe-0/0/31, xe-0/0/32, xe-0/0/33), configure the port mode as **tagged-access** and membership in the FCoE VLAN (**fcoe\_vlan**):

```
[edit interfaces]
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/32 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/33 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and FCoE access interfaces. 2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes:

```
[edit interfaces]
user@switch# set ae1 mtu 2180
user@switch# set xe-0/0/30 mtu 2180
user@switch# set xe-0/0/31 mtu 2180
user@switch# set xe-0/0/32 mtu 2180
user@switch# set xe-0/0/33 mtu 2180
```

14. Set the LAG interface as an FCoE trusted port. Ports that connect to other switches should be trusted and should not perform FIP snooping:

```
[edit]
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

**NOTE:** Access ports xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33 are not configured as FCoE trusted ports. The access ports remain in the default state as untrusted ports because they connect directly to FCoE devices and must perform FIP snooping to ensure network security.

15. Enable FIP snooping on the FCoE VLAN to prevent unauthorized FCoE network access (this example uses VN2VN\_Port FIP snooping; the example is equally valid if you use VN2VF\_Port FIP snooping):

```
[edit]
user@switch# set ethernet-switching-options secure-access-port vlan fcoe_vlan
examine-fip examine-vn2vn beacon-period 90000
```

### Results

Display the results of the CoS configuration on MC-LAG Switch S1 and on MC-LAG Switch S2 (the results on both switches are the same):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
```

```
fcoe-tcp {
  scheduler-map fcoe-map;
  shaping-rate percent 100;
  guaranteed-rate 3000000000;
}
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
}
interfaces {
  ae0 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
  ae1 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
}
scheduler-maps {
  fcoe-map {
    forwarding-class fcoe scheduler fcoe-sched;
  }
}
schedulers {
  fcoe-sched {
    transmit-rate 3000000000;
    shaping-rate percent 100;
    priority low;
  }
}
```

**NOTE:** The forwarding class and classifier configurations are not shown because the show command does not display default portions of the configuration.

For MC-LAG verification commands, see [“Example: Configuring Multichassis Link Aggregation” on page 2471](#).

Display the results of the CoS configuration on FCoE Transit Switch TS1 and on FCoE Transit Switch TS2 (the results on both transit switches are the same):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 30000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
interfaces {
  xe-0/0/30 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
  xe-0/0/31 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
  xe-0/0/32 {
```

```
forwarding-class-set {
  fcoe-pg {
    output-traffic-control-profile fcoe-tcp;
  }
}
congestion-notification-profile fcoe-cnp;
}
xe-0/0/33 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
ae1 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
}
scheduler-maps {
  fcoe-map {
    forwarding-class fcoe scheduler fcoe-sched;
  }
}
schedulers {
  fcoe-sched {
    transmit-rate 3000000000;
    shaping-rate percent 100;
    priority low;
  }
}
```

**NOTE:** The forwarding class and classifier configurations are not shown because the `show` command does not display default portions of the configuration.

---

## Verification

---

To verify that the CoS components and FIP snooping have been configured and are operating properly, perform these tasks. Because this example uses the default **fcoe** forwarding class and the default IEEE 802.1p trusted classifier, the verification of those configurations is not shown:

- [Verifying That the Output Queue Schedulers Have Been Created on page 6011](#)
- [Verifying That the Priority Group Output Scheduler \(Traffic Control Profile\) Has Been Created on page 6012](#)

- [Verifying That the Forwarding Class Set \(Priority Group\) Has Been Created on page 6012](#)
- [Verifying That Priority-Based Flow Control Has Been Enabled on page 6012](#)
- [Verifying That the Interface Class of Service Configuration Has Been Created on page 6013](#)
- [Verifying That the Interfaces Are Correctly Configured on page 6015](#)
- [Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces on page 6017](#)
- [Verifying That the FIP Snooping Mode Is Correct on FCoE Transit Switches TS1 and TS2 on page 6018](#)
- [Verifying That IGMP Snooping Is Disabled on the FCoE VLAN on page 6019](#)

### ***Verifying That the Output Queue Schedulers Have Been Created***

**Purpose** Verify that the output queue scheduler for FCoE traffic has the correct bandwidth parameters and priorities, and is mapped to the correct forwarding class (output queue). Queue scheduler verification is the same on each of the four switches.

**Action** List the scheduler map using the operational mode command **show class-of-service scheduler-map fcoe-map**:

```
user@switch> show class-of-service scheduler-map fcoe-map
Scheduler map: fcoe-map, Index: 9023
```

```
Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289
  Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
  Buffer Limit: none, Priority: low
  Excess Priority: unspecified
  Shaping rate: 100 percent,
  drop-profile-map-set-type: mark
  Drop profiles:
    Loss priority  Protocol  Index  Name
    Low            any        1      <default-drop-profile>
    Medium high    any        1      <default-drop-profile>
    High           any        1      <default-drop-profile>
```

**Meaning** The **show class-of-service scheduler-map fcoe-map** command lists the properties of the scheduler map **fcoe-map**. The command output includes:

- The name of the scheduler map (**fcoe-map**)
- The name of the scheduler (**fcoe-sched**)
- The forwarding classes mapped to the scheduler (**fcoe**)
- The minimum guaranteed queue bandwidth (transmit rate **3000000000 bps**)
- The scheduling priority (**low**)
- The maximum bandwidth in the priority group the queue can consume (shaping rate **100 percent**)
- The drop profile loss priority for each drop profile name. This example does not include drop profiles because you do not apply drop profiles to FCoE traffic.

***Verifying That the Priority Group Output Scheduler (Traffic Control Profile) Has Been Created***

**Purpose** Verify that the traffic control profile **fcoe-tcp** has been created with the correct bandwidth parameters and scheduler mapping. Priority group scheduler verification is the same on each of the four switches.

**Action** List the FCoE traffic control profile properties using the operational mode command **show class-of-service traffic-control-profile fcoe-tcp**:

```
user@switch> show class-of-service traffic-control-profile fcoe-tcp
Traffic control profile: fcoe-tcp, Index: 18303
  Shaping rate: 100 percent
  Scheduler map: fcoe-map
  Guaranteed rate: 3000000000
```

**Meaning** The **show class-of-service traffic-control-profile fcoe-tcp** command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (**fcoe-tcp**)
- The maximum port bandwidth the priority group can consume (shaping rate **100 percent**)
- The scheduler map associated with the traffic control profile (**fcoe-map**)
- The minimum guaranteed priority group port bandwidth (guaranteed rate **3000000000** in bps)

***Verifying That the Forwarding Class Set (Priority Group) Has Been Created***

**Purpose** Verify that the FCoE priority group has been created and that the **fcoe** priority (forwarding class) belongs to the FCoE priority group. Forwarding class set verification is the same on each of the four switches.

**Action** List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set fcoe-pg**:

```
user@switch> show class-of-service forwarding-class-set fcoe-pg
Forwarding class set: fcoe-pg, Type: normal-type, Forwarding class set index:
31420
  Forwarding class          Index
  fcoe                      1
```

**Meaning** The **show class-of-service forwarding-class-set fcoe-pg** command lists all of the forwarding classes (priorities) that belong to the **fcoe-pg** priority group, and the internal index number of the priority group. The command output shows that the forwarding class set **fcoe-pg** includes the forwarding class **fcoe**.

***Verifying That Priority-Based Flow Control Has Been Enabled***

**Purpose** Verify that PFC is enabled on the FCoE code point. PFC verification is the same on each of the four switches.

**Action** List the FCoE congestion notification profile using the operational mode command **show class-of-service congestion-notification fcoe-cnp**:

```
user@switch> show class-of-service congestion-notification fcoe-cnp
Type: Input, Name: fcoe-cnp, Index: 6879
Cable Length: 100 m
  Priority    PFC      MRU
  000        Disabled
  001        Disabled
  010        Disabled
  011        Enabled    2500
  100        Disabled
  101        Disabled
  110        Disabled
  111        Disabled
Type: Output
  Priority    Flow-Control-Queues
  000
  001        0
  010        1
  011        2
  100        3
  101        4
  110        5
  111        6
  111        7
```

**Meaning** The **show class-of-service congestion-notification fcoe-cnp** command lists all of the IEEE 802.1p code points in the congestion notification profile that have PFC enabled. The command output shows that PFC is enabled on code point **011** (**fcoe** queue) for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

#### *Verifying That the Interface Class of Service Configuration Has Been Created*

**Purpose** Verify that the CoS properties of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches TS1 and TS2.

**Action** List the interface CoS configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
ae0 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
```

```
    }  
  }  
  congestion-notification-profile fcoe-cnp;  
}  
  
ae1 {  
  forwarding-class-set {  
    fcoe-pg {  
      output-traffic-control-profile fcoe-tcp;  
    }  
  }  
  congestion-notification-profile fcoe-cnp;  
}
```

List the interface CoS configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces  
xe-0/0/30 {  
  forwarding-class-set {  
    fcoe-pg {  
      output-traffic-control-profile fcoe-tcp;  
    }  
  }  
  congestion-notification-profile fcoe-cnp;  
}  
xe-0/0/31 {  
  forwarding-class-set {  
    fcoe-pg {  
      output-traffic-control-profile fcoe-tcp;  
    }  
  }  
  congestion-notification-profile fcoe-cnp;  
}  
xe-0/0/32 {  
  forwarding-class-set {  
    fcoe-pg {  
      output-traffic-control-profile fcoe-tcp;  
    }  
  }  
  congestion-notification-profile fcoe-cnp;  
}  
xe-0/0/33 {  
  forwarding-class-set {  
    fcoe-pg {  
      output-traffic-control-profile fcoe-tcp;  
    }  
  }  
  congestion-notification-profile fcoe-cnp;  
}  
ae1 {  
  forwarding-class-set {  
    fcoe-pg {  
      output-traffic-control-profile fcoe-tcp;  
    }  
  }  
  congestion-notification-profile fcoe-cnp;  
}
```

**Meaning** The **show configuration class-of-service interfaces** command lists the class of service configuration for all interfaces. For each interface, the command output includes:

- The name of the interface (for example, **ae0** or **xe-0/0/30**)
- The name of the forwarding class set associated with the interface (**fcoe-pg**)
- The name of the traffic control profile associated with the interface (output traffic control profile, **fcoe-tcp**)
- The name of the congestion notification profile associated with the interface (**fcoe-cnp**)

**NOTE:** Interfaces that are members of a LAG are not shown individually. The LAG or MC-LAG CoS configuration is applied to all interfaces that are members of the LAG or MC-LAG. For example, the interface CoS configuration output on MC-LAG Switches S1 and S2 shows the LAG CoS configuration but does not show the CoS configuration of the member interfaces separately. The interface CoS configuration output on FCoE Transit Switches TS1 and TS2 shows the LAG CoS configuration but also shows the configuration for interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33**, which are not members of a LAG.

#### *Verifying That the Interfaces Are Correctly Configured*

**Purpose** Verify that the LAG membership, MTU, VLAN membership, and port mode of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches T1 and T2.

**Action** List the interface configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
xe-0/0/10 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/11 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/20 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/21 {
    ether-options {
        802.3ad ae1;
    }
}
```

```
ae0 {
  mtu 2180;
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members fcoe_vlan;
      }
    }
  }
}
ae1 {
  mtu 2180;
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members fcoe_vlan;
      }
    }
  }
}
```

List the interface configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
xe-0/0/25 {
  ether-options {
    802.3ad ae1;
  }
}
xe-0/0/26 {
  ether-options {
    802.3ad ae1;
  }
}
xe-0/0/30 {
  mtu 2180;
  unit 0 {
    family ethernet-switching {
      port-mode tagged-access;
      vlan {
        members fcoe_vlan;
      }
    }
  }
}
xe-0/0/31 {
  mtu 2180;
  unit 0 {
    family ethernet-switching {
      port-mode tagged-access;
      vlan {
        members fcoe_vlan;
      }
    }
  }
}
xe-0/0/32 {
```

```

mtu 2180;
unit 0 {
    family ethernet-switching {
        port-mode tagged-access;
        vlan {
            members fcoe_vlan;
        }
    }
}
xe-0/0/33 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
ae1 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}

```

**Meaning** The **show configuration interfaces** command lists the configuration of each interface by interface name.

For each interface that is a member of a LAG, the command lists only the name of the LAG to which the interface belongs.

For each LAG interface and for each interface that is not a member of a LAG, the command output includes:

- The MTU (**2180**)
- The unit number of the interface (**0**)
- The port mode (**trunk** mode for interfaces that connect two switches, **tagged-access** mode for interfaces that connect to FCoE hosts)
- The name of the VLAN in which the interface is a member (**fcoe\_vlan**)

***Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces***

**Purpose** Verify that FIP snooping is enabled on the FCoE VLAN access interfaces. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches

TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Transit Switch TS1 and TS2 FCoE access ports.

**Action** List the port security configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration ethernet-switching-options secure-access-port**:

```
user@switch> show configuration ethernet-switching-options secure-access-port
interface ae1.0 {
    fcoe-trusted;
}
vlan fcoe_vlan {
    examine-fip {
        examine-vn2vn {
            beacon-period 90000;
        }
    }
}
```

**Meaning** The **show configuration ethernet-switching-options secure-access-port** command lists port security information, including whether a port is trusted. The command output shows that:

- LAG port **ae1.0**, which connects the FCoE transit switch to the MC-LAG switches, is configured as an FCoE trusted interface. FIP snooping is not performed on the member interfaces of the LAG (**xe-0/0/25** and **xe-0/0/26**).
- FIP snooping is enabled (**examine-fip**) on the FCoE VLAN (**fcoe\_vlan**), the type of FIP snooping is VN2VN\_Port FIP snooping (**examine-vn2vn**) and the beacon period is set to 90000 milliseconds. On Transit Switches TS1 and TS2, all interface members of the FCoE VLAN perform FIP snooping unless the interface is configured as FCoE trusted. On Transit Switches TS1 and TS2, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** perform FIP snooping because they are not configured as FCoE trusted. The interface members of LAG **ae1** (**xe-0/0/25** and **xe-0/0/26**) do not perform FIP snooping because the LAG is configured as FCoE trusted.

#### ***Verifying That the FIP Snooping Mode Is Correct on FCoE Transit Switches TS1 and TS2***

**Purpose** Verify that the FIP snooping mode is correct on the FCoE VLAN. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Transit Switch TS1 and TS2 FCoE access ports.

**Action** List the FIP snooping configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show fip snooping brief**:

```
user@switch> show fip snooping brief
VLAN: fcoe_vlan,      Mode: VN2VN Snooping
FC-MAP: 0e:fd:00
...
```

**NOTE:** The output has been truncated to show only the relevant information.

**Meaning** The **show fip snooping brief** command lists FIP snooping information, including the FIP snooping VLAN and the FIP snooping mode. The command output shows that:

- The VLAN on which FIP snooping is enabled is **fcoe\_vlan**
- The FIP snooping mode is VN2VN\_Port FIP snooping (**VN2VN Snooping**)

#### *Verifying That IGMP Snooping Is Disabled on the FCoE VLAN*

**Purpose** Verify that IGMP snooping is disabled on the FCoE VLAN on all four switches.

**Action** List the IGMP snooping protocol information on each of the four switches using the **show configuration protocols igmp-snooping** command:

```
user@switch> show configuration protocols igmp-snooping
vlan fcoe_vlan {
    disable;
}
```

**Meaning** The **show configuration protocols igmp-snooping** command lists the IGMP snooping configuration for the VLANs configured on the switch. The command output shows that IGMP snooping is disabled on the FCoE VLAN (**fcoe\_vlan**).

### **Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch)**

The default system configuration supports FCoE traffic on priority 3 (IEEE 802.1p code point 011). If the FCoE traffic on your converged Ethernet network uses priority 3, the only user configuration required for lossless transport is to enable PFC on code point 011 on the FCoE ingress interfaces.

However, if your network uses a different priority than 3 for FCoE traffic, you need to configure lossless FCoE transport on that priority. This example shows you how to

configure lossless FCoE transport on a converged Ethernet network that uses priority 5 (IEEE 802.1p code point 101) for FCoE traffic instead of using priority 3.

- [Requirements on page 6020](#)
- [Overview on page 6020](#)
- [Configuration on page 6022](#)
- [Verification on page 6024](#)

---

## Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

---

## Overview

Although FCoE traffic typically uses IEEE 802.1p priority 3 on converged Ethernet networks, some networks use a different priority for FCoE traffic. Regardless of the priority used, FCoE traffic must receive lossless treatment. Supporting lossless behavior for FCoE traffic when your network does not use priority 3 requires configuring:

- A lossless forwarding class for FCoE traffic.
- A behavior aggregate (BA) classifier to map the FCoE forwarding class to the appropriate IEEE 802.1p priority.
- A congestion notification profile (CNP) to enable PFC on the FCoE code point at the interface ingress and to configure flow control on the interface egress. Flow control on the interface egress enables the interface to respond to PFC messages received from the connected peer and pause the correct IEEE 802.1p priority on the correct output queue.

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

---

- A DCBX application and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priority. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNP, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that

the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

### Topology

This example shows how to configure one lossless FCoE traffic class, map it to a priority other than priority 3, and configure flow control to ensure lossless behavior on the interfaces. This example uses two Ethernet interfaces, xe-0/0/25 and xe-0/0/26. The interfaces connect to a converged Ethernet network that uses IEEE 802.1p priority 5 (code point 101) for FCoE traffic.

The configuration on the two interfaces is the same. Both interfaces use the same explicitly configured lossless FCoE forwarding class and the same ingress classifier. Both interfaces enable PFC on priority 5 and enable flow control on the same output queue (which is mapped to the lossless FCoE forwarding class).

Table 542 on page 6021 shows the configuration components for this example.

**Table 542: Components of the Configuration Topology for FCoE Traffic That Does Not Use Priority 3**

Component	Settings
Hardware	QFX3500 switch
Forwarding class	Name— <b>fcoe1</b>  Queue mapping—queue 5  Packet drop attribute— <b>no-loss</b>  <b>NOTE:</b> A lossless forwarding class can be mapped to any output queue. However, because the <b>fcoe1</b> forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.
BA classifier	Name— <b>fcoe_p5</b>  FCoE priority mapping—Forwarding class <b>fcoe1</b> mapped to code point <b>101</b> (IEEE 802.1p priority 5) and a packet loss priority of <b>low</b> .

**Table 542: Components of the Configuration Topology for FCoE Traffic That Does Not Use Priority 3 (continued)**

Component	Settings
PFC configuration (CNPs)	CNP name— <b>fcoe_p5_cnp</b>  Input CNP code point— <b>101</b>  MRU— <b>2240</b> bytes  Cable length— <b>100</b> meters  Output CNP code point— <b>101</b>  Output CNP flow control queue— <b>5</b>  <b>NOTE:</b> When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.
DCBX application mapping	Application name— <b>fcoe_p5_app</b>  Application EtherType— <b>0x8906</b>  Application map name— <b>fcoe_p5_app_map</b>  Application map code points— <b>101</b>  <b>NOTE:</b> LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

### Configuration

#### CLI Quick Configuration

To quickly configure a lossless FCoE forwarding class that uses a different priority than IEEE 802.1p priority 3 for FCoE traffic on an FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service interfaces xe-0/0/25 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service interfaces xe-0/0/26 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 101
pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p5_cnp input cable-length 100
```

```

set class-of-service congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
set class-of-service interfaces xe-0/0/25 congestion-notification-profile fcoe_p5_cnp
set class-of-service interfaces xe-0/0/26 congestion-notification-profile fcoe_p5_cnp
set applications application fcoe_p5_app ether-type 0x8906
set policy-options application-maps fcoe_p5_app_map application fcoe_p5_app code-points 101
set protocols dcbx interface xe-0/0/25 application-map fcoe_p5_app_map
set protocols dcbx interface xe-0/0/26 application-map fcoe_p5_app_map

```

### *Configuring A Lossless FCoE Forwarding Class On IEEE 802.1p Priority 5*

#### **Step-by-Step Procedure**

To configure a lossless forwarding class for FCoE traffic on IEEE 802.1p priority 5 (code point 101), classify FCoE traffic into the lossless forwarding class, configure a congestion notification profile to enable PFC on the FCoE priority and output queue, and configure DCBX application protocol TLV exchange for traffic on the FCoE priority:

1. Configure the lossless forwarding class (named **fcoe1** and mapped to output queue **5**) for FCoE traffic on IEEE 802.1p priority 5:

```

[edit class-of-service]
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss

```

2. Configure the ingress classifier (**fcoe\_p5**). The classifier maps the FCoE priority (code point 101) to the lossless FCoE forwarding class **fcoe1**:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low code-points
101

```

3. Apply the classifier to interfaces **xe-0/0/25** and **xe-0/0/26**:

```

[edit class-of-service]
user@switch# set interfaces xe-0/0/25 unit 0 classifiers ieee-802.1 fcoe_p5
user@switch# set interfaces xe-0/0/26 unit 0 classifiers ieee-802.1 fcoe_p5

```

4. Configure the CNP. The input stanza enables PFC on the FCoE priority (IEEE 802.1p code point 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queue 5 on the FCoE priority:

```

[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5

```

5. Apply the CNP to the interfaces:

```

[edit class-of-service]
user@switch# set interfaces xe-0/0/25 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/26 congestion-notification-profile fcoe_p5_cnp

```

6. Configure the DCBX application for FCoE to map to the Ethernet interfaces, so that DCBX can exchange application protocol TLVs on the IEEE 802.1p priority 5 instead of on the default priority 3:

```

[edit]
user@switch# set applications application fcoe_p5_app ether-type 0x8906

```

7. Configure a DCBX application map to map the FCoE application to the correct IEEE 802.1p FCoE priority:

```
[edit]
user@switch# set policy-options application-maps fcoe_p5_app_map application
fcoe_p5_app code-points 101
```

8. Apply the application map to the Ethernet interfaces so that DCBX exchanges FCoE application TLVs on the correct code point:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/25 application-map fcoe_p5_app_map
user@switch# set protocols dcbx interface xe-0/0/26 application-map fcoe_p5_app_map
```

### Verification

To verify the configuration and proper operation of the lossless forwarding class and IEEE 802.1p priority, perform these tasks:

- [Verifying the Forwarding Class Configuration on page 6024](#)
- [Verifying the Behavior Aggregate Classifier Configuration on page 6025](#)
- [Verifying the PFC Flow Control Configuration \(CNP\) on page 6025](#)
- [Verifying the Interface Configuration on page 6026](#)
- [Verifying the DCBX Application Configuration on page 6026](#)
- [Verifying the DCBX Application Map Configuration on page 6026](#)
- [Verifying the DCBX Application Protocol Exchange Interface Configuration on page 6027](#)

#### Verifying the Forwarding Class Configuration

**Purpose** Verify that the lossless forwarding class **fcoe1** has been created.

**Action** Show the forwarding class configuration by using the operational command **show class-of-service forwarding-class**:

```
user@switch# show class-of-service forwarding-class
```

Forwarding class	ID	Queue	Policing priority	No-Loss
best-effort	0	0	normal	Disabled
fcoe	1	3	normal	Enabled
no-loss	2	4	normal	Enabled
network-control	3	7	normal	Disabled
fcoe1	4	5	normal	Enabled
mcast	8	8	normal	Disabled

**Meaning** The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue 5 with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

#### *Verifying the Behavior Aggregate Classifier Configuration*

**Purpose** Verify that the classifier maps the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

**Action** List the classifier configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_p5, Code point type: ieee-802.1, Index: 63065
  Code point      Forwarding class      Loss priority
  101             fcoe1                     low
```

**Meaning** The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier.

Classifier **fcoe\_p5** maps code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**, and all other priorities to the **best-effort** forwarding class with a packet loss priority of **high**.

#### *Verifying the PFC Flow Control Configuration (CNP)*

**Purpose** Verify that PFC is enabled on the correct input priority and that flow control is configured on the correct output queue in the CNP.

**Action** Display the congestion notification profile using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_p5_cnp, Index: 12137
Type: Input
Cable Length: 100 m
  Priority      PFC      MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled    2240
  110          Disabled
  111          Disabled
Type: Output
  Priority      Flow-Control-Queues
  101
  5
```

**Meaning** The **show class-of-service congestion-notification** command shows the input and output stanzas of the configured CNPs.

The **fcoe\_p5\_cnp** CNP input stanza shows that PFC is enabled on code point **101** (priority 5), the MRU is **2240** bytes, and the cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queue **5** for code point **101** (priority 5).

### *Verifying the Interface Configuration*

**Purpose** Verify that the correct classifier and congestion notification profile are configured on the interfaces.

**Action** List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/25** and **show configuration class-of-service interfaces xe-0/0/26**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/25
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/26
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5;
    }
}
```

**Meaning** Both the **show configuration class-of-service interfaces xe-0/0/25** command and the **show configuration class-of-service interfaces xe-0/0/26** command show that the congestion notification profile **fcoe\_p5\_cnp** is configured on each interface, and that the IEEE 802.1p classifier associated with each interface is **fcoe\_p5**.

### *Verifying the DCBX Application Configuration*

**Purpose** Verify that the DCBX application for FCoE is configured.

**Action** List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application fcoe_p5_app {
    ether-type 0x8906;
```

**Meaning** The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe\_p5\_app** is configured with an EtherType of **0x8906**.

### *Verifying the DCBX Application Map Configuration*

**Purpose** Verify that the application map is configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_p5_app_map {
    application fcoe_p5_app code-points 101;
}
```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that application map **fcoe\_p5\_app\_map** consists of the application named **fcoe\_p5\_app**, which is mapped to IEEE 802.1p code point 101.

### *Verifying the DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application map is applied to the correct interfaces.

**Action** List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/25.0 {
    application-map fcoe_p5_app_map;
}
interface xe-0/0/26.0 {
    application-map fcoe_p5_app_map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interfaces **xe-0/0/25.0** and **xe-0/0/26.0** use application map **fcoe\_p5\_app\_map**.

## Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface

The default system configuration supports FCoE traffic on priority 3 (IEEE 802.1p code point 011). If the FCoE traffic on your converged Ethernet network uses priority 3, the only user configuration required for lossless transport is to enable PFC on code point 011 on the FCoE ingress interfaces.

However, if your converged Ethernet network uses more than one priority for FCoE traffic, you need to configure lossless transport for each FCoE priority. This example shows you how to configure lossless FCoE transport on a converged Ethernet network that uses both priority 3 (IEEE 802.1p code point 011) and priority 5 (IEEE 802.1p code point 101) for FCoE traffic.

- [Requirements on page 6028](#)
- [Overview on page 6028](#)
- [Configuration on page 6031](#)
- [Verification on page 6032](#)

---

### Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

---

### Overview

Some network topologies support FCoE traffic on more than one IEEE 802.1p priority. For example, a converged Ethernet network might include two separate FCoE networks that use different priorities to identify traffic. Interfaces that carry traffic for both FCoE networks need to support lossless FCoE transport on both priorities.

Supporting lossless behavior for two FCoE traffic classes requires configuring:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class).
- A behavior aggregate (BA) classifier to map the FCoE forwarding classes to the appropriate IEEE 802.1p code points (priorities).
- A congestion notification profile (CNP) to enable PFC on the FCoE code points at the interface ingress and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer.

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- DCBX applications and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priorities. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifier, CNP, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

### Topology

This example shows how to configure two lossless FCoE traffic classes on an interface, map them to two different priorities, and configure flow control to ensure lossless behavior. This example uses two Ethernet interfaces, xe-0/0/20 and xe-0/0/21, that are connected to the converged Ethernet network. Both interfaces transport FCoE traffic on priorities 3 (011) and 5 (101), and must support lossless transport of that traffic.

Table 543 on page 6029 shows the configuration components for this example.

**Table 543: Components of the Two Lossless FCoE Priorities on an Interface Configuration Topology**

Component	Settings
Hardware	QFX3500 switch
Forwarding classes	<p>Name—<b>fcoe1</b>  Queue mapping—queue 5  Packet drop attribute—<b>no-loss</b></p> <p><b>NOTE:</b> A lossless forwarding class can be mapped to any output queue. However, because the <b>fcoe1</b> forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.</p> <p>Name—<b>fcoe</b>  This is the default lossless FCoE forwarding class, so no configuration required. The <b>fcoe</b> forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of <b>no-loss</b>.</p>

**Table 543: Components of the Two Lossless FCoE Priorities on an Interface Configuration Topology (*continued*)**

Component	Settings
BA classifier	<p>Name—<b>fcoe_classifier</b></p> <p>FCoE priority mapping for forwarding class <b>fcoe</b>—mapped to code point <b>011</b> (IEEE 802.1p priority 3) and a packet loss priority of <b>low</b>.</p> <p>FCoE priority mapping for forwarding class <b>fcoe1</b>—mapped to code point <b>101</b> (IEEE 802.1p priority 5) and a packet loss priority of <b>low</b>.</p>
PFC configuration (CNP)	<p>CNP name—<b>fcoe_cnp</b></p> <p>Input CNP code points—<b>011</b> and <b>101</b></p> <p>MRU—2240 bytes</p> <p>Cable length—100 meters</p> <p>Output CNP code points—<b>011</b> and <b>101</b></p> <p>Output CNP flow control queues—<b>3</b> and <b>5</b></p> <p><b>NOTE:</b> When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for PFC pause in the default configuration (queues 3 and 4) are not enabled for PFC pause unless they are included in the explicitly configured output CNP. In this example, because the explicit output CNP overwrites the default output CNP, we must explicitly configure flow control on queue 3.</p>
DCBX application mapping	<p>Application name—<b>fcoe_app</b></p> <p>Application EtherType—<b>0x8906</b></p> <p>Application map name—<b>fcoe_app_map</b></p> <p>Application map code points—<b>011</b> and <b>101</b></p> <p><b>NOTE:</b> LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.</p>
Interfaces	<p>Interfaces <b>xe-0/0/20</b> and <b>xe-0/0/21</b> use the same configuration:</p> <ul style="list-style-type: none"> <li>Classifier—<b>fcoe_classifier</b></li> <li>CNP—<b>fcoe_cnp</b></li> <li>DCBX application map—<b>fcoe_app_map</b></li> </ul>

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

## Configuration

### CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes that use different priorities on an FCoE transit switch interface, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1p fcoe_classifier forwarding-class fcoe loss-priority low
code-points 011

### Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic on the same interface, classify FCoE traffic into the forwarding classes, configure CNPs to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding class **fcoe1** and map it to output queue **5** for FCoE traffic that uses IEEE 802.1p priority 5:

```
[edit class-of-service]
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
```

**NOTE:** This examples uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class.

2. Configure the ingress classifier. The classifier maps the FCoE priorities (IEEE 802.1p code points **011** and **101**) to lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1p fcoe_classifier forwarding-class fcoe loss-priority low
code-points 011
user@switch# set ieee-802.1p fcoe_classifier forwarding-class fcoe1 loss-priority low
code-points 101
```

3. Apply the classifier to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_classifier
user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_classifier
```

4. Configure the CNP. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points 011 and 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_cnp input ieee-802.1 code-point 011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_cnp input ieee-802.1 code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_cnp output ieee-802.1 code-point 011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
```

5. Apply the CNP to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 congestion-notification-profile fcoe_cnp
user@switch# set interfaces xe-0/0/21 congestion-notification-profile fcoe_cnp
```

6. Configure a DCBX application for FCoE to map to the Ethernet interfaces, so that DCBX can exchange application protocol TLVs on both of the IEEE 802.1p priorities used for FCoE transport:

```
[edit]
user@switch# set applications application fcoe_app ether-type 0x8906
```

7. Configure a DCBX application map to map the FCoE application to the correct IEEE 802.1p FCoE priorities:

```
[edit]
user@switch# set policy-options application-maps fcoe_app_map application fcoe_app code-points [011 101]
```

8. Apply the application map to the interfaces so that DCBX exchanges FCoE application TLVs on the correct code points:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/20 application-map fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/21 application-map fcoe_app_map
```

---

## Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- [Verifying the Forwarding Class Configuration on page 6033](#)
- [Verifying the Behavior Aggregate Classifier Configuration on page 6033](#)
- [Verifying the PFC Flow Control Configuration \(CNP\) on page 6034](#)
- [Verifying the Interface Configuration on page 6034](#)
- [Verifying the DCBX Application Configuration on page 6035](#)

- [Verifying the DCBX Application Map Configuration on page 6035](#)
- [Verifying the DCBX Application Protocol Exchange Interface Configuration on page 6035](#)

### *Verifying the Forwarding Class Configuration*

**Purpose** Verify that the lossless forwarding class **fcoe1** has been created.

**Action** Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
```

Forwarding class	ID	Queue	Policing priority	No-Loss
best-effort	0	0	normal	Disabled
fcoe	1	3	normal	Enabled
no-loss	2	4	normal	Enabled
network-control	3	7	normal	Disabled
fcoe1	4	5	normal	Enabled
mcast	8	8	normal	Disabled

**Meaning** The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

### *Verifying the Behavior Aggregate Classifier Configuration*

**Purpose** Verify that the three classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

**Action** List the classifiers using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
```

Classifier: fcoe\_classifier, Code point type: ieee-802.1p, Index: 10964

Code point	Forwarding class	Loss priority
011	fcoe	low
101	fcoe1	low

**Meaning** The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier.

Classifier **fcoe\_classifier** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

### *Verifying the PFC Flow Control Configuration (CNP)*

**Purpose** Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities.

**Action** List the CNPs using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_cnp, Index: 46504
Type: Input
Cable Length: 100 m
  Priority   PFC      MRU
  000       Disabled
  001       Disabled
  010       Disabled
  011       Enabled   2240
  100       Disabled
  101       Enabled   2240
  110       Disabled
  111       Disabled
Type: Output
  Priority   Flow-Control-Queues
  011
  101
  3
  5
```

**Meaning** The **show class-of-service congestion-notification** command shows the input and output stanzas of the CNP.

The CNP **fcoe\_cnp** input stanza shows that PFC is enabled on code points **011** and **101**, the MRU is **2240** bytes on both priorities, and the interface cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queues **3** and **5** for code points **011** and **101**, respectively.

### *Verifying the Interface Configuration*

**Purpose** Verify that the classifier and congestion notification profile are configured on the interfaces. Both interfaces should show the same configuration.

**Action** List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20** and **show configuration class-of-service interfaces xe-0/0/21**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
congestion-notification-profile fcoe_cnp;
unit 0 {
  classifiers {
    ieee-802.1 fcoe_classifier;
  }
}

user@switch> show configuration class-of-service interfaces xe-0/0/21
congestion-notification-profile fcoe_cnp;
unit 0 {
```

```

        classifiers {
            ieee-802.1 fcoe_classifier;
        }
    }

```

**Meaning** The **show configuration class-of-service interfaces xe-0/0/20** command shows that the congestion notification profile **fcoe\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_classifier**.

The **show configuration class-of-service interfaces xe-0/0/21** command shows that the congestion notification profile **fcoe\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_classifier**.

#### *Verifying the DCBX Application Configuration*

**Purpose** Verify that the DCBX application for FCoE is configured.

**Action** List the DCBX applications by using the configuration mode command **show applications**:

```

user@switch# show applications
application fcoe_app {
    ether-type 0x8906;
}

```

**Meaning** The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe\_app** is configured with an EtherType of **0x8906**.

#### *Verifying the DCBX Application Map Configuration*

**Purpose** Verify that the application map is configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```

user@switch# show policy-options application-maps
fcoe_app_map {
    application fcoe_app code-points [011 101];
}

```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that application map **fcoe\_app\_map** consists of the application named **fcoe\_app**, which is mapped to IEEE 802.1p code points **011** and **101** (priorities 3 and 5, respectively).

#### *Verifying the DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application map is applied to the interfaces.

**Action** List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```

user@switch# show protocols dcbx

```

```
interface xe-0/0/20.0 {  
    application-map fcoe_app_map;  
}  
interface xe-0/0/21.0 {  
    application-map fcoe_app_map;  
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interfaces **xe-0/0/20.0** and **xe-0/0/21.0** use application map **fcoe\_app\_map**.

## Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces

Although the default configuration provides two lossless forwarding classes mapped to two different IEEE 802.1p priorities (code points), you can explicitly configure up to six lossless forwarding classes and map them to different priorities. You can support up to six different types of lossless traffic, and you can support the same type of traffic if it uses different priorities in different parts of your converged network.

This example shows you how to configure two lossless forwarding classes for FCoE traffic and map them to two different priorities on an FCoE transit switch.

---

### Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

## Overview

Some network topologies support FCoE traffic on more than one IEEE 802.1p priority. For example, when the switch acts as a transit switch, it could be connected to two QFX3500 switches in FCoE-FC gateway mode. Each of the gateway switches could connect a set of FCoE clients to a different SAN, and each set of FCoE clients could use a different priority for FCoE traffic to avoid fate sharing and maintain separation of the two FCoE networks. In this case, you need to configure two forwarding classes for FCoE traffic, each mapped to a different output queue and a different priority.

Supporting lossless behavior for two FCoE traffic classes requires configuring:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the two lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class)
- Behavior aggregate (BA) classifiers to map the FCoE forwarding classes to the appropriate IEEE 802.1p code points (priorities) on each interface
- Congestion notification profiles (CNPs) for each interface to enable PFC on the FCoE code points at the interface ingress and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- DCBX applications and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priorities. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNPs, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

## Topology

This example shows how to configure two lossless FCoE traffic classes, map them to two different priorities, and configure flow control to ensure lossless behavior for those priorities on the interfaces. This example uses three Ethernet interfaces, xe-0/0/20, xe-0/0/21, and xe-0/0/22:

- Interface xe-0/0/20 connects to an FCoE-FC gateway that connects to Fibre Channel (FC) SAN 1. FCoE traffic to and from FC SAN 1 uses the default **fcoe** forwarding class and the default mapping to priority 3 (IEEE 802.1p code point 011) and output queue 3.
- Interface xe-0/0/21 connects to another FCoE-FC gateway that connects to Fibre Channel (FC) SAN 2. FCoE traffic to and from FC SAN-2 uses an explicitly configured FCoE forwarding class that is mapped to priority 5 (code point 101) and output queue 5.
- Interface xe-0/0/22 connects to FCoE devices on the converged Ethernet network and handles traffic destined for FC SAN 1 and FC SAN 2. Interface xe-0/0/22 must properly handle lossless FCoE traffic of both priorities (both FCoE forwarding classes), including pausing the traffic on ingress or egress as required.

Figure 215 on page 6038 shows the topology for this example, and Table 544 on page 6038 shows the configuration components for this example.

Figure 215: Topology of the Two Lossless FCoE Priorities Example

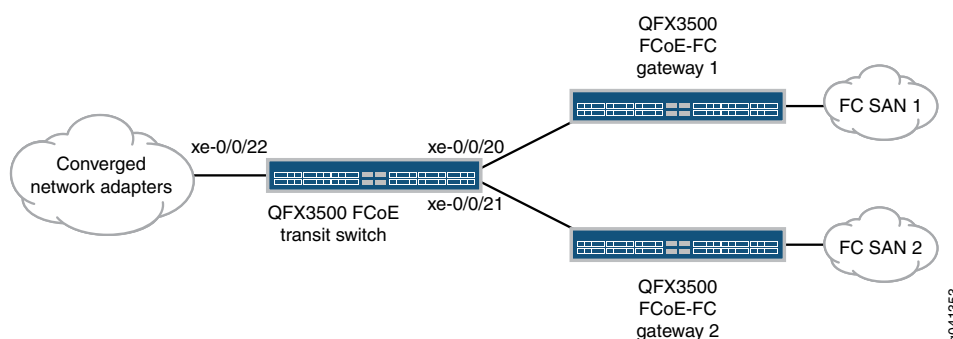

Table 544: Components of the Two Lossless FCoE Priorities Configuration Topology

Component	Settings
Hardware	QFX3500 switch
Forwarding classes	<p>Name—<b>fcoe1</b>  Queue mapping—queue 5  Packet drop attribute—<b>no-loss</b></p> <p><b>NOTE:</b> A lossless forwarding class can be mapped to any output queue. However, because the <b>fcoe1</b> forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.</p> <p>Name—<b>fcoe</b>  This is the default lossless FCoE forwarding class, so no configuration required. The <b>fcoe</b> forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of <b>no-loss</b></p>

**Table 544: Components of the Two Lossless FCoE Priorities Configuration Topology (*continued*)**

Component	Settings
BA classifiers	<p>Each interface requires a different classifier because each interface handles a different subset of FCoE traffic.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/20 classifier: Name—<b>fcoe_p3</b> FCoE priority mapping—Forwarding class <b>fcoe</b> mapped to code point <b>011</b> (IEEE 802.1p priority 3) and a packet loss priority of <b>low</b>.</li> <li>Interface xe-0/0/21 classifier: Name—<b>fcoe_p5</b> FCoE priority mapping—Forwarding class <b>fcoe1</b> mapped to code point <b>101</b> (IEEE 802.1p priority 5) and a packet loss priority of <b>low</b>.</li> <li>Interface xe-0/0/22 classifier: Name—<b>fcoe_p3_p5</b> FCoE priority mapping—Forwarding class <b>fcoe1</b> mapped to code point <b>101</b> and a packet loss priority of <b>low</b>, and forwarding class <b>fcoe</b> mapped to code point <b>011</b> and a packet loss priority of <b>low</b>.</li> </ul>

Table 544: Components of the Two Lossless FCoE Priorities Configuration Topology (*continued*)

Component	Settings
PFC configuration (CNPs)	<p>Each interface requires a different CNP because each interface handles a different subset of FCoE traffic and must pause that traffic on different priorities.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/20 CNP:  CNP name—<b>fcoe_p3_cnp</b>  Input CNP code point—<b>011</b>  MRU—2240 bytes  Cable length—100 meters    <b>NOTE:</b> Because interface xe-0/0/20 uses the default FCoE configuration, output queue 3 is paused by default and you do not need to configure the output stanza of the CNP.</li> <li>Interface xe-0/0/21 CNP:  CNP name—<b>fcoe_p5_cnp</b>  Input CNP code point—<b>101</b>  MRU—2240 bytes  Cable length—150 meters  Output CNP code point—<b>101</b>  Output CNP flow control queue—<b>5</b></li> <li>Interface xe-0/0/22 CNP:  CNP name—<b>fcoe_p3_p5_cnp</b>  Input CNP code points—<b>011</b> and <b>101</b>  MRU—2240 bytes (both priorities)  Cable length—100 meters  Output CNP code points—<b>011</b> (for queue 3) and <b>101</b> (for queue 5)  Output CNP flow control queues—<b>3</b> for priority 3 (code point 011) and <b>5</b> for priority 5 (code point 101)</li> </ul> <p><b>NOTE:</b> When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.</p>

**Table 544: Components of the Two Lossless FCoE Priorities Configuration Topology (*continued*)**

Component	Settings
DCBX application mapping	<p>Interface xe-0/0/20 does not need an application map because DCBX exchanges application protocol TLVs only on the default FCoE priority (priority 3).</p> <p>Interface xe-0/0/21 requires an application map that enables DCBX application protocol TLV exchange on priority 5 (code point 101) for FCoE traffic. Interface xe-0/0/22 requires an application map that enables DCBX application protocol TLV exchange both on priority 3 (code point 011) and on priority 5 (code point 101) for FCoE traffic.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/21 DCBX application mapping: Application name—<b>fcoe_p5_app</b> Application ether-type—<b>0x8906</b> Application map name—<b>fcoe_p5_app_map</b> Application map code points—<b>101</b></li> <li>Interface xe-0/0/22 DCBX application mapping: Application name—<b>fcoe_all_app</b> Application ether-type—<b>0x8906</b> Application map name—<b>fcoe_all_app_map</b> Application map code points—<b>011</b> and <b>101</b></li> </ul> <p><b>NOTE:</b> LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.</p>

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

### Configuration

#### CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes that use different priorities on an FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p3 forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low

set policy-options application-maps fcoe_all_app_map application fcoe_all_app code-points [011
101]
set protocols dcbx interface xe-0/0/21 application-map fcoe_p5_app_map
set protocols dcbx interface xe-0/0/22 application-map fcoe_all_app_map

```

### Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic on different interfaces, classify FCoE traffic into the forwarding classes, configure congestion notification profiles to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding class **fcoe1** and map it to output queue **5** for FCoE traffic that uses IEEE 802.1p priority 5:

```

[edit class-of-service]
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss

```

**NOTE:** This examples uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class.

2. Configure the ingress classifier (**fcoe\_p3**) for interface **xe-0/0/20**. The classifier maps the FCoE priority (IEEE 802.1p code point **011**) to lossless FCoE forwarding class **fcoe**:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p3 forwarding-class fcoe loss-priority low code-points
011

```

3. Configure the ingress classifier (**fcoe\_p5**) for interface **xe-0/0/21**. The classifier maps the FCoE priority (IEEE 802.1p code point **101**) to lossless FCoE forwarding class **fcoe1**:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low code-points
101

```

4. Configure the ingress classifier (**fcoe\_p3\_p5**) for interface **xe-0/0/22**. The classifier maps the two FCoE priorities (IEEE 802.1p code points **011** and **101**) to the two lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low code-points
011
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low code-points
101
```

5. Apply each classifier to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_p3
user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_p5
user@switch# set interfaces xe-0/0/22 unit 0 classifiers ieee-802.1 fcoe_p3_p5
```

6. Configure the CNP input stanza for interface **xe-0/0/20** to enable PFC on the FCoE priority (IEEE 802.1p code point **011**), set the MRU value (2240 bytes), and set the cable length value (100 meters). No output stanza is needed because queue 3 is paused by default on priority 3, and we are not explicitly configuring output queue flow control for any other queues.

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point
011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_cnp input cable-length 100
```

7. Configure the CNP for interface **xe-0/0/21**. The input stanza enables PFC on the FCoE priority (IEEE 802.1p code point **101**), sets the MRU value (2240 bytes), and sets the cable length value (150 meters). The output stanza configures flow control on output queue 5 on the FCoE priority:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 150
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
```

8. Configure the CNP for interface **xe-0/0/22**. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points **011** and **101**), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1
code-point 011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1
code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1
code-point 011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1
code-point 101 pfc flow-control-queue 5
```

9. Apply each CNP to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 congestion-notification-profile fcoe_p3_cnp
```

```

user@switch# set interfaces xe-0/0/21 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/22 congestion-notification-profile fcoe_p3_p5_cnp

```

10. Configure the DCBX FCoE application and application map to apply to interface xe-0/0/21. Interface xe-0/0/21 uses priority 5 (IEEE 802.1p code point 101) for FCoE traffic, which requires DCBX to exchange FCoE application protocol TLVs on priority 5 on interface xe-0/0/21. Configure an application named **fcoe\_p5\_app** for FCoE traffic (EtherType **0x8906**) and configure an application map named **fcoe\_p5\_app\_map** to map the application to code point 101:

```

[edit]
user@switch# set applications application fcoe_p5_app ether-type 0x8906
user@switch# set policy-options application-maps fcoe_p5_app_map application
fcoe_p5_app code-points 101

```

**NOTE:** Interface xe-0/0/20 uses the default FCoE configuration (priority 3). DCBX exchanges protocol TLVs for the FCoE application by default, so you do not need to configure DCBX explicitly on interface xe-0/0/20.

11. Configure the DCBX FCoE application and application map to apply to interface xe-0/0/22. Interface xe-0/0/22 uses both priority 3 (IEEE 802.1p code point 011) and priority 5 for FCoE traffic, which requires DCBX to exchange FCoE application protocol TLVs on both priority 3 and priority 5. Configure an application named **fcoe\_all\_app** for FCoE traffic (EtherType **0x8906**) and configure an application map named **fcoe\_all\_app\_map** to map the application to code points 011 and 101:

```

[edit]
user@switch# set applications application fcoe_all_app ether-type 0x8906
user@switch# set policy-options application-maps fcoe_all_app_map application
fcoe_all_app code-points [011 101]

```

12. Apply the application maps to the interfaces xe-0/0/21 and xe-0/0/22 so that DCBX exchanges FCoE application TLVs on the correct code points on each interface:

```

[edit]
user@switch# set protocols dcbx interface xe-0/0/21 application-map fcoe_p5_app_map
user@switch# set protocols dcbx interface xe-0/0/22 application-map fcoe_all_app_map

```

## Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- [Verifying the Forwarding Class Configuration on page 6045](#)
- [Verifying the Behavior Aggregate Classifier Configuration on page 6045](#)
- [Verifying the PFC Flow Control Configuration \(CNP\) on page 6046](#)
- [Verifying the Interface Configuration on page 6048](#)
- [Verifying the DCBX Application Configuration on page 6048](#)
- [Verifying the DCBX Application Map Configuration on page 6049](#)
- [Verifying the DCBX Application Protocol Exchange Interface Configuration on page 6049](#)

**Verifying the Forwarding Class Configuration**

**Purpose** Verify that the lossless forwarding class **fcoe1** has been created.

**Action** Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
```

Forwarding class	ID	Queue	Policing priority	No-Loss
best-effort	0	0	normal	Disabled
fcoe	1	3	normal	Enabled
no-loss	2	4	normal	Enabled
network-control	3	7	normal	Disabled
fcoe1	4	5	normal	Enabled
mcast	8	8	normal	Disabled

**Meaning** The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

**Verifying the Behavior Aggregate Classifier Configuration**

**Purpose** Verify that the three classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

**Action** List the classifiers configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
```

Classifier: fcoe\_p3, Code point type: ieee-802.1, Index: 13913

Code point	Forwarding class	Loss priority
011	fcoe	low

Classifier: fcoe\_p5, Code point type: ieee-802.1, Index: 63065

Code point	Forwarding class	Loss priority
101	fcoe1	low

Classifier: fcoe\_p3\_p5, Code point type: ieee-802.1, Index: 10964

Code point	Forwarding class	Loss priority
011	fcoe	low
101	fcoe1	low

**Meaning** The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier. The command output shows that there are three classifiers, **fcoe\_p3**, **fcoe\_p5**, and **fcoe\_p3\_p5**.

Classifier **fcoe\_p3** maps code point **011** (priority 3) to default lossless forwarding class **fcoe** and a packet loss priority of **low**.

Classifier **fcoe\_p5** maps code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **fcoe\_p3\_p5** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

### ***Verifying the PFC Flow Control Configuration (CNP)***

**Purpose** Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities in each CNP.

**Action** List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
```

```
Name: fcoe_p3_cnp, Index: 12037
```

```
Type: Input
```

```
Cable Length: 100 m
```

Priority	PFC	MRU
000	Disabled	
001	Disabled	
010	Disabled	
011	Enabled	2240
100	Disabled	
101	Disabled	
110	Disabled	
111	Disabled	

```
Type: Output
```

Priority	Flow-Control-Queues
000	0
001	1
010	2
011	3
100	4
101	5
110	6
111	7

```
Name: fcoe_p3_p5_cnp, Index: 46484
```

```
Type: Input
```

```
Cable Length: 100 m
```

Priority	PFC	MRU
000	Disabled	
001	Disabled	
010	Disabled	
011	Enabled	2240

```

100      Disabled
101      Enabled      2240
110      Disabled
111      Disabled
Type: Output
Priority  Flow-Control-Queues
011
3
101
5

Name: fcoe_p5_cnp, Index: 12133
Type: Input
Cable Length: 150 m
Priority  PFC      MRU
000      Disabled
001      Disabled
010      Disabled
011      Disabled
100      Disabled
101      Enabled   2240
110      Disabled
111      Disabled
Type: Output
Priority  Flow-Control-Queues
101
5

```

**Meaning** The **show class-of-service congestion-notification** command shows the input and output stanzas of the three CNPs. For CNP **fcoe\_p3\_cnp**, the input stanza shows that PFC is enabled on IEEE 802.1p code point **011** (priority 3), the MRU is **2240** bytes, and the cable length is **100** meters. The CNP output stanza shows the default mapping of priorities to output queues.

**NOTE:** By default, only queues 3 and 4 are enabled to respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza. In this example, only queue 3 responds to pause messages from the connected peer on interfaces that use CNP **fcoe\_p3\_cnp**, because the input stanza enables PFC priority 3 only.

For CNP **fcoe\_p3\_p5\_cnp**, the input stanza shows that PFC is enabled on code points **011** and **101**, the MRU is **2240** bytes on both priorities, and the cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queues **3** and **5** for code points **011** and **101**, respectively.

For CNP **fcoe\_p5\_cnp**, the input stanza shows that PFC is enabled on code point **101** (priority 5), the MRU is **2240** bytes, and the cable length is **150** meters. The CNP output stanza shows that output flow control is configured on queue **5** for code point **101** (priority 5).

### *Verifying the Interface Configuration*

**Purpose** Verify that the correct classifiers and congestion notification profiles are configured on the correct interfaces.

**Action** List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20**, **show configuration class-of-service interfaces xe-0/0/21**, and **show configuration class-of-service interfaces xe-0/0/22**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
  congestion-notification-profile fcoe_p3_cnp;
  unit 0 {
    classifiers {
      ieee-802.1p fcoe_p3;
    }
  }
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/21
  congestion-notification-profile fcoe_p5_cnp;
  unit 0 {
    classifiers {
      ieee-802.1p fcoe_p5;
    }
  }
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/22
  congestion-notification-profile fcoe_p3_p5_cnp;
  unit 0 {
    classifiers {
      ieee-802.1p fcoe_p3_p5;
    }
  }
```

**Meaning** The **show configuration class-of-service interfaces xe-0/0/20** command shows that the congestion notification profile **fcoe\_p3\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p3**.

The **show configuration class-of-service interfaces xe-0/0/21** command shows that the congestion notification profile **fcoe\_p5\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p5**.

The **show configuration class-of-service interfaces xe-0/0/22** command shows that the congestion notification profile **fcoe\_p3\_p5\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p3\_p5**.

### *Verifying the DCBX Application Configuration*

**Purpose** Verify that the two DCBX applications for FCoE are configured.

**Action** List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
  application fcoe_all_app {
    ether-type 0x8906;
```

```
application fcoe_p5_app {
    ether-type 0x8906;
```

**Meaning** The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe\_all\_app** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic) and that the application **fcoe\_p5\_app** is also configured with an EtherType of **0x8906**.

### *Verifying the DCBX Application Map Configuration*

**Purpose** Verify that the application maps are configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_all_app_map {
    application fcoe_all_app code-points [011 101];
}
fcoe_p5_app_map {
    application fcoe_p5_app code-points 101;
}
```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that there are two application maps.

Application map **fcoe\_all\_app\_map** consists of the application named **fcoe\_all\_app** mapped to IEEE 802.1p code points **011** (priority 3) and **101** (priority 5).

Application map **fcoe\_p5\_app\_map** consists of the application named **fcoe\_p5\_app** mapped to IEEE 802.1p code point **101** (priority 5).

### *Verifying the DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application maps are applied to the correct interfaces.

**Action** List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/21.0 {
    application-map fcoe_p5_app_map;
}
interface xe-0/0/22.0 {
    application-map fcoe_all_app_map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interface **xe-0/0/21.0** uses application map **fcoe\_p5\_app\_map** and interface **xe-0/0/22.0** uses application map **fcoe\_all\_app\_map**.

**NOTE:** Because interface xe-0/0/20 uses the default lossless FCoE configuration, you do not configure application mapping to interface xe-0/0/20. The default configuration automatically exchanges application protocol TLVs for the default FCoE configuration on priority 3 (IEEE 802.1p code point 011).

**Related Documentation**

## Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI)

Although the default configuration provides two lossless forwarding classes mapped to two different IEEE 802.1p priorities (code points), you can explicitly configure up to six lossless forwarding classes and map them to different priorities. You can support up to six different types of lossless traffic, and you can support the same type of traffic on different priorities in different parts of your converged network.

This example shows you how to configure two lossless forwarding classes for FCoE traffic and one lossless forwarding class for iSCSI traffic, and map the forwarding classes to three different priorities. (The converged Ethernet network includes two FCoE networks, each of which uses a different priority to identify FCoE traffic, and an iSCSI network.)

- [Requirements on page 6050](#)
- [Overview on page 6051](#)
- [Configuration on page 6055](#)
- [Verification on page 6059](#)

### Requirements

---

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode

- Junos OS Release 12.3 or later for the QFX Series

## Overview

Some converged Ethernet networks support FCoE on more than one IEEE 802.1p priority and also require supporting other lossless traffic classes. Interfaces that carry multiple lossless forwarding classes need to support lossless behavior for the priorities mapped to those forwarding classes. To support the two FCoE forwarding classes and the iSCSI forwarding class used in this example, you need to configure:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the two lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class)
- A lossless forwarding class for iSCSI traffic
- Behavior aggregate (BA) classifiers to map the lossless forwarding classes to the appropriate IEEE 802.1p code points (priorities) on each interface
- Congestion notification profiles (CNPs) for each interface to enable PFC on the FCoE and iSCSI code points at the interface ingress, and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- DCBX applications and an application map to support DCBX application TLV exchange for the FCoE and iSCSI traffic on the configured lossless priorities. By default, DCBX is enabled on all Ethernet interfaces for FCoE, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNPs, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

## Topology

This example shows how to configure two lossless FCoE traffic classes and one lossless iSCSI traffic class, map them to three different priorities, and configure flow control to ensure lossless behavior for those priorities on the interfaces. This example uses four Ethernet interfaces, xe-0/0/31, xe-0/0/32, xe-0/0/33, and xe-0/0/34:

- Interface xe-0/0/31 handles FCoE traffic on priority 3 (IEEE 802.1p code point 011) and iSCSI traffic on priority 4 (code point 100).
- Interface xe-0/0/32 handles FCoE traffic on priority 5 (code point 101) and iSCSI traffic on priority 4.
- Interface xe-0/0/33 handles FCoE traffic on priority 3 and priority 5.
- Interface xe-0/0/34 handles iSCSI traffic on priority 4.

Figure 216 on page 6052 shows the topology for this example, and Table 545 on page 6052 shows the configuration components for this example.

**Figure 216: Topology of the Lossless FCoE and iSCSI Priorities Example**

**Table 545: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology**

Component	Settings
Hardware	QFX3500 switch

**Table 545: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology (*continued*)**

Component	Settings
Forwarding classes	<p>This example uses one explicitly configured lossless FCoE forwarding class, the default lossless FCoE forwarding class, and one explicitly configured iSCSI forwarding class.</p> <ul style="list-style-type: none"> <li>iSCSI forwarding class: Name—<b>iscsi</b> Queue mapping—queue 4 Packet drop attribute—<b>no-loss</b></li> <li>FCoE forwarding class (explicitly configured): Name—<b>fcoe1</b> Queue mapping—queue 5 Packet drop attribute—<b>no-loss</b></li> </ul> <p><b>NOTE:</b> A lossless forwarding class can be mapped to any output queue. However, because the <b>fcoe1</b> forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.</p> <ul style="list-style-type: none"> <li>FCoE forwarding class (default) Name—<b>fcoe</b> The default <b>fcoe</b> forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of <b>no-loss</b>.</li> </ul>
BA classifiers	<p>Each interface requires a different classifier because each interface handles a different subset of FCoE traffic.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/31 classifier: Name—<b>fcoe_p3_iscsi</b> FCoE priority mapping—Forwarding class <b>fcoe</b> mapped to code point <b>011</b> (IEEE 802.1p priority 3) and a packet loss priority of <b>low</b>. iSCSI priority mapping—Forwarding class <b>iscsi</b> mapped to code point <b>100</b> (priority 4) and a packet loss priority of <b>low</b>.</li> <li>Interface xe-0/0/32 classifier: Name—<b>fcoe_p5_iscsi</b> FCoE priority mapping—Forwarding class <b>fcoe1</b> mapped to code point <b>101</b> (IEEE 802.1p priority 5) and a packet loss priority of <b>low</b>. iSCSI priority mapping—Forwarding class <b>iscsi</b> mapped to code point <b>100</b> (priority 4) and a packet loss priority of <b>low</b>.</li> <li>Interface xe-0/0/33 classifier: Name—<b>fcoe_p3_p5</b> FCoE priority mapping—Forwarding class <b>fcoe1</b> mapped to code point <b>101</b> (priority 5) and a packet loss priority of <b>low</b>, and forwarding class <b>fcoe</b> mapped to code point <b>011</b> and a packet loss priority of <b>low</b>.</li> <li>Interface xe-0/0/34 classifier: Name—<b>iscsi_classifier</b> iSCSI priority mapping—Forwarding class <b>iscsi</b> mapped to code point <b>100</b> (priority 4) and a packet loss priority of <b>low</b>.</li> </ul>

**Table 545: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology (continued)**

Component	Settings
PFC configuration (CNPs)	<p>Each interface requires a different CNP because each interface handles a different subset of FCoE and iSCSI traffic, and must pause that traffic on different priorities.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/31 CNP:  CNP name—<b>fcoe_p3_cnp</b>  Input CNP code points—<b>011</b> and <b>100</b>  MRU—2240 bytes for code point <b>011</b>, default value (2500 bytes) for code point <b>100</b>  Cable length—100 meters    <b>NOTE:</b> On interface xe-0/0/31, the FCoE forwarding class is mapped to queue 3 and priority 3 (code point 011), and the iSCSI forwarding class is mapped to queue 4 and priority 4 (code point 100). Therefore, interface xe-0/0/31 does not require an output CNP configuration because queue 3 and queue 4 are enabled for PFC flow control by default on code points 011 and 100, respectively.</li> <li>Interface xe-0/0/32 CNP:  CNP name—<b>fcoe_p5_cnp</b>  Input CNP code points—<b>100</b> and <b>101</b>  MRU—Default value (2500 bytes) for code point <b>100</b>, <b>2240</b> bytes for code point <b>101</b>  Cable length—150 meters  Output CNP code points—<b>100</b> and <b>101</b>  Output CNP flow control queues—<b>4</b> and <b>5</b></li> <li>Interface xe-0/0/33 CNP:  CNP name—<b>fcoe_p3_p5_cnp</b>  Input CNP code points—<b>011</b> and <b>101</b>  MRU—<b>2240</b> bytes (both priorities)  Cable length—100 meters  Output CNP code points—<b>011</b> and <b>101</b>  Output CNP flow control queues—<b>3</b> and <b>5</b></li> <li>Interface xe-0/0/34 CNP:  CNP name—<b>iscsi_cnp</b>  Input CNP code point—<b>100</b>  MRU—<b>2500</b> bytes (default value)  Cable length—100 meters    <b>NOTE:</b> On interface xe-0/0/34, the iSCSI forwarding class is mapped to queue 4 and priority 4 (code point 100). Interface xe-0/0/34 does not require an output CNP configuration because queue 4 is enabled for PFC flow control by default on code point 100.</li> </ul> <p><b>NOTE:</b> When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for PFC pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.</p>

**Table 545: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology (*continued*)**

Component	Settings
DCBX application mapping	<p>This example requires configuring applications for FCoE and iSCSI, including them in the same application map, and applying the application map to all four interfaces.</p> <p>Application map name—<b>dcbx_iscsi_fcoe_app_map</b></p> <ul style="list-style-type: none"> <li>FCoE application name—<b>fcoe_app</b> Application ether-type—<b>0x8906</b> Application map code points—<b>011</b> and <b>101</b></li> <li>iSCSI application name—<b>iscsi_app</b> Application protocol type—<b>tcp</b> Application destination port—<b>3260</b> Application map code point—<b>100</b></li> </ul> <p><b>NOTE:</b> LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.</p>

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

### Configuration

#### CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes and one lossless iSCSI forwarding class and map them to different priorities, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class iscsi queue-num 4 no-loss
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p3_iscsi forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p3_iscsi forwarding-class iscsi loss-priority low

```

### Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic and one lossless forwarding class for iSCSI traffic, classify the traffic into the three forwarding classes, configure congestion notification profiles to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding classes **iscsi** for iSCSI traffic and **fcoe1** for FCoE traffic (this example uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class) and map them to output queues:

```

[edit class-of-service]
user@switch# set forwarding-classes class iscsi queue-num 4 no-loss
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss

```

2. Configure the ingress classifier (**fcoe\_p3\_iscsi**) for interface **xe-0/0/31**. The classifier maps the FCoE priority (code point **011**) to lossless FCoE forwarding class **fcoe** and the iSCSI priority (code point **100**) to lossless iSCSI forwarding class **iscsi**:

```

[edit class-of-service classifiers]

```

```

user@switch# set ieee-802.1 fcoe_p3_iscsi forwarding-class fcoe loss-priority low
code-points 011
user@switch# set ieee-802.1 fcoe_p3_iscsi forwarding-class iscsi loss-priority low
code-points 100

```

3. Configure the ingress classifier (**fcoe\_p5\_iscsi**) for interface **xe-0/0/32**. The classifier maps the FCoE priority (code point **101**) to lossless FCoE forwarding class **fcoe1** and the iSCSI priority (code point **100**) to lossless iSCSI forwarding class **iscsi**:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p5_iscsi forwarding-class iscsi loss-priority low
code-points 100
user@switch# set ieee-802.1 fcoe_p5_iscsi forwarding-class fcoe1 loss-priority low
code-points 101

```

4. Configure the ingress classifier (**fcoe\_p3\_p5**) for interface **xe-0/0/33**. The classifier maps the two FCoE priorities (code points **011** and **101**) to lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low code-points
011
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low code-points
101

```

5. Configure the ingress classifier (**iscsi\_classifier**) for interface **xe-0/0/34**. The classifier maps the iSCSI priority (code point **101**) to lossless iSCSI forwarding class **iscsi**:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 iscsi_classifier forwarding-class iscsi loss-priority low
code-points 100

```

6. Apply each classifier to the appropriate interface:

```

[edit class-of-service]
user@switch# set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe_p3_iscsi
user@switch# set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe_p5_iscsi
user@switch# set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe_p3_p5
user@switch# set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 iscsi_classifier

```

7. Configure the CNP input stanza for interface **xe-0/0/31** to enable PFC on the FCoE and iSCSI priorities that the interface handles (code points **011** and **100**), set the MRU value for the FCoE traffic (2240 bytes), and set the cable length value (100 meters). No output stanza is needed because queues 3 and 4 are paused by default on priorities 3 and 4, respectively, and we are not explicitly configuring output queue flow control for any other queues.

```

[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point
011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point
100 pfc
user@switch# set congestion-notification-profile fcoe_p3_cnp input cable-length 100

```

8. Configure the CNP for interface **xe-0/0/32**. The input stanza enables PFC on the FCoE priority (code point **101**), sets the MRU value for FCoE traffic (2240 bytes), enables PFC on the iSCSI priority (code point **100**), and sets the cable length value (150 meters). The output stanza configures flow control on output queue 5 on the FCoE priority and on output queue 4 on the iSCSI priority:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
100 pfc
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 150
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
100 pfc flow-control-queue 4
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
```

9. Configure the CNP for interface xe-0/0/33. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points 011 and 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1
code-point 011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1
code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1
code-point 011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1
code-point 101 pfc flow-control-queue 5
```

10. Configure the CNP input stanza for interface xe-0/0/34 to enable PFC on the iSCSI priority (code point 100) and set the cable length value (100 meters). No output stanza is needed because queue 4 is paused by default on priority 4, and we are not explicitly configuring output queue flow control for any other queues.

```
[edit class-of-service]
user@switch# set congestion-notification-profile iscsi_cnp input ieee-802.1 code-point
100 pfc
user@switch# set congestion-notification-profile iscsi_cnp input cable-length 100
```

11. Apply each CNP to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe_p3_cnp
user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe_p3_p5_cnp
user@switch# set interfaces xe-0/0/34 congestion-notification-profile iscsi_cnp
```

12. Configure the DCBX applications for FCoE and iSCSI to map to the interfaces so that DCBX can exchange application protocol TLVs on the IEEE 802.1p priorities used for FCoE and iSCSI traffic:

```
[edit]
user@switch# set applications application fcoe_app ether-type 0x8906
user@switch# set applications application iscsi_app protocol tcp destination-port 3260
```

13. Configure a DCBX application map to map the FCoE and iSCSI applications to the correct priorities:

```
[edit]
user@switch# set policy-options application-maps dcbx_iscsi_fcoe_app_map application
fcoe_app code-points [011 101]
user@switch# set policy-options application-maps dcbx_iscsi_fcoe_app_map application
iscsi_app code-points 100
```

14. Apply the application map to the interfaces so that DCBX exchanges FCoE application TLVs on the correct code points:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/31 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/32 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/33 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/34 application-map
dcbx_iscsi_fcoe_app_map
```

### Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- [Verifying the Forwarding Class Configuration on page 6059](#)
- [Verifying the Behavior Aggregate Classifier Configuration on page 6060](#)
- [Verifying the PFC Flow Control Configuration \(CNP\) on page 6060](#)
- [Verifying the Interface Configuration on page 6063](#)
- [Verifying the DCBX Application Configuration on page 6064](#)
- [Verifying the DCBX Application Map Configuration on page 6064](#)
- [Verifying the DCBX Application Protocol Exchange Interface Configuration on page 6065](#)

#### *Verifying the Forwarding Class Configuration*

**Purpose** Verify that the lossless forwarding classes **iscsi** and **fcoe1** have been created and that the default lossless forwarding class **fcoe** is still enabled for lossless transport.

**Action** Show the forwarding class configuration by using the operational command **show class-of-service forwarding-class**:

```
user@switch> show class-of-service forwarding-class
```

Forwarding class	ID	Queue	Policing priority	No-Loss
best-effort	0	0	normal	Disabled
fcoe	1	3	normal	Enabled
iscsi	2	4	normal	Enabled
network-control	3	7	normal	Disabled
fcoe1	4	5	normal	Enabled
mcast	8	8	normal	Disabled

**Meaning** The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **iscsi** and **fcoe1** forwarding classes are configured on output queues 4 and 5, respectively, with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default **fcoe** forwarding class, it remains in its default state (lossless configuration).

### *Verifying the Behavior Aggregate Classifier Configuration*

**Purpose** Verify that the four classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

**Action** List the classifiers configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_p3_iscsi, Code point type: ieee-802.1, Index: 13915
  Code point  Forwarding class  Loss priority
  011         fcoe             low
  100         iscsi            low
```

```
Classifier: fcoe_p5_iscsi, Code point type: ieee-802.1, Index: 62035
  Code point  Forwarding class  Loss priority
  100         iscsi            low
  101         fcoe1            low
```

```
Classifier: fcoe_p3_p5, Code point type: ieee-802.1, Index: 17774
  Code point  Forwarding class  Loss priority
  011         fcoe             low
  101         fcoe1            low
```

```
Classifier: iscsi_classifier, Code point type: ieee-802.1, Index: 31635
  Code point  Forwarding class  Loss priority
  100         iscsi            low
```

**Meaning** The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier. The command output shows that there are four classifiers, **fcoe\_p3\_iscsi**, **fcoe\_p5\_iscsi**, **fcoe\_p3\_p5**, and **iscsi\_classifier**.

Classifier **fcoe\_p3\_iscsi** maps code point **011** (priority 3) to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and code point **100** (priority 4) to explicitly configured lossless forwarding class **iscsi**.

Classifier **fcoe\_p5\_iscsi** maps code point **100** to explicitly configured forwarding class **iscsi** and a packet loss priority of **low**, and code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **fcoe\_p3\_p5** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **iscsi\_classifier** maps code point **100** to explicitly configured forwarding class **iscsi** and a packet loss priority of **low**.

### *Verifying the PFC Flow Control Configuration (CNP)*

**Purpose** Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities in each CNP.

**Action** List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
```

```

111
      7
```

**Meaning** The **show class-of-service congestion-notification** command shows the input and output stanzas of the four CNPs.

For CNP **fcoe\_p3\_cnp**, the input stanza shows that PFC is enabled on IEEE 802.1p code point **011** (priority 3) with an MRU of **2240** bytes, and cable length of **100** meters. The input stanza also shows that PFC is enabled on code point **100** (priority 4) with the default MRU value of **9216** bytes. The CNP output stanza shows the default mapping of priorities to output queues because no explicit output CNP is configured.

**NOTE:** By default, only queues 3 and 4 are enabled respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza. In this example, only queues 3 and 4 respond to pause messages from the connected peer on interfaces that use CNP `fcoe_p3_cnp` because the input stanza enables PFC only on priorities 3 and 4.

For CNP `fcoe_p3_p5_cnp`, the input stanza shows that PFC is enabled on code points 011 and 101 (priority 5), the MRU is 2240 bytes on both priorities, and the cable length is 100 meters. The CNP output stanza shows that output flow control is configured on queues 3 and 5 for code points 011 and 101, respectively.

For CNP `fcoe_p5_cnp`, the input stanza shows that PFC is enabled on code points 100 and 101. The MRU for code point 101 (FCoE traffic) is 2240 bytes and the MRU for code point 100 is 9216. The interface cable length is 150 meters. The CNP output stanza shows that output flow control is configured on queue 4 for code point 100 and on queue 5 for code point 101.

For CNP `iscsi_cnp`, the input stanza shows that PFC is enabled on code point 100, the MRU value is 9216 bytes, and the interface cable length is 100 meters. The CNP output stanza shows the default mapping of priorities to output queues because no explicit output CNP is configured.

### *Verifying the Interface Configuration*

**Purpose** Verify that the correct classifiers and congestion notification profiles are configured on the correct interfaces.

**Action** List the ingress interfaces using the operational mode commands `show configuration class-of-service interfaces xe-0/0/31`, `show configuration class-of-service interfaces xe-0/0/32`, `show configuration class-of-service interfaces xe-0/0/33`, and `show configuration class-of-service interfaces xe-0/0/34`:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
congestion-notification-profile fcoe_p3_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p3_iscsi;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5_iscsi;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/33
congestion-notification-profile fcoe_p3_p5_cnp;
unit 0 {
  classifiers {
    ieee-802.1 fcoe_p3_p5;
  }
}

user@switch> show configuration class-of-service interfaces xe-0/0/34
congestion-notification-profile iscsi_cnp;
unit 0 {
  classifiers {
    ieee-802.1 iscsi_classifier;
  }
}
```

**Meaning** The **show configuration class-of-service interfaces xe-0/0/31** command shows that the congestion notification profile **fcoe\_p3\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p3\_iscsi**.

The **show configuration class-of-service interfaces xe-0/0/32** command shows that the congestion notification profile **fcoe\_p5\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p5\_iscsi**.

The **show configuration class-of-service interfaces xe-0/0/33** command shows that the congestion notification profile **fcoe\_p3\_p5\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p3\_p5**.

The **show configuration class-of-service interfaces xe-0/0/34** command shows that the congestion notification profile **iscsi\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **iscsi\_classifier**.

#### *Verifying the DCBX Application Configuration*

**Purpose** Verify that the DCBX applications for FCoE and iSCSI are configured.

**Action** List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application iscsi_app {
  protocol tcp;
  destination-port 3260;
}
application fcoe_app {
  ether-type 0x8906;
```

**Meaning** The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **iscsi\_app** is configured with a protocol value of **tcp** and a destination port value of **3260**, and that the application **fcoe\_app** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic).

#### *Verifying the DCBX Application Map Configuration*

**Purpose** Verify that the application map is configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
    application iscsi_app code-points 100;
    application fcoe_app code-points [011 101];
}
```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that there is one application map named **dcbx-iscsi-fcoe\_app\_map**. It consists of the application **iscsi\_app** mapped to code point **100** and the application **fcoe\_app** mapped to code points **011** and **101**.

### *Verifying the DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application maps are applied to the correct interfaces.

**Action** List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/31.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/32.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/33.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/34.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that all four interfaces use the application map **dcbx-iscsi-fcoe-app-map**.

## Example: Configuring Unicast Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. You apply classifiers to ingress interfaces.

- [Requirements on page 6066](#)
- [Overview on page 6066](#)
- [Configuring Unicast Classifiers on page 6067](#)
- [Verification on page 6067](#)

### Requirements

---

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

---

Junos OS supports three general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP or DSCP IPv6) value, IEEE 802.1p value, or MPLS EXP value. (EXP classifiers can be applied only to **family mpls** interfaces.)
- Fixed classifiers. Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.
- Multifield traffic classifiers—Examine multiple fields in the packet, such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

**NOTE:** You must assign unicast traffic and multidestination (multicast, broadcast, and destination lookup fail) traffic to different classifiers. One classifier cannot include both unicast and multidestination forwarding classes. A unicast classifier can include only forwarding classes for unicast traffic.

---

This example describes how to configure a BA classifier called **ba-ucast-classifier** as the default IEEE 802.1 map and apply it to ingress interface **xe-0/0/10**. The BA classifier assigns loss priorities, as shown in [Table 546 on page 6067](#), to incoming packets in the four forwarding classes.

You can use the same procedure to set multifield classifiers (except that you use firewall filter rules).

**Table 546: ba-ucast-classifier Loss Priority Assignments**

Unicast Forwarding Class	For CoS Traffic Type	ba-ucast-classifier Loss Priority to IEEE 802.1p Code Point Mapping	Packet Drop Attribute
<b>be</b>	Best-effort traffic	Low loss priority code point: <b>000</b>	drop
<b>fcoe</b>	Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic	Low loss priority code point: <b>011</b>	no-loss
<b>no-loss</b>	Guaranteed delivery for TCP traffic	Low loss priority code point: <b>100</b>	no-loss
<b>nc</b>	Network-control traffic	Low loss priority code point: <b>110</b>	drop

### Configuring Unicast Classifiers

To configure a unicast IEEE 802.1 BA classifier named **ba-ucast-classifier** as the default IEEE 802.1 map:

- Associate code point **000** with forwarding class **be** and loss priority **low**:  

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-ucast-classifier import default forwarding-class be
loss-priority low code-points 000
```
- Associate code point **011** with forwarding class **fcoe** and loss priority **low**:  

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class fcoe loss-priority low
code-points 011
```
- Associate code point **100** with forwarding class **no-loss** and loss priority **low**:  

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class no-loss loss-priority low
code-points 100
```
- Associate code point **110** with forwarding class **nc** and loss priority **low**:  

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class nc loss-priority low
code-points 110
```
- Apply the unicast classifier to ingress interface **xe-0/0/10**:  

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/10 unit 0 classifiers ieee-802.1 ba-ucast-classifier
```

### Verification

To verify the unicast classifier configuration, perform these tasks:

- [Verifying the Unicast Classifier Configuration on page 6068](#)
- [Verifying the Ingress Interface Configuration on page 6068](#)

### *Verifying the Unicast Classifier Configuration*

**Purpose** Verify that you configured the unicast classifier with the correct forwarding classes, loss priorities, and code points.

**Action** List the classifier configuration using the operational mode command **show configuration class-of-service classifiers ieee-802.1 ba-ucast-classifier**:

```
user@switch> show configuration class-of-service classifiers ieee-802.1 ba-ucast-classifier
    forwarding-class be {
        loss-priority low code-points 000;
    }
    forwarding-class fcoe {
        loss-priority low code-points 011;
    }
    forwarding-class no-loss {
        loss-priority low code-points 100;
    }
    forwarding-class nc
        loss-priority low code-points 110;
    }
```

### *Verifying the Ingress Interface Configuration*

**Purpose** Verify that the unicast classifier **ba-ucast-classifier** is attached to ingress interface **xe-0/0/10**.

**Action** List the ingress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/10**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/10
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 ba-ucast-classifier;
    }
}
```

## Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class.

- [Requirements on page 6069](#)
- [Overview on page 6069](#)
- [Configuring Multidestination Classifiers on page 6070](#)
- [Verification on page 6070](#)

### Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

Junos OS supports three general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value or IEEE 802.1p value.

**NOTE:** DSCP IPv6 multidestination classifiers are not supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.

- Fixed classifiers. Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.
- Multifield traffic classifiers—Examine multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

Multidestination classifiers apply to all of the switch interfaces and handle multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot apply a multidestination classifier to a single interface or to a range of interfaces.

**NOTE:** You must assign unicast traffic and multicast traffic to different classifiers. One classifier cannot include both unicast and multicast forwarding classes. A multidestination classifier can include only forwarding classes for multicast traffic.

The following example describes how to configure a BA classifier called **ba-mcast-classifier**, which is applied to all of the switch interfaces. The BA classifier assigns loss priorities, as shown in [Table 547 on page 6070](#), to incoming packets in the multdestination forwarding class.

You can use the same procedure to set multifield classifiers (except that you use firewall filter rules).

**Table 547: BA-mcast-classifier Loss Priority Assignments**

Multicast Forwarding Class	For CoS Traffic Type	ba-mcast-classifier Assignment
<b>mcast</b>	Best-effort multicast traffic	Low loss priority code point: 000

### Configuring Multidestination Classifiers

To configure a multicast IEEE 802.1 BA classifier named **ba-mcast-classifier**:

- Associate code point **000** with forwarding class **mcast** and loss priority **low**:  

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-mcast-classifier forwarding-class mcast loss-priority low
code-points 000
```
- Configure the classifier as a multdestination classifier:  

```
[edit class-of-service]
user@switch# set multi-destination classifiers ieee-802.1 ba-mcast-classifier
```

### Verification

To verify the multdestination classifier configuration, perform these tasks:

- [Verifying the IEEE 802.1 Multidestination Classifier on page 6070](#)
- [Verifying the Multidestination Classifier Configuration on page 6070](#)

#### Verifying the IEEE 802.1 Multidestination Classifier

**Purpose** Verify that the classifier **ba-mcast-classifier** is configured as the IEEE 802.1 multdestination classifier:

**Action** Verify the results of the classifier configuration using the operational mode command **show configuration class-of-service multi-destination classifiers ieee-802.1**:

```
user@switch> show configuration class-of-service multi-destination classifiers ieee-802.1
ba-mcast-classifier;
```

#### Verifying the Multidestination Classifier Configuration

**Purpose** Verify that you configured the multdestination classifier with the correct forwarding classes, loss priorities, and code points.

**Action** List the classifier configuration using the operational mode command **show configuration class-of-service classifiers ieee-802.1 ba-mcast-classifier**:

```
user@switch> show configuration class-of-service classifiers ieee-802.1 ba-mcast-classifier
```

```
forwarding-class mcast {
    loss-priority low code-points 000;
}
```

## Example: Configuring WRED Drop Profiles

You can configure an interpolated weighted random early detection (WRED) profile to control packet drop characteristics for different traffic loss priorities.

**NOTE:** You cannot enable WRED on multidestination (multicast) queues. You can enable WRED only on unicast queues.

Also, do not enable WRED on lossless traffic flows. Use priority-based flow control (PFC) to prevent packet loss on lossless forwarding classes.

- [Requirements on page 6071](#)
- [Overview on page 6071](#)
- [Configuring a Drop Profile on page 6073](#)
- [Verification on page 6073](#)

### Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

You associate a WRED profile with a loss priority in a scheduler. When you attach the scheduler to a forwarding class (queue), you apply the interpolated drop profile to traffic of the specified loss priority in that queue. *Interpolated* means that the switch creates a smooth drop curve from a drop start point to a drop end point, with a maximum drop rate that is reached at the drop end point:

- Drop start point—Percentage of average queue fill level when the WRED algorithm starts to drop packets. Before the drop start point, no packets are scheduled to drop.
- Drop end point—Average queue fill level at which all subsequently arriving packets are dropped. When the queue fill levels falls below the drop end point, packets begin to

be forwarded again. (At the drop end point, the packet drop probability becomes 100 percent.)

- Maximum drop rate—Drop probability when the average queue fill level reaches the drop end point.

You set the drop start point and the drop end point by specifying two queue fill level percentage values. The first value is the drop start point and the second value is the drop end point.

You set the maximum drop rate by specifying two drop probability percentage values. The first value is always zero (0), which is the minimum drop rate, the probability of dropping a packet at the drop start point. The second value is the maximum drop rate at the drop end point.

The drop rate is zero until the queue fill level reaches the drop start point. As the queue continues to fill, packets drop in smooth linear curve until the queue reaches the drop end point, when packets drop at the maximum drop rate. If the queue fills beyond the drop end point, all packets that match the drop profile are dropped.

Figure 217 on page 6072 shows the graph for a drop profile with a drop start point of 30 percent, a drop end point of 50 percent, and a maximum drop rate of 80 percent.

**Figure 217: WRED Drop Profile Packet Drop Example**

The graph shows that when the queue fill level is less than 30 percent, the packet drop rate is zero. When the queue fill level reaches 30 percent, packets begin to drop. As the queue fills, a higher percentage of packets drop. When the queue fill level reaches 50 percent, the packet drop rate has climbed to 80 percent. When the queue fill level exceeds 50 percent, all packets drop.

This example describes how to configure the drop profile shown in Figure 217 on page 6072. The drop profile will have:

- The name **be-dp1**
- 30 percent for the drop start point (first **fill-level** setting)

- 50 percent for the drop end point (second **fill-level** setting)
- 0 percent for the minimum drop rate (first **drop-probability** setting)
- 80 percent for the maximum drop rate (second **drop-probability** setting)

You apply a drop profile by configuring a drop profile map that maps the drop profile to a packet loss priority and associates the drop profile and packet loss priority with a scheduler. When you associate the scheduler with a forwarding class (queue), the switch applies the drop profile to the packets in the forwarding class that have a matching packet loss priority.

### Configuring a Drop Profile

1. Set the drop start point at **30** percent, the drop end point at **50** percent, the minimum drop rate at **0** percent, and the maximum drop rate at **80** percent for the drop profile **be-dp1**:

```
[edit class-of-service]
user@switch# set drop-profile be-dp1 interpolate fill-level 30 fill-level 50 drop-probability
0 drop-probability 80
```

### Verification

#### Verifying the Drop Profile Configuration

**Purpose** Verify that you configured the drop profile **be-dp1** with the correct drop start and end points and with the correct drop rates.

**Action** Verify the results of the drop profile configuration using the operational mode command **show configuration class-of-service drop-profiles be-dp1**:

```
user@switch> show configuration class-of-service drop-profiles be-dp1
interpolate {
    fill-level [ 30 50 ];
    drop-probability [ 0 80 ];
}
```

**Related Documentation**

- [Example: Configuring Queue Schedulers on page 6081](#)
- [Example: Configuring Drop Profile Maps on page 6073](#)
- [Configuring CoS WRED Drop Profiles on page 6163](#)
- [Understanding CoS WRED Drop Profiles on page 5909](#)

### Example: Configuring Drop Profile Maps

A drop-profile map associates a WRED profile for traffic of a specified loss priority with a scheduler. When you use a scheduler map to map a scheduler to a forwarding class,

the drop profile map associated with the scheduler applies the specified WRED profile to traffic in the forwarding class that matches the specified loss priority.

- [Requirements on page 6074](#)
- [Overview on page 6074](#)
- [Configuring a Drop Profile Map on page 6074](#)
- [Verification on page 6075](#)

---

## Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

---

## Overview

Drop profile maps enable you to configure different drop profiles for traffic of different loss priorities within the same scheduler. You can associate different drop profiles with low-priority, medium-high priority, and high-priority traffic within a single scheduler, and then map that scheduler to a forwarding class. This applies the appropriate drop profile to traffic of each loss priority in a forwarding class. Drop profile maps apply to all traffic protocols.

The following example describes how to configure a drop profile map for a scheduler named **mylan** that includes:

- A drop profile called **lp-profile** for low-priority traffic
- A drop profile called **mh-profile** for medium-high priority traffic
- A drop profile called **h-profile** for high-priority traffic

You apply the drop profiles in the drop profile map to a forwarding class by associating the scheduler **mylan** with a forwarding class in a scheduler map.

---

## Configuring a Drop Profile Map

1. Configure the drop profile for low-priority traffic:

```
[edit class-of-service]
user@switch# set schedulers mylan drop-profile-map loss-priority low protocol any
drop-profile lp-profile
```

2. Configure the drop profile for medium-high priority traffic:

```
[edit class-of-service]
user@switch# set schedulers mylan drop-profile-map loss-priority medium-high protocol
any drop-profile mh-profile
```

3. Configure the drop profile for high-priority traffic:

```
[edit class-of-service]
user@switch# set schedulers mylan drop-profile-map loss-priority high protocol any
drop-profile h-profile
```

## Verification

### Verifying the Drop Profile Map Configuration

**Purpose** Verify that you configured the drop profile map for the scheduler **mylan** with the correct loss priorities and drop profiles.

**Action** Verify the results of the drop profile map configuration using the operational mode command **show configuration class-of-service schedulers mylan**:

```
user@switch> show configuration class-of-service schedulers mylan
transmit-rate 3g;
shaping-rate percent 100;
priority low;
drop-profile-map loss-priority low protocol any drop-profile lp-profile;
drop-profile-map loss-priority medium-high protocol any drop-profile mh-profile;
drop-profile-map loss-priority high protocol any drop-profile h-profile;
```

**NOTE:** This example does not include configuring scheduler bandwidth and priority. This information (transmit rate, shaping rate, and priority) is shown for completeness.

## Example: Configuring Forwarding Classes

Forwarding classes allow you to group packets for transmission. You assign packets to unicast or multideestination (multicast, broadcast, and destination lookup fail) output queues based on forwarding classes.

- [Requirements on page 6075](#)
- [Overview on page 6076](#)
- [Configuring Forwarding Classes on page 6077](#)
- [Verification on page 6078](#)

### Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

## Overview

---

The switch supports a total of 12 forwarding classes. In order to forward traffic, you must map (assign) the forwarding classes to unicast or multideestination output queues. The switch has 12 queues. Queues 0 through 7 are for unicast traffic, and queues 8 through 11 are for multideestination traffic. The switch supports up to two lossless forwarding classes.

By default, four categories of unicast forwarding classes and one multideestination forwarding class are defined. You can define the remaining seven forwarding classes and configure them as unicast or multideestination by mapping them to unicast or multideestination queues. The type of queue, unicast or multideestination, determines the type of forwarding class.

The four default unicast forwarding classes are:

- **be**—Best-effort traffic
- **fcoe**—Guaranteed delivery for Fibre Channel over Ethernet traffic
- **no-loss**—Guaranteed delivery for TCP no-loss traffic
- **nc**—Network control traffic

The default multideestination forwarding class is:

- **mcast**—Multideestination traffic

Map forwarding classes to queues using the **class** statement, which enables you to configure up to 12 forwarding classes. You can map more than one forwarding class to a single queue, but all forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. You cannot mix unicast and multicast forwarding classes on the same queue. The statement format is:

```
[edit class-of-service forwarding-classes]
user@switch# class class-name queue-num queue-number;
```

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

---

**NOTE:** Junos OS Release 11.3R1 and earlier supported an alternate method of mapping forwarding classes to queues that allowed you to map only one forwarding class to a queue using the statement:

```
[edit class-of-service forwarding-classes]
user@switch# queue queue-number class-name
```

The `queue` statement has been deprecated and is no longer valid in Junos OS Release 11.3R2 and later. If you have a configuration that uses the `queue` statement to map forwarding classes to queues, edit the configuration to replace the `queue` statement with the `class` statement.

**NOTE:** Hierarchical scheduling controls output queue forwarding. When you define a forwarding class that will carry traffic on the switch (the behavior aggregate classifier has a forwarding class and you expect traffic for the forwarding class), you must also define a scheduling policy for the forwarding class. Defining a scheduling policy means:

- Mapping a scheduler to the forwarding class in a scheduler map
- Including the forwarding class in a forwarding class set
- Associating the scheduler map with a traffic control profile
- Attaching the traffic control profile to a forwarding class set and an interface

Table 548 on page 6077 shows the configuration forwarding-class-to-queue mapping for this example:

**Table 548: Forwarding-Class-to-Queue Example Configuration**

Forwarding Class	Queue
best-effort	0
nc	7
mcast	8

### Configuring Forwarding Classes

To configure CoS forwarding classes, map the forwarding classes to queues:

1. Map the **best-effort** forwarding class to queue 0:

```
[edit class-of-service forwarding-classes]
user@switch# set class best-effort queue-num 0
```

2. Map the **nc** forwarding class to queue 7:

```
[edit class-of-service forwarding-classes]
```

```
user@switch# set class nc queue-num 7
```

3. Map the **mcast-be** forwarding class to queue 8:

```
[edit class-of-service forwarding-classes]  
user@switch# set class mcast-be queue-num 8
```

---

### Verification

#### *Verifying the Forwarding-Class-to-Queue Mapping*

**Purpose** Verify the forwarding-class-to-queue mapping. (The system shows only the explicitly configured forwarding classes; it does not show default forwarding classes such as **fcoe** and **no-loss**.)

**Action** Verify the results of the forwarding class configuration using the operational mode command **show configuration class-of-service forwarding-classes**:

```
user@switch> show configuration class-of-service forwarding-classes  
class best-effort queue-num 0;

### Example: Configuring Forwarding Class Sets

A forwarding class set (fc-set) is a priority group for enhanced transmission selection (ETS) traffic control. Each fc-set consists of one or more forwarding classes (output queues).

ETS enables you to configure link resources (bandwidth and bandwidth sharing characteristics) for a priority group, and then allocate the priority group's resources among the forwarding classes that belong to the priority group. This is called two-tier, or hierarchical, scheduling. Traffic control profiles control the scheduling for the priority group, and schedulers control the scheduling for individual forwarding classes.

- [Requirements on page 6079](#)
- [Overview on page 6079](#)
- [Configuring Forwarding Class Sets on page 6080](#)
- [Verification on page 6080](#)

## Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

## Overview

You can configure up to three unicast fc-sets and one multicast fc-set. A common way to configure unicast priority groups is to configure separate fc-sets for local area network (LAN) traffic, storage area network (SAN) traffic, and high-performance computing (HPC) traffic, and then assign the appropriate forwarding classes to each fc-set.

**NOTE:** If you configure strict-high priority queues, you must create an fc-set that is dedicated only to strict-high priority traffic. Only one fc-set can contain strict-high priority queues. Queues that are not strict-high priority cannot belong to the same fc-set as strict-high priority queues. The multidestination fc-set cannot contain strict-high priority queues.

To apply ETS, you map one or more fc-sets to a physical egress port. You can map up to three forwarding class sets to each port. When you map an fc-set to a port, the port uses hierarchical scheduling to allocate port resources to the priority group (fc-set) and to allocate the priority group resources to the queues (forwarding classes) that belong to the priority group.

This example describes how to:

- Configure three fc-sets called **lan-pg**, **san-pg**, and **hpc-pg**.
- Assign forwarding classes to each of the fc-sets.
- Apply the fc-sets and their output traffic control profiles to an egress interface.

This example does not describe how to configure the forwarding classes assigned to the fc-sets or how to configure traffic control profiles. [Table 549 on page 6079](#) shows the configuration components for this example:

**Table 549: Components of the Forwarding Class Sets Configuration Example**

Component	Settings
Hardware	QFX3500 switch
LAN traffic priority group	Forwarding class set: <b>lan-pg</b> Forwarding classes: <b>best-effort-1</b> , <b>best-effort-2</b>
SAN traffic priority group	Forwarding class set: <b>san-pg</b> Forwarding classes: <b>fcoe</b> , <b>fcoe-2</b>

Table 549: Components of the Forwarding Class Sets Configuration Example (*continued*)

Component	Settings
HPC traffic priority group	Forwarding class set: <b>hpc-pg</b> Forwarding classes: <b>nc, high-perf</b>
Egress interface	<b>xe-0/0/7</b>

### Configuring Forwarding Class Sets

1. Define the **lan-pg** priority group (fc-set) and assign to it the forwarding classes **best-effort-1** and **best-effort-2**:  

```
[edit class-of-service]
user@switch# set forwarding-class-sets lan-pg class best-effort-1
user@switch# set forwarding-class-sets lan-pg class best-effort-2
```
2. Define the **san-pg** priority group and assign to it the forwarding classes **fcoe** and **fcoe-2**:  

```
[edit class-of-service]
user@switch# set forwarding-class-sets san-pg class fcoe
user@switch# set forwarding-class-sets san-pg class fcoe-2
```
3. Define the **hpc-pg** priority group and assign to it the forwarding classes **nc** and **high-perf**:  

```
[edit class-of-service]
user@switch# set forwarding-class-sets hpc-pg class nc
user@switch# set forwarding-class-sets hpc-pg class high-perf
```
4. Map the three forwarding class sets to an interface (the output traffic control profiles associated with the forwarding class sets determine the class of service scheduling for the priority groups):  

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/7 forwarding-class-set lan-pg
output-traffic-control-profile lan-tcp
user@switch# set interfaces xe-0/0/7 forwarding-class-set san-pg
output-traffic-control-profile san-tcp
user@switch# set interfaces xe-0/0/7 forwarding-class-set hpc-pg
output-traffic-control-profile hpc-tcp
```

### Verification

To verify the priority group configuration, perform these tasks:

- [Verifying Forwarding Class Set Membership on page 6080](#)
- [Verifying the Egress Interface Configuration on page 6081](#)

#### Verifying Forwarding Class Set Membership

**Purpose** Verify that you configured the **lan-pg**, **san-pg**, and **hpc-pg** priority groups with the correct forwarding classes.

**Action** List the forwarding class set member configuration using the operational mode command **show configuration class-of-service forwarding-class-sets**:

```
user@switch> show configuration class-of-service forwarding-class-sets
lan-pg {
    class best-effort-1;
    class best-effort-2;
}
san-pg {
    class fcoe;
    class fcoe-2;
}
hpc-pg {
    class high-perf;
    class nc;
}
```

#### *Verifying the Egress Interface Configuration*

**Purpose** Verify that egress interface **xe-0/0/7** is associated with the **lan-pg**, **san-pg**, and **hpc-pg** priority groups and with the correct output traffic control profiles.

**Action** Display the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    lan-pg {
        output-traffic-control-profile lan-tcp;
    }
    san-pg {
        output-traffic-control-profile san-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
```

## Example: Configuring Queue Schedulers

Schedulers define the CoS properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the priority of the queue, whether explicit congestion notification (ECN) is enabled on the queue, and the WRED packet drop profiles associated with the queue.

- [Requirements on page 6082](#)
- [Overview on page 6082](#)

---

## Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

---

## Overview

Scheduler parameters define the following characteristics for the queues mapped to the scheduler:

- **transmit-rate**—Minimum bandwidth, also known as the committed information rate (CIR). Each queue mapped to the scheduler receives a minimum of either the configured amount of absolute bandwidth or the configured percentage of bandwidth. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue. You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

**NOTE:** The **transmit-rate** setting works only if you also configure the **guaranteed-rate** in the traffic control profile that is attached to the forwarding class set to which the queue belongs. If you do not configure the **guaranteed-rate**, the **transmit-rate** does not work. The sum of all queue transmit rates in a forwarding class set should not exceed the traffic control profile guaranteed rate. If you configure transmit rates whose sum exceeds the forwarding class set guaranteed rate, the commit check fails, and the system rejects the configuration.

**NOTE:** Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR). Each queue receives a maximum of the configured amount of absolute bandwidth or the configured percentage of bandwidth, even if more bandwidth is available.

**NOTE:** Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **priority**—One of two bandwidth priorities that queues associated with a scheduler can receive:

- **low**—The scheduler has low priority.
- **strict-high**—The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.

We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.

- **drop-profile-map**—Mapping of a drop profile to a loss priority and protocol to apply WRED to the scheduler.
- **buffer-size**—Size of the queue buffer as a percentage of the dedicated buffer space on the port, or as a proportional share of the dedicated buffer space on the port that remains after the explicitly configured queues are served.
- **explicit-congestion-notification**—Enables ECN on a best-effort queue. ECN enables end-to-end congestion notification between two ECN-enabled endpoints on TCP/IP based networks. ECN must be enabled on both endpoints and on all of the intermediate devices between the endpoints for ECN to work properly. ECN is disabled by default.

**NOTE:** Ingress port congestion can occur during periods of egress port congestion if an ingress port forwards traffic to more than one egress port, and at least one of those egress ports experiences congestion. If this occurs, the congested egress port can cause the ingress port to exceed its fair allocation of ingress buffer resources. When the ingress port exceeds its buffer resource allocation, frames are dropped at the ingress. Ingress port frame drop affects not only the congested egress ports, but also all of the egress ports to which the congested ingress port forwards traffic.

If a congested ingress port drops traffic that is destined for one or more uncongested egress ports, configure a weighted random early detection (WRED) drop profile and apply it to the egress queue that is causing the congestion. The drop profile prevents the congested egress queue from affecting egress queues on other ports by dropping frames at the egress instead of causing congestion at the ingress port.

**NOTE:** Do not configure drop profiles for the fcoe and no-loss forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.

Scheduler maps associate schedulers with forwarding classes (queues). After defining schedulers and mapping them to queues in a scheduler map, to configure hardware queue scheduling (port scheduling) you:

1. Associate a scheduler map with a traffic control profile (a traffic control profile schedules resources for a group of forwarding classes, called a *forwarding class set* or *priority group*).
2. Attach a forwarding class and a traffic control profile to an interface.

You can associate up to four user-defined scheduler maps with forwarding class sets.

This process configures the hardware queues, packet schedulers, and WRED characteristics that operate according to the scheduler mapping. The traffic control profile uses the scheduler CoS properties to determine the resources that should be allocated to the individual output queues from the total resources available to the priority group.

Table 550 on page 6084 shows the configuration components for this example.

**Table 550: Components of the Queue Scheduler Configuration Example**

Component	Settings
Hardware	QFX3500 switch
Scheduler	Name: <b>be-sched</b> Transmit rate: <b>20%</b> Shaping rate: <b>40%</b> Buffer size: <b>20%</b> Priority: <b>low</b> Drop profile: <b>be-dp</b> ECN: <b>disable</b> (default)
Scheduler map	Name: <b>be-map</b> Forwarding class to associate with the <b>be-sched</b> scheduler: <b>best-effort</b>
Traffic control profile	Name: <b>be-tcp</b>  <b>NOTE:</b> This topic does not describe how to define a traffic control profile.
Forwarding class set	Name: <b>lan-pg</b>

## Configuring a CoS Scheduler

To configure a CoS scheduler using the CLI:

1. Create a scheduler (**be-sched**) with a minimum guaranteed bandwidth of 2 Gbps, a maximum bandwidth of 4 Gbps, low priority, and map it to the drop profile **be-dp**:

```
[edit class-of-service schedulers]
user@switch# set be-sched transmit-rate percent 20
user@switch# set be-sched shaping-rate percent 40
user@switch# set be-sched buffer-size percent 20
user@switch# set be-sched priority low
user@switch# set be-sched drop-profile-map loss-priority low protocol any drop-profile
be-dp
```

**NOTE:** Because ECN is disabled by default, no ECN configuration is shown.

2. Configure a scheduler map (**be-map**) that associates the scheduler (**be-sched**) with the forwarding class (**best-effort**):

```
[edit class-of-service scheduler-maps]
user@switch# set be-map forwarding-class best-effort scheduler be-sched
```

3. Associate the scheduler map **be-map** with a traffic control profile (**be-tcp**):

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp scheduler-map be-map
```

4. Associate the traffic control profile **be-tcp** with a forwarding class set (**lan-pg**) and a 10-Gigabit Ethernet interface (**xe-0/0/7**):

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/7 forwarding-class-set lan-pg
output-traffic-control-profile be-tcp
```

5. Alternatively, you can assign the scheduler map (**be-map**) to all the 10-Gigabit Ethernet interfaces using wildcards (**xe-\***):

```
[edit class-of-service interfaces]
user@switch# set xe-* forwarding-class-set lan-pg output-traffic-control-profile be-tcp
```

## Verification

To verify that the queue scheduler has been created and is mapped to the correct interfaces, perform these tasks:

- [Verifying the Scheduler Configuration on page 6085](#)
- [Verifying the Scheduler Map Configuration on page 6086](#)
- [Verifying That the Scheduler Is Associated with the Interface on page 6086](#)

### Verifying the Scheduler Configuration

**Purpose** Verify that the queue scheduler **be-sched** has been created with a minimum guaranteed bandwidth of 2 Gbps, a maximum bandwidth of 4 Gbps, the priority set to **low**, and the drop profile **be-dp**.

**Action** Display the scheduler using the operational mode command **show configuration class-of-service schedulers be-sched**:

```
user@switch> show configuration class-of-service schedulers be-sched
transmit-rate percent 20;
shaping-rate percent 40;
buffer-size percent 20
priority low;
drop-profile-map loss-priority low protocol any drop-profile be-dp;
```

#### *Verifying the Scheduler Map Configuration*

**Purpose** Verify that the scheduler map **be-map** has been created and associates the forwarding class **best-effort** with the scheduler **be-sched**, and also that the scheduler map is attached to the traffic control profile **be-tcp**.

**Action** Display the scheduler map using the operational mode command **show configuration class-of-service scheduler-maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
forwarding-class best-effort scheduler be-sched;
```

Display the traffic control profile to verify that the scheduler map **be-map** is attached using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

**NOTE:** This topic does not describe how to configure a traffic control profile or its allocation of port bandwidth. Using a traffic control profile to configure the port resource allocation to the priority group is necessary to implement hierarchical scheduling.

---

#### *Verifying That the Scheduler Is Associated with the Interface*

**Purpose** Verify that the forwarding class set (**lan-pg**) and the traffic control profile (**be-tcp**) that are associated with the queue scheduler are attached to the interface **xe-0/0/7**.

**Action** List the interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    lan-pg {
        output-traffic-control-profile be-tcp;
    }
}
```

## Example: Configuring Queue Scheduling Priority

You can configure the bandwidth scheduling priority of individual queues by specifying the priority in a scheduler, and then using a scheduler map to associate the scheduler with a queue.

- [Requirements on page 6087](#)
- [Overview on page 6087](#)
- [Configuring Queue Scheduling Priority on page 6088](#)
- [Verification on page 6089](#)

### Requirements

---

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

---

Queues can have one of two bandwidth priorities:

- **strict-high**—You can configure only one queue as a strict-high or high-priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.

**NOTE:** If you configure strict-high priority queues, you must create an fc-set that is dedicated only to strict-high priority traffic. Only one fc-set can contain strict-high priority queues. Queues that are not strict-high priority cannot belong to the same fc-set as strict-high priority queues. The multidestination fc-set cannot contain strict-high priority queues.

We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.

- **low**—Low priority. Traffic with this priority is serviced after any queue that has a **strict-high** priority.

Table 551 on page 6088 shows the configuration components for this example.

This example describes how to set the queue priority for two forwarding classes (queues) named **fcoe** and **no-loss**. Both queues have a priority of **low**. The scheduler for the **fcoe** queue is named **fcoe-sched** and the scheduler for the **no-loss** queue is named **nl-sched**. One scheduler map, **schedmap1**, associates the schedulers to the queues.

**Table 551: Components of the Queue Scheduler Priority Configuration Example**

Component	Settings
Hardware	QFX3500 switch
Schedulers	<b>fcoe-sched</b> for FCoE traffic <b>nl-sched</b> for no-loss traffic
Priority	<b>low</b> for FCoE traffic <b>low</b> for no-loss traffic
Scheduler map	<b>schedmap1</b> : FCoE mapping: scheduler <b>fcoe-sched</b> to forwarding class <b>fcoe</b> No-loss mapping: scheduler <b>nl-sched</b> to forwarding class <b>no-loss</b>

### Configuring Queue Scheduling Priority

To configure queue priority using the CLI:

1. Create the FCoE scheduler with **low** priority:  

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low
```
2. Create the no-loss scheduler with **low** priority:  

```
[edit class-of-service]
```

```
user@switch# set schedulers nl-sched priority low
```

3. Associate the schedulers with the desired queues in the scheduler map:

```
[edit class-of-service]
```

```
user@switch# set scheduler-maps schedmap1 forwarding-class fcoe scheduler fcoe-sched
```

```
user@switch# set scheduler-maps schedmap1 forwarding-class no-loss scheduler nl-sched
```

## Verification

To verify that you configured the queue scheduling priority for bandwidth and mapped the schedulers to the correct forwarding classes, perform these tasks:

- [Verifying the Queue Scheduling Priority on page 6089](#)
- [Verifying the Scheduler-to-Forwarding-Class Mapping on page 6089](#)

### Verifying the Queue Scheduling Priority

**Purpose** Verify that you configured the queue schedulers **fcoe-sched** and **nl-sched** with **low** queue scheduling priority.

**Action** Display the **fcoe-sched** scheduler priority configuration using the operational mode command **show configuration class-of-service schedulers fcoe-sched priority**:

```
user@switch> show configuration class-of-service schedulers fcoe-sched priority
priority low;
```

Display the **nl-sched** scheduler priority configuration using the operational mode command **show configuration class-of-service schedulers nl-sched priority**:

```
user@switch> show configuration class-of-service schedulers nl-sched priority
priority low;
```

### Verifying the Scheduler-to-Forwarding-Class Mapping

**Purpose** Verify that you configured the scheduler map **schedmap1** to map scheduler **fcoe-sched** to forwarding class **fcoe** and schedule **nl-sched** to forwarding class **no-loss**.

**Action** Display the scheduler map **schedmap1** using the operational mode command **show configuration class-of-service scheduler-maps schedmap1**:

```
user@switch> show configuration class-of-service scheduler-maps schedmap1
forwarding-class fcoe scheduler fcoe-sched;
forwarding-class no-loss scheduler nl-sched;
```

## Example: Configuring ECN

This example shows how to enable explicit congestion notification (ECN) on an output queue.

- [Requirements on page 6090](#)
- [Overview on page 6090](#)
- [Configuration on page 6091](#)
- [Verification on page 6093](#)

---

### Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX Series switch
- Junos OS Release 13.2X51-D25 or later for the QFX Series

---

### Overview

ECN enables end-to-end congestion notification between two endpoints on TCP/IP based networks. The two endpoints are an ECN-enabled sender and an ECN-enabled receiver. ECN must be enabled on both endpoints and on all of the intermediate devices between the endpoints for ECN to work properly. Any device in the transmission path that does not support ECN breaks the end-to-end ECN functionality.

A weighted random early detection (WRED) packet drop profile must be applied to the output queues on which ECN is enabled. ECN uses the WRED drop profile thresholds to mark packets when the output queue experiences congestion.

ECN reduces packet loss by forwarding ECN-capable packets during periods of network congestion instead of dropping those packets. (TCP notifies the network about congestion by dropping packets.) During periods of congestion, ECN marks ECN-capable packets that egress from congested queues. When the receiver receives an ECN packet that is marked as experiencing congestion, the receiver echoes the congestion state back to the sender. The sender then reduces its transmission rate to clear the congestion.

ECN is disabled by default. You can enable ECN on best-effort traffic. ECN should not be enabled on lossless traffic queues, which uses priority-based flow control (PFC) for congestion notification, and ECN should not be enabled on strict-high priority traffic queues.

To enable ECN on an output queue, you not only need to enable ECN in the queue scheduler, you also need to:

- Configure a WRED packet drop profile.
- Configure a queue scheduler that includes the WRED drop profile and enables ECN. (This example shows only ECN and drop profile configuration; you can also configure bandwidth, priority, and buffer settings in a scheduler.)
- Map the queue scheduler to a forwarding class (output queue).

- Add the forwarding class to a forwarding class set (priority group, for hierarchical scheduling).
- Associate the queue scheduler with a traffic control profile (priority group scheduler for hierarchical scheduling).
- Apply the traffic control profile and the forwarding class set to an interface. On that interface, the specified output queue (the queue mapped to the forwarding class) uses the scheduler that is mapped to the traffic control profile, which enables ECN on the queue and applies the WRED drop profile to the queue.

Table 552 on page 6091 shows the configuration components for this example.

**Table 552: Components of the ECN Configuration Example**

Component	Settings
Hardware	QFX Series switch
Drop profile	Name: <b>be-dp</b> Drop start fill level: <b>30</b> percent Drop end fill level: <b>75</b> percent Drop probability at drop start (minimum drop rate): <b>0</b> percent Drop probability at drop end (maximum drop rate): <b>80</b> percent
Scheduler	Name: <b>be-sched</b> ECN: enabled Drop profile: <b>be-dp</b> Transmit rate: <b>25%</b> Shaping rate: <b>50%</b> Buffer size: <b>25%</b> Priority: <b>low</b>
Scheduler map	Name: <b>be-map</b> Forwarding class: <b>best-effort</b> Scheduler: <b>be-sched</b>  <b>NOTE:</b> By default, the <b>best-effort</b> forwarding class is mapped to output queue <b>0</b> .
Forwarding class set	Name: <b>be-pg</b> Forwarding class: <b>best-effort</b> (queue 0)
Traffic control profile	Name: <b>be-tcp</b> Scheduler map: <b>be-map</b>
Interface	Name: <b>xe-0/0/20</b> Forwarding class set: <b>be-pg</b> (Output) traffic control profile: <b>be-tcp</b>

### Configuration

**CLI Quick Configuration** To quickly configure the drop profile, scheduler with ECN enabled, and to map the scheduler to an output queue on an interface, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service]
set drop-profile be-dp interpolate fill-level 30 fill-level 75 drop-probability 0 drop-probability 80
set schedulers be-sched explicit-congestion-notification
set schedulers be-sched drop-profile-map loss-priority low protocol any drop-profile be-dp
set schedulers be-sched transmit-rate percent 25
set schedulers be-sched shaping-rate percent 50
set schedulers be-sched buffer-size percent 25
set schedulers be-sched priority low
set scheduler-maps be-map forwarding-class best-effort scheduler be-sched
set forwarding-class-sets be-pg class best-effort
set traffic-control-profiles be-tcp scheduler-map be-map
set interfaces xe-0/0/20 forwarding-class-set be-pg output-traffic-control-profile be-tcp
```

### Configuring ECN

#### Step-by-Step Procedure

To configure ECN using the CLI:

1. Configure the WRED packet drop profile **be-dp**. This example uses a drop start point of **30** percent, a drop end point of **75** percent, a minimum drop rate of **0** percent, and a maximum drop rate of **80** percent:

```
[edit class-of-service]
user@switch# set drop-profile be-dp interpolate fill-level 30 fill-level 75 drop-probability 0 drop-probability 80
```

2. Create the scheduler **be-sched** with ECN enabled and associate the drop profile **be-dp** with the scheduler:

```
[edit class-of-service]
user@switch# set schedulers be-sched explicit-congestion-notification
user@switch# set schedulers be-sched drop-profile-map loss-priority low protocol any drop-profile be-dp
user@switch# set be-sched transmit-rate percent 25
user@switch# set be-sched shaping-rate percent 50
user@switch# set be-sched buffer-size percent 25
user@switch# set be-sched priority low
```

3. Map the scheduler **be-sched** to the **best-effort** forwarding class (output queue 0) using scheduler map **be-map**:

```
[edit class-of-service]
user@switch# set scheduler-maps be-map forwarding-class best-effort scheduler be-sched
```

4. Add the forwarding class **best-effort** to the forwarding class set **be-pg**:

```
[edit class-of-service]
user@switch# set forwarding-class-sets be-pg class best-effort
```

5. Associate the scheduler map **be-map** with the traffic control profile **be-tcp**:

```
[edit class-of-service]
user@switch# set traffic-control-profiles be-tcp scheduler-map be-map
```

6. Associate the traffic control profile **be-tcp** and the forwarding class set **be-pg** with the interface on which you want to enable ECN on the best-effort queue:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 forwarding-class-set be-pg output-traffic-control-profile be-tcp
```

## Verification

To verify that ECN is enabled, perform the following task:

- [Verifying That ECN Is Enabled on page 6093](#)

### *Verifying That ECN Is Enabled*

**Purpose** Verify that ECN is enabled in the scheduler **be-sched** by showing the configuration for the scheduler map **be-map**.

**Action** Display the scheduler map configuration using the operational mode command **show class-of-service scheduler-map be-map**:

```
user@switch> show class-of-service scheduler-map be-map
Scheduler map: be-map, Index: 12240
```

```
Scheduler:be-sched, Forwarding class: best-effort, Index: 115
Transmit rate: 25 percent, Rate Limit: none, Buffer size: 25 percent,
Buffer Limit: none, Priority: low
Excess Priority: unspecified, Explicit Congestion Notification: enable
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           any       3312   be-dp
  Medium-high   any       1      <default-drop-profile>
  High          any       1      <default-drop-profile>
```

**Meaning** The **show class-of-service scheduler-map** operational command shows the configuration of the scheduler associated with the scheduler map and the forwarding class mapped to that scheduler. The output shows that:

- The scheduler associated with the scheduler map is **be-sched**.
- The scheduler map applies to the forwarding class **best-effort** (output queue 0).
- The scheduler **be-sched** has a transmit rate of **25** percent, a queue buffer size of **25** percent, and a drop priority of **low**.
- Explicit congestion notification state is **enable**.
- The WRED drop profile used for low drop priority traffic is **be-dp**.

## Example: Configuring Traffic Control Profiles (Priority Group Scheduling)

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) mapped to a forwarding class set share the bandwidth resources that you configure in the traffic control profile. A scheduler map associates forwarding classes with schedulers to define how the individual queues in a forwarding class set share the bandwidth allocated to that forwarding class set.

- [Requirements on page 6094](#)
- [Overview on page 6094](#)
- [Configuring a Traffic Control Profile on page 6095](#)
- [Verification on page 6096](#)

---

### Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

---

### Overview

The parameters you configure in a traffic control profile define the following characteristics for the priority group:

- **guaranteed-rate**—Minimum bandwidth, also known as the committed information rate (CIR). Each priority group receives a minimum of either the configured amount of absolute bandwidth or the configured percentage of bandwidth. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

**NOTE:** In order for the **transmit-rate** option (minimum bandwidth for a queue that you set using scheduler configuration) to work properly, you must configure the **guaranteed-rate** for the priority group. If a priority group does not have a guaranteed minimum bandwidth, the queues (forwarding classes) that belong to the priority group cannot have a guaranteed minimum bandwidth.

**NOTE:** Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR). Each priority group receives a maximum of the configured amount of absolute

bandwidth or the configured percentage of bandwidth, even if more bandwidth is available.

**NOTE:** Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **scheduler-map**—Bandwidth and scheduling characteristics for the queues, defined by mapping forwarding classes to schedulers. (The queue scheduling characteristics represent amounts or percentages of the priority group bandwidth, not the amounts or percentages of total link bandwidth.)

**NOTE:** Because a port can have more than one priority group, when you assign resources to a priority group, keep in mind that the total port bandwidth must serve all of the queues associated with that port.

For example, if you map three priority groups to a 10-Gigabit Ethernet port, the queues associated with all three of the priority groups share the 10-Gbps bandwidth as defined by the traffic control profiles. Therefore, the total combined guaranteed-rate value of the three priority groups should not exceed 10 Gbps. If you configure guaranteed rates whose sum exceeds the port bandwidth, the system sends a syslog message to notify you that the configuration is not valid. However, the system does not perform a commit check. If you commit a configuration in which the sum of the guaranteed rates exceeds the port bandwidth, the hierarchical scheduler behaves unpredictably.

The sum of the queue (forwarding class) transmit rates cannot exceed the total guaranteed-rate of the priority group to which the queues belong. If you configure transmit rates whose sum exceeds the priority group guaranteed rate, the commit check fails and the system rejects the configuration.

If you configure the guaranteed-rate of a priority group as a percentage, configure all of the transmit rates associated with that priority group as percentages. In this case, if any of the transmit rates are configured as absolute values instead of percentages, the configuration is not valid and the system sends a syslog message.

### Configuring a Traffic Control Profile

This example describes how to configure a traffic control profile named **san-tcp** with a scheduler map named **san-map1** and allocate to it a minimum bandwidth of 4 Gbps and a maximum bandwidth of 8 Gbps:

1. Create the traffic control profile and set the **guaranteed-rate** (minimum guaranteed bandwidth) to **4g**:

```
[edit class-of-service]
user@switch# set traffic-control-profiles san-tcp guaranteed-rate 4g
```

2. Set the **shaping-rate** (maximum guaranteed bandwidth) to **8g**:

```
[edit class-of-service]
user@switch# set traffic-control-profiles san-tcp shaping-rate 8g
```

3. Associate the scheduler map **san-map1** with the traffic control profile:

```
[edit class-of-service]
user@switch# set traffic-control-profiles san-tcp scheduler-map san-map1
```

---

## Verification

### *Verifying the Traffic Control Profile Configuration*

**Purpose** Verify that the traffic control profile **san-tcp** has been created with a minimum guaranteed bandwidth of 4 Gbps, a maximum bandwidth of 8 Gbps, and the scheduler map **san-map1**.

**Action** List the traffic control profile using the operational mode command **show configuration class-of-service traffic-control-profiles san-tcp**:

```
user@switch> show configuration class-of-service traffic-control-profiles san-tcp
scheduler-map san-map1;
shaping-rate percent 8g;
guaranteed-rate 4g;
```

---

## Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

## Overview

The priority group minimum guaranteed bandwidth defines the minimum total amount of bandwidth available for all of the queues in the priority group to meet their minimum bandwidth requirements.

The **transmit-rate** setting in the scheduler configuration determines the minimum guaranteed bandwidth for an individual queue. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

The **guaranteed-rate** setting in the traffic control profile configuration determines the minimum guaranteed bandwidth for a priority group. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

**NOTE:** You must configure both the **transmit-rate** value for the queue and the **guaranteed-rate** value for the priority group in order to set a valid minimum bandwidth guarantee for a queue. (If the priority group does not have a guaranteed minimum bandwidth, there is no guaranteed bandwidth pool from which the queue can take its guaranteed minimum bandwidth.)

The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

**NOTE:** When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

**NOTE:** You cannot configure minimum guaranteed bandwidth on strict-high priority queues or on a priority group that contains strict-high priority queues.

This example describes how to:

- Configure a transmit rate (minimum guaranteed queue bandwidth) of 2 Gbps for queues in a scheduler named **be-sched**.
- Configure a guaranteed rate (minimum guaranteed priority group bandwidth) of 4 Gbps for a priority group in a traffic control profile named **be-tcp**.

- Assign the scheduler to a queue named **best-effort** by using a scheduler map named **be-map**.
- Associate the scheduler map **be-map** with the traffic control profile **be-tcp**.
- Assign the queue **best-effort** to a priority group named **be-pg**.
- Assign the priority group and the minimum guaranteed bandwidth scheduling to the egress interface **xe-0/0/7**.

Table 553 on page 6098 shows the configuration components for this example:

**Table 553: Components of the Minimum Guaranteed Output Bandwidth Configuration Example**

Component	Settings
Hardware	QFX3500 switch
Minimum guaranteed queue bandwidth	Transmit rate: <b>2g</b>
Minimum guaranteed priority group bandwidth	Guaranteed rate: <b>4g</b>
Scheduler	<b>be-sched</b>
Scheduler map	<b>be-map</b>
Traffic control profile	<b>be-tcp</b>
Forwarding class set (priority group)	<b>be-pg</b>
Queue (forwarding class)	<b>best-effort</b>
Egress interface	<b>xe-0/0/7</b>

### Configuring Guaranteed Minimum Bandwidth

To configure the minimum guaranteed bandwidth hierarchical scheduling for a queue and a priority group:

1. Configure the minimum guaranteed queue bandwidth of 2 Gbps for scheduler **be-sched**:  

```
[edit class-of-service schedulers]
user@switch# set be-sched transmit-rate 2g
```
2. Configure the minimum guaranteed priority group bandwidth of 4 Gbps for traffic control profile **be-tcp**:  

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp guaranteed-rate 4g
```
3. Associate the scheduler **be-sched** with the **best-effort** queue in the scheduler map **be-map**:  

```
[edit class-of-service scheduler-maps]
user@switch# set be-map forwarding-class best-effort scheduler be-sched
```

- Associate the scheduler map with the traffic control profile:

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp scheduler-map be-map
```

- Assign the **best-effort** queue to the priority group **be-pg**:

```
[edit class-of-service forwarding-class-sets]
user@switch# set be-pg class best-effort
```

- Apply the configuration to interface **xe-0/0/7**:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/7 forwarding-class-set be-pg output-traffic-control-profile be-tcp
```

## Verification

- Verifying the Minimum Guaranteed Queue Bandwidth on page 6099
- Verifying the Priority Group Minimum Guaranteed Bandwidth and Scheduler Map Association on page 6099
- Verifying the Scheduler Map Configuration on page 6100
- Verifying Queue (Forwarding Class) Membership in the Priority Group on page 6100
- Verifying the Egress Interface Configuration on page 6100

### *Verifying the Minimum Guaranteed Queue Bandwidth*

**Purpose** Verify that you configured the minimum guaranteed queue bandwidth as **2g** in the scheduler **be-sched**.

**Action** Display the minimum guaranteed bandwidth in the **be-sched** scheduler configuration using the operational mode command **show configuration class-of-service schedulers be-sched transmit-rate**:

```
user@switch> show configuration class-of-service schedulers be-sched transmit-rate
2g;
```

### *Verifying the Priority Group Minimum Guaranteed Bandwidth and Scheduler Map Association*

**Purpose** Verify that the minimum guaranteed priority group bandwidth is **4g** and the attached scheduler map is **be-map** in the traffic control profile **be-tcp**.

**Action** Display the minimum guaranteed bandwidth in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp guaranteed-rate**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp guaranteed-rate
4g;
```

Display the scheduler map in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

#### *Verifying the Scheduler Map Configuration*

**Purpose** Verify that the scheduler map **be-map** maps the forwarding class **best-effort** to the scheduler **be-sched**.

**Action** Display the **be-map** scheduler map configuration using the operational mode command **show configuration class-of-service schedulers maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
forwarding-class best-effort scheduler be-sched;
```

#### *Verifying Queue (Forwarding Class) Membership in the Priority Group*

**Purpose** Verify that the forwarding class set **be-pg** includes the forwarding class **best-effort**.

**Action** Display the **be-pg** forwarding class set configuration using the operational mode command **show configuration class-of-service forwarding-class-sets be-pg**:

```
user@switch> show configuration class-of-service forwarding-class-sets be-pg
class best-effort;
```

#### *Verifying the Egress Interface Configuration*

**Purpose** Verify that the forwarding class set **be-pg** and the traffic control profile **be-tcp** are attached to egress interface **xe-0/0/7**.

**Action** Display the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    be-pg {
        output-traffic-control-profile be-tcp;
    }
}
```

## Example: Configuring Maximum Output Bandwidth

Scheduling the maximum output bandwidth for a queue (forwarding class) requires configuring both tiers of the hierarchical scheduler. One tier is scheduling the resources for the individual queue. The other tier is scheduling the resources for the priority group (forwarding class set) to which the queue belongs.

- [Requirements on page 6101](#)
- [Overview on page 6101](#)
- [Configuring Maximum Bandwidth on page 6102](#)
- [Verification on page 6103](#)

### Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

The priority group maximum bandwidth defines the maximum total amount of bandwidth available for all of the queues in the priority group.

The **shaping-rate** setting in the scheduler configuration determines the maximum bandwidth for an individual queue.

The **shaping-rate** setting in the traffic control profile configuration determines the maximum bandwidth for a priority group.

**NOTE:** When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

**NOTE:** When you set the maximum bandwidth (**shaping-rate**) for a queue or for a priority group at 100 Kbps or less, the traffic shaping behavior is accurate only within  $\pm 20$  percent of the configured **shaping-rate** value.

This example describes how to:

- Configure a maximum rate of 4 Gbps for queues in a scheduler named **be-sched**.
- Configure a maximum rate of 6 Gbps for a priority group in a traffic control profile named **be-tcp**.

- Assign the scheduler to a queue named **best-effort** by using a scheduler map named **be-map**.
- Associate the scheduler map **be-map** with the traffic control profile **be-tcp**.
- Assign the queue **best-effort** to a priority group named **be-pg**.
- Assign the priority group and the bandwidth scheduling to the interface **xe-0/0/7**.

Table 554 on page 6102 shows the configuration components for this example:

**Table 554: Components of the Maximum Output Bandwidth Configuration Example**

Component	Settings
Hardware	QFX3500 switch
Maximum queue bandwidth	Shaping rate: <b>4g</b>
Maximum priority group bandwidth	Shaping rate: <b>6g</b>
Scheduler	<b>be-sched</b>
Scheduler map	<b>be-map</b>
Traffic control profile	<b>be-tcp</b>
Forwarding class set (priority group)	<b>be-pg</b>
Queue (forwarding class)	<b>best-effort</b>
Egress interface	<b>xe-0/0/7</b>

### Configuring Maximum Bandwidth

To configure the maximum bandwidth hierarchical scheduling for a queue and a priority group:

1. Configure the maximum queue bandwidth of 4 Gbps for scheduler **be-sched**:  

```
[edit class-of-service schedulers]
user@switch# set be-sched shaping-rate 4g
```
2. Configure the maximum priority group bandwidth of 6 Gbps for traffic control profile **be-tcp**:  

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp shaping-rate 6g
```
3. Associate the scheduler **be-sched** with the **best-effort** queue in the scheduler map **be-map**:  

```
[edit class-of-service scheduler-maps]
user@switch# set be-map forwarding-class best-effort scheduler be-sched
```
4. Associate the scheduler map with the traffic control profile:

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp scheduler-map be-map
```

- Assign the **best-effort** queue to the priority group **be-pg**:

```
[edit class-of-service forwarding-class-sets]
user@switch# set be-pg class best-effort
```

- Apply the configuration to interface **xe-0/0/7**:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/7 forwarding-class-set be-pg output-traffic-control-profile be-tcp
```

## Verification

To verify the maximum output bandwidth configuration, perform these tasks:

- [Verifying the Maximum Queue Bandwidth on page 6103](#)
- [Verifying the Priority Group Maximum Bandwidth and Scheduler Map Association on page 6103](#)
- [Verifying the Scheduler Map Configuration on page 6104](#)
- [Verifying Queue \(Forwarding Class\) Membership in the Priority Group on page 6104](#)
- [Verifying the Egress Interface Configuration on page 6104](#)

### *Verifying the Maximum Queue Bandwidth*

**Purpose** Verify that you configured the maximum queue bandwidth as **4g** in the scheduler **be-sched**.

**Action** List the maximum bandwidth in the **be-sched** scheduler configuration using the operational mode command **show configuration class-of-service schedulers be-sched shaping-rate**:

```
user@switch> show configuration class-of-service schedulers be-sched shaping-rate
4g;
```

### *Verifying the Priority Group Maximum Bandwidth and Scheduler Map Association*

**Purpose** Verify that the maximum priority group bandwidth is **6g** and the attached scheduler map is **be-map** in the traffic control profile **be-tcp**.

**Action** List the maximum bandwidth in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp shaping-rate**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp shaping-rate
4g;
```

List the scheduler map in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

## **Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic**

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly best-effort (lossy) unicast traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

- [Requirements on page 6105](#)
- [Overview on page 6105](#)
- [Configuration on page 6107](#)
- [Verification on page 6108](#)

## Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

## Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause

message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)

- **Lossy buffers**—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multdestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- **Lossless buffers**—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- **Lossy buffers**—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- **Multicast buffers**—Percentage of shared buffer pool for all multdestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly best-effort unicast traffic, more buffer space needs to be allocated to lossy buffers, and less buffer space should be allocated to lossless buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly unicast traffic.

### **Topology**

[Table 555 on page 6106](#) shows the configuration components for this example.

**Table 555: Components of the Recommended Shared Buffer Configuration for Best-Effort Unicast Network Topologies**

Component	Settings
Hardware	QFX3500 switch

**Table 555: Components of the Recommended Shared Buffer Configuration for Best-Effort Unicast Network Topologies (*continued*)**

Component	Settings
Ingress shared buffer	<p>Percentage of available ingress buffer space allocated to the ingress shared buffer: 100%</p> <p>Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 5%</p> <p>Percentage of ingress buffer space allocated to lossless headroom traffic (lossless-headroom buffer partition): 0%</p> <p>Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 95%</p>
Egress shared buffer	<p>Percentage of available egress buffer space allocated to the egress shared buffer: 100%</p> <p>Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 5%</p> <p>Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 75%</p> <p>Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 20%</p>

### Configuration

#### CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly best-effort unicast traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 0
set ingress buffer-partition lossy percent 95
set egress percent 100
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 75
set egress buffer-partition multicast percent 20
```

#### *Configuring the Global Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic*

#### Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly best-effort unicast traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:
 

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent 100
```
2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:
 

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent 5
user@switch# set ingress buffer-partition lossless-headroom percent 0
user@switch# set ingress buffer-partition lossy percent 95
```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```
4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:  

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 5
user@switch# set egress buffer-partition lossy percent 75
user@switch# set egress buffer-partition multicast percent 20
```

### Results

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 95;
    }
    buffer-partition lossless-headroom {
        percent 0;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 75;
    }
    buffer-partition multicast {
        percent 20;
    }
}
```

---

### Verification

Verify that the shared buffer configuration has been created properly.

#### *Verifying the Shared Buffer Configuration*

**Purpose** Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

**Action** List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer      : 9360.00 KB
  Dedicated Buffer  : 2158.00 KB
```

```

Shared Buffer      : 7202.00 KB
Lossless          : 360.10 KB
Lossless Headroom : 0.00 KB
Lossy             : 6841.90 KB

```

Lossless Headroom Utilization:

Node Device	Total	Used	Free
0	0.00 KB	0.00 KB	0.00 KB

Egress:

```

Total Buffer      : 9360.00 KB
Dedicated Buffer  : 2704.00 KB
Shared Buffer     : 6656.00 KB
Lossless         : 332.80 KB
Multicast        : 1331.20 KB
Lossy            : 4992.00 KB

```

**Meaning** The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 360.10 KB to lossless traffic
  - No space to lossless headroom traffic
  - 6841.90 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Because the lossless headroom buffer partition is set to 0 (zero) percent, the total amount of lossless headroom buffer space is 0 KB; therefore the amount of used and free lossless headroom buffer space is also 0 KB.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.

- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 332.80 KB to lossless traffic
  - 1331.20 KB to multicast traffic
  - 4992 KB to lossy unicast traffic

**NOTE:** The output values are valid for QFX3500 and QFX3600 switches. QFX5100 and EX4600 switches have larger buffers (12MB instead of 9MB), so the total buffer size and the sizes of each buffer partition are larger on QFX5100 and EX4600 switches.

### Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links with Ethernet PAUSE Enabled

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly best-effort (lossy) traffic on links with Ethernet PAUSE (IEEE 802.3X) enabled. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

---

## Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

---

## Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly best-effort traffic on links enabled for Ethernet PAUSE, more buffer space needs to be allocated to ingress dedicated port buffers, and less buffer space should be allocated to ingress shared buffers. Also, more buffer space needs to be allocated to lossless-headroom buffers, and less space to ingress lossy buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly best-effort traffic on links enabled for Ethernet PAUSE.

### Topology

Table 556 on page 6112 shows the configuration components for this example.

**Table 556: Components of the Recommended Shared Buffer Configuration for Best-Effort Network Topologies with Links Enabled for Ethernet PAUSE**

Component	Settings
Hardware	QFX3500 switch
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 70%  Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 5%  Percentage of ingress buffer space allocated to lossless headroom traffic (lossless-headroom buffer partition): 80%  Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 15%

**Table 556: Components of the Recommended Shared Buffer Configuration for Best-Effort Network Topologies with Links Enabled for Ethernet PAUSE (continued)**

Component	Settings
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100%
	Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 5%
	Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 75%
	Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 20%

### Configuration

#### CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly best-effort unicast traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 70
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 80
set ingress buffer-partition lossy percent 15
set egress percent 100
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 75
set egress buffer-partition multicast percent 20
```

#### *Configuring the Global Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links Enabled for Ethernet PAUSE*

#### Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent 70
```
2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:  

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent 5
user@switch# set ingress buffer-partition lossless-headroom percent 80
user@switch# set ingress buffer-partition lossy percent 15
```
3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```
4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:  

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 5
user@switch# set egress buffer-partition lossy percent 75
```

```
user@switch# set egress buffer-partition multicast percent 20
```

### Results

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 70;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 15;
    }
    buffer-partition lossless-headroom {
        percent 80;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 75;
    }
    buffer-partition multicast {
        percent 20;
    }
}
```

---

### Verification

Verify that the shared buffer configuration has been created properly.

#### *Verifying the Shared Buffer Configuration*

**Purpose** Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

**Action** List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer      : 9360.00 KB
  Dedicated Buffer  : 4318.60 KB
  Shared Buffer     : 5041.40 KB
    Lossless       : 252.07 KB
    Lossless Headroom : 4033.12 KB
    Lossy          : 756.21 KB

Egress:
  Total Buffer      : 9360.00 KB
  Dedicated Buffer  : 2704.00 KB
  Shared Buffer     : 6656.00 KB
    Lossless       : 332.80 KB
```

```

Multicast      : 1331.20 KB
Lossy          : 4992.00 KB

```

**Meaning** The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 4318.6 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 70 percent of the available (user-configurable) buffer space.
- With the ingress shared buffer pool configured as 70 percent of the available buffers, the total size of the ingress shared buffer pool is 5041.4 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 252.07 KB to lossless traffic
  - 4033.12 KB to lossless headroom traffic
  - 756.21 KB to lossy unicast traffic

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 332.80 KB to lossless traffic
  - 1331.20 KB to multicast traffic
  - 4992 KB to lossy unicast traffic

**NOTE:** The output values are valid for QFX3500 and QFX3600 switches. QFX5100 and EX4600 switches have larger buffers (12MB instead of 9MB), so the total buffer size and the sizes of each buffer partition are larger on QFX5100 and EX4600 switches.

## Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly multicast traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

### Requirements

---

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

---

## Overview

---

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multdestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multdestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly multicast traffic, more buffer space needs to be allocated to lossy buffers, less buffer space should be allocated to lossless buffers, and more space needs to be allocated to egress multicast buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly multicast traffic.

### Topology

[Table 557 on page 6118](#) shows the configuration components for this example.

**Table 557: Components of the Recommended Shared Buffer Configuration for Multicast Network Topologies**

Component	Settings
Hardware	QFX3500 switch
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 100% Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 5% Percentage of ingress buffer space allocated to lossless headroom traffic (lossless-headroom buffer partition): 0% Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 95%
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100% Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 5% Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 20% Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 75%

### Configuration

#### CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly multicast traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 0
set ingress buffer-partition lossy percent 95
set egress percent 100
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 20
set egress buffer-partition multicast percent 75
```

*Configuring the Global Shared Buffer Pool for Networks with Mostly Multicast Traffic*

**Step-by-Step Procedure** To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly multicast traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent 100
```
2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:  

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent 5
user@switch# set ingress buffer-partition lossless-headroom percent 0
user@switch# set ingress buffer-partition lossy percent 95
```
3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```
4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:  

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 5
user@switch# set egress buffer-partition lossy percent 20
user@switch# set egress buffer-partition multicast percent 75
```

**Results**

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 95;
    }
    buffer-partition lossless-headroom {
        percent 0;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 20;
    }
    buffer-partition multicast {
        percent 75;
    }
}
```

## Verification

---

Verify that the shared buffer configuration has been created properly.

### *Verifying the Shared Buffer Configuration*

**Purpose** Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

**Action** List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer      : 9360.00 KB
  Dedicated Buffer  : 2158.00 KB
  Shared Buffer     : 7202.00 KB
    Lossless       : 360.10 KB
    Lossless Headroom : 0.00 KB
    Lossy          : 6841.90 KB

  Lossless Headroom Utilization:
  Node Device      Total      Used      Free
  0                0.00 KB    0.00 KB    0.00 KB

Egress:
  Total Buffer      : 9360.00 KB
  Dedicated Buffer  : 2704.00 KB
  Shared Buffer     : 6656.00 KB
    Lossless       : 332.80 KB
    Multicast      : 4992.00 KB
    Lossy          : 1331.20 KB
```

**Meaning** The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 360.10 KB to lossless traffic
  - No space to lossless headroom traffic

- 6841.90 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Because the lossless headroom buffer partition is set to 0 (zero) percent, the total amount of lossless headroom buffer space is 0 KB; therefore the amount of used and free lossless headroom buffer space is also 0 KB.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 332.80 KB to lossless traffic
  - 4992 KB to multicast traffic
  - 1331.20 KB to lossy unicast traffic

**NOTE:** The output values are valid for QFX3500 and QFX3600 switches. QFX5100 and EX4600 switches have larger buffers (12MB instead of 9MB), so the total buffer size and the sizes of each buffer partition are larger on QFX5100 and EX4600 switches.

## Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly lossless traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

**NOTE:** When we discuss lossless buffers, we mean buffers that handle traffic on which you enable priority-based flow control (PFC) to ensure lossless transport. The lossless buffers are not used for best-effort traffic on a link on which you enable Ethernet PAUSE (IEEE 802.3x).

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

---

### Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

## Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multdestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multdestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly lossless traffic, more buffer space needs to be allocated to lossless buffers, and less buffer space should be allocated to lossy buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly lossless traffic.

### Topology

[Table 558 on page 6124](#) shows the configuration components for this example.

**Table 558: Components of the Recommended Shared Buffer Configuration for Lossless Network Topologies**

Component	Settings
Hardware	QFX3500 switch
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 100% Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 15% Percentage of ingress buffer space allocated to lossless headroom traffic (lossless headroom buffer partition): 80% Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 5%
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100% Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 90% Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 5% Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 5%

### Configuration

#### CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly lossless traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 15
set ingress buffer-partition lossless-headroom percent 80
set ingress buffer-partition lossy percent 5
set egress percent 100
set egress buffer-partition lossless percent 90
set egress buffer-partition lossy percent 5
set egress buffer-partition multicast percent 5
```

*Configuring the Global Shared Buffer Pool for Networks with Mostly Lossless Traffic*

**Step-by-Step Procedure** To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly lossless traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent 100
```
2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:  

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent 15
user@switch# set ingress buffer-partition lossless-headroom percent 80
user@switch# set ingress buffer-partition lossy percent 5
```
3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```
4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:  

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 90
user@switch# set egress buffer-partition lossy percent 5
user@switch# set egress buffer-partition multicast percent 5
```

**Results**

Display the results of the configuration:

```
rroot@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
  percent 100;
  buffer-partition lossless {
    percent 15;
  }
  buffer-partition lossy {
    percent 5;
  }
  buffer-partition lossless-headroom {
    percent 80;
  }
}
egress {
  percent 100;
  buffer-partition lossless {
    percent 90;
  }
  buffer-partition lossy {
    percent 5;
  }
  buffer-partition multicast {
    percent 5;
  }
}
```

## Verification

---

Verify that the shared buffer configuration has been created properly.

### *Verifying the Shared Buffer Configuration*

**Purpose** Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

**Action** List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer      : 9360.00 KB
  Dedicated Buffer  : 2158.00 KB
  Shared Buffer     : 7202.00 KB
    Lossless       : 1080.30 KB
    Lossless Headroom : 5761.60 KB
    Lossy          : 360.10 KB

  Lossless Headroom Utilization:
  Node Device      Total          Used          Free
  0                5761.60 KB    0.00 KB      5761.60 KB

Egress:
  Total Buffer      : 9360.00 KB
  Dedicated Buffer  : 2704.00 KB
  Shared Buffer     : 6656.00 KB
    Lossless       : 5990.40 KB
    Multicast      : 332.80 KB
    Lossy          : 332.80 KB
```

**Meaning** The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 1080 KB to lossless traffic
  - 5761.60 KB to lossless headroom traffic

- 360.10 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Of the total available lossless headroom buffer space of 5761.60 KB, currently no buffer space is being used, so all 5761.60 KB of buffer space is free.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 5990.40 KB to lossless traffic
  - 332.80 KB to multicast traffic
  - 332.80 KB to lossy unicast traffic

**NOTE:** The output values are valid for QFX3500 and QFX3600 switches. QFX5100 and EX4600 switches have larger buffers (12MB instead of 9MB), so the total buffer size and the sizes of each buffer partition are larger on QFX5100 and EX4600 switches.

## Example: Configuring DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers by exchanging application configuration information. DCBX detects feature misconfiguration and mismatches and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

The switch supports DCBX application protocol exchange for Layer 2 and Layer 4 applications such as the Internet Small Computer System Interface (iSCSI). You specify applications by EtherType (for Layer 2 applications) or by the destination port and protocol (for Layer 4 applications; the protocol can be either TCP or UDP).

The switch handles Fibre Channel over Ethernet (FCoE) application protocol exchange differently than other protocols in some cases:

- If FCoE is the only application for which you want to enable DCBX application protocol TLV exchange on an interface, you do not have to explicitly configure the FCoE application or an application map. By default, the switch exchanges FCoE application protocol TLVs on all interfaces that carry FCoE traffic (traffic mapped to the **fcoe** forwarding class) and have priority-based flow control (PFC) enabled on the FCoE priority (the FCoE IEEE 802.1p code point). The default priority mapping for the FCoE application is IEEE 802.1p code point 011 (the default **fcoe** forwarding class code point).
- If you want an interface to use DCBX to exchange application protocol TLVs for any other applications in addition to FCoE, you must configure the applications (including FCoE), define an application map (including FCoE), and apply the application map to the interface. If you apply an application map to an interface, you must explicitly configure the FCoE application, or the interface does not exchange FCoE application protocol TLVs.

This example shows how to configure interfaces to exchange both Layer 2 and Layer 4 applications by configuring one interface to exchange iSCSI and FCoE application protocol information and configuring another interface to exchange iSCSI and Precision Time Protocol (PTP) application protocol information.

---

### Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX Series device

- Junos OS Release 12.1 or later for the QFX Series

## Overview

The switch supports DCBX application protocol exchange for:

- Layer 2 applications, defined by EtherType
- Layer 4 applications, defined by destination port and protocol

**NOTE:** DCBX also advertises PFC and enhanced transmission selection (ETS) information. See [“Configuring DCBX Autonegotiation” on page 5669](#) for how DCBX negotiates and advertises configuration information for these features and for the applications.

DCBX is configured on a per-interface basis for each supported feature or application. For applications that you want to enable for DCBX application protocol exchange, you must:

- Define the application name and configure the EtherType or the destination port and protocol (TCP or UDP) of the application. Use the EtherType for Layer 2 applications, and use the destination port and protocol for Layer 4 protocols.
- Map the application to an IEEE 802.1p code point in an application map.
- Add the application map to DCBX interface.

In addition, for all applications (including FCoE, even when you do not use an application map), you either must create an IEEE 802.1p classifier and apply it to the appropriate ingress interfaces or use the default classifier. A classifier maps the code points of incoming traffic to a forwarding class and a loss priority so that ingress traffic is assigned to the correct class of service (CoS). The forwarding class determines the output queue on the egress interface.

If you do not create classifiers, trunk and tagged-access ports use the unicast IEEE 802.1 default trusted classifier. [Table 455 on page 5597](#) shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode. [Table 456 on page 5597](#) shows the default untrusted classifier IEEE 802.1 code-point values to unicast forwarding class mapping for ports in access mode.

**Table 559: Default IEEE 802.1 Classifiers for Trunk Ports and Tagged-Access Ports (Default Trusted Classifier)**

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low
be1 (001)	best-effort	low
ef (010)	best-effort	low

**Table 559: Default IEEE 802.1 Classifiers for Trunk Ports and Tagged-Access Ports (Default Trusted Classifier) (*continued*)**

Code Point	Forwarding Class	Loss Priority
ef1 (011)	fcoe	low
af11 (100)	no-loss	low
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

**Table 560: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier)**

Code Point	Forwarding Class	Loss Priority
000	best-effort	low
001	best-effort	low
010	best-effort	low
011	best-effort	low
100	best-effort	low
101	best-effort	low
110	best-effort	low
111	best-effort	low

**Topology**

This example shows how to configure DCBX application protocol exchange for three protocols (iSCSI, PTP, and FCoE) on two interfaces. One interface exchanges iSCSI and FCoE application protocol information, and the other interface exchanges iSCSI and PTP application protocol information.

**NOTE:** You must map FCoE traffic to the interfaces on which you want to forward FCoE traffic. You must also enable PFC on the FCoE interfaces and create an ingress classifier for FCoE traffic, or else use the default classifier.

Table 457 on page 5598 shows the configuration components for this example.

**Table 561: Components of DCBX Application Protocol Exchange Configuration Topology**

Component	Settings

```
set class-of-service interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

### *Configuring DCBX Application Protocol TLV Exchange*

**Step-by-Step Procedure** To define the applications, map the applications to IEEE 802.1p code points, apply the applications to interfaces, and create classifiers for DCBX application protocol exchange:

1. Define the iSCSI application by specifying its protocol and destination port, and define the FCoE and PTP applications by specifying their EtherTypes.  

```
[edit applications]
user@switch# set application iSCSI protocol tcp destination-port 3260
user@switch# set application FCoE ether-type 0x8906
user@switch# set application PTP ether-type 0x88F7
```
2. Define an application map that maps the iSCSI and FCoE applications to IEEE 802.1p code points.  

```
[edit policy-options]
user@switch# set application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
user@switch# set application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011
```
3. Define the application map that maps the iSCSI and PTP applications to IEEE 802.1p code points.  

```
[edit policy-options]
user@switch# set application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points 111
user@switch# set application-maps dcbx-iscsi-ptp-app-map application PTP code-points [001 101]
```
4. Apply the iSCSI and FCoE application map to interface xe-0/0/10, and apply the iSCSI and PTP application map to interface xe-0/0/11.  

```
[edit protocols dcbx]
user@switch# set interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
user@switch# set interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map
```
5. Create the congestion notification profile to enable PFC on the FCoE code point (011), and apply the congestion notification profile to interface xe-0/0/10.  

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
user@switch# set interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
```
6. Configure the classifier to apply to the interface that exchanges iSCSI and FCoE application information.  

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe loss-priority high code-points 011
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class network-control loss-priority high code-points 111
```
7. Configure the classifier to apply to the interface that exchanges iSCSI and PTP application information.  

```
[edit class-of-service classifiers]
```

```
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class network-control
loss-priority low code-points 111
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
```

8. Apply the classifiers to the appropriate interfaces.

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
user@switch# set interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

---

### Verification

To verify that DCBX application protocol exchange configuration has been created and is operating properly, perform these tasks:

- [Verifying the Application Configuration on page 6134](#)
- [Verifying the Application Map Configuration on page 6134](#)
- [Verifying DCBX Application Protocol Exchange Interface Configuration on page 6135](#)
- [Verifying the PFC Configuration on page 6135](#)
- [Verifying the Classifier Configuration on page 6136](#)

#### *Verifying the Application Configuration*

**Purpose** Verify that DCBX applications have been configured.

**Action** List the applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application iSCSI {
    protocol tcp;
    destination-port 3260;
}

application fcoe {
    ether-type 0x8906;
}

application ptp {
    ether-type 0x88F7;
}
```

**Meaning** The **show applications** configuration mode command lists all of the configured applications and either their protocol and destination port (Layer 4 applications) or their EtherType (Layer 2 applications). The command output shows that the iSCSI application is configured with the **tcp** protocol and destination port **3260**, the FCoE application is configured with the EtherType **0x8906**, and that the PTP application is configured with the EtherType **0x88F7**.

#### *Verifying the Application Map Configuration*

**Purpose** Verify that the application maps have been configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
    application iSCSI code-points 111;
    application FCoE code-points 011;
}

dcbx-iscsi-ptp-app-map {
    application iSCSI code-points 111;
    application PTP code-points [001 101];
}
```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The command output shows that there are two application maps, **dcbx-iscsi-fcoe-app-map** and **dcbx-iscsi-ptp-app-map**.

The application map **dcbx-iscsi-fcoe-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point 111, and the FCoE application, which is mapped to IEEE 802.1p code point 011.

The application map **dcbx-iscsi-ptp-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point 111, and the PTP application, which is mapped to IEEE 802.1p code points 001 and 101.

#### *Verifying DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application maps have been applied to the correct interfaces.

**Action** List the application maps by using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/10.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}

interface xe-0/0/11.0 {
    application-map dcbx-iscsi-ptp-app-map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists whether the interfaces are enabled for DCBX and lists the application map applied to each interface. The command output shows that interfaces **xe-0/0/10.0** and **xe-0/0/11.0** are enabled for DCBX, and that interface **xe-0/0/10.0** uses application map **dcbx-iscsi-fcoe-app-map**, and interface **xe-0/0/11.0** uses application map **dcbx-iscsi-ptp-app-map**.

#### *Verifying the PFC Configuration*

**Purpose** Verify that PFC has been enabled on the FCoE code point and applied to the correct interface.

**Action** Display the PFC configuration to verify that PFC is enabled on the FCoE code point (011) in the congestion notification profile **fcoe-cnp** by using the configuration mode command **show class-of-service congestion-notification-profile**:

```
user@switch# show class-of-service congestion-notification-profile
fcoe-cnp {
  input {
    ieee-802.1 {
      code-point 011 {
        pfc;
      }
    }
  }
}
```

Display the class-of-service (CoS) interface information to verify that the correct interface has PFC enabled for the FCoE application by using the configuration mode command **show class-of-service interfaces**:

```
user@switch# show class-of-service interfaces
xe-0/0/10 {
  congestion-notification-profile fcoe-cnp;
}
```

**NOTE:** The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the PFC configuration.

**Meaning** The **show class-of-service congestion-notification-profile** configuration mode command lists the configured congestion notification profiles. The command output shows that the congestion notification profile **fcoe-cnp** has been configured and has enabled PFC on the IEEE 802.1p code point **011** (the default FCoE code point).

The **show class-of-service interfaces** configuration mode command shows the interface CoS configuration. The command output shows that the congestion notification profile **fcoe-cnp**, which enables PFC on the FCoE code point, is applied to interface **xe-0/0/10**.

### *Verifying the Classifier Configuration*

**Purpose** Verify that the classifiers have been configured and applied to the correct interfaces.

**Action** Display the classifier configuration by using the configuration mode command **show class-of-service**:

```
user@switch# show class-of-service
classifiers {
  ieee-802.1 fcoe-iscsi-cl1 {
    import default;
    forwarding-class network-control {
      loss-priority high code-points 111;
    }
  }
  forwarding-class fcoe {
    loss-priority high code-points 011;
  }
}
```

```

    }
  }
  ieee-802.1 iscsi-ptp-cl2 {
    import default;
    forwarding-class network-control {
      loss-priority low code-points 111;
    }
    forwarding-class best-effort {
      loss-priority low code-points [ 001 101 ];
    }
  }
}
interfaces {
  xe-0/0/10 {
    congestion-notification-profile fcoe-cnp;
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-iscsi-cl1;
      }
    }
  }
  xe-0/0/11 {
    unit 0 {
      classifiers {
        ieee-802.1 iscsi-ptp-cl2;
      }
    }
  }
}
}

```

**NOTE:** The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the classifier configuration.

**Meaning** The **show class-of-service** configuration mode command lists the classifier and CoS interface configuration, as well as other information not shown in this example. The command output shows that there are two classifiers configured, **fcoe-iscsi-cl1** and **iscsi-ptp-cl2**.

Classifier **fcoe-iscsi-cl1** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **high** and is mapped to code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **fcoe** is set to a loss priority of **high** and is mapped to code point **011** (the code point mapped by default to the FCoE application).

Classifier **iscsi-ptp-cl2** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **low** and is mapped to IEEE 802.1p code point **111** (the code point mapped to the iSCSI application).

- The forwarding class **best-effort** is set to a loss priority of **low** and is mapped to IEEE 802.1p code points **001** and **101** (the code points mapped by default to the PTP application).

The command output also shows that classifier **fcoe-iscsi-cl1** is mapped to interface **xe-0/0/10.0** and that classifier **iscsi-ptp-cl2** is mapped to interface **xe-0/0/11.0**.

## Configuration Examples (QFX5100 Switches Only)

---

- [Example: Configuring PFC Across Layer 3 Interfaces on page 6138](#)

### Example: Configuring PFC Across Layer 3 Interfaces

Priority-based flow control (PFC) helps ensure lossless transport across data center bridging interfaces by pausing incoming traffic when output queue buffers fill to a certain threshold. On a QFX5100 switch or an EX4600 switch running the Enhanced Layer 2 Software (ELS) CLI, in addition to configuring PFC on Layer 2 (bridging) interfaces, you can configure PFC on traffic that traverses Layer 3 interfaces. This enables you to preserve the lossless characteristics that PFC provides on traffic, even when the traffic crosses Layer 3 interfaces that connect two Layer 2 networks.

- [Requirements on page 6138](#)
- [Overview on page 6139](#)
- [Configuration on page 6142](#)
- [Verification on page 6149](#)

#### Requirements

---

This example uses the following hardware and software components:

- Two Juniper Networks QFX5100 Switches
- Junos OS Release 13.2 or later for the QFX Series

- Two Ethernet hosts

### Overview

On a network that uses two QFX5100 or EX4600 switches to connect hosts on two different Ethernet networks across a Layer 3 network, to configure PFC across the Layer 2 and Layer 3 interfaces, you must:

- Configure the Layer 2 and Layer 3 interfaces on the switches
- Configure VLANs to carry the traffic across the Layer 2 and Layer 3 networks
- Configure integrated routing and bridging (IRB) interfaces on the Layer 2 interfaces to move the Layer 2 VLAN traffic to Layer 3
- Configure and apply the appropriate classifiers to the interfaces
- Configure and apply congestion notification profiles (CNPs) on the interfaces to enable PFC on the traffic that you want to be lossless

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- Configure lossless forwarding classes and hierarchical port scheduling (also known as enhanced transmission selection) on the interfaces

**NOTE:** PFC operates at the queue level, based on the IEEE 802.1p code point in the priority code point (PCP) field of the Ethernet frame header (sometimes known as the CoS bits). For this reason, traffic on Layer 3 interfaces on which you want to enable PFC must use an IEEE 802.1p classifier to map incoming traffic to forwarding classes (which are in turn mapped to output queues) and loss priorities. You cannot use a DSCP or DSCP IPv6 classifier to classify Layer 3 traffic if you want to enable PFC on traffic flows.

### Topology

Figure 218 on page 6140 shows the topology for this example.

Figure 218: Enabling PFC Across Layer 3 Interface Hops

Table 562 on page 6140 shows the configuration components for this example. On the two QFX5100 switches, the Ethernet host-facing interfaces use the same interface names and configuration, and the Layer 3 network-facing interfaces use the same interface names and configuration.

Table 562: Components of the PFC Across Layer 3 Interfaces Topology

Layer 2 interface behavior aggregate (BA) classifier	<p>Name—lossless-3-4-ieee Forwarding class lossless-3—mapped to code point 011 (IEEE 802.1p priority 3) and a packet loss priority of low Forwarding class lossless-4—mapped to code point 100 (IEEE 802.1p priority 4) and a packet loss priority of low</p> <p>Apply the Layer 2 IEEE 802.1p classifier to both the Layer 2 and the Layer 3 interfaces (xe-0/0/20, xe-0/0/21, xe-0/0/40, and xe-0/0/41).</p>
Congestion notification profile (PFC, both switches)	<p>Name—lossless-cnp PFC enabled on IEEE 802.1p code points—011 (lossless-3 forwarding class and priority), 100 (lossless-4 forwarding class and priority)</p> <p>Apply the CNP to both the Layer 2 and the Layer 3 interfaces (xe-0/0/20, xe-0/0/21, xe-0/0/40, and xe-0/0/41) to enable PFC on IEEE 802.1p code points 011 and 100.</p>

**Table 562: Components of the PFC Across Layer 3 Interfaces Topology (continued)**

Component	Settings
Hierarchical port scheduling (ETS)	<p>Hierarchical port scheduling (ETS) includes configuring:</p> <ul style="list-style-type: none"> <li>• Schedulers to assign bandwidth to traffic</li> <li>• Scheduler mapping to forwarding classes</li> <li>• Grouping of the forwarding classes (priorities) in forwarding class sets (priority groups)</li> <li>• A traffic control profile to assign bandwidth to the forwarding class set and to associate the forwarding class set with the scheduler mapping</li> </ul> <p>Hierarchical port scheduling also includes applying the hierarchical scheduler (defined in the traffic control profile) to the interfaces.</p> <p>This example focuses on configuring PFC across the Layer 2 and Layer 3 interfaces. To maintain this focus, this example includes the CLI statements needed to configure hierarchical port scheduling, but does not include descriptive explanations of the configuration. The <i>Related Documentation</i> section provides links to example documents that show how to configure hierarchical port scheduling.</p> <p>Apply the scheduling configuration to both the Layer 2 and the Layer 3 interfaces (xe-0/0/20, xe-0/0/21, xe-0/0/40, and xe-0/0/41).</p>

### Configuration

- [Step-by-Step Procedure on page 6144](#)
- [Results on page 6146](#)

#### CLI Quick Configuration

To configure PFC across Layer 3 interfaces, copy the following commands, paste them in a text file, remove the line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. The same configuration applies to both QFX5100 Switch SW1 and QFX5100 Switch SW2:

```

set interfaces xe-0/0/40 vlan-tagging
set interfaces xe-0/0/40 unit 0 vlan-id 103
set interfaces xe-0/0/40 unit 0 family inet address 100.103.1.2/24
set interfaces xe-0/0/41 vlan-tagging
set interfaces xe-0/0/41 unit 0 vlan-id 104
set interfaces xe-0/0/41 unit 0 family inet address 100.104.1.2/24
set interfaces xe-0/0/20 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan105
set interfaces xe-0/0/21 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan106
set interfaces vlan unit 105 family inet address 100.105.1.1/24
set interfaces vlan unit 106 family inet address 100.106.1.1/24
set interfaces irb unit 105 family inet address 100.105.1.1/24
set interfaces irb unit 106 family inet address 100.106.1.1/24
set vlans vlan105 vlan-id 105
set vlans vlan106 vlan-id 106
set vlans vlan105 l3-interface irb.105
set vlans vlan106 l3-interface irb.106

```

```

set class-of-service forwarding-classes class lossless-3 queue-num 3 no-loss
set class-of-service forwarding-classes class lossless-4 queue-num 4 no-loss

set class-of-service interfaces xe-0/0/41 classifiers ieee-802.1 lossless-3-4-ieee

```

### Step-by-Step Procedure

**Step-by-Step Procedure** The following step-by-step procedure shows you how to configure the interfaces, VLANs, lossless forwarding classes, classifiers, and PFC settings to enable PFC across Layer 3 interfaces. For completeness, the class-of-service scheduling configuration (hierarchical port scheduling) is included in the procedure, but without explanatory text. See the *Related Documentation* links for detailed examples of the scheduling elements of the configuration.

1. Configure the Layer 3 interface VLANs and IP addresses:

```
[edit interfaces]
user@switch# set xe-0/0/40 vlan-tagging
user@switch# set xe-0/0/40 unit 0 vlan-id 103
user@switch# set xe-0/0/40 unit 0 family inet address 100.103.1.2/24
user@switch# set xe-0/0/41 vlan-tagging
user@switch# set xe-0/0/41 unit 0 vlan-id 104
user@switch# set xe-0/0/41 unit 0 family inet address 100.104.1.2/24
```

2. Configure the Layer 2 interface VLAN membership and interface mode:

```
[edit interfaces]
user@switch# set xe-0/0/20 unit 0 family ethernet-switching interface-mode trunk
user@switch# set xe-0/0/20 unit 0 family ethernet-switching vlan members vlan105
user@switch# set xe-0/0/21 unit 0 family ethernet-switching interface-mode trunk
user@switch# set xe-0/0/21 unit 0 family ethernet-switching vlan members vlan106
```

3. Configure the VLANs for the IRB interfaces:

```
[edit interfaces]
user@switch# set vlan unit 105 family inet address 100.105.1.1/24
user@switch# set vlan unit 106 family inet address 100.106.1.1/24
```

4. Configure the IRB interfaces and VLANs to transport incoming Layer 2 traffic assigned to VLANs vlan105 (of which interface xe-0/0/20 is a member) and vlan106 (of which interface xe-0/0/21 is a member) across Layer 3:

```
[edit]
user@switch# set interfaces irb unit 105 family inet address 100.105.1.1/24
user@switch# set interfaces irb unit 106 family inet address 100.106.1.1/24
user@switch# set vlans vlan105 vlan-id 105
user@switch# set vlans vlan106 vlan-id 106
user@switch# set vlans vlan105 l3-interface irb.105
user@switch# set vlans vlan106 l3-interface irb.106
```

5. Configure the lossless forwarding classes and a best-effort forwarding class for any other traffic that might use the interfaces:

```
[edit class-of-service]
user@switch# set forwarding-classes class lossless-3 queue-num 3 no-loss
user@switch# set forwarding-classes class lossless-4 queue-num 4 no-loss
user@switch# set forwarding-classes class all-others queue-num 0
```

6. Configure the IEEE classifier for the Layer 2 and Layer 3 interfaces to classify incoming traffic into the lossless forwarding classes based on the IEEE 802.1p code point of the traffic:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 lossless-3-4-ieee forwarding-class lossless-3 loss-priority low code-points 011
```

```
user@switch# set ieee-802.1 lossless-3-4-ieee forwarding-class lossless-4 loss-priority
low code-points 100
```

7. Configure the CNP to enable PFC on the lossless priorities (the lossless forwarding classes mapped to IEEE 802.1p code points 3 and 4):

```
[edit class-of-service congestion-notification-profile]
user@switch# set lossless-cnp input ieee-802.1 code-point 011 pfc
user@switch# set lossless-cnp input ieee-802.1 code-point 100 pfc
```

8. Configure hierarchical scheduling to support the lossless configuration (included here for completeness; see the *Related Documentation* links for detailed examples of scheduling configuration) and apply it to the Layer 2 and Layer 3 interfaces:

```
[edit class-of-service]
set schedulers lossless_sch transmit-rate 6g
set schedulers lossless_sch shaping-rate percent 100
set schedulers all-others_sch transmit-rate 4g
set scheduler-maps lossless_map forwarding-class lossless-3 scheduler lossless_sch

9. Apply the Layer 2 IEEE 802.1p classifier and the CNP to the Layer 3 interfaces:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/40 classifiers ieee-802.1 lossless-3-4-ieee
user@switch# set xe-0/0/40 congestion-notification-profile lossless-cnp
user@switch# set xe-0/0/41 classifiers ieee-802.1 lossless-3-4-ieee
user@switch# set xe-0/0/41 congestion-notification-profile lossless-cnp
```

10. Apply the Layer 2 IEEE 802.1p classifier and the CNP to the Layer 2 interfaces:

```
[edit class-of-service interfaces]
user@switch# xe-0/0/20 unit 0 classifiers ieee-802.1 lossless-3-4-ieee
user@switch# xe-0/0/20 congestion-notification-profile lossless-cnp
user@switch# xe-0/0/21 unit 0 classifiers ieee-802.1 lossless-3-4-ieee
user@switch# xe-0/0/21 congestion-notification-profile lossless-cnp
```

### Results

Display the results of the interface, VLAN, and class-of-service configurations (the system shows only the explicitly configured parameters; it does not show default parameters). The results are valid for both QFX5100 Switch SW1 and QFX5100 Switch SW2 because the same configuration is used on both switches.

Display the results of the interface configuration:

```
user@switch# show configuration interfaces
```

```
xe-0/0/20 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
      vlan {
        members vlan105;
      }
    }
  }
}
xe-0/0/21 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
      vlan {
        members vlan106;
      }
    }
  }
}
xe-0/0/40 {
  vlan-tagging;
  unit 0 {
    vlan-id 103;
    family inet {
      address 100.103.1.2/24;
    }
  }
}
xe-0/0/41 {
  vlan-tagging;
  unit 0 {
    vlan-id 104;
    family inet {
      address 100.104.1.2/24;
    }
  }
}
irb {
  unit 105 {
    family inet {
      address 100.105.1.1/24;
    }
  }
  unit 106 {
    family inet {
      address 100.106.1.1/24;
    }
  }
}
```

```

vlan {
  unit 105 {
    family inet {
      address 100.105.1.1/24;
    }
  }
  unit 106 {
    family inet {
      address 100.106.1.1/24;
    }
  }
}

```

Display the results of the vlan configuration:

```

user@switch# show configuration vlans
vlan105 {
  vlan-id 105;
  l3-interface irb.105;
}
vlan106 {
  vlan-id 106;
  l3-interface irb.106;
}

```

Display the results of the class-of-service configuration:

```

user@switch# show configuration class-of-service
classifiers {
  ieee-802.1 lossless-3-4-ieee {
    forwarding-class lossless-3 {
      loss-priority low code-points 011;
    }
    forwarding-class lossless-4 {
      loss-priority low code-points 100;
    }
  }
}
forwarding-classes {
  class lossless-3 queue-num 3 no-loss;
  class lossless-4 queue-num 4 no-loss;
  class all-others queue-num 0;
}

        transmit-rate 4g;
    }
}
}

```

**TIP:** To quickly configure the switch, issue the `load merge terminal` command, and then copy the hierarchies and paste them into the switch terminal window.

## Verification

To verify that the PFC across Layer 3 interfaces configuration has been created and is operating properly, perform these tasks:

- [Verifying the Interface Configuration on page 6150](#)
- [Verifying the VLAN Configuration on page 6152](#)
- [Verifying the PFC Configuration \(Congestion Notification Profile\) on page 6152](#)
- [Verify the Forwarding Class Configuration on page 6153](#)

- [Verifying the Classifier Configuration on page 6153](#)
- [Verifying the Interface CoS Configuration \(Hierarchical Scheduling, PFC, and Classifier Mapping to Interfaces\) on page 6154](#)

### ***Verifying the Interface Configuration***

**Purpose** Verify that the Layer 2 Ethernet interfaces, Layer 3 IP interfaces, IRB interfaces, and VLAN interfaces have been created on the switch and are correctly configured.

**Action** Display the switch interface configuration using the **show configuration interfaces** command:

```

user@switch> show configuration interfaces
xe-0/0/20 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
      vlan {
        members vlan105;
      }
    }
  }
}
xe-0/0/21 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
      vlan {
        members vlan106;
      }
    }
  }
}
xe-0/0/40 {
  vlan-tagging;
  unit 0 {
    vlan-id 103;
    family inet {
      address 100.103.1.2/24;
    }
  }
}
xe-0/0/41 {
  vlan-tagging;
  unit 0 {
    vlan-id 104;
    family inet {
      address 100.104.1.2/24;
    }
  }
}
irb {
  unit 105 {
    family inet {
      address 100.105.1.1/24;
    }
  }
  unit 106 {
    family inet {
      address 100.106.1.1/24;
    }
  }
}
vlan {
  unit 105 {
    family inet {
      address 100.105.1.1/24;
    }
  }
}

```

```
    unit 106 {  
        family inet {  
            address 100.106.1.1/24;  
        }  
    }  
}
```

**Meaning** The **show configuration interfaces** command displays all of the interfaces configured on the switch. The command output shows that:

- Interfaces xe-0/0/20 and xe-0/0/21 are Ethernet interfaces (family ethernet-switching) in trunk interface mode. Interface xe-0/0/20 is a member of VLAN vlan105, and interface xe-0/0/21 is a member of VLAN vlan106.
- Interfaces xe-0/0/40 and xe-0/0/41 are IP interfaces (family inet) with VLAN tagging enabled. Interface xe-0/0/40 has an IP address of 100.103.1.2/24 and a VLAN ID of 103. Interface xe-0/0/41 has an IP address of 100.104.1.2/24 and a VLAN ID of 104.
- Two IRB interfaces are configured, IRB unit 105 with an IP address of 100.105.1.1/24 and IRB unit 106 with an IP address of 100.106.1.1/24.
- Two VLAN interfaces are configured, VLAN unit 105 with an IP address of 100.105.1.1/24 (for IRB interface unit 105) and VLAN unit 106 with an IP address of 100.106.1.1/24 (for IRB interface unit 106).

#### *Verifying the VLAN Configuration*

**Purpose** Verify that VLANs have been created on the switch and are correctly configured.

**Action** Display the VLAN configuration using the **show configuration vlans** command:

```
user@switch> show configuration vlans  
vlan105 {  
    vlan-id 105;  
    l3-interface irb.105;  
}  
vlan106 {  
    vlan-id 106;  
    l3-interface irb.106;  
}
```

**Meaning** The **show configuration vlans** command displays all of the VLANs configured on the switch. The command output shows that:

- VLAN vlan105 has been configured with VLAN ID 105 on IRB interface irb.105.
- VLAN vlan106 has been configured with VLAN ID 106 on IRB interface irb.106.

#### *Verifying the PFC Configuration (Congestion Notification Profile)*

**Purpose** Verify that PFC has been enabled on the correct IEEE 802.1p code points (priorities) in the CNP.

**Action** Display the PFC configuration using the **show configuration class-of-service congestion-notification-profile** command:

```
user@switch> show configuration class-of-service congestion-notification-profile
lossless-cnp {
    input {
        ieee-802.1 {
            code-point 011 {
                pfc;
            }
            code-point 100 {
                pfc;
            }
        }
    }
}
```

**Meaning** The **show configuration class-of-service congestion-notification-profile** command displays all of the CNPs configured on the switch. The command output shows that:

- The CNP named **lossless-cnp** is configured on the switch.
- The CNP **lossless-cnp** enables PFC on IEEE 802.1p code points 100 and 100.

#### *Verify the Forwarding Class Configuration*

**Purpose** Verify that the two lossless forwarding classes and the best-effort forwarding class have been configured on the switch.

**Action** Display the forwarding class configuration using the **show configuration class-of-service forwarding-classes** command:

```
user@switch> show configuration class-of-service forwarding-classes
class lossless-3 queue-num 3 no-loss;
class lossless-4 queue-num 4 no-loss;
class all-others queue-num 0;
```

**Meaning** The **show configuration class-of-service forwarding-classes** command displays all of the forwarding classes configured on the switch (default forwarding classes are not displayed). The command output shows that:

- Forwarding class **lossless-3** is mapped to queue 3 and is configured as a lossless forwarding class (the **no-loss** attribute is applied)
- Forwarding class **lossless-4** is mapped to queue 4 and is configured as a lossless forwarding class (the **no-loss** attribute is applied)
- Forwarding class **all-others** is mapped to queue 0. It is not a lossless forwarding class (the **no-loss** attribute is not applied).

#### *Verifying the Classifier Configuration*

**Purpose** Verify that the IEEE 802.1p classifier has been configured on the switch.

**Action** Display the classifier configuration using the **show configuration class-of-service classifiers** command:

```
user@switch> show configuration class-of-service classifiers
ieee-802.1 lossless-3-4-ieee {
  forwarding-class lossless-3 {
    loss-priority low code-points 011;
  }
  forwarding-class lossless-4 {
    loss-priority low code-points 100;
  }
}
```

**Meaning** The **show configuration class-of-service classifiers** command displays all of the classifiers configured on the switch. The command output shows that the Layer 2 IEEE 802.1p classifier **lossless-3-4-ieee** classifies traffic with the code point 011 into the **lossless-3** forwarding class with a loss priority of **low**, and classifies traffic with the code point 100 into the **lossless-4** forwarding class with a loss priority of **low**.

***Verifying the Interface CoS Configuration (Hierarchical Scheduling, PFC, and Classifier Mapping to Interfaces)***

**Purpose** Verify that the interfaces have the correct hierarchical scheduling, PFC, and classifier configurations.

**Action** Display the interface CoS configuration using the **show configuration class-of-service interfaces** command:

```
user@switch> show configuration class-of-service interfaces
xe-0/0/20 {
  forwarding-class-set {
    lossless_fc_set {
      output-traffic-control-profile lossless_tcp;
    }
    all-others_fc_set {
      output-traffic-control-profile all-others_tcp;
    }
  }
  congestion-notification-profile lossless-cnp;
  unit 0 {
    classifiers {
      ieee-802.1 lossless-3-4-ieee;
    }
  }
}
xe-0/0/21 {
  forwarding-class-set {
    all-others_fc_set {
      output-traffic-control-profile all-others_tcp;
    }
    lossless_fc_set {
      output-traffic-control-profile lossless_tcp;
    }
  }
  congestion-notification-profile lossless-cnp;
  unit 0 {
    classifiers {
      ieee-802.1 lossless-3-4-ieee;
    }
  }
}
xe-0/0/40 {
  forwarding-class-set {
    lossless_fc_set {
      output-traffic-control-profile lossless_tcp;
    }
    all-others_fc_set {
      output-traffic-control-profile all-others_tcp;
    }
  }
  congestion-notification-profile lossless-cnp;
  classifiers {
    ieee-802.1 lossless-3-4-ieee;
  }
}
xe-0/0/41 {
  forwarding-class-set {
    lossless_fc_set {
      output-traffic-control-profile lossless_tcp;
    }
    all-others_fc_set {
      output-traffic-control-profile all-others_tcp;
    }
  }
  congestion-notification-profile lossless-cnp;
}
```

```
    classifiers {  
        ieee-802.1 lossless-3-4-ieee;  
    }  
}
```

**Meaning** The **show configuration class-of-service interfaces** command displays all of the CoS components configured on the switch interfaces. The command output shows that:

- The configuration on Layer 2 Ethernet interfaces xe-0/0/20 and xe-0/0/21 includes:
  - Hierarchical scheduling—The forwarding class set **lossless\_fc\_set** with the traffic control profile **lossless\_tcp** for the lossless traffic, and the forwarding class set **all-others\_fc\_set** with the traffic control profile **all-others\_tcp** for the best-effort traffic are applied to both interfaces.
  - PFC—The **lossless-cnp** congestion notification profile is applied to both interfaces.
  - Classifiers—The Layer 2 IEEE 802.1p classifier **lossless-3-4-ieee** is applied to both interfaces.
- The configuration on Layer 3 IP interfaces xe-0/0/40 and xe-0/0/41 includes:
  - Hierarchical scheduling—The forwarding class set **lossless\_fc\_set** with the traffic control profile **lossless\_tcp** for the lossless traffic, and the forwarding class set **all-others\_fc\_set** with the traffic control profile **all-others\_tcp** for the best-effort traffic are applied to both interfaces.
  - PFC—The **lossless-cnp** congestion notification profile is applied to both interfaces.
  - Classifiers—The Layer 2 IEEE 802.1p classifier **lossless-3-4-ieee** is applied to both interfaces. Traffic that would use a DSCP or a DSCP IPv6 classifier if it were configured uses the IEEE 802.1p classifier instead. Using the IEEE 802.1p classifier allows the interface to use PFC to pause traffic during periods of congestion to prevent packet loss.

## Configuring CoS

The class-of-service topics describe how to configure the Junos CoS components. You can configure forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level for each queue. After defining the CoS components, you assign classifiers to the required physical and logical interfaces.

You can configure various CoS components individually or in combination to define CoS services.

**NOTE:** When you change or when you deactivate and then reactivate the class-of-service configuration, the system experiences packet drops because the system momentarily blocks traffic to change the mapping of incoming traffic to input queues.

The following topics describe how to configure CoS components :

- [Example: Configuring Unicast Classifiers on page 6066](#)
- [Example: Configuring Multidestination \(Multicast, Broadcast, DLF\) Classifiers on page 6069](#)
- [Example: Configuring WRED Drop Profiles on page 6071](#)

## Defining CoS Code-Point Aliases

You can use code-point aliases to streamline the process of configuring CoS features on your switch. A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

You can configure code-point aliases for the following CoS marker types:

- DSCP or DSCP IPv6—Handles incoming IPv4 or IPv6 packets.
- IEEE 802.1p—Handles Layer 2 CoS.

To configure a code-point alias:

1. Specify a CoS marker type (IEEE 802.1 or DSCP).
2. Assign an alias.
3. Specify the code point that corresponds to the alias.

```
[edit class-of-service code-point-aliases]
user@switch# set (dscp | dscp-ipv6 | ieee-802.1) alias-name code-point-bits
```

For example, to configure a code-point alias for an IEEE 802.1 CoS marker type that has the alias name `fcoe1` and maps to the code-point bits 011:

```
[edit class-of-service code-point-aliases]
user@switch# set ieee-802.1 fcoe1 011
```

## Defining CoS Unicast BA Classifiers (DSCP, DSCP IPv6, IEEE 802.1p)

Packet classification associates incoming packets with a particular CoS servicing level. Behavior aggregate (BA) classifiers examine the Differentiated Services code point (DSCP or DSCP IPv6) value, the IEEE 802.1p CoS value, or the MPLS EXP value in the packet header to determine the CoS settings applied to the packet. (See [“Configuring a Global MPLS EXP Classifier” on page 4479](#) for how to define EXP classifiers for MPLS traffic.) BA classifiers allow you to set the forwarding class and loss priority of a packet based on the incoming CoS value.

Unicast traffic must use different classifiers than multidestination (multicast, broadcast, and destination lookup fail) traffic.

To configure a unicast DSCP, DSCP IPv6, or IEEE 802.1p BA classifier using the CLI:

1. Create a unicast BA classifier:

- To create a unicast DSCP, DSCP IPv6, or IEEE 802.1p BA classifier based on the default classifier, import the default DSCP, DSCP IPv6, or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

```
[edit class-of-service classifiers]
user@switch# set (dscp | ieee-802.1) classifier-name import default forwarding-class
forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
```

- To create a unicast BA classifier that is not based on the default classifier, create a DSCP, DSCP IPv6, or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

```
[edit class-of-service classifiers]
user@switch# set (dscp | ieee-802.1) classifier-name forwarding-class
forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
```

2. Apply the unicast classifier to a specific 10-Gigabit Ethernet interface or to all 10-Gigabit Ethernet interfaces or to all Fibre Channel interfaces on the switch.

- To apply the classifier to a specific interface:

```
[edit class-of-service interfaces]
user@switch# set interface-name unit unit classifiers (dscp | ieee-802.1) classifier-name
```

- To apply the classifier to all 10-Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and the logical-interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set xe-* unit * classifiers (dscp | ieee-802.1) classifier-name
```

## Configuring a Global MPLS EXP Classifier

EXP packet classification associates incoming packets with a particular MPLS CoS servicing level. EXP behavior aggregate (BA) classifiers examine the MPLS EXP value in the packet header to determine the CoS settings applied to the packet. EXP BA classifiers allow you to set the forwarding class and loss priority of an MPLS packet based on the incoming CoS value.

You can configure as many EXP classifiers as you want, however, the switch uses only one MPLS EXP classifier as a global classifier, which is applied only on interfaces configured as **family mpls**. All **family mpls** switch interfaces use the global EXP classifier to classify MPLS traffic.

If an EXP classifier is configured, MPLS traffic on **family mpls** interfaces uses the EXP classifier. If an EXP classifier is not configured, then if a fixed classifier is applied to the interface, the MPLS traffic uses the fixed classifier. If no EXP classifier and no fixed classifier is applied to the interface, MPLS traffic is treated as best-effort traffic. DSCP classifiers are not applied to MPLS traffic.

**NOTE:** There is no default MPLS EXP classifier. If you want to use an MPLS EXP classifier, you must configure it. The MPLS EXP classifier is global and applies only to all **family mpls** interfaces on the switch. You can configure as many MPLS EXP classifiers as you want, but you can only use one MPLS EXP classifier on switch interfaces at any time.

To configure a unicast MPLS EXP classifier using the CLI:

1. Create an EXP classifier and associate it with a forwarding class, a loss priority, and a code point:

```
[edit class-of-service classifiers]
user@switch# set (dscp | ieee-802.1 | exp) classifier-name forwarding-class
forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
```

2. Apply the EXP classifier to the switch interfaces:

```
[edit class-of-service]
user@switch# set system-defaults classifiers exp classifier-name
```

## Defining CoS Multidestination (Multicast, Broadcast, DLF) BA Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Behavior aggregate (BA) classifiers examine the Differentiated Services code point (DSCP) value or IEEE 802.1p CoS value in the packet header to determine the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the incoming CoS value.

**NOTE:** DSCP IPv6 multidestination classifiers are not supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.

Multidestination classifiers apply to all of the switch interfaces and handle multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot apply a multidestination classifier to a single interface or to a range of interfaces.

Unicast and multidestination traffic must use different classifiers.

To configure a multidestination BA classifier using the CLI:

1. Create a DSCP or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

```
[edit class-of-service classifiers]
user@switch# set (dscp | ieee-802.1) classifier-name forwarding-class forwarding-class-name
loss-priority level code-points [aliases] [bit-patterns]
```

2. Configure the classifier as a multidestination classifier:

```
[edit class-of-service]
user@switch# set multi-destination classifiers (dscp | ieee-802.1) classifier-name
```

## Configuring CoS WRED Drop Profiles

You can configure an interpolated weighted random early detection (WRED) profile to control packet drop characteristics for different traffic loss priorities.

**NOTE:** You cannot enable WRED on multidestination (multicast) queues. You can enable WRED only on unicast queues.

Also, do not enable WRED on lossless traffic flows. Use priority-based flow control (PFC) to prevent packet loss on lossless forwarding classes.

*Interpolated* means that the switch creates a smooth drop curve from a drop start point to a drop end point, with a maximum drop rate that is reached at the drop end point.

The drop start point is the average queue fill level when the WRED algorithm starts to drop packets. Before the drop start point, no packets are scheduled to drop. Specify the drop start point using the first of two **fill-level** statements.

The drop end point is the average queue fill level at which all subsequently arriving packets are dropped. When the queue fill levels falls below the drop end point, packets begin to be forwarded again. (At the drop end point, the packet drop probability becomes 100 percent.) Specify the drop end point using the second of two **fill-level** statements.

The minimum drop rate is always 0. Specify the minimum drop rate using the first of two **drop-probability** statements. The maximum drop rate is the drop probability when the average queue fill level reaches the drop end point. Specify the maximum drop rate using the second of two **drop-probability** statements.

The drop rate is zero until the queue fill level reaches the drop start point. As the queue continues to fill, packets drop in smooth linear curve until the queue reaches the drop end point, when packets drop at the maximum drop rate. If the queue fills beyond the drop end point, all packets that match the drop profile are dropped.

To configure a WRED profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

## Configuring CoS Drop Profile Maps

A drop-profile map associates a WRED profile for traffic of a specified loss priority with a scheduler. When you use a scheduler map to map a scheduler to a forwarding class, the drop profile map associated with the scheduler applies the specified WRED profile to traffic in the forwarding class that matches the specified loss priority.

Drop profile maps enable you to configure different drop profiles for traffic of different loss priorities within the same scheduler. You can associate different drop profiles with low-priority, medium-high priority, and high-priority traffic within a single scheduler, and then map that scheduler to a forwarding class. This applies the appropriate drop profile to traffic of each loss priority in a forwarding class. Drop profile maps apply to all traffic protocols.

To configure a drop-profile map using the CLI:

- For the desired scheduler, configure the traffic loss priority and specify the drop profile you want to use to control the drop characteristics for traffic of that loss priority:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name drop-profile-map loss-priority level protocol
any drop-profile drop-profile-name
```

## Defining CoS Forwarding Classes

Forwarding classes allow you to group packets for transmission. The switch supports a total of 12 forwarding classes. In order to forward traffic, you map (assign) the forwarding classes to unicast or multdestination (multicast, broadcast, and destination lookup fail) output queues.

The switch has 12 output queues. Queues 0 through 7 are for unicast traffic and queues 8 through 11 are for multicast traffic. Forwarding classes mapped to unicast queues must carry unicast traffic, and forwarding classes mapped to multdestination queues must carry multdestination traffic. There are four default unicast forwarding classes and one default multdestination forwarding class.

The default unicast forwarding classes are:

- **best-effort**—Best-effort traffic
- **fcoe**—Guaranteed delivery for FCoE traffic
- **no-loss**—Guaranteed delivery for TCP no-loss traffic
- **network-control**—Network control traffic

The default multidestination forwarding class is:

- **mcast**—Multidestination traffic

Map forwarding classes to queues using the **class** statement, which enables you to configure up to 12 forwarding classes. You can map more than one forwarding class to a single queue, but all forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. In addition, all forwarding classes mapped to a particular queue must be either lossless or lossy. You cannot mix lossless and lossy forwarding classes (traffic) on the same queue. Also, you cannot mix unicast and multicast forwarding classes on the same queue.

[edit class-of-service forwarding-classes]

```
user@switch# class class-name queue-num queue-number <no-loss>
```

**NOTE:** If you are using Junos OS Release 12.2 or later, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best-effort) traffic and does *not* receive lossless treatment unless you include the optional no-loss packet drop attribute introduced in Junos OS Release 12.3 in the forwarding class configuration..

**NOTE:** Junos OS Release 11.3R1 and earlier supported an alternate method of mapping forwarding classes to queues that allowed you to map only one forwarding class to a queue using the statement:

[edit class-of-service forwarding-classes]

```
user@switch# queue queue-number class-name
```

The **queue** statement has been deprecated and is no longer valid in Junos OS Release 11.3R2 and later. If you have a configuration that uses the **queue** statement to map forwarding classes to queues, edit the configuration to replace the **queue** statement with the **class** statement.

## Defining CoS Forwarding Class Sets

A forwarding class set is a priority group for enhanced transmission selection (ETS) traffic control. Each forwarding class set consists of one or more forwarding classes (priorities, which can also be considered as output queues).

You can configure up to three unicast forwarding class sets and one multicast forwarding class set.

To configure a forwarding class set using the CLI:

1. Assign one or more forwarding classes to the forwarding class set:

```
[edit class-of-service]
user@switch# set forwarding-class-sets forwarding-class-set-name class
forwarding-class-name
```

2. Map the forwarding class set to an interface:

```
[edit class-of-service]
user@switch# set interfaces interface-name forwarding-class-set forwarding-class-set-name
```

## Disabling the ETS Recommendation TLV

The enhanced transmission selection (ETS) Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is “willing,” the peer interface changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV.

**NOTE:** Disabling the ETS Recommendation TLV on interfaces that use DCBX version 1.01 as the DCBX mode has no effect and does not change DCBX behavior.

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is “willing,” the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

To disable the ETS Recommendation TLV:

- [edit protocols dcbx interface *interface-name*]  
user@switch# **set enhanced-transmission-selection no-recommendation-tlv**

## Defining CoS Queue Schedulers

Schedulers define the CoS properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the priority of the queue, whether explicit congestion notification (ECN) is enabled on the queue, the WRED packet drop profiles associated with the queue, and the queue buffer size.

The parameters you configure in a scheduler define the following characteristics for the queues mapped to the scheduler:

- **transmit-rate**—Minimum bandwidth, also known as the committed information rate (CIR), set as a percentage rate or as an absolute value in bits per second. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

**NOTE:** Include the preamble bytes and interframe gap (IFG) bytes as well as the data bytes in your bandwidth calculations.

**NOTE:** You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR), set as a percentage rate or as an absolute value in bits per second.

**NOTE:** Include the preamble bytes and interframe gap (IFG) bytes as well as the data bytes in your bandwidth calculations.

- **priority**—One of two bandwidth priorities that queues associated with a scheduler can receive:

- **low**—The scheduler has low priority.
- **strict-high**—The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.

We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.

- **drop-profile-map**—Drop profile mapping to a loss priority and protocol to apply WRED to the scheduler.
- **buffer-size**—Size of the queue buffer as a percentage of the dedicated buffer space on the port, or as a proportional share of the dedicated buffer space on the port that remains after the explicitly configured queues are served.
- **explicit-congestion-notification**—Enables ECN on a best-effort queue. ECN enables end-to-end congestion notification between two ECN-enabled endpoints on TCP/IP based networks. ECN must be enabled on both endpoints and on all of the intermediate devices between the endpoints for ECN to work properly. ECN is disabled by default.

**NOTE:** Ingress port congestion can occur during periods of egress port congestion if an ingress port forwards traffic to more than one egress port, and at least one of those egress ports experiences congestion. If this occurs, the congested egress port can cause the ingress port to exceed its fair allocation of ingress buffer resources. When the ingress port exceeds its buffer resource allocation, frames are dropped at the ingress. Ingress port frame drop affects not only the congested egress ports, but also all of the egress ports to which the congested ingress port forwards traffic.

If a congested ingress port drops traffic that is destined for one or more uncongested egress ports, configure a weighted random early detection (WRED) drop profile and apply it to the egress queue that is causing the congestion. The drop profile prevents the congested egress queue from affecting egress queues on other ports by dropping frames at the egress instead of causing congestion at the ingress port.

**NOTE:** Do not configure drop profiles for the fcoe and no-loss forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.

To apply scheduling properties to traffic, map schedulers to forwarding classes using a scheduler map, and then associate the scheduler map with the interfaces. This applies the configured scheduling to the traffic in the specified forwarding class on the associated interface. Using different scheduler maps, you can map different schedulers to the same traffic (the same forwarding class) to apply different scheduling to that traffic on different interfaces.

To configure a scheduler using the CLI:

1. Name the scheduler and define the minimum guaranteed bandwidth for the queue:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name transmit-rate (rate | percent percentage)
```

2. Define the maximum bandwidth for the queue:

```
[edit class-of-service schedulers scheduler-name]
user@switch# set shaping-rate (rate | percent percentage)
```

3. Define the queue priority:

```
[edit class-of-service schedulers scheduler-name]
user@switch# set priority level
```

4. Define the drop profile using a drop profile map:

```
[edit class-of-service schedulers scheduler-name]
user@switch# set drop-profile-map loss-priority (low | medium-high | high) protocol protocol
drop-profile drop-profile-name
```

5. Configure the size of the port dedicated buffer space for the queue:

```
[edit class-of-service schedulers scheduler-name]
```

```
user@switch# set buffer-size percent 20
```

6. Enable ECN, if desired (queue should handle best-effort traffic):

```
[edit class-of-service schedulers scheduler-name]  
user@switch# set explicit-congestion-notification
```

7. Configure a scheduler map to map the scheduler to a forwarding class, which applies the scheduler's properties to the traffic in that forwarding class:

```
[edit class-of-service]  
user@switch# set scheduler-maps scheduler-map-name forwarding-class  
forwarding-class-name scheduler scheduler-name
```

8. Assign the scheduler map and its associated schedulers to one or more interfaces using hierarchical scheduling. See [“Example: Configuring CoS Hierarchical Port Scheduling \(ETS\)” on page 5966](#) for a detailed example of hierarchical scheduling.

```
[edit class-of-service]  
user@switch# set traffic-control-profiles tcp-name scheduler-map scheduler-map-name  
user@switch# set interfaces interface-name forwarding-class-set fc-set-name  
output-traffic-control-profile tcp-name
```

## Defining CoS Queue Scheduling Priority

You can configure the scheduling priority of individual queues by specifying the priority in a scheduler, and then associating the scheduler with a queue by using a scheduler map. Queues can have one of two bandwidth priorities:

- **strict-high** —The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.

We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.

- **low**—Low priority. Traffic with this priority is serviced after any queue that has a **strict-high** priority.
- To configure queue priority using the CLI:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name priority level
```

### Related Documentation

## Changing the Host Outbound Traffic Default Queue Mapping

If you do not want to use the default mapping of host Routing Engine and CPU outbound traffic to queues, you can change the default output queue. You can also change the default DSCP bits used in the type of service (ToS) field of packets generated by the Routing Engine.

Configuring a queue for host outbound traffic maps all traffic that the host generates to one forwarding class (queue). The configuration is global and applies to all host-generated traffic on the switch. Configuring a forwarding class for host outbound traffic does not affect transit or incoming traffic.

**NOTE:** Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) packets generated by the CPU are always transmitted on the `fcoe` queue (queue 3), even if you configure a queue for host outbound traffic. This helps to ensure lossless behavior for FCoE traffic. QFabric systems classify FIP control packets into the same traffic class (`fcoe`) across the Interconnect device (fabric) and the egress Node device.

To change the host outbound traffic egress queue by including the **host-outbound-traffic** statement at the **[edit class-of-service]** hierarchy level:

```
[edit class-of-service]
host-outbound-traffic {
  forwarding-class class-name;
  dscp-code-point code-point;
}
```

For example, to map host outbound traffic to queue 7 (the network control forwarding class) and set the DSCP code point value to 101010:

```
[edit class-of-service]
host-outbound-traffic {
  forwarding-class network-control;
  dscp-code-point 101010
}
```

### Related Documentation

## Defining CoS Traffic Control Profiles (Priority Group Scheduling)

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) contained in a forwarding class set share the bandwidth resources that you configure in the traffic control profile. A scheduler map associates forwarding classes with schedulers to define how the individual queues in a forwarding class set share the bandwidth allocated to that forwarding class set.

The parameters you configure in a traffic control profile define the following characteristics for the priority group:

- **guaranteed-rate**—Minimum bandwidth, also known as the committed information rate (CIR). The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

**NOTE:** You cannot configure a guaranteed rate for a forwarding class set (priority group) that includes strict-high priority queues. If the traffic control profile is for a forwarding class set that contains strict-high priority queues, do not configure a guaranteed rate.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR).
- **scheduler-map**—Bandwidth and scheduling characteristics for the queues, defined by mapping forwarding classes to schedulers. (The queue scheduling characteristics represent amounts or percentages of the priority group bandwidth, not the amounts or percentages of total link bandwidth.)

**NOTE:** Because a port can have more than one priority group, when you assign resources to a priority group, keep in mind that the total port bandwidth must serve all of the queues associated with that port.

To configure a traffic control profile using the CLI:

1. Name the traffic control profile and define the minimum guaranteed bandwidth for the priority group:  

```
[edit class-of-service ]
user@switch# set traffic-control-profiles traffic-control-profile-name guaranteed-rate (rate | percent percentage)
```
2. Define the maximum bandwidth for the priority group:  

```
[edit class-of-service traffic-control-profiles traffic-control-profile-name]
user@switch# set shaping-rate (rate | percent percentage)
```
3. Attach a scheduler map to the traffic control profile:  

```
[edit class-of-service traffic-control-profiles traffic-control-profile-name]
user@switch# set scheduler-map scheduler-map-name
```

## Configuring CoS PFC (Congestion Notification Profiles)

A congestion notification profile (CNP) enables priority-based flow control (PFC) on specified IEEE 802.1p priorities (code points). A CNP has two components:

- Input CNP:
  - Enable PFC on a specified priority.
  - Configure the maximum receive unit (MRU) on an interface for traffic that matches the PFC priority (optional).
  - Specify the length of the attached cable on the ingress interface (optional)
- Output CNP (optional): Configure flow control to enable PFC pause on specific output queues for specified priorities.

**NOTE:** By default, output queues 3 and 4 (which are mapped to default lossless forwarding classes `fcoe` and `no-loss`, respectively) are configured to respond to PFC pause messages received from the connected peer on priorities 3 and 4 (code points 011 and 100, respectively). If you explicitly configure flow control on any output queue, you must configure flow control on every output queue that you want to respond to pause messages. (The explicit configuration overrides the default configuration.)

To achieve lossless behavior, the output queue priorities on which you enable PFC flow control must match the PFC priorities on which you enable PFC on the input interfaces. For example, if you program output queues to pause priorities 3 (011) and 5 (101) in the output component of the CNP, then you must also enable pause on priorities 3 and 5 on the input component of the CNP. (In addition, the forwarding classes mapped to the paused output queues must be lossless forwarding classes.)

Associating a CNP with an interface enables PFC on the ingress traffic that matches the priority specified in the input CNP, and programs the queues listed in the output CNP to pause when the interface receives a PFC pause message from the connected peer. Configure PFC on a priority end to end along the entire data path to create a lossless lane of traffic on the network.

**NOTE:** You must enable PFC on the priority used by FCoE traffic on ingress interfaces (input CNP). Enable PFC on the FCoE priority on every interface that carries FCoE traffic. By convention, FCoE traffic uses priority 3 (code point 011), which maps to queue 3. If your network uses priority 3 for FCoE traffic, the default forwarding class and classifier configuration support lossless transport, but you must still configure a CNP and apply it to the correct ingress interfaces to enable PFC and achieve lossless transport.

If your network does not use priority 3 for FCoE traffic, you need to configure a classifier that classifies FCoE traffic into a lossless forwarding class, based on the priority your network uses for FCoE traffic. If you are not using the default lossless forwarding class configuration, then you also need to ensure that the output queue mapped to the lossless FCoE forwarding class is programmed to pause.

You can attach only one CNP to an interface. There is no limit to the total number of CNPs you can create.

Configuring a CNP consists of:

- Naming the CNP.
- Specifying the IEEE 802.1 code point (priority) on which you want to enable PFC on ingress interfaces (input CNP).
- Optionally, specifying the MRU and the length of the attached cable on ingress interfaces (input CNP).
- Optionally, configuring flow control (PFC pause) on specified output queues if you want queues other than queues 3 and 4 to respond to pause messages received from the connected peer (output CNP).
- Mapping the CNP to an interface.

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

1. Enable PFC on the desired priority in the input CNP and optionally configure the interface MRU for traffic on that priority:

```
[edit class-of-service]
user@switch# set congestion-notification-profile cnp-name input ieee-802.1 code-point
code-point bits pfc mru mru-value
```

For example, to configure a CNP named **fcoe-cnp** that enables PFC on IEEE 802.1 code point **011** and configures an MRU value of **2240**:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011
pfc mru 2240
```

2. Configure the length of the cable attached to the ingress interface (optional):

```
[edit class-of-service]
user@switch# set congestion-notification-profile cnp-name input cable-length
cable-length-value
```

For example, to configure a CNP named **fcoe-cnp** that sets the length of the ingress interface cable to **100** meters:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input cable-length 100
```

3. (Optional) Configure flow control on output queues:

```
[edit class-of-service]
user@switch# set congestion-notification-profile cnp-name output ieee-802.1 code-point
code-point-bits flow-control-queue [queue | list-of-queues]
```

For example, to configure a CNP named **fcoe-cnp** that enables PFC pause flow control on output queues 3 and 5 for FCoE traffic that uses priority 3 (code point **011**) and on output queue 4 for traffic that uses priority 4 (code point **100**):

```
[edit class-of-service]
user@switch# set congestion-notification-profile cnp-name output ieee-802.1 code-point
011 flow-control-queue [3 5]
user@switch# set congestion-notification-profile cnp-name output ieee-802.1 code-point
100 flow-control-queue 4
```

4. Map the CNP to an interface:

```
[edit class-of-service]
user@switch# set interfaces interface congestion-notification-profile cnp-name
```

For example, to map the CNP **fcoe-cnp** to the interface **xe-0/0/7**:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/7 congestion-notification-profile fcoe-cnp
```

## Enabling and Disabling CoS Symmetric Ethernet PAUSE Flow Control

Ethernet PAUSE flow control is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link, including Ethernet links that belong to Ethernet link aggregated (LAG) interfaces. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to PAUSE messages it receives from the connected peer to stop sending traffic.

Symmetric flow control means that an interface has the same PAUSE configuration in both directions. The PAUSE generation and PAUSE response functions are both configured as enabled, or they are both disabled.

Asymmetric flow control allows you to configure the PAUSE functionality in each direction independently on an interface. The configuration for generating PAUSE messages and for responding to PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction. If you do not want to PAUSE all of the traffic on a link, you can use priority-based flow control (PFC) to selectively pause traffic based on its IEEE 802.1p code point.

On any particular interface, symmetric and asymmetric flow control are mutually exclusive. If you attempt to configure both features, the switch returns a commit error. Ethernet PAUSE and PFC are also mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

By default, all flow control features are disabled. You enable symmetric flow control on the interfaces on which you want to PAUSE all of the traffic on a link.

- To enable symmetric flow control on an interface:

```
[edit interfaces interface-name ether-options]
user@switch# set flow-control
```

- To disable symmetric flow control on an interface:

```
[edit interfaces interface-name ether-options]
user@switch# set no-flow-control
```

## Configuring CoS Asymmetric Ethernet PAUSE Flow Control

Ethernet PAUSE flow control is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link, including Ethernet links that belong to link aggregated (LAG) interfaces. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to PAUSE messages it receives from the connected peer to stop sending traffic.

Asymmetric flow control allows you to configure the PAUSE functionality in each direction independently on an interface. The configuration for generating PAUSE messages and for responding to PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction.

Symmetric flow control means that the interface has the same configuration in both directions. The PAUSE generation and PAUSE response functions are both configured as enabled or they are both disabled. If you do not want to PAUSE all of the traffic on a link, you can use priority-based flow control (PFC) to selectively pause traffic based on its IEEE 802.1p code point.

Asymmetric flow control provides the ability to configure the receive buffer and transmit buffer Ethernet PAUSE actions independently on an interface. The buffers perform the following actions:

- The receive buffers generate and send PAUSE messages to the connected peer to ask the peer to stop sending traffic for a time period specified in the PAUSE frame. The peer interface's buffers may store outgoing frames until the PAUSE period elapses and the interface can resume sending traffic.
- The transmit buffers respond to PAUSE messages received from the connected peer to stop sending traffic to the peer. The transmit buffer may store outgoing frames until the PAUSE period elapses and the interface can resume sending traffic.

Asymmetric flow control enables you to specify independently whether or not the interface receive buffer generates and sends PAUSE messages to stop the connected peer from transmitting traffic, and whether or not the interface transmit buffer responds to PAUSE messages it receives from the connected peer and stops transmitting traffic. The receive buffer configuration determines if the interface transmits PAUSE messages, and the transmit buffer configuration determines if the interface receives and responds to PAUSE messages:

- Receive buffers on—Enable PAUSE transmission (generate and send PAUSE frames)
- Transmit buffers on—Enable PAUSE reception (respond to received PAUSE frames)

You must explicitly set both the receive buffer and the transmit buffer to configure asymmetric flow control.

- To configure asymmetric flow control on an interface:

```
[edit interfaces interface-name ether-options]
```

```
user@switch# set configured-flow-control rx-buffers (on | off) tx-buffers (on | off)
```

For example, to configure interface **xe-0/0/24** to generate and send PAUSE messages but not to respond to received PAUSE messages:

```
set interfaces xe-0/0/24 ether-options configured-flow-control rx-buffers on tx-buffers off
```

For example, to configure interface **xe-0/0/30** to respond to received PAUSE messages but not to generate and send PAUSE messages:

```
set interfaces xe-0/0/30 ether-options configured-flow-control rx-buffers off tx-buffers on
```

**NOTE:** If you configure both buffers to be on, that is equivalent to symmetric flow control. If you configure both buffers to be off, there is no flow control (flow control is disabled).

## Configuring Global Ingress and Egress Shared Buffers

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of ingress and egress buffers to better support different mixes of network traffic.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best-effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from one of the recommended configurations, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multdestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multdestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffer allocation and partitioning using the CLI:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent percent
```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent percent
user@switch# set ingress buffer-partition lossless-headroom percent percent
user@switch# set ingress buffer-partition lossy percent percent
```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set egress percent percent
```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent percent
user@switch# set egress buffer-partition lossy percent percent
user@switch# set egress buffer-partition multicast percent percent
```

## Defining CoS Rewrite Rules

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of a switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure a CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and code point. This creates a rewrite table. After the rewrite rule is created, enable it on an interface (EXP rewrite rules can only be enabled on **family mpls** logical interfaces, not on physical interfaces). You can also apply an existing rewrite rule on an interface.

**NOTE:** On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

**NOTE:** To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the existing rewrite rule and then apply the new rule.

**NOTE:** For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.

To create rewrite rules and enable them on interfaces:

- To create an 802.1p rewrite rule named **customup-rw** in the rewrite table for all Layer 2 interfaces:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low code-point 000
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority high code-point 001
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low code-point 010
user@switch# set ieee-802.1 customup-rw forwarding-class fcoe loss-priority low code-point 011
user@switch# set ieee-802.1 customup-rw forwarding-class ef-no-loss loss-priority low code-point 100
user@switch# set ieee-802.1 customup-rw forwarding-class ef-no-loss loss-priority high code-point 101
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority low code-point 110
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority high code-point 111
```

- To enable an 802.1p rewrite rule named **customup-rw** on a Layer 2 interface:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/7 unit 0 rewrite-rules ieee-802.1
customup-rw
```

**NOTE:** All forwarding classes assigned to port xe-0/0/7 must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same physical interface.

- To enable an 802.1p rewrite rule named **customup-rw** on all 10-Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and logical interface (unit) number:

```
[edit]
user@switch# set class-of-service interfaces xe-* unit * rewrite-rules customup-rw
```

**NOTE:** In this case, *all* forwarding classes assigned to *all* 10-Gigabit Ethernet ports must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same physical interface.

## Configuring Rewrite Rules for MPLS EXP Classifiers

You configure EXP rewrite rules to alter CoS values in outgoing MPLS packets on the outbound **family mpls** interfaces of a switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure an EXP CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and code point. This creates a rewrite table. After the rewrite rule is created, enable it on a logical **family mpls** interface. EXP rewrite rules can only be enabled on logical **family mpls** interfaces, not on physical interfaces or on interfaces of other family types. You can also apply an existing EXP rewrite rule on a logical interface.

**NOTE:** There are no default rewrite rules.

You can configure as many EXP rewrite rules as you want, but you can only use 16 EXP rewrite rules at any time on the switch. On a given **family mpls** logical interface, all pushed MPLS labels have the same EXP rewrite rule applied to them. You can apply different EXP rewrite rules to different logical interfaces on the same physical interface.

**NOTE:** On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

**NOTE:** To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the existing rewrite rule and then apply the new rule.

To create an EXP rewrite rule for MPLS traffic and enable it on a logical interface:

1. Create an EXP rewrite rule:

```
user@switch# set class-of-service rewrite-rules exp rewrite-rule-name forwarding-class forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
```

For example, to configure an EXP rewrite rule named **exp-rr-1** for a forwarding class named **mpls-1** with a loss priority of **low** that rewrites the EXP code point value to **001**:

```
user@switch# set class-of-service rewrite-rules exp exp-rr-1 forwarding-class mpls-1 loss-priority low code-points 001
```

2. Apply the rewrite rule to a logical interface:

```
user@switch # set class-of-service interfaces interface-name unit logical-unit rewrite-rules exp rewrite-rule-name
```

For example, to apply a rewrite rule named **exp-rr-1** to logical interface **xe-0/0/10.0**:

```
user@switch# set class-of-service interfaces xe-0/0/10 unit 0 rewrite-rules exp exp-rr-1
```

**NOTE:** In this example, all forwarding classes assigned to port xe-0/0/10 must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same interface.

## Assigning CoS Components to Interfaces

After you define the following CoS components, you assign them to physical or logical interfaces. Components that you assign to physical interfaces are valid for all of the logical interfaces configured on the physical interface. Components that you assign to a logical interface are valid only for that logical interface.

- Classifiers—Assign only to logical interfaces.
- Congestion notification profiles—Assign only to physical interfaces.
- Forwarding classes—Assign to interfaces by mapping to forwarding class sets.
- Forwarding class sets—Assign only to physical interfaces.
- Output traffic control profiles—Assign only to physical interfaces (with a forwarding class set).
- Rewrite rules—Assign only to logical interfaces.

You can assign a CoS component to a single interface or to multiple interfaces using wildcards. You can also assign a congestion notification profile or a forwarding class set globally to all interfaces.

To assign CoS components to interfaces:

Assign CoS components to a single interface by associating a CoS component (for example a forwarding class set named **san-priority-group**) with an interface:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/7 forwarding-class-set san-priority-group
```

Assign a CoS component to multiple interfaces by associating a CoS component (for example, a rewrite rule named **customup-rw**) to all 10-Gigabit Ethernet interfaces on the switch, use wildcard characters for the interface name and logical interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set xe-* unit * rewrite-rules ieee-802.1 customup-rw
```

Assign a congestion notification profile or a forwarding class set globally to all interfaces using the **set class-of-service interfaces all** statement. For example, to assign a forwarding class set named **be\_fcset** to all interfaces:

```
[edit class-of-service interfaces]
user@switch# set all forwarding-class-set be_fcset
```

**NOTE:** If there is an existing CoS configuration of any type on an interface, the global configuration is not applied to that particular interface. The global configuration is applied to all interfaces that do not have an existing CoS configuration.

For example, if you configure a rewrite rule, assign it to interfaces **xe-0/0/20.0** and **xe-0/0/22.0**, and then configure a congestion notification profile and apply it to all interfaces, the congestion notification profile is applied to every interface except **xe-0/0/20** and **xe-0/0/22**.

## Configuring the DCBX Mode

You can configure the DCBX mode that an interface uses to communicate with the connected peer. Three DCBX modes are supported:

- Autonegotiation—The interface negotiates with the connected peer to determine the DCBX mode. This is the default DCBX mode.
- IEEE DCBX—The interface uses IEEE DCBX type, length, and value (TLV) to exchange DCBX information with the connected peer. QFX3500 Node devices come up with IEEE DCBX enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.
- DCBX Version 1.01—The interface uses Converged Enhanced Ethernet (CEE) DCBX version 1.01 TLVs to exchange DCBX information with the connected peer. QFabric system Node devices other than QFX3500 switches come up with DCBX version 1.01 enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.

**NOTE:** Pre-CEE (pre-DCB) versions of DCBX such as DCBX version 1.00 are not supported. If an interface receives an LLDP frame with pre-CEE DCBX TLVs, the system drops the frame.

Configure the DCBX mode by specifying the mode for one interface or for all interfaces.

- To configure the DCBX mode, specify the interface and the mode:

```
[edit protocols dcbx]
user@switch# set interface interface-name mode (auto-negotiate | ieee-dcbx |
dcbx-version-1.01)
```

For example, to configure DCBX version 1.01 on interface **xe-0/0/21**:

```
user@switch# set protocols dcbx interface xe-0/0/21 mode dcbx-version-1.01
```

To configure IEEE DCBX on all interfaces:

```
user@switch# set protocols dcbx interface all mode ieee-dcbx
```

## Configuring DCBX Autonegotiation

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of peers by exchanging feature configuration information. DCBX also detects feature misconfiguration and mismatches, and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP), and LLDP must remain enabled on every interface for which you want to use DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

The switch supports DCBX autonegotiation for:

- Priority-based flow control (PFC) configuration
- Layer 2 and Layer 4 applications such as Fibre Channel over Ethernet (FCoE) and Internet Small Computer System Interface (iSCSI)
- Enhanced transmission selection (ETS) advertisement

DCBX autonegotiation is configured on a per-interface basis for each supported feature or application. The PFC and application DCBX exchanges use autonegotiation by default. The default autonegotiation behavior is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

You can override the default behavior for each feature by turning off autonegotiation to force an interface to enable or disable the feature.

Autonegotiation of ETS means that when ETS is enabled on an interface (priority groups are configured), the interface advertises its ETS configuration to the peer device. In this case, priorities (forwarding classes) that are not part of a priority group (forwarding class set) receive no bandwidth and are advertised in an automatically generated default forwarding class. If ETS is not enabled on an interface (no priority groups are configured), all of the priorities are advertised in one automatically generated default priority group that receives 100 percent of the port bandwidth.

Disabling ETS autonegotiation prevents the interface from sending the Recommendation TLV or the Configuration TLV to the connected peer.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable autonegotiation of the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers. DCBX still exchanges the ETS Configuration TLV if you disable the ETS Recommendation TLV.

Autonegotiation of PFC means that when PFC is enabled on an interface, if the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled.

In addition, if the peer advertises that it is “willing” to learn its PFC configuration from the switch, DCBX pushes the switch’s PFC configuration to the peer and does not check the peer’s administrative state. The switch does not learn PFC configuration from peers (the switch does not advertise its state as “willing”).

Disabling PFC autonegotiation prevents the interface from exchanging PFC configuration information with the peer. It forces the interface to enable PFC if PFC is configured on the interface or to disable PFC if PFC is not configured on the interface. If you disable PFC autonegotiation, the assumption is that the peer is also configured manually.

Autonegotiation of applications depends on whether or not you apply an application map to an interface. If you apply an application map to an interface, the interface autonegotiates DCBX for each application in the application map. PFC must be enabled on the FCoE priority (the FCoE IEEE 802.1p code point) for the interface to advertise the FCoE application. The interface only advertises applications that are included in the application map.

For example, if you apply an application map to an interface and the application map does not include the FCoE application, then that interface does not perform DCBX advertisement of FCoE.

If you do not apply an application map to an interface, DCBX does not advertise applications on that interface, with the exception of FCoE, which is handled differently than other applications.

**NOTE:** If you do not apply an application map to an interface, the interface performs autonegotiation of FCoE if the interface carries traffic in the FCoE forwarding class and also has PFC enabled on the FCoE priority. On such interfaces, if DCBX detects that the peer device connected to the interface supports FCoE, the switch advertises its FCoE capability and IEEE 802.1p code point on that interface. If DCBX detects that the peer device connected to the interface does not support FCoE, DCBX marks that interface as “FCoE down” and disables FCoE on the interface.

When DCBX marks an interface as “FCoE down,” the behavior of the switch depends on how you use it in the network:

- When the switch acts as an FCoE-FC gateway, it does not send or receive FCoE Initialization Protocol (FIP) packets.
- When the switch acts as an FCoE transit switch, the interface drops all of the FIP packets it receives. In addition, FIP packets received from an FCoE forwarder (FCF) are not forwarded to interfaces marked as “FCoE down.”

Disabling autonegotiation prevents the interface from exchanging application information with the peer. In this case, the assumption is that the peer is also configured manually.

To disable DCBX autonegotiation of PFC, applications (including FCoE), and ETS using the CLI:

1. Turn off autonegotiation for PFC.

```
[edit]
user@switch# set protocols dcbx interface interface-name priority-flow-control
no-auto-negotiation
```

2. Turn off autonegotiation for applications.

```
[edit]
user@switch# set protocols dcbx interface interface-name applications no-auto-negotiation
```

3. Turn off autonegotiation for ETS.

```
[edit]
user@switch# set protocols dcbx interface interface-name enhanced-transmission-selection
no-auto-negotiation
```

To disable autonegotiation of the ETS Recommendation TLV so that DCBX exchanges only the ETS Configuration TLV:

- [edit protocols dcbx interface *interface-name*]  
user@switch# set enhanced-transmission-selection no-recommendation-tlv

## Defining an Application for DCBX Application Protocol TLV Exchange

Define each application for which you want DCBX to exchange application protocol information. You can define Layer 2 and Layer 4 applications. After you define applications, you map them to IEEE 802.1p code points, and then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to configure application maps and apply them to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Define Layer 2 applications by mapping an application name to an EtherType. Define Layer 4 applications by mapping an application name to a protocol (TCP or UDP) and a destination port.

- To define a Layer 2 application, specify the name of the application and its EtherType:

```
[edit applications]
user@switch# set application application-name ether-type ether-type
```

For example, to configure an application named **PTP** (for Precision Time Protocol) that uses the EtherType **0x88F7**:

```
user@switch# set applications application ptp ether-type 0x88F7
```

- To define a Layer 4 application, specify the name of the application, its protocol (TCP or UDP), and its destination port:

```
[edit]
user@switch# set applications application application-name protocol (tcp | udp)
destination-port port-value
```

For example, to configure an application named **iscsi** (for Internet Small Computer System Interface) that uses the protocol **TCP** and the destination port **3260**:

```
user@switch# set applications application iscsi protocol tcp destination-port 3260
```

## Configuring an Application Map for DCBX Application Protocol TLV Exchange

After you define applications for which you want to exchange DCBX application protocol information, map the applications to IEEE 802.1p code points. The IEEE 802.1p code points identify incoming traffic and allow you to map that traffic to the desired application. You then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to define applications and apply the application map to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Configure an application map by creating an application map name and mapping an application to one or more IEEE 802.1p code points.

- To define an application map, specify the name of the application map, the name of the application, and the IEEE 802.1p code points of the incoming traffic that you want to associate with the application in the application map:

```
[edit policy-options]
user@switch# set application-maps application-map-name application application-name
code-points [ aliases ] [ bit-patterns ]
```

For example, to configure an application map named **ptp-app-map** that includes an application named **PTP** (for Precision Time Protocol) and map the application to IEEE 802.1p code points **001** and **101**:

```
user@switch# set policy-options application-maps ptp-app-map application ptp code points
[ 001 101 ]
```

## buffer-partition (Egress)

**Syntax** `buffer-partition (lossless | lossy | multicast) {  
percent percent;  
}`

**Hierarchy Level** [edit [class-of-service shared-buffer egress](#)]

**Release Information** Statement introduced in Junos OS Release 12.3 for the QFX Series.

**Description** The egress shared buffer pool is divided into three partitions. Each partition reserves a percentage of the available shared buffer pool for a type of traffic, so that the switch provides enough resources to support a mix of best-effort, lossless, and multicast traffic (multicast also includes broadcast and destination lookup fail traffic). To better support the mix of traffic on your network, you can optimize the allocation of egress shared buffers to different types of traffic by fine-tuning the shared buffer partitions.

The percentages you configure for the three egress shared buffer partitions must total exactly 100 percent. If the total of the three shared buffer percentages is not 100 percent, the system returns a commit error and does not commit the configuration. You can configure any partition to 0 (zero) percent as long as the allocation to other partitions totals 100 percent.

This is a global allocation that applies to all ports. All ports on the switch receive the same allocation of egress shared buffers.

If you do not configure buffer partitions, the switch uses the default partitioning.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

**Default** The default egress buffer partition shown in [Table 563 on page 6201](#) supports networks with a balanced mix of best-effort, multicast, and lossless traffic. It is the recommended configuration if you are using the default configuration with two lossless forwarding classes.

**Table 563: Default Egress Shared Buffer Partitioning**

Lossless Partition	Lossy Partition	Multicast Partition
50%	31%	19%

The sum of the default percentages configured for each partition is 100 percent. The sum of the partition percentages must always total 100 percent.

**Options** **lossless**—Shared buffer space reserved for all lossless egress traffic.

**lossy**—Shared buffer space for best-effort unicast egress traffic.

**multicast**—Shared buffer space reserved for all multicast (including broadcast and destination lookup fail) egress traffic.

**percent percent**—The percentage of buffer space to allocate to the specified buffer partition (lossless, lossy, or multicast buffers). The sum of the percentages for the three buffer partitions must total 100 percent.

**Required Privilege Level** interfaces—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## buffer-partition (Ingress)

**Syntax** `buffer-partition (lossless | lossless-headroom | lossy) {  
percent percentage;  
}`

**Hierarchy Level** [edit [class-of-service shared-buffer ingress](#)]

**Release Information** Statement introduced in Junos OS Release 12.3 for the QFX Series.

**Description** The ingress shared buffer pool is divided into three partitions. Each partition reserves a percentage of the available shared buffer pool for a type of traffic, so that the switch provides enough resources to support a mix of best effort (best-effort unicast and multicast) and lossless traffic. To better support the mix of traffic on your network, you can optimize the allocation of ingress shared buffers to different types of traffic by fine-tuning the shared buffer partitions.

The percentages you configure for the three ingress shared buffer partitions must total exactly 100 percent. If the total of the three shared buffer percentages is not 100 percent, the system returns a commit error and does not commit the configuration. You can configure any partition to 0 (zero) percent as long as the allocation to other partitions totals 100 percent.

This is a global allocation that applies to all ingress traffic. All ports on the switch receive the same allocation of ingress shared buffers.

If you do not configure buffer partitions, the switch uses the default partitioning.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

**Default** The default ingress buffer partition shown in [Table 564 on page 6203](#) supports networks with a balanced mix of best-effort, multicast, and lossless traffic. It is the recommended configuration if you are using the default configuration with two lossless forwarding classes.

**Table 564: Default Ingress Shared Buffer Partitioning**

Lossless Partition	Lossless-Headroom Partition	Lossy Partition
9%	45%	46%

The sum of the default percentages configured for each partition is 100 percent. The sum of the partition percentages always must total 100 percent.

**Options** **lossless**—Shared buffer space reserved for all lossless ingress traffic.

**lossless-headroom**—Shared buffer space reserved to store packets received while either an 802.3x Ethernet PAUSE or a priority-based flow control (PFC) pause is asserted. (When an ingress interface pauses traffic, it must have the buffer space to store all of the packets currently in the buffer, and also all of the packets received before the connected peer stops sending traffic and the wire is cleared of packets.)

**lossy**—Shared buffer space for best-effort ingress traffic.

**percent *percent***—The percentage of buffer space to allocate to the specified buffer partition (lossless, lossless-headroom, or lossy buffers). The sum of the percentages for the three buffer partitions must total 100 percent.

<b>Required Privilege</b>	interfaces—To view this statement in the configuration.
<b>Level</b>	interface-control—To add this statement to the configuration.

## buffer-size

<b>Syntax</b>	<code>buffer-size (percent <i>percent</i>   remainder);</code>
<b>Hierarchy Level</b>	[edit <code>class-of-service schedulers <i>scheduler-name</i></code> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Set the dedicated buffer size of the egress queue that you bind the scheduler to in the scheduler map configuration. The switch allocates space from the global dedicated buffer pool to ports and queues in a hierarchical manner. The switch allocates an equal number of dedicated buffers to each egress port, so each egress port receives the same amount of dedicated buffer space. The amount of dedicated buffer space per port is not configurable.

However, the **buffer-size** statement allows you to control the way each port allocates its share of dedicated buffers to its queues. For example, if a port only uses two queues to forward traffic, you can configure the port to allocate all of its dedicated buffer space to those two ports and avoid wasting buffer space on queues that are not in use. We recommend that the buffer size should be the same size as the minimum guaranteed transmission rate (the **transmit-rate**).

You configure the proportion of port dedicated buffers allocated to a particular output queue using the following process:

1. Configure a scheduler and set the **buffer-size** option to match the scheduler **transmit-rate** value.
2. Use a scheduler map to map the scheduler to the forwarding class that is mapped to the queue to which you want to apply the buffer size.

For example, suppose that you want to change the dedicated buffer allocation for FCoE traffic. FCoE traffic is mapped to the `fcoe` forwarding class, and the `fcoe` forwarding class is mapped to queue 3 (this is the default configuration). To use default FCoE traffic mapping, in the scheduler map configuration, map the scheduler to the **fcoe** forwarding class.

3. Associate the scheduler map with the traffic control profile you want to use on the egress ports that carry FCoE traffic.
4. Associate the traffic control profile that includes the scheduler map with the desired egress ports. For this example, you associate the traffic control profile with the ports that carry FCoE traffic.

Queue 3, which is mapped to the `fcoe` forwarding class and therefore to the FCoE traffic, receives the dedicated buffer allocation specified in the **buffer-size** statement.

**NOTE:** The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

**Default** The port allocates dedicated buffers to queues that have an explicitly configured scheduler buffer size. If you do not explicitly configure a scheduler buffer size for a queue, the port serves the explicitly configured queues first. Then the port divides the remaining dedicated buffers equally among the queues that have an explicitly attached scheduler *without* an explicitly configured buffer size configuration. (If you configure a scheduler, but you do not configure the buffer size parameter, the default is equivalent to configuring the buffer size with the **remainder** option.)

If you use the default scheduler and scheduler map on a port (no explicit scheduler configuration), then the port allocates its dedicated buffer pool to queues based on the default scheduling, as shown in [Table 565 on page 6206](#). The default buffer size is the same as the default transmit rate for each default queue:

**Table 565: Default Output Queue Buffer Sizes**

Queue Number	Forwarding Class	Transmit Rate	Buffer Size
0	best-effort	5%	5%
3	fcoe	35%	35%
4	no-loss	35%	35%
7	network-control	5%	5%
8	mcast	20%	20%

Because the default scheduler includes only five forwarding classes, only the queues mapped to those forwarding classes receive dedicated buffers from the port buffer pool. (Buffers are not wasted on queues that do not carry traffic.)

**Options** **percent percent**—Percentage of the port dedicated buffer pool allocated to the queue (or queues) mapped to the scheduler.

**remainder**—Remaining dedicated buffer pool after the port satisfies the needs of the explicitly configured buffers. The port divides the remaining buffers equally among the queues that are explicitly attached to a scheduler but that do not have an explicit buffer size configuration (or are configured with **remainder** as the buffer size).

**Required Privilege** interfaces—To view this statement in the configuration.

**Level** interface-control—To add this statement to the configuration.

## cable-length (Congestion Notification)

<b>Syntax</b>	<code>cable-length <i>cable-length-value</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service congestion-notification-profile <i>profile-name</i></a> <a href="#">input</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Specify the length of the cable between the interface and its peer interface in meters. The system uses the cable length and the maximum receive unit (MRU) to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The the shorter the cable length and lower the MRU, the less headroom buffer space is required for PFC.
<div>  <p><b>NOTE:</b> You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the <code>mtu</code> statement at the [edit <a href="#">interfaces <i>interface-name</i></a>] hierarchy level.</p> </div>	
<b>Default</b>	The default cable length value is 100 meters (approximately 328 feet).
<b>Options</b>	<code><i>cable-length-value</i></code> —Length of the cable in meters. (Generally from 1 to 300 meters, but there is no configuration restriction.)
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.

## class (Forwarding Classes)

---

**Syntax**    `class {  
              class-name {  
                  queue-num queue-number <no-loss>;  
              }  
          }`

**Hierarchy Level**    [edit [class-of-service forwarding-classes](#)]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.  
No-loss option introduced in Junos OS Release 12.3 for the QFX Series.

**Description**    Map one or more forwarding classes to a single queue. You can map unicast forwarding classes to a unicast queue (0 through 7) and multdestination forwarding classes to a multicast queue (8 through 11). The queue to which you map a forwarding class determines if the forwarding class is a unicast or multicast forwarding class.

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the fcoe and no-loss forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the no-loss option. If you do not specify the no-loss option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if you explicitly configure the fcoe forwarding class and you do not include the no-loss option, the fcoe forwarding class is lossy, not lossless.

---

**Options**    *class-name* —Name of the forwarding class.

The remaining statement is explained separately.

**Required Privilege Level**    interfaces—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

<b>Hierarchy Level</b>	[edit <a href="#">class-of-service congestion-notification-profile</a> <i>profile-name</i> <a href="#">input</a> <a href="#">ieee-802.1</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Enable priority-based flow control (PFC) on an IEEE 802.1p code point (priority).
<b>Options</b>	<p><b><i>code-point-bits</i></b>—3-bit value in decimal form.</p> <p>The remaining statements are described separately.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring CoS PFC for FCoE Traffic on page 5606</a></li> <li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 6174</a></li> <li>• <a href="#">Understanding CoS Flow Control (Ethernet PAUSE and PFC) on page 5559</a></li> </ul>

## code-point (Output Congestion Notification)

---

<b>Syntax</b>	<code>code-point [ <i>code-point-bits</i> ] {     <i>flow-control-queue</i> [ <i>queue</i>   <i>list-of-queues</i> ]; }</code>
<b>Hierarchy Level</b>	[edit <i>class-of-service congestion-notification-profile profile-name output ieee-802.1</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Specify the IEEE 802.1p code point bits that identify the traffic you want to enable for priority-based flow control (PFC) pause.
<b>Default</b>	<p>By default, IEEE 802.1p priorities 3 and 4 (code points 011 and 100, respectively) are enabled for PFC pause on all Ethernet interfaces. If you explicitly configure priorities to pause and the output queues on which to enable pause, the explicit configuration overrides the default configuration. When you apply an explicit output congestion notification profile to an interface, only the priorities and queues specified in the output congestion notification profile are enabled for pause on that interface.</p> <p>For example, if you configure an output congestion notification profile that specifies priority 2 (code point 010), then traffic with IEEE 802.1p priority 2 is paused on the configured output queue during periods of congestion. However, traffic with priority 3 and priority 4 is not programmed to pause, because the explicit configuration overwrites the default configuration, and the explicit configuration does not pause priority 3 and priority 4. If you configure an explicit output congestion notification profile, all of the priorities you want to enable for PFC and all of the output queues you want to pause must be explicitly configured.</p>
<b>Options</b>	<p><i>code-point-bits</i>—3-bit value in decimal form.</p> <p>The remaining statements are described separately.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

<b>Hierarchy Level</b>	[edit <a href="#">class-of-service</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define an alias for a CoS marker. You can use the alias instead of the bit pattern when you specify the code point during configuration.
<b>Options</b>	<p>(<a href="#">dscp</a>   <a href="#">dscp-ipv6</a>   <a href="#">ieee-802.1</a>)—Set the type of classifier for which you are creating an alias.</p> <p><i>alias-name</i>—Name of the code-point alias.</p> <p><i>bits</i> —Value of the code-point bits, in decimal form.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Defining CoS Code-Point Aliases on page 6159</a></li> <li>• <a href="#">Understanding CoS Code-Point Aliases on page 5808</a></li> </ul>

## code-points (Application Maps)

---

Syntax	<code>code-points [ <i>aliases</i> ] [ <i>bit-patterns</i> ];</code>
Hierarchy Level	<code>[edit policy-options <b>application-maps</b> <i>application-map-name</i> <b>application</b> <i>application-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	Define one or more code-point aliases or bit sets for an application.
Options	<i>aliases</i> —Name of the alias or aliases.  <i>bit-patterns</i> —Value of the code-point bits, in decimal form.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring an Application Map for DCBX Application Protocol TLV Exchange on page 5674</a></li><li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 5595</a></li><li>• <a href="#">Example: Configuring DCBX to Support an iSCSI Application</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on page 5589</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on EX Series Switches</a></li></ul>

## code-points (CoS)

---

Syntax	<code>code-points [ <i>aliases</i> ] [ <i>bit-patterns</i> ];</code>
Hierarchy Level	<code>[edit <b>class-of-service</b> <b>classifiers</b> (<b>dscp</b>   <b>dscp-ipv6</b>   <b>ieee-802.1</b>) <i>classifier-name</i> <b>forwarding-class</b> <i>class-name</i> <b>loss-priority</b> <i>level</i>]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure one or more code-point aliases or bit sets to apply to a forwarding class.
Options	<i>aliases</i> —Name of the alias or aliases.  <i>bit-patterns</i> —Value of the code-point bits, in decimal form.
Required Privilege Level	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Unicast Classifiers on page 6066</a></li><li>• <a href="#">Understanding CoS Classifiers on page 5810</a></li></ul>

## configured-flow-control

<b>Syntax</b>	configured-flow-control { <b>rx-buffers</b> (on   off); <b>tx-buffers</b> (on   off); }
<b>Hierarchy Level</b>	[edit <b>interfaces</b> <i>interface-name</i> <b>ether-options</b> ]
<b>Description</b>	<p>Configure Ethernet PAUSE asymmetric flow control on an interface. You can set an interface to generate and send PAUSE messages, and you can set an interface to respond to PAUSE messages sent by the connected peer. You must set both the <b>rx-buffers</b> and the <b>tx-buffers</b> values when you configure asymmetric flow control.</p> <p>Use the <b>flow-control</b> and <b>no-flow-control</b> statements to enable and disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.</p> <hr/> <div>  <p><b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC) by applying a congestion notification profile to the interface.</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div> <hr/>
<b>Default</b>	Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">congestion-notification-profile on page 6220</a></li> <li>• <a href="#">flow-control on page 2659</a></li> </ul>

## congestion-notification-profile

<b>Syntax</b>	<pre> congestion-notification-profile <i>profile-name</i> {   input {     ieee-802.1 {       code-point [<i>code-point-bits</i>] {         pfc {           mru <i>mru-value</i>;         }       }     }     cable-length <i>cable-length-value</i>;   }   output {     ieee-802.1 {       code-point [<i>code-point-bits</i>] {         flow-control-queue [<i>queue</i>   <i>list-of-queues</i>];       }     }   } } </pre>
<b>Interface Congestion Notification Profile Association</b>	<pre> congestion-notification-profile <i>profile-name</i> { </pre>
<b>Hierarchy Level</b>	<pre> [edit <i>class-of-service</i>], [edit <i>class-of-service interfaces interface-name</i>] </pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a congestion notification profile to enable priority-based flow control (PFC) on traffic specified by an IEEE 802.1 code point, and apply the profile to an interface.

**NOTE:** You must configure PFC for FCoE traffic. Each interface that carries FCoE traffic should be configured for PFC on the FCoE code point (usually 011).

You can attach a maximum of one congestion notification profile to an interface. There is no limit to the total number of congestion notification profiles you can create.

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

**Options** *profile-name*—Name of the congestion notification profile.

The remaining statements are explained separately.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## dcbx

---

Syntax	<pre>dcbx {   disable;   interface (<i>interface-name</i>   all) {     disable;     application-map <i>application-map-name</i>;     applications {       no-auto-negotiation;     }     enhanced-transmission-selection {       no-auto-negotiation;       no-recommendation-tlv;       recommendation-tlv {         no-auto-negotiation;       }     }     dcbx-version (auto-negotiate   ieee-dcbx   dcbx-version-1.01);     priority-flow-control {       no-auto-negotiation;     }   } }</pre>
Hierarchy Level	[edit <a href="#">protocols</a> ]
Release Information	<p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 11.3 for EX Series switches.</p> <p><b>mode</b> and <b>recommendation-tlv</b> statements introduced in Junos OS Release 12.2 for the QFX Series.</p>
Description	Configure DCBX properties.
Options	The statements are explained separately.
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show dcbx neighbors on page 5724</a></li><li>• <a href="#">Understanding DCB Features and Requirements on page 5515</a></li><li>• <a href="#">Configuring DCBX Autonegotiation on page 5669</a></li><li>• <i>Understanding DCB Features and Requirements on EX Series Switches</i></li><li>• <i>Disabling DCBX to Disable PFC Autonegotiation on EX Series Switches (CLI Procedure)</i></li></ul>

## dcbx-version

---

<b>Syntax</b>	<code>dcbx-version (auto-negotiate   ieee-dcbx   dcbx-version-1.01);</code>
<b>Hierarchy Level</b>	[edit <a href="#">protocols dcbx interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	<p>Set the DCBX version for the specified interface or interfaces.</p> <p>QFX3500 switches come up in IEEE DCBX mode and then autonegotiate with the connected peer to set the DCBX version.</p> <p>QFabric system Node devices come up using DCBX version 1.01, and then autonegotiate with the connected peer to set the DCBX mode.</p>
<b>Default</b>	The default DCBX mode is autonegotiation.
<b>Options</b>	<p><b>auto-negotiate</b>—Automatically negotiate the DCBX version with the connected peer.</p> <p><b>ieee-dcbx</b>—Force the interface to use IEEE DCBX mode, regardless of the peer configuration.</p> <p><b>dcbx-version-1.01</b>—Force the interface to use version 1.01 DCBX mode, regardless of the peer configuration.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dcbx neighbors on page 5724</a></li> <li>• <a href="#">Configuring DCBX Autonegotiation on page 5669</a></li> <li>• <a href="#">Understanding DCBX on page 5580</a></li> </ul>

## destination-port (Applications)

---

<b>Syntax</b>	<code>destination-port <i>port-value</i>;</code>
<b>Hierarchy Level</b>	[edit applications <b>application</b> <i>application-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) destination port number, which combines with <b>protocol</b> to identify an application type. The Internet Assigned Numbers Authority (IANA) assigns port numbers. See the IANA <i>Service Name and Transport Protocol Port Number Registry</i> at <a href="http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml">http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml</a> for a list of assigned port numbers.</p>
<hr/>	
<div> <b>NOTE:</b> To create an application for iSCSI, use the protocol <code>tcp</code> with the destination port number <code>3260</code>.</div> <hr/>	
<b>Options</b>	<i>port-value</i> —Identifier for the port.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Defining an Application for DCBX Application Protocol TLV Exchange on page 5672</a></li><li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 5595</a></li><li>• <a href="#">Example: Configuring DCBX to Support an iSCSI Application</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on page 5589</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on EX Series Switches</a></li></ul>

## disable (DCBX)

---

<b>Syntax</b>	disable
<b>Hierarchy Level</b>	[edit <a href="#">protocols dcbx</a> ]  [edit <a href="#">protocols dcbx interface</a> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 11.3 for EX Series switches.
<b>Description</b>	Disable Data Center Bridging Capability Exchange protocol (DCBX) on one or more 10-Gigabit Ethernet interfaces.
<b>Default</b>	DCBX is enabled by default on all 10-Gigabit or higher Ethernet interfaces.  DCBX is enabled by default on all 10-Gigabit Ethernet interfaces on EX4500 CEE-enabled switches.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring DCBX Autonegotiation on page 5669</a></li> <li>• <i>Disabling DCBX to Disable PFC Autonegotiation on EX Series Switches (CLI Procedure)</i></li> <li>• <a href="#">Understanding DCB Features and Requirements on page 5515</a></li> <li>• <i>Understanding DCB Features and Requirements on EX Series Switches</i></li> </ul>

## drop-probability

---

Syntax	drop-probability 0 drop-probability <i>high-value</i> ;
Hierarchy Level	[edit <a href="#">class-of-service drop-profiles</a> <i>profile-name</i> interpolate]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	<p>When configuring WRED, map the packet <b>drop-probability</b> to the fullness of a queue (<b>fill-level</b>). You configure the <b>fill-level</b> and <b>drop-probability</b> statements in related pairs by specifying a low <b>fill-level</b> value at which packets begin to drop (the drop probability is zero until the queue reaches this level of fullness) and a high <b>fill-level</b> value at which packets drop at the highest drop probability. As the queue fills from the low fill level to the high fill level, the rate of packet drop increases in a linear pattern from zero to the high drop probability.</p>
Options	<p>0—Probability that packets will drop at the lowest <b>fill-level</b> value. This is always zero, because until the queue reaches the specified low <b>fill-level</b> value, no packets are scheduled to drop.</p> <p><b>high-value</b>—The maximum probability that packets will drop before queue fullness exceeds the high value of the queue <b>fill-level</b>, expressed as a percentage. If the queue fills beyond the high <b>fill-level</b> value, all packets drop.</p> <p><b>Range:</b> 0 through 100</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring WRED Drop Profiles on page 6071</a></li><li>• <a href="#">Understanding CoS WRED Drop Profiles on page 5909</a></li></ul>

## drop-profile

<b>Syntax</b>	<code>drop-profile <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service schedulers <i>scheduler-name</i></a> <a href="#">drop-profile-map <i>loss-priority</i></a> (low   medium-high   high) <a href="#">protocol <i>protocol</i></a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define drop profiles for random early detection (RED). When a packet arrives, RED checks the queue fill level specified in the drop profile. If the fill level corresponds to a nonzero drop probability, the RED algorithm determines whether to drop the arriving packet.
<b>Options</b>	<i>profile-name</i> —Name of the drop profile.
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Drop Profile Maps on page 6073</a></li> <li>• <a href="#">Example: Configuring WRED Drop Profiles on page 6071</a></li> <li>• <a href="#">Understanding CoS WRED Drop Profiles on page 5909</a></li> </ul>

## drop-profile-map

<b>Syntax</b>	<code>drop-profile-map <a href="#">loss-priority</a> (low   medium-high   high) <a href="#">protocol <i>protocol</i></a> <a href="#">drop-profile <i>drop-profile-name</i></a>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service schedulers <i>scheduler-name</i></a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Map a drop profile to a loss priority and protocol for random early detection (RED). When a packet arrives, RED checks the queue fill level. If the fill level corresponds to a nonzero drop probability, the RED algorithm determines whether to drop the arriving packet.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Drop Profile Maps on page 6073</a></li> <li>• <a href="#">Example: Configuring WRED Drop Profiles on page 6071</a></li> <li>• <a href="#">Understanding CoS WRED Drop Profiles on page 5909</a></li> </ul>

## drop-profiles

---

<b>Syntax</b>	<pre>drop-profiles {     profile-name {         interpolate {             fill-level low-value fill-level high-value drop-probability 0 drop-probability high-value;         }     } }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Define drop profiles for weighted random early detection (WRED).</p> <p>For a packet to be dropped, it must match the drop profile. When a packet arrives, WRED checks the queue fill level. If the fill level corresponds to a nonzero drop probability, the WRED algorithm determines whether to drop the arriving packet.</p>
<b>Options</b>	<p><b>profile-name</b>—Name of the drop profile.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring WRED Drop Profiles on page 6071</a></li><li>• <a href="#">Understanding CoS WRED Drop Profiles on page 5909</a></li></ul>

## dscp

<b>List of Syntax</b>	<a href="#">Syntax (Classifier) on page 6229</a> <a href="#">Syntax (Code-Point Alias) on page 6229</a> <a href="#">Syntax (Multidestination Classifier) on page 6229</a> <a href="#">Syntax (Interface Classifier Association) on page 6229</a> <a href="#">Syntax (Rewrite Rule) on page 6229</a>

<b>Hierarchy (Rewrite Rule)</b>	[edit <a href="#">class-of-service rewrite-rules</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	Define the Differentiated Services code point (DSCP) IPv6 mapping that is applied to the packets.

**NOTE:** There is no DSCP IPv6 classifier for multdestination (multicast, broadcast, and destination lookup fail) traffic. Multidestination IPv6 traffic uses the multidestination DSCP classifier.

<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Unicast Classifiers on page 6066</a></li><li>• <a href="#">Defining CoS Code-Point Aliases on page 6159</a></li><li>• <a href="#">Defining CoS Rewrite Rules on page 6182</a></li><li>• <a href="#">Assigning CoS Components to Interfaces on page 6185</a></li><li>• <a href="#">Understanding CoS Classifiers on page 5810</a></li><li>• <a href="#">Understanding CoS Rewrite Rules on page 5914</a></li><li>• <a href="#">Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces on page 5820</a></li></ul>

---

## dscp-code-point

---

<b>Syntax</b>	<code>dscp-code-point <i>code-point</i>;</code>
<b>Hierarchy Level</b>	[edit class-of-service <a href="#">host-outbound-traffic</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Set the value of the DSCP code point in the type of service (ToS) field of the packet generated by the Routing Engine (host).
<b>Options</b>	<b>code-point</b> —Six-bit DSCP code point value.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Changing the Host Outbound Traffic Default Queue Mapping on page 6172</a></li><li>• <a href="#">Understanding Host Routing Engine Outbound Traffic Queues and Defaults on page 5806</a></li></ul>

## egress (Buffer Configuration)

<b>Syntax</b>	<pre>egress {   percent <i>percent</i>;   <b>buffer-partition</b> (lossless   lossy   multicast) {     percent <i>percent</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit <b>class-of-service shared-buffer</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	<p>Configure the global shared buffer pool allocation for egress traffic. The system allocates the shared buffer pool dynamically across its ports as the ports require memory space. Some buffer space is reserved for other buffers such as dedicated buffers (buffers allocated permanently to ports).</p> <p>The percentage you specify is the percentage of available (user-configurable) buffer space allocated to the global shared egress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports. However, on a port, you can configure the portion of dedicated port buffer space allocated to each queue in the scheduler configuration using the <b>buffer-size</b> option.)</p>
	<div style="display: flex; align-items: center;">  <div style="margin-left: 10px;"> <p><b>CAUTION:</b> Changing the buffer configuration is a disruptive event. Traffic stops on <i>all</i> ports until buffer reprogramming is complete.</p> </div> </div>
	<p>You can also partition the shared buffer pool to adjust the egress buffer allocations for different mixes of network traffic using the <b>buffer-partition</b> statement.</p>
<b>Default</b>	The default shared buffer percentage is 100 percent. (All available buffer space is allocated to the shared buffer pool.)
<b>Options</b>	<p><b>percent <i>percent</i></b>—Percentage of available egress buffer space allocated to the shared buffer pool. If the percentage is less than 100 percent, the remaining buffer space is allocated to the dedicated buffer pool.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

## ether-type

---

<b>Syntax</b>	<code>ether-type <i>ether-type</i>;</code>
<b>Hierarchy Level</b>	[edit applications <a href="#">application</a> <i>application-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Two-octet field in an Ethernet frame that defines the protocol encapsulated in the frame payload. See <a href="http://standards.ieee.org/develop/regauth/ethertype/eth.txt">http://standards.ieee.org/develop/regauth/ethertype/eth.txt</a> for a list of Institute of Electrical and Electronics Engineers (IEEE) EtherTypes.

**NOTE:** To create a FIP application, use the EtherType 0x8914.

---

<b>Options</b>	<i>type</i> —Identifier for the EtherType.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Defining an Application for DCBX Application Protocol TLV Exchange on page 5672</a></li> <li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 5595</a></li> <li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on page 5589</a></li> </ul>

## exp

---

Syntax	<pre>exp classifier-name {     import (classifier-name   default);     forwarding-class class-name {         loss-priority level {             code-points [ aliases ] [ bit-patterns ];         }     } }</pre>
Rewrite Rule Configuration	<pre>exp rewrite-name {     import (rewrite-name   default);     forwarding-class class-name {         loss-priority level {             code-point [ aliases ] [ bit-patterns ];         }     } }</pre>
Global Classifier Association with Interfaces	<pre>exp classifier-name;</pre>
Hierarchy Level	<pre>[edit class-of-service classifiers], [edit class-of-service rewrite-rules] [edit class-of-service system-defaults classifiers]</pre>
Release Information	Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	<p>Define the EXP code point mapping that is applied to MPLS packets. EXP classifiers are not applied to any traffic except MPLS traffic. EXP classifiers are applied only to interfaces that are configured as <b>family mpls</b> (for example, <b>set interfaces xe-0/0/35 unit 0 family mpls</b>.)</p> <p>You can configure as many EXP classifiers as you want. However, the switch uses only one EXP classifier as a global MPLS classifier on all interfaces. You specify the global EXP classifier in the <b>[edit class-of-service system-defaults]</b> hierarchy.</p>
Options	<b>classifier-name</b> —Name of the EXP classifier.
Required Privilege Level	<b>interfaces</b> —To view this statement in the configuration. <b>interface-control</b> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring a Global MPLS EXP Classifier on page 4479</a></li><li>• <a href="#">Configuring Rewrite Rules for MPLS EXP Classifiers on page 4480</a></li><li>• <a href="#">Understanding CoS MPLS EXP Classifiers and Rewrite Rules on page 4419</a></li><li>• <a href="#">Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces on page 5820</a></li></ul>

## explicit-congestion-notification

<b>Syntax</b>	explicit-congestion-notification;
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service schedulers</a> <i>scheduler-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.
<b>Description</b>	<p>Enable explicit congestion notification (ECN) on the output queue (forwarding class) or output queues (forwarding classes) mapped to the scheduler. ECN enables end-to-end congestion notification between two endpoints on TCP/IP based networks. The two endpoints are an ECN-enabled sender and an ECN-enabled receiver. ECN must be enabled on both endpoints and on all of the intermediate devices between the endpoints for ECN to work properly. Any device in the transmission path that does not support ECN breaks the end-to-end ECN functionality.</p> <p>A weighted random early detection (WRED) packet drop profile must be applied to the output queues on which ECN is enabled. ECN uses the WRED drop profile thresholds to mark packets when the output queue experiences congestion.</p> <p>ECN reduces packet loss by forwarding ECN-capable packets during periods of network congestion instead of dropping those packets. (TCP notifies the network about congestion by dropping packets.) During periods of congestion, ECN marks ECN-capable packets that egress from congested queues. When the receiver receives an ECN packet that is marked as experiencing congestion, the receiver echoes the congestion state back to the sender. The sender then reduces its transmission rate to clear the congestion.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring ECN on page 6090</a></li> <li>• <a href="#">Example: Configuring Queue Schedulers on page 6081</a></li> <li>• <a href="#">Understanding CoS Explicit Congestion Notification on page 5926</a></li> <li>• <a href="#">Understanding CoS Output Queue Schedulers on page 5868</a></li> </ul>

## fill-level

---

Syntax	fill-level <i>low-value</i> fill-level <i>high-value</i> ;
Hierarchy Level	[edit <a href="#">class-of-service drop-profiles profile-name interpolate</a> ]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	<p>When configuring random early detection (RED), map the fullness of a queue to a packet <a href="#">drop-probability</a> value. You configure the <b>fill-level</b> and <b>drop-probability</b> statements in related pairs by specifying a low <b>fill-level</b> value at which packets begin to drop (the drop probability is zero until the queue reaches this level of fullness) and a high <b>fill-level</b> value at which packets drop at the highest drop probability. As the queue fills from the low fill level to the high fill level, the rate of packet drop increases in a linear pattern from zero to the high drop probability.</p>
Options	<p><b>low-value</b>—Fullness of the queue before packets begin to drop, expressed as a percentage. The low value must be less than the high value.</p> <p><b>Range:</b> 0 through 100</p> <p><b>high-value</b>—Fullness of the queue before it reaches the maximum drop probability. If the queue fills beyond the fill level high value, all packets drop. The high value must be greater than the low value.</p> <p><b>Range:</b> 0 through 100</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring WRED Drop Profiles on page 6071</a></li><li>• <a href="#">Understanding CoS WRED Drop Profiles on page 5909</a></li></ul>

## flow-control

<b>Syntax</b>	(flow-control   no-flow-control);
<b>Hierarchy Level</b>	[edit <b>interfaces</b> <i>interface-name</i> <b>ether-options</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Explicitly enable or disable symmetric Ethernet PAUSE flow control, which regulates the flow of packets from the switch to the remote side of the connection by pausing all traffic flows on a link during periods of network congestion. Symmetric flow control means that Ethernet PAUSE is enabled in both directions. The interface generates and sends Ethernet PAUSE messages when the receive buffers fill to a certain threshold and the interface responds to PAUSE messages received from the connected peer. By default, flow control is disabled.</p> <p>You can configure asymmetric flow control by including the <b>configured-flow-control</b> statement at the [edit <b>interfaces</b> <i>interface-name</i> <b>ether-options</b> hierarchy level. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.</p>
	<div>  <p><b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div>
	<ul style="list-style-type: none"> <li>• <b>flow-control</b>—Enable flow control; flow control is useful when the remote device is a Gigabit Ethernet switch.</li> <li>• <b>no-flow-control</b>—Disable flow control.</li> </ul>
<b>Default</b>	Flow control is disabled.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">configured-flow-control on page 2637</a></li> <li>• <a href="#">Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2586</a></li> <li>• <a href="#">Understanding CoS Flow Control (Ethernet PAUSE and PFC) on page 5559</a></li> <li>• <i>Junos OS Network Interfaces Library for Routing Devices</i></li> </ul>

## flow-control-queue (Output Congestion Notification)

---

<b>Syntax</b>	<code>flow-control-queue [ <i>queue</i>   <i>list-of-queues</i> ];</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service congestion-notification-profile <i>profile-name</i> output ieee-802.1 code-point <i>code-point-bits</i></a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	<p>Specify one or more output queues to pause, to support priority-based flow control (PFC). The specified queues pause when the interface receives a PFC frame with a matching IEEE 802.1p code point.</p>
<b>Default</b>	<p>Queue 3 (mapped to the fcoe forwarding class) and queue 4 (mapped to the no-loss forwarding class) are programmed as flow control queues to pause. No other output queues are programmed to pause by default.</p> <p>If you configure flow control queues explicitly, only the queues that you specify are programmed to pause. The explicit flow control queue to pause configuration overrides the default setting, so the queues paused in the default configuration are no longer paused by default.</p> <p>For example, if you configure queue 2 as a flow control queue, then queue 2 pauses when congestion occurs, but queues 3 and 4 do not pause because they were not explicitly specified. To enable pause on output queues 2, 3, and 4, you must explicitly configure all three of the queues as flow control queues.</p> <p>The same behavior applies to the IEEE 802.1p code points (priorities) on which PFC is enabled. By default, priorities 3 (011) and 4 (100) are enabled for PFC pause. If you explicitly configure flow control queues to pause, you must also explicitly configure pause for each priority (code point) that you want to pause, because the explicit configuration overrides the default configuration.</p>
<b>Options</b>	[ <i>queue</i>   <i>list-of-queues</i> ]—The output queue or a list of output queues to pause.
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 6174</a></li><li>• <a href="#">Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces on page 6036</a></li><li>• <a href="#">Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface on page 6028</a></li><li>• <a href="#">Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch) on page 6019</a></li><li>• <a href="#">Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI) on page 6050</a></li></ul>

## forwarding-class (Host Outbound Traffic)

<b>Syntax</b>	<code>forwarding-class <i>class-name</i>;</code>
<b>Hierarchy Level</b>	[edit <code>class-of-service</code> <code>host-outbound-traffic</code> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Define forwarding class name for outbound host traffic (traffic generated by the Routing Engine).
<b>Options</b>	<i>class-name</i> —Name of the forwarding class.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Changing the Host Outbound Traffic Default Queue Mapping on page 6172</a></li> <li>• <a href="#">Understanding Host Routing Engine Outbound Traffic Queues and Defaults on page 5806</a></li> </ul>

## forwarding-class-set

<b>Syntax</b>	<code>forwarding-class-set <i>forwarding-class-set-name</i> {     <code>output-traffic-control-profile</code> <i>profile-name</i>; }</code>
<b>Hierarchy Level</b>	[edit <code>class-of-service</code> <code>interfaces</code> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Apply a previously defined forwarding class set to an output traffic control profile.
<b>Options</b>	<i>forwarding-class-set-name</i> —Name of the forwarding class set.  The remaining statement is explained separately.
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li> <li>• <a href="#">Assigning CoS Components to Interfaces on page 6185</a></li> <li>• <a href="#">Understanding CoS Forwarding Class Sets (Priority Groups) on page 5835</a></li> </ul>

## forwarding-class-sets

---

<b>Syntax</b>	<code>forwarding-class-sets <i>forwarding-class-set-name</i> {     class <i>class-name</i>; }</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Assign forwarding classes to forwarding class sets (priority groups).
<b>Options</b>	<p><i>forwarding-class-set-name</i>—Name of the forwarding class set.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li><li>• <a href="#">Example: Configuring Forwarding Class Sets on page 6078</a></li><li>• <a href="#">Understanding CoS Forwarding Class Sets (Priority Groups) on page 5835</a></li></ul>

## forwarding-classes

**Syntax**

```
forwarding-classes {
  class {
    class-name {
      queue-num queue-number <no-loss>;
    }
  }
}
```

**Hierarchy Level** [edit [class-of-service](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.  
No-loss option introduced in Junos OS Release 12.3 for the QFX Series.

**Description** Map one or more forwarding classes to a single queue. You can configure up to 12 forwarding classes (8 unicast forwarding classes on queues 0 through 7 and 4 multidestination forwarding classes on queues 8 through 11) and map them to queues. You can map multiple forwarding classes to a single queue using the **class** statement. All forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. You cannot mix unicast and multicast forwarding classes on the same queue.

You cannot configure weighted random early detection (WRED) packet drop on forwarding classes configured with the no-loss packet drop attribute. Do not associate a drop profile with lossless forwarding classes.

**NOTE:** If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the fcoe and no-loss forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the no-loss option. If you do not specify the no-loss option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if

you explicitly configure the `fcoe` forwarding class and you do not include the `no-loss` option, the `fcoe` forwarding class is lossy, not lossless.

---

<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	<code>interfaces</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Forwarding Classes on page 6075</a></li><li>• <a href="#">Understanding CoS Forwarding Classes on page 5830</a></li></ul>

## guaranteed-rate

<b>Syntax</b>	<code>guaranteed-rate (rate  percent <i>percentage</i>);</code>
<b>Hierarchy Level</b>	[edit <code>class-of-service traffic-control-profiles</code> <i>traffic-control-profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a guaranteed minimum rate of transmission for a traffic control profile. The sum of the guaranteed rates of all of the forwarding class sets (priority groups) on a port should not exceed the total port bandwidth. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group (forwarding class set) can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.
	<div>  <p><b>NOTE:</b> You cannot configure a guaranteed rate for a forwarding class set (priority group) that includes strict-high priority queues. If the traffic control profile is for a forwarding class set that contains strict-high priority queues, do not configure a guaranteed rate.</p> </div>
<b>Default</b>	If you do not specify a guaranteed rate, the guaranteed rate is zero (0) and there is no minimum guaranteed bandwidth.
	<div>  <p><b>NOTE:</b> If you do not configure a guaranteed rate for a traffic control profile, the queues that belong to any forwarding class set (priority group) that uses that traffic control profile cannot have a configured transmit rate. The result is that there is no minimum guaranteed bandwidth for those queues and that those queues can be starved during periods of congestion.</p> </div>
<b>Options</b>	<p><b>percent <i>percentage</i></b>—Minimum percentage of transmission capacity allocated to the forwarding class set or logical interface.</p> <p><b>Range:</b> 1 through 100 percent</p> <p><b><i>rate</i></b>—Minimum transmission rate allocated to the forwarding class set or logical interface, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p><b>Range:</b> 1000 through 10,000,000,000 bps</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

## host-outbound-traffic

---

<b>Syntax</b>	<pre>host-outbound-traffic {     forwarding-class <i>class-name</i>;     dscp-code-point <i>code-point</i>; }</pre>
<b>Hierarchy Level</b>	[edit class-of-service]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Allow queue selection for traffic generated by the Routing Engine (host). The selected queue must be configured properly. You can also configure specific DSCP code point bits for the type of service (ToS) field of the generated packets. This configuration does not affect transit packets or incoming packets. This is a global configuration that only affects packets originating on the Routing Engine. If you do not configure an output queue for host outbound traffic, the switch uses the default queue mapping.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

<b>Hierarchy Level (Rewrite Rule)</b>	[edit <a href="#">class-of-service rewrite-rules</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.

<b>Description</b>	Configure an IEEE 802.1 classifier, configure an IEEE 802.1 code-point alias, apply a fixed IEEE 802.1 classifier to an interface, or apply an IEEE-802.1 rewrite rule.
<b>Options</b>	<i>classifier-name</i> —Name of the classifier.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Unicast Classifiers on page 6066</a></li><li>• <a href="#">Defining CoS Code-Point Aliases on page 6159</a></li><li>• <a href="#">Defining CoS Rewrite Rules on page 6182</a></li><li>• <a href="#">Assigning CoS Components to Interfaces on page 6185</a></li><li>• <a href="#">Understanding CoS Classifiers on page 5810</a></li><li>• <a href="#">Understanding CoS Rewrite Rules on page 5914</a></li></ul>

---

## ieee-802.1 (Input Congestion Notification)

---

<b>Syntax</b>	<pre>ieee-802.1 {     code-point [<i>code-point-bits</i>] {         pfc {             mru <i>mru-value</i>;         }     } }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service congestion-notification-profile</a> <i>profile-name</i> <a href="#">input</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure an IEEE 802.1 code point and apply priority-based flow control (PFC) to packets with that code point.
<b>Options</b>	The statements are described separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring CoS PFC for FCoE Traffic on page 5606</a></li><li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 6174</a></li><li>• <a href="#">Understanding CoS Flow Control (Ethernet PAUSE and PFC) on page 5559</a></li></ul>

## ieee-802.1 (Output Congestion Notification)

<b>Syntax</b>	<pre> ieee-802.1 {   code-point [ code-point-bits ] {     flow-control-queue [ queue   list-of-queues ];   } } </pre>
<b>Hierarchy Level</b>	[edit <b>class-of-service congestion-notification-profile</b> <i>profile-name</i> <b>output</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Configure an IEEE 802.1 code point and apply priority-based flow control (PFC) to packets with that code point on output queues.
<b>Options</b>	The statements are described separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 6174</a></li> <li>• <a href="#">Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces on page 6036</a></li> <li>• <a href="#">Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface on page 6028</a></li> <li>• <a href="#">Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch) on page 6019</a></li> <li>• <a href="#">Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI) on page 6050</a></li> <li>• <a href="#">Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows on page 5837</a></li> </ul>

## import

---

<b>Syntax</b>	<code>import (<i>import</i>   default);</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service classifiers</a> ( <a href="#">dscp</a>   <a href="#">dscp-ipv6</a>   <a href="#">ieee-802.1</a> ) <i>classifier-name</i> ], [edit <a href="#">class-of-service rewrite-rules</a> ( <a href="#">dscp</a>   <a href="#">dscp-ipv6</a>   <a href="#">ieee-802.1</a> ) <i>classifier-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a default or previously defined classifier.
<b>Options</b>	<p><b><i>import</i></b>—Name of the classifier mapping configured at the <a href="#">[edit class-of-service classifiers]</a> hierarchy level.</p> <p><b>default</b>—Default classifier mapping.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p><a href="#">interfaces</a>—To view this statement in the configuration.</p> <p><a href="#">interface-control</a>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Unicast Classifiers on page 6066</a></li><li>• <a href="#">Defining CoS Rewrite Rules on page 6182</a></li><li>• <a href="#">Understanding CoS Classifiers on page 5810</a></li><li>• <a href="#">Understanding CoS Rewrite Rules on page 5914</a></li></ul>

## ingress (Buffer Configuration)

<b>Syntax</b>	<pre>ingress {   <b>buffer-partition</b> (lossless   lossless-headroom   lossy) {     percent <i>percent</i>;   }   percent <i>percent</i>; }</pre>
<b>Hierarchy Level</b>	[edit <b>class-of-service shared-buffer</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	<p>Configure the global shared buffer pool allocation for ingress traffic. The system allocates the shared buffer pool dynamically across its ports as the ports require memory space. Some buffer space is reserved for buffers such as dedicated buffers (buffers allocated permanently to ports) and headroom buffers (buffers that help prevent packet loss on lossless flows).</p> <p>The percentage you specify is the percentage of available (user-configurable) buffer space allocated to the global shared ingress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports.)</p>
	<div>  <p><b>CAUTION:</b> Changing the buffer configuration is a disruptive event. Traffic stops on <i>all</i> ports until buffer reprogramming is complete.</p> </div>
	<p>You can also partition the shared buffer pool to adjust the ingress buffer allocations for different mixes of network traffic using the <b>buffer-partition</b> statement.</p>
<b>Default</b>	The default shared buffer percentage is 100 percent. (All available buffer space is allocated to the shared buffer pool.)
<b>Options</b>	<p><b>percent <i>percent</i></b>—Percentage of available ingress buffer space allocated to the shared buffer pool. If the percentage is less than 100 percent, the remaining buffer space is allocated to the dedicated buffer pool.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic on page 6104</a></li> <li>• <a href="#">Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic on page 6116</a></li> </ul>

## input (Congestion Notification)

---

**Syntax**

```
input {  
  ieee-802.1 {  
    code-point [code-point-bits] {  
      pfc {  
        mru mru-value;  
      }  
    }  
  }  
  cable-length cable-length-value;  
}
```

**Hierarchy Level** [edit [class-of-service congestion-notification-profile](#) *profile-name*]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure priority-based flow control (PFC) on incoming traffic.

**Options** The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

## interface (DCBX)

<b>Syntax</b>	<pre> interface (<i>interface-name</i>   all) {   disable;   application-map <i>application-map-name</i>;   applications {     no-auto-negotiation;   }   enhanced-transmission-selection {     no-auto-negotiation;     no-recommendation-tlv;     recommendation-tlv {       no-auto-negotiation;     }   }   dcbx-version (auto-negotiate   ieee-dcbx   dcbx-version-1.01);   priority-flow-control {     no-auto-negotiation;   } } </pre>
<b>Hierarchy Level</b>	[edit <a href="#">protocols dcbx</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 11.3 for the EX Series switches.</p> <p><b>Mode</b> and <b>recommendation-tlv</b> statements introduced in Junos OS Release 12.2 for the QFX Series.</p>
<b>Description</b>	Configure DCBX properties on an interface.
<b>Options</b>	<p><b><i>interface-name</i></b>—Name of the interface.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dcbx neighbors on page 5724</a></li> <li>• <a href="#">Configuring DCBX Autonegotiation on page 5669</a></li> <li>• <a href="#">Example: Configuring DCBX to Support an iSCSI Application</a></li> <li>• <a href="#">Understanding DCB Features and Requirements on page 5515</a></li> <li>• <a href="#">Understanding DCB Features and Requirements on EX Series Switches</a></li> <li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on EX Series Switches</a></li> </ul>

## interfaces (Class of Service)

---

**Syntax**

```
interfaces {  
  interface-name {  
    congestion-notification-profile profile-name {  
    }  
    forwarding-class lossless-forwarding-class-name;  
    forwarding-class-set forwarding-class-set-name {  
      output-traffic-control-profile profile-name;  
    }  
    rewrite-value {  
      input {  
        ieee-802.1 {  
          code-point code-point-bits;  
        }  
      }  
    }  
  }  
  unit logical-unit-number {  
    classifiers {  
      (dscp | dscp-ipv6 | ieee-802.1 | exp) (classifier-name | default);  
    }  
    forwarding-class class-name;  
    rewrite-rules {  
      (dscp | dscp-ipv6 | ieee-802.1) (classifier-name | default);  
    }  
  }  
}
```

**Hierarchy Level** [edit [class-of-service](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure interface-specific CoS properties for incoming packets.

**Options** *interface-name*—Name of the interface.  
  
The statements are explained separately.

**Required Privilege Level** interfaces—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## interpolate

---

<b>Syntax</b>	<pre> interpolate {   fill-level <i>low-value</i> fill-level <i>high-value</i>;   drop-probability 0 drop-probability <i>high-value</i>; } </pre>
<b>Hierarchy Level</b>	[edit class-of-service <b>drop-profiles</b> <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Specify values for interpolating the relationship between queue fill level and drop probability.</p> <p>The statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring WRED Drop Profiles on page 6071</a></li> <li>• <a href="#">Understanding CoS WRED Drop Profiles on page 5909</a></li> </ul>

## loss-priority (Classifiers)

---

<b>Syntax</b>	<code>loss-priority <i>level</i> {     <i>code-points</i> [ <i>aliases</i> ] [ <i>bit-patterns</i> ]; }</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service classifiers</a> ( <a href="#">dscp</a>   <a href="#">dscp-ipv6</a>   <a href="#">ieee-802.1</a> ) <i>classifier-name</i> <a href="#">forwarding-class</a> <i>class-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure packet loss priority value for a specific set of code-point aliases and bit patterns.
<b>Options</b>	<p><i>level</i>—Can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>low</b>—Packet has low loss priority.</li><li>• <b>medium-high</b>—Packet has medium-high loss priority.</li><li>• <b>high</b>—Packet has high loss priority.</li></ul> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p><code>interfaces</code>—To view this statement in the configuration.</p> <p><code>interface-control</code>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Unicast Classifiers on page 6066</a></li><li>• <a href="#">Understanding CoS Classifiers on page 5810</a></li></ul>

## loss-priority (Drop Profiles)

---

<b>Syntax</b>	<code>loss-priority <i>level</i> <i>protocol protocol</i> <i>drop-profile profile-name</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service schedulers scheduler-name drop-profile-map</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure packet loss priority value for a drop profile mapped to a system drop profile.
<b>Options</b>	<p><i>level</i>—Can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>low</b>—Packet has low loss priority.</li> <li>• <b>medium-high</b>—Packet has medium-high loss priority.</li> <li>• <b>high</b>—Packet has high loss priority.</li> </ul> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Drop Profile Maps on page 6073</a></li> <li>• <a href="#">Example: Configuring WRED Drop Profiles on page 6071</a></li> <li>• <a href="#">Understanding CoS WRED Drop Profiles on page 5909</a></li> </ul>

## loss-priority (Rewrite Rules)

---

<b>Syntax</b>	<code>loss-priority <i>level</i> {     <i>code-point</i> (<i>alias</i>   <i>bit-pattern</i>); }</code>
<b>Hierarchy Level</b>	[edit <code>class-of-service rewrite-rules</code> ( <code>dscp</code>   <code>dscp-ipv6</code>   <code>ieee-802.1</code> ) <i>rewrite-name</i> <i>forwarding-class</i> <i>class-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a loss priority to which to apply a rewrite rule. The rewrite rule sets the code-point aliases and bit patterns for a specific forwarding class and loss priority. Packets that match the forwarding class and loss priority are rewritten with the rewrite code-point alias or bit pattern.
<b>Options</b>	<p><i>level</i>—Can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>low</b>—Packet has low loss priority.</li><li>• <b>medium-high</b>—Packet has medium-high loss priority.</li><li>• <b>high</b>—Packet has high loss priority.</li></ul> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p><code>interfaces</code>—To view this statement in the configuration.</p> <p><code>interface-control</code>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Defining CoS Rewrite Rules on page 6182</a></li><li>• <a href="#">Understanding CoS Rewrite Rules on page 5914</a></li></ul>

---

## multi-destination

---

<b>Syntax</b>	<pre>multi-destination {   classifiers {     (dscp   ieee-802.1) classifier-name;   } }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define a multicast CoS behavior aggregate (BA) classifier.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers on page 6069</a></li><li>• <a href="#">Assigning CoS Components to Interfaces on page 6185</a></li><li>• <a href="#">Understanding CoS Classifiers on page 5810</a></li></ul>

## mrp

<b>Syntax</b>	<code>mrp <i>mrp-value</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service congestion-notification-profile <i>profile-name</i> input ieee-802.1 code-point <i>code-point-bits</i> pfc</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Configure the maximum receive unit (MRU) of the interface in bytes (incoming packet sizes must be less than or equal to the MRU, or the packets are dropped). The system uses the MRU and the cable length to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The lower the MRU and the shorter the cable length, the less headroom buffer space is required for PFC.
<div>  <p><b>NOTE:</b> You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the <code>mtu</code> statement at the [edit <a href="#">interfaces <i>interface-name</i></a>] hierarchy level.</p> </div>	
<b>Default</b>	For priority 3 traffic, the default MRU value is 2500 bytes.  For priority 4 traffic, the default MRU value is 9612 bytes.
<b>Options</b>	<b><i>mrp-value</i></b> —Value of the maximum packet receive unit size in bytes (generally from 1500 to 9216 bytes, but there is no configuration restriction).
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 6174</a></li> <li>• <a href="#">Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces on page 6036</a></li> <li>• <a href="#">Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface on page 6028</a></li> <li>• <a href="#">Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch) on page 6019</a></li> <li>• <a href="#">Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI) on page 6050</a></li> <li>• <a href="#">Understanding CoS Flow Control (Ethernet PAUSE and PFC) on page 5559</a></li> <li>• <a href="#">Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows on page 5837</a></li> </ul>

## output (Congestion Notification)

<b>Syntax</b>	<pre>output {   ieee-802.1 {     code-point [code-point-bits] {       flow-control-queue [queue   list-of-queues];     }   } }</pre>
<b>Hierarchy Level</b>	[edit <b>class-of-service congestion-notification-profile</b> <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Configure priority-based flow control (PFC) on output queues.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 6174</a></li> <li>• <a href="#">Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces on page 6036</a></li> <li>• <a href="#">Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface on page 6028</a></li> <li>• <a href="#">Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch) on page 6019</a></li> <li>• <a href="#">Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI) on page 6050</a></li> <li>• <a href="#">Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows on page 5837</a></li> </ul>

## output-traffic-control-profile

---

<b>Syntax</b>	<code>output-traffic-control-profile <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service interfaces</a> <i>interface-name</i> <a href="#">forwarding-class-set</a> <i>forwarding-class-set-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Apply an output traffic scheduling and shaping profile to a forwarding class set (priority group).
<b>Options</b>	<i>profile-name</i> —Name of the traffic-control profile to apply to the specified forwarding class set.
<b>Required Privilege Level</b>	<code>interfaces</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li><li>• <a href="#">Example: Configuring Traffic Control Profiles (Priority Group Scheduling) on page 6094</a></li><li>• <a href="#">Assigning CoS Components to Interfaces on page 6185</a></li><li>• <a href="#">Understanding CoS Traffic Control Profiles on page 5880</a></li></ul>

## pfc (Input Congestion Notification)

<b>Syntax</b>	<code>pfc {     <b>mru</b> <i>mru-value</i>; }</code>
<b>Hierarchy Level</b>	[edit <b>class-of-service</b> <b>congestion-notification-profile</b> <i>profile-name</i> <b>input</b> <b>ieee-802.1</b> <b>code-point</b> <i>code-point-bits</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Enable and configure ingress interface priority-based flow control (PFC).
<b>Options</b>	The remaining statement is explained separately.
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 6174</a></li> <li>• <a href="#">Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces on page 6036</a></li> <li>• <a href="#">Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface on page 6028</a></li> <li>• <a href="#">Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch) on page 6019</a></li> <li>• <a href="#">Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI) on page 6050</a></li> <li>• <a href="#">Understanding CoS Flow Control (Ethernet PAUSE and PFC) on page 5559</a></li> <li>• <a href="#">Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows on page 5837</a></li> </ul>

## policy-options

---

**Syntax**    `policy-options`

```
  application-maps application-map-name {
    application application-name {
      code-points [ aliases ] [ bit-patterns ];
    }
  }
  policy-statement policy-name {
    term term-name {
      from {
        family family-name;
        match-conditions;
        policy subroutine-policy-name;
        prefix-list prefix-list-name;
        prefix-list-filter prefix-list-name match-type <actions>;
        route-filter destination-prefix match-type <actions>;
        source-address-filter source-prefix match-type <actions>;
      }
      to {
        match-conditions;
        policy subroutine-policy-name;
      }
      then actions;
    }
  }
```

**Hierarchy Level**    [edit]

**Release Information**    Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.1 for the EX Series.

**Description**    Configure options such as application maps for DCBX application protocol exchange and policy statements.

**Required Privilege Level**    storage—To view this statement in the configuration.  
storage-control—To add this statement to the configuration.

## priority (Schedulers)

<b>Syntax</b>	<code>priority <i>priority</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service schedulers</a> <i>scheduler-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the packet-scheduling drop priority value.
<b>Options</b>	<p><b><i>priority</i></b>—It can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>low</b>—Scheduler has low priority.</li> <li>• <b>strict-high</b>—Scheduler has strict high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.</li> </ul>
<div>  <p><b>NOTE:</b> We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.</p> </div>	
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li> <li>• <a href="#">Example: Configuring Queue Schedulers on page 6081</a></li> <li>• <a href="#">Understanding CoS Output Queue Schedulers on page 5868</a></li> </ul>

## priority-flow-control

---

<b>Syntax</b>	<pre>priority-flow-control {     no-auto-negotiation; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">protocols dcbx interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 11.3 for EX Series switches.
<b>Description</b>	Disable autonegotiation of priority-based flow control (PFC) on one or more Ethernet interfaces. Autonegotiation enables PFC on an interface only if the switch and the peer device connected to the switch both support PFC and have the same PFC configuration. Disabling autonegotiation on an interface forces the interface to use the PFC state (enabled or disabled) that is configured on the switch by the configuration and assignment of the congestion notification profile.
<b>Options</b>	<b>no-auto-negotiation</b> —Disable automatic negotiation of PFC.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show dcbx neighbors on page 5724</a></li><li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 6174</a></li><li>• <a href="#">Configuring Priority-Based Flow Control for an EX Series Switch (CLI Procedure)</a></li><li>• <a href="#">Configuring DCBX Autonegotiation on page 5669</a></li><li>• <a href="#">Example: Configuring CoS PFC for FCoE Traffic on page 5606</a></li><li>• <a href="#">Understanding Data Center Bridging Capability Exchange Protocol for EX Series Switches</a></li><li>• <a href="#">Understanding Priority-Based Flow Control</a></li><li>• <a href="#">Understanding DCB Features and Requirements on page 5515</a></li></ul>

## protocol (Applications)

<b>Syntax</b>	<code>protocol (tcp   udp);</code>
<b>Hierarchy Level</b>	[edit applications <b>application</b> <i>application-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Networking protocol type, which combines with <b>destination-port</b> to identify an application type.
<div>  <b>NOTE:</b> To create an application for iSCSI, use the protocol <b>tcp</b> with the destination port number <b>3260</b>. </div>	
<b>Options</b>	<b>tcp</b> —Transmission Control Protocol  <b>udp</b> —User Datagram Protocol
<b>Required Privilege Level</b>	<b>interface</b> —To view this statement in the configuration. <b>interface-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Defining an Application for DCBX Application Protocol TLV Exchange on page 5672</a></li> <li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 5595</a></li> <li>• <a href="#">Example: Configuring DCBX to Support an iSCSI Application</a></li> <li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on page 5589</a></li> <li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on EX Series Switches</a></li> </ul>

## protocol (Drop Profile Map)

---

<b>Syntax</b>	<code>protocol protocol <b>drop-profile</b> profile-name;</code>
<b>Hierarchy Level</b>	[edit <b>class-of-service schedulers scheduler-name drop-profile-map loss-priority</b> (low   medium-high   high)]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the protocol type for the specified drop profile.
<b>Options</b>	<p><b>protocol</b>—Type of protocol. The protocol can be:</p> <ul style="list-style-type: none"><li>• <b>any</b>—Accept any protocol type.</li></ul> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li><li>• <a href="#">Example: Configuring Drop Profile Maps on page 6073</a></li><li>• <a href="#">Example: Configuring WRED Drop Profiles on page 6071</a></li><li>• <a href="#">Understanding CoS WRED Drop Profiles on page 5909</a></li></ul>

## queue-num

<b>Syntax</b>	<code>queue-num <i>queue-number</i> &lt;no-loss&gt;;</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service forwarding-classes class</a> <i>class-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. No-loss option introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Map a forwarding class to an output queue number. Optionally, configure the forwarding class as a lossless forwarding class.

You can map some or all of the eight unicast forwarding classes to a unicast queue (0 through 7) or some or all of the four multdestination (multicast, broadcast, destination lookup fail) forwarding classes to the same multdestination queue (8 through 11), providing that you do not map one forwarding class to more than one queue. The queue to which you map a forwarding class determines if the forwarding class is a unicast or multdestination forwarding class.

You cannot configure weighted random early detection (WRED) packet drop on forwarding classes configured with the no-loss packet drop attribute. Do not associate a drop profile with lossless forwarding classes.

**NOTE:** If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the fcoe and no-loss forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the no-loss option. If you do not specify the no-loss option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if you explicitly configure the fcoe forwarding class and you do not include the no-loss option, the fcoe forwarding class is lossy, not lossless.

<b>Options</b>	<b><i>queue-number</i></b> —Number of the CoS unicast queue (0 through 7) or the CoS multidestination queue (8 through 11).  <b><i>no-loss</i></b> —Optional packet drop attribute keyword to configure the forwarding class as lossless.
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Forwarding Classes on page 6075</a></li><li>• <a href="#">Understanding CoS Forwarding Classes on page 5830</a></li></ul>

---

## recommendation-tlv

---

<b>Syntax</b>	<pre>recommendation-tlv {     no-auto-negotiation; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">protocols dcbx interface interface-name enhanced-transmission-selection</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	Enable DCBX to send the ETS Recommendation TLV (also known as the Information TLV) on egress. This feature is valid only if the interface DCBX mode is IEEE DCBX. If the interface DCBX mode is DCBX version 1.01, this statement has no effect. (DCBX version 1.01 does not advertise separate TLVs for individual attributes.)
<b>Default</b>	DCBX-enabled interfaces send the ETS recommendation TLV unless it is disabled.
<b>Options</b>	<b><i>no-auto-negotiation</i></b> —Disable sending of the ETS recommendation TLV.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show dcbx neighbors on page 5724</a></li><li>• <a href="#">Configuring DCBX Autonegotiation on page 5669</a></li></ul>

## rewrite-rules

<b>List of Syntax</b>	<a href="#">Syntax (Rewrite Rule Configuration) on page 6273</a> <a href="#">Syntax (Rewrite Rule Association with Interface) on page 6273</a>
<b>Syntax (Rewrite Rule Configuration)</b>	<pre>rewrite-rules {   (dscp   dscp-ipv6   ieee-802.1   exp) rewrite-name {     import (rewrite-name   default);     forwarding-class class-name {       loss-priority priority code-point (alias   bits);     }   } }</pre>
<b>Syntax (Rewrite Rule Association with Interface)</b>	<pre>rewrite-rules {   (dscp   dscp-ipv6   ieee-802.1   exp) rewrite-name; }</pre>
<b>Hierarchy Level (Rewrite Rule Configuration)</b>	[edit <a href="#">class-of-service</a> ],
<b>Hierarchy Level (Rewrite Rule Association with Interface)</b>	[edit <a href="#">class-of-service interfaces</a> <i>interface-name</i> <a href="#">unit</a> <i>logical-unit-number</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. EXP statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	<p>Configure rewrite rules that map traffic to code points when traffic exits the system, and apply the rewrite rules to a specific interface.</p> <p>MPLS EXP rewrite rules can only be bound to logical interfaces, not to physical interfaces. You can configure as many EXP rewrite rules as you want, but you can use only 16 EXP rewrite rules on switch interfaces at any given time.</p>
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Defining CoS Rewrite Rules on page 6182</a></li> <li>• <a href="#">Configuring Rewrite Rules for MPLS EXP Classifiers on page 4480</a></li> <li>• <a href="#">Understanding CoS Rewrite Rules on page 5914</a></li> <li>• <a href="#">Understanding CoS MPLS EXP Classifiers and Rewrite Rules on page 4419</a></li> </ul>

## rx-buffers

<b>Syntax</b>	rx-buffers (on   off);
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">ether-options</a> <a href="#">configured-flow-control</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Enable or disable an interface to generate and send Ethernet PAUSE messages. If you enable the receive buffers to generate and send PAUSE messages, when the receive buffers reach a certain level of fullness, the interface sends a PAUSE message to the connected peer. If the connected peer is properly configured, it stops transmitting frames to the interface on the entire link. When the interface receive buffer empties below a certain threshold, the interface sends a message to the connected peer to resume sending frames.</p> <p>Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the <b>rx-buffers</b> statement with the <b>tx-buffers</b> statement to configure asymmetric Ethernet PAUSE on an interface. (Use the <b>flow-control</b> statement to enable symmetric PAUSE and the <b>no-flow-control</b> statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)</p>
	<p> <b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p>
<b>Default</b>	Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.
<b>Options</b>	<b>on   off</b> —Enable or disable an interface to generate and send Ethernet PAUSE messages.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">flow-control on page 2659</a></li> <li>• <a href="#">tx-buffers on page 2742</a></li> </ul>

## scheduler

---

<b>Syntax</b>	<code>scheduler <i>scheduler-name</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service scheduler-maps <i>map-name</i> forwarding-class <i>class-name</i></a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Map a scheduler to a forwarding class using a scheduler map.
<b>Options</b>	<i>scheduler-name</i> —Name of the scheduler to map to the forwarding class.
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li> <li>• <a href="#">Example: Configuring Queue Schedulers on page 6081</a></li> <li>• <a href="#">Understanding CoS Output Queue Schedulers on page 5868</a></li> </ul>

## scheduler-map

---

<b>Syntax</b>	<code>scheduler-map <i>map-name</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service traffic-control-profiles <i>traffic-control-profile-name</i></a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Associate a scheduler map with a traffic control profile.
<b>Options</b>	<i>map-name</i> —Name of the scheduler map.
<b>Required Privilege Level</b>	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li> <li>• <a href="#">Example: Configuring Traffic Control Profiles (Priority Group Scheduling) on page 6094</a></li> <li>• <a href="#">Example: Configuring Queue Schedulers on page 6081</a></li> <li>• <a href="#">Understanding CoS Traffic Control Profiles on page 5880</a></li> <li>• <a href="#">Understanding CoS Output Queue Schedulers on page 5868</a></li> </ul>

## scheduler-maps

---

<b>Syntax</b>	<pre>scheduler-maps {   map-name {     forwarding-class class-name scheduler scheduler-name;   } }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a scheduler map name to map a scheduler configuration to a forwarding class.
<b>Options</b>	<p><i>map-name</i>—Name of the scheduler map.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li><li>• <a href="#">Example: Configuring Queue Schedulers on page 6081</a></li><li>• <a href="#">Understanding CoS Output Queue Schedulers on page 5868</a></li></ul>

## schedulers

<b>Syntax</b>	<pre> schedulers {   scheduler-name {     buffer-size (percent <i>percentage</i>   remainder);     drop-profile-map loss-priority (low   medium-high   high) protocol <i>protocol</i> drop-profile       drop-profile-name;     explicit-congestion-notification;     priority <i>priority</i>;     shaping-rate (<i>rate</i>   percent <i>percentage</i>);     transmit-rate (percent <i>percentage</i>);   } } </pre>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify scheduler name and parameter values such minimum bandwidth ( <b>transmit-rate</b> ), maximum bandwidth ( <b>shaping-rate</b> ), and priority ( <b>priority</b> ).
<b>Options</b>	<p><b>scheduler-name</b> —Name of the scheduler.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li> <li>• <a href="#">Example: Configuring Queue Schedulers on page 6081</a></li> <li>• <a href="#">Example: Configuring Drop Profile Maps on page 6073</a></li> <li>• <a href="#">Example: Configuring ECN on page 6090</a></li> <li>• <a href="#">Understanding CoS Output Queue Schedulers on page 5868</a></li> </ul>

## shaping-rate

---

<b>Syntax</b>	<code>shaping-rate (rate   percent <i>percentage</i>);</code>
<b>Hierarchy Level</b>	[edit <code>class-of-service schedulers <i>scheduler-name</i></code> ], [edit <code>class-of-service traffic-control-profiles <i>profile-name</i></code> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure the shaping rate. The shaping rate throttles the rate of packet transmission by setting a maximum bandwidth (rate in bits per second) or a maximum percentage of bandwidth for a queue or a forwarding class set. You specify the maximum bandwidth for a queue by using a scheduler map to associate a forwarding class (queue) with a scheduler that has a configured shaping rate. You specify the maximum bandwidth for a forwarding class set by setting the shaping rate for a traffic control profile, and then applying the traffic control profile and a forwarding class set to an interface.</p> <p>We recommend that you configure the shaping rate as an absolute maximum usage and not as additional usage beyond the configured transmit rate (the minimum guaranteed bandwidth for a queue) or the configured guaranteed rate (the minimum guaranteed bandwidth for a forwarding class set).</p> <div><div></div><div><p><b>NOTE:</b> When you set the maximum bandwidth (shaping-rate value) for a queue or for a priority group at 100 Kbps or less, the traffic shaping behavior is accurate only within +/- 20 percent of the configured shaping-rate value.</p></div></div> <div><div></div><div><p><b>NOTE:</b> We recommend that you always apply a shaping rate to strict-high priority queues to prevent them from starving other queues. If you do not apply a shaping rate to limit the amount of bandwidth a strict-high priority queue can use, then the strict-high priority queue can use all of the available port bandwidth and starve other queues on the port.</p></div></div>
<b>Default</b>	If you do not configure a shaping rate, the default shaping rate is 100 percent (all of the available bandwidth), which is the equivalent of no rate shaping.
<b>Options</b>	<p><b>percent <i>percentage</i></b>—Shaping rate as a percentage of the available interface bandwidth. <b>Range:</b> 1 through 100 percent</p> <p><b><i>rate</i></b>—Peak (maximum) rate, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000). <b>Range:</b> 1000 through 10,000,000,000 bps</p>

**Required Privilege** interfaces—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## shared-buffer

```
Syntax  shared-buffer {
        egress {
            buffer-partition (lossless | lossy | multicast) {
                percent percent
            }
            percent percent;
        }
        ingress {
            percent percent;
            buffer-partition (lossless | lossless-headroom | lossy) {
                percent percent
            }
        }
    }
```

Hierarchy Level [edit [class-of-service](#)]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

**Description** Configure the global shared buffer pool allocation to ports. Shared buffers are a pool of buffer space that the system can allocate dynamically across all of its ports as memory space is needed. Some buffer space is reserved for dedicated buffers (buffers allocated permanently to ports), headroom buffers (buffers that help prevent packet loss on lossless flows), and other buffers.

Configure the way the system uses the available (user-configurable) buffer space by setting the **shared-buffer** percentage for the ingress buffer pool and for the egress buffer pool.

The percentage you specify is the percentage of available buffer space allocated to the global shared ingress buffer pool or to the global shared egress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports.)

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until the buffer reprogramming is complete.

You can also partition the ingress shared buffer pool and the egress shared buffer pool to adjust the buffer allocations for different mixes of network traffic (best-effort, lossless, multicast) using the **buffer-partition** statement.

**Options** The statements are explained separately.

<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic on page 6104</a></li> <li>• <a href="#">Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic on page 6116</a></li> <li>• <a href="#">Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic on page 6122</a></li> <li>• <a href="#">Configuring Global Ingress and Egress Shared Buffers on page 6179</a></li> <li>• <a href="#">Understanding CoS Buffer Configuration on page 5891</a></li> </ul>

## system-defaults

---

<b>Syntax</b>	<pre>system-defaults {   classifiers exp classifier-name; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Configure the global EXP classifier used on all interfaces to classify MPLS traffic.</p> <p>Although you can configure as many EXP classifiers as you want, the switch uses only one EXP classifier as a global MPLS classifier on all interfaces. All switch interfaces use the EXP classifier specified as the system default to classify MPLS traffic.</p>
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a Global MPLS EXP Classifier on page 4479</a></li> <li>• <a href="#">Configuring Rewrite Rules for MPLS EXP Classifiers on page 4480</a></li> <li>• <a href="#">Understanding CoS MPLS EXP Classifiers and Rewrite Rules on page 4419</a></li> <li>• <a href="#">Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces on page 5820</a></li> </ul>

## traceoptions (Class of Service)

---

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;size <i>size</i>&gt; &lt;files <i>number</i>&gt;     &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt;;     no-remote-trace }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set class-of-service (CoS) tracing options.

**NOTE:** The `traceoptions` statement is not supported on the QFabric system.

**Default** Traceoptions is disabled.

**Options** **file *filename***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the `/var/log/` directory.

**files *number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file.0***. The traceoption output continues in a second trace file named ***trace-file.1***. When ***trace-file.1*** reaches its maximum size, output continues in a third file named ***trace-file.2***, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

**Range:** 2 through 1000 files

**Default:** 1 trace file

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Trace all operations.
- **asynch**—Trace asynchronous configuration processing.
- **chassis-scheduler**—Trace chassis stream scheduler processing.
- **cos-adjustment**—Trace CoS rate adjustments.
- **dynamic**—Trace dynamic CoS functions.
- **hardware-database**—Trace the chassis hardware database related processing.
- **init**—Trace initialization events.

- **performance-monitor**—Trace performance monitor counters.
- **process**—Trace configuration processing.
- **restart**—Trace restart processing.
- **route-socket**—Trace route-socket events.
- **show**—Trace show command servicing.
- **snmp**—Trace SNMP-related processing.
- **util**—Trace utilities.

The following are the global tracing options:

- **all**—Perform all tracing operations
- **parse**—Trace parser processing.

**no-remote-trace**—(Optional) Disable remote tracing.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. Incoming tracefile data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

## traffic-control-profiles

---

<b>Syntax</b>	<pre>traffic-control-profiles <i>profile-name</i> {     <b>guaranteed-rate</b> (<i>rate</i>  percent <i>percentage</i>);     <b>scheduler-map</b> <i>map-name</i>;     <b>shaping-rate</b> (<i>rate</i>  percent <i>percentage</i>); }</pre>
<b>Hierarchy Level</b>	[edit <b>class-of-service</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure traffic shaping and scheduling profiles for forwarding class sets (priority groups) to implement enhanced transmission selection (ETS) or for logical interfaces.
<b>Options</b>	<p><b>profile-name</b>—Name of the traffic-control profile. This name is also used to specify an output traffic control profile.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li><li>• <a href="#">Example: Configuring Traffic Control Profiles (Priority Group Scheduling) on page 6094</a></li><li>• <a href="#">Example: Configuring Forwarding Class Sets on page 6078</a></li><li>• <a href="#">Assigning CoS Components to Interfaces on page 6185</a></li><li>• <a href="#">output-traffic-control-profile on page 6264</a></li><li>• <a href="#">Understanding CoS Traffic Control Profiles on page 5880</a></li></ul>

## transmit-rate

<b>Syntax</b>	<code>transmit-rate (rate   percent <i>percentage</i>);</code>
<b>Hierarchy Level</b>	[edit <code>class-of-service schedulers <i>scheduler-name</i></code> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the minimum transmission rate or percentage for a queue (forwarding class) scheduler. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.
	<p> <b>NOTE:</b> The <code>transmit-rate</code> setting works only if you also configure the <code>guaranteed-rate</code> in the traffic control profile that is attached to the forwarding class set to which the queue belongs. If you do not configure the guaranteed rate, the minimum guaranteed rate for individual queues that you set using the <code>transmit-rate</code> statement does not work. The sum of all queue transmit rates in a forwarding class set should not exceed the traffic control profile guaranteed rate.</p> <p> <b>NOTE:</b> You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.</p> <p> <b>NOTE:</b> For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.</p>
<b>Default</b>	If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 11 are:

Queue Number	Default Minimum Guaranteed Bandwidth
0 (best-effort)	5 %
1	0
2	0
3 (fcoe)	35 %
4 (no-loss)	35 %
5	0
6	0
7 (network control)	5 %
8 (mcast)	20 %
9	0
10	0
11	0

Configure schedulers if you want to change the minimum guaranteed bandwidth and other queue characteristics.

**Options** *rate*—Minimum transmission rate for the queue, in bps. You can specify a value in bits-per-second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

**Range:** 1000 through 10,000,000,000 bps

**percent** *percentage*—Minimum percentage of transmission capacity allocated to the queue. A percentage of zero means that there is no minimum bandwidth guarantee for the queue.

**Range:** 0 through 100 percent

**Required Privilege Level** interfaces—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## tx-buffers

<b>Syntax</b>	tx-buffers (on   off);
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">ether-options</a> <a href="#">configured-flow-control</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Enable or disable an interface to respond to received Ethernet PAUSE messages. If you enable the transmit buffers to respond to PAUSE messages, when the interface receives a PAUSE message from the connected peer, the interface stops transmitting frames on the entire link. When the receive buffer on the connected peer empties below a certain threshold, the peer interface sends a message to the paused interface to resume sending frames.</p> <p>Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the <b>tx-buffers</b> statement with the <b>rx-buffers</b> statement to configure asymmetric Ethernet PAUSE on an interface. (Use the <b>flow-control</b> statement to enable symmetric PAUSE and the <b>no-flow-control</b> statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)</p>
<div>  <p><b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div>	
<b>Default</b>	Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.
<b>Options</b>	on   off—Enable or disable an interface to respond to an Ethernet PAUSE message.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">flow-control on page 2659</a></li> <li>• <a href="#">rx-buffers on page 2728</a></li> </ul>

## unit

---

**Syntax**     `unit logical-unit-number {  
                  classifiers {  
                    (dscp | dscp-ipv6 | ieee-802.1 | exp) (classifier-name | default);  
                  }  
                  forwarding-class class-name;  
                  rewrite-rules {  
                    (dscp | dscp-ipv6 | ieee-802.1) (classifier-name | default);  
                  }  
                  }`

**Hierarchy Level**     [edit **class-of-service interfaces** *interface-name*]

**Release Information**     Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**     Configure a logical interface on the physical device. You must configure a logical interface to use the physical device.

**Options**     *logical-unit-number*—Number of the logical unit.

**Range:** 0 through 16,385

The remaining statements are explained separately.

**Required Privilege Level**     interfaces—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

- [Monitoring CoS Value Aliases on page 6294](#)

## Monitoring CoS Classifiers

**Purpose** Display the mapping of incoming CoS values to forwarding class and loss priority for each classifier.

**Action** To monitor CoS classifiers in the CLI, enter the CLI command:

```
user@switch> show class-of-service classifier
```

To monitor a particular classifier in the CLI, enter the CLI command:

```
user@switch> show class-of-service classifier name classifier-name
```

To monitor a particular type of classifier in the CLI, enter the CLI command:

```
user@switch> show class-of-service classifier type classifier-type
```

**Meaning** [Table 566 on page 6289](#) summarizes key output fields for CoS classifiers.

**Table 566: Summary of Key CoS Classifier Output Fields**

Field	Values
Classifier	Name of a classifier.

Table 566: Summary of Key CoS Classifier Output Fields (*continued*)

Field	Values
Code point type	Type of classifier: <ul style="list-style-type: none"> <li>• <b>dscp</b>—All classifiers of the DSCP type.</li> <li>• <b>ieee-802.1</b>—All classifiers of the IEEE 802.1 type.</li> <li>• <b>ieee-mcast</b>—All classifiers of the IEEE 802.1 multicast type.</li> </ul>
Index	Internal index of the classifier.
Code point	DSCP or IEEE 802.1 code point value of the incoming packets, in bits. These values are used for classification.
Forwarding Class	Name of the forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the switch.
Loss Priority	Loss priority value that the classifier assigns to the incoming packet based on its code point value.

## Monitoring CoS Forwarding Classes

**Purpose** Use the monitoring functionality to view the current assignment of CoS forwarding classes to queue numbers on the system.

**Action** To monitor CoS forwarding classes in the CLI, enter the following CLI command:

```
user@switch> show class-of-service forwarding-class
```

**Meaning** [Table 567 on page 6291](#) summarizes key output fields for CoS forwarding classes.

Table 567: Summary of Key CoS Forwarding Class Output Fields

Field	Values
Forwarding Class	<p>Names of forwarding classes assigned to queue numbers. By default, the following unicast forwarding classes are assigned to queues 0, 3, 4, and 7, respectively:</p> <ul style="list-style-type: none"> <li>• <b>best-effort</b>—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value.</li> <li>• <b>fcoe</b>—Provides guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic.</li> <li>• <b>no-loss</b>—Provides guaranteed delivery for TCP lossless traffic</li> <li>• <b>network-control</b>—Packets can be delayed but not dropped.</li> </ul> <p>By default, the following multideestination forwarding class is assigned to queue 8:</p> <ul style="list-style-type: none"> <li>• <b>mcast</b>—Provides no special CoS handling of packets.</li> </ul>
Queue	<p>Queue number corresponding to the forwarding class name.</p> <p>By default, four queues (0, 3, 4, and 7) are assigned to unicast forwarding classes and one queue (8) is assigned to a multideestination forwarding class.</p>
No-Loss	<p>Packet drop attribute associated with each forwarding class:</p> <ul style="list-style-type: none"> <li>• Disabled—The forwarding class is configured for lossy transport (packets might drop during periods of congestion)</li> <li>• Enabled—The forwarding class is configured for lossless transport</li> </ul> <p><b>NOTE:</b> To achieve lossless transport, you must ensure that priority-based flow control (PFC) and DCBX are properly configured on the lossless priority (IEEE 802.1p code point), and that sufficient port bandwidth is reserved for the lossless traffic flows.</p>

## Monitoring Interfaces That Have CoS Components

**Purpose** Use the monitoring functionality to display details about the physical and logical interfaces and the CoS components assigned to them.

**Action** To monitor interfaces that have CoS components in the CLI, enter the command:

```
user@switch> show class-of-service interface
```

To monitor a specific interface in the CLI, enter the command:

```
user@switch> show class-of-service interface interface-name
```

**Meaning** [Table 568 on page 6292](#) summarizes key output fields for CoS interfaces.

Table 568: Summary of Key CoS Interfaces Output Fields

Field	Values
Physical interface	Name of a physical interface to which CoS components are assigned.
Index	Index of this interface or the internal index of a specific object.
Queues supported	Number of queues you can configure on the interface.
Queues in use	Number of queues currently configured.
Scheduler map	Name of the scheduler map associated with this interface.
Congestion-notification	Status of congestion notification (enabled or disabled).
Rewrite Input IEEE Code-point	(Fibre Channel NP_Port interfaces only) IEEE 802.1p code point (priority) the interface assigns to incoming Fibre Channel (FC) traffic when the interface encapsulates the FC traffic in Ethernet before forwarding it onto the FCoE network.
Logical Interface	Name of a logical interface on the physical interface to which CoS components are assigned.
Object	Category of an object—for example, <b>classifier</b> , <b>scheduler-map</b> , or <b>rewrite</b> .
Name	Name of the object—for example, <b>ba-classifier</b> .
Type	Type of the object—for example, <b>ieee8021p</b> for a classifier.

**Related Documentation** • [Assigning CoS Components to Interfaces on page 6185](#)

## Monitoring CoS Rewrite Rules

**Purpose** Use the monitoring functionality to display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

**Action** To monitor CoS rewrite rules in the CLI, enter the CLI command:

```
user@switch> show class-of-service rewrite-rule
```

To monitor a particular rewrite rule in the CLI, enter the CLI command:

```
user@switch> show class-of-service rewrite-rule name rewrite-rule-name
```

To monitor a particular type of rewrite rule (for example, DSCP, DSCP IPv6, or IEEE-802.1) in the CLI, enter the CLI command:

```
user@switch> show class-of-service rewrite-rule type rewrite-rule-type
```

**Meaning** [Table 569 on page 6293](#) summarizes key output fields for CoS rewrite rules.

**Table 569: Summary of Key CoS Rewrite Rule Output Fields**

Field	Values
Rewrite rule	Name of the rewrite rule.
Code point type	Rewrite rule type: <ul style="list-style-type: none"> <li>• <b>dscp</b>—For IPv4 DiffServ traffic.</li> <li>• <b>dscp-ipv6</b>—For IPv6 Diffserv traffic.</li> <li>• <b>ieee-802.1</b>—For Layer 2 traffic.</li> </ul>
Index	Internal index for the rewrite rule.
Forwarding class	Name of the forwarding class that is used to determine CoS values for rewriting in combination with loss priority.  Rewrite rules are applied to CoS values in outgoing packets based on forwarding class and loss priority setting.
Loss priority	Level of loss priority that is used to determine CoS values for rewriting in combination with forwarding class.
Code point	Rewrite code point value.

**Related Documentation** • [Defining CoS Rewrite Rules on page 6182](#)

## Monitoring CoS Scheduler Maps

**Purpose** Use the monitoring functionality to display assignments of CoS forwarding classes to schedulers.

**Action** To monitor CoS scheduler maps in the CLI, enter the CLI command:

```
user@switch> show class-of-service scheduler-map
```

To monitor a specific scheduler map in the CLI, enter the CLI command:

```
user@switch> show class-of-service scheduler-map scheduler-map-name
```

**Meaning** [Table 570 on page 6293](#) summarizes key output fields for CoS scheduler maps.

**Table 570: Summary of Key CoS Scheduler Maps Output Fields**

Field	Values
Scheduler map	Name of the scheduler map.
Index	Index of a specific object—scheduler maps, schedulers, or drop profiles.

Table 570: Summary of Key CoS Scheduler Maps Output Fields (*continued*)

Field	Values
Scheduler	Name of the scheduler.
Forwarding class	Names of the forwarding classes to which the scheduler is assigned.
Transmit rate	Configured transmit rate of the scheduler as a percentage of the total interface bandwidth.
Priority	<p>Scheduling priority of a queue:</p> <ul style="list-style-type: none"> <li>• <b>strict-high</b> or <b>high</b>—Packets in this queue are transmitted first. Only one queue can be configured as <b>strict-high</b> or <b>high</b>.</li> <li>• <b>low</b>—Packets in this queue are transmitted after packets in the <b>strict-high</b> queue.</li> </ul>
Drop Profiles	Name and index of a drop profile that is assigned to a specific loss priority and protocol pair.
Loss Priority	Drop profile associated with each packet loss priority. You can configure different drop profiles for <b>low</b> , <b>medium-high</b> , and <b>high</b> loss priority traffic.
Protocol	Transport protocol of the drop profile for the particular priority.
Name	Name of the drop profile.

**Related Documentation** • [Defining CoS Queue Schedulers on page 6167](#)

## Monitoring CoS Value Aliases

**Purpose** Use the monitoring functionality to display information about the CoS value aliases that the system is currently using to represent DSCP and IEEE 802.1p code point bits.

**Action** To monitor CoS value aliases in the CLI, enter the CLI command:

```
user@switch> show class-of-service code-point-aliases
```

To monitor a specific type of code-point alias (for example, DSCP or IEEE 802.1) in the CLI, enter the CLI command:

```
user@switch> show class-of-service code-point-aliases ieee-802.1
```

**Meaning** [Table 571 on page 6295](#) summarizes key output fields for CoS value aliases.

Table 571: Summary of Key CoS Value Alias Output Fields

Field	Values
Code point type	Type of the CoS value: <ul style="list-style-type: none"> <li>• <b>dscp</b>—Examines Layer 3 packet headers for IP packet classification.</li> <li>• <b>ieee-802.1</b>—Examines Layer 2 packet headers for packet classification.</li> </ul>
Alias	Name given to a set of bits—for example, <b>af11</b> is a name for bits <b>001010</b> .
Bit pattern	Set of bits associated with the alias.

## show class-of-service

<b>Syntax</b>	<b>show class-of-service</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the class-of-service (CoS) information.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Monitoring CoS Value Aliases on page 6294</a></li> <li>• <a href="#">Monitoring CoS Classifiers on page 6289</a></li> <li>• <a href="#">Monitoring CoS Forwarding Classes on page 6290</a></li> <li>• <a href="#">Monitoring Interfaces That Have CoS Components on page 6291</a></li> <li>• <a href="#">Monitoring CoS Scheduler Maps on page 6293</a></li> <li>• <a href="#">Monitoring CoS Rewrite Rules on page 6292</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show class-of- service on page 6298</a>
<b>Output Fields</b>	Table 572 on page 6297 lists the output fields for the <b>show class-of-service</b> command. Output fields are listed in the approximate order in which they appear.

**Table 572: show class-of-service Output Fields**

Field Name	Field Description	Level of Output
<b>Forwarding class</b>	The forwarding class configuration: <ul style="list-style-type: none"> <li>• <b>Forwarding class</b>—Name of the forwarding class.</li> <li>• <b>ID</b>—Forwarding class ID.</li> <li>• <b>Queue</b>—Queue number.</li> </ul>	All levels
<b>Code point type</b>	The type of code-point alias: <ul style="list-style-type: none"> <li>• <b>dscp</b>—Aliases for DiffServ code point (DSCP) values.</li> <li>• <b>ieee-802.1</b>—Aliases for IEEE 802.1p values.</li> </ul>	All levels
<b>Alias</b>	Names given to CoS values.	All levels
<b>Bit pattern</b>	Set of bits associated with an alias.	All levels
<b>Classifier</b>	Name of the classifier.	All levels
<b>Code point</b>	Code-point values.	All levels
<b>Loss priority</b>	Loss priority assigned to specific CoS values and aliases of the classifier.	All levels
<b>Rewrite rule</b>	Name of the rewrite rule if one has been configured.	All levels

Table 572: show class-of-service Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Drop profile</b>	Name of the drop profile.	All levels
<b>Type</b>	Type of drop profile. QFX Series supports only the <b>discrete</b> type of drop-profile.	All levels
<b>Fill level</b>	Percentage of queue buffer fullness in a drop profile at which packets begin to drop during periods of congestion.	All levels
<b>Scheduler map</b>	Name of the scheduler map.	All levels
<b>Scheduler</b>	Name of the scheduler.	All levels
<b>Transmit rate</b>	Transmission rate of the scheduler.	All levels
<b>Buffer size</b>	Delay buffer size in the queue.	All levels
<b>Drop profiles</b>	Drop profiles configured for the specified scheduler.	All levels
<b>Protocol</b>	Transport protocol corresponding to the drop profile.	All levels
<b>Name</b>	Name of the drop profile.	All levels
<b>Queues supported</b>	Number of queues that can be configured on the interface.	All levels
<b>Queues in use</b>	Number of queues currently configured.	All levels
<b>Physical interface</b>	Name of the physical interface.	All levels
<b>Scheduler map</b>	Name of the scheduler map.	All levels
<b>Congestion-notification</b>	Enabled if a congestion notification profile is applied to the interface; disabled if no congestion notification profile is applied to the interface.	All levels
<b>Forwarding class set</b>	Name of the forwarding class set (priority group).	
<b>Index</b>	Internal index of an object.	All levels

## Sample Output

### show class-of- service

```

user@switch> show class-of-service

## show class-of-service classifier

<b>Syntax</b>	show class-of-service classifier <name <i>name</i> > <type dscp   type dscp-ipv6   type exp   type ieee-802.1   type inet-precedence>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For each class-of-service (CoS) classifier, display the mapping of code point value to forwarding class and loss priority.
<b>Options</b>	<p><b>none</b>—Display all classifiers.</p> <p><b>name <i>name</i></b>—(Optional) Display named classifier.</p> <p><b>type dscp</b>—(Optional) Display all classifiers of the Differentiated Services code point (DSCP) type.</p> <p><b>type dscp-ipv6</b>—(Optional) Display all classifiers of the DSCP for IPv6 type.</p> <p><b>type exp</b>—(Optional) Display all classifiers of the MPLS experimental (EXP) type.</p> <p><b>type ieee-802.1</b>—(Optional) Display all classifiers of the ieee-802.1 type.</p> <p><b>type inet-precedence</b>—(Optional) Display all classifiers of the inet-precedence type.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show class-of-service classifier type ieee-802.1 on page 6302</a> <a href="#">show class-of-service classifier type ieee-802.1 (QFX Series) on page 6302</a>
<b>Output Fields</b>	<a href="#">Table 573 on page 6301</a> describes the output fields for the <b>show class-of-service classifier</b> command. Output fields are listed in the approximate order in which they appear.

**Table 573: show class-of-service classifier Output Fields**

Field Name	Field Description
<b>Classifier</b>	Name of the classifier.
<b>Code point type</b>	Type of the classifier: <b>exp</b> (not on EX Series switch), <b>dscp</b> , <b>dscp-ipv6</b> (not on EX Series switch), <b>ieee-802.1</b> , or <b>inet-precedence</b> .
<b>Index</b>	Internal index of the classifier.
<b>Code point</b>	Code point value used for classification
<b>Forwarding class</b>	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.

Table 573: show class-of-service classifier Output Fields (*continued*)

Field Name	Field Description
Loss priority	Loss priority value used for classification. For most platforms, the value is <b>high</b> or <b>low</b> . For some platforms, the value is <b>high</b> , <b>medium-high</b> , <b>medium-low</b> , or <b>low</b> .

## Sample Output

### show class-of-service classifier type ieee-802.1

```

user@host> show class-of-service classifier type ieee-802.1
Classifier: ieee802.1-default, Code point type: ieee-802.1, Index: 3
Code Point      Forwarding Class      Loss priority
000             best-effort           low
001             best-effort           high
010             expedited-forwarding  low
011             expedited-forwarding  high
100             assured-forwarding    low
101             assured-forwarding    medium-high
110             network-control       low
111             network-control       high

Classifier: users-ieee802.1, Code point type: ieee-802.1
Code point      Forwarding class      Loss priority
100             expedited-forwarding  low

```

### show class-of-service classifier type ieee-802.1 (QFX Series)

```

user@switch> show class-of-service classifier type ieee-802.1
Classifier: ieee8021p-default, Code point type: ieee-802.1, Index: 11
Code point      Forwarding class      Loss priority
000             best-effort           low
001             best-effort           low
010             best-effort           low
011             fcoe                  low
100             no-loss               low
101             best-effort           low
110             network-control       low
111             network-control       low

Classifier: ieee-mcast, Code point type: ieee-802.1, Index: 46
Code point      Forwarding class      Loss priority
000             mcast                 low
001             mcast                 low
010             mcast                 low
011             mcast                 low
100             mcast                 low
101             mcast                 low
110             mcast                 low
111             mcast                 low

```

## show class-of-service code-point-aliases

<b>Syntax</b>	<code>show class-of-service code-point-aliases</code> <code>&lt;dscp   dscp-ipv6   exp   ieee-802.1   inet-precedence&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the mapping of class-of-service (CoS) code point aliases to corresponding bit patterns.
<b>Options</b>	<p><b>none</b>—Display code point aliases of all code point types.</p> <p><b>dscp</b>—(Optional) Display Differentiated Services code point (DSCP) aliases.</p> <p><b>dscp-ipv6</b>—(Optional) Display IPv6 DSCP aliases.</p> <p><b>exp</b>—(Optional) Display MPLS EXP code point aliases.</p> <p><b>ieee-802.1</b>—(Optional) Display IEEE-802.1 code point aliases.</p> <p><b>inet-precedence</b>—(Optional) Display IPv4 precedence code point aliases.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show class-of-service code-point-aliases exp on page 6304</a>
<b>Output Fields</b>	<a href="#">Table 574 on page 6303</a> describes the output fields for the <b>show class-of-service code-point-aliases</b> command. Output fields are listed in the approximate order in which they appear.

**Table 574: show class-of-service code-point-aliases Output Fields**

Field Name	Field Description
<b>Code point type</b>	Type of the code points displayed: <b>dscp</b> , <b>dscp-ipv6</b> (not on EX Series switch), <b>exp</b> (not on EX Series switch or the QFX Series), <b>ieee-802.1</b> , or <b>inet-precedence</b> (not on the QFX Series).
<b>Alias</b>	Alias for a bit pattern.
<b>Bit pattern</b>	Bit pattern for which the alias is displayed.

## Sample Output

`show class-of-service code-point-aliases exp`

```
user@host> show class-of-service code-point-aliases exp
Code point type: exp
Alias      Bit pattern
af11      100
af12      101
be        000

ef1       011
nc1       110
nc2       111
```

## show class-of-service congestion-notification

<b>Syntax</b>	show class-of-service congestion-notification
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display whether priority-based flow control (PFC) is enabled for each IEEE 802.1p code point.
<b>Options</b>	<b>none</b> —Display the PFC state for all IEEE 802.1p code points.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 6174</a></li> <li>• <a href="#">Example: Configuring CoS PFC for FCoE Traffic on page 5606</a></li> <li>• <a href="#">Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch) on page 6019</a></li> <li>• <a href="#">Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface on page 6028</a></li> <li>• <a href="#">Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces on page 6036</a></li> <li>• <a href="#">Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI) on page 6050</a></li> <li>• <a href="#">Example: Configuring IEEE 802.1p Priority Remapping on an FCoE-FC Gateway</a></li> <li>• <a href="#">Example: Configuring PFC Across Layer 3 Interfaces on page 6138</a></li> <li>• <a href="#">Understanding CoS Flow Control (Ethernet PAUSE and PFC) on page 5559</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 575 on page 6305</a> describes the output fields for the <b>show class-of-service congestion-notification</b> command. Output fields are listed in the approximate order in which they appear.

**Table 575: show class-of-service congestion-notification Output Fields**

Field Name	Field Description
<b>Type</b>	Type of interfaces on which congestion notification is applied. Congestion notification is applied on input interfaces.
<b>Index</b>	Index of this congestion notification profile.
<b>Name</b>	Name of the congestion notification profile.
<b>Cable Length</b>	Length of the attached physical cable in meters. The default value is 100 meters.

Table 575: show class-of-service congestion-notification Output Fields (*continued*)

Field Name	Field Description
Priority	IEEE 802.1p code point.
PFC	State of PFC for the corresponding code point, either <b>enabled</b> or <b>disabled</b> .
MRU	<p>Maximum receive unit of the interface in bytes. (Incoming traffic that exceeds the MRU size of an interface is dropped.) The default values are:</p> <ul style="list-style-type: none"> <li>2500 bytes for priority 3 traffic</li> <li>9216 bytes for priority 4 traffic</li> </ul> <p><b>NOTE:</b> If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not configure an MRU value, the default MRU value is 2500 bytes.</p>
Flow-Control-Queues	Output queue mapping to IEEE 802.1p code points (priorities). Explicit output queue to priority mapping overwrites the default configuration, and only explicitly mapped queues are displayed in the output. Flow control is only enabled on a queue when you enable PFC on the corresponding priority in the input stanza of the congestion notification profile.

## Sample Output

### show class-of-service congestion-notification

```

user@switch> show class-of-service congestion-notification

## show class-of-service forwarding-class

<b>Syntax</b>	show class-of-service forwarding-class
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about forwarding classes, including the mapping of forwarding classes to queue numbers.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring CoS on EX Series Switches</a></li> <li>• <a href="#">Example: Configuring Forwarding Classes on page 6075</a></li> <li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5966</a></li> <li>• <a href="#">Monitoring CoS Forwarding Classes</a></li> <li>• <a href="#">Defining CoS Forwarding Classes (CLI Procedure)</a></li> <li>• <a href="#">Defining CoS Forwarding Class Sets on page 6166</a></li> <li>• <a href="#">Configuring CoS Traffic Classification for Ingress Queuing on Oversubscribed Ports on EX8200 Line Cards (CLI Procedure)</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show class-of-service forwarding-class on page 6312</a> <a href="#">show class-of-service forwarding-class (EX8200 Switch) on page 6312</a> <a href="#">show class-of-service forwarding-class (QFX Series) on page 6312</a>
<b>Output Fields</b>	Table 577 on page 6311 describes the output fields for the <b>show class-of-service forwarding-class</b> command. Output fields are listed in the approximate order in which they appear.

**Table 577: show class-of-service forwarding-class Output Fields**

Field Name	Field Description
<b>Forwarding class</b>	Name of the forwarding class.
<b>ID</b>	Forwarding class identifier.
<b>Queue</b>	CoS queue mapped to the forwarding class.
<b>Policing priority</b>	Not supported on EX Series switches or the QFX Series and can be ignored.
<b>Fabric priority</b>	(EX8200 switches only) Fabric priority for the forwarding class, either <b>high</b> or <b>low</b> . Determines the priority of packets entering the switch fabric.

Table 577: show class-of-service forwarding-class Output Fields (*continued*)

Field Name	Field Description
<b>No-Loss</b>	<p>(QFX Series only) Packet loss attribute to differentiate lossless forwarding classes from lossy forwarding classes:</p> <ul style="list-style-type: none"> <li>Disabled—Lossless transport is not configured on the forwarding class (packet drop attribute is <b>drop</b>).</li> <li>Enabled—Lossless transport is configured on the forwarding class (packet drop attribute is <b>no-loss</b>).</li> </ul>

## Sample Output

### show class-of-service forwarding-class

```

user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue Policing priority
best-effort           0        0      normal
expedited-forwarding  1        5      normal
assured-forwarding    2        1      normal
network-control       3        7      normal

```

## Sample Output

### show class-of-service forwarding-class (EX8200 Switch)

```

user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue Fabric priority

## show class-of-service forwarding-class-set

<b>Syntax</b>	<code>show class-of-service forwarding-class-set</code> <code>&lt;forwarding-class-set-name&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the forwarding classes associated with each forwarding class set.
<b>Options</b>	<p><b>none</b>—Display all forwarding class sets.</p> <p><b>forwarding-class-set-name</b>—(Optional) Display the forwarding classes associated with the specified forwarding class set.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding CoS Forwarding Class Sets (Priority Groups) on page 5835</a></li> <li>• <a href="#">Defining CoS Forwarding Class Sets on page 6166</a></li> <li>• <a href="#">Example: Configuring Forwarding Class Sets on page 6078</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 578 on page 6313</a> describes the output fields for the <b>show class-of-service forwarding-class-set</b> command. Output fields are listed in the approximate order in which they appear.

**Table 578: show class-of-service forwarding-class-set Output Fields**

Field Name	Field Description
Forwarding class set	Name of the forwarding class set.
Type	Internal Junos OS type.
Forwarding class set index	Index of this forwarding class set.
Forwarding class	Name of a forwarding class.
Index	Index of this forwarding class.

## Sample Output

### show class-of-service forwarding-class-set

```

user@switch> show class-of-service forwarding-class-set
Forwarding class set: san_fcset, Type: normal-type, Forwarding class set index:
37839

## show class-of-service forwarding-table classifier

<b>Syntax</b>	show class-of-service forwarding-table classifier
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the mapping of code point value to queue number and loss priority for each classifier as it exists in the forwarding table.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show class-of-service forwarding-table classifier on page 6319</a>
<b>Output Fields</b>	<a href="#">Table 579 on page 6319</a> describes the output fields for the <b>show class-of-service forwarding-table classifier</b> command. Output fields are listed in the approximate order in which they appear.

**Table 579: show class-of-service forwarding-table classifier Output Fields**

Field Name	Field Description
<b>Classifier table index</b>	Index of the classifier table.
<b>entries</b>	Total number of entries.
<b>Table type</b>	Type of code points in the table: <b>DSCP</b> , <b>EXP</b> (not on the QFX Series), <b>IEEE 802.1</b> , <b>IPv4 precedence</b> (not on the QFX Series), or <b>IPv6 DSCP</b> .
<b>Entry #</b>	Entry number.
<b>Code point</b>	Code point value used for classification.
<b>Forwarding-class #</b>	Forwarding class to which the code point is assigned.
<b>PLP</b>	Packet loss priority value set by classification. For most platforms, the value can be <b>0</b> or <b>1</b> . For some platforms, the value is <b>0</b> , <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>0</b> represents low PLP. The value <b>1</b> represents <b>high</b> PLP. The value <b>2</b> represents medium-low PLP. The value <b>3</b> represents medium-high PLP.

## Sample Output

### show class-of-service forwarding-table classifier

```

## show class-of-service forwarding-table rewrite-rule

<b>Syntax</b>	show class-of-service forwarding-table rewrite-rule
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display mapping of queue number and loss priority to code point value for each rewrite rule as it exists in the forwarding table.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show class-of-service forwarding-table rewrite-rule on page 6325</a>
<b>Output Fields</b>	<a href="#">Table 582 on page 6325</a> describes the output fields for the <b>show class-of-service forwarding-table rewrite-rule</b> command. Output fields are listed in the approximate order in which they appear.

**Table 582: show class-of-service forwarding-table rewrite-rule Output Fields**

Field Name	Field Description
Rewrite table index	Index for this rewrite rule.
# entries	Number of entries in this rewrite rule.
Table type	Type of table: <b>DSCP</b> , <b>EXP</b> (not on the QFX Series), <b>EXP-PUSH-3</b> (not on the QFX Series), <b>EXP-SWAP-PUSH-2</b> , (J Series routers only), <b>IEEE 802.1</b> , <b>IPv4 precedence</b> (not on the QFX Series), <b>IPv6 DSCP</b> , or <b>Fixed</b> .
Q#	Queue number to which this entry is assigned.
Low bits	Code point value for low-priority loss profile.
State	State of this code point: <b>enabled</b> , <b>rewritten</b> , or <b>disabled</b> .
High bits	Code point value for high-priority loss profile.

## Sample Output

### show class-of-service forwarding-table rewrite-rule

```

user@host> show class-of-service forwarding-table rewrite-rule
Rewrite table index: 3753, # entries: 4, Table type: DSCP

## show class-of-service forwarding-table scheduler-map

<b>Syntax</b>	show class-of-service forwarding-table scheduler-map
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For each physical interface, display the scheduler map information as it exists in the forwarding table.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show class-of-service forwarding-table scheduler-map on page 6329</a>
<b>Output Fields</b>	<a href="#">Table 584 on page 6328</a> describes the output fields for the <b>show class-of-service forwarding-table scheduler-map</b> command. Output fields are listed in the approximate order in which they appear.

**Table 584: show class-of-service forwarding-table scheduler-map Output Fields**

Field Name	Field Description
Interface	Name of the physical interface.
Index	Physical interface index.
Map index	Scheduler map index.
Num of queues	Number of queues defined in this scheduler map.
Entry	Number of this entry in the scheduler map.
Scheduler index	Scheduler policy index.
Forwarding-class #	Forwarding class number to which this entry is applied.
Tx rate	Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.
Max buffer delay	Amount of transmit delay (in milliseconds) or buffer size of the queue. This amount is a percentage of the total interface buffer allocation or the keyword <b>remainder</b> , which indicates that the buffer is sized according to what remains after other scheduler buffer allocations.
Priority	<ul style="list-style-type: none"> <li><b>high</b>—Queue priority is high.</li> <li><b>low</b>—Queue priority is low.</li> </ul>
PLP high	Drop profile index for a high packet loss priority profile.

Table 584: show class-of-service forwarding-table scheduler-map Output Fields (*continued*)

Field Name	Field Description
PLP low	Drop profile index for a low packet loss priority profile.
PLP medium-high	Drop profile index for a medium-high packet loss priority profile.
PLP medium-low	Drop profile index for a medium-low packet loss priority profile.
TCP PLP high	Drop profile index for a high TCP packet loss priority profile.
TCP PLP low	Drop profile index for a low TCP packet loss priority profile.
Policy is exact	If this line appears in the output, exact rate limiting is enabled. Otherwise, no rate limiting is enabled.

## Sample Output

### show class-of-service forwarding-table scheduler-map

```

user@host> show class-of-service forwarding-table scheduler-map
Interface: so-5/0/0 (Index: 9, Map index: 17638, Num of queues: 2):
  Entry 0 (Scheduler index: 6090, Forwarding-class #: 0):
    Tx rate: 0 Kb (30%), Max buffer delay: 39 bytes (0%)

**Output Fields** [Table 585 on page 6331](#) describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

**Table 585: show class-of-service interface Output Fields**

Field Name	Field Description
<b>Physical interface</b>	Name of a physical interface.
<b>Index</b>	Index of this interface or the internal index of this object.
<b>Dedicated Queues</b>	Status of dedicated queues configured on an interface. Supported only on Trio MPC/MIC interfaces on MX Series routers.
<b>Queues supported</b>	Number of queues you can configure on the interface.
<b>Queues in use</b>	Number of queues currently configured.
<b>Total non-default queues created</b>	Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.
<b>Rewrite Input IEEE Code-point</b>	(QFX Series only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value.
<b>Shaping rate</b>	Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the <b>Shaping rate</b> field is displayed for either the physical interface or the logical interface.
<b>Scheduler map</b>	Name of the output scheduler map associated with this interface.
<b>Scheduler map forwarding class sets</b>	(QFX Series only) Name of the fabric forwarding class set scheduler map associated with a QFabric system Interconnect device interface.
<b>Input shaping rate</b>	For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.
<b>Input scheduler map</b>	For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.
<b>Chassis scheduler map</b>	Name of the scheduler map associated with the packet forwarding component queues.
<b>Rewrite</b>	Name and type of the rewrite rules associated with this interface.
<b>Classifier</b>	Name and type of classifiers associated with this interface.

Table 585: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
<b>Forwarding-class-map</b>	Name of the forwarding map associated with this interface.
<b>Congestion-notification</b>	(QFX Series only) Congestion notification state, <b>enabled</b> or <b>disabled</b> .
<b>Logical interface</b>	Name of a logical interface.
<b>Object</b>	Category of an object: <b>Classifier</b> , <b>Fragmentation-map</b> (for LSQ interfaces only), <b>Scheduler-map</b> , <b>Rewrite</b> , or <b>Translation Table</b> (for IQE PICs only).
<b>Name</b>	Name of an object.
<b>Type</b>	Type of an object: <b>dscp</b> , <b>dscp-ipv6</b> , <b>exp</b> , <b>ieee-802.1</b> , <b>ip</b> , or <b>inet-precedence</b> .
<b>Link-level type</b>	Encapsulation on the physical interface.
<b>MTU</b>	MTU size on the physical interface.
<b>Speed</b>	Speed at which the interface is running.
<b>Loopback</b>	Whether loopback is enabled and the type of loopback.
<b>Source filtering</b>	Whether source filtering is enabled or disabled.
<b>Flow control</b>	Whether flow control is enabled or disabled.
<b>Auto-negotiation</b>	(Gigabit Ethernet interfaces) Whether autonegotiation is enabled or disabled.
<b>Remote-fault</b>	(Gigabit Ethernet interfaces) Remote fault status. <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>

Table 585: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
<b>Device flags</b>	<p>The <b>Device flags</b> field provides information about the physical device and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Down</b>—Device has been administratively disabled.</li> <li>• <b>Hear-Own-Xmit</b>—Device receives its own transmissions.</li> <li>• <b>Link-Layer-Down</b>—The link-layer protocol has failed to connect with the remote endpoint.</li> <li>• <b>Loopback</b>—Device is in physical loopback.</li> <li>• <b>Loop-Detected</b>—The link layer has received frames that it sent, thereby detecting a physical loopback.</li> <li>• <b>No-Carrier</b>—On media that support carrier recognition, no carrier is currently detected.</li> <li>• <b>No-Multicast</b>—Device does not support multicast traffic.</li> <li>• <b>Present</b>—Device is physically present and recognized.</li> <li>• <b>Promiscuous</b>—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media.</li> <li>• <b>Quench</b>—Transmission on the device is quenched because the output buffer is overflowing.</li> <li>• <b>Recv-All-Multicasts</b>—Device is in multicast promiscuous mode and therefore provides no multicast filtering.</li> <li>• <b>Running</b>—Device is active and enabled.</li> </ul>
<b>Interface flags</b>	<p>The <b>Interface flags</b> field provides information about the physical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Admin-Test</b>—Interface is in test mode and some sanity checking, such as loop detection, is disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Hardware-Down</b>—Interface is nonfunctional or incorrectly connected.</li> <li>• <b>Link-Layer-Down</b>—Interface keepalives have indicated that the link is incomplete.</li> <li>• <b>No-Multicast</b>—Interface does not support multicast traffic.</li> <li>• <b>No-receive No-transmit</b>—Passive monitor mode is configured on the interface.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>Pop all MPLS labels from packets of depth</b>—MPLS labels are removed as packets arrive on an interface that has the <b>pop-all-labels</b> statement configured. The depth value can be one of the following: <ul style="list-style-type: none"> <li>• <b>1</b>—Takes effect for incoming packets with one label only.</li> <li>• <b>2</b>—Takes effect for incoming packets with two labels only.</li> <li>• <b>[ 1 2 ]</b>—Takes effect for incoming packets with either one or two labels.</li> </ul> </li> <li>• <b>Promiscuous</b>—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses.</li> <li>• <b>Recv-All-Multicasts</b>—Interface is in multicast promiscuous mode and provides no multicast filtering.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul>

Table 585: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
<b>Flags</b>	<p>The <b>Logical interface flags</b> field provides information about the logical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>ACFC Encapsulation</b>—Address control field Compression (ACFC) encapsulation is enabled (negotiated successfully with a peer).</li> <li>• <b>Device-down</b>—Device has been administratively disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Clear-DF-Bit</b>—GRE tunnel or IPsec tunnel is configured to clear the Don't Fragment (DF) bit.</li> <li>• <b>Hardware-Down</b>—Interface protocol initialization failed to complete successfully.</li> <li>• <b>PFC</b>—Protocol field compression is enabled for the PPP session.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul>
<b>Encapsulation</b>	Encapsulation on the logical interface.
<b>Admin</b>	Administrative state of the interface ( <b>Up</b> or <b>Down</b> )
<b>Link</b>	Status of physical link ( <b>Up</b> or <b>Down</b> ).
<b>Proto</b>	Protocol configured on the interface.
<b>Input Filter</b>	Names of any firewall filters to be evaluated when packets are received on the interface, including any filters attached through activation of dynamic service.
<b>Output Filter</b>	Names of any firewall filters to be evaluated when packets are transmitted on the interface, including any filters attached through activation of dynamic service.
<b>Link flags</b>	<p>Provides information about the physical link and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>ACFC</b>—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option.</li> <li>• <b>Give-Up</b>—Link protocol does not continue connection attempts after repeated failures.</li> <li>• <b>Loose-LCP</b>—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-LMI</b>—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-NCP</b>—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational.</li> <li>• <b>Keepalives</b>—Link protocol keepalives are enabled.</li> <li>• <b>No-Keepalives</b>—Link protocol keepalives are disabled.</li> <li>• <b>PFC</b>—Protocol field compression is configured. The PPP session negotiates the PFC option.</li> </ul>
<b>Hold-times</b>	Current interface hold-time up and hold-time down, in milliseconds.
<b>CoS queues</b>	Number of CoS queues configured.

Table 585: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .
<b>Statistics last cleared</b>	Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>
<b>IPv6 transit statistics</b>	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.
<b>Input errors</b>	Input errors on the interface. The labels are explained in the following list: <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Bucket Drops</b>—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>HS link FIFO overflows</b>—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> </ul>

Table 585: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
<b>Output errors</b>	<p>Output errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Drops</b> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>HS link FIFO underflows</b>—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeds the MTU of the interface.</li> </ul>
<b>Egress queues</b>	Total number of egress queues supported on the specified interface.
<b>Queue counters</b>	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Dropped packets</b> field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>
<b>SONET alarms</b> <b>SONET defects</b>	<p>(SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: <b>SONET PHY</b>, <b>SONET section</b>, <b>SONET line</b>, and <b>SONET path</b>.</p>
<b>SONET PHY</b>	<p>Counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET PHY</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>PLL Lock</b>—Phase-locked loop</li> <li>• <b>PHY Light</b>—Loss of optical signal</li> </ul>

Table 585: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
<b>SONET section</b>	<p>Counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET section</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>BIP-B1</b>—Bit interleaved parity for SONET section overhead</li> <li>• <b>SEF</b>—Severely errored framing</li> <li>• <b>LOS</b>—Loss of signal</li> <li>• <b>LOF</b>—Loss of frame</li> <li>• <b>ES-S</b>—Errored seconds (section)</li> <li>• <b>SES-S</b>—Severely errored seconds (section)</li> <li>• <b>SEFS-S</b>—Severely errored framing seconds (section)</li> </ul>
<b>SONET line</b>	<p>Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET line</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>BIP-B2</b>—Bit interleaved parity for SONET line overhead</li> <li>• <b>REI-L</b>—Remote error indication (near-end line)</li> <li>• <b>RDI-L</b>—Remote defect indication (near-end line)</li> <li>• <b>AIS-L</b>—Alarm indication signal (near-end line)</li> <li>• <b>BERR-SF</b>—Bit error rate fault (signal failure)</li> <li>• <b>BERR-SD</b>—Bit error rate defect (signal degradation)</li> <li>• <b>ES-L</b>—Errored seconds (near-end line)</li> <li>• <b>SES-L</b>—Severely errored seconds (near-end line)</li> <li>• <b>UAS-L</b>—Unavailable seconds (near-end line)</li> <li>• <b>ES-LFE</b>—Errored seconds (far-end line)</li> <li>• <b>SES-LFE</b>—Severely errored seconds (far-end line)</li> <li>• <b>UAS-LFE</b>—Unavailable seconds (far-end line)</li> </ul>

Table 585: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
<b>SONET path</b>	<p>Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET path</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>BIP-B3</b>—Bit interleaved parity for SONET section overhead</li> <li>• <b>REI-P</b>—Remote error indication</li> <li>• <b>LOP-P</b>—Loss of pointer (path)</li> <li>• <b>AIS-P</b>—Path alarm indication signal</li> <li>• <b>RDI-P</b>—Path remote defect indication</li> <li>• <b>UNEQ-P</b>—Path unequipped</li> <li>• <b>PLM-P</b>—Path payload (signal) label mismatch</li> <li>• <b>ES-P</b>—Errored seconds (near-end STS path)</li> <li>• <b>SES-P</b>—Severely errored seconds (near-end STS path)</li> <li>• <b>UAS-P</b>—Unavailable seconds (near-end STS path)</li> <li>• <b>ES-PFE</b>—Errored seconds (far-end STS path)</li> <li>• <b>SES-PFE</b>—Severely errored seconds (far-end STS path)</li> <li>• <b>UAS-PFE</b>—Unavailable seconds (far-end STS path)</li> </ul>
<b>Received SONET overhead</b>  <b>Transmitted SONET overhead</b>	<p>Values of the received and transmitted SONET overhead:</p> <ul style="list-style-type: none"> <li>• <b>C2</b>—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P.</li> <li>• <b>F1</b>—Section user channel byte. This byte is set aside for the purposes of users.</li> <li>• <b>K1</b> and <b>K2</b>—These bytes are allocated for APS signaling for the protection of the multiplex section.</li> <li>• <b>J0</b>—Section trace. This byte is defined for STS-1 number 1 of an STS-<i>N</i> signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter.</li> <li>• <b>S1</b>—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-<i>N</i> signal.</li> <li>• <b>Z3</b> and <b>Z4</b>—Allocated for future use.</li> </ul>
<b>Received path trace</b>  <b>Transmitted path trace</b>	<p>SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.</p>
<b>HDLC configuration</b>	<p>Information about the HDLC configuration.</p> <ul style="list-style-type: none"> <li>• <b>Policing bucket</b>—Configured state of the receiving policer.</li> <li>• <b>Shaping bucket</b>—Configured state of the transmitting shaper.</li> <li>• <b>Giant threshold</b>—Giant threshold programmed into the hardware.</li> <li>• <b>Runt threshold</b>—Runt threshold programmed into the hardware.</li> </ul>

Table 585: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
<b>Packet Forwarding Engine configuration</b>	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number.</li> <li>• <b>PLP byte</b>—Packet Level Protocol byte.</li> </ul>
<b>CoS information</b>	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> <li>• <b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li>• <b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li>• <b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li>• <b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li>• <b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>• <b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li>• <b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul>
<b>Forwarding classes</b>	Total number of forwarding classes supported on the specified interface.
<b>Egress queues</b>	Total number of egress queues supported on the specified interface.
<b>Queue</b>	Queue number.
<b>Forwarding classes</b>	Forwarding class name.
<b>Queued Packets</b>	Number of packets queued to this queue.
<b>Queued Bytes</b>	Number of bytes queued to this queue. The byte counts vary by PIC type.
<b>Transmitted Packets</b>	Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.
<b>Transmitted Bytes</b>	Number of bytes transmitted by this queue. The byte counts vary by PIC type.
<b>Tail-dropped packets</b>	Number of packets dropped because of tail drop.

Table 585: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
RED-dropped packets	<p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP packets dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP packets dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP packets dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP packets dropped because of RED.</li> </ul> </li> <li>(MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low</b>—Number of low-loss priority packets dropped because of RED.</li> <li><b>Medium-low</b>—Number of medium-low loss priority packets dropped because of RED.</li> <li><b>Medium-high</b>—Number of medium-high loss priority packets dropped because of RED.</li> <li><b>High</b>—Number of high-loss priority packets dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>
RED-dropped bytes	<p>Number of bytes dropped because of RED. The byte counts vary by PIC type.</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP bytes dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP bytes dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP bytes dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP bytes dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>
Transmit rate	Configured transmit rate of the scheduler. The rate is a percentage of the total interface bandwidth.
Rate Limit	<p>Rate limiting configuration of the queue. Possible values are :</p> <ul style="list-style-type: none"> <li><b>None</b>—No rate limit.</li> <li><b>exact</b>—Queue transmits at the configured rate.</li> </ul>
Buffer size	Delay buffer size in the queue.
Priority	Scheduling priority configured as <b>low</b> or <b>high</b> .
Excess Priority	Priority of the excess bandwidth traffic on a scheduler: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .

Table 585: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
Drop profiles	<p>Display the assignment of drop profiles.</p> <ul style="list-style-type: none"> <li>• <b>Loss priority</b>—Packet loss priority for drop profile assignment.</li> <li>• <b>Protocol</b>—Transport protocol for drop profile assignment.</li> <li>• <b>Index</b>—Index of the indicated object. Objects that have indexes in this output include schedulers and drop profiles.</li> <li>• <b>Name</b>—Name of the drop profile.</li> <li>• <b>Type</b>—Type of the drop profile: <b>discrete</b> or <b>interpolated</b>.</li> <li>• <b>Fill Level</b>—Percentage fullness of a queue.</li> <li>• <b>Drop probability</b>—Drop probability at this fill level.</li> </ul>
Excess Priority	Priority of the excess bandwidth traffic on a scheduler.
Drop profiles	<p>Display the assignment of drop profiles.</p> <ul style="list-style-type: none"> <li>• <b>Loss priority</b>—Packet loss priority for drop profile assignment.</li> <li>• <b>Protocol</b>—Transport protocol for drop profile assignment.</li> <li>• <b>Index</b>—Index of the indicated object. Objects that have indexes in this output include schedulers and drop profiles.</li> <li>• <b>Name</b>—Name of the drop profile.</li> <li>• <b>Type</b>—Type of the drop profile: <b>discrete</b> or <b>interpolated</b>.</li> <li>• <b>Fill Level</b>—Percentage fullness of a queue.</li> <li>• <b>Drop probability</b>—Drop probability at this fill level.</li> </ul>
Adjustment information	<p>Display the assignment of shaping-rate adjustments on a scheduler node or queue.</p> <ul style="list-style-type: none"> <li>• <b>Adjusting application</b>—Application that is performing the shaping-rate adjustment. <ul style="list-style-type: none"> <li>• The adjusting application can appear as <b>anclp LS-0</b>, which is the Junos OS Access Node Control Profile process (<b>anclpd</b>) that performs shaping-rate adjustments on schedule nodes.</li> <li>• The adjusting application can also appear as <b>pppoe</b>, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual-data-rate-downstream attribute. The overhead accounting value is based on the access-loop-encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode).</li> </ul> </li> <li>• <b>Adjustment type</b>—Type of adjustment: <b>absolute</b> or <b>delta</b>.</li> <li>• <b>Configured shaping rate</b>—Shaping rate configured for the scheduler node or queue.</li> <li>• <b>Adjustment value</b>—Value of adjusted shaping rate.</li> <li>• <b>Adjustment target</b>—Level of shaping-rate adjustment performed: <b>node</b> or <b>queue</b>.</li> <li>• <b>Adjustment overhead-accounting mode</b>—Configured shaping mode: <b>frame</b> or <b>cell</b>.</li> </ul>

## Sample Output

### show class-of-service interface (Physical)

```

## show class-of-service multi-destination

<b>Syntax</b>	show class-of-service multi-destination
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For each class-of-service (CoS) multideestination classifier, display the classifier type.
<b>Options</b>	<b>none</b> —Display all multideestination classifiers.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Defining CoS Multideestination (Multicast, Broadcast, DLF) BA Classifiers on page 6162</a></li> <li>• <a href="#">Example: Configuring Multideestination (Multicast, Broadcast, DLF) Classifiers on page 6069</a></li> <li>• <a href="#">Understanding CoS Classifiers on page 5810</a></li> <li>• <a href="#">Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces on page 5820</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 586 on page 6358</a> describes the output fields for the <b>show class-of-service multi-destination</b> command. Output fields are listed in the approximate order in which they appear.

**Table 586: show class-of-service multi-destination Output Fields**

Field Name	Field Description
Family ethernet	Family to which the classifier belongs.
Classifier Name	Name of the classifier.
Classifier Type	Type of the classifier: <b>dscp</b> or <b>ieee-802.1</b> .
Classifier Index	Internal index of the classifier.

## Sample Output

### show class-of-service multi-destination

```
user@switch> show class-of-service multi-destination
```

```

Family ethernet:
Classifier Name      Classifier Type      Classifier Index
ba-mcast-classifier  ieee-802.1          62376

```

## show class-of-service rewrite-rule

<b>Syntax</b>	show class-of-service rewrite-rule <name <i>name</i> > <type <i>type</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the mapping of forwarding classes and loss priority to code point values.
<b>Options</b>	<p><b>none</b>—Display all rewrite rules.</p> <p><b>name <i>name</i></b>—(Optional) Display the specified rewrite rule.</p> <p><b>type <i>type</i></b>—(Optional) Display the rewrite rule of the specified type. The rewrite rule type can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>dscp</b>—For IPv4 traffic.</li> <li>• <b>dscp-ipv6</b>—For IPv6 traffic.</li> <li>• <b>exp</b>—For MPLS traffic.</li> <li>• <b>frame-relay-de</b>—(J Series routers only) For Frame Relay traffic.</li> <li>• <b>ieee-802.1</b>—For Layer 2 traffic.</li> <li>• <b>inet-precedence</b>—For IPv4 traffic.</li> </ul>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show class-of-service rewrite-rule type dscp on page 6360</a> <a href="#">show class-of-service rewrite-rule type dscp (QFX Series) on page 6360</a>
<b>Output Fields</b>	<a href="#">Table 587 on page 6359</a> describes the output fields for the <b>show class-of-service rewrite-rule</b> command. Output fields are listed in the approximate order in which they appear.

**Table 587: show class-of-service rewrite-rule Output Fields**

Field Name	Field Description
<b>Rewrite rule</b>	Name of the rewrite rule.
<b>Code point type</b>	Type of rewrite rule: <b>dscp</b> , <b>dscp-ipv6</b> , <b>exp</b> , <b>frame-relay-de</b> , or <b>inet-precedence</b> .
<b>Forwarding class</b>	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router or switch.
<b>Index</b>	Internal index for this particular rewrite rule.
<b>Loss priority</b>	Loss priority for rewriting.

Table 587: show class-of-service rewrite-rule Output Fields (*continued*)

Field Name	Field Description
Code point	Code point value to rewrite.

## Sample Output

### show class-of-service rewrite-rule type dscp

```

user@host> show class-of-service rewrite-rule type dscp
Rewrite rule: dscp-default, Code point type: dscp
  Forwarding class      Loss priority      Code point
  gold                  high              000000
  silver                low               110000
  silver                high              111000
  bronze                low               001010
  bronze                high              001100
  lead                  high              101110

Rewrite rule: abc-dscp-rewrite, Code point type: dscp, Index: 3245
  Forwarding class      Loss priority      Code point
  gold                  low               000111
  gold                  high              001010
  silver                low               110000
  silver                high              111000
  bronze                high              001100
  lead                  low               101110
  lead                  high              110111

```

## Sample Output

### show class-of-service rewrite-rule type dscp (QFX Series)

```

user@host> show class-of-service rewrite-rule type dscp
Rewrite rule: dscp-default, Code point type: dscp, Index: 31
  Forwarding class      Loss priority      Code point
  best-effort           low               000000
  best-effort           high              000000
  fcoe                  low               101110
  fcoe                  high              101110
  no-loss               low               001010
  no-loss               high              001100
  network-control       low               110000
  network-control       high              111000

```

## show class-of-service scheduler-map

<b>Syntax</b>	show class-of-service scheduler-map <name>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the mapping of schedulers to forwarding classes and a summary of scheduler parameters for each entry.
<b>Options</b>	<b>none</b> —Display all scheduler maps.  <b>name</b> —(Optional) Display a summary of scheduler parameters for each forwarding class to which the named scheduler is assigned.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show class-of-service scheduler-map on page 6362</a>
<b>Output Fields</b>	<a href="#">Table 588 on page 6361</a> describes the output fields for the <b>show class-of-service scheduler-map</b> command. Output fields are listed in the approximate order in which they appear.

**Table 588: show class-of-service scheduler-map Output Fields**

Field Name	Field Description
<b>Scheduler map</b>	Name of the scheduler map.
<b>Index</b>	Index of the indicated object. Objects having indexes in this output include scheduler maps, schedulers, and drop profiles.
<b>Scheduler</b>	Name of the scheduler.
<b>Forwarding class</b>	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.
<b>Transmit rate</b>	Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.
<b>Rate Limit</b>	Rate limiting configuration of the queue. Possible values are <b>none</b> , meaning no rate limiting, and <b>exact</b> , meaning the queue only transmits at the configured rate.
<b>Maximum buffer delay</b>	Amount of transmit delay (in milliseconds) or the buffer size of the queue. The buffer size is shown as a percentage of the total interface buffer allocation, or by the keyword <b>remainder</b> to indicate that the buffer is sized according to what remains after other scheduler buffer allocations.
<b>Priority</b>	Scheduling priority: <b>low</b> or <b>high</b> .

Table 588: show class-of-service scheduler-map Output Fields (*continued*)

Field Name	Field Description
Excess priority	Priority of excess bandwidth: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .
Explicit Congestion Notification	(QFX Series only) Explicit congestion notification (ECN) state: <ul style="list-style-type: none"> <li>Disable—ECN is disabled on the specified scheduler</li> <li>Enable—ECN is enabled on the specified scheduler</li> </ul> ECN is disabled by default.
Adjust minimum	Minimum shaping rate for an adjusted queue, in bps.
Adjust percent	Bandwidth adjustment applied to a queue, in percent.
Drop profiles	Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.
Loss priority	Packet loss priority for drop profile assignment.
Protocol	Transport protocol for drop profile assignment.
Name	Name of the drop profile.

## Sample Output

### show class-of-service scheduler-map

```

user@host> show class-of-service scheduler-map
Scheduler map: dd-scheduler-map, Index: 84

Scheduler: aa-scheduler, Index: 8721, Forwarding class: aa-forwarding-class
Transmit rate: 30 percent, Rate Limit: none, Maximum buffer delay: 39 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile
  Low           TCP       9874   bb-drop-profile
  High          non-TCP   8833   cc-drop-profile
  High          TCP       8484   dd-drop-profile

Scheduler: bb-scheduler, Forwarding class: aa-forwarding-class
Transmit rate: 40 percent, Rate limit: none, Maximum buffer delay: 68 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile
  Low           TCP       9874   bb-drop-profile
  High          non-TCP   8833   cc-drop-profile
  High          TCP       8484   dd-drop-profile

```

## show class-of-service shared-buffer

<b>Syntax</b>	show class-of-service shared-buffer <egress   ingress>
<b>Release Information</b>	Command introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Display the shared buffer allocation and partitioning configuration.
<b>Options</b>	<p><b>none</b>—Display ingress and egress shared buffer settings.</p> <p><b>egress</b>—(Optional) Display the egress shared buffer settings.</p> <p><b>ingress</b>—(Optional) Display the ingress shared buffer settings.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic on page 6104</a></li> <li>• <a href="#">Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic on page 6116</a></li> <li>• <a href="#">Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic on page 6122</a></li> <li>• <a href="#">Configuring Global Ingress and Egress Shared Buffers on page 6179</a></li> <li>• <a href="#">Understanding CoS Buffer Configuration on page 5891</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show class-of-service shared-buffer on page 6364</a>
<b>Output Fields</b>	Table 589 on page 6363 describes the output fields for the <b>show class-of-service shared-buffer</b> command. Output fields are listed in the approximate order in which they appear.

**Table 589: show class-of-service shared-buffer Output Fields**

Field Name	Field Description
Ingress	Ingress shared buffer configuration.
Total Buffer	Total buffer space available to the ports in KB. This is the combined dedicated buffer pool and shared buffer pool.
Dedicated Buffer	Buffer space allocated to the dedicated buffer pool in KB.
Shared Buffer	Buffer space allocated to the shared buffer pool in KB.
Lossless	Buffer space allocated to the lossless traffic buffer pool in KB.

Table 589: show class-of-service shared-buffer Output Fields (*continued*)

Field Name	Field Description
<b>Lossless Headroom</b>	Buffer space allocated to the lossless headroom traffic buffer pool to support priority-based flow control (PFC) and Ethernet PAUSE in KB. (Ingress ports only.)
<b>Lossy</b>	Buffer space allocated to the lossy (best-effort) traffic buffer pool in KB.
<b>Lossless Headroom Utilization</b>	Utilization of the ingress lossless headroom buffer pool. (These fields can help you to determine how much headroom buffer space you need to reserve to support PFC and Ethernet PAUSE for lossless flows.)
<b>Node Device</b>	Index number that identifies the switch. On a QFX3500 switch, this field always has a value of zero (0).
<b>Total</b>	Size of the lossless headroom ingress buffer pool in KB.
<b>Used</b>	Amount in KB of lossless headroom ingress buffer used.
<b>Free</b>	Amount in KB of lossless headroom ingress buffer free (unused).
<b>Egress</b>	Egress shared buffer configuration.
<b>Multicast</b>	Buffer space allocated to the multicast traffic buffer pool in KB. (Egress ports only.)

## Sample Output

### show class-of-service shared-buffer

```
user@switch> show class-of-service shared-buffer
```

```
Ingress:
```

```
Total Buffer      : 9360.00 KB
Dedicated Buffer   : 2158.00 KB
Shared Buffer      : 7202.00 KB
  Lossless        : 648.18 KB
  Lossless Headroom : 3240.90 KB
  Lossy           : 3312.92 KB
```

```
Lossless Headroom Utilization:
```

```
Node Device      Total      Used      Free
0                3240.90 KB  0.00 KB  3240.90 KB
```

```
Egress:
```

```
Total Buffer      : 9360.00 KB
Dedicated Buffer   : 2704.00 KB
Shared Buffer      : 6656.00 KB
  Lossless        : 3328.00 KB
  Multicast       : 1264.64 KB
  Lossy           : 2063.36 KB
```

## show class-of-service traffic-control-profile

<b>Syntax</b>	<code>show class-of-service traffic-control-profile</code> <code>&lt;profile-name&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 12.2 for ACX Series Routers.
<b>Description</b>	For Gigabit Ethernet IQ PICs, Channelized IQ PICs, EQ DPCs, and Trio MPC/MIC interfaces only, display traffic shaping and scheduling profiles.  (ACX Series routers) For ATM IMA pseudowire interfaces, display traffic shaping and scheduling profiles.
<b>Options</b>	<b>none</b> —Display all profiles.  <b>profile-name</b> —(Optional) Display information about a single profile.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show class-of-service traffic-control-profile on page 6367</a> <a href="#">show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC) on page 6367</a> <a href="#">show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces) on page 6367</a>
<b>Output Fields</b>	<a href="#">Table 590 on page 6365</a> describes the output fields for the <b>show class-of-service traffic-control-profile</b> command. Output fields are listed in the approximate order in which they appear.

**Table 590: show class-of-service traffic-control-profile Output Fields**

Field Name	Field Description
<b>Traffic control profile</b>	Name of the traffic control profile.
<b>Index</b>	Index number of the traffic control profile.
<b>ATM Service</b>	(MX Series routers with ATM Multi-Rate CE MIC) Configured category of ATM service. Possible values: <ul style="list-style-type: none"> <li>cbr—Constant bit rate.</li> <li>rtvbr—Real time variable bit rate.</li> <li>nrtvbr—Non real time variable bit rate.</li> <li>ubr—Unspecified bit rate.</li> </ul>
<b>Maximum Burst Size</b>	Configured maximum burst size, in cells.
<b>Peak rate</b>	Configured peak rate, in cps.

Table 590: show class-of-service traffic-control-profile Output Fields (*continued*)

Field Name	Field Description
<b>Sustained rate</b>	Configured sustained rate, in cps.
<b>Shaping rate</b>	Configured shaping rate, in bps.  <b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) Configured peak rate, in cps.
<b>Shaping rate burst</b>	Configured burst size for the shaping rate, in bytes.  <b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) Configured maximum burst rate, in cells.
<b>Shaping rate priority high</b>	Configured shaping rate for high-priority traffic, in bps.
<b>Shaping rate priority medium</b>	Configured shaping rate for medium-priority traffic, in bps.
<b>Shaping rate priority low</b>	Configured shaping rate for low-priority traffic, in bps.
<b>Shaping rate excess high</b>	Configured shaping rate for high-priority excess traffic, in bps.
<b>Shaping rate excess low</b>	Configured shaping rate for low-priority excess traffic, in bps.
<b>Scheduler map</b>	Name of the associated scheduler map.
<b>Delay Buffer rate</b>	Configured delay buffer rate, in bps.
<b>Excess rate</b>	Configured excess rate, in percent or proportion.
<b>Excess rate high</b>	Configured excess rate for high priority traffic, in percent or proportion.
<b>Excess rate low</b>	Configured excess rate for low priority traffic, in percent or proportion.
<b>Guaranteed rate</b>	Configured guaranteed rate, in bps or cps.  <b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) This value depends on the ATM service category chosen. Possible values: <ul style="list-style-type: none"> <li>• <b>cbr</b>—Guaranteed rate is equal to the configured peak rate in cps.</li> <li>• <b>rtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> <li>• <b>nrtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> </ul>
<b>Guaranteed rate burst</b>	Configured burst size for the guaranteed rate, in bytes.
<b>adjust-minimum</b>	Configured minimum shaping rate for an adjusted queue, in bps.

Table 590: show class-of-service traffic-control-profile Output Fields (*continued*)

Field Name	Field Description
overhead accounting mode	Configured shaping mode: <b>Frame Mode</b> or <b>Cell Mode</b> .
Overhead bytes	Configured byte adjustment value.

## Sample Output

### show class-of-service traffic-control-profile

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: Profile1, Index: 57625
  Scheduler map: m1
  Delay Buffer rate: 500000
  Guaranteed rate: 1000000

Traffic control profile: Profile2, Index: 57624
  Scheduler map: m2
  Delay Buffer rate: 600000
  Guaranteed rate: 2000000

Traffic control profile: Profile3, Index: 57627
  Scheduler map: m3
  Delay Buffer rate: 800000
  Guaranteed rate: 3000000
  .Excess rate high: proportion 4

Traffic control profile: Profile4, Index: 57626
  Scheduler map: m4
  Delay Buffer rate: 750000
  Guaranteed rate: 4000000
  ..adjust-minimum 20000000

```

### show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: at-vbr1, Index: 11395
  ATM Service: RTVBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode
  Shaping rate: 1000 cps
  Shaping rate burst: 500 cells
  Delay Buffer rate: 2000 cps
  Guaranteed rate: 1000 cps

Traffic control profile: foo, Index: 38286
  ATM Service: UBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode

```

### show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: foo, Index: 38286
  ATM Service: RTVBR
  Shaping rate: 2000 cps

```

Shaping rate burst: 200 cells  
Scheduler map: <default>  
Delay Buffer rate: 1000 cps  
Guaranteed rate: 1700 cps

## show dcbx

<b>Syntax</b>	show dcbx
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	List DCBX status (enabled or disabled) and the interfaces on which DCBX is enabled.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dcbx neighbors on page 5724</a></li> <li>• <a href="#">Configuring DCBX Autonegotiation on page 5669</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 463 on page 5723</a> lists the output fields for the <b>show dcbx</b> command. Output fields are listed in the approximate order in which they appear.

Table 591: show dcbx output fields

Field Name	Field Description
DCBX	Status of DCBX on the switch or for the specified interface: <ul style="list-style-type: none"> <li>• Enabled—DCBX is enabled on the switch or on the specified interface</li> <li>• Disabled—DCBX is disabled on the switch or on the specified interface</li> </ul>
Interface	Name of the interface

## Sample Output

### show dcbx

```

user@switch> show dcbx
DCBX                : Enabled
Interface           DCBX
xe-0/0/9.0          enabled
xe-0/0/32.0         enabled
xe-0/0/36.0         enabled

```

## show dcbx neighbors

<b>Syntax</b>	<b>show dcbx neighbors</b> <interface <i>interface-name</i> > <terse>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 11.3 for EX Series switches.
<b>Description</b>	Display information about Data Center Bridging Capability Exchange protocol (DCBX) neighbor interfaces.
<b>Options</b>	<b>none</b> —Display information about all DCBX neighbor interfaces.  <b>interface-name</b> —(Optional) Display information for the specified interface.  <b>terse</b> —Display the specified level of output.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring DCBX Autonegotiation on page 5669</a></li> <li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 5595</a></li> <li>• <a href="#">Example: Configuring an FCoE Transit Switch</a></li> <li>• <a href="#">Example: Configuring DCBX to Support an iSCSI Application</a></li> <li>• <a href="#">Understanding DCB Features and Requirements on page 5515</a></li> <li>• <a href="#">Understanding Data Center Bridging Capability Exchange Protocol for EX Series Switches</a></li> <li>• <a href="#">dcbx on page 5685</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show dcbx neighbors interface (QFX Series, DCBX Version 1.01 Mode) on page 6383</a> <a href="#">show dcbx neighbors interface (QFX Series, IEEE DCBX Mode) on page 6385</a> <a href="#">show dcbx neighbors terse (QFX Series) on page 6387</a> <a href="#">show dcbx neighbors (EX4500 Switch: FCoE Interfaces on Both Local and Peer with PFC Configured Compatibly) on page 6387</a> <a href="#">show dcbx neighbors (EX4500 Switch: DCBX Interfaces on Local and Peer Are Configured Compatibly with iSCSI Application) on page 6388</a> <a href="#">show dcbx neighbors (EX4500 Switch: Includes ETS) on page 6389</a>
<b>Output Fields</b>	<a href="#">Table 464 on page 5724</a> lists the output fields for the <b>show dcbx neighbors</b> command. Output fields are listed in the approximate order in which they appear.

Table 592: show dcbx neighbors Output Fields

Field Name	Field Description
Interface	Name of the interface.

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
Parent Interface	Name of the link aggregation group (LAG) interface to which the DCBX interface belongs.
Active-application-map	Name of the application map applied to the interface.
Protocol-Mode	<p>(QFX Series) DCBX protocol mode the interface uses:</p> <ul style="list-style-type: none"> <li>IEEE DCBX Version—The interface uses IEEE DCBX mode.</li> <li>DCBX Version 1.01—The interface uses DCBX version 1.01.</li> </ul> <p><b>NOTE:</b> On interfaces that use the IEEE DCBX mode, the <b>show dcbx neighbors interface <i>interface-name</i></b> operational command does not include application, PFC, or ETS operational state in the output.</p>
Protocol-State	<p>(DCBX Version 1.01 only) DCBX protocol state synchronization status:</p> <ul style="list-style-type: none"> <li><b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface.</li> <li><b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface.</li> </ul>
Local-Advertisement	<p>(DCBX Version 1.01 only)</p> <p>Status of advertisements that the local interface sends to the peer.</p>
Operational version	Version of the DCBX standard used.
sequence-number	<p>Number of state change messages sent to the peer.</p> <p>If the interface <b>Protocol-State</b> value is <b>in-sync</b>, this number should match the <b>acknowledge-id</b> number in the <b>Peer-Advertisement</b> section.</p> <p>If the interface <b>Protocol-State</b> value is <b>ack-pending</b>, this number does not match the <b>acknowledge-id</b> number in the <b>Peer-Advertisement</b> section.</p>
acknowledge-id	<p>Number of acknowledge messages received from the peer.</p> <p>If the <b>Protocol-State</b> value is <b>in-sync</b>, this number should match the <b>sequence-number</b> value in the <b>Peer-Advertisement</b> section.</p> <p>If the <b>Protocol-State</b> value is <b>ack-pending</b>, this number does not match the <b>sequence-number</b> value in the <b>Peer-Advertisement</b> section.</p>

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Peer-Advertisement</b>	(DCBX Version 1.01 only)  Status of advertisements that the peer sends to the local interface.
<b>Operational version</b>	Version of the DCBX standard used.
<b>sequence-number</b>	<p>Number of state change messages the peer sent to the local interface.</p> <p>If this number matches the <b>acknowledge-id</b> number in the <b>Local-Advertisement</b> field, this indicates that the local interface has acknowledged all of the peer's state change messages and is synchronized.</p> <p>If this number does not match the <b>acknowledge-id</b> number in the <b>Local-Advertisement</b> field, this indicates that the peer has not yet received an acknowledgment for a state change message from the local interface.</p>
<b>acknowledge-id</b>	<p>Number of acknowledge messages the peer has received from the local interface.</p> <p>If this number matches the <b>sequence-number</b> value in the <b>Local-Advertisement</b> field, this indicates that the peer has acknowledged all of the local interface's state change messages and is in synchronization.</p> <p>If this number does not match the <b>sequence-number</b> value in the <b>Local-Advertisement</b> field, this indicates that the peer has not yet sent an acknowledgment for a state change message from the local interface.</p>

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Feature: PFC</b>	Priority-based flow control (PFC) feature DCBX state information.
<b>Protocol-State</b>	(DCBX Version 1.01 only)  DCBX protocol state synchronization status: <ul style="list-style-type: none"> <li>• <b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface.</li> <li>• <b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface.</li> <li>• <b>not-applicable</b>—PFC autonegotiation is disabled.</li> </ul>
<b>Operational State</b>	(DCBX Version 1.01 only)  Operational state of the feature: <b>enabled</b> or <b>disabled</b> .
<b>Local-Advertisement</b>	Status of advertisements that the local interface sends to the peer.
<b>Enable</b>	(DCBX Version 1.01 only)  State that the local interface advertises to the peer: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>Willing</b>	Willingness of the local interface to learn the PFC configuration from the peer using DCBX: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The local interface is willing to learn the PFC configuration from the peer.</li> <li>• <b>No</b>—The local interface is not willing to learn the PFC configuration from the peer.</li> </ul>
<b>Mac auth Bypass Capability</b>	(IEEE DCBX only)  (QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. This is not supported, so the only value seen in the local advertisement field is <b>no</b> .
<b>Error</b>	(DCBX Version 1.01 only)  Configuration compatibility error status: <ul style="list-style-type: none"> <li>• <b>No</b>—No error detected. Local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. Local and peer configuration are not compatible.</li> </ul>

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Operational State</b>	<p>PFC operational state on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled on the interface</li> <li>• <b>Disabled</b>—PFC is disabled on the interface</li> </ul>
<b>Maximum Traffic Classes capable to support PFC</b>	<p>Largest number of traffic classes the local interface supports for PFC:</p> <ul style="list-style-type: none"> <li>• <b>6</b> (EX Series switches)</li> <li>• <b>8</b> (QFX Series)</li> </ul>
<b>Code Point</b>	<p>PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.</p>
<b>Admin Mode</b>	<p>PFC administrative state for each code point on the local interface:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled for the code point.</li> <li>• <b>Disabled</b>—PFC is disabled for the code point.</li> </ul>
<b>Operational Mode</b>	<p>(QFX Series) PFC operational mode for each code point:</p> <ul style="list-style-type: none"> <li>• <b>Enable</b>—PFC is enabled on the code point.</li> <li>• <b>Disable</b>—PFC is disabled on the code point.</li> </ul>
<b>Peer-Advertisement</b>	<p>Status of advertisements that the peer sends to the local interface.</p>
<b>Enable</b>	<p>(DCBX Version 1.01 only)</p> <p>State that the peer advertises to the local interface:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>Willing</b>	<p>Willingness of the peer to learn the PFC configuration from the local interface using DCBX:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The peer is willing to learn the PFC configuration from the local interface.</li> <li>• <b>No</b>—The peer is not willing to learn the PFC configuration from the local interface.</li> </ul>
<b>Error</b>	<p>(DCBX Version 1.01 only)</p> <p>Configuration compatibility error status:</p> <ul style="list-style-type: none"> <li>• <b>No</b>—No error detected. Local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. Local and peer configuration are not compatible.</li> </ul>

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Operational State</b>	<p>PFC operational state on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled on the interface</li> <li>• <b>Disabled</b>—PFC is disabled on the interface</li> </ul>
<b>Mac auth Bypass Capability</b>	<p>(IEEE DCBX only)</p> <p>(QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. Although the QFX Series does not support this feature, the connected peer might support it. This field reports the peer state:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The connected peer supports MAC authentication bypass.</li> <li>• <b>No</b>—The connected peer does not support MAC authentication bypass.</li> </ul>
<b>Maximum Traffic Classes capable to support PFC</b>	<p>Largest number of traffic classes the peer supports for PFC:</p> <ul style="list-style-type: none"> <li>• <b>6</b> (EX Series switches)</li> <li>• <b>8</b> (QFX Series)</li> </ul>

The local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. The local and peer configuration are not compatible.</li> </ul>
<b>Appl-Name</b>	Name of the application:

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Ethernet-Type</b>	<p>(DCBX Version 1.01 only)</p> <p>Ethernet type (EtherType) of the application. For example, <b>0x8906</b> indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.</p>
<b>Socket-Number</b>	<p>Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.</p>
<b>Priority-Field or Priority-Map</b>	<p>Priority assigned to the application.</p> <p>For EX Series switches, the priority of the FCoE application is determined by the PFC congestion notification profile that has been configured and associated with the FCoE interface. For other applications, the priority is based on the application map.</p>
<b>Status</b>	<p>(DCBX Version 1.01 only)</p> <p>Local status when autonegotiation is enabled:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.)</li> <li>• <b>Disabled</b>—The local configuration and the peer configuration do not match.</li> </ul> <p><b>NOTE:</b> If there is a configuration mismatch in one application between the switch and the peer, all the other applications including FCoE are disabled.</p>
<b>Peer-Advertisement</b>	<p>Status of advertisements that the peer sends to the local interface.</p>
<b>Enable</b>	<p>(DCBX Version 1.01 only)</p> <p>State that the peer advertises to the local interface:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>Willing</b>	<p>(DCBX Version 1.01 only)</p> <p>Willingness of the peer to learn the FCoE interface state from the local interface using DCBX:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The peer is willing to learn the FCoE interface state from the local interface.</li> <li>• <b>No</b>—The peer is not willing to learn the FCoE interface state from the local interface.</li> </ul>

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Error</b>	(DCBX Version 1.01 only)  Configuration compatibility error status: <ul style="list-style-type: none"> <li>• <b>No</b>—No error detected. Local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. Local and peer configuration are not compatible.</li> </ul>
<b>Appl-Name</b>	Name of the application: <ul style="list-style-type: none"> <li>• <b>FCoE</b>—Fibre Channel over Ethernet</li> </ul>
<b>Ethernet-Type</b>	Ethernet type (EtherType) of the application. For example, <b>0x8906</b> indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket-Number (for Layer 4 applications) of the application is displayed in the output.
<b>Socket-Number</b>	Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
<b>Priority-Field or Priority-Map</b>	Priority assigned to the application.
<b>Status</b>	(DCBX Version 1.01 only)  Peer interface status: <ul style="list-style-type: none"> <li>• <b>Enabled</b>—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.)</li> <li>• <b>Disabled</b>—The local configuration and the peer configuration do not match.</li> </ul>

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Feature: ETS</b>	Enhanced Transmission Selection (ETS) DCBX state information.
<b>Protocol-State</b>	(DCBX Version 1.01 only)  ETS protocol state synchronization status: <ul style="list-style-type: none"> <li>• <b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface.</li> <li>• <b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface.</li> </ul>
<b>Operational State</b>	(DCBX Version 1.01 only)  Operational state of the feature, <b>enabled</b> or <b>disabled</b> .
<b>Local-Advertisement</b>	Status of advertisements that the local interface sends to the peer.
<b>Enable</b>	(DCBX Version 1.01 only)  State that the local interface advertises to the peer: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>TLV Type</b>	(IEEE DCBX only)  Type of ETS TLV: <ul style="list-style-type: none"> <li>• <b>Configuration</b>—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration.</li> <li>• <b>Recommendation</b>—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is “willing,” configures the peer interface to match the local ETS configuration.</li> <li>• <b>Recommendation-or-Configuration</b>—Advertises both TLVs.</li> </ul>
<b>Willing</b>	Willingness of the local interface to learn the ETS state from the peer using DCBX (EX Series switches always advertise <b>No</b> for this field): <ul style="list-style-type: none"> <li>• <b>Yes</b>—Local interface is willing to learn the ETS state from the peer.</li> <li>• <b>No</b>—Local interface is not willing to learn the ETS state from the peer.</li> </ul>
<b>Credit Based Shaper</b>	

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
	(IEEE DCBX only)
	Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always <b>No</b> .
<b>Error</b>	(DCBX Version 1.01 only)  Configuration error status: <ul style="list-style-type: none"> <li>• <b>No</b>—No error. This should always be the switch ETS error state.</li> <li>• <b>Yes</b>—Error detected.</li> </ul>
<b>Maximum Traffic Classes capable to support PFC</b>	(DCBX Version 1.01 only)  Largest number of traffic classes the local interface supports for PFC.
<b>Maximum Traffic Classes supported</b>	(IEEE DCBX only)  Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)
<b>Code Point</b>	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
<b>Priority-Group</b>	Class-of-service (CoS) priority group (forwarding class set) identification number.
<b>Percentage B/W</b>	Configured minimum percentage of link bandwidth allocated to the priority group. Only explicitly configured values appear in this output column. If the link bandwidth is the default percentage, it is not shown. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.)
<b>Transmission Selection Algorithm</b>	(IEEE DCBX only)  The transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is <b>ETS</b> .
<b>Peer-Advertisement</b>	Status of advertisements that the peer sends to the local interface.
<b>Enable</b>	

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
	(DCBX Version 1.01 only)  State that the peer advertises to the local interface: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>TLV Type</b>	(IEEE DCBX only)  Type of ETS TLV: <ul style="list-style-type: none"> <li>• <b>Configuration</b>—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration.</li> <li>• <b>Recommendation</b>—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is “willing,” configures the peer interface to match the local ETS configuration.</li> <li>• <b>Configuration/Recommendation</b>—Advertises both TLVs.</li> </ul>
<b>Willing</b>	Willingness of the peer to learn the ETS state from the local interface using DCBX: <ul style="list-style-type: none"> <li>• <b>Yes</b>—Peer is willing to learn the ETS state from the local interface.</li> <li>• <b>No</b>—Peer is not willing to learn the ETS state from the local interface.</li> </ul>
<b>Credit Based Shaper</b>	(IEEE DCBX only)  Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always <b>No</b> .
<b>Error</b>	(DCBX Version 1.01 only)  Configuration error status of the peer: <ul style="list-style-type: none"> <li>• <b>No</b>—No error in peer ETS TLV.</li> <li>• <b>Yes</b>—Error in peer ETS TLV.</li> </ul>
<b>Maximum Traffic Classes capable to support PFC</b>	(DCBX Version 1.01 only)  Largest number of traffic classes the local interface supports for PFC.
<b>Maximum Traffic Classes supported</b>	(IEEE DCBX only)  Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)
<b>Code Point</b>	

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
<b>Priority-Group</b>	CoS priority group (forwarding class set) identification number.
<b>Percentage B/W</b>	Configured minimum percentage of link bandwidth allocated to the priority group. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.)
<b>Transmission Selection Algorithm</b>	(IEEE DCBX only)  Transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is <b>ETS</b> .
<b>PFC</b>	(QFX Series, <b>terse</b> option only) DCBX TLV advertisement state for PFC: <ul style="list-style-type: none"> <li>• Disabled—PFC configuration matches the configuration on the connected peer and PFC is disabled</li> <li>• Enabled—PFC configuration matches the configuration on the connected peer and PFC is enabled</li> <li>• Not Advt—Interface does not advertise PFC to the connected peer</li> </ul>
<b>ETS</b>	( <b>terse</b> option only) Local DCBX TLV advertisement state for ETS: <ul style="list-style-type: none"> <li>• Advt—Interface advertises ETS TLVs</li> <li>• Disabled—ETS is disabled on the interface (interface does not advertise ETS)</li> </ul>
<b>ETS Rec</b>	( <b>terse</b> option only) DCBX TLV peer advertisement state for ETS (state received from the connected DCBX peer): <ul style="list-style-type: none"> <li>• Advt—Peer interface advertises ETS TLVs</li> <li>• Not Advt—Peer interface does not advertise ETS</li> </ul> <p><b>NOTE:</b> When the DCBX mode is DCBX version 1.01, no peer information is displayed.</p>

Table 592: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
Version	<p>(<b>terse</b> option only) The DCBX version used on the interface and whether the DCBX version was autonegotiated or explicitly configured:</p> <ul style="list-style-type: none"> <li>• <b>IEEE</b>—The interface uses IEEE DCBX.</li> <li>• <b>1.01</b>—The interface uses DCBX version 1.01.</li> </ul> <p>When the DCBX version used is the result of autonegotiation, the term (<b>Auto</b>) appears next to the version. For example, <b>IEEE (Auto)</b> indicates that the interface autonegotiated with the connected peer to use IEEE DCBX. Autonegotiation is enabled by default.</p>

## show interfaces queue

---

**Syntax**    show interfaces queue  
              <aggregate | remaining-traffic>  
              <both-ingress-egress>  
              <egress>  
              <forwarding-class *forwarding-class*>  
              <ingress>  
              <interface-name *interface-name*>  
              <l2-statistics>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              **both-ingress-egress**, **egress**, and **ingress** options introduced in Junos OS Release 7.6.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              **l2-statistics** option introduced in Junos OS Release 12.1.

**Description**    Display class-of-service (CoS) queue information for physical interfaces.

**Options**    **none**—Show detailed CoS queue statistics for all physical interfaces.

**aggregate**—(Optional) Display the aggregated queuing statistics of all logical interfaces that have traffic-control profiles configured. (Not on the QFX Series.)

**both-ingress-egress**—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics. (Not on the QFX Series.)

**egress**—(Optional) Display egress queue statistics.

**forwarding-class *forwarding-class***—(Optional) Forwarding class name for this queue. Shows detailed CoS statistics for the queue associated with the specified forwarding class.

**ingress**—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics. (Not on the QFX Series.)

**interface-name *interface-name***—(Optional) Show detailed CoS queue statistics for the specified interface.

**l2-statistics**—(Optional) Display Layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles

**remaining-traffic**—(Optional) Display the remaining-traffic queue statistics of all logical interfaces that have traffic-control profiles configured.

### Overhead for Layer 2 Statistics

Transmitted packets and transmitted byte counts are displayed for the Layer 2 level with the addition of encapsulation overheads applied for fragmentation, as shown in [Table 257 on page 2813](#). Others counters, such as packets and bytes queued (input) and drop counters, are displayed at the Layer 3 level. In the case of link fragmentation and interleaving (LFI) for which fragmentation is not applied, corresponding Layer 2 overheads are added, as shown in [Table 257 on page 2813](#).

Table 593: Layer 2 Overhead, Transmitted Packets/Bytes

Protocol	Fragmentation		LFI
	First fragmentation	Second to <i>n</i> fragmentations	
	Bytes	Bytes	
MLPPP (Long)	13	12	8
MLPPP (short)	11	10	8
MLFR (FRF15)	12	10	8
MFR (FRF16)	10	8	-
MCMLPPP(Long)	13	12	-
MCMLPPP(Short)	11	10	-

## Layer 2 Statistics—Fragmentation Overhead Calculation

## MLPPP/MC-MLPPP Overhead details:

=====

## Fragment 1:

```

Outer PPP header           : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
Inner PPP header           : 1 byte
HDLC flag and FCS bytes    : 4 bytes

```

## Fragments 2 .. n :

```

Outer PPP header           : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
HDLC flag and FCS bytes    : 4 bytes

```

## MLFR (FRF15) Overhead details:

=====

## Fragment 1:

```

Framereley header         : 2 bytes
Control,NLPID             : 2 bytes
Fragmentaion header       : 2 bytes
Inner proto               : 2 bytes
HDLC flag and FCS         : 4 bytes

```

## Fragments 2 ...n :

```

Framereley header         : 2 bytes
Control,NLPID             : 2 bytes
Fragmentaion header       : 2 bytes
HDLC flag and FCS         : 4 bytes

```

## MFR (FRF16) Overhead details:

=====

Fragment 1:  
Fragmentation header : 2 bytes  
Framereplay header : 2 bytes  
Inner proto : 2 bytes  
HDLC flag and FCS : 4 bytes

Fragments 2 ...n :  
Fragmentation header : 2 bytes  
Framereplay header : 2 bytes  
HDLC flag and FCS : 4 bytes

## Overhead with LFI

MLPPP(Long & short sequence):  
=====

Outer PPP header	: 4 bytes
HDLC flag and FCS	: 4 bytes

MLFR (FRF15):  
=====

Framereplay header	: 2 bytes
Control,NLPID	: 2 bytes
HDLC flag and FCS	: 4 bytes

The following examples show overhead for different cases:

- A 1000-byte packet is sent to a mlppp bundle without any fragmentation. At the Layer 2 level, bytes transmitted is 1013 in 1 packet. This overhead is for MLPPP long sequence encap.
- A 1000-byte packet is sent to a mlppp bundle with a fragment threshold of 250byte. At the Layer 2 level, bytes transmitted is 1061 bytes in 5 packets.
- A 1000-byte LFI packet is sent to an mlppp bundle. At the Layer 2 level, bytes transmitted is 1008 in 1 packet.

**remaining-traffic**—(Optional) Display the queuing statistics of all logical interfaces that do not have traffic-control profiles configured. (Not on the QFX Series.)

## Additional Information

For rate-limited interfaces hosted on Modular Interface Cards (MICs), Modular Port Concentrators (MPCs), or Enhanced Queuing DPCs, rate-limit packet-drop operations occur *before* packets are queued for transmission scheduling. For such interfaces, the statistics for queued traffic do not include the packets that have already been dropped due to rate limiting, and consequently the displayed statistics for queued traffic are the same as the displayed statistics for transmitted traffic.

**NOTE:** For rate-limited interfaces hosted on other types of hardware, rate-limit packet-drop operations occur *after* packets are queued for transmission scheduling. For these other interface types, the statistics for queued traffic include the packets that are later dropped due to rate limiting, and consequently the displayed statistics for queued traffic equals the sum of the statistics for transmitted and rate-limited traffic.

On M Series routers (except for the M320 and M120 routers), this command is valid only for a PIC installed on an enhanced Flexible PIC Concentrator (FPC).

Queue statistics for aggregated interfaces are supported on the M Series and T Series routers only. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can view the statistics for a child interface by using the **show interfaces statistics** command for that child interface.

When you configure tricolor marking on a 10-port 1-Gigabit Ethernet PIC, for queues 6 and 7 only, the output does not display the number of queued bytes and packets, or the number of bytes and packets dropped because of RED. If you do not configure tricolor marking on the interface, these statistics are available for all queues.

For the 4-port Channelized OC12 IQE PIC and 1-port Channelized OC48 IQE PIC, the **Packet Forwarding Engine Chassis Queues** field represents traffic bound for a particular physical interface on the PIC. For all other PICs, the **Packet Forwarding Engine Chassis Queues** field represents the total traffic bound for the PIC.

For Gigabit Ethernet IQ2 PICs, the **show interfaces queue** command output does not display the number of tail-dropped packets. This limitation does not apply to Packet Forwarding Engine chassis queues.

When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.

The behavior of the **egress** queues for the **Routing Engine-Generated Traffic** is not same as the configured queue for MLPPP and MFR configurations.

For information about how to configure CoS, see the *Junos OS Network Interfaces Library for Routing Devices*. For related CoS operational mode commands, see the [CLI Explorer](#).

**Output Fields** Table 258 on page 2816 lists the output fields for the **show interfaces queue** command. Output fields are listed in the approximate order in which they appear.

**Table 594: show interfaces queue Output Fields**

Field Name	Field Description
<b>Physical interface</b>	Name of the physical interface.
<b>Enabled</b>	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .
<b>Interface index</b>	Physical interface's index number, which reflects its initialization sequence.
<b>SNMP ifindex</b>	SNMP index number for the interface.
<b>Forwarding classes supported</b>	Total number of forwarding classes supported on the specified interface.
<b>Forwarding classes in use</b>	Total number of forwarding classes in use on the specified interface.
<b>Ingress queues supported</b>	On Gigabit Ethernet IQ2 PICs only, total number of ingress queues supported on the specified interface.
<b>Ingress queues in use</b>	On Gigabit Ethernet IQ2 PICs only, total number of ingress queues in use on the specified interface.
<b>Output queues supported</b>	Total number of output queues supported on the specified interface.
<b>Output queues in use</b>	Total number of output queues in use on the specified interface.
<b>Egress queues supported</b>	Total number of egress queues supported on the specified interface.
<b>Egress queues in use</b>	Total number of egress queues in use on the specified interface.
<b>Queue counters (Ingress)</b>	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>
<b>Burst size</b>	(Logical interfaces on IQ PICs only) Maximum number of bytes up to which the logical interface can burst. The burst size is based on the shaping rate applied to the interface.
The following output fields are applicable to both interface component and Packet Forwarding component in the <b>show interfaces queue</b> command:	
<b>Queue</b>	Queue number.
<b>Forwarding classes</b>	Forwarding class name.

Table 594: show interfaces queue Output Fields (*continued*)

Field Name	Field Description
<b>Queued Packets</b>	<p>Number of packets queued to this queue.</p> <p><b>NOTE:</b> For Gigabit Ethernet IQ2 interfaces, the Queued Packets count is calculated by the Junos OS interpreting one frame buffer as one packet. If the queued packets are very large or very small, the calculation might not be completely accurate for transit traffic. The count is completely accurate for traffic terminated on the router.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see <a href="#">“Additional Information” on page 2814</a>.</p>
<b>Queued Bytes</b>	<p>Number of bytes queued to this queue. The byte counts vary by interface hardware. For more information, see <a href="#">Table 259 on page 2819</a>.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see <a href="#">“Additional Information” on page 2814</a>.</p>
<b>Transmitted Packets</b>	<p>Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.</p> <p><b>NOTE:</b> For Layer 2 statistics, see <a href="#">“Overhead for Layer 2 Statistics” on page 2812</a></p>
<b>Transmitted Bytes</b>	<p>Number of bytes transmitted by this queue. The byte counts vary by interface hardware. For more information, see <a href="#">Table 259 on page 2819</a>.</p> <p><b>NOTE:</b> On MX Series routers, this number can be inaccurate when you issue the command for a physical interface repeatedly and in quick succession, because the statistics for the child nodes are collected infrequently. Wait ten seconds between successive iterations to avoid this situation.</p> <p><b>NOTE:</b> For Layer 2 statistics, see <a href="#">“Overhead for Layer 2 Statistics” on page 2812</a></p>
<b>Tail-dropped packets</b>	Number of packets dropped because of tail drop.
<b>RL-dropped packets</b>	<p>Number of packets dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs, MPCs, and Enhanced Queuing DPCs only, this statistic is not included in the queued traffic statistics. For more information, see <a href="#">“Additional Information” on page 2814</a>.</p>
<b>RL-dropped bytes</b>	<p>Number of bytes dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs, MPCs, and Enhanced Queuing DPCs only, this statistic is not included in the queued traffic statistics. For more information, see <a href="#">“Additional Information” on page 2814</a>.</p>

Table 594: show interfaces queue Output Fields (*continued*)

Field Name	Field Description
RED-dropped packets	<p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP packets dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP packets dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP packets dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP packets dropped because of RED.</li> </ul> </li> <li>(J Series routers and MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low</b>—Number of low-loss priority packets dropped because of RED.</li> <li><b>Medium-low</b>—Number of medium-low loss priority packets dropped because of RED.</li> <li><b>Medium-high</b>—Number of medium-high loss priority packets dropped because of RED.</li> <li><b>High</b>—Number of high-loss priority packets dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>
RED-dropped bytes	<p>Number of bytes dropped because of RED. The byte counts vary by interface hardware. For more information, see <a href="#">Table 259 on page 2819</a>.</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP bytes dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP bytes dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP bytes dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP bytes dropped because of RED.</li> </ul> </li> <li>(J Series routers only) The output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> <li><b>Low</b>—Number of low-loss priority bytes dropped because of RED.</li> <li><b>Medium-low</b>—Number of medium-low loss priority bytes dropped because of RED.</li> <li><b>Medium-high</b>—Number of medium-high loss priority bytes dropped because of RED.</li> <li><b>High</b>—Number of high-loss priority bytes dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>

Byte counts vary by interface hardware. [Table 259 on page 2819](#) shows how the byte counts on the outbound interfaces vary depending on the interface hardware.

[Table 259 on page 2819](#) is based on the assumption that outbound interfaces are sending IP traffic with 478 bytes per packet.

Table 595: Byte Count by Interface Hardware

Interface Hardware	Output Level	Byte Count Includes	Comments
Gigabit Ethernet IQ and IQE PICs	Interface	<p>Queued: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes</p> <p>Transmitted: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes</p> <p>RED dropped: 496 bytes per packet representing 478 bytes of Layer 3 packet + 18 bytes</p>	<p>The 12 additional bytes include 6 bytes for the destination MAC address + 4 bytes for the VLAN + 2 bytes for the Ethernet type.</p> <p>For RED dropped, 6 bytes are added for the source MAC address.</p>
	Packet forwarding component	<p>Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> <p>Transmitted: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p>	—
Non-IQ PIC	Interface	<p>T Series, TX Series, T1600, and MX Series routers:</p> <ul style="list-style-type: none"> <li>• Queued: 478 bytes of Layer 3 packet.</li> <li>• Transmitted: 478 bytes of Layer 3 packet.</li> </ul> <p>T4000 routers with Type 5 FPCs :</p> <ul style="list-style-type: none"> <li>• Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead 8 bytes preamble + 12 bytes Inter frame Gap.</li> <li>• Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead 8 bytes preamble + 12 bytes Interframe Gap.</li> </ul> <p>M Series routers:</p> <ul style="list-style-type: none"> <li>• Queued: 478 bytes of Layer 3 packet.</li> <li>• Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead.</li> </ul> <p>PTX Series Packet Transport Routers:</p> <ul style="list-style-type: none"> <li>• Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes FCS + the full Layer 1 overhead of the MAC header DA + SA + EtherType (non-VLAN).</li> <li>• Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead of the MAC header DA + SA + EtherType (non-VLAN).</li> <li>• RED dropped: 478 bytes of Layer 3 packet + 22 bytes special header. To the TQ, this packet has 4 bytes more than queued or transmitted.</li> </ul>	<p>The Layer 2 overhead is 14 bytes for non-VLAN traffic and 18 bytes for VLAN traffic.</p>

Table 595: Byte Count by Interface Hardware (*continued*)

Interface Hardware	Output Level	Byte Count Includes	Comments
IQ and IQE PICs with a SONET/SDH interface	Interface	<p>Queued: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p> <p>Transmitted: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p> <p>RED dropped: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p>	The additional 4 bytes are for the Layer 2 Point-to-Point Protocol (PPP) header.
	Packet forwarding component	<p>Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> <p>Transmitted: 486 bytes per packet, representing 478 bytes of Layer 3 packet + 8 bytes</p>	For transmitted packets, the additional 8 bytes includes 4 bytes for the PPP header and 4 bytes for a cookie.
Non-IQ PIC with a SONET/SDH interface	Interface	<p>T Series, TX Series, T1600, and MX Series routers:</p> <ul style="list-style-type: none"> <li>Queued: 478 bytes of Layer 3 packet.</li> <li>Transmitted: 478 bytes of Layer 3 packet.</li> </ul> <p>M Series routers:</p> <ul style="list-style-type: none"> <li>Queued: 478 bytes of Layer 3 packet.</li> <li>Transmitted: 483 bytes per packet, representing 478 bytes of Layer 3 packet + 5 bytes</li> <li>RED dropped: 478 bytes per packet, representing 478 bytes of Layer 3 packet</li> </ul>	For transmitted packets, the additional 5 bytes includes 4 bytes for the PPP header and 1 byte for the packet loss priority (PLP).
Interfaces configured with Frame Relay Encapsulation	Interface	The default Frame Relay overhead is 7 bytes. If you configure the Frame Check Sequence (FCS) to 4 bytes, then the overhead increases to 10 bytes.	
1-port 10-Gigabit Ethernet IQ2 and IQ2-E PICs	Interface	<p>Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.</p> <p>Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.</p>	The Layer 2 overhead is 18 bytes for non-VLAN traffic and 22 bytes for VLAN traffic.
4-port 1G IQ2 and IQ2-E PICs	Packet forwarding component	Queued: 478 bytes of Layer 3 packet.	—
8-port 1G IQ2 and IQ2-E PICs		Transmitted: 478 bytes of Layer 3 packet.	

## Sample Output

### show interfaces queue (Rate-Limited Interface on a Gigabit Ethernet MIC in an MPC)

The following example shows queue information for the rate-limited interface ge-4/2/0 on a Gigabit Ethernet MIC in an MPC. For rate-limited queues for interfaces hosted on MICs or MPCs, rate-limit packet drops occur prior to packet output queuing. In the

command output, the nonzero statistics displayed in the **RL-dropped packets** and **RL-dropped bytes** fields quantify the traffic dropped to rate-limit queue 0 output to 10 percent of 1 gigabyte (100 megabits) per second. Because the RL-dropped traffic is not included in the **Queued** statistics, the statistics displayed for queued traffic are the same as the statistics for transmitted traffic.

```
user@host> show interfaces queue ge-4/2/0
Physical interface: ge-4/2/0, Enabled, Physical link is Up
  Interface index: 203, SNMP ifIndex: 1054
Forwarding classes: 16 supported, 4 in use
Egress queues: 8 supported, 4 in use
Queue: 0, Forwarding classes: best-effort
  Queued:

## show pfe filter hw summary

<b>Syntax</b>	show pfe filter hw summary
<b>Release Information</b>	Command introduced in Junos OS Release 14.1X53-D10 for the QFX Series.
<b>Description</b>	<p>Display a summary of the access control list (ACL; also known as firewall filter) ternary content-addressable memory (TCAM) hardware utilization to show the allocated, used, and free TCAM entry space.</p> <p>Command supported on standalone QFX Series switches, QFX5100-only (pure QFX5100) Virtual Chassis Fabric (VCF), QFX5100-only (pure QFX5100) Virtual Chassis (VC), and QFX3500-only (pure QFX3500) VC.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Planning the Number of Firewall Filters to Create on page 5236</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show pfe summary on page 6433</a>
<b>Output Fields</b>	<a href="#">Table 596 on page 6432</a> lists the output fields for the <b>show pfe filter</b> command. Output fields are listed in the approximate order in which they appear.

**Table 596: show pfe filter Output Fields**

Field Name	Field Description
<b>Group</b>	<p>ACL ingress and egress filter groups:</p> <ul style="list-style-type: none"> <li>• iRACL group—ingress routing ACL filter group</li> <li>• iVACL group—ingress VLAN ACL filter group</li> <li>• iPACL group—ingress port ACL filter group</li> <li>• ePACL group—egress port ACL filter group</li> <li>• eVACL group—egress VLAN ACL filter group</li> <li>• eRACL group—egress routing ACL filter group</li> <li>• eRACL IPv6 group—egress IPv6 routing ACL filter group</li> </ul>
<b>Group-ID</b>	Internal identification number of the filter group.
<b>Allocated</b>	Number of TCAM filter entries allocated to the filter group.
<b>Used</b>	Number of TCAM filter entries used by the filter group.
<b>Free</b>	Number of TCAM filter entries available for use by the filter group.

## Sample Output

### show pfe summary

```
user@switch> show pfe summary
```

Group	Group-ID	Allocated	Used	Free
-----				
> Ingress filter groups:				
iRACL group	14	512	4	508
iVACL group	13	512	2	510
iPACL group	12	256	2	254
> Egress filter groups:				
ePACL group	20	256	3	253
eVACL group	21	256	4	252
eRACL group	22	256	245	11
eRACL IPV6 group	24	256	3	253

## show pfe next-hop

**Output Fields** Table 597 on page 6436 lists the output fields for the **show pfe next-hop** command. Output fields are listed in the approximate order in which they appear.

**Table 597: show pfe next-hop Output Fields**

Field Name	Field Description
ID	The next-hop ID for the entry.
Type	The next-hop type for the entry.
Interface	The interface to which the next-hop entry is assigned.
Protocol	The protocol type for the next-hop entry.
Encap	Encapsulation type for the next-hop entry.
Next Hop Addr	Next-hop address for the next-hop entry.
MTU	MTU value for the nexthop entry.

## Sample Output

### show pfe next-hop

```

user@host> show pfe next-hop

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 13.3 for the MX Series.</p> <p>Command option <b>hw</b> introduced in Junos OS Release 14.1X53-D10 for the QFX Series.</p>
<b>Description</b>	<p>Display the routes in the Packet Forwarding Engine forwarding table. The Packet Forwarding Engine forwards packets between input and output interfaces.</p>

**NOTE:** The Routing Engine maintains a master copy of the forwarding table. It copies the forwarding table to the Packet Forwarding Engine, which is the part of the router or switch responsible for forwarding packets. To display the routes in the Routing Engine forwarding table, use the **show route forwarding table** command. For more information, see the [CLI Explorer](#).

**Options** **none**—Display all Packet Forwarding Engine forwarding table information.

**clnp**—(Optional) Show International Standards Organization (ISO) connectionless-mode network protocol (CLNP) route table information.

**dhcp**—(Optional) Display Packet Forwarding Engine DHCP-Snooping route table information.

**fpc slot**—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.

- On a TX Matrix router, if you specify the number of a T640 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **31**.
- On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **31**.
- On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **63**.

For example, the following commands have the same result:

```
user@host> show pfe route fpc 1 lcc 1
user@host> show pfe route fpc 9
```

**host**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display host routes installed in the on-chip hardware table.

**hw**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display routes installed in the on-chip hardware table (as opposed to displaying routes from the routing table and the PFE forwarding table before they are installed in the hardware).

**index index**—(Optional) Display table index.

**inet6**—(Optional) Display Packet Forwarding Engine IPv6 routes.

**ip**—(Optional) Display Packet Forwarding Engine IPv4 routes.

**iso**—(Optional) Display ISO version routing tables.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the router (line-card chassis) that houses the FPC.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**lpm**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display longest prefix match (LPM) routes installed in the on-chip hardware table.

**mpls**—(Optional) Display Packet Forwarding Engine MPLS information.

**multicast**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display multicast routes installed in the on-chip hardware table.

**prefix *prefix***—(Optional) IPv4 or IPv6 prefix for which to show table entries.

**summary**—(Optional) Display summary of Packet Forwarding Engine information.

**table <*table-name*>**—(Optional) Display table information.

**Required Privilege Level**

admin

**Output Fields** [Table 598 on page 6442](#) lists the output fields for the **show pfe route** command. Output fields are listed in the approximate order in which they appear.

**Table 598: show pfe route Output Fields**

Field Name	Field Description
<b>Destination</b>	Destination address for the entry.
<b>NH IP Addr</b>	Next-hop IP address for the entry.
<b>Type</b>	Next-hop type for the entry
<b>NH ID</b>	Next-hop ID for the entry
<b>Encap</b>	Encapsulation type for the next-hop entry.
<b>Interface</b>	Interface to which the next-hop entry is assigned.

[Table 599 on page 6442](#) lists the output fields for the QFX Series **show pfe route** hardware table (**hw**) commands. Output fields are listed in the approximate order in which they appear.

**Table 599: QFX Series show pfe route Hardware Table Output Fields**

Field Name	Field Description
<b>Max</b>	Maximum routing entries per route type.
<b>Used</b>	Number of routing entries consumed per route type.
<b>Free</b>	Number of unused routing entries per route type.
<b>% Free</b>	Percentage of unused routing entries per route type.
<b>Rtt</b>	Internal routing engine index number of the route table.
<b>VRF</b>	Internal hardware index number for the corresponding route table.
<b>Destination</b>	Destination address for the entry.
<b>Type</b>	( <b>show pfe route summary hw</b> )—Route type for the entry: IPv4 or IPv6 route, and host, LPM, or multicast route.  ( <b>show pfe route (ip   inet6) hw</b> )—Next-hop type for the entry.
<b>NH ID</b>	Next-hop ID for the entry
<b>Interface</b>	Interface to which the next-hop entry is assigned.

Table 599: QFX Series show pfe route Hardware Table Output Fields (*continued*)

Field Name	Field Description
HW NH-ID	Internal hardware index number of the next-hop.
Src-MAC-Address	Source MAC address.
Port	Port number.
Dst-MAC-Address	Destination MAC address.
VLAN	ID of the multicast group VLAN.
GROUP	Internal hardware index number of the multicast group next-hop.
CLASS	Internal class number of the multicast group.

## Sample Output

### show pfe route ip

```
user@host> show pfe route ip

## Troubleshooting Dropped FCoE Traffic

**Problem**    **Description:** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

**Cause**    There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.

5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

---

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

**Solution** The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

If you explicitly configured a forwarding class for FCoE traffic, ensure that:

- You specified the **no-loss** packet drop attribute in the forwarding class configuration
- The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
- The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority  PFC      MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Disabled
  100      Disabled
  101      Enabled   2500
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  101      5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces interface-name**.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the *scheduler-name*) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the *traffic-control-profile*) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.
7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See “[Example: Configuring CoS PFC for FCoE Traffic](#)” on page 5606 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

## Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth

**Problem**     **Description:** The maximum bandwidth of a queue when measured at the egress port exceeds the maximum bandwidth (shaping rate) configured for the queue.

**Cause**        When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not rate-shape the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its maximum bandwidth calculations.

The measured egress bandwidth can exceed the configured maximum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**Solution** When you calculate the bandwidth requirements for queues on which you expect a significant amount of traffic with small packet sizes, consider the shaping rate as the maximum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined maximum data rate (shaping rate) and the preamble and IFG.

If the maximum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to the queue, reduce the shaping rate for that queue.

## Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth

**Problem** **Description:** The minimum bandwidth of a queue or a priority group when measured at the egress port exceeds the minimum bandwidth configured for the queue (transmit-rate) or for the priority group (guaranteed-rate).

**Cause** When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not include the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its minimum bandwidth calculations.

The measured egress bandwidth can exceed the configured minimum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**NOTE:** The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

**Solution** When you calculate the bandwidth requirements for queues and priority groups on which you expect a significant amount of traffic with small packet sizes, consider the transmit

rate and the guaranteed rate as the minimum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined minimum data rate and the preamble and IFG.

If the minimum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to a queue or to a priority group, reduce the transmit rate for that queue and reduce the guaranteed rate of the priority group that contains the queue.

## Troubleshooting Egress Queue Bandwidth Impacted by Congestion

**Problem**    **Description:** Congestion on an egress port causes egress queues to receive less bandwidth than expected. Egress port congestion can impact the amount of bandwidth allocated to queues on the congested port and, in some cases, on ports that are not congested.

**Cause**       Egress queue congestion can cause the ingress port buffer to fill above a certain threshold and affect the flow to the queues on the egress port. One queue receives its configured bandwidth, but the other queues on the egress port are affected and do not receive their configured share of bandwidth.

**Solution**    The solution is to configure a drop profile to apply weighted random early detection (WRED) to the queue or queues on the congested ports.

Configure a drop profile on the queue that is receiving its configured bandwidth. This queue is preventing the other queues from receiving their expected bandwidth. The drop profile prevents the queue from affecting the other queues on the port.

To configure a WRED profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

## Troubleshooting an Unexpected Rewrite Value

**Problem**    **Description:** Traffic from one or more forwarding classes on an egress port is assigned an unexpected rewrite value.

**NOTE:** For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rules rewrite only the outer VLAN tag.

**Cause**    If you configure a rewrite rule for a forwarding class on an egress port but you do not configure a rewrite rule for every forwarding class on that egress port, then the forwarding classes that do not have a configured rewrite rule are assigned random rewrite values.

For example:

1. Configure forwarding classes **fc1**, **fc2**, and **fc3**.
2. Configure rewrite rules for forwarding classes **fc1** and **fc2**, but not for forwarding class **fc3**.
3. Assign forwarding classes **fc1**, **fc2**, and **fc3** to a port.

When traffic for these forwarding classes flows through the port, traffic for forwarding classes **fc1** and **fc2** is rewritten correctly. However, traffic for forwarding class **fc3** is assigned a random rewrite value.

**Solution**    If any forwarding class on an egress port has a configured rewrite rule, then all forwarding classes on that egress port must have a configured rewrite rule. Configuring a rewrite rule for any forwarding class that is assigned a random rewrite value solves the problem.

**TIP:** If you want the forwarding class to use the same code point value assigned to it by the ingress classifier, specify that value as the rewrite rule value. For example, if a forwarding class has the IEEE 802.1 ingress classifier code point value 011, configure a rewrite rule for that forwarding class that uses the IEEE 802.1p code point value 011.

**NOTE:** There are no default rewrite rules. You can bind one rewrite rule for each type (DSCP and IEEE 802.1) to a given interface. A rewrite rule can contain multiple forwarding-class-to-rewrite-value associations.

1. Assign a rewrite value to a forwarding class. Add the new rewrite value to the same rewrite rule as the other forwarding classes on the port:

```
[edit class-of-service rewrite-rules]
```

```
user@switch# set (dscp | ieee-802.1) rewrite-name forwarding-class class-name loss-priority
priority code-point (alias | bits)
```

For example, if the other forwarding classes on the port use rewrite values defined in the rewrite rule **custom-rw**, the forwarding class **fcoe** is being randomly rewritten, and you want to use IEEE 802.1 code point **011** for the **fcoe** forwarding class:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 custom-rw forwarding-class fcoe loss-priority high code-point
011
```

2. Enable the rewrite rule on an interface if it is not already enabled on the desired interface:

```
[edit]
user@switch# set class-of-service interfaces interface-name unit unit rewrite-rules (dscp |
ieee-802.1) rewrite-rule-name
```

For example, to enable the rewrite rule **custom-rw** on interface **xe-0/0/24.0**:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/24 unit 0 rewrite-rules ieee-802.1
custom-rw
```

## Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic

**Problem**    **Description:** In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets.

**Cause**      Failure of a queue to transmit packets for 12 consecutive seconds may be due to:

- A strict-high priority queue consuming all of the port bandwidth
- Several queues consuming all of the port bandwidth
- Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
- Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

**Solution**    If the cause is a strict-high priority queue or other queues consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the queues that are using all of the port bandwidth and preventing other queues from obtaining bandwidth on the port. You configure a maximum rate by creating a scheduler, using a scheduler map to apply it to a forwarding class (which maps to an output queue), and applying the scheduler map to the port using a forwarding class set and a traffic control profile.

To configure rate shaping using the CLI:

1. Name the existing scheduler or create a scheduler and define the maximum bandwidth as a rate or as a percentage:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name shaping-rate (rate | percent percentage)
```

2. Configure a scheduler map to associate the scheduler with the forwarding class (queue) that is consuming all of the port bandwidth:

```
[edit class-of-service]
user@switch# set scheduler-maps scheduler-map-name forwarding-class
forwarding-class-name scheduler scheduler-name
```

3. Associate the scheduler map with a traffic control profile:

```
[edit class-of-service]
user@switch# set traffic-control-profiles traffic-control-profile-name scheduler-map
scheduler-map-name
```

4. Associate the traffic control profile (and thus the scheduler map that contains the rate shaping queue scheduler) with a forwarding class set and apply them to the interface that is being reset:

```
[edit class-of-service]
user@switch# set interfaces interface-name forwarding-class-set fc-set-name
output-traffic-control-profile traffic-control-profile-name
```

For example, a strict-high priority queue is using all of the bandwidth on interface **shpnode:xe-0/0/10** and preventing other queues from transmitting for 12 consecutive seconds. You decide to set a maximum rate of 7 Gbps on the strict-high priority queue to ensure that at least 3 Gbps of the port bandwidth is available to service other queues.

[Table 600 on page 6459](#) shows the topology for this example:

**Table 600: Components of the Rate Shaping Troubleshooting Example**

Component	Settings
Affected interface	<b>shpnode:xe-0/0/10</b>
Scheduler (strict-high priority scheduler)	Name: <b>shp-sched</b> Shaping rate: <b>7g</b> Priority: <b>strict-high</b>  <b>NOTE:</b> This example assumes that the scheduler already exists and has been configured as <b>strict-high</b> priority, but that rate shaping to prevent the strict-high priority traffic from using all of the port bandwidth has not been applied.
Scheduler map	Name: <b>shp-map</b> Forwarding class to associate with the <b>shp-sched</b> scheduler: <b>strict-high</b>  <b>NOTE:</b> This example assumes that a strict-high priority forwarding class has been configured and assigned the name <b>strict-high</b> .
Traffic control profile	Name: <b>shp-tcp</b>  <b>NOTE:</b> This example does not describe how to define a complete traffic control profile.

Table 600: Components of the Rate Shaping Troubleshooting Example (*continued*)

Component	Settings
Forwarding class set	Name: <b>shp-pg</b>

To configure the scheduler, map it to the strict-high priority forwarding class, and apply it to interface **shpnode:xe-0/0/10** using the CLI:

1. Specify the scheduler for the strict-high priority queue (**shp-sched**) with a maximum bandwidth of 7 Gbps:

```
[edit class-of-service schedulers]
user@switch# set shp-sched shaping-rate 7g
```

2. Configure a scheduler map (**shp-map**) that associates the scheduler (**shp-sched**) with the forwarding class (**strict-high**):

```
[edit class-of-service scheduler-maps]
user@switch# set shp-map forwarding-class strict-high scheduler shp-sched
```

3. Associate the scheduler map **shp-map** with a traffic control profile (**shp-tcp**):

```
[edit class-of-service traffic-control-profiles]
user@switch# set shp-tcp scheduler-map shp-map
```

4. Associate the traffic control profile **shp-tcp** with a forwarding class set (**shp-pg**) and the affected interface (**shpnode:xe-0/0/10**):

```
[edit class-of-service]
user@switch# set interfaces shpnode:xe-0/0/10 forwarding-class-set shp-pg
output-traffic-control-profile shp-tcp
```

## Understanding Device and Network Management Features

After you install a QFX Series product or EX4600 switch in your network, you need to manage the device. The products support features that you use to manage the device within the network, including the management of configuration, system performance, fault monitoring, and remote access.

[Table 601 on page 6463](#) lists the device and network management features on the QFX Series and EX4600.

Table 601: Device and Network Management Features on the QFX Series and EX4600

Feature	Typical Uses	Documentation
AI-Scripts and Advanced Insight Manager (AIM)—Automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems, and submit problem reports to Juniper Support Systems.	Fault management	<a href="#">Advanced Insight Scripts (AI-Scripts) Release Notes</a>

**Table 601: Device and Network Management Features on the QFX Series and EX4600 (*continued*)**

Feature	Typical Uses	Documentation
Alarms and LEDs on the switch—Show status of hardware components and indicate warning or error conditions.	Fault management	<a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 7192</a>
Firewall filters—Control the packets that are sent to and from the network, balance network traffic, and optimize performance.	Performance management	<ul style="list-style-type: none"> <li>• <a href="#">Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</a></li> <li>• <a href="#">Overview of Firewall Filters on page 5209</a></li> </ul>
In-band management—Enables connection to the switch using the same interfaces through which customer traffic flows. Communication between the switch and a remote console is typically enabled using SSH and Telnet services. SSH provides secure encrypted communications, whereas Telnet provides unencrypted, and therefore less secure, access to the switch.	Remote access management	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SSH Service for Remote Access to the Router or Switch on page 1361</a></li> <li>• <a href="#">Configuring Telnet Service for Remote Access to a Router or Switch</a></li> </ul>
Juniper Networks Junos OS automation scripts—Configuration and operations automation tools provided by Junos OS. These tools include commit scripts, operation scripts, event scripts, and event policies. Commit scripts enforce custom configuration rules, whereas operation scripts, event policies, and event scripts automate network troubleshooting and management.	<ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul>	<a href="#">Junos OS Automation Library</a>
Junos OS command-line interface (CLI)—CLI configuration statements that enable you to configure the switch based on your networking requirements, such as security, service, and performance.	<ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• User access management</li> <li>• Remote access management</li> </ul>	<a href="#">CLI User Guide</a>
Junos Space software—Multipurpose GUI-based network management system that includes a base platform, the Network Application Platform, and other optional applications such as Ethernet Design, Service Now, Service Insight, and Virtual Control.	<ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Junos Space Support on page 6489</a></li> <li>• <a href="#">Junos Space Network Application Platform User Guide</a></li> </ul>

**Table 601: Device and Network Management Features on the QFX Series and EX4600 (*continued*)**

Feature	Typical Uses	Documentation
<p>Junos XML API—XML representation of Junos OS configuration statements and operational mode commands. Junos XML configuration tag elements are the content to which the Junos XML protocol operations apply. Junos XML operational tag elements are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device. The Junos XML API also includes tag elements that are the counterpart to Junos CLI configuration statements.</p>	<ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul>	<ul style="list-style-type: none"> <li>• <a href="#">Junos XML API Configuration Developer Reference</a></li> <li>• <a href="#">Junos XML API Operational Developer Reference</a></li> </ul>
<p>NETCONF XML management protocol—XML-based management protocol that client applications use to request and change configuration information on routing, switching, and security platforms running Junos OS. The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b>, <b>set</b>, and <b>commit</b> to perform those operations.</p>	<ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul>	<p><a href="#">NETCONF XML Management Protocol Developer Guide</a></p>
<p>Operational mode commands—May be used to do the following:</p> <ul style="list-style-type: none"> <li>• Monitor switch performance. For example, the <b>show chassis routing-engine</b> command shows the CPU utilization of the Routing Engine. High CPU utilization of the Routing Engine can affect performance of the switch.</li> <li>• View current activity and status of the device or network. For example, you can use the <b>ping</b> command to monitor and diagnose connectivity problems, and the <b>traceroute</b> command to locate points of failure on the network.</li> </ul>	<ul style="list-style-type: none"> <li>• Performance management</li> <li>• Fault management</li> </ul>	<p><a href="#">CLI Explorer</a></p>

**Table 601: Device and Network Management Features on the QFX Series and EX4600 (continued)**

Feature	Typical Uses	Documentation
Out-of-band management—Enables connection to the switch through a management interface. Out-of-band management is supported on two dedicated management Ethernet interfaces as well as on the console and auxiliary ports. The management Ethernet interfaces connect directly to the Routing Engine. No transit traffic is allowed through the interfaces, separating customer and management traffic and ensuring that congestion or failures in the transit network do not affect the management of the switch.	Remote access management	<ul style="list-style-type: none"> <li>• <a href="#">Connecting a QFX3500 Device to a Network for Out-of-Band Management</a></li> <li>• <a href="#">Connecting a QFX Series Device to a Management Console</a></li> <li>• <a href="#">Configuring Console and Auxiliary Port Properties on page 6583</a></li> </ul>
SNMP Configuration Management MIB—Provides notification for configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in jnxCmChgEventTable.	Configuration management	<a href="#">SNMP MIBs and Traps Reference</a>
SNMP MIBs and traps—Enable the monitoring of network devices from a central location. Use SNMP requests such as <b>get</b> and <b>walk</b> to monitor and view system activity.  The QFX3500 switch supports SNMP Version 1 (v1), v2, and v3, and both standard and Juniper Networks enterprise-specific MIBs and traps.	Fault management	<ul style="list-style-type: none"> <li>• <a href="#">SNMP MIBs and Traps Reference</a></li> <li>• <a href="#">Understanding the Implementation of SNMP on page 6513</a></li> </ul>
System log messages—Log details of system and user events, including errors. You can specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	<ul style="list-style-type: none"> <li>• Fault management</li> <li>• User access management</li> </ul>	<ul style="list-style-type: none"> <li>• <a href="#">Junos OS System Log Messages Reference</a></li> <li>• <a href="#">Overview of Junos OS System Log Messages on page 6560</a></li> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 6561</a></li> </ul>

## Understanding Network Management Implementation on the QFabric System

This topic describes network management features on the QFabric system that are implemented differently than on other devices running Junos OS.

The following network management features are supported on the QFabric system:

- **System log messages**—The QFabric system monitors events that occur on its component devices, distributes system log messages about those events to all external system log message servers (hosts) that are configured, and archives the messages. Component devices include Node devices, Interconnect devices, Director devices, and

the Virtual Chassis. You configure system log messages at the **[edit system syslog]** hierarchy level. Use the **show log filename** operational mode command to view messages.

- **Simple Network Management Protocol (SNMP) Version 1 (v1) and v2c**—SNMP monitors network devices from a central location. The SNMP implementation on the QFabric system supports the basic SNMP architecture of Junos OS with some limitations, including a reduced set of MIB objects, read-only access for SNMP communities, and limited support for SNMP requests. You configure SNMP at the **[edit snmp]** hierarchy level. Only the **show snmp statistics** operational mode command is supported, but you can issue SNMP requests using external SNMP client applications.
- **Advanced Insight Solutions (AIS)**—AIS provides tools and processes to automate the delivery of support services for the QFabric system. AIS components include Advanced Insight Scripts (AI-Scripts) and Advanced Insight Manager (AIM). You install AI-Scripts using the **request system scripts add** operational mode command. However, the **jais-activate-scripts.slax** file used during installation is preconfigured for the QFabric system and cannot be changed.

**NOTE:** Do not install Junos Space and AIS on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system

## Understanding Telnet on the QFabric System

This topic describes the support for the Telnet protocol on QFabric systems.

Telnet service is available for devices running Junos OS, including QFX Series devices. However, on QFabric systems, Telnet support is limited and the following conditions apply:

- You can telnet from a QFabric system to external devices that are connected to the QFabric system by way of the network Node group. To connect to these external devices, issue the **telnet** command from the QFabric default partition CLI.
- You cannot use the Telnet protocol to connect from the QFabric system default partition CLI to individual components. To access system components, you must issue the **request component login** command instead.

#### Related Documentation

- [request component login on page 1480](#)
- [telnet](#)

## Understanding Tracing and Logging Operations

Tracing and logging operations enable you to track events that occur in the switch—both normal operations and error conditions—and to track the packets that are generated by or passed through the switch. The results of tracing and logging operations are placed in files in the `/var/log` directory on the switch.

The Junos OS supports remote tracing for the following processes:

- **chassisd**—Chassis-control process
- **eventd**—Event-processing process
- **cosd**—Class-of-service process

You configure remote tracing by using the **tracing** statement at the **[edit system]** hierarchy level.

**NOTE:** The **tracing** statement is not supported on the QFX3000 QFabric system.

If you enabled remote tracing but wish to disable it for specific processes on the switch, use the **no-remote-trace** statement at the **[edit process-name traceoptions]** hierarchy level. This feature does not alter local tracing functionality in any way, and logging files are stored on the switch.

Logging operations use a system logging mechanism similar to the UNIX **syslogd** utility to record systemwide, high-level operations, such as interfaces going up or down and users logging in to or out of the switch. You configure these operations by using the **syslog** statement at the **[edit system]** hierarchy level and by using the **options** statement at the **[edit ethernet-switching-options]** hierarchy level.

Tracing operations record more detailed information about the operations of the switch, including packet forwarding and routing information. To configure tracing operations, use the **traceoptions** statement.

**NOTE:** The **traceoptions** statement is not supported on the QFX3000 QFabric system.

You can define tracing operations in different portions of the switch configuration:

- **SNMP agent activity tracing operations**—Define tracing of the activities of SNMP agents on the switch. You configure SNMP agent activity tracing operations at the **[edit snmp]** hierarchy level.
- **Global switching tracing operations**—Define tracing for all switching operations. You configure global switching tracing operations at the **[edit ethernet-switching-options]** hierarchy level of the configuration.

- Protocol-specific tracing operations—Define tracing for a specific routing protocol. You configure protocol-specific tracing operations in the **[edit protocols]** hierarchy when configuring the individual routing protocol. Protocol-specific tracing operations override any equivalent operations that you specify in the global **traceoptions** statement. If there are no equivalent operations, they supplement the global tracing options. If you do not specify any protocol-specific tracing, the routing protocol inherits all the global tracing operations.
- Tracing operations within individual routing protocol entities—Some protocols allow you to define more granular tracing operations. For example, in Border Gateway Protocol (BGP), you can configure peer-specific tracing operations. These operations override any equivalent BGP-wide operations or, if there are no equivalents, supplement them. If you do not specify any peer-specific tracing operations, the peers inherit, first, all the BGP-wide tracing operations and, second, the global tracing operations.
- Interface tracing operations—Define tracing for individual interfaces and for the interface process itself. You define interface tracing operations at the **[edit interfaces]** hierarchy level of the configuration.
- Remote tracing—To enable system-wide remote tracing, configure the **destination-override syslog host** statement at the **[edit system tracing]** hierarchy level. This specifies the remote host running the system log process (syslogd), which collects the traces. Traces are written to files on the remote host in accordance with the syslogd configuration in **/etc/syslog.conf**. By default, remote tracing is not configured.

To override the system-wide remote tracing configuration for a particular process, include the **no-remote-trace** statement at the **[edit process-name traceoptions]** hierarchy. When **no-remote-trace** is enabled, the process does local tracing.

To collect traces, use the **local0** facility as the selector in the **/etc/syslog.conf** file on the remote host. To separate traces from various processes into different files, include the process name or trace-file name (if it is specified at the **[edit process-name traceoptions file]** hierarchy level) in the Program field in the **/etc/syslog.conf** file. If your system log server supports parsing hostname and program name, then you can separate traces from the various processes.

**NOTE:** During a commit check, warnings about the **traceoptions** configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

## Overview of QFX5100 Switch Automation Enhancements

The QFX5100 switch automation enhancements are designed to support the increasing needs of large data centers for more automation and programmability.

- [Features of the QFX5100 Switch Automation Enhancements on page 6470](#)

### Features of the QFX5100 Switch Automation Enhancements

---

To use the QFX5100 switch automation enhancements, you must install the `jinstall-qfx-5-flex-x.tgz` software bundle. This software bundle is identical to the other QFX5100 switch software bundle except that Veriexec is disabled, which enables you to run unsigned programs, such as programs that you develop with Python, Chef, and Puppet. The QFX5100 switch automation enhancements include the following features:

- The factory default configuration is a Layer 3 configuration. (The standard default factory configuration is Layer 2.)
- Safeguards ensure that you cannot overwrite essential Junos OS files, including system log notifications.
- Zero Touch Provisioning (ZTP) allows you to provision new switches in your network automatically, without manual intervention. See [“Understanding Zero Touch Provisioning” on page 32](#).
- The installation automatically sets up and reserves a 1-gigabit user partition on your system. You can use this partition to store your binaries and additional packages.
- The user partition is not overwritten when you upgrade or downgrade the software to a QFX5100 switch Junos OS image that does not contain the automation enhancements.

**NOTE:** If you make changes to the user partition while performing a unified in-service software upgrade (unified ISSU), the changes might be lost.

---

- The Python interpreter is included by default.
  - You can invoke Python directly from the shell. See [“Invoking the Python Interpreter” on page 6587](#).

- Starting with Junos OS Release 14.1X53-D10, three Open Source Python modules are pre-installed in the `jinstall-qfx-5-flex-x.tgz` software bundle. See “[Overview of Python with QFX5100 Switch Automation Enhancements](#)” on page 6471 for details.
- Chef for Junos OS and Puppet for Junos OS automation tools for provisioning and managing computer networking and storage resources are included.
- For further information on Chef, see [Chef for Junos Getting Started Guide](#).
- For further information on Puppet, see [Puppet for Junos OS Documentation](#).

**NOTE:** For full compatibility, you must use only Chef for Junos OS and Puppet for Junos OS rather than the standard FreeBSD versions of Chef and Puppet software.

**CAUTION:** Download additional third party packages at your own risk.

#### Related Documentation

## Overview of Python with QFX5100 Switch Automation Enhancements

Python is a programming language that lets you work more quickly and integrate your systems more effectively. The Python interpreter is included within the Junos operating system (Junos OS) `jinstall-qfx-5-flex-x.tgz` software bundle.

Python is also suitable as an extension language for customizable applications.

Starting with Junos OS Release 14.1X53-D10, these Open Source Python modules are pre-installed in the `jinstall-qfx-5-flex-x.tgz` software bundle:

- **ncclient**—Facilitates client scripting and application development through the NETCONF protocol. See <http://ncclient.grnet.gr/0.3.2/> for documentation of some of the external APIs of the ncclient Python module. At the bottom of this list, see examples of usage of some of these APIs with sample scripts.
- **lxml**—Combines the speed and XML feature completeness of the C libraries libxml2 and libxslt with the simplicity of a native Python API. See <http://lxml.de/tutorial.html/> for documentation of some of the external APIs of the lxml Python module.
- **jinja2**—Serves as a fast, secure, designer-friendly templating language. See <http://jinja.pocoo.org/docs/api/> for documentation of some of the external APIs of the jinja2 Python module.

Example usage of some of the APIs of the ncclient Python module follows:

**\* Example of "connect" and "command" API:**

```
from ncclient import manager

def connect(host, port, user, password):
    conn = manager.connect(host=host,
                           port=port,
                           username=user,
                           password=password,
                           timeout=10,
                           device_params = {'name': 'junos'},
                           hostkey_verify=False)

    print 'show version'
    print '*' * 30
    result = conn.command('show version', format='text')
    print result.xpath('output')[0].text

if __name__ == '__main__':
    connect('router', '22', 'netconf', 'juniper!')
```

**\* Example of "compare\_configuration" API:**

```
from ncclient import manager
from ncclient.xml_ import *

import time

def connect(host, port, user, password, source):
    conn = manager.connect(host=host,
                           port=port,
                           username=user,
                           password=password,
                           timeout=10,
                           device_params = {'name': 'junos'},
                           hostkey_verify=False)

    compare_config = conn.compare_configuration(rollback=3)
    print compare_config.tostring

if __name__ == '__main__':
    connect('router', 830, 'netconf', 'juniper!', 'candidate')
```

**\* Example of "lock", "load\_configuration", "validate", "commit", "discard\_changes", "unlock" APIs:**

```
from ncclient import manager
from ncclient.xml_ import *

import time

def connect(host, port, user, password, source):
    conn = manager.connect(host=host,
                           port=port,
                           username=user,
                           password=password,
                           timeout=10,
                           device_params = {'name': 'junos'},
                           hostkey_verify=False)

    print 'locking configuration'
    lock = conn.lock()
```

```

# build configuration element
config = new_ele('system')
sub_ele(config, 'host-name').text = 'foo'
sub_ele(config, 'domain-name').text = 'bar'

send_config = conn.load_configuration(config=config)
print send_config.tostring

check_config = conn.validate()
print check_config.tostring

compare_config = conn.compare_configuration()
print compare_config.tostring

print 'commit confirmed 300'
#commit_config = conn.commit(confirmed=True, timeout='300')
commit_config = conn.commit()
print commit_config.tostring

print 'sleeping for 5 sec...'
time.sleep(5)

discard_changes = conn.discard_changes()
print discard_changes.tostring

print 'unlocking configuration'
unlock = conn.unlock()
print unlock.tostring

if __name__ == '__main__':
    connect('router', 830, 'netconf', 'juniper!', 'candidate')

```

**NOTE:** For information on using Python, refer to your Python documentation.

## Understanding Automation Scripts Support

This document describes the support for the Junos OS automation scripts on the QFabric system Director devices.

Junos OS automation consists of a suite of tools used to automate operational and configuration tasks on network devices running Junos OS. The automation tools, which leverage the native XML capabilities of the Junos OS, include commit scripts, operation (op) scripts, event policies and event scripts, and macros.

**NOTE:** Event policies and event scripts are not supported on the QFabric system at this time.

The QFabric system supports Junos OS automation scripts that are written in Stylesheet Language Alternative Syntax (SLAX) version 1.0.

Commit scripts automate the commit process and enforce custom configuration rules. You can use commit scripts to generate specific errors and warnings, and customize configurations and configuration templates. When a candidate configuration is committed, it is inspected by each active commit script. If a configuration violates your custom rules and the scripts generate an error, the commit fails. If the commit is successful, any configuration changes (both transient and permanent) are incorporated into the active configuration before it is passed to the Director software, which distributes the configuration to all applicable QFabric system components, including Node devices and Node servers.

Op scripts automate operational and troubleshooting tasks. Op scripts can be executed manually from the Junos OS CLI or NETCONF XML management protocol, or they can be called from another script.

The QFabric system supports the following automation script features:

- Commit scripts and op scripts are supported.
- Scripts written in SLAX version 1 are supported.
- Scripts are configured and deployed from the Director group. Since there is more than one Director device in a Director group, scripts must be deployed by each Director device or deployed in the shared media space.
- Scripts are stored in the shared media at this location:  
`/pbdata/mgd_shared/partition-ip/var/db/scripts`. Under this directory, commit scripts are stored in the **commit** subdirectory, and op scripts are stored in the **op** subdirectory.
- Scripts are not stored in flash memory.

## How Commit Scripts Work

You enable commit scripts by listing the names of one or more commit script files at the **[edit system scripts commit]** hierarchy level. These scripts contain instructions that enforce custom configuration rules. Commit scripts are invoked during the commit process before the standard Junos OS validity checks are performed.

When you perform a commit operation, Junos OS executes each script in turn, passing the information in the candidate configuration to the scripts. The script inspects the configuration, performs the necessary tests and validations, and generates a set of instructions for performing certain actions. These actions include generating error, warning, and system log messages. If errors are generated, the commit operation fails and the candidate configuration remains unchanged. This is the same behavior that occurs with standard commit errors.

Commit scripts can also generate changes to the system configuration. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

Figure 219 on page 6475 shows the flow of commit script input and output.

**Figure 219: Commit Script Input and Output**

Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.

The following sections discuss several important concepts related to the commit script input and output:

- [Commit Script Input on page 6475](#)
- [Commit Script Output on page 6476](#)
- [Commit Scripts and the Junos OS Commit Model on page 6477](#)

### Commit Script Input

The input for a commit script is the postinheritance candidate configuration in Junos XML API format. The term *postinheritance* means that all configuration group values have been inherited by their targets in the candidate configuration and the inactive portions of the configuration have been removed. For more information about configuration groups, see the *CLI User Guide*.

When you issue the **commit** command, Junos OS automatically generates the candidate configuration in XML format and reads it into the management (mgd) process, at which time the input is evaluated by any commit scripts.

To display the XML format of the postinheritance configuration, issue the **show | display commit-scripts view** command:

```
[edit]
user@host# show | display commit-scripts view
```

To display all configuration groups data, including script-generated changes to the groups, issue the **show groups | display commit-scripts** command:

```
[edit]
user@host# show groups | display commit-scripts
```

To save the commit script input to a file, add the **save** command to the command line:

```
[edit]
user@host# show | display commit-scripts view | save filename.xml
```

By default, the file is placed in your home directory on the switch, router, or security device.

### Commit Script Output

---

To specify the desired commit script output—including warning, error, and system log messages, persistent changes, and transient changes—the script can contain tags that appear in any order, in any number. The tags for specifying output are as follows:

- **<xnm:warning>**—Generates a warning message
- **<xnm:error>**—Generates an error message.
- **<syslog><message>**—Generates a system log message.
- **<change>**—Generates a persistent change to the configuration.
- **<transient-change>**—Generates a transient change to the configuration.
- **<xsl:call-template name="jcs:emit-change">**
  - <xsl:with-param name="content">**—Generates a persistent change relative to the current context node as defined by an XPath expression.
- **<xsl:call-template name="jcs:emit-change">**
  - <xsl:with-param name="tag" select="transient-change"/>**
    - <xsl:with-param name="content">**—Generates a transient change relative to the current context node as defined by an XPath expression.
- **<xsl:call-template name="jcs:emit-change">**
  - <xsl:with-param name="message">**
    - <xsl:text>**—Generates a warning message in conjunction with a configuration change. You can use this set of tags to generate a notification that the configuration has been changed.

Junos OS processes this output and performs the appropriate actions. Errors and warnings are passed back to the Junos OS CLI or to a Junos XML protocol client application. The presence of an error automatically causes the commit operation to fail. Persistent and transient changes are loaded into the appropriate configuration database.

To test the output of error, warning, and system log messages from commit scripts, issue the **commit check | display xml** command:

```
[edit]
user@host# commit check | display xml
```

To display a detailed trace of commit script processing, issue the **commit check | display detail** command:

```
[edit]
user@host# commit check | display detail
```

**NOTE:** System log messages do not appear in the trace output, so you cannot use the commit check operation to test script-generated system log messages. Furthermore, system log messages are written to the system log during a commit operation, but not during a commit check operation.

### Commit Scripts and the Junos OS Commit Model

Junos OS uses a commit model to update the device's configuration. This model allows you to make a series of changes to a candidate configuration without affecting the operation of the device. When the changes are complete, you can commit the configuration. The commit operation saves the candidate configuration changes into the current configuration.

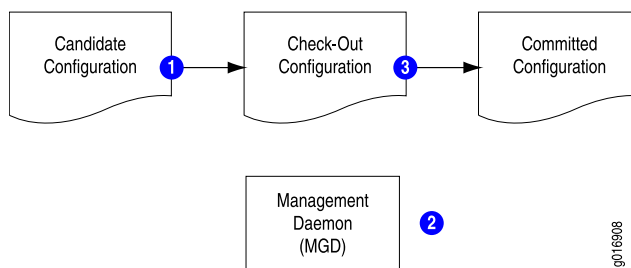

When you commit a set of changes in the candidate configuration, two methods are used to forward these changes to the current configuration:

- Standard commit model—Used when no commit scripts are active on the device.
- Commit script model—Incorporates commit scripts into the commit model.

#### Standard Commit Model

In the standard commit model, the management (mgd) process validates the candidate configuration based on standard Junos validation rules. If the configuration file is valid, it becomes the current active configuration. [Figure 220 on page 6478](#) and the accompanying discussion explain how the standard commit model works:

Figure 220: Standard Commit Model

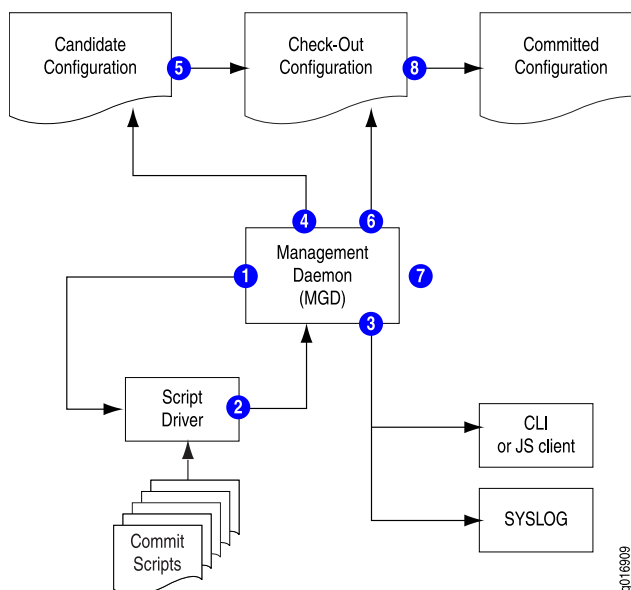

In the standard commit model, the software performs the following steps:

1. When the candidate configuration is committed, it is copied to become the checkout configuration.
2. The mgd process validates the checkout configuration.
3. If no error occurs, the checkout configuration is copied as the current active configuration.

### Commit Model with Commit Scripts

When commit scripts are added to the standard commit model, the process becomes more complex. The mgd process first passes an XML-formatted checkout configuration to a script driver, which handles the verification of the checkout configuration by the commit scripts. When verification is complete, the script driver returns an XML *action file* to the mgd process. The mgd process follows the instructions in the action file to update the candidate and checkout configurations, issue messages to the CLI, and write information to the system log as required. After processing the action file, the mgd process performs the standard Junos OS validation. [Figure 221 on page 6478](#) and the accompanying discussion explain this process.

Figure 221: Commit Model with Commit Scripts Added

In the commit script model, Junos OS performs the following steps:

1. When the candidate configuration is committed, the mgd process sends the XML-formatted candidate configuration to the script driver.
2. Each enabled commit script is invoked against the candidate configuration, and each script can generate a set of actions for the mgd process to perform. The actions are collected in an XML action file.
3. The mgd process performs the following actions in response to **<error>**, **<warning>**, and **<syslog>** tag elements in the action file:
  - **<error>**—The mgd process halts the commit process (that is, the commit operation fails), returns an error message to the CLI or Junos XML protocol client, and takes no further action.
  - **<warning>**—The mgd process forwards the message to the CLI or the Junos XML protocol client.
  - **<syslog>**—The mgd process forwards the message to the system log process.
4. If the action file includes any **<change>** tag elements, the mgd process loads the requested changes into the candidate configuration.
5. The candidate configuration is copied to become the checkout configuration.
6. If the action file includes any **<transient-change>** tag elements, the mgd process loads the requested changes into the checkout configuration.
7. The mgd process validates the checkout configuration.
8. If there are no validation errors, the checkout configuration is copied to become the current active configuration.

**NOTE:** Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.

Changes that are made to the candidate configuration during the commit operation are not evaluated by the custom rules during that commit operation. However, persistent changes are maintained in the candidate configuration and are evaluated by the custom rules during subsequent commit operations. For more information about how commit scripts change the candidate configuration, see [“Avoiding Potential Conflicts When Using Multiple Commit Scripts” on page 6480](#).

Transient changes are never evaluated by the custom rules in commit scripts, because they are made to the checkout configuration only after the commit scripts have evaluated the candidate configuration and the candidate is copied to become the checkout configuration. To remove a transient change from the configuration, remove, disable, or deactivate the commit script (as discussed in *Controlling Execution of Commit Scripts During Commit Operations*), or comment out the code that generates the transient change.

For more information about differences between persistent and transient changes, see [“Overview of Generating Persistent or Transient Configuration Changes”](#) on page 6481.

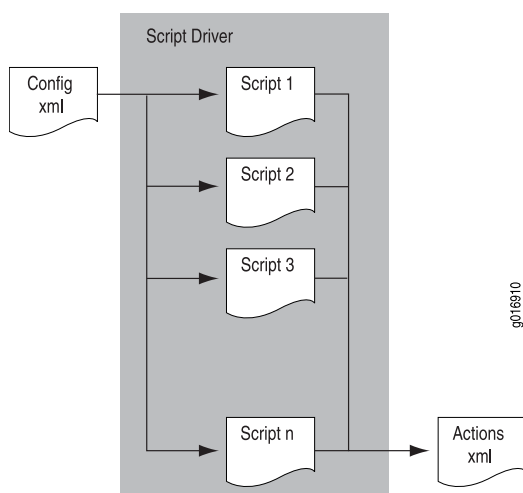

**Related Documentation**

- [Avoiding Potential Conflicts When Using Multiple Commit Scripts on page 6480](#)

## Avoiding Potential Conflicts When Using Multiple Commit Scripts

When you use multiple commit scripts, each script evaluates the original candidate configuration file. Changes made by one script are not evaluated by the other scripts. This means that conflicts between scripts might not be resolved when the scripts are first applied to the configuration. The commit scripts are executed in the order they are listed at the `[edit system scripts commit]` hierarchy level, as illustrated in [Figure 222 on page 6480](#).

**Figure 222: Configuration Evaluation by Multiple Commit Scripts**

As an example of a conflict between commit scripts, suppose that commit script **A.xsl** is created to ensure that the device uses the domain name server with IP address 192.168.0.255. Later, the DNS server's address is changed to 192.168.255.255 and a second script, **B.xsl**, is added to check that the device uses the DNS server with that address. However, script **A.xsl** is not removed or disabled.

Because each commit script evaluates the original candidate configuration, the final result of executing both scripts **A.xsl** and **B.xsl** depends on which DNS server address is configured in the original candidate configuration. If the now outdated address of 192.168.0.255 is configured, script **B.xsl** changes it to 192.168.255.255. However, if the correct address of 192.168.255.255 is configured, script **A.xsl** changes it to the incorrect value 192.168.0.255.

As another example of a potential conflict between commit scripts, suppose that a commit script protects a hierarchy using the **protect** attribute. If a second commit script attempts to modify or delete the hierarchy or the statements within the hierarchy, Junos OS issues a warning during the commit process and prevents the configuration change.

Exercise care to ensure that you do not introduce conflicts between scripts like those described in the examples. As a method of checking for conflicts with persistent changes, you can issue two separate **commit** commands.

## Overview of Generating Persistent or Transient Configuration Changes

Junos OS commit scripts enforce custom configuration rules. When a candidate configuration includes statements that you have decided must not be included in your configuration, or when the candidate configuration omits statements that you have decided are required, commit scripts can automatically change the configuration and thereby correct the problem.

- [Differences Between Persistent and Transient Changes on page 6481](#)
- [Interaction of Configuration Changes and Configuration Groups on page 6484](#)
- [Tag Elements and Templates for Generating Changes on page 6484](#)

### Differences Between Persistent and Transient Changes

Configuration changes made by commit scripts can be *persistent* or *transient*.

A persistent change remains in the candidate configuration and affects routing operations until you explicitly delete it, even if you subsequently remove or disable the commit script that generated the change and reissue the **commit** command. In other words, removing the commit script does not cause a persistent change to be removed from the configuration.

A transient change, in contrast, is made in the *checkout configuration* but not in the candidate configuration. The checkout configuration is the configuration database that is inspected for standard Junos OS syntax just before it is copied to become the active configuration on the device. If you subsequently remove or disable the commit script that made the change and reissue the **commit** command, the change is no longer made to the checkout configuration and so does not affect the active configuration. In other words, removing the commit script effectively removes a transient change from the configuration.

A common use for transient changes is to eliminate the need to repeatedly configure and display well-known policies, thus allowing these policies to be enforced implicitly. For example, if MPLS must be enabled on every interface with an International Organization for Standardization (ISO) protocol enabled, the change can be transient, so that the repetitive or redundant configuration data need not be carried or displayed in the candidate configuration. Furthermore, transient changes allow you to write script instructions that apply the change only if a set of conditions is met.

Persistent and transient changes are loaded into the configuration in the same manner that the **load replace** configuration mode command loads an incoming configuration. When generating a persistent or transient change, adding the **replace="replace"** attribute to a configuration element produces the same behavior as a **replace:** tag in a **load replace** operation.

By default, Junos OS merges the incoming configuration and the candidate configuration. New statements and hierarchies are added, and conflicting statements are overridden. When generating a persistent or transient change, if you add the **replace="replace"** attribute to a configuration element, Junos OS replaces the existing configuration element with the incoming configuration element. If the **replace="replace"** attribute is added to a configuration element, but there is no existing element of the same name in the current configuration, the incoming configuration element is added into the configuration. Elements that do not have the **replace** attribute are merged into the configuration.

Persistent and transient changes are loaded before the standard Junos validation checks are performed. This means any configuration changes introduced by a commit script are validated for correct syntax. If the syntax is correct, the new configuration becomes the active, operational device configuration.

Protected elements in the configuration hierarchy cannot be modified or deleted by either a persistent or a transient change. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made, and proceeds with the commit.

Persistent and transient changes have several important differences, as described in [Table 602 on page 6482](#).

**Table 602: Differences Between Persistent and Transient Changes**

Persistent Changes	Transient Changes
A persistent change is represented in a commit script by the <b>&lt;change&gt;</b> tag.	A transient change is represented in a commit script by the <b>&lt;transient-change&gt;</b> tag.
Another way to represent a persistent change is with the <b>content</b> parameter inside a call to the <b>jcs:emit-change</b> template.	Another way to represent a transient change is to use the <b>content</b> parameter and the <b>tag transient</b> parameter inside a call to the <b>jcs:emit-change</b> template.
The <b>jcs:emit-change</b> template is a helper template contained in the <b>junos.xsl</b> import file.	
You can use persistent changes to perform any Junos XML protocol operation, such as activate, deactivate, delete, insert (reorder), comment (annotate), and replace sections of the configuration.	Like persistent changes, you can use transient changes to perform any Junos XML protocol operation. However, some Junos XML protocol operations do not make sense to use with transient changes, such as generating comments and inactive settings.
Persistent changes are always loaded during the commit process if no errors are generated by any commit scripts or by the standard Junos OS validity check.	For transient changes to be loaded, you must include the <b>allow-transients</b> statement at the <b>[edit system scripts commit]</b> hierarchy level. If you enable a commit script that generates transient changes and you do not include the <b>allow-transients</b> statement in the configuration, the CLI generates an error message and the commit operation fails.
	Like persistent changes, transient changes must pass the standard Junos OS validity check.
	You cannot use a commit script to generate the <b>allow-transients</b> statement at the <b>[edit system scripts commit]</b> hierarchy level. Rather, you must include this statement directly by using the CLI.

Table 602: Differences Between Persistent and Transient Changes (*continued*)

Persistent Changes	Transient Changes
<p>Persistent changes work like the <b>load replace</b> configuration mode command, and the change is added to the candidate configuration.</p> <p>When generating a persistent change, if you add the <b>replace="replace"</b> attribute to a configuration element, Junos OS replaces the existing element in the candidate configuration with the incoming configuration element. If there is no existing element of the same name in the candidate configuration, the incoming configuration element is added into the configuration. Elements that do not have the <b>replace</b> attribute are merged into the configuration.</p>	<p>Transient changes work like the <b>load replace</b> configuration mode command, and the change is added to the checkout configuration.</p> <p>When generating a transient change, if you add the <b>replace="replace"</b> attribute to a configuration element, Junos OS replaces the existing element in the checkout configuration with the incoming configuration element. If there is no existing element of the same name in the checkout configuration, the incoming configuration element is added into the configuration. Elements that do not have the <b>replace</b> attribute are merged into the configuration.</p> <p>Transient changes are not copied to the candidate configuration. For this reason, transient changes are not saved in the configuration if the associated commit script is deleted or deactivated.</p>
<p>After a persistent change is committed, the software treats it like a change you make by directly editing and committing the candidate configuration.</p> <p>After the persistent changes are copied to the candidate configuration, they are copied to the checkout configuration. If the changes pass the standard Junos OS validity checks, the changes are propagated to the switch, router, or security device components.</p>	<p>Each time a transient change is committed, the software updates the checkout configuration database. After the transient changes pass the standard Junos OS validity checks, the changes are propagated to the device components.</p>
<p>After committing a script that causes a persistent change to be generated, you can view the persistent change by issuing the <b>show</b> configuration mode command:</p> <pre>user@host# show</pre> <p>This command displays persistent changes only, not transient changes.</p>	<p>After committing a script that causes a transient change to be generated, you can view the transient change by issuing the <b>show   display commit-scripts</b> configuration mode command:</p> <pre>user@host# show   display commit-scripts</pre> <p>This command displays both persistent and transient changes.</p>
<p>Persistent changes must conform to your custom configuration design rules as dictated by commit scripts.</p> <p>This does not become apparent until after a second commit operation because persistent changes are not evaluated by commit script rules on the current commit operation. The subsequent commit operation fails if the persistent changes do not conform to the rules imposed by the commit scripts configured during the first commit operation.</p>	<p>Transient changes are never tested by and do not need to conform to your custom rules. This is caused by the order of operations in the Junos OS commit model, which is explained in detail in <a href="#">“Commit Scripts and the Junos OS Commit Model” on page 6477</a>.</p>
<p>A persistent change remains in the configuration even if you delete, disable, or deactivate the commit script instructions that generated the change.</p>	<p>If you delete, disable, or deactivate the commit script instructions that generate a transient change, the change is removed from the configuration after the next commit operation. In short, if the associated instructions or the entire commit script is removed, the transient change is also removed.</p>

Table 602: Differences Between Persistent and Transient Changes (*continued*)

Persistent Changes	Transient Changes
As with direct CLI configuration, you can remove a persistent change by rolling back to a previous configuration that did not include the change and issuing the <b>commit</b> command. However, if you do not disable or deactivate the associated commit script, and the problem that originally caused the change to be generated still exists, the change is automatically regenerated when you issue another <b>commit</b> command.	You cannot remove a transient change by rolling back to a previous configuration.
You can alter persistent changes directly by editing the configuration using the CLI.	<p>You cannot directly alter or delete a transient change by using the Junos OS CLI, because the change is not in the candidate configuration.</p> <p>To alter the contents of a transient change, you must alter the statements in the commit script that generates the transient change.</p>

### Interaction of Configuration Changes and Configuration Groups

Any configuration change you can make by directly editing the configuration using the Junos OS command-line interface (CLI) can also be generated by a commit script as a persistent or transient change. This includes values specified at a specific hierarchy level or in configuration groups. As with direct CLI configuration, values specified in the *target* override values inherited from a configuration group. The target is the statement to which you apply a configuration group by including the **apply-groups** statement.

If you define persistent or transient changes as belonging to a configuration group, the configuration groups are applied in the order you specify in the **apply-groups** statements, which you can include at any hierarchy level except the top level. You can also disable inheritance of a configuration group by including the **apply-groups-except** statement at any hierarchy level except the top level.

**CAUTION:** Each commit script inspects the postinheritance view of the configuration. If a candidate configuration contains a configuration group, be careful when using a commit script to change the related target configuration, because doing so might alter the intended inheritance from the configuration group.

Also be careful when using a commit script to change a configuration group, because the configuration group might be generated by an application that performs a load replace operation on the group during each commit operation.

For more information about configuration groups, see the *CLI User Guide*.

### Tag Elements and Templates for Generating Changes

To generate changes, you can use the **jcs:emit-change** template, which implicitly includes **<change>** and **<transient-change>** XML elements; or you can explicitly include **<change>**

and `<transient-change>` XML elements. Using the `jcs:emit-change` template allows you to set the hierarchical context of the change once rather than multiple times.

The `<change>` and `<transient-change>` elements are similar to the `<load-configuration>` operation defined by the Junos XML management protocol. The possible contents of the `<change>` and `<transient-change>` elements are the same as the contents of the `<configuration>` tag element used in the Junos XML protocol operation `<load-configuration>`. For complete details about the `<load-configuration>` element, see the *Junos XML Management Protocol Developer Guide*.

## Required Boilerplate for Commit Scripts

When you write commit scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all commit scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make commit scripts easier to read and write, which you import from a file called `junos.xsl`. For more information about the extension functions and templates, see *Junos Script Automation: Understanding Extension Functions in the jcs and slax Namespaces* and *Junos Script Automation: Named Templates in the jcs Namespace Overview*.

Commit scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all commit scripts that you create. The XSLT boilerplate follows:

### XSLT Boilerplate for Commit Scripts

```

1  <?xml version="1.0" standalone="yes"?>
2  <xsl:stylesheet version="1.0"
3    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4    xmlns:junos="http://xml.juniper.net/junos/*/junos"
5    xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6    xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7    <xsl:import href="../../../import/junos.xsl"/>

8    <xsl:template match="configuration">
9      <!-- ... Insert your code here ... -->
10   </xsl:template>
11 </xsl:stylesheet>
```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI). This PI specifies that the code is written in XML using version 1.0. The XML PI, if present, must be the first noncomment token in the script file.

```
1  <?xml version="1.0"?>
```

Lines 2 through 6 set the style sheet element and the associated namespaces. Line 2 sets the style sheet version as 1.0. Lines 3 through 6 list all the namespace mappings commonly used in commit scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```
2 <xsl:stylesheet version="1.0"
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6   xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as `../import/junos.xsl`, which ships as part of the Junos OS. The `junos.xsl` file contains a set of named templates you can call in your scripts. These named templates are discussed in *Junos Script Automation: Named Templates in the jcs Namespace Overview* and *Junos Named Templates in the jcs Namespace Summary*.

```
7 <xsl:import href="../import/junos.xsl"/>
```

Line 8 defines a template that matches the `<configuration>` element, which is the node selected by the `<xsl:template match="/">` template, contained in the `junos.xsl` import file. The `<xsl:template match="configuration">` element allows you to exclude the `/configuration/` root element from all XML Path Language (XPath) expressions in the script and begin XPath expressions with the top Junos OS hierarchy level. For more information, see *XPath Overview*.

```
8 <xsl:template match="configuration">
```

Add your code between Lines 8 and 9.

Line 9 closes the template.

```
9 </xsl:template>
```

Line 10 closes the style sheet and the commit script.

```
10 </xsl:stylesheet>
```

### SLAX Boilerplate for Commit Scripts

The corresponding SLAX boilerplate is as follows:

```
version 1.0;
ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xsl";

match configuration {
/*
* Insert your code here
*/
}
```

## How Op Scripts Work

Op scripts execute Junos OS operational commands and inspect the resulting output. After inspection, op scripts can automatically correct errors within the device running Junos OS based on this output.

You add op scripts to device operations by listing the filenames of one or more op script files within the **[edit system scripts op]** hierarchy level. These files must be added to the appropriate op script file directory. For more information about op script file directories, see *Storing Scripts in Flash Memory*. Once added to the device, op scripts are invoked from the command line, using the **op filename** command.

You can use op scripts to generate changes to the device configuration by including the **<load-configuration>** tag element. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

Figure 223 on page 6487 shows a high-level view of the flow of op script input and output.

**Figure 223: Op Script Input and Output**

## Required Boilerplate for Op Scripts

When you write operation (op) scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all op scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make scripts easier to read and write, which you import from a file called **junos.xml**. For more information about the extension functions and templates, see *Junos Script Automation: Understanding Extension Functions in the jcs and slax Namespaces* and *Junos Script Automation: Named Templates in the jcs Namespace Overview*.

Op scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all op scripts that you create. The XSLT boilerplate follows:

### XSLT Boilerplate for Op Scripts

```

1 <?xml version="1.0" standalone="yes"?>
2 <xsl:stylesheet version="1.0"
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6   xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7   <xsl:import href="../import/junos.xml"/>
8   <xsl:template match="/">

```

```
9      <op-script-results>
      <!-- ... insert your code here ... -->
10    </op-script-results>
11  </xsl:template>
      <!-- ... insert additional template definitions here ... -->
12 </xsl:stylesheet>
```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI), which marks this file as XML and specifies the version of XML as 1.0. The XML PI, if present, must be the first non-comment token in the script file.

```
1 <?xml version="1.0"?>
```

Line 2 opens the style sheet and specifies the XSLT version as 1.0.

```
2 <xsl:stylesheet version="1.0"
```

Lines 3 through 6 list all the namespace mappings commonly used in operation scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6   xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as `../import/junos.xsl`, which ships as part of Junos OS (in the file `/usr/libdata/cscript/import/junos.xsl`). The `junos.xsl` file contains a set of named templates you can call in your scripts. These named templates are discussed in *Junos Script Automation: Named Templates in the jcs Namespace Overview* and *Junos Named Templates in the jcs Namespace Summary*.

```
7   <xsl:import href="../import/junos.xsl"/>
```

Line 8 defines a template that matches the `</>` element. The `<xsl:template match="/">` element is the root element and represents the top level of the XML hierarchy. All XML Path Language (XPath) expressions in the script must start at the top level. This allows the script to access all possible Junos XML and Junos XML protocol remote procedure calls (RPCs). For more information, see *XPath Overview*.

```
8   <xsl:template match="/">
```

After the `<xsl:template match="/">` tag element, the `<op-script-results>` and `</op-script-results>` container tags must be the top-level child tags, as shown in Lines 9 and 10.

```
9      <op-script-results>
      <!-- ... insert your code here ... -->
10    </op-script-results>
```

Line 11 closes the template.

```
11  </xsl:template>
```

Between Line 11 and Line 12, you can define additional XSLT templates that are called from within the `<xsl:template match="/">` template.

Line 12 closes the style sheet and the op script.

```
12 </xsl:stylesheet>
```

### SLAX Boilerplate for Op Scripts

The corresponding SLAX boilerplate is as follows:

```
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xml";

match / {
  <op-script-results> {
    /*
     * Insert your code here
     */
  }
}
```

## Junos Space

- [Understanding Junos Space Support on page 6489](#)

### Understanding Junos Space Support

The Juniper Networks Junos Space application, running on a JA1500 appliance or a Junos Space Virtual Appliance, is a comprehensive platform for building and deploying applications for collaboration, productivity, and network infrastructure and operations management. Junos Space provides a runtime environment implemented as a fabric of virtual and physical appliances.

The Junos Space Network Management Platform software comprises various applications for network management and configuration, including:

- Junos Space Administration—Provides management of Junos Space fabric, databases, licenses, applications, authentication servers, tags, permission labels, DMI schemas, and troubleshooting.
- Network Director—Provides unified management of supported Juniper Networks devices in your network. By providing full network life cycle management, Network Director simplifies the discovery, configuration, visualization, monitoring, and administration of large networks.
- Service Automation—Provides an end-to-end solution designed to streamline operations and enable proactive network management for Junos OS devices. The solution consists of Advanced Insight Scripts (AI-Scripts), Junos Space Service Now and Service Insight applications, and Juniper Support Systems (JSS).

**NOTE:** Do not install Junos Space and AI-Scripts on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system

Before you can use Junos Space Network Director to manage the QFX Series device, you must ensure that the configuration on the device meets the requirements for all managed devices. For example:

- The device configuration has a static management IP address that is reachable from the Junos Space server.
- There is a user with full administrative privileges for Junos Space administration.
- SNMP is enabled (only if you plan on using SNMP as part of the device discovery).
- In Junos Space, set up a default device management interface (DMI) schema for the QFX Series device.

For more information about Network Director requirements, see the *Network Director Quick Start Guide* at:

[http://www.juniper.net/techpubs/en\\_US/network-director1.5/information-products/pathway-pages/index.html](http://www.juniper.net/techpubs/en_US/network-director1.5/information-products/pathway-pages/index.html)

For more information about Junos Space, go to:

[http://www.juniper.net/techpubs/en\\_US/release-independent/junos-space/index.html](http://www.juniper.net/techpubs/en_US/release-independent/junos-space/index.html)

- [Prototype File for the Google Protocol Buffer Stream Format on page 6508](#)

### Network Analytics Overview

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. This feature collects data from the switch, analyzes the data using sophisticated algorithms, and captures the results in reports. Network administrators can use the reports to help troubleshoot problems, make decisions, and adjust resources as needed. The analytics manager (analyticsm) in the Packet Forwarding Engine collects traffic and queue statistics, and the analytics daemon (analyticd) in the Routing Engine analyzes the data and generates reports. You can enable network analytics by configuring microburst monitoring and high-frequency traffic statistics monitoring.

**NOTE:** In Junos OS Release 13.2X51-D15, the network analytics feature was enhanced, and extensive changes were made to the CLI statements and hierarchies. If you upgrade to Junos OS Release 13.2X51-D15 or later from a release prior to 13.2X51-D15, network analytics configurations committed in previous releases will appear on your device, but the feature is disabled. To enable this feature, you must reconfigure it using the new CLI statements and hierarchies.

For more information, see:

- [Analytics Feature Overview on page 6491](#)
- [Network Analytics Enhancements Overview on page 6492](#)
- [Summary of CLI Changes on page 6493](#)

### Analytics Feature Overview

You enable network analytics by configuring queue (microburst) monitoring and high-frequency traffic statistics monitoring. You use microburst monitoring to look at traffic queue conditions in the network. A microburst occurrence indicates to the Packet Forwarding Engine that a user-specified queue depth or latency threshold is reached. The queue depth is the buffer (in bytes) containing the data, and latency is the time (in nanoseconds or microseconds) the data stays in the queue.

You can configure queue monitoring based on either queue depth or latency (but not both), and configure the frequency (polling interval) at which the Packet Forwarding Engine checks for microbursts and sends the data to the Routing Engine for processing. You may configure queue monitoring globally for all physical interfaces on the system, or for a specific interface on the switch. However, the specified queue monitoring interval applies either to all interfaces, or none; you cannot configure the interval for each interface.

You use high-frequency traffic statistics monitoring to collect traffic statistics at specified polling intervals. Similar to the queue monitoring interval, the traffic monitoring interval applies either to all interfaces, or none; you cannot configure the interval for each interface.

Both traffic and queue monitoring are disabled by default. You must configure each type of monitoring using the CLI. In each case, the configuration for an interface always takes precedence over the global configuration.

**NOTE:** You can configure traffic and queue monitoring for physical interfaces only; logical interfaces and Virtual Chassis port (VCP) interfaces are not supported.

The analyticsd daemon in the Routing Engine generates local log files containing queue and traffic statistics records. You can specify the log filename and size, and the number of log files. If you do not configure a filename, the data is not saved.

You can display the local log file or specify a server to receive the streaming data containing the queue and traffic statistics.

For each port, information for the last 10 records of traffic statistics and 100 records of queue statistics is cached. You may view this information by using the **show analytics** commands.

To store traceoptions data, you configure the **traceoptions** statement at the **[edit services analytics]** hierarchy level.

### Network Analytics Enhancements Overview

---

Beginning in Junos OS Release 13.2X51-D15, the network analytics feature provides the following enhancements:

- **Resources**—Consist of interfaces and system. The interfaces resource allows you to configure an interface name and an associated resource profile name for each interface. With the system resource, you can configure the polling intervals for queue monitoring and traffic monitoring, and an associated resource profile for the system.
- **Resource profile**—A template that contains the configurations for queue and traffic monitoring, such as depth threshold and latency threshold values, and whether each type of monitoring is enabled or disabled. Once a resource profile is configured, you apply it to a system or interfaces resource.
- **Collector**—A server for collecting queue and traffic monitoring statistics, and can be a local or remote server. You can configure a local server to store monitoring statistics in a log file, or a remote server to receive streamed statistics data.
- **Export profile**—You must configure an export profile if you wish to send streaming data to a remote collector. In the export profile, you define the category of streamed data (system-wide or interface-specific) to determine stream type the collector will receive. You can specify both system and interface stream categories. System data includes system information and status of queue and traffic monitoring. Interface-specific data includes interface information, queue and traffic statistics, and link, queue, and traffic status.
- **Google Protocol Buffer (GBP) stream format**—A new streaming format for monitoring statistics data that is sent to a remote collector in a single AnRecord message. This stream format provides nine types of information, including:
  - **System information**—General system information, including boot time, model information, serial number, number of ports, and so on.
  - **System queue status**—Queue status for the system in general.
  - **System traffic status**—Traffic status for the system in general.
  - **Interface information**—Includes SNMP index, slot, port, and other information.
  - **Queue statistics for interfaces**—Queue statistics for specific interfaces.
  - **Traffic statistics for interfaces**—Traffic statistics for specific interfaces.
  - **Link status for interfaces**—Includes link speed, state, and so on.

- Queue status for interfaces—Queue status for specific interfaces.
- Traffic status for interfaces—Traffic status for specific interfaces.
- The **analytics.proto** file—Provides a template for the GBP stream format. This file can be used for writing your analytics server application. To download the file, go to:  
[http://www.juniper.net/techpubs/en\\_US/junos13.2/topics/reference/proto-files/analytics-proto.txt](http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/proto-files/analytics-proto.txt)
- Use of threshold values—The Analytics Manager (analyticsm) will generate a queue statistics record when the lower queue depth or latency threshold value is exceeded.
- User Datagram Protocol (UDP)—Additional transport protocol you can configure, in addition to Transmission Control Protocol (TCP), for the remote streaming server port.
- Single file for local logging—Replaces the separate log files for queue and traffic statistics.
- Change in latency measurement—Configuration and reporting of latency values have changed from microseconds to nanoseconds.
- Change in reporting of the collection time in UTC format—Statistics collection time is reported in microseconds instead of milliseconds.
- New operational mode command **show analytics collector**—Replaces the **show analytics streaming-server** command.
- Changes in command output format—Include the following changes:
  - Addition of unicast, multicast, and broadcast packet counters in queue and traffic statistics.
  - Reversal of the sequence of statistics information in the output. The most recent record is displayed at the beginning, and the oldest record at the end of the output.
  - Removal of traffic or queue monitoring status information from the global portion of the **show analytics configuration** and **show analytics status** command output if there is no global configuration.
  - Addition of **n/a** to the interface-specific portion of the **show analytics configuration** and **show analytics status** command output if a parameter is not configured (for example, depth threshold or latency threshold).

### Summary of CLI Changes

Beginning in Junos OS Release 13.2X51-D15, enhancements to the network analytics feature result in changes in the CLI when you configure the feature. See [Table 603 on page 6494](#) for a summary of CLI changes.

Table 603: Network Analytics CLI Changes

Task	CLI for Junos OS Release 13.2X50-D15 and 13.2X51-D10	CLI for Junos OS Release 13.2X51-D15 and later
Configuring global queue and traffic monitoring polling interval	<pre>[edit services analytics]  traffic-statistics {   interval <i>interval</i>; } queue-statistics {   interval <i>interval</i>; }</pre>	<pre>[edit services analytics]  resource {   system {     polling-interval {       queue-monitoring <i>interval</i>;       traffic-monitoring <i>interval</i>;     }   } }</pre>
Configuring local files for traffic and queue statistics reporting	<pre>[edit services analytics]  traffic-statistics {   file <i>filename</i>;   size <i>size</i>;   files <i>number</i>; } queue-statistics {   file <i>filename</i>;   size <i>size</i>;   files <i>number</i>; }</pre>	<pre>[edit services analytics]  collector {   local {     file <i>filename</i> {       files <i>number</i>;       size <i>size</i>;     }   } }</pre>
Enabling queue statistics and traffic monitoring, and specifying the depth threshold for all interfaces (globally)	<pre>[edit services analytics]  interfaces {   all {     queue-statistics;     traffic-statistics;     depth-threshold {       high <i>number</i>;       low <i>number</i>;     }   } }</pre>	<p>Requires defining a resource profile and applying it to the system:</p> <ol style="list-style-type: none"> <li>To define a resource profile: <pre>[edit services analytics]  resource-profiles {   <i>profile-name</i> {     queue-monitoring;     traffic-monitoring;     depth-threshold {       high <i>number</i>;       low <i>number</i>;     }   } }</pre> </li> <li>To apply a profile to the system: <pre>[edit services analytics]  resource {   system {     resource-profile <i>profile-name</i>;   } }</pre> </li> </ol>

Table 603: Network Analytics CLI Changes (*continued*)

Task	CLI for Junos OS Release 13.2X50-D15 and 13.2X51-D10	CLI for Junos OS Release 13.2X51-D15 and later
Enabling queue statistics and traffic monitoring, and specifying the latency threshold for one interface	<pre>[edit services analytics] interfaces {   interface {     queue-statistics;     traffic-statistics;     latency-threshold       high <i>number</i>;       low <i>number</i>;   } }</pre>	<p>Requires defining a resource profile and applying it to the interface:</p> <ol style="list-style-type: none"> <li>To define a resource profile: <pre>[edit services analytics] resource-profiles {   profile-name {     queue-monitoring;     traffic-monitoring;     latency-threshold {       high <i>number</i>;       low <i>number</i>;     }   } }</pre> </li> <li>To apply a profile to the interface: <pre>[edit services analytics] resource {   interfaces {     interface-name {       resource-profile <i>profile-name</i>;     }   } }</pre> </li> </ol>
<p>Configuring the streaming data format (JSON, CSV, or TSV) to send to a remote server</p> <p><b>NOTE:</b> Junos OS Release 13.2X51-D15 added support for the GPB stream format and configuration of the transport protocols (TCP or UDP).</p>	<pre>[edit services analytics] streaming-servers {   address <i>ip-address</i> {     port <i>number</i> {       stream-format <i>format</i>;     }   } }</pre>	<p>Requires defining the stream format in an export profile and applying the profile to the collector.</p> <ol style="list-style-type: none"> <li>To configure the stream format: <pre>[edit services analytics] export-profiles {   profile-name {     stream-format <i>format</i>;   } }</pre> </li> <li>To apply an export profile to the collector: <pre>[edit services analytics] collector {   address <i>ip-address</i> {     port <i>number</i> {       transport <i>protocol</i> {         export-profile <i>profile-name</i>;       }     }   } }</pre> </li> </ol>

Table 603: Network Analytics CLI Changes (*continued*)

Task	CLI for Junos OS Release 13.2X50-D15 and 13.2X51-D10	CLI for Junos OS Release 13.2X51-D15 and later
Configuring the streaming message types (queue or traffic statistics) to send to a remote server	<pre> [edit services analytics] streaming-servers {   address <i>ip-address</i> {     port <i>number</i> {       stream-type <i>type</i>;       stream-type <i>type</i>;     }   } } </pre>	<p>Requires defining an export profile and applying it to the collector:</p> <ol style="list-style-type: none"> <li>To define an export profile: <pre> [edit services analytics] export-profiles {   <i>profile-name</i> {     interface {       information;       statistics {         queue;         traffic;       }       status {         link;         queue;         traffic;       }     }   }   system {     information;     status {       queue;       traffic;     }   } } </pre> </li> <li>To apply an export profile to the collector: <pre> [edit services analytics] collector {   address <i>ip-address</i> {     port <i>number</i> {       export-profile <i>profile-name</i>;     }   } } </pre> </li> </ol>

Table 603: Network Analytics CLI Changes (*continued*)

Task	CLI for Junos OS Release 13.2X50-D15 and 13.2X51-D10	CLI for Junos OS Release 13.2X51-D15 and later
Configuring the transport protocol for sending streaming data to an external server	No configuration is available. Only the TCP protocol is supported.	Configuration is available. Both TCP and UDP protocols are supported, and can be configured for the same port.  [edit services analytics]  collector { address <i>ip-address</i> { port <i>number1</i> { transport tcp; transport udp; } port <i>number2</i> { transport udp; } } }
Show information about remote streaming server or collector	Issue the <b>show analytics streaming-sever</b> command.	Issue the <b>show analytics collector</b> command.

Related Documentation • [analytics on page 6667](#)

## Understanding Network Analytics Configuration and Status

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. You can enable network analytics by configuring traffic and queue statistics monitoring.

**NOTE:** This topic describes the configuration and status output from Junos OS Release 13.2X50-D15 and 13.2X51-D10 only.

If you had enabled traffic or queue monitoring, you can issue the **show analytics configuration** and **show analytics status** commands to view the global interface configuration and status and that of specific interfaces. The output that is displayed depends on your configuration at the global interface and specific interface levels. For example:

- A global interface configuration (for all interfaces) to disable monitoring supersedes the configuration to enable it on an interface.
- The interface configuration to enable or disable monitoring supersedes the global interface configuration, unless monitoring had been disabled globally for all interfaces.
- If there is no configuration, whether for all interfaces or a specific interface, monitoring is disabled by default (see [Table 604 on page 6498](#)).

Table 604 on page 6498 describes the correlation between the user configuration and the settings that are displayed.

**Table 604: Configuration and Status Output in Junos OS Release 13.2X51-D10 and 13.2X50-D15**

User Configuration	Global or System Settings		Specific Interface Settings	
	Configuration	Status	Configuration	Status
No global or specific interface configuration. This is the default setting.	Auto	Auto	Auto	Disabled
No global interface configuration but the specific interface monitoring is disabled.	Auto	Auto	Disabled	Disabled
No global interface configuration but the specific interface monitoring is enabled.	Auto	Auto	Enabled	Enabled
Monitoring is disabled globally and there is no interface configuration.	Disabled	Disabled	Auto	Disabled
Monitoring is disabled at both the global and specific interface levels.	Disabled	Disabled	Disabled	Disabled
Monitoring is disabled at the global interface level but is enabled at the specific interface level. The global interface <i>Disabled</i> setting supersedes the <i>Enabled</i> setting for a specific interface.	Disabled	Disabled	Enabled	Disabled
Monitoring is enabled for all interfaces but there is no configuration for the specific interface .	Enabled	Enabled	Auto	Enabled
Monitoring is enabled at both the global and specific interface levels.	Enabled	Enabled	Enabled	Enabled
Monitoring is enabled for all interfaces but is disabled for the specific interface.	Enabled	Enabled	Disabled	Disabled

## Understanding Network Analytics Streaming Data

This topic describes the network analytics queue and traffic statistics that are streamed to remote servers.

You can configure one or more remote servers to receive streamed data containing queue and traffic statistics. The format of the streamed data can be Javascript Object Notation (JSON), Comma-separated Values (CSV), or Tab-separated Values (TSV).

**NOTE:** The output shown in this topic applies to Junos OS Release 13.2X51-D10 only. The time is displayed in the Unix epoch format (also known as Unix time or POSIX time).

The following examples show the streamed queue statistics data output in different formats.

- JSON format:

```
{"record-type":"queue-stats","time":1383453988263,"router-id":"qfx5100-switch",
"port":"xe-0/0/18","latency":0,"queue-depth":208}
```

- CSV format:

```
q,1383454067604,qfx5100-switch,xe-0/0/18,0,208
```

- TSV format:

```
q      585870192561703872      qfx5100-switch      xe-0/0/18      (null)
208    2
```

[Table 605 on page 6499](#) describes the output fields for streamed queue statistics data in the order they appear.

**Table 605: Streamed Queue Statistics Data Output Fields**

Field	Description
record-type	Type of statistics. Displayed as: <ul style="list-style-type: none"> <li>• <b>queue-stats</b> (JSON format)</li> <li>• <b>q</b> (CSV or TSV format)</li> </ul>
time	Time (in Unix epoch format) at which the statistics were captured.
router-id	ID of the network analytics host device.
port	Name of the physical port configured for network analytics.
latency	Traffic queue latency in milliseconds.
queue depth	Depth of the traffic queue in bytes.

The following examples show the streamed traffic statistics data output in different formats.

- JSON format:

```

```

[Table 606 on page 6500](#) describes the output fields for streamed traffic statistics data in the order they appear.

**Table 606: Streamed Traffic Statistics Data Output Fields**

Field	Description
record-type	Type of statistics. Displayed as: <ul style="list-style-type: none"> <li><b>traffic-stats</b> (JSON format)</li> <li><b>t</b> (CSV or TSV format)</li> </ul>
time	Time (in Unix epoch format) at which the statistics were captured.
router-id	ID of the network analytics host device.
port	Name of the physical port configured for network analytics.
rxpkt	Total packets received.
rxpps	Total packets received per second.
rxbyte	Total bytes received.
rxbps	Total bytes received per second.
rxdrop	Total incoming packets dropped.
rxerr	Total packets with errors.
txpkt	Total packets transmitted.
txpps	Total packets transmitted per second.
txbyte	Total bytes transmitted.

Table 606: Streamed Traffic Statistics Data Output Fields (*continued*)

Field	Description
txbps	Total bytes transmitted per second.
txdrop	Total transmitted bytes dropped.
txerr	Total transmitted packets with errors (dropped).

## Understanding Enhanced Network Analytics Streaming Data

Network analytics monitoring data can be streamed to remote servers called collectors. You can configure one or more collectors to receive streamed data containing queue and traffic statistics. This topic describes the streamed data output.

**NOTE:** This topic applies to Junos OS Release 13.2X51-D15 or later.

Starting in Junos OS Release 13.2X51-D15, network analytics supports the following streaming data formats and output:

- [Google Protocol Buffer \(GPB\) on page 6501](#)
- [JavaScript Object Notation \(JSON\) on page 6504](#)
- [Comma-separated Values \(CSV\) on page 6504](#)
- [Tab-separated Values \(TSV\) on page 6504](#)
- [Queue Statistics Output for JSON, CSV, and TSV on page 6505](#)
- [Traffic Statistics Output for JSON, CSV, and TSV on page 6505](#)

### Google Protocol Buffer (GPB)

Support for the Google Protocol Buffer (GPB) streaming format has been added in Junos OS Release 13.2X51-D15. This streaming format provides:

- Support for nine types of messages, based on resource type (system-wide or interface-specific).
- Sends messages in a hierarchical format.
- You can generate other stream format messages (JSON, CSV, TSV) from GPB formatted messages.
- Includes a 8-byte message header. See [Table 607 on page 6502](#) for more information.

[Table 607 on page 6502](#) describes the GPB stream format message header.

Table 607: GPB Stream Format Message Header Information

Byte Position	Field
0 to 3	Length of message
4	Message version
5 to 7	Reserved for future use

The following GPB prototype file (**analytics.proto**) provides details about the streamed data:

```
package analytics;

// Traffic statistics related info
message TrafficStatus {
    optional uint32          status          = 1;
    optional uint32          poll_interval   = 2;
}

// Queue statistics related info
message QueueStatus {
    optional uint32          status          = 1;
    optional uint32          poll_interval   = 2;
    optional uint64          lt_high         = 3;
    optional uint64          lt_low          = 4;
    optional uint64          dt_high         = 5;
    optional uint64          dt_low          = 6;
}

message LinkStatus {
    optional uint64          speed           = 1;
    optional uint32          duplex          = 2;
    optional uint32          mtu             = 3;
    optional bool            state           = 4;
    optional bool            auto_negotiation= 5;
}

message InterfaceInfo {
    optional uint32          snmp_index      = 1;
    optional uint32          index           = 2;
    optional uint32          slot           = 3;
    optional uint32          port           = 4;
    optional uint32          media_type      = 5;
    optional uint32          capability      = 6;
    optional uint32          porttype       = 7;
}

message InterfaceStatus {

}

```

### JavaScript Object Notation (JSON)

The JavaScript Object Notation (JSON) streaming format supports the following data:

- Queue statistics data. For example:

```

{"record-type":"queue-stats","time":1383453988263,"router-id":"qfx5100-switch",
"port":"xe-0/0/18","latency":0,"queue-depth":208}

```

See [Table 605 on page 6499](#) for more information about queue statistics output fields.

- Traffic statistics. For example:

```

{"record-type":"traffic-stats","time":1383453986763,"router-id":"qfx5100-switch",
"port":"xe-0/0/16","rxpkt":26524223621,"rxpps":8399588,"rxbyte":3395100629632,
"rxbps":423997832,"rxdrop":0,"rxerr":0,"txpkt":795746503,"txpps":0,"txbyte":101855533467,
"txbps":0,"txdrop":0,"txerr":0}

```

See [Table 606 on page 6500](#) for more information about traffic statistics output fields.

### Comma-separated Values (CSV)

The Comma-separated Values (CSV) streaming format supports the following data:

- Queue statistics. For example:

```

q,1383454067604,qfx5100-switch,xe-0/0/18,0,208

```

See [Table 605 on page 6499](#) for more information about queue statistics output fields.

- Traffic statistics. For example:

```

t,1383454072924,qfx5100-switch,xe-0/0/19,1274299748,82950,163110341556,85603312,0,0,
27254178291,8300088,3488534810679,600002408,27268587050,3490379142400

```

See [Table 606 on page 6500](#) for more information about traffic statistics output fields.

### Tab-separated Values (TSV)

The Tab-separated Values (TSV) streaming format supports the following data:

- Queue statistics. For example:

```

q      585870192561703872      qfx5100-switch      xe-0/0/18      (null)
208      2

```

See [Table 605 on page 6499](#) for more information about queue statistics output fields.

- Traffic statistics. For example:

```

t      1383454139025      qfx5100-switch      xe-0/0/19      1279874033      82022
163823850036      84801488      0      0      27811618258      8199630
3559887126455      919998736      27827356915      3561901685120

```

See [Table 606 on page 6500](#) for more information about traffic statistics output fields.

### Queue Statistics Output for JSON, CSV, and TSV

Table 605 on page 6499 describes the output fields for streamed queue statistics data in the order they appear.

**Table 608: Streamed Queue Statistics Data Output Fields**

Field	Description
record-type	Type of statistics. Displayed as: <ul style="list-style-type: none"> <li>• <b>queue-stats</b> (JSON format)</li> <li>• <b>q</b> (CSV or TSV format)</li> </ul>
time	Time (in Unix epoch format) at which the statistics were captured.
router-id	ID of the network analytics host device.
port	Name of the physical port configured for network analytics.
latency	Traffic queue latency in milliseconds.
queue depth	Depth of the traffic queue in bytes.

### Traffic Statistics Output for JSON, CSV, and TSV

Table 606 on page 6500 describes the output fields for streamed traffic statistics data in the order they appear.

**Table 609: Streamed Traffic Statistics Data Output Fields**

Field	Description
record-type	Type of statistics. Displayed as: <ul style="list-style-type: none"> <li>• <b>traffic-stats</b> (JSON format)</li> <li>• <b>t</b> (CSV or TSV format)</li> </ul>
time	Time (in Unix epoch format) at which the statistics were captured.
router-id	ID of the network analytics host device.
port	Name of the physical port configured for network analytics.
rxpkt	Total packets received.
rxpps	Total packets received per second.
rxbyte	Total bytes received.
rxbps	Total bytes received per second.

Table 609: Streamed Traffic Statistics Data Output Fields (*continued*)

Field	Description
rxdrop	Total incoming packets dropped.
rxerr	Total packets with errors.
txpkt	Total packets transmitted.
txpps	Total packets transmitted per second.
txbyte	Total bytes transmitted.
txbps	Total bytes transmitted per second.
txdrop	Total transmitted bytes dropped.
txerr	Total transmitted packets with errors (dropped).

## Understanding Enhanced Analytics Local File Output

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. You enable network analytics by configuring queue or traffic statistics monitoring, or both. In addition, you can configure a local file for storing the traffic and queue statistics records.

**NOTE:** This topic describes the local file output in Junos OS Release 13.2X51-D15 and later. For information about local file output from earlier releases, see the [monitor start \(Analytics\)](#) topic.

Beginning in Junos OS Release 13.2X51-D15, the traffic and queue monitoring statistics can be stored locally in a single file. The following example shows the output from the **monitor start** command.

```
root@qfx5100-33> monitor start an
root@qfx5100-33>
*** an ***
q,1393947567698432,qfx5100-33,xe-0/0/19,1098572,1373216

```

See [Table 610 on page 6507](#) for queue statistics output, and [Table 611 on page 6507](#) for traffic statistics output. The fields in the tables are listed in the order they appear in the output example.

**Table 610: Output Fields for Queue Statistics in Local Analytics File**

Field	Description	Example in Output
Record type	Type of statistics (queue or traffic monitoring)	<b>q</b>
Time (microseconds)	Unix epoch (or Unix time) in microseconds at which the statistics were captured.	<b>1393947567698432</b>
Router ID	ID of the network analytics host device.	<b>qfx5100-33</b>
Port	Name of the physical port configured for network analytics.	<b>xe-0/0/19</b>
Latency (nanoseconds)	Traffic queue latency in nanoseconds.	<b>1098572</b>
Queue depth (bytes)	Depth of the traffic queue in bytes.	<b>1373216</b>

**Table 611: Output Fields for Traffic Statistics in Local Analytics File**

Field	Description	Example in Output
Record type	Type of statistics (queue or traffic monitoring)	<b>t</b>
Time (microseconds)	Unix epoch (or Unix time) in microseconds at which the statistics were captured.	<b>1393947569874528</b>
Router ID	ID of the network analytics host device.	<b>qfx5100-33</b>
Port	Name of the physical port configured for network analytics.	<b>xe-0/0/16</b>
rxpkt	Total packets received.	<b>12603371884</b>
rxucpkt	Total unicast packets received.	<b>12603371884</b>
rxmcpkt	Total multicast packets received.	<b>0</b>
rxbcpkt	Total broadcast packets received.	<b>0</b>
rxpps	Total packets received per second.	<b>8426023</b>

Table 611: Output Fields for Traffic Statistics in Local Analytics File (*continued*)

Field	Description	Example in Output
rxbyte	Total octets received.	1613231610488
rxbps	Total bytes received per second.	8628248712
rxdroppkt	Total incoming packets dropped.	0
rxrcerr	CRC/Align errors received.	3
txpkt	Total packets transmitted.	5916761
txucpkt	Total unicast packets transmitted.	5916761
txmcpkt	Total multicast packets transmitted.	0
txbcpkt	Total broadcast packets transmitted.	0
txpps	Total packets transmitted per second.	0
txbyte	Total octets transmitted.	757345408
txbps	Bytes per second transmitted.	0
txdroppkt	Total transmitted packets dropped.	0
txrcerr	CRC/Align errors transmitted.	0

## sFlow Technology

---

- [Understanding How to Use sFlow Technology for Network Monitoring on a Switch on page 6509](#)

### Understanding How to Use sFlow Technology for Network Monitoring on a Switch

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology randomly samples network packets and sends the samples to a monitoring station called a *collector*. You can configure sFlow technology on a Juniper Networks switch to continuously monitor traffic at wire speed on all interfaces simultaneously.

This topic describes:

- [Sampling Mechanism and Architecture of sFlow Technology on Switches on page 6509](#)
- [Adaptive Sampling on page 6511](#)
- [sFlow Agent Address Assignment on page 6511](#)
- [sFlow Limitations on Switches on page 6512](#)

---

#### Sampling Mechanism and Architecture of sFlow Technology on Switches

---

sFlow technology uses the following two sampling mechanisms:

- **Packet-based sampling**—Samples one packet out of a specified number of packets from an interface enabled for sFlow technology. Only the first 128 bytes of each packet are sent to the collector. Data collected include the Ethernet, IP, and TCP headers, along with other application-level headers (if present). Although this type of sampling might not capture infrequent packet flows, the majority of flows are reported over time, allowing the collector to generate a reasonably accurate representation of network activity. To configure packet-based sampling, you must specify a sample rate.
- **Time-based sampling**—Samples interface statistics at a specified interval from an interface enabled for sFlow technology. Statistics such as Ethernet interface errors are captured. To configure time-based sampling, you must specify a polling interval.

The sampling information is used to create a network traffic visibility picture. The Juniper Networks Junos operating system (Junos OS) fully supports the sFlow standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks* (see <http://faqs.org/rfcs/rfc3176.html>).

**NOTE:** sFlow technology on the switches samples only raw packet headers. A raw Ethernet packet is the complete Layer 2 network frame.

---

An sFlow monitoring system consists of an sFlow agent embedded in the switch and a centralized collector. The sFlow agent's two main activities are random sampling and statistics gathering. It combines interface counters and flow samples and sends them across the network to the sFlow collector as UDP datagrams, directing those datagrams

to the IP address and UDP destination port of the collector. Each datagram contains the following information:

- The IP address of the sFlow agent
- The number of samples
- The interface through which the packets entered the agent
- The interface through which the packets exited the agent
- The source and destination interface for the packets
- The source and destination VLAN for the packets

EX Series switches, QFX Series switches, and the QFabric systems adopt the distributed sFlow architecture. The sFlow agent has two separate sampling entities that are associated with each Packet Forwarding Engine in case of switches and nodes in case of a QFabric system. These sampling entities are known as subagents. Each subagent has a unique ID that is used by the collector to identify the data source. A subagent has its own independent state and forwards its own sample messages to the sFlow agent. The sFlow agent is responsible for packaging the samples into datagrams and sending them to the sFlow collector. Because sampling is distributed across subagents, the protocol overhead associated with sFlow technology is significantly reduced at the collector.

**NOTE:** On the QFabric system, an sFlow collector must be reachable through the data network. Because each Node device has all routes stored in the default routing instance, the collector IP address should be included in the default routing instance to ensure the collector's reachability from the Node device.

---

**NOTE:** You cannot configure sFlow monitoring on a link aggregation group (LAG), but you can configure it individually on a LAG member interface.

---

Infrequent sampling flows might not be reported in the sFlow information, but over time the majority of flows are reported. Based on a configured sampling rate  $N$ , 1 out of  $N$  packets is captured and sent to the collector. This type of sampling does not provide a 100 percent accurate result in the analysis, but it does provide a result with quantifiable accuracy. A user-configured polling interval defines how often the sFlow data for a specific interface are sent to the collector, but an sFlow agent can also schedule polling.

**NOTE:** We recommend that you configure the same sample rate for all the ports in a line card. If you configure different sample rates, the lowest value is used for all ports on the line card..

---

**NOTE:** If the mastership assignment changes in a Virtual Chassis setup, sFlow technology continues to function.

### Adaptive Sampling

To ensure sampling accuracy and efficiency, EX Series switches and QFX Series devices use adaptive sFlow sampling. Adaptive sampling monitors the overall incoming traffic rate on the device and provides feedback to the interfaces to dynamically adapt their sampling rate to traffic conditions. The sFlow agent reads the statistics on the interfaces every few seconds (12 seconds for EX Series switches and 5 seconds for QFX Series devices) and identifies five interfaces with the highest number of samples.

On a Flexible PIC Concentrator (FPC), when the CPU processing limit is reached because of sflow sample processing, a binary backoff algorithm is initiated. This reduces the sampling load, arriving through the top five sample-producing interfaces on that FPC by half. The backoff algorithm achieves this by doubling the sampling rate on these five earmarked interfaces. This process is repeated until the CPU-load due to sflow on the given FPC comes down to an acceptable level.

On a QFabric system, sFlow technology monitors the interfaces on each node device as a group, and implements the binary backoff algorithm based on the traffic on that group of interfaces.

**NOTE:** On the QFX Series standalone switches, if you configure sFlow technology monitoring on multiple interfaces and with a high sampling rate, we recommend that you specify a collector that is on the data network instead of on the management network. Having a high volume of sFlow technology monitoring traffic on the management network might interfere with other management interface traffic.

Using adaptive sampling prevents overloading of the CPU and keeps the device operating at its optimum level even when there is a change in traffic patterns on the interfaces. The reduced sampling rate is used until the device is rebooted or when a new sampling rate is configured.

**NOTE:** sFlow technology on EX Series switches does not support graceful restart. When a graceful restart occurs, the adaptive sampling rate is set to the user-configured sampling rate.

### sFlow Agent Address Assignment

The sFlow collector uses the sFlow agent's IP address to determine the source of the sFlow data. You can configure the IP address of the sFlow agent to ensure that the agent ID of the sFlow agent remains constant. If you do not specify the IP address to be assigned

to the agent, an IP address is automatically assigned to the agent based on the following order of priority of interfaces configured on the device:

EX Series Devices	QFX Series Devices
<ol style="list-style-type: none"> <li>1. Virtual Management Ethernet (VME) interface</li> <li>2. Management Ethernet interface</li> </ol>	<ol style="list-style-type: none"> <li>1. Management Ethernet interface me0 IP address</li> <li>2. Any Layer 3 interface if the me0 IP address is not available</li> </ol>

If a particular interface is not configured, the IP address of the next interface in the priority list is used as the IP address for the agent. Once an IP address is assigned to the agent, the agent ID is not modified until the sFlow service is restarted. At least one interface has to be configured for an IP address to be assigned to the agent. When the agent's IP address is assigned automatically, the IP address is dynamic and changes when the switch reboots.

On the QFabric system, the following default values are used if the optional parameters are not configured:

- Agent ID is the management IP address of the default partition.
- Source IP is the management IP address of the default partition.

In addition, the QFabric system subagent ID (which is included in the sFlow datagrams) is the ID of the node group from which the datagram is sent to the collector.

sFlow data can be used to provide network traffic visibility information. You can explicitly configure the source IP address to be assigned to the sFlow datagrams. If you do not explicitly configure the IP address, the IP address of any of the configured Layer 3 network interfaces is used as the source IP address. If a Layer 3 IP address is not configured, then the agent IP address is used as the source IP address.

### sFlow Limitations on Switches

On the QFX Series, limitations of sFlow traffic sampling include the following:

- sFlow sampling on ingress interfaces does not capture CPU-bound traffic.
- sFlow sampling on egress interfaces does not support broadcast and multicast packets.
- Egress samples do not contain modifications made to the packet in the egress pipeline.
- If a packet is discarded because of a firewall filter, the reason code for discarding the packet is not sent to the collector.
- The out-priority field for a VLAN is always set to 0 (zero) on ingress and egress samples.
- On QFX5100 standalone switches and the QFX Series Virtual Chassis (including mixed QFX Series Virtual Chassis), egress firewall filters are not applied to sFlow sampling packets. On these platforms, the software architecture is different from that on other QFX Series devices—sFlow packets are sent by the Routing Engine (not the line card on the host) and do not transit the switch. Egress firewall filters affect data packets that are transiting a switch, but do not affect packets sent by the Routing Engine. As a result, sFlow sampling packets are always sent to the sFlow collector.

EX9200 switches support configuration of only one sampling rate (inclusive of ingress and egress rates) on an FPC. To support compatibility with the sflow configuration of other Juniper Networks products, EX9200 switches still accept multiple rate configuration on different interfaces of the same FPC. However, the switch programs the lowest rate as the sampling rate for all the interfaces of that FPC. The sFlow show command (**show sflow interfaces**) displays the configured rate and the actual (effective) rate. However, different rates on different FPCs is still supported on EX9200 switches.

## Understanding the Implementation of SNMP

The QFX Series products support the Simple Network Management Protocol (SNMP) that is implemented in the Junos OS software.

**NOTE:** By default, SNMP is not enabled on devices running Junos OS. For information on enabling SNMP on a device running Junos OS, see [“Configuring SNMP” on page 1356](#).

A typical SNMP implementation includes the following components:

- Network management system (NMS)—The NMS is a combination of hardware and software that is used to monitor and administer a network. Software running on the

NMS includes the SNMP manager, which collects information about network connectivity, activity, and events by polling the managed devices.

- **Managed device**—A managed device (also called a network element) is any device managed by the NMS. Routers and switches are common examples of managed devices. The SNMP agent is the SNMP process that resides on the managed device and communicates with the NMS.
- **SNMP agent**—The SNMP agent exchanges network management information with SNMP manager software running on an NMS, or host. The agent responds to requests for information and actions from the manager. The agent also controls access to the agent's MIB, the collection of objects that can be viewed or changed by the SNMP manager.

SNMP data is stored in a highly structured, hierarchical format known as a management information base (MIB). The MIB structure is based on a tree structure, which defines a grouping of objects into related sets. Each object in the MIB is associated with an object identifier (OID), which names the object. The “leaf” in the tree structure is the actual managed object instance, which represents a resource, event, or activity that occurs in your network device. The SNMP implementation in Junos OS uses both standard (developed by IETF and documented in RFCs) and Juniper Networks enterprise-specific MIBs.

Communication between the agent and the manager occurs in one of the following forms:

- **Get, GetBulk, and GetNext requests**—The manager requests information from the agent; the agent returns the information in a **Get** response message.
- **Set requests**—The manager changes the value of a MIB object controlled by the agent; the agent indicates status in a **Set** response message.
- **Traps notification**—The agent sends traps to notify the manager of significant events that occur on the network device.

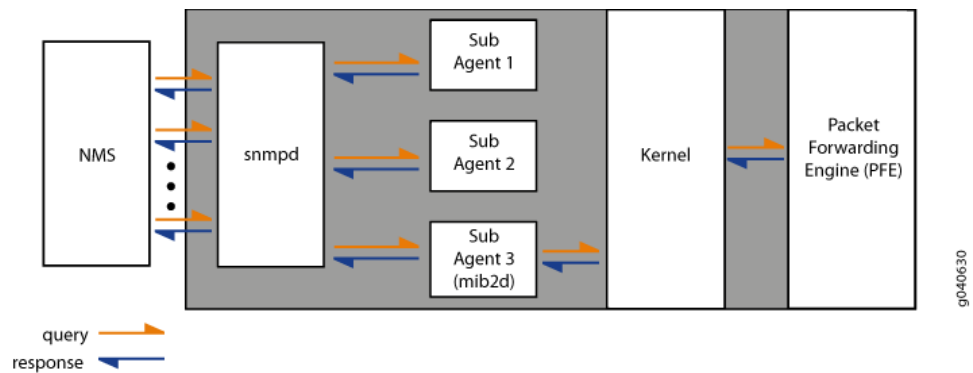

The processes maintaining the SNMP management data include:

- A master SNMP agent (known as SNMP process, or `snmpd`) that resides on the managed device and is managed by the NMS or host.
- Various subagents that reside on different modules of Junos OS, such as the Routing Engine, and are managed by the master SNMP agent.
- Junos OS processes that share data with the subagents when polled for SNMP data (for example, interface-related MIBs).

When an NMS polls the master agent for data, the master agent immediately shares the data with the NMS if the requested data is available from the master agent or one of the subagents. However, if the requested data is not maintained by the master agent or subagents, the subagent polls the Junos OS kernel or the process that maintains that data. The Junos OS kernel may need to get the data from the Packet Forwarding Engine. On receiving the required data, the subagent passes the response back on to the master agent, which in turn passes it on to the NMS.

Figure 224 on page 6515 shows the communication flow among the NMS, SNMP master agent (snmpd), SNMP subagents, Junos OS kernel, and Packet Forwarding Engine.

Figure 224: SNMP Communication Flow

When a significant event, most often an error or a failure, occurs on a network device, the SNMP agent sends notifications to the SNMP manager. SNMP notifications can be sent as traps (unconfirmed notifications) or inform requests (confirmed notifications).

Junos OS supports trap queuing to ensure that traps are not lost because of temporary unavailability of routes. Two types of queues, destination queues and a throttle queue, are formed to ensure delivery of traps and control the trap traffic. On QFX Series products, the maximum size of trap queues (throttle queue plus destination queue) is 40,960 traps. The maximum size of any one queue is 20,480 traps.

Junos OS forms a destination queue when a trap to a particular destination is returned because the host is not reachable, and it adds the subsequent traps to the same destination to the queue. Junos OS checks for availability of routes every 30 seconds, and sends the traps from the destination queue in a round-robin fashion.

If the trap delivery fails, the trap is added back to the queue, and the delivery attempt counter and the next delivery attempt timer for the queue are reset. Subsequent attempts occur at progressive intervals of 1 minute, 2 minutes, 4 minutes, and 8 minutes. The maximum delay between the attempts is 8 minutes, and the maximum number of attempts is ten. After ten unsuccessful attempts, the destination queue and all the traps in the queue are deleted.

Junos OS also has a throttle mechanism to control the number of traps (throttle threshold) sent during a particular time period (throttle interval). The throttle mechanism ensures consistency in trap traffic, especially when large numbers of traps are generated because of interface status changes. The throttle interval period begins when the first trap arrives at the throttle. All traps within the trap threshold are processed, and the traps beyond the threshold limit are queued. The default throttle threshold is 500 traps, and the throttle interval default is 5 seconds.

**NOTE:** You cannot configure trap queueing in Junos OS. You cannot view information about trap queues except for what is provided in the system logs.

## Understanding the Implementation of SNMP on the QFabric System

SNMP monitors network devices from a central location. The QFabric system supports the basic SNMP architecture of Junos OS, but its implementation of SNMP differs from that of other devices running Junos OS. This topic provides an overview of the SNMP implementation on the QFabric system.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent resides in the QFabric Director software and is responsible for receiving and distributing all traps as well as responding to all the queries of the SNMP manager. For example, traps that are generated by a Node device are sent to the SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

**NOTE:** In its SNMP implementation, the QFabric system acts as an SNMP proxy server, and requires more time to process SNMP requests than a typical Junos OS device does. The default timeout setting on most SNMP client applications is 3 seconds, which is not enough time for the QFabric system to respond to SNMP requests, so the results of your `mibwalk` command may be incomplete. For this reason, we recommend that you change the SNMP timeout setting to 5 seconds or longer for the QFabric system to complete the responses to your requests.

Support for SNMP on the QFabric system includes:

- Support for the SNMP Version 1 (v1) and v2.

**NOTE:** Only SNMPv2 traps are supported on the QFabric system.

- Support for the following standard MIBs:
  - RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*
  - RFC 1157, *A Simple Network Management Protocol (SNMP)*
  - RFC 1212, *Concise MIB Definitions*
  - RFC 1213, *Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II* (partial support, including the system group and interfaces group)
  - RFC 1215, *A Convention for Defining Traps for use with the SNMP*
  - RFC 1901, *Introduction to Community-based SNMPv2*

- RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 2011, *SNMPv2 Management Information Base for the Internet Protocol Using SMIv2*

- RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol Using SMIv2*
- RFC 2233, *The Interfaces Group MIB Using SMIv2*
- RFC 2571, *An Architecture for Describing SNMP Management Frameworks* (read-only access) (excluding SNMPv3)
- RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (read-only access) (excluding SNMPv3)
- RFC 2576, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework* (excluding SNMPv3)
- RFC 2578, *Structure of Management Information Version 2 (SMIv2)*
- RFC 2579, *Textual Conventions for SMIv2*
- RFC 2580, *Conformance Statements for SMIv2*
- RFC 2665, *Definitions of Managed Objects for the Ethernet-like Interface Types*
- RFC 2863, *The Interfaces Group MIB*
- RFC 3410, *Introduction and Applicability Statements for Internet Standard Management Framework* (excluding SNMPv3)
- RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Framework* (excluding SNMPv3)
- RFC 3412, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (excluding SNMPv3)
- RFC 3413, *Simple Network Management Protocol (SNMP) Applications* (excluding SNMPv3)
- RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*
- RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*
- RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*
- RFC 3584, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework* (excluding SNMPv3)
- RFC 4188, *Definitions of Managed Objects for Bridges*

- RFC 4293, *Management Information Base for the Internet Protocol (IP)*
- RFC 4363b, *Q-Bridge VLAN MIB*
- Support for the following Juniper Networks enterprise-specific MIBs:
  - Chassis MIB (mib-jnx-chassis.txt)
  - Class-of-Service MIB (mib-jnx-cos.txt)
  - Configuration Management MIB (mib-jnx-cfgmngmt.txt)
  - Fabric Chassis MIB (mib-jnx-fabric-chassis.txt)
  - Interface MIB Extensions (mib-jnx-if-extensions.txt)
  - Power Supply Unit MIB (mib-jnx-power-supply-unit.txt)
  - QFabric MIB (mib-jnx-qf-smi.txt)
  - Utility MIB (mib-jnx-util.txt)
- Support for operational mode commands—Limited to the **show snmp statistics** command. You may issue other SNMP requests, including **get**, **get next**, and **walk** requests, by using external SNMP client applications.

## Fabric Chassis MIB

The Juniper Networks enterprise-specific SNMP Fabric Chassis MIB (mib-jnx-fabric-chassis) provides hardware information about the QFabric system and its component devices in a single MIB. The Fabric Chassis MIB is based on the Juniper Networks enterprise-specific Chassis MIB that provides information for individual devices. Unlike the Chassis MIB, the Fabric Chassis MIB represents the QFabric system component devices as part of the QFabric system. Only the information from the Fabric Chassis MIB (and not from individual Chassis MIBs) is available to SNMP management clients of the QFabric system.

The Fabric Chassis MIB uses the basic information structure of the Chassis MIB, but adds another level of indexing that provides detailed information about QFabric system devices. Each physical device in a QFabric system (such as a Node device or an Interconnect device) is represented with its hardware components, including the power supply, fans, and front and rear cards.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent (snmpd) resides in the QFabric system Director software and is responsible for receiving and distributing all traps as well as responding to all queries from the SNMP manager. In addition, there is an SNMP subagent running in the Routing Engine of each Node group and Interconnect device. The SNMP subagent manages the information about the component device, and that information is communicated to the SNMP agent in the Director software as needed. Traps that are generated by a Node device are sent to the

SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

Table 612 on page 6519 describes the tables and objects in the Fabric Chassis MIB.

**Table 612: Fabric Chassis MIB Tables and Objects**

Table or Object Name	Root OID	Description
<b>Tables with Counterparts in the Chassis MIB</b>		
jnxFabricContainersTable	1.3.6.1.4.1.2636.3.42.2.2.2	<p>Provides information about different types of containers in QFabric system devices.</p> <ul style="list-style-type: none"> <li>Containers for Interconnect devices include fan trays, power supply units, control boards, and so on.</li> <li>Containers for Node devices include fan trays, power supply units, Flexible PIC Concentrator (FPC), PICs, and so on.</li> <li>Containers for the Director devices include CPU, memory, fan trays, power supply units, and hard disks. The containers have a non-hierarchical or flat structure, and components in them are organized as siblings to each other.</li> </ul>
jnxFabricContentsTable	1.3.6.1.4.1.2636.3.42.2.2.3	<p>Contains contents that are present across all devices represented in the jnxFabricDeviceTable object. This table includes all field replaceable units (FRUs) and non-FRUs for QFabric system devices.</p> <ul style="list-style-type: none"> <li>Contents in the Interconnect devices include fan trays and control boards.</li> <li>Contents in the Node devices include fan trays and power supply units.</li> <li>Contents in the Director devices include CPUs, memory, fan trays, power supply units, and hard disks, but do not include network interface cards (NICs).</li> </ul>
jnxFabricFilledTable	1.3.6.1.4.1.2636.3.42.2.2.4	<p>Shows the status of containers in QFabric devices. The jnxFabricFilledState object represents the state of the component: (1) unknown, (2) empty, or (3) filled.</p> <p><b>NOTE:</b> The jnxFabricFilledTable object does not contain information about the Director group.</p>
jnxFabricOperatingTable	1.3.6.1.4.1.2636.3.42.2.2.5	<p>Represents different operating parameters for the contents that are populated in the jnxFabricContentsTable object.</p> <ul style="list-style-type: none"> <li>Contents in each Node device and Interconnect device include fan trays, power supply units, FPC, PIC, and Routing Engine.</li> <li>Contents in the Director device include CPUs, memory, fan trays, power supply units, and hard disks, but do not include network interface cards (NICs).</li> </ul> <p>The jnxFabricOperatingState object provides the state of the device: (1) unknown, (2) running, (3) ready, (4) reset, (5) runningAtFullSpeed (for fans only), (6) down, (6) off (for power supply units), or (7) standby.</p>

Table 612: Fabric Chassis MIB Tables and Objects (*continued*)

Table or Object Name	Root OID	Description
jnxFabricRedundancyTable	1.3.6.1.4.1.2636.3.42.2.2.6	<p>Represents the redundancy information that is available at different subsystem levels across the QFabric system. Information about the Routing Engines in Node devices is included, but there are no corresponding entries for Interconnect devices in this table. The jnxFabricRedundancyState object indicates the state of the subsystem: (1) unknown, (2) master, (3) backup, or (4) disabled.</p> <p><b>NOTE:</b> Information about redundant Director devices, virtual machines (VMs) within Director groups, and Virtual Chassis devices is not available at this time.</p>
jnxFabricFruTable	1.3.6.1.4.1.2636.3.42.2.2.7	<p>Contains all FRUs for the QFabric system in the jnxFabricDeviceTable table. The FRUs are listed regardless of whether or not they are installed or online. The jnxFabricFruState object represents the state of the FRU, including online, offline, or empty, and so on. This table also contains information about each FRU, such as name, type, temperature, time last powered on, and time last powered off.</p> <p><b>NOTE:</b> The jnxFabricFruTable table does not include network interface cards (NICs) on Director devices.</p>
<b>Table Specific to the Fabric Chassis MIB</b>		
jnxFabricDeviceTable	1.3.6.1.4.1.2636.3.42.2.2.1	<p>Contains information about all devices in the QFabric system. This table organizes scalar variables represented in the Chassis MIB into a table format for the QFabric system component devices. Columns in this table include device information such as model, device alias, and serial number. The jnxFabricDeviceIndex identifies each QFabric system device (Node device, Interconnect device, and Director device).</p> <p><b>NOTE:</b> At this time, information about the Virtual Chassis is not available.</p> <p><b>NOTE:</b> The following objects are not supported:</p> <ul style="list-style-type: none"> <li>jnxFabricDeviceEntryRevision</li> <li>jnxFabricDeviceEntryFirmwareRevision</li> <li>jnxFabricDeviceEntryKernelMemoryUsedPercent</li> </ul>

#### Scalar Variables

Table 612: Fabric Chassis MIB Tables and Objects (*continued*)

Table or Object Name	Root OID	Description
<p>The following scalar variables are supported:</p> <ul style="list-style-type: none"> <li>• jnxFabricClass</li> <li>• jnxFabricDescr</li> <li>• jnxFabricSerialNo</li> <li>• jnxFabricRevision</li> <li>• jnxFabricLastInstalled</li> <li>• jnxFabricContentsLastChange</li> <li>• jnxFabricFilledLastChange</li> </ul>	1.3.6.1.4.1.2636.3.42.2.1	<p>Describe the QFabric system as a whole.</p> <p><b>NOTE:</b> The jnxFabricFirmwareRevision scalar variable is not supported at this time.</p>

Table 613 on page 6521 describes the SNMPv2 traps that are defined in the Fabric Chassis MIB.

**NOTE:** Only SNMPv2 traps are supported on the QFabric system.

Table 613: Fabric Chassis MIB SNMPv2 Traps

Trap Group and Name	Root OID	Description
<p>jnxFabricChassisTraps group—Includes the following traps:</p> <ul style="list-style-type: none"> <li>• jnxFabricPowerSupplyFailure</li> <li>• jnxFabricFanFailure</li> <li>• jnxFabricOverTemperature</li> <li>• jnxFabricRedundancySwitchover</li> <li>• jnxFabricFruRemoval</li> <li>• jnxFabricFruInsertion</li> <li>• jnxFabricFruPowerOff</li> <li>• jnxFabricFruPowerOn</li> <li>• jnxFabricFruFailed</li> <li>• jnxFabricFruOffline</li> <li>• jnxFabricFruOnline</li> <li>• jnxFabricFruCheck</li> <li>• jnxFabricFEBSwitchover</li> <li>• jnxFabricHardDiskFailed</li> <li>• jnxFabricHardDiskMissing</li> <li>• jnxFabricBootFromBackup</li> </ul>	1.3.6.1.4.1.2636.4.19	<p>Indicates an alarm condition.</p> <p><b>NOTE:</b> Hardware events on the Director group are detected by scanning. As a result, a trap may not be generated until up to 30 seconds after the event has occurred.</p> <p><b>NOTE:</b> The software does not distinguish between the fan removal and fan failure events on the Director group. In each case, both the jnxFabricFanFailure and jnxFabricFruFailed traps are generated.</p>

## Utility MIB

The Juniper Networks enterprise-specific Utility MIB, whose object ID is {jnxUtilMibRoot 1}, defines objects for counters, integers, and strings. The Utility MIB contains one table for each of the following five data types:

- 32-bit counters
- 64-bit counters
- Signed integers
- Unsigned integers
- Octet strings

Each data type has an arbitrary ASCII name, which is defined when the data is populated, and a timestamp that shows the last time when the data instance was modified. For a downloadable version of this MIB, see

[http://www.juniper.net/techpubs/en\\_US/junos14.1/topics/reference/mibs/mib-jnx-util.txt](http://www.juniper.net/techpubs/en_US/junos14.1/topics/reference/mibs/mib-jnx-util.txt).

For information about the enterprise-specific Utility MIB objects, see the following topics:

## SNMPv3 Overview

The QFX3500 switch supports SNMP version 3 (SNMPv3). SNMPv3 enhances the functionality of SNMPv1 and SNMPv2c by supporting user authentication and data encryption. SNMPv3 uses the user-based security model (USM) to provide security for SNMP messages, and the view-based access control model (VACM) for user access control.

SNMPv3 features include:

- With USM, the SNMP messages between the SNMP manager and the agent can have the message source authenticated and the data integrity checked. USM reduces messaging delays and message replays by enforcing timeout limits and by checking for duplicate message request IDs.
- VACM complements USM by providing user access control for SNMP queries to the agent. You define access privileges that you wish to extend to a group of one or more users. Access privileges are determined by the security model parameters (**usm**, **v1**, or **v2**) and security level parameters (**authentication**, **privacy**, or **none**). For each security level, you must associate one MIB view for the group. Associating a MIB view with a group grants the read, write, or notify permission to a set of MIB objects for the group.
- You configure security parameters for each user, including the username, authentication type and authentication password, and privacy type and privacy password. The username given to each user is in a format that is dependent on the security model configured for that user.
- To ensure messaging security, another type of username, called the security name, is included in the messaging data that is sent between the local SNMP server and the destination SNMP server. Each user name is mapped to a security name, but the security name is in a format that is independent of the security model.
- Trap entries in SNMPv3 are created by configuring the notify, notify filter, target address, and target parameters. The **notify** statement specifies the type of notification (trap) and contains a single tag that defines a set of target addresses to receive a trap. The notify filter defines access to a collection of trap object identifiers (OIDs). The target address defines the address of an SNMP management application and other attributes used in sending notifications. Target parameters define the message processing and security parameters used in sending notifications to a particular target.

## Minimum SNMPv3 Configuration on a Device Running Junos OS

To configure the minimum requirements for SNMPv3, include the following statements at the `[edit snmp v3]` and `[edit snmp]` hierarchy levels:

**NOTE:** You must configure at least one view (notify, read, or write) at the `[edit snmp view-name]` hierarchy level.

```
[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
  tag tag-name;
}
notify-filter profile-name {
  oid object-identifier (include | exclude);
}
snmp-community community-index {
  security-name security-name;
}
target-address target-address-name {
  address address;
  target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);

### RMON Overview

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

An operational support system (OSS) or a fault-monitoring system can be used to automatically monitor events that track many different metrics, including performance, availability, faults, and environmental data. For example, an administrator might want to know when the internal temperature of a chassis has risen above a configured threshold, which might indicate that a chassis fan tray is faulty, the chassis air flow is impeded, or the facility cooling system in the vicinity of the chassis is not operating normally.

The RMON MIB also defines tables that store various statistics for Ethernet interfaces, including the **etherStatsTable** and the **etherHistoryTable**. The **etherStatsTable** contains cumulative real-time statistics for Ethernet interfaces, such as the number of unicast, multicast, and broadcast packets received on an interface. The **etherHistoryTable** maintains a historical sample of statistics for Ethernet interfaces. The control of the **etherHistoryTable**, including the interfaces to track and the sampling interval, is defined by the RMON **historyControlTable**.

To enable RMON alarms, you perform the following steps:

1. Configure SNMP, including trap groups. You configure SNMP at the `[edit snmp]` hierarchy level.
2. Configure rising and falling events in the `eventTable`, including the event types and trap groups. You can also configure events using the CLI at the `[edit snmp rmon event]` hierarchy level.
3. Configure alarms in the `alarmTable`, including the variables to monitor, rising and falling thresholds, the sampling types and intervals, and the corresponding events to generate when alarms occur. You can also configure alarms using the CLI at the `[edit snmp rmon alarm]` hierarchy level.

Extensions to the `alarmTable` are defined in the Juniper Networks enterprise-specific MIB `jnxRmon` (`mib-jnx-rmon.txt`).

### Alarm Thresholds and Events

By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range (see [Figure 225 on page 6526](#)).

Figure 225: Setting Thresholds

Events are only generated when the alarm threshold is first crossed in any one direction rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs. This considerably reduces the quantity of events that are produced by the system, making it easier for operations staff to react when events do occur.

Before you configure remote monitoring, you should identify what variables need to be monitored and their allowable operational range. This requires some period of baselining to determine the allowable operational ranges. An initial baseline period of at least

3 months is not unusual when you first identify the operational ranges and define thresholds, but baseline monitoring should continue over the life span of each monitored variable.

## RMON MIB Event, Alarm, Log, and History Control Tables

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

[Table 614 on page 6527](#) provides each field in the RMON eventTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the `[edit snmp rmon]` hierarchy level.

**Table 614: RMON Event Table**

Field	Description	Statement [edit snmp rmon]
eventDescription	Text description of this event.	<b>description</b>
eventType	Type of event (for example, log, trap, or log and trap).	<b>type</b>
eventCommunity	Trap group to which to send this event, as defined in the Junos OS configuration. (This is not the same as the SNMP community.)	<b>community</b>
eventOwner	Entity (for example, manager) that created this event.	—
eventStatus	Status of this row (for example, valid, invalid, or createRequest).	—

[Table 615 on page 6527](#) provides each field in the RMON alarmTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the `[edit snmp rmon]` hierarchy level.

**Table 615: RMON Alarm Table**

Field	Description	Statement [edit snmp rmon]
alarmStatus	Status of this row (for example, valid, invalid, or createRequest)	—
alarmInterval	Sampling period (in seconds) of the monitored variable	<b>interval</b>
alarmVariable	Object identifier (OID) and instance of the variable to be monitored	—

Table 615: RMON Alarm Table (*continued*)

Field	Description	Statement [edit snmp rmon]
alarmValue	Actual value of the sampled variable	—
alarmSampleType	Sample type (absolute or delta changes)	<b>sample-type</b>
alarmStartupAlarm	Initial alarm (rising, falling, or either)	<b>startup-alarm</b>
alarmRisingThreshold	Rising threshold against which to compare the value	<b>rising-threshold</b>
alarmFallingThreshold	Falling threshold against which to compare the value	<b>falling-threshold</b>
alarmRisingEventIndex	Index (row) of the rising event in the event table	<b>rising-event-index</b>
alarmFallingEventIndex	Index (row) of the falling event in the event table	<b>falling-event-index</b>

Table 616 on page 6528 provides each field in the `jnxRmon jnxRmonAlarmTable`, which is an extension to the RMON `alarmTable`. You can troubleshoot the RMON agent, `rmopd`, that runs on a switch by inspecting the contents of the `jnxRmonAlarmTable` object.

Table 616: jnxRmon Alarm Table

Field	Description
<code>jnxRmonAlarmGetFailCnt</code>	Number of times the internal <b>Get</b> request for the variable failed
<code>jnxRmonAlarmGetFailTime</code>	Value of the <code>sysUpTime</code> object when the last failure occurred
<code>jnxRmonAlarmGetFailReason</code>	Reason why the <b>Get</b> request failed
<code>jnxRmonAlarmGetOkTime</code>	Value of the <code>sysUpTime</code> object when the variable moved out of failure state
<code>jnxRmonAlarmState</code>	Status of this alarm entry

Table 617 on page 6528 provides each field in the RMON `historyControlTable`, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the **[edit snmp rmon history]** hierarchy level. The `historyControlTable` controls the RMON `etherHistoryTable`.

Table 617: RMON History Control Table

Field	Description	Statement [edit snmp rmon history]
<code>historyControlDataSource</code>	Identifies the source of the data for which historical data was collected.	<b>interface</b>

Table 617: RMON History Control Table (*continued*)

Field	Description	Statement [edit snmp rmon history]
historyControlBucketsRequested	Requested number of discrete time intervals over which data is to be saved.	<b>bucket-size</b>
historyControlBucketsGranted	Number of discrete sampling intervals over which data is to be saved.	—
historyControlInterval	Interval, in seconds, over which the data is sampled for each bucket.	<b>interval</b>
historyControlOwner	Entity that configured this entry.	<b>owner</b>
historyControlStatus	Status of this entry.	—

## Understanding Health Monitoring

Health monitoring is an SNMP feature that extends the RMON alarm infrastructure to provide monitoring for a predefined set of objects (such as file system usage, CPU usage, and memory usage), and for Junos OS processes.

You enable the health monitor feature using the **health-monitor** statement at the **[edit snmp]** hierarchy level. You can also configure health monitor parameters such as a falling threshold, rising threshold, and interval. If the value of a monitored object exceeds the rising or falling threshold, an alarm is triggered and an event may be logged.

The falling threshold is the lower threshold for the monitored object instance. The rising threshold is the upper threshold for the monitored object instance. Each threshold is expressed as a percentage of the maximum possible value. The interval represents the period of time, in seconds, over which the object instance is sampled and compared with the rising and falling thresholds.

Events are only generated when a threshold is first crossed in any one direction, rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs.

System log entries for health monitor events have a corresponding HEALTHMONITOR tag and not a generic SNMPD\_RMON\_EVENTLOG tag. However, the health monitor sends generic RMON risingThreshold and fallingThreshold traps. You can use the **show snmp health-monitor** operational command to view information about health monitor alarms and logs.

When you configure the health monitor, monitoring information for certain object instances is available, as shown in [Table 618 on page 6530](#).

**Table 618: Monitored Object Instances**

Object	Description
jnxHrStoragePercentUsed.1	Monitors the <b>/dev/ad0s1a</b> : file system on the switch. This is the root file system mounted on <b>/</b> .
jnxHrStoragePercentUsed.2	Monitors the <b>/dev/ad0s1e</b> : file system on the switch. This is the configuration file system mounted on <b>/config</b> .
jnxOperatingCPU (RE0)	Monitors CPU usage by the Routing Engine (RE0).
jnxOperatingBuffer (RE0)	Monitors the amount of memory available on the Routing Engine (RE0).
sysApplElmtRunCPU	Monitors the CPU usage for each Junos OS process (also called daemon). Multiple instances of the same process are monitored and indexed separately.
sysApplElmtRunMemory	Monitors the memory usage for each Junos OS process. Multiple instances of the same process are monitored and indexed separately.

**Table 620: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis**

MIB	Description
Alarm MIB (mib-jnx-chassis-alarm)	<p>Provides support for alarms from the switch.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis-alarm.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis-alarm.txt</a>.</p> <p>For more information, see <i>Alarm MIB</i>.</p>
Analyzer MIB (mib-jnx-analyzer)	<p>Contains analyzer and remote analyzer data related to port mirroring.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-analyzer.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-analyzer.txt</a>.</p> <p>For more information, see <i>Analyzer MIB</i>.</p>
Chassis MIB (mib-jnx-chassis)	<p>Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and airflow) and inventory support for the chassis, Flexible PIC Concentrators (FPCs), and PICs.</p> <p><b>NOTE:</b> The jnxLEDTable table has been deprecated.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis.txt</a>.</p> <p>For more information, see <i>Chassis MIBs</i>.</p>
Chassis Definitions for Router Model MIB (mib-jnx-chas-defines)	<p>Contains the object identifiers (OIDs) that are used by the Chassis MIB to identify routing and switching platforms and chassis components. The Chassis MIB provides information that changes often, whereas the Chassis Definitions for Router Model MIB provides information that changes less often.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chas-defines.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chas-defines.txt</a>.</p> <p>For more information, see <i>Chassis MIBs</i>.</p>
Class-of-Service MIB (mib-jnx-cos)	<p>Provides support for monitoring interface output queue statistics per interface and per forwarding class.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt</a>.</p> <p>For more information, see <i>Class-of-Service MIB</i>.</p>

**Table 620: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis (*continued*)**

MIB	Description
Configuration Management MIB (mib-jnx-cfgmgmt)	<p>Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made.</p> <p>A history of the last 32 configuration changes is kept in jnxCmChgEventTable.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt</a>.</p> <p>For more information, see <i>Configuration Management MIB</i>.</p>
Ethernet MAC MIB (mib-jnx-mac)	<p>Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, inoctets, inframes, outoctets, and outframes on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mac.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mac.txt</a>.</p> <p>For more information, see <i>Ethernet MAC MIB</i>.</p>
Event MIB (mib-jnx-event)	<p>Defines a generic trap that can be generated using an operations script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found.</p> <p>In Junos OS release 13.2X51-D10 or later, if you configured an event policy to raise a trap when a new SNMP trap target is added, the SNMPD_TRAP_TARGET_ADD_NOTICE trap is generated with information about the new target.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-event.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-event.txt</a>.</p> <p>For more information, see <i>Event MIB</i>.</p>
Firewall MIB (mib-jnx-firewall)	<p>Provides support for monitoring firewall filter counters.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-firewall.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-firewall.txt</a>.</p> <p>For more information, see <i>Firewall MIB</i>.</p>

**Table 620: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis (*continued*)**

MIB	Description
Host Resources MIB (mib-jnx-hostresources)	<p>Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt</a>.</p> <p>For more information, see <i>Host Resources MIB</i>.</p>
Interface MIB (Extensions) (mib-jnx-if-extensions)	<p>Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt</a>.</p> <p>For more information, see <i>Interface MIB</i>.</p>
MPLS MIB (mib-jnx-mpls)	<p>Provides MPLS information and defines MPLS notifications.</p> <p><b>NOTE:</b> This MIB is not supported on the QFX5100 switch.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls.txt</a>.</p> <p>For more information, see <i>MPLS MIB</i>.</p>
MPLS LDP MIB (mib-jnx-mpls-ldp)	<p>Contains object definitions as described in RFC 3815, <i>Definitions of Managed Objects for the Multiprotocol Label Switching (MPLS), Label Distribution Protocol (LDP)</i>.</p> <p><b>NOTE:</b> This MIB is not supported on the QFX5100 switch.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls-ldp.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls-ldp.txt</a>.</p> <p>For more information, see <i>MPLS LDP MIB</i>.</p>
Ping MIB (mib-jnx-ping)	<p>Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-ping.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-ping.txt</a>.</p> <p>For more information, see <i>PING MIB</i>.</p>

**Table 620: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis (*continued*)**

MIB	Description
RMON Events and Alarms MIB (mib-jnx-rmon)	<p>Supports Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments the alarmTable object with additional information about each alarm. Two additional traps are also defined to indicate when problems are encountered with an alarm.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-rmon.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-rmon.txt</a>.</p> <p>For more information, see <i>RMON Events and Alarms MIB</i>.</p>
Structure of Management Information MIB (mib-jnx-smi)	<p>Explains how the Juniper Networks enterprise-specific MIBs are structured.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-smi.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-smi.txt</a>.</p> <p>For more information, see <i>Structure of Management Information MIB</i>.</p>
System Log MIB (mib-jnx-syslog)	<p>Enables notification of an SNMP trap-based application when an important system log message occurs.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-syslog.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-syslog.txt</a>.</p> <p>For more information, see <i>System Log MIB</i>.</p>
Utility MIB (mib-jnx-util)	<p>Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt</a>.</p> <p>For more information, see “Utility MIB” on page 6522 and “Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage” on page 6810.</p>
VLAN MIB (mib-jnx-vlan)	<p>Contains information about prestandard IEEE 802.10 VLANs and their association with LAN emulation clients.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-vlan.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-vlan.txt</a>.</p> <p>For more information, see <i>VLAN MIB</i>.</p>

### MIBs Supported on QFabric Systems

The QFabric systems support both standard MIBs and Juniper Networks enterprise-specific MIBs. For more information, see:

- [Table 621 on page 6540](#) for standard MIBs.
- [Table 622 on page 6543](#) for Juniper Networks enterprise-specific MIBs.

**Table 621: Standard MIBs Supported on QFabric Systems**

RFC	Additional Information
RFC 1155, <i>Structure and Identification of Management Information for TCP/IP-based Internets</i>	—
RFC 1157, <i>A Simple Network Management Protocol (SNMP)</i>	—
RFC 1212, <i>Concise MIB Definitions</i>	—
RFC 1213, <i>Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II</i>	<p>The following areas are supported:</p> <ul style="list-style-type: none"> <li>• MIB II and its SNMP version 2 derivatives, including: <ul style="list-style-type: none"> <li>• Statistics counters</li> <li>• IP, except for ipRouteTable, which has been replaced by ipCidrRouteTable (RFC 2096, <i>IP Forwarding Table MIB</i>)</li> <li>• ipAddrTable</li> <li>• SNMP management</li> <li>• Interface management</li> </ul> </li> <li>• SNMPv1 <b>Get</b>, <b>GetNext</b> requests, and version 2 <b>GetBulk</b> request</li> <li>• Junos OS-specific secured access list</li> <li>• Master configuration keywords</li> <li>• Reconfigurations upon SIGHUP</li> </ul>
RFC 1215, <i>A Convention for Defining Traps for use with the SNMP</i>	Support is limited to MIB II SNMP version 1 traps and version 2 notifications.
RFC 1286, <i>Definitions of Managed Objects for Bridges</i>	—
RFC 1901, <i>Introduction to Community-based SNMPv2</i>	—
RFC 1905, <i>Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)</i>	—
RFC 1907, <i>Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)</i>	—
RFC 2011, <i>SNMPv2 Management Information Base for the Internet Protocol Using SMIv2</i>	<p><b>NOTE:</b> On the QFabric system, for the SNMP mibwalk request to work, you must configure the IP address of at least one interface besides the management Ethernet interfaces (me0 and me1) in the Director group.</p>

Table 621: Standard MIBs Supported on QFabric Systems (*continued*)

RFC	Additional Information
RFC 2012, <i>SNMPv2 Management Information Base for the Transmission Control Protocol Using SMIv2</i>	—
RFC 2013, <i>SNMPv2 Management Information Base for the User Datagram Protocol Using SMIv2</i>	—
RFC 2233, <i>The Interfaces Group MIB Using SMIv2</i>	<p><b>NOTE:</b> RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863.</p> <p><b>NOTE:</b> The QFabric system supports the following objects only: ifNumber, ifTable, and ifxTable.</p>
RFC 2571, <i>An Architecture for Describing SNMP Management Frameworks</i> (read-only access)	<b>NOTE:</b> RFC 2571 has been replaced by RFC 3411. However, Junos OS supports both RFC 2571 and RFC 3411.
RFC 2572, <i>Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)</i> (read-only access)	<b>NOTE:</b> RFC 2572 has been replaced by RFC 3412. However, Junos OS supports both RFC 2572 and RFC 3412.
RFC 2576, <i>Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework</i>	<b>NOTE:</b> RFC 2576 has been replaced by RFC 3584. However, Junos OS supports both RFC 2576 and RFC 3584.
RFC 2578, <i>Structure of Management Information Version 2 (SMIv2)</i>	—
RFC 2579, <i>Textual Conventions for SMIv2</i>	—
RFC 2580, <i>Conformance Statements for SMIv2</i>	—
RFC 2665, <i>Definitions of Managed Objects for the Ethernet-like Interface Types</i>	<p>The QFabric system supports the following tables only:</p> <ul style="list-style-type: none"> <li>• dot3StatsTable—There is one row with statistics for each Ethernet-like interface in the QFabric system. The dot3StatsIndex is an interface index that is unique across the system.</li> <li>• dot3ControlTable—There is one row in this table for each Ethernet-like interface in the QFabric system that implements the MAC control sublayer. OIDs supported are dot3ControlFunctionsSupported and dot3ControlInUnknownOpcode.</li> <li>• dot3PauseTable—There is one row in this table for each Ethernet-like interface in the QFabric system that supports the MAC control PAUSE function. OIDs supported are dot3PauseAdminMode, dot3PauseOperMode, dot3InPauseFrames, and dot3OutPauseFrames.</li> </ul> <p><b>NOTE:</b> Scalar variables are not supported on the QFabric system.</p>

Table 621: Standard MIBs Supported on QFabric Systems (*continued*)

RFC	Additional Information
RFC 2863, <i>The Interfaces Group MIB</i>	<p><b>NOTE:</b> RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863.</p> <p><b>NOTE:</b> The QFabric system supports the following objects only: ifNumber, ifTable, and ifxTable.</p>
RFC 2933, <i>Internet Group Management Protocol (IGMP) MIB</i>	—
RFC 3410, <i>Introduction and Applicability Statements for Internet Standard Management Framework</i>	—
RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i>	<b>NOTE:</b> RFC 3411 replaces RFC 2571. However, Junos OS supports both RFC 3411 and RFC 2571.
RFC 3412, <i>Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)</i>	<b>NOTE:</b> RFC 3412 replaces RFC 2572. However, Junos OS supports both RFC 3412 and RFC 2572.
RFC 3416, <i>Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)</i>	<b>NOTE:</b> RFC 3416 replaces RFC 1905, which was supported in earlier versions of Junos OS.
RFC 3417, <i>Transport Mappings for the Simple Network Management Protocol (SNMP)</i>	—
RFC 3418, <i>Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)</i>	<b>NOTE:</b> RFC 3418 replaces RFC 1907, which was supported in earlier versions of Junos OS.
RFC 3584, <i>Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework</i>	—
RFC 4188, <i>Definitions of Managed Objects for Bridges</i>	<p>The QFabric system support is limited to the following objects:</p> <ul style="list-style-type: none"> <li>Under the dot1dBase OID, the dot1dBasePortTable table supports only the first two columns in the table: dot1dBasePort and dot1dBasePortIfIndex.</li> <li>The system does not implement the optional traps supporting dot1dNotifications (dot1dBridge 0).</li> <li>Under the dot1dStp OID, supports only the dot1dStpPortTable table. Does not support the scalar variables under dot1dStp.</li> <li>The system does not support scalar variables under dot1dTp, but under that, the dot1dTpFdbTable table is supported (dot1dBridge 4).</li> <li>For OIDs with tables support only, scalar values that are returned by the SNMP agent may not be meaningful and are therefore not recommended for use.</li> </ul>

Table 621: Standard MIBs Supported on QFabric Systems (*continued*)

RFC	Additional Information
RFC 4293, <i>Management Information Base for the Internet Protocol (IP)</i>	<p>Supports the ipAddrTable table only.</p> <p>On the QFabric system, supported objects in the ipAddrTable table include: ipAdEntAddr, ipAdEntIfIndex, ipAdEntNetMask, ipAdEntBcastAddr, and ipAdEntReasmMaxSize.</p> <p><b>NOTE:</b> On the QFabric system, for the SNMP mibwalk request to work, you must configure the IP address of at least one interface besides the management Ethernet interfaces (me0 and me1) in the Director group.</p>
RFC 4363b, <i>Q-Bridge VLAN MIB</i>	<p>The QFabric system supports the following tables only:</p> <ul style="list-style-type: none"> <li>• dot1qTpFdbTable</li> <li>• dot1qVlanStaticTable</li> <li>• dot1qPortVlanTable</li> <li>• dot1qFdbTable</li> </ul>

Table 622: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems

MIB	Description
Analyzer MIB (mib-jnx-analyzer)	<p>Contains analyzer and remote analyzer data related to port mirroring.</p> <p>The QFabric system supports:</p> <ul style="list-style-type: none"> <li>• Analyzer table—jnxAnalyzerName, jnxMirroringRatio, jnxLossPriority.</li> <li>• Analyzer input table—jnxAnalyzerInputValue, jnxAnalyzerInputOption, jnxAnalyzerInputType.</li> <li>• Analyzer output table—jnxAnalyzerOutputValue, jnxAnalyzerOutputType.</li> </ul> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-analyzer.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-analyzer.txt</a>.</p> <p>For more information, see <i>Analyzer MIB</i>.</p>
Chassis MIB (mib-jnx-chassis)	<p><b>NOTE:</b> The Chassis MIB has been deprecated for the QFabric system. We recommend that you use the Fabric Chassis MIB (mib-jnx-fabric-chassis) for information about the QFabric system.</p>

**Table 622: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems** (*continued*)

MIB	Description
Class-of-Service MIB (mib-jnx-cos)	<p>Provides support for monitoring interface output queue statistics per interface and per forwarding class.</p> <p>The QFabric system supports the following tables and objects:</p> <ul style="list-style-type: none"> <li>• Jnxcosifstatflagtable—jnxCosIfstatFlags and jnxCosIfIndex.</li> <li>• Jnxcosqstattable—jnxCosQstatTxedPkts, jnxCosQstatTxedPktRate, jnxCosQstatTxedBytes, and jnxCosQstatTxedByteRate.</li> <li>• Jnxcosfcidtable—jnxCosFcIdToFcName.</li> <li>• Jnxcosfctable—jnxCosFcQueueNr.</li> </ul> <p>The QFabric system does not support any traps for this MIB.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt</a>.</p> <p>For more information, see <i>Class-of-Service MIB</i>.</p>
Configuration Management MIB (mib-jnx-cfgmgmt)	<p>Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made.</p> <p>A history of the last 32 configuration changes is kept in jnxCmChgEventTable.</p> <p><b>NOTE:</b> On the QFabric system, these conditions apply:</p> <ul style="list-style-type: none"> <li>• All scalar variables under the jnxCmCfgChg table are supported.</li> <li>• Supported scalar OIDs are jnxCmCfgChgLatestIndex, jnxCmCfgChgLatestTime, jnxCmCfgChgLatestDate, jnxCmCfgChgLatestSource, jnxCmCfgChgLatestUser, and jnxCmCfgChgMaxEventEntries.</li> <li>• Scalar variables under the jnxCmRescueChg table are not supported.</li> </ul> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt</a>.</p> <p>For more information, see <i>Configuration Management MIB</i>.</p>
Fabric Chassis MIB (mib-jnx-fabric-chassis)	<p>Provides hardware information about the QFabric system and its component devices. This MIB is based on the Juniper Networks enterprise-specific Chassis MIB but adds another level of indexing that provides information for QFabric system component devices.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-fabric-chassis.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-fabric-chassis.txt</a>.</p> <p>For more information, see “Fabric Chassis MIB” on page 6518.</p>

**Table 622: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems (*continued*)**

MIB	Description
Host Resources MIB (mib-jnx-hostresources)	<p>Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt</a>.</p> <p>For more information, see <i>Host Resources MIB</i>.</p>
Interface MIB (Extensions) (mib-jnx-if-extensions)	<p>Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables.</p> <p><b>NOTE:</b> On the QFabric system, scalar variables are not supported.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt</a>.</p> <p>For more information, see <i>Interface MIB</i>.</p>
Power Supply Unit MIB (mib-jnx-power-supply-unit)	<p>Provides support for environmental monitoring of the power supply unit for the Interconnect device of the QFabric system.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-power-supply-unit.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-power-supply-unit.txt</a>.</p> <p>For more information, see <i>Power Supply Unit MIB</i>.</p> <p><b>NOTE:</b> On the QFabric system, scalar variables for the jnxPsuObjects 1 object ID in the jnxPsuScalars table are not supported.</p>
QFabric MIB (jnx-qf-smi)	<p>Explains how the Juniper Networks enterprise-specific QFabric MIBs are structured. Defines the MIB objects that are reported by the QFabric system and the contents of the traps that can be issued by the QFabric system.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-qf-smi.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-qf-smi.txt</a>.</p>
Utility MIB (mib-jnx-util)	<p>Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt</a>.</p> <p>For more information, see “Utility MIB” on page 6522 and “Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage” on page 6810.</p>

SNMP Traps Support

The QFX Series standalone switches, QFX Series Virtual Chassis, and QFabric systems support standard SNMP traps and Juniper Networks enterprise-specific traps.

For more information, see:

- [SNMP Traps Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis on page 6546](#)
- [SNMP Traps Supported on QFabric Systems on page 6554](#)

SNMP Traps Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis

QFX Series standalone switches and QFX Series Virtual Chassis support SNMPv1 and v2 traps. For more information, see:

- [SNMPv1 Traps on page 6546](#)
- [SNMPv2 Traps on page 6550](#)

SNMPv1 Traps

QFX Series standalone switches and QFX Series Virtual Chassis support both standard SNMPv1 traps and Juniper Networks enterprise-specific SNMPv1 traps. See:

- [Table 623 on page 6546](#) for standard SNMPv1 traps.
- [Table 624 on page 6549](#) for enterprise-specific SNMPv1 traps.

The traps are organized first by trap category and then by trap name. The system logging severity levels are listed for those traps that have them. Traps that do not have corresponding system logging severity levels are marked with an en dash (–).

**SNMP Traps Supported on QFabric Systems**

QFabric systems support standard SNMPv2 traps and Juniper Networks enterprise-specific SNMPv2 traps.

**NOTE:** QFabric systems do not support SNMPv1 traps.

For more information, see:

- [Table 627 on page 6555](#) for standard SNMPv2 traps
- [Table 628 on page 6556](#) for Juniper Networks enterprise-specific SNMPv2 traps

## System Logging

- [Overview of Junos OS System Log Messages on page 6560](#)
- [Overview of Single-Chassis System Logging Configuration on page 6561](#)
- [Understanding the Implementation of System Log Messages on the QFabric System on page 6562](#)

### Overview of Junos OS System Log Messages

The Junos OS generates system log messages (also called *syslog messages*) to record events that occur on the switch, including the following:

- Routine operations, such as a user login into the configuration database.
- Failure and error conditions, such as failure to access a configuration file.
- Emergency or critical conditions, such as power-down of the switch due to excessive temperature.

Each system log message identifies the Junos OS process that generated the message and briefly describes the operation or error that occurred. For detailed information about specific system log messages, see the *Junos OS System Log Messages Reference*.

- Related Documentation**
- [Junos OS System Log Configuration Statements on page 6616](#)
  - [Junos OS Minimum System Logging Configuration on page 6616](#)

## Overview of Single-Chassis System Logging Configuration

The Junos OS system logging utility on the QFX Series is similar to the UNIX **syslogd** utility. This topic describes how to configure system logging for a single-chassis system that runs the Junos OS.

Each system log message belongs to a *facility*, which groups together related messages. Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions. You always specify the facility and severity of the messages to include in the log. For more information, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 6631](#).

You direct messages to one or more destinations by including the appropriate statement at the **[edit system syslog]** hierarchy level:

- To a named file in a local file system, by including the **file** statement. See [“Directing System Log Messages to a Log File” on page 6618](#).
- To the terminal session of one or more specific users (or all users) when they are logged in to the switch, by including the **user** statement. See [“Directing System Log Messages to a User Terminal” on page 6620](#).
- To the switch console, by including the **console** statement. See [“Directing System Log Messages to the Console” on page 6620](#).
- To a remote machine that is running the **syslogd** utility, by including the **host** statement. See [“Directing System Log Messages to a Remote Machine” on page 6619](#).

By default, messages are logged in a standard format, which is based on a UNIX system log format; for detailed information about message formatting, see the *Junos OS System Log Messages Reference*. You can alter the content and format of logged messages in the following ways:

- You can log messages to a file in structured-data format instead of the standard Junos OS format. Structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from the message. For more information, see [“Logging Messages in Structured-Data Format” on page 6624](#).
- A message’s facility and severity level are together referred to as its *priority*. By default, the standard Junos OS format for messages does not include priority information (structured-data format includes a priority code by default). To include priority information in standard-format messages directed to a file or a remote destination, include the **explicit-priority** statement. For more information, see [“Including Priority Information in System Log Messages” on page 6622](#).
- By default, the standard Junos OS format for messages specifies the month, date, hour, minute, and second when the message was logged. You can modify the timestamp on standard-format system log messages to include the year, the millisecond, or both. (Structured-data format specifies the year and millisecond by default.) For more information, see [“Including the Year or Millisecond in Timestamps” on page 6623](#).

- When directing messages to a remote machine, you can specify the IP address that is reported in messages as their source. You can also configure features that make it easier to separate messages generated by Junos OS or messages generated on particular switches. For more information, see [“Directing System Log Messages to a Remote Machine” on page 6619](#).
- The predefined facilities group together related messages, but you can also use regular expressions to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination. For more information, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 6637](#).

**NOTE:** During a commit check, warnings about the `traceoptions` configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

## Understanding the Implementation of System Log Messages on the QFabric System

This topic provides an overview of system log (syslog) messages as implemented on the QFabric system.

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

You configure system log messages by using the **host** and **file** statements at the **[edit system syslog]** hierarchy level. Use the **show log filename** operational mode command to view the messages.

**NOTE:** On the QFabric system, a syslog file named `messages` with a size of 100 MB is configured by default. If you do not configure a filename, you can use the default filename `messages` with the `show log filename` command.

All messages with a severity level of notice or higher are logged. Messages with a facility level of `interactive-commands` on Node devices are not logged.

The QFabric system supports the following system log message features:

- The `file filename` and `host hostname` statements at the `[edit system syslog]` hierarchy level are supported. Other statements at that hierarchy level are not supported.
- You can specify the maximum amount of data that is displayed when you issue the `show log filename` command by configuring the `file filename archive maximum-file-size` statement.
- You can specify that one or more system log message servers receive messages, which are sent to each server that is configured.
- If you configured an alias for a device or interface, the alias is displayed in the message for the device or interface.
- The level of detail that is included in a message depends on the facility and severity levels that are configured. Messages include the highest level of detail available for the configured facility and severity levels.
- The unit of time is measured and displayed in seconds, and not milliseconds. If you attempt to configure the `time-format` option in milliseconds, the log output displays `000`.

Starting in Junos OS Release 13.1, the QFabric system supports these additional syslog features:

- You can filter the output of the `show log filename` operational mode command by device type and device ID or device alias when you specify the `device-type (device-id | device-alias)` optional parameters. Device types include `director-device`, `infrastructure-device`, `interconnect-device`, and `node-device`.
- You can specify the syslog structured data output format when you configure the `structured-data` statement at the `[edit system syslog file filename]` and `[edit system syslog host hostname]` hierarchy levels.

**NOTE:** Information displayed in the structured data output for system logs originating from the Director software may not be complete.

- You can filter the types of logs that the Director group collects from a component device when you configure the `filter all facility severity` or `filter all match "regular-expression"` statements at the `[edit system syslog]` hierarchy level.

Unsupported syslog features include:

- File access to syslog messages
- Monitoring of syslog messages

### Examples: Configuring System Logging

The system log provides an excellent way of tracking all management activity on the switch by recording events such as user authentication, access authorization, and command execution. Logged command executions include commands entered by users at the CLI prompt or by client applications such as the Junos XML protocol or NETCONF XML client. Because system log files contain information about commands executed on the switch and the user who executed the commands, checking system log files for failed authentication events can help identify attempts to hack in to the switch. You can also

analyze network activity by correlating executed commands with events and changes that occurred on the network at a particular time.

System log files are stored locally on the switch in the default `/var/log` directory.

The following example shows how to configure system log messages to record all commands entered by users and all authentication or authorization attempts. Logged commands include those entered by users at the CLI prompt and by client applications. Authentication and authorization attempts include events that are saved in the file named `cli-commands` and those that are sent to the terminal of a user who is logged in.

```
[edit system]
syslog {
  file cli-commands {
    interactive-commands info;
    authorization info;
  }
  user * {
    interactive-commands info;
    authorization info;
  }
}
```

The following example shows how to log all alarms state changes to the file `/var/log/alarms`:

```
[edit system]
syslog {
  file alarms {
    kernel warning;
  }
}
```

The following example shows how to configure the handling of messages of various types, as described in the comments. Information is logged to two files, to the terminal of user alex, to a remote machine, and to the console:

```
[edit system]
syslog {
  /* write all security-related messages to file /var/log/security */
  file security {
    authorization info;
    interactive-commands info;
  }
  /* write messages about potential problems to file /var/log/messages: */
  /* messages from "authorization" facility at level "notice"
  and above, */
  /* messages from all other facilities at level "warning" and above */
  file messages {
    authorization notice;
    any warning;
  }
  /* write all messages at level "critical" and above to terminal of user
  "alex" if */
  /* that user is logged in */
  user alex {
```

```

        any critical;
    }
    /* write all messages from the &ldquo;daemon&rdquo; facility at level &ldquo;info&rdquo;
       and above, and */
    /* messages from all other facilities at level &ldquo;warning&rdquo; and above, to the
       */
    /* machine monitor.mycompany.com */
    host monitor.mycompany.com {
        daemon info;
        any warning;
    }
    /* write all messages at level &ldquo;error&rdquo; and above to the system console */
    console {
        any error;
    }
}

```

The following example shows how to configure the handling of messages generated when users issue Junos OS CLI commands, by specifying the interactive-commands facility at the info, notice, and warning severity levels:

```

[edit system]
file user-actions {
    interactive-commands info;
}
user philip {
    interactive-commands notice;
}
console {
    interactive-commands warning;
}
}

```

The following list describes the security levels used in the example:

- **info**—Logs a message when users issue any command at the CLI operational or configuration mode prompt. The example writes the messages to the file `/var/log/user-actions`.
- **notice**—Logs a message when users issue the configuration mode command **commit**. The example writes the messages to the terminal of user philip.
- **warning**—Logs a message when users issue a command that restarts a software process. The example writes the messages to the console.

#### Related Documentation

- [Overview of Single-Chassis System Logging Configuration on page 6561](#)

### Examples: Assigning an Alternative Facility

This topic contains examples of configuring system log messages to use an alternative facility for logging.

The following example shows how to log all messages generated on the switch at the **error** level or higher to the **local0** facility on the remote host called **monitor.mycompany.com**:

```
[edit system syslog]
host monitor.mycompany.com {
  any error;
  facility-override local0;
}
```

The following example contains two sets of statements that show how to configure switches located in California and in New York to send messages to a single remote host called **central-logger.mycompany.com**. The messages from California are assigned to alternative facility **local0** and the messages from New York are assigned to alternative facility **local2**.

- The following statements configure the California switch to aggregate messages in the **local0** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local0;
}
```

- The following statements configure the New York switch to aggregate messages in the **local2** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local2;
}
```

On the remote host named **central-logger** you can subsequently configure the system logging utility to write messages from the **local0** facility to one file (for example, **california-config**) and the messages from the **local2** facility to another file (for example, **new-york-config**).

**Related  
Documentation**

- [Alternate Facilities for System Log Messages Directed to a Remote Destination on page 6635](#)

## Example: Configuring System Log Messages

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

This example describes how to configure system log messages on the QFabric system.

- [Requirements on page 6569](#)
- [Overview on page 6569](#)
- [Configuration on page 6569](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- QFabric system
- External servers that can be configured as system log message hosts

### Overview

Component devices that generate system log message events may include Node devices, Interconnect devices, Director devices, and the control plane switches. The following configuration example includes these components in the QFabric system:

- Director software running on the Director group
- Control plane switches
- Interconnect device
- Multiple Node devices

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system syslog host 10.1.1.12 any error
set system syslog file qflogs
set system syslog file qflogs structured-data brief
set system syslog file qflogs archive size 1g
```

#### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure system messages from the QFabric Director device:

1. Specify a host, any facility, and the **error** severity level.

```
[edit system syslog]
user@switch# set host 10.1.1.12 any error
```

**NOTE:** You can configure more than one system log message server (host). The QFabric system sends the messages to each server configured.

2. (Optional) Specify a filename to capture log messages.

**NOTE:** On the QFabric system, a syslog file named `messages` is configured implicitly with facility and severity levels of any any and a file size of 100 MBs. Therefore, you cannot specify the filename `messages` in your configuration, and automatic command completion does not work for that filename.

```
[edit system syslog]
user@switch# set file qflogs structured-data brief
user@switch# set file qflogs
```

3. (Optional) Configure the maximum size of your system log message archive file. This example specifies an archive size of 1 GB.

```
[edit system syslog]
user@switch# set file qflogs archive size 1g
```

**Results** From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show system
syslog {
  file qflogs {
  }
  host 10.1.1.12 {
    any error;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Example: Monitoring Network Traffic Using sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

This example describes how to configure and use sFlow monitoring on a QFX3500 switch in standalone mode.

- [Requirements on page 6571](#)
- [Overview on page 6571](#)
- [Configuration on page 6572](#)
- [Verification on page 6573](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 11.3 or later
- One QFX3500 switch

### Overview

---

An sFlow monitoring system consists of an sFlow agent embedded in the device and a centralized collector on the network. The two main activities of the sFlow agent are random sampling and statistics gathering. The sFlow agent combines interface counters and flow samples and sends them to the IP address and UDP destination port of the sFlow collector in UDP datagrams.

[Figure 226 on page 6572](#) depicts the basic elements of an sFlow system.

Figure 226: sFlow Technology Monitoring System

### Configuration

#### CLI Quick Configuration

To quickly configure sFlow technology, copy the following commands and paste them into the terminal window of the switch:

```
[edit protocols sflow]
set collector 10.204.32.46 udp-port 5600
set interfaces xe-0/0/1.0
set polling-interval 20
set sample-rate 1000
```

#### Step-by-Step Procedure

To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

```
[edit protocols sflow]
user@switch# set collector 10.204.32.46 udp-port 5600
```

The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

```
[edit protocols sflow]
user@switch# set interfaces xe-0/0/1.0
```

**NOTE:** You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a LAG interface (for example, ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

```
[edit protocols sflow]
user@switch# set polling-interval 20
```

**NOTE:** Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets must be sampled at the global level. The following example sets a sample rate of 1 in 1000 packets:

```
[edit protocols sflow]
user@switch# set sample-rate 1000
```

**Results** Check the results of the configuration:

```
[edit]
user@switch# show protocols
sflow {
  collector 10.204.32.46 {
    udp-port 5600;
  }
  interfaces xe-0/0/1.0 {
    polling-interval 20;
    sample-rate 1000;
  }
}
```

### Verification

To confirm that the configuration is correct, perform these tasks:

- [Verifying That sFlow Technology Has Been Configured Properly on page 6573](#)
- [Verifying That sFlow Technology Is Enabled on an Interface on page 6574](#)
- [Verifying the sFlow Collector Configuration on page 6574](#)

#### *Verifying That sFlow Technology Has Been Configured Properly*

**Purpose** Verify that sFlow technology has been configured properly.

**Action** Enter the **show sflow** operational mode command:

```
user@switch> show sflow
```

```
sFlow           : Enabled
Sample limit    : 300 packets/second
Polling interval : 20 second
Sample rate     : 1:1000
Agent ID       : 10.1.1.2
```

**NOTE:** The sample limit cannot be configured and is set to 300 packets per second.

**Meaning** The output shows that sFlow technology is enabled and specifies the values for the sampling limit, polling interval, and sampling rate.

#### *Verifying That sFlow Technology Is Enabled on an Interface*

**Purpose** Verify that sFlow technology is enabled on interfaces and display the sampling parameters.

**Action** Enter the **show sflow interface** operational mode command:

```
user@switch> show sflow interface
Interface      Status      Sample   Polling
                rate      interval
xe-0/0/1.0     Enabled     1000     20
```

**Meaning** The output indicates that sFlow technology is enabled on the **Node1:xe-0/0/1.0** interface on the Node device with a sampling rate of 1000 and a polling interval of 20 seconds.

#### *Verifying the sFlow Collector Configuration*

**Purpose** Verify the sFlow collector configuration.

**Action** Enter the **show sflow collector** operational mode command:

```
user@switch> show sflow collector
Collector      Udp-port   No. of samples
address
10.204.32.46   5600       7516
```

**Meaning** The output displays the IP address of the collector, the UDP port, and the number of samples collected.

**Related Documentation**

- [Overview of sFlow Technology](#)

## Example: Configuring SNMP

By default, SNMP is disabled on devices running Junos OS. This example describes the steps for configuring SNMP on the QFabric system.

- [Requirements on page 6575](#)
- [Overview on page 6575](#)
- [Configuration on page 6575](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- Network management system (NMS) (running the SNMP manager)
- QFabric system (running the SNMP agent) with multiple Node devices

### Overview

Because SNMP is disabled by default on devices running Junos OS, you must enable SNMP on your device by including configuration statements at the **[edit snmp]** hierarchy level. At a minimum, you must configure the **community public** statement. The community defined as public grants read-only access to MIB data to any client.

If no **clients** statement is configured, all clients are allowed. We recommend that you always include the **restrict** option to limit SNMP client access to the switch.

The network topology in this example includes an NMS, a QFabric system with four Node devices, and external SNMP servers that are configured for receiving traps.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set snmp name "snmp qfabric" description "qfabric0 switch"
set snmp location "Lab 4 Row 11" contact "qfabric-admin@qfabric0"
set snmp community public authorization read-only
set snmp client-list list0 192.168.0.0/24
set snmp community public client-list-name list0
set snmp community public clients 192.170.0.0/24 restrict
set snmp trap-group "qf-traps" destination-port 155 targets 192.168.0.100
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure SNMP on the QFabric system:

**NOTE:** If the name, description, location, contact, or community name contains spaces, enclose the text in quotation marks (" ").

1. Configure the SNMP system name:

```
[edit snmp]
user@switch# set name "snmp qfabric"
```

2. Specify a description.

```
[edit snmp]
user@switch# set description "qfabric0 system"
```

This string is placed into the MIB II sysDescription object.

3. Specify the physical location of the QFabric system.

```
[edit snmp]
user@switch# set location "Lab 4 Row 11"
```

This string is placed into the MIB II sysLocation object.

4. Specify an administrative contact for the SNMP system.

```
[edit snmp]
user@switch# set contact "qfabric-admin@qfabric0"
```

This name is placed into the MIB II sysContact object.

5. Specify a unique SNMP community name and the read-only authorization level.

**NOTE:** The read-write option is not supported on the QFabric system.

```
[edit snmp]
user@switch# set community public authorization read-only
```

6. Create a client list with a set of IP addresses that can use the SNMP community.

```
[edit snmp]
user@switch# set client-list list0 192.168.0.0/24
user@switch# set community public client-list-name list0
```

7. Specify IP addresses of clients that are restricted from using the community.

```
[edit snmp]
user@switch# set community public clients 192.170.0.0/24 restrict
```

8. Configure a trap group, destination port, and a target to receive the SNMP traps in the trap group.

```
[edit snmp]
user@switch# set trap-group "qf-traps" destination-port 155 targets 192.168.0.100
```

**NOTE:** You do not need to include the `destination-port` statement if you use the default port 162.

The trap group `qf-traps` is configured to send traps to 192.168.0.100.

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show
snmp {
  name "snmp qfabric";
  description "qfabric0 system";
  location "Lab 4 Row 11";
  contact "qfabric-admin@qfabric0";
  client-list list0 {
    192.168.0.0/24;
  }
  community public {
    authorization read-only;
    clients {
      197.170.0.0/24 restrict;
    }
  }
  trap-group qf-traps {
    destination-port 155;
    targets {
      192.168.0.100;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Example: Configuring Network Analytics

This example shows how to configure network analytics which includes queue and traffic monitoring on a QFX3500 standalone switch.

**NOTE:** The configuration shown in this example is supported only on Junos OS Release 13.2X50-D15 and 13.2X51-D10.

- [Requirements on page 6578](#)
- [Overview on page 6578](#)
- [Configuration on page 6578](#)
- [Verification on page 6581](#)

---

## Requirements

This example uses the following hardware and software components:

- A QFX3500 standalone switch
- A external streaming server to collect data
- Junos OS Release 13.2X50-D15 software
- TCP server software (for remote streaming servers)

Before you configure network analytics, be sure you have:

- Junos OS Release 13.2X50-D15 or later software installed and running on the QFX3500 switch
- (Optional for streaming servers) TCP server software set up for processing records separated by a newline character (\n) on the remote streaming server
- All other devices running

---

## Overview

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. This feature collects data from the switch, analyzes the data using sophisticated algorithms, and captures the results in reports. Network administrators can use the reports to help troubleshoot problems, make decisions, and adjust resources as needed. You can enable network analytics by configuring queue and traffic statistics monitoring.

### **Topology**

In this example, the QFX3500 switch is connected to an external server used for streaming statistics data.

---

## Configuration

To configure network analytics, perform these tasks:

- [Configuring Queue and Traffic Statistics Monitoring on page 6579](#)
- [Configuring Local Statistics Files on page 6579](#)
- [Configuring Streaming Servers on page 6580](#)
- [Results on page 6580](#)

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
[edit]
set services analytics interfaces all queue-statistics
set services analytics interfaces all latency-threshold high 900 low 300
set services analytics interfaces xe-0/0/1 traffic-statistics
set services analytics queue-statistics file qstats1.qs files 3 size 10
set services analytics queue-statistics interval 10
set services analytics traffic-statistics file tstats1.ts files 3 size 10
set services analytics traffic-statistics interval 2
set services analytics streaming-servers address 10.94.198.11 port 50001 stream-format
json stream-type queue-statistics
set services analytics streaming-servers address 10.94.198.11 port 50005 stream-format
csv stream-type traffic-statistics
```

### *Configuring Queue and Traffic Statistics Monitoring*

**Step-by-Step Procedure** To configure queue and traffic monitoring on physical interfaces:

**NOTE:** You can configure queue and traffic monitoring on physical network interfaces only; logical interfaces and Virtual Chassis physical (VCP) interfaces are not supported.

**NOTE:** Disabling of the queue or traffic monitoring supersedes the configuration (enabling) of this feature. You disable monitoring by issuing the `no-queue-statistics` or `no-traffic-statistics` at the **[edit services analytics interfaces]** hierarchy level.

1. Configure all interfaces for queue monitoring and set the latency thresholds (in microseconds):

```
[edit]
set services analytics interfaces all queue-statistics
set services analytics interfaces all latency-threshold high 900 low 300
```

2. Configure one interface for traffic monitoring:

```
[edit]
set services analytics interfaces xe-0/0/1 traffic-statistics
```

### *Configuring Local Statistics Files*

**Step-by-Step Procedure** To configure local statistics files:

1. Configure the number of queue statistics files, and each file size in MB:

```
[edit]
```

```
set services analytics queue-statistics file qstats1.qs files 3 size 10m
```

2. Configure the queue statistics collection interval in milliseconds

```
[edit]
set services analytics queue-statistics interval 10
```

3. Configure the number of traffic statistics files, and each file size in MB:

```
[edit]
set services analytics traffic-statistics file tstats1.ts files 3 size 10m
```

4. Configure the traffic statistics collection interval in seconds:

```
[edit]
set services analytics traffic-statistics interval 2
```

### *Configuring Streaming Servers*

#### **Step-by-Step Procedure**

To configure streaming servers for receiving monitoring data:

**NOTE:** In addition to configuring streaming servers, you must also set up the TCP client software to process records that are separated by the newline character (\n) on the remote server.

1. Configure a server IP address and port for queue statistics monitoring:

```
[edit]
set services analytics streaming-servers address 10.94.198.11 port 50001
stream-format json stream-type queue-statistics
```

2. Configure a server IP address and port for traffic statistics monitoring:

```
[edit]
set services analytics streaming-servers address 10.94.198.11 port 50005
stream-format csv stream-type traffic-statistics
```

### *Results*

Display the results of the configuration:

```
[edit services analytics]
user@switch> show configuration
queue-statistics {
  file qstats1.qs size 10m files 3;
  interval 10;
}
traffic-statistics {
  file tstats1.ts size 10m files 3;
  interval 2;
}
interfaces {
  xe-0/0/1 {
    traffic-statistics;
  }
  all {
```

```

        queue-statistics;
        latency-threshold high 900 low 300;
    }
}

```

### Verification

Confirm that the configuration is correct and works as expected by performing these tasks:

- [Verifying the Network Analytics Configuration on page 6581](#)
- [Verifying the Network Analytics Status on page 6581](#)
- [Verifying Streaming Servers Configuration on page 6582](#)
- [Verifying Queue Statistics on page 6582](#)
- [Verifying Traffic Statistics on page 6582](#)

#### *Verifying the Network Analytics Configuration*

**Purpose** Verify the configuration for network analytics.

**Action** From operational mode, enter the **show analytics configuration** command to display the traffic and queue monitoring configuration.

```

user@host> show analytics configuration
Global configurations:
  Traffic statistics: Auto, Poll interval: 2 seconds
  Queue statistics: Enabled, Poll interval: 10 milliseconds
  Depth threshold high: 0 bytes, low: 0 bytes
  Latency threshold high: 900 microseconds, low: 300 microseconds

```

Interface	Traffic	Queue	Depth-threshold		Latency-threshold	
	Statistics	Statistics	High	Low	High	Low
			(bytes)		(microseconds)	
xe-0/0/1	Enabled	Auto	0	0	900	300

**Meaning** The output displays information about traffic and queue monitoring on the switch.

#### *Verifying the Network Analytics Status*

**Purpose** Verify the network analytics operational status of the switch.

**Action** From operational mode, enter the **show analytics status** command to display the traffic and queue monitoring status.

```
user@host> show analytics status
Global configurations:
  Traffic statistics: Auto, Poll interval: 2 seconds
  Queue statistics: Auto, Poll interval: 10 milliseconds
  Depth threshold high: 1228800 bytes, low: 1024 bytes
  Latency threshold high: 900 microseconds, low: 300 microseconds
```

Interface	Traffic	Queue	Depth-threshold		Latency-threshold	
	Statistics	Statistics	High	Low	High	Low
			(bytes)		(microseconds)	
xe-0/0/1	Enabled	Auto	1228800	1024	900	300
xe-0/0/7	Auto	Auto	1228800	1024	900	300
xe-0/0/8	Auto	Auto	1228800	1024	900	300

### *Verifying Streaming Servers Configuration*

**Purpose** Verify the configuration for streaming data to remote servers is working.

**Action** From operational mode, enter the **show analytics streaming-servers** command to display the streaming servers configuration.

```
user@host> show analytics streaming-servers
```

Address	Port	Stream-Format	Stream-Type	State	Sent
10.94.198.11	50001	json	QS	Established	1100
10.94.198.11	50005	csv	TS/QS	In Progress	0

**Meaning** The output displays information about the remote streaming server.

### *Verifying Queue Statistics*

**Purpose** Verify that queue statistics collection is working.

**Action** From operational mode, enter the **show analytics queue-statistics** command to display the queue statistics.

```
user@host> show analytics queue-statistics
```

Time	Interface	Queue-length (bytes)	Latency (us)
Apr 6 0:17:18.224	xe-0/0/1	1043952	835
Apr 6 0:17:18.234	xe-0/0/1	1053520	842
Apr 6 0:17:18.244	xe-0/0/1	1055184	844

**Meaning** The output displays queue-statistics information as expected.

### *Verifying Traffic Statistics*

**Purpose** Verify that traffic statistics collection is working.

**Action** From operational mode, enter the **show analytics traffic-statistics** command to display the traffic statistics.

```

user@host> show analytics traffic-statistics
Time: Apr 5 19:52:48.549, Physical interface: xe-0/0/1
Traffic Statistics:
Total octets:          4797548752936          408886273632
Total packet:          5658257464            3190613435
Octets per second:      0                    0
Packet per second:      0                    0
Octets dropped:         0                    252901000
Packet dropped:         0                    252901
Utilization:           0.0%                  0.0%
Time: Apr 5 19:52:48.549, Physical interface: xe-0/0/7
Traffic Statistics:
Total octets:          4790866253100          477139024

## Configuration Tasks for Network Management

- [Configuring Console and Auxiliary Port Properties on page 6583](#)
- [Configuring SSH Service for Remote Access to the Router or Switch on page 6584](#)
- [Configuring Telnet Service for Remote Access to a Switch on page 6586](#)

### Configuring Console and Auxiliary Port Properties

The console port and auxiliary port on a switch provide out-of-band remote access to the switch. You can configure the console and auxiliary ports so that an external data terminal may be connected to the switch. The console port is enabled by default, and its speed is 9600 baud. The auxiliary port is disabled by default.

By default, terminal connections to the console and auxiliary ports are secure. When you configure the console and auxiliary ports as insecure, root logins are not allowed to establish terminal connections, and superusers and anyone with a user identifier (UID) of 0 are not allowed to establish terminal connections in multiuser mode.

To configure the console and auxiliary port properties on the switch:

1. To specify that the console port session should terminate if the connection to the data carrier is lost:

```
[edit system ports]
user@switch# set console log-out-on-disconnect
```

2. To specify the auxiliary port terminal type:

```
[edit system ports]
user@switch# set auxiliary type (ansi | small-xterm | vt100 | xterm)
```

For example, to specify the auxiliary port terminal type of **xterm** with a display of 80 columns by 65 rows:

```
[edit system ports]
user@switch# set auxiliary type xterm
```

3. To check the configuration:

```
[edit system ports]
user@switch# show
console log-out-on-disconnect;
auxiliary type xterm;
```

- Related Documentation**
- [auxiliary on page 257](#)
  - [console \(Physical Port\) on page 266](#)
  - [ports on page 298](#)

## Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
  ciphers [ cipher-1 cipher-2 cipher-3 ...]
  client-alive-count-max number;
  client-alive-interval seconds;
  connection-limit limit;
  hostkey-algorithm <algorithm | no-algorithm>;
  key-exchange algorithm;
  macs algorithm;
  max-sessions-per-connection number;
  no-passwords;
  no-tcp-forwarding;
  protocol-version [v1 v2];
  rate-limit limit;
  root-login <allow | deny | deny-password>;
```

```
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection *number***—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

By default, a user can create an SSH tunnel over a CLI session to a router running Junos OS via SSH. This type of tunnel could be used to forward TCP traffic, bypassing any firewall filters or ACLs, allowing access to resources beyond the router. Use the **no-tcp-forwarding** option to prevent a user from creating an SSH tunnel to a router via SSH.

For information about other configuration settings, see the following topics:

- [Configuring the Root Login Through SSH on page 6585](#)
- [Configuring the SSH Protocol Version on page 6586](#)
- [Configuring the Client Alive Mechanism on page 6586](#)

### Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit systems services ssh]** hierarchy level:

```
[edit system services ssh]
  root-login (allow | deny | deny-password);
```

**allow**—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

**deny**—Disables users from logging in to the router or switch as root through SSH.

**deny-password**—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

### Configuring the SSH Protocol Version

---

By default, both version 1 and version 2 of the SSH protocol are enabled. To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 ];
```

To configure the router or switch to use only version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v2 ];
```

To explicitly configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 v2 ];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

### Configuring the Client Alive Mechanism

---

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
client-alive-count-max 5;
client-alive-interval 20;
```

### Configuring Telnet Service for Remote Access to a Switch

Telnet provides unencrypted access to network devices. Configuring Telnet service for a switch enables in-band remote access to the switch.

By default, the switch supports a limited number of simultaneous Telnet sessions and connection attempts per minute. Optionally, you can change the default Telnet settings by configuring the connection limit and rate limit at the **[edit system services telnet]** hierarchy level.

The connection limit is the maximum number of simultaneous connections per protocol (IPv4). The range is from 1 through 250. The default is 75.

The rate limit is the maximum number of connection attempts accepted per minute per protocol. The range is from 1 through 250. The default is 150.

To configure Telnet service:

1. To specify the connection limit:

```
[edit system services]
user@switch# set telnet connection-limit connection-limit
```

2. To specify the rate limit:

```
[edit system services]
user@switch# set telnet rate-limit rate-limit
```

3. Check that the Telnet connection limit and rate limit show the values you specified:

```
[edit system services]
user@switch# show
telnet {
  connection-limit 50;
  rate-limit 100;
}
```

## Configuration Tasks for Automation

- [Invoking the Python Interpreter on page 6587](#)
- [Controlling the Execution of Commit Scripts on page 6588](#)

### Invoking the Python Interpreter

The Python interpreter is available by default with the QFX5100 switch automation enhancements. You can invoke Python by entering the **python** command at the shell script.

To invoke the Python interpreter:

1. Start the shell interface:

```
user@switch> start shell
```

2. Enter the **python** command without any parameters:

```
% python
```

**NOTE:** The Python interpreter is designated with the prompt >>> at the beginning of a line or ... to indicate the continuation of a line.

## Controlling the Execution of Commit Scripts

This document describes the tasks that affect the way commit scripts are executed. In the QFabric system, commit scripts are stored in the `/pbdata/mgd_shared/partition-ip/var/db/scripts/commit` directory that is shared among Director devices in a Director group.

To determine which commit scripts are currently enabled on the QFabric system, use the `show` command to display the files included at the `[edit system scripts commit]` hierarchy level. To ensure that the enabled files are on the device, list the contents of the `/pbdata/mgd_shared/partition-ip/var/db/scripts/commit` directory using the `file list` operational mode command.

See the following tasks:

- [Enabling Commit Scripts to Execute on page 6588](#)
- [Removing Commit Scripts from the Configuration on page 6589](#)
- [Deactivating Commit Scripts on page 6590](#)
- [Activating Inactive Commit Scripts on page 6590](#)

---

### Enabling Commit Scripts to Execute

The commit operation requires that all scripts be included in configuration at the `[edit system scripts commit file]` hierarchy level for all QFabric Director devices.

If you need to temporarily remove a script from a commit operation but do not want to remove it from the configuration permanently, you may configure the `optional` statement at the `[edit system scripts commit file filename]` hierarchy level to enable the commit operation to succeed even if a script is missing from the commit script directory.

**CAUTION:** When you include the `optional` statement at the `[edit system scripts commit file filename]` hierarchy level, no error message is generated during the commit operation if the file does not exist. As a result, you might not be aware that a script has not been executed as expected.

---

The filename of a commit script written in SLAX must include the **.slax** extension for the script to be executed.

To enable a commit script to execute during a commit operation:

1. Ensure that the commit script is located in the correct directory:  
**/pbdata/mgd\_shared/partition-ip/var/db/scripts/commit** directory on the Director device.

```
[edit system scripts commit]
user@switch# set file filename <optional>
```

3. Commit the configuration.

```
[edit system scripts commit]
user@switch# top
[edit]
user@switch# commit
```

### Removing Commit Scripts from the Configuration

You can prevent commit scripts from executing during a commit operation by removing the scripts from the commit directory in the configuration.

**NOTE:** You can also deactivate a script using the **deactivate** statement instead of removing it from the configuration. Deactivated scripts may be reactivated later.

To prevent a commit script from executing during a commit operation:

1. Delete the commit script file from the commit directory in the configuration.

```
[edit system scripts commit]
user@switch# delete file filename
```

2. Commit the configuration.

```
[edit system scripts commit]
user@switch# top
[edit]
user@switch# commit
```

3. Remove the commit script from the **/pbdata/mgd\_shared/** directory on the Director device.

**BEST PRACTICE:** Although removing the commit script is not necessary, we recommend deleting unused files from the system.

### Deactivating Commit Scripts

---

Deactivating a commit script results in its being marked as inactive in the configuration. The script is not executed during the commit operation, but you can reactivate the script by using the **activate** statement.

To deactivate the commit script:

1. Deactivate the script.

```
[edit]
user@switch deactivate system scripts commit file filename
```

2. Commit your changes.

```
[edit]
user@switch# commit
```

3. Verify that the commit script is deactivated.

```
[edit]
user@switch# show system scripts commit
inactive: file mycommit.slax
```

### Activating Inactive Commit Scripts

---

Deactivating a commit script results in its being marked as inactive in the configuration and is therefore not executed during the commit operation.

To activate an inactive commit script:

1. Activate the script.

```
[edit]
user@switch# activate system scripts commit file filename
```

2. Commit your changes.

```
[edit]
user@switch# commit
```

## Configuration Tasks for Network Analytics

---

- [Configuring Queue Monitoring on page 6591](#)
- [Configuring Traffic Monitoring on page 6593](#)
- [Configuring a Local File for Network Analytics Data on page 6594](#)
- [Configuring a Remote Collector for Streaming Analytics Data on page 6595](#)

## Configuring Queue Monitoring

Network analytics queue monitoring provides visibility into the performance and behavior of the data center infrastructure. This feature collects data from the switch, analyzes the data using sophisticated algorithms, and captures the results in reports. You can use the reports to help troubleshoot problems, make decisions, and adjust resources as needed.

You enable queue monitoring by first defining a resource profile template, and then applying the profile to the system (for a global configuration) or to individual interfaces.

**NOTE:** You can configure queue monitoring on physical network interfaces only; logical interfaces and Virtual Chassis physical (VCP) interfaces are not supported.

**NOTE:** This procedure requires Junos OS Release 13.2X51-D15 or later to be installed on your device.

To configure queue monitoring on a QFX Series standalone switch:

1. Configure the queue monitoring polling interval (in milliseconds) globally (for the system):

```
[edit]
set services analytics resource system polling-interval queue-monitoring interval
```

2. Configure a resource profile for the system, and enable queue monitoring:

```
[edit]
set services analytics resource-profiles profile-name queue-monitoring
```

3. Configure high and low values of the depth-threshold (in bytes) for queue monitoring in the system profile:

```
[edit]
set services analytics resource-profiles profile-name depth-threshold high number low number
```

For both high and low values, the range is from 1 to 1,250,000,000 bytes, and the default value is 0 bytes.

**NOTE:** You can configure either the depth-threshold or latency threshold for the system, but not both.

4. Apply the resource profile template to the system for a global configuration:

```
[edit]
set services analytics resource system resource-profile profile-name
```

5. Configure an interface-specific resource profile and enable queue monitoring for the interface:

```
[edit]  
set services analytics resource-profiles profile-name queue-monitoring
```

6. Configure the latency-threshold (high and low values) for queue monitoring in the interface-specific profile:

```
[edit]  
set services analytics resource-profiles profile-name latency-threshold high number  
low number
```

For both high and low values, the range is from 1 to 100,000,000 nanoseconds, and the default value is 1,000,000 nanoseconds.

**NOTE:** You can configure either the depth-threshold or latency threshold for interfaces, but not both.

---

7. Apply the resource profile template for interfaces to one or more interfaces:

```
[edit]  
set services analytics resource interfaces interface-name resource-profile profile-name
```

**NOTE:** If a conflict arises between the system and interface configurations, the interface-specific configuration supersedes the global (system) configuration.

---

- [analytics on page 6667](#)

## Configuring Traffic Monitoring

Network analytics queue monitoring provides visibility into the performance and behavior of the data center infrastructure. This feature collects data from the switch, analyzes the data using sophisticated algorithms, and captures the results in reports. You can use the reports to help troubleshoot problems, make decisions, and adjust resources as needed.

You enable traffic monitoring by first defining a resource profile template, and then applying the profile to the system (for a global configuration) or to individual interfaces.

**NOTE:** You can configure traffic monitoring on physical network interfaces only; logical interfaces and Virtual Chassis physical (VCP) interfaces are not supported.

**NOTE:** This procedure requires Junos OS Release 13.2X51-D15 or later to be installed on your device.

To configure traffic monitoring on a QFX Series standalone switch:

1. Configure the traffic monitoring polling interval (in seconds) for the system:

[edit]

**set services analytics resource system polling-interval traffic-monitoring *interval***

2. Configure a resource profile for the system, and enable traffic monitoring in the profile:

[edit]

**set services analytics resource-profiles *profile-name* traffic-monitoring**

3. Apply the resource profile to the system for a global configuration:

[edit]

**set services analytics resource system resource-profile *profile-name***

4. Configure a resource profile for interfaces, and enable traffic monitoring in the profile:

[edit]

**set services analytics resource-profiles *profile-name* traffic-monitoring**

**NOTE:** If a conflict arises between the system and interface configurations, the interface-specific configuration supersedes the global (system) configuration.

5. Apply the resource profile template to one or more interfaces:

[edit]

**set services analytics resource interfaces *interface-name* resource-profile *profile-name***

- Related Documentation**
- [Network Analytics Overview on page 6490](#)
  - [Example: Configuring Enhanced Network Analytics Features](#)
  - [analytics on page 6667](#)

## Configuring a Local File for Network Analytics Data

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. This feature collects data from the switch, analyzes the data using sophisticated algorithms, and captures the results in reports. Network administrators can use the reports to help troubleshoot problems, make decisions, and adjust resources as needed.

To save the queue and traffic statistics data in a local file, you must configure a filename to store it.

**NOTE:** This procedure requires Junos OS Release 13.2X51-D15 or later to be installed on your device.

To configure a local file for storing queue and traffic monitoring statistics:

1. Configure a filename:

[edit]

**set services analytics collector local file *filename***

There is no default filename. If you do not configure a filename, network analytics statistics are not saved locally.

2. Configure the number of files (from 2 to 1000 files):

[edit]

**set services analytics collector local file *filename* files *number***

3. Configure the file size (from 10 to 4095 MB) in the format of xm:

[edit]

**set services analytics collector local file an size *size***

- Related Documentation**

  - [Example: Configuring Enhanced Network Analytics Features](#)
  - [analytics on page 6667](#)

## Configuring a Remote Collector for Streaming Analytics Data

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. This feature collects data from the switch, analyzes the data using sophisticated algorithms, and captures the results in reports. Network administrators can use the reports to help troubleshoot problems, make decisions, and adjust resources as needed.

You can configure an export profile to define the stream format and type of data, and one or more remote servers (collectors) to receive streaming network analytics data.

**NOTE:** This procedure requires Junos OS Release 13.2X51-D15 or later to be installed on your device.

To configure a collector for receiving streamed analytics data:

1. Create an export profile and specify the stream format:

```
[edit]
set services analytics export-profiles profile-name stream-format format
```

2. Configure the export profile to include interface information:

```
[edit]
set services analytics export-profiles profile-name interface information
```

3. Configure the export profile to include interface queue statistics:

```
[edit]
set services analytics export-profiles profile-name interface statistics queue
```

4. Configure the export profile to include interface traffic statistics:

```
[edit]
set services analytics export-profiles profile-name interface statistics traffic
```

5. Configure the export profile to include interface status link information:

```
[edit]
set services analytics export-profiles profile-name interface status link
```

6. Configure the export profile to include system information:

```
[edit]
set services analytics export-profiles profile-name system information
```

7. Configure the export profile to include system queue status:

```
[edit]
set services analytics export-profiles profile-name system status queue
```

8. Configure the export profile to include system traffic status:

```
[edit]
set services analytics export-profiles profile-name system status traffic
```

9. Configure the transport protocol for the collector addresses and apply the export profile:

```
[edit]
set services analytics collector address ip-address port port transport protocol
export-profile profile-name
set services analytics collector address ip-address port port transport protocol
export-profile profile-name
```

---

**NOTE:** If you configure the `tcp` or `udp` option for the JSON, CSV, and TSV formats, you must also set up the TCP or UDP client software on the remote collector to process records that are separated by the newline character (`\n`) on the remote server.

If you configure the `tcp` or `udp` option for the GPB format, you must also set up the TCP or UDP build streaming server using the `analytics.proto` file.

## Configuration Tasks for sFlow Technology

---

- [Configuring sFlow Technology on page 6596](#)

### Configuring sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

On the QFabric system, the sFlow monitoring global configuration that is defined on the Director device is distributed to Node groups that have sFlow sampling configured on the interfaces.

To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

```
[edit protocols sflow]
user@host# set collector ip-address udp-port port-number
```

The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

```
[edit protocols sflow]
user@host# set interfaces interface-name
```

**NOTE:** You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a LAG interface (for example ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

```
[edit protocols sflow]
user@host# set polling-interval seconds
```

**NOTE:** Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets are sampled at the global level. For example, configuring a *number* of 1000 sets a sample rate of 1 in 1000 packets.

```
[edit protocols sflow]
user@host# set sample-rate number
```

5. (Optional) You can also configure the polling interval and sample rate at the interface level:

```
[edit protocols sflow]
user@host# set interfaces interface-name polling-interval seconds sample-rate number
```

**NOTE:** The interface-level configuration overrides the global configuration for the specified interface.

## Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
      address restrict;
    }
    logical-system logical-system-name {
      routing-instance routing-instance-name {
        clients {
          addresses;
        }
      }
    }
    routing-instance routing-instance-name {
      clients {
        addresses;
      }
    }
    view view-name;
  }
  contact contact;
  description description;
  filter-duplicates;
  filter-interfaces;
  health-monitor {
    falling-threshold integer;
    interval seconds;
    rising-threshold integer;
  }
  interface [ interface-names ];
```

```

location location;
name name;
nonvolatile {
    commit-delay seconds;
}
rmon {
    alarm index {
        description description;
        falling-event-index index;
        falling-threshold integer;
        falling-threshold-interval seconds;
        interval seconds;
        request-type;
        rising-event-index index;
        rising-threshold integer;
        sample-type (absolute-value | delta-value);
        startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
        syslog-subtag syslog-subtag;
        variable oid-variable;
    }
    event index {
        community community-name;
        description description;
        type type;
    }
    history history-index {
        bucket-size number;
        interface interface-name;
        interval seconds;
        owner owner-name;
    }
}
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable> <match
        regular-expression>;
    flag flag;
}
trap-group group-name {
    categories {
        category;
    }
    destination-port port-number;
    routing-instance routing-instance-name;
    targets {
        address;
    }
    version (all | v1 | v2);
}
trap-options {
    agent-address outgoing-interface;
    source-address address;
}
v3 {

## Configuring the SNMP Community String

The SNMP community string defines the relationship between an SNMP server system and the client systems. This string acts like a password to control the clients' access to

the server. To configure a community string in a Junos OS configuration, include the **community** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
community name {
  authorization authorization;
  clients {
    default restrict;
    address restrict;
  }
  view view-name;
}
```

If the community name contains spaces, enclose it in quotation marks (" ").

The default authorization level for a community is **read-only**. To allow **Set** requests within a community, you need to define that community as **authorization read-write**. For **Set** requests, you also need to include the specific MIB objects that are accessible with read-write privileges using the **view** statement. The default view includes all supported MIB objects that are accessible with read-only privileges; no MIB objects are accessible with read-write privileges. For more information about the **view** statement, see [“Configuring MIB Views” on page 6605](#).

The **clients** statement lists the IP addresses of the clients (community members) that are allowed to use this community. If no **clients** statement is present, all clients are allowed. For **address**, you must specify an IPv4 address, not a hostname. Include the **default restrict** option to deny access to all SNMP clients for which access is not explicitly granted. We recommend that you always include the **default restrict** option to limit SNMP client access to the local switch.

**NOTE:** Community names must be unique within each SNMP system.

---

Related Documentation

- [Configuring SNMP on page 1356](#)

## Configuring SNMP Trap Groups

Before any SNMP traps can be sent, you must configure a trap group, the categories of traps the group can receive, and the targets (systems) that will receive the traps. To create and name an SNMP trap group, include the **trap-group** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

```
}
```

The trap group name can be any string and is embedded in the community name field of the trap. To configure your own trap group port, include the **destination-port** statement. The default destination port is port 162.

For each trap group that you define, you must include the **target** statement to define at least one system as the recipient of the SNMP traps in the trap group. Specify the IPv4 address of each recipient and not its hostname.

Specify the types of traps the trap group can receive in the **categories** statement.

A trap group can receive the following categories of traps:

- **authentication**—Authentication failures
- **chassis**—Chassis or environment notifications
- **configuration**—Configuration notifications
- **link**—Link-related notifications such as up-down transitions
- **remote-operations**—Remote operation notifications
- **startup**—System warm and cold starts

The **version** statement allows you to specify the SNMP version of the traps sent to targets of the trap group. If you specify **v1** only, SNMPv1 traps are sent. If you specify **v2** only, SNMPv2 traps are sent. If you specify **all**, both an SNMPv1 and an SNMPv2 trap are sent for every trap condition. For more information about the **version** statement, see [version](#).

- *Juniper Networks Enterprise-Specific SNMP Version 1 Traps*
- *Juniper Networks Enterprise-Specific SNMP Version 2 Traps*

## Adding a Group of Clients to an SNMP Community

Junos OS enables you to add one or more groups of clients to an SNMP community. You can include the **client-list-name name** statement at the **[edit snmp community community-name]** hierarchy level to add all the members of the client list or prefix list to an SNMP community.

To define a list of clients, include the **client-list** statement followed by the IP addresses of the clients at the **[edit snmp]** hierarchy level:

```
[edit snmp]
  client-list client-list-name {
    ip-addresses;
  }
```

You can configure a prefix list at the **[edit policy options]** hierarchy level. Support for prefix lists in the SNMP community configuration enables you to use a single list to configure the SNMP and routing policies. For more information about the **prefix-list**

statement, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

To add a client list or prefix list to an SNMP community, include the **client-list-name** statement at the **[edit snmp community *community-name*]** hierarchy level:

```
[edit snmp community community-name]  
client-list-name client-list-name;
```

**NOTE:** The client list and prefix list must not have the same name.

The following example shows how to define a client list:

```
[edit]  
snmp {  
  client-list clentlist1 {  
    10.1.1.1/32;  
    10.2.2.2/32;  
  }  
}
```

The following example shows how to add a client list to an SNMP community:

```
[edit]  
snmp {  
  community community1 {  
    authorization read-only;  
    client-list-name clientlist1;  
  }  
}
```

The following example shows how to add a prefix list to an SNMP community:

```
[edit]  
policy-options {  
  prefix-list prefixlist {  
    10.3.3.3/32;  
    10.5.5.5/32;  
  }  
}  
snmp {  
  community community2 {  
    client-list-name prefixlist;  
  }  
}
```

- Related Documentation**
- [client-list on page 1408](#)
  - [client-list-name on page 1409](#)

## Configuring the Interfaces on Which SNMP Requests Can Be Accepted

By default, all router or switch interfaces have SNMP access privileges. To limit the access through certain interfaces only, include the **interface** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
interface [ interface-names ];
```

Specify the names of any logical or physical interfaces that should have SNMP access privileges. Any SNMP requests entering the router or switch from interfaces not listed are discarded.

#### Related Documentation

## Configuring MIB Views

SNMPv3 defines the concept of MIB views in RFC 3415, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)*. MIB views provide an agent better control over who can access specific branches and objects within its MIB tree. A view consists of a name and a collection of SNMP object identifiers, which are either explicitly included or excluded. Once defined, a view is then assigned to an SNMPv3 group or SNMPv1/v2c community (or multiple communities), automatically masking which parts of the agent's MIB tree members of the group or community can (or cannot) access.

By default, an SNMP community grants read access and denies write access to all supported MIB objects (even communities configured as **authorization read-write**). To restrict or grant read or write access to a set of MIB objects, you must configure a MIB view and associate the view with a community.

To create a MIB view and assign it to a community:

1. Configure a MIB view.

Although most network management systems use SNMPv3, Junos OS allows the use of MIB views with both SNMPv1 and SNMPv2c communities.

The **view** statement defines a MIB view and identifies a group of MIB objects. Each MIB object of a view has a common object identifier (OID) prefix. Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as **interfaces**). A configuration statement uses a view to specify a group of MIB objects on which to define access. You can also use a wildcard character asterisk (\*) to include OIDs that match a particular pattern in the SNMP view. To enable a view, you must associate the view with a community.

To remove an OID completely, use the **delete view all oid oid-number** command but omit the **include** parameter.

```
[edit groups global snmp]
user@host# set view view-name oid object-identifier (include | exclude)
```

The following example creates a MIB view called ping-mib-view. The **oid** statement does not require a dot at the beginning of the object identifier. The **snmp view** statement

includes the branch under the object identifier .1.3.6.1.2.1.80. This includes the entire DISMAN-PINGMIB subtree (as defined in RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*), which effectively permits access to any object under that branch.

```
[edit groups global snmp]
user@host# set view ping-mib-view oid 1.3.6.1.2.1.80 include
```

The following example adds a second branch in the same MIB view.

```
[edit groups global snmp]
user@host# set view ping-mib-view oid jnxPingMIB include
```

2. Assign a MIB view to a community that you want to control.

```
[edit groups global snmp community community-name]
user@host# set view view-name
```

This example creates a new community ping-mib which has read-write access to create entries within the DISMAN-PING-MIB.

```
[edit groups global snmp community ping-mib]
user@host# set authorization read-write
```

This example associate the MIB view created earlier with the new community.

```
[edit groups global snmp community ping-mib]
user@host# set view ping-mib-view
```

3. At the top level of the configuration, apply the configuration group.

If you use a configuration group, you must apply it for it to take effect.

```
[edit]
user@host# set apply-groups global
```

4. Commit the configuration.

```
user@host# commit
```

5. To verify, make sure that any member of the ping-mib community has read/write access to the branches that you specified under ping-mib-view.

## Configuring RMON Alarms and Events

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and

its corresponding event are generated. The event can be logged and can generate an SNMP trap.

To configure RMON alarms and events using the CLI, perform these tasks:

1. [Configuring SNMP on page 6607](#)
2. [Configuring an Event on page 6607](#)
3. [Configuring an Alarm on page 6608](#)

## Configuring SNMP

To configure SNMP:

1. Grant read-only access to all SNMP clients:

```
[edit snmp]
user@switch# set community community-name authorization authorization
```

For example:

```
[edit snmp]
user@switch# set community public authorization read-only
```

2. Grant read-write access to the RMON and jnx-rmon MIBs:

```
[edit snmp]
user@switch# set view view-name oid object-identifier include
user@switch# set view view-name oid object-identifier include
user@switch# set community community-name authorization authorization view view-name
```

For example:

```
[edit snmp]
user@switch# set view rmon-mib-view oid .1.3.6.1.2.1.16 include
user@switch# set view rmon-mib-view oid .1.3.6.1.4.1.2636.13 include
user@switch# set community private authorization read-write view rmon-mib-view
```

OIDs 1.3.6.1.2.1.16 and 1.3.6.1.4.1.2636.13 correspond to the RMON and jnxRmon MIBs.

3. Configure an SNMP trap group:

```
[edit snmp]
user@switch# set trap-group group-name categories category
user@switch# set trap-group group-name targets address
```

For example:

```
[edit snmp]
user@switch# set trap-group rmon-trap-group categories rmon-alarm
user@switch# set trap-group rmon-trap-group targets 192.168.5.5
```

The trap group **rmon-trap-group** is configured to send RMON traps to 192.168.5.5.

## Configuring an Event

To configure an event:

1. Configure an event index, community name, and type:

```
[edit snmp rmon]
user@switch# set event index community community-name type type
```

For example:

```
[edit snmp rmon]
```

```
user@switch# set event 1 community rmon-trap-group type log-and-trap
```

The event community corresponds to the SNMP trap group and is not the same as an SNMP community. This event generates an SNMP trap and adds an entry to the **logTable** in the RMON MIB.

2. Configure a description for the event:

```
[edit snmp rmon]
user@switch# set event index description description
```

For example:

```
[edit snmp rmon]
user@switch# set event 1 description "rmon event"
```

---

## Configuring an Alarm

To configure an alarm:

1. Configure an alarm index, the variable to monitor, the rising and falling thresholds, and the corresponding rising and falling events:

```
[edit snmp rmon]
user@switch# set alarm index variable oid-variable falling-threshold integer rising-threshold
integer rising-event-index index falling-event-index index
```

For example:

```
[edit snmp rmon]
user@switch# set alarm 5 variable .1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0 falling-threshold 75
rising-threshold 90 rising-event-index 1 falling-event-index 1
```

The variable `.1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0` corresponds to the **jnxRmon** MIB object **jnxOperatingCPU**, which represents the CPU utilization of the Routing Engine. The falling and rising threshold integers are 75 and 90. The rising and falling events both generate the same event (event index 1).

2. Configure the sample interval and type and the alarm type:

```
[edit snmp rmon]
user@switch# set alarm index interval seconds sample-type (absolute-value | delta-value)
startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm)
```

For example:

```
[edit snmp rmon]
user@switch# set alarm 5 interval 30 sample-type absolute-value
startup-alarm rising-or-falling-alarm
```

The absolute value of the monitored variable is sampled every 30 seconds. The initial alarm can occur because of rising above the rising threshold or falling below the falling threshold.

## Configuring Health Monitoring

This topic describes how to configure the health monitor feature for QFX Series devices.

The health monitor feature extends the SNMP RMON alarm infrastructure to provide predefined monitoring for a selected set of object instances (such as file system usage, CPU usage, and memory usage) and dynamic object instances (such as Junos OS processes).

To configure health monitoring:

1. Configure the health monitor:

```
[edit snmp]
user@switch# set health-monitor
```

2. Configure the falling threshold:

```
[edit snmp]
user@switch# set health-monitor falling-threshold percentage
```

For example:

```
user@switch# set health-monitor falling-threshold 85
```

3. Configure the rising threshold:

```
[edit snmp]
user@switch# set health-monitor rising-threshold percentage
```

For example:

```
user@switch# set health-monitor rising-threshold 75
```

4. Configure the interval:

```
[edit snmp]
user@switch# set health-monitor interval seconds
```

For example:

```
user@switch# set health-monitor interval 600
```

### Related Documentation

## Creating SNMPv3 Users

For each SNMPv3 user, you can specify the username, authentication type, authentication password, privacy type, and privacy password. After a user enters a password, a key based on the engine ID and password is generated and is written to the configuration file. After the generation of the key, the password is deleted from this configuration file.

**NOTE:** You can configure only one encryption type for each SNMPv3 user.

To create users, include the **user** statement at the **[edit snmp v3 usm local-engine]** hierarchy level:

```
[edit snmp v3 usm local-engine]
user username;
```

**username** is the name that identifies the SNMPv3 user.

To configure user authentication and encryption, include the following statements at the **[edit snmp v3 usm local-engine user username]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
authentication-md5 {
  authentication-password authentication-password;
}
authentication-sha {
  authentication-password authentication-password;
}
authentication-none;
privacy-aes128 {
  privacy-password privacy-password;
}
privacy-des {
  privacy-password privacy-password;
}
privacy-3des {
  privacy-password privacy-password;
}
privacy-none;
```

**Related  
Documentation**

## Configuring Access Privileges for a Group

In SNMPv3, you can configure a group that sets the same access privileges for one or more users. Configuring a group includes defining the security model and security level, and associating one or more MIB view permissions for the group.

**NOTE:** You must associate at least one MIB view with the group. You can associate multiple MIB views (read, notify, write) to authorize different permissions based on the view. The view name cannot exceed 32 characters.

To configure access privileges for a group:

1. To configure the group:

```
[edit snmp v3 vacm access]
user@switch# edit group group-name
```

2. To configure the context prefix of the SNMP instance for the group:

```
[edit snmp v3 vacm access group group-name]
user@switch# edit (default-context-prefix | context-prefix context-prefix)
```

For example, to configure the default context prefix:

```
[edit snmp v3 vacm access group group-name]
user@switch# edit default-context-prefix
```

3. To configure the security model:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix)]
user@switch# edit security-model (any | usm | v1 | v2c)
```

For example, to configure the SNMPv3 user-based security model (USM):

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix)]
user@switch# edit security-model usm
```

4. To configure the security level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c)]
user@switch# edit security-level (authentication | none | privacy)
```

For example, to configure a security level requiring user authentication and encryption:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c)]
user@switch# edit security-level privacy
```

**NOTE:** Access privileges are granted to all packets with a security level equal to or greater than that configured. If you are configuring the SNMPv1 or v2c security model, use *none* as your security level. If you are configuring the SNMPv3 security model (USM), use the *authentication*, *none*, or *privacy* security level.

5. (Optional) To associate a read-only MIB view with an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit read-view view-name
```

6. (Optional) To associate a MIB view with an SNMP notification permission for an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit notify-view view-name
```

7. (Optional) To associate a MIB view with write permission for an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit write-view view-name
```

## Assigning a Security Name to a Group

In SNMPv3, each username is associated with a security name. The security name, together with the SNMP engine ID, is included in SNMP messages to ensure messaging security.

Before you assign a security name to a group, first create the security name. For an SNMPv3 client, the security name is the username configured at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level. For SNMPv1 or v2c clients, the security name is the community string configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Assigning a security name to a group includes configuring a security model for the group, assigning the security name to the group, and configuring the group.

To assign an SNMP security name to a group:

1. To configure a security model for the group:

```
[edit snmp v3 vacm security-to-group]
user@switch# edit security-model (usm | v1 | v2c)
```

For example, to configure the SNMPv3 user-based security model (USM):

```
[edit snmp v3 vacm security-to-group]
user@switch# edit security-model usm
```

2. To associate the security name with a group:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]
user@switch# edit security-name security-name
```

3. To configure a group of SNMPv3 security names with the same security policy:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name
security-name]
user@switch# edit group group-name
```

## Configuring SNMPv3 Traps on a Device Running Junos OS

In SNMPv3, you create traps and informs by configuring the **notify**, **target-address**, and **target-parameters** parameters. Traps are unconfirmed notifications, whereas informs are confirmed notifications. This section describes how to configure SNMP traps. For information about configuring SNMP informs, see [“Configuring SNMP Informs” on page 6614](#).

The target address defines a management application’s address and parameters to be used in sending notifications. Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target. SNMPv3 also lets you define SNMPv1 and SNMPv2c traps.

**NOTE:** When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Access privileges are configured at the `[edit snmp v3 vacm access]` and `[edit snmp v3 vacm security-to-group]` hierarchy levels.

To configure SNMP traps, include the following statements at the `[edit snmp v3]` hierarchy level:

```
[edit snmp v3]
  notify name {
    tag tag-name;
    type trap;
  }
  notify-filter name {
    oid object-identifier (include | exclude);
  }
```

```
target-address target-address-name {  
    address address;  
    address-mask address-mask;  
    logical-system (SNMP) logical-system;  
    port port-number;  
    routing-instance instance;  
    tag-list tag-list;  
    target-parameters target-parameters-name;  
}  
target-parameters target-parameters-name {  
    notify-filter profile-name;  
    parameters {  
        message-processing-model (v1 | v2c | v3);  
        security-level (authentication | none | privacy);  
        security-model (usm | v1 | v2c);  
        security-name security-name;  
    }  
}
```

## Configuring SNMP Informs

Junos OS supports two types of notifications: traps and informs. With traps, the receiver does not send any acknowledgment when it receives a trap. Therefore, the sender cannot determine if the trap was received. A trap may be lost because a problem occurred during transmission. To increase reliability, an inform is similar to a trap except that the inform is stored and retransmitted at regular intervals until one of these conditions occurs:

- The receiver (target) of the inform returns an acknowledgment to the SNMP agent.
- A specified number of unsuccessful retransmissions have been attempted and the agent discards the inform message.

If the sender never receives a response, the inform can be sent again. Thus, informs are more likely to reach their intended destination than traps are. Informs use the same communications channel as traps (same socket and port) but have different protocol data unit (PDU) types.

Informs are more reliable than traps, but they consume more network, router, and switch resources (see [Figure 227 on page 6615](#)). Unlike a trap, an inform is held in memory until a response is received or the timeout is reached. Also, traps are sent only once, whereas an inform may be retried several times. Use informs when it is important that the SNMP manager receive all notifications. However, if you are more concerned about network traffic, or router and switch memory, use traps.

**Figure 227: Inform Request and Response**

For information about configuring SNMP traps, see “[Configuring SNMPv3 Traps on a Device Running Junos OS](#)” on page 6613.

## Junos OS Minimum System Logging Configuration

To record or view system log messages, you must include the **syslog** statement at the **[edit system]** hierarchy level. Specify at least one destination for the messages, as described in [Table 629 on page 6616](#). For more information about the configuration statements, see *Single-Chassis System Logging Configuration Overview*.

**Table 629: Minimum Configuration Statements for System Logging**

Destination	Minimum Configuration Statements
File	<pre>[edit system syslog] file filename {   facility severity; }</pre>
Terminal session of one, several, or all users	<pre>[edit system syslog] user (username   *) {   facility severity; }</pre>
Router or switch console	<pre>[edit system syslog] console {   facility severity; }</pre>
Remote machine or the other Routing Engine on the router or switch	<pre>[edit system syslog] host (hostname   other-routing-engine) {   facility severity; }</pre>

### Related Documentation

- [Overview of Junos OS System Log Messages on page 6560](#)
- [Overview of Single-Chassis System Logging Configuration on page 6561](#)

## Junos OS System Log Configuration Statements

To configure the switch to log system messages, include the **syslog** statement at the **[edit system]** hierarchy level:

```

[edit system]
syslog {
  archive <files number> <size size> <world-readable | no-world-readable>;
  console {
    facility severity;
  }
  file filename {
    facility severity;
    archive <archive-sites (ftp-url <password password>)> <files number> <size size>
      <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
      no-world-readable>;
    explicit-priority;
    match "regular-expression";
    structured-data {
      brief;
    }
  }
  host hostname {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string
    match "regular-expression";
  }
  source-address source-address;
  time-format (year | millisecond | year millisecond);
  user (username | *) {
    facility severity;
    match "regular-expression";
  }
}

```

**Related Documentation**

- [Overview of Junos OS System Log Messages on page 6560](#)

## Adding a Text String to System Log Messages Directed to a Remote Destination

To add a text string to every system log message directed to a remote machine or to the other Routing Engine, include the **log-prefix** statement at the **[edit system syslog host]** hierarchy level:

```

[edit system syslog host (hostname | other-routing-engine)]
facility severity;
log-prefix string;

```

The string can contain any alphanumeric or special character except the equal sign ( = ) and the colon ( : ). It also cannot include the space character; do not enclose the string in quotation marks ( " ") in an attempt to include spaces in it.

The Junos OS system logging utility automatically appends a colon and a space to the specified string when the system log messages are written to the log. The string is inserted after the identifier for the Routing Engine that generated the message.

The following example shows how to add the string M120 to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine hardware-logger.mycompany.com:

```
[edit system syslog]
host hardware-logger.mycompany.com {
  any info;
  log-prefix M120;
}
```

When these configuration statements are included on an M120 router called origin1, a message in the system log on hardware-logger.mycompany.com looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user 'root', command 'run
show version'
```

**Related  
Documentation**

- [Single-Chassis System Logging Configuration Overview](#)
- [Specifying Log File Size, Number, and Archiving Properties on page 6629](#)
- [Overview of Single-Chassis System Logging Configuration on page 6561](#)

## Directing System Log Messages to a Log File

To direct system log messages to a file in the `/var/log` directory of the local Routing Engine, include the `file` statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
file filename {
  facility severity;
  archive <archive-sites (ftp-url <password password>) > <files number> <size size>
    <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
    no-world-readable>;
  explicit-priority;
  match "regular-expression";
  structured-data {
    brief;
  }
}
```

For the list of facilities and severity levels, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 6631](#).

To prevent log files from growing too large, the Junos OS system logging utility by default writes messages to a sequence of files of a defined size. By including the `archive` statement, you can configure the number of files, their maximum size, and who can read them, either for all log files or for a certain log file. For more information, see [“Specifying Log File Size, Number, and Archiving Properties” on page 6629](#).

For information about the following statements, see the indicated sections:

- `explicit-priority`—See [“Including Priority Information in System Log Messages” on page 6622](#)
- `match`—See [“Using Regular Expressions to Refine the Set of Logged Messages” on page 6637](#)

- **structured-data**—See *Logging Messages in Structured-Data Format*

#### Related Documentation

- *Single-Chassis System Logging Configuration Overview*
- [Overview of Junos OS System Log Messages on page 6560](#)
- [Logging Messages in Structured-Data Format on page 6624](#)
- *Examples: Configuring System Logging*
- [Examples: Configuring System Logging on page 6565](#)

## Directing System Log Messages to a Remote Machine

To direct system log messages to a remote machine, include the **host** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
host (hostname | other-routing-engine) {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string;
    match "regular-expression";
}
source-address source-address;
```

To direct system log messages to a remote machine, include the **host hostname** statement to specify the remote machine's IP version 4 (IPv4) address or fully qualified hostname. The remote machine must be running the standard **syslogd** utility. We do not recommend directing messages to another Juniper Networks switch. In each system log message directed to the remote machine, the hostname of the local Routing Engine appears after the timestamp to indicate that it is the source for the message.

For the list of logging facilities and severity levels to configure under the **host** statement, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 6631](#).

To record facility and severity level information in each message, include the **explicit-priority** statement. For more information, see [“Including Priority Information in System Log Messages” on page 6622](#).

For information about the **match** statement, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 6637](#).

When directing messages to remote machines, you can include the **source-address** statement to specify the IP address of the switch that is reported in the messages as their source. In each **host** statement, you can also include the **facility-override** statement to assign an alternative facility and the **log-prefix** statement to add a string to each message.

#### Related Documentation

- [Overview of Single-Chassis System Logging Configuration on page 6561](#)

## Directing System Log Messages to a User Terminal

To direct system log messages to the terminal session of one or more specific users (or all users) when they are logged in to the local Routing Engine, include the **user** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
user (username | *) {
    facility severity;
    match "regular-expression";
}
```

Specify one or more Junos OS usernames, separating multiple values with spaces, or use the asterisk (\*) to indicate all users who are logged in to the local Routing Engine.

For the list of logging facilities and severity levels, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 6631](#). For information about the **match** statement, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 6637](#).

## Directing System Log Messages to the Console

To direct system log messages to the console of the local Routing Engine, include the **console** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
console {
    facility severity;
}
```

For the list of logging facilities and severity levels, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 6631](#).

## Disabling the System Logging of a Facility

To disable the logging of messages that belong to a particular facility, include the **facility none** statement in the configuration. This statement is useful when, for example, you want to log messages that have the same severity level and belong to all but a few facilities. Instead of including a statement for each facility you want to log, you can include

the **any severity** statement and then a **facility none** statement for each facility that you do not want to log. For example, the following logs all messages at the **error** level or higher to the console, except for messages from the **daemon** and **kernel** facilities. Messages from those facilities are logged to the file **>/var/log/internals** instead:

```
[edit system syslog]
console {
  any error;
  daemon none;
  kernel none;
}
file internals {
  daemon info;
  kernel info;
}
```

## Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
process): new instance detected (variable: sysApp1ElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysApp1ElmtRunMemory.5.8.2292)
...
Nov  4 12:08:30 switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30 switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
AS 100): Can't assign requested address
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
```

```
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the daemon facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
SNMP trap: cold start
...
```

- [Interpreting Messages Generated in Structured-Data Format on page 6625](#)

## Including Priority Information in System Log Messages

The facility and severity level of a message are together referred to as its *priority*. By default, messages logged in the standard Junos OS format do not include information about priority. To include priority information in standard-format messages directed to a file, include the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
[edit system syslog file filename]
  facility severity;
  explicit-priority;
```

**NOTE:** Messages logged in structured-data format include priority information by default. If you include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level along with the **explicit-priority** statement, the **explicit-priority** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Messages Reference*.

To include priority information in messages directed to a remote machine or the other Routing Engine, include the **explicit-priority** statement at the **[edit system syslog host (*hostname* | other-routing-engine)]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
  facility severity;
  explicit-priority;
```

**NOTE:** The `other-routing-engine` option does not apply to the QFX Series.

The priority recorded in a message always indicates the original, local facility name. If the **facility-override** statement is included for messages directed to a remote destination, the Junos OS system logging utility still uses the alternative facility name for the messages themselves when directing them to the remote destination. For more information, see [“Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination” on page 6636](#).

When the **explicit-priority** statement is included, the Junos OS logging utility prepends codes for the facility name and severity level to the message tag name, if the message has one:

*FACILITY-severity[-TAG]*

(The tag is a unique identifier assigned to some Junos OS system log messages; for more information, see the *Junos OS System Log Messages Reference*.)

In the following example, the **CHASSISD\_PARSE\_COMPLETE** message belongs to the **daemon** facility and is assigned severity **info** (6):

```
Aug 21 12:36:30 router1 chassisd[522]: %DAEMON-6-CHASSISD_PARSE_COMPLETE:
Using new configuration
```

When the **explicit-priority** statement is not included, the priority does not appear in the message:

```
Aug 21 12:36:30 router1 chassisd[522]: CHASSISD_PARSE_COMPLETE: Using new
configuration
```

For more information about message formatting, see the *Junos OS System Log Messages Reference*.

## Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 15:36:30
```

To include the year, the millisecond, or both, in the timestamp, include the **time-format** statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2010):

```
Aug 21 15:36:30.401 2010
```

**NOTE:** By default, messages logged in structured-data format include the year and millisecond. If you include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level along with the **time-format** statement, the **time-format** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see [“Logging Messages in Structured-Data Format” on page 6624](#). For information about interpreting messages in a structured-data format, see [“Interpreting Messages Generated in Structured-Data Format” on page 6625](#).

---

## Logging Messages in Structured-Data Format

You can log messages to a file in structured-data format instead of the standard Junos OS format. The structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from a message.

The structured-data format complies with Internet draft **draft-ietf-syslog-protocol-21.txt**. The draft establishes a standard message format regardless of the source or transport protocol for logged messages.

To output messages to a file in structured-data format, include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
[edit system syslog file filename]  
  facility severity;  
  structured-data {  
    brief;  
  }
```

The optional **brief** statement suppresses the English-language text that appears by default at the end of a message to describe the error or event. For information about the fields in a structured-data-format message, see [“Interpreting Messages Generated in Structured-Data Format” on page 6625](#).

The structured format is used for all messages logged to the file that are generated by a Junos OS process or software library.

**NOTE:** If you include either or both of the **explicit-priority** and **time-format** statements along with the **structured-data** statement, they are ignored. These statements apply to the standard Junos OS system log format, not to structured-data format.

## Interpreting Messages Generated in Structured-Data Format

By default, Junos OS processes and software libraries write messages to the system log file in structured-data format. For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*.

Structured-format makes it easier for automated applications to extract information from the message. In particular, the standardized format for reporting the value of variables (elements in the English-language message that vary depending on the circumstances that triggered the message) makes it easy for an application to extract those values.

The structured-data format for a message includes the following fields (which appear here on two lines only for legibility):

```
<priority code>version timestamp hostname process processID TAG [junos@2636.platform
variable-value-pairs] message-text
```

Table 630 on page 6625 describes the fields. If the system logging utility cannot determine the value in a particular field, a hyphen ( - ) appears instead.

**Table 630: Fields in Structured-Data Messages**

Field	Description	Examples
<b>&lt;priority code&gt;</b>	Number that indicates the facility and severity of a message. It is calculated by multiplying the facility number by 8 and then adding the numerical value of the severity. For a mapping of the numerical codes to facility and severity, see “Specifying the Facility and Severity of Messages to Include in the Log” on page 6631.	<165> for a message from the <b>pfe</b> facility (facility=20) with severity <b>notice</b> (severity=5).
<b>version</b>	Version of the Internet Engineering Task Force (IETF) system logging protocol specification.	1 for the initial version

Table 630: Fields in Structured-Data Messages (*continued*)

Field	Description	Examples
<i>timestamp</i>	Time when the message was generated, in one of two representations: <ul style="list-style-type: none"> <li><i>YYYY-MM-DDTHH:MM:SS.MSZ</i> is the year, month, day, hour, minute, second and millisecond in Universal Coordinated Time (UTC)</li> <li><i>YYYY-MM-DDTHH:MM:SS.MS+/-HH:MM</i> is the year, month, day, hour, minute, second and millisecond in local time; the hour and minute that follows the plus sign (+) or minus sign (-) is the offset of the local time zone from UTC</li> </ul>	2007-02-15T09:17:15.719Z is 9:17 AM UTC on 15 February 2007. 2007-02-15T01:17:15.719-08:00 is the same timestamp expressed as Pacific Standard Time in the United States.
<i>hostname</i>	Name of the host that originally generated the message.	switch1
<i>process</i>	Name of the Junos OS process that generated the message.	mgd
<i>processID</i>	UNIX process ID (PID) of the Junos process that generated the message.	3046
<i>TAG</i>	Junos OS system log message tag, which uniquely identifies the message.	UI_DBASE_LOGOUT_EVENT
<i>junos@2636.platform</i>	An identifier for the type of hardware platform that generated the message. The <i>junos@2636</i> prefix indicates that the platform runs the Junos OS. It is followed by a dot-separated numerical identifier for the platform type.	junos@2636.1.1.1.2.18
<i>variable-value-pairs</i>	A variable-value pair for each element in the <i>message-text</i> string that varies depending on the circumstances that triggered the message. Each pair appears in the format <i>variable</i> = " <i>value</i> ".	username="regress"
<i>message-text</i>	English-language description of the event or error (omitted if the brief statement is included at the [edit system syslog file <i>filename</i> structured-data] hierarchy level).	User 'regress' exiting configuration mode

By default, the structured-data version of a message includes English text at the end, as in the following example (which appears on multiple lines only for legibility):

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="regress"] User 'regress' exiting configuration mode
```

When the brief statement is included at the [edit system syslog file *filename* structured-data ] hierarchy level, the English text is omitted, as in this example:

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="regress"]
```

Table 631 on page 6627 maps the codes that appear in the **priority-code** field to facility and severity level.

**NOTE:** Not all of the facilities and severities listed in Table 631 on page 6627 can be included in statements at the [edit system syslog] hierarchy level (some are used by internal processes). For a list of the facilities and severity levels that can be included in the configuration, see “[Specifying the Facility and Severity of Messages to Include in the Log](#)” on page 6631.

Table 631: Facility and Severity Codes in the priority-code Field

Facility (number)	Severity emergency	alert	critical	error	warning	notice	info	debug

## Interpreting Messages Generated in Standard Format

The syntax of a standard-format message generated by a Junos OS process or subroutine library depends on whether it includes priority information:

- When the **explicit-priority** statement is included at the `[edit system syslog file filename]` or `[edit system syslog host hostname]` hierarchy level, a system log message has the following syntax:

```
timestamp message-source: %facility-severity-TAG: message-text
```

- When directed to the console or to users, or when the **explicit-priority** statement is not included for files or remote hosts, a system log message has the following syntax:

```
timestamp message-source: TAG: message-text
```

Table 632 on page 6628 describes the message fields.

Table 632: Fields in Standard-Format Messages

Field	Description
<i>timestamp</i>	Time at which the message was logged.
<i>message-source</i>	Identifier of the process or component that generated the message and the routing platform on which the message was logged. This field includes two or more subfields: hostname, process and process ID (PID). If the process does not report its PID, the PID is not displayed. The message source subfields are displayed in the following format:  <i>hostname process[process-ID]</i>
<i>facility</i>	Code that specifies the facility to which the system log message belongs. For a mapping of codes to facility names, see Table: <b>Facility Codes Reported in Priority Information</b> in “Including Priority Information in System Log Messages” on page 6622.

Table 632: Fields in Standard-Format Messages (*continued*)

Field	Description
<b>severity</b>	Numerical code that represents the severity level assigned to the system log message. For a mapping of codes to severity names, see Table: <b>Numerical Codes for Severity Levels Reported in Priority Information</b> in “Including Priority Information in System Log Messages” on page 6622.
<b>TAG</b>	Text string that uniquely identifies the message, in all uppercase letters and using the underscore (_) to separate words. The tag name begins with a prefix that indicates the generating software process or library. The entries in this reference are ordered alphabetically by this prefix.  Not all processes on a routing platform use tags, so this field does not always appear.
<b>message-text</b>	Text of the message.

## Specifying Log File Size, Number, and Archiving Properties

To prevent log files from growing too large, by default the Junos system logging utility writes messages to a sequence of files of a defined size. The files in the sequence are referred to as *archive* files to distinguish them from the *active* file to which messages are currently being written. The default maximum size depends on the platform type:

- 128 kilobytes (KB) for EX Series switches and J Series routers
- 1 megabyte (MB) for M Series, MX Series, and T Series routers
- 10 MB for TX Matrix or TX Matrix Plus routers
- 1 MB for the QFX Series

When an active log file called **logfile** reaches the maximum size, the logging utility closes the file, compresses it, and names the compressed archive file **logfile.0.gz**. The logging utility then opens and writes to a new active file called **logfile**. This process is also known as file rotation. When the new **logfile** reaches the configured maximum size, **logfile.0.gz** is renamed **logfile.1.gz**, and the new **logfile** is closed, compressed, and renamed **logfile.0.gz**. By default, the logging utility creates up to 10 archive files in this manner. When the maximum number of archive files is reached and when the size of the active file reaches the configured maximum size, the contents of the last archived file are overwritten by the current active file. The logging utility by default also limits the users who can read log files to the **root** user and users who have the Junos OS **maintenance** permission.

Junos OS provides a configuration statement **log-rotate-frequency** that configures the system log file rotation frequency by configuring the time interval for checking the log file size. The frequency can be set to a value of 1 minute through 59 minutes. The default frequency is 15 minutes.

To configure the log rotation frequency, include the **log-rotate-frequency** statement at the **[edit system syslog]** hierarchy level.

You can include the **archive** statement to change the maximum size of each file, how many archive files are created, and who can read log files.

To configure values that apply to all log files, include the **archive** statement at the **[edit system syslog]** hierarchy level:

```
archive <files number> <size size> <world-readable | no-world-readable>;
```

To configure values that apply to a specific log file, include the **archive** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
archive <archive-sites (ftp-url <password password>)> <files number> <size size>  
<start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |  
no-world-readable>;
```

**archive-sites *site-name*** specifies a list of archive sites that you want to use for storing files. The ***site-name*** value is any valid FTP URL to a destination. If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the specified log filename. For information about how to specify valid FTP URLs, see [“Format for Specifying Filenames and URLs in Junos OS CLI Commands” on page 42](#).

**binary-data** Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems). To restore the default setting, include the **no-binary-data** statement.

**files *number*** specifies the number of files to create before the oldest file is overwritten. The value can be from 1 through 1000.

**size *size*** specifies the maximum size of each file. The value can be from 64 KB (64k) through 1 gigabyte (1g); to represent megabytes, use the letter **m** after the integer. There is no space between the digits and the **k**, **m**, or **g** units letter.

**start-time "YYYY-MM-DD.hh:mm"** defines the date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

**transfer-interval *interval*** defines the amount of time the current log file remains open (even if it has not reached the maximum possible size) and receives new statistics before it is closed and transferred to an archive site. This interval value can be from 5 through 2880 minutes.

**world-readable** enables all users to read log files. To restore the default permissions, include the **no-world-readable** statement.

#### Related Documentation

- [Overview of Single-Chassis System Logging Configuration on page 6561](#)
- [Routing Matrix with a TX Matrix Plus Router Solutions Page](#)

## Specifying the Facility and Severity of Messages to Include in the Log

Each system log message belongs to a facility, which groups together messages that either are generated by the same source (such as a software process) or concern a similar condition or activity (such as authentication attempts). Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects routing platform functions.

When you configure logging for a facility and destination, you specify a severity level for each facility. Messages from the facility that are rated at that level and higher are logged to the following destination:

```
[edit system syslog]
(console | file filename | host destination | user username) {
  facility severity ;
}
```

For more information about the destinations, see [“Directing System Log Messages to a User Terminal” on page 6620](#), and, [“Directing System Log Messages to the Console” on page 6620](#).

To log messages belonging to more than one facility to a particular destination, specify each facility and associated severity as a separate statement within the set of statements for the destination.

[Table 633 on page 6631](#) lists the Junos system logging facilities that you can specify in configuration statements at the `[edit system syslog]` hierarchy level.

**Table 633: Junos OS System Logging Facilities**

Facility	Type of Event or Error
<b>any</b>	All (messages from all facilities)
<b>authorization</b>	Authentication and authorization attempts
<b>change-log</b>	Changes to the Junos OS configuration
<b>conflict-log</b>	Specified configuration is invalid on the router type
<b>daemon</b>	Actions performed or errors encountered by system processes
<b>dfc</b>	Events related to dynamic flow capture
<b>firewall</b>	Packet filtering actions performed by a firewall filter
<b>ftp</b>	Actions performed or errors encountered by the FTP process
<b>interactive-commands</b>	Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client

Table 633: Junos OS System Logging Facilities (*continued*)

Facility	Type of Event or Error
<b>kernel</b>	Actions performed or errors encountered by the Junos OS kernel
<b>pfe</b>	Actions performed or errors encountered by the Packet Forwarding Engine
<b>user</b>	Actions performed or errors encountered by user-space processes

Table 634 on page 6632 lists the severity levels that you can specify in configuration statements at the **[edit system syslog]** hierarchy level. The levels from **emergency** through **info** are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the **none** level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see “Disabling the System Logging of a Facility” on page 6620.

Table 634: System Log Message Severity Levels

Severity Level	Description
<b>any</b>	Includes all severity levels
<b>none</b>	Disables logging of the associated facility to a destination
<b>emergency</b>	System panic or other condition that causes the router to stop functioning
<b>alert</b>	Conditions that require immediate correction, such as a corrupted system database
<b>critical</b>	Critical conditions, such as hard errors
<b>error</b>	Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels
<b>warning</b>	Conditions that warrant monitoring
<b>notice</b>	Conditions that are not errors but might warrant special handling
<b>info</b>	Events or nonerror conditions of interest

## Junos OS System Logging Facilities and Message Severity Levels

Table 633 on page 6631 lists the Junos system logging facilities that you can specify in configuration statements at the **[edit system syslog]** hierarchy level.

**Table 635: Junos OS System Logging Facilities**

Facility	Type of Event or Error
<b>any</b>	All (messages from all facilities)
<b>authorization</b>	Authentication and authorization attempts
<b>change-log</b>	Changes to the Junos OS configuration
<b>conflict-log</b>	Specified configuration is invalid on the router type
<b>daemon</b>	Actions performed or errors encountered by system processes
<b>dfc</b>	Events related to dynamic flow capture
<b>firewall</b>	Packet filtering actions performed by a firewall filter
<b>ftp</b>	Actions performed or errors encountered by the FTP process
<b>interactive-commands</b>	Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client
<b>kernel</b>	Actions performed or errors encountered by the Junos OS kernel
<b>pfe</b>	Actions performed or errors encountered by the Packet Forwarding Engine
<b>user</b>	Actions performed or errors encountered by user-space processes

Table 634 on page 6632 lists the severity levels that you can specify in configuration statements at the **[edit system syslog]** hierarchy level. The levels from **emergency** through **info** are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the **none** level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see “Disabling the System Logging of a Facility” on page 6620.

**Table 636: System Log Message Severity Levels**

Severity Level	Description
<b>any</b>	Includes all severity levels
<b>none</b>	Disables logging of the associated facility to a destination

**Table 636: System Log Message Severity Levels (*continued*)**

Severity Level	Description
<b>emergency</b>	System panic or other condition that causes the router to stop functioning
<b>alert</b>	Conditions that require immediate correction, such as a corrupted system database
<b>critical</b>	Critical conditions, such as hard errors
<b>error</b>	Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels
<b>warning</b>	Conditions that warrant monitoring
<b>notice</b>	Conditions that are not errors but might warrant special handling
<b>info</b>	Events or nonerror conditions of interest

  - [Overview of Single-Chassis System Logging Configuration on page 6561](#)

## Alternate Facilities for System Log Messages Directed to a Remote Destination

Table 638 on page 6635 lists the facilities that you can specify in the **facility-override** statement.

**Table 638: Facilities for the facility-override Statement**

Facility	Description
<b>authorization</b>	Authentication and authorization attempts
<b>daemon</b>	Actions performed or errors encountered by system processes
<b>ftp</b>	Actions performed or errors encountered by the FTP process
<b>kernel</b>	Actions performed or errors encountered by the Junos OS kernel
<b>local0</b>	Local facility number 0
<b>local1</b>	Local facility number 1
<b>local2</b>	Local facility number 2
<b>local3</b>	Local facility number 3
<b>local4</b>	Local facility number 4
<b>local5</b>	Local facility number 5
<b>local6</b>	Local facility number 6
<b>local7</b>	Local facility number 7
<b>user</b>	Actions performed or errors encountered by user-space processes

We do not recommend including the **facility-override** statement at the **[edit system syslog host other-routing-engine]** hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

- Related Documentation**

  - [Single-Chassis System Logging Configuration Overview](#)
  - [Overview of Single-Chassis System Logging Configuration on page 6561](#)

## Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination

Some facilities assigned to messages logged on the local router or switch have Junos OS-specific names (see [“Junos OS System Logging Facilities and Message Severity Levels” on page 6633](#)). In the recommended configuration, a remote machine designated at the `[edit system syslog host hostname]` hierarchy level is not a Juniper Networks router or switch, so its syslogd utility cannot interpret the Junos OS-specific names. To enable the standard syslogd utility to handle messages from these facilities when messages are directed to a remote machine, a standard **localX** facility name is used instead of the Junos OS-specific facility name.

[Table 637 on page 6634](#) lists the default alternative facility name next to the Junos OS-specific facility name it is used for.

The syslogd utility on a remote machine handles all messages that belong to a facility in the same way, regardless of the source of the message (the Juniper Networks router or switch or the remote machine itself). For example, the following statements in the configuration of the router called **local-router** direct messages from the **authorization** facility to the remote machine *monitor.mycompany.com*:

```
[edit system syslog]
host monitor.mycompany.com {
  authorization info;
}
```

The default alternative facility for the local **authorization** facility is also **authorization**. If the syslogd utility on **monitor** is configured to write messages belonging to the **authorization** facility to the file `/var/log/auth-attempts`, then the file contains the messages generated when users log in to **local-router** and the messages generated when users log in to **monitor**. Although the name of the source machine appears in each system log message, the mixing of messages from multiple machines can make it more difficult to analyze the contents of the **auth-attempts** file.

To make it easier to separate the messages from each source, you can assign an alternative facility to all messages generated on **local-router** when they are directed to **monitor**. You can then configure the syslogd utility on **monitor** to write messages with the alternative facility to a different file from messages generated on **monitor** itself.

To change the facility used for all messages directed to a remote machine, include the **facility-override** statement at the `[edit system syslog host hostname]` hierarchy level:

```
[edit system syslog host hostname]
  facility severity;
  facility-override facility;
```

In general, it makes sense to specify an alternative facility that is not already in use on the remote machine, such as one of the **localX** facilities. On the remote machine, you must also configure the syslogd utility to handle the messages in the desired manner.

[Table 638 on page 6635](#) lists the facilities that you can specify in the **facility-override** statement.

We do not recommend including the **facility-override** statement at the **[edit system syslog host other-routing-engine]** hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

The following example shows how to log all messages generated on the local router at the error level or higher to the local0 facility on the remote machine called `monitor.mycompany.com`:

```
[edit system syslog]
host monitor.mycompany.com {
  any error;
  facility-override local0;
}
```

The following example shows how to configure routers located in California and routers located in New York to send messages to a single remote machine called `central-logger.mycompany.com`. The messages from California are assigned to alternative facility `local0` and the messages from New York are assigned to alternative facility `local2`.

- Configure California routers to aggregate messages in the `local0` facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local0;
}
```

- Configure New York routers to aggregate messages in the `local2` facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local2;
}
```

On `central-logger`, you can then configure the system logging utility to write messages from the `local0` facility to the file **change-log** and the messages from the `local2` facility to the file **new-york-config**.

## Using Regular Expressions to Refine the Set of Logged Messages

The predefined facilities group together related messages, but you can also use regular expression matching to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination.

To specify the text string that must (or must not) appear in a message for the message to be logged to a destination, include the **match** statement and specify the regular expression which the text string must match:

```
match "regular-expression";
```

You can include this statement at the following hierarchy levels:

- **[edit system syslog file *filename*]** (for a file)
- **[edit system syslog user (*username* | \*)]** (for a specific user session or for all user sessions on a terminal)
- **[edit system syslog host (*hostname* | other-routing-engine)]** (for a remote destination)

In specifying the regular expression, use the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. Explaining regular expression syntax is beyond the scope of this document, but POSIX standards are available from the Institute of Electrical and Electronics Engineers (IEEE, <http://www.ieee.org>).

Table 639 on page 6638 specifies which character or characters are matched by some of the regular expression operators that you can use in the match statement. In the descriptions, the term *term* refers to either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

**NOTE:** The match statement is not case-sensitive.

**Table 639: Regular Expression Operators for the match Statement**

Operator	Matches
. (period)	One instance of any character except the space.
* (asterisk)	Zero or more instances of the immediately preceding term.
+ (plus sign)	One or more instances of the immediately preceding term.
? (question mark)	Zero or one instance of the immediately preceding term.
(pipe)	One of the terms that appears on either side of the pipe operator.
! (exclamation point)	Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of the exclamation point is Junos OS-specific.
^ (caret)	Start of a line, when the caret appears outside square brackets.  One instance of any character that does not follow it within square brackets, when the caret is the first character inside square brackets.
\$ (dollar sign)	End of a line.

**Table 639: Regular Expression Operators for the match Statement (*continued*)**

Operator	Matches
[ ] (paired square brackets)	One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen ( - ) to separate the beginning and ending characters of the range. For example, [a-z0-9] matches any letter or number.
( ) (paired parentheses)	One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.

**Using Regular Expressions** Filter messages that belong to the **interactive-commands** facility, directing those that include the string **configure** to the terminal of the root user:

```
[edit system syslog]
user root {
  interactive-commands any;
  match ".*configure.*";
}
```

Messages like the following appear on the **root** user's terminal when a user issues a **configure** command to enter configuration mode:

```
timestamp router-name mgd[PID]: UI_CMDLINE_READ_LINE: User 'user', command
'configure private'
```

Filter messages that belong to the **daemon** facility and have a severity of **error** or higher, directing them to the file **/var/log/process-errors**. Omit messages generated by the SNMP process (snmpd), instead directing them to the file **/var/log/snmpd-errors**:

```
[edit system syslog]
file process-errors {
  daemon error;
  match "!(.*snmpd.*)";
}
file snmpd-errors {
  daemon error;
  match ".*snmpd.*";
}
```

## connection-limit

<b>Syntax</b>	<code>connection-limit <i>limit</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system services finger],</code> <code>[edit system services ftp],</code> <code>[edit system services netconf ssh],</code> <code>[edit system services ssh],</code> <code>[edit system services telnet],</code> <code>[edit system services xnm-clear-text],</code> <code>[edit system services xnm-ssl]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the maximum number of connections sessions for each type of system services (finger, ftp, ssh, telnet, xnm-clear-text, or xnm-ssl) per protocol (either IPv6 or IPv4).
<b>Options</b>	<p><b>limit</b>—(Optional) Maximum number of established connections per protocol (either IPv6 or IPv4).</p> <p><b>Range:</b> 1 through 250</p> <p><b>Default:</b> 75</p>

**NOTE:** The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured `connection-limit` value if the system resources are limited.

<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## destination-override

---

<b>Syntax</b>	<code>destination-override {   syslog host <i>ip-address</i>; }</code>
<b>Hierarchy Level</b>	[edit system tracing]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Override the system-wide configuration of the switch at the <b>[edit system tracing]</b> hierarchy level. This statement has no effect if system tracing is not configured.
<b>Options</b>	<b>syslog</b> —System process log files to send to the remote tracing host. <ul style="list-style-type: none"><li>• <b>syslog</b>—System process log files to send to the remote tracing host.</li><li>• <b>host <i>ip-address</i></b>—IP address to which to send tracing information.</li></ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Tracing and Logging Operations on page 6468</a></li><li>• <a href="#">tracing on page 330</a></li></ul>

## no-remote-trace

---

<b>Syntax</b>	<code>no-remote-trace</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the switch to disable remote tracing after remote tracing has been enabled.
<b>Default</b>	Remote tracing is disabled.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">tracing on page 330</a></li></ul>

---

## protocol-version

---

<b>Syntax</b>	<code>protocol-version <i>version</i>;</code>
<b>Hierarchy Level</b>	[edit system services ssh]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the secure shell (SSH) protocol version.
<b>Default</b>	<b>v2</b> —SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.
<b>Options</b>	<b><i>version</i></b> —SSH protocol version: <b>v1</b> , <b>v2</b> , or both.
<b>Required Privilege Level</b>	<b>admin</b> —To view this statement in the configuration. <b>admin-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the SSH Protocol Version on page 1363</a></li></ul>

## rate-limit

---

<b>Syntax</b>	<code>rate-limit <i>limit</i>;</code>
<b>Hierarchy Level</b>	[edit system services finger], [edit system services ftp], [edit system services netconf ssh], [edit system services ssh], [edit system services telnet], [edit system services xnm-clear-text], [edit system services xnm-ssl]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the maximum number of connections attempts per protocol (either IPv6 or IPv4) on an access service.
<b>Default</b>	150 connections
<b>Options</b>	<b>rate-limit <i>limit</i></b> —(Optional) Maximum number of connection attempts allowed per minute, per IP protocol (either IPv4 or IPv6). <b>Range:</b> 1 through 250 <b>Default:</b> 150
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i></li></ul>

## ssh

<b>Syntax</b>	<pre>ssh {   ciphers [ <i>cipher-1 cipher-2 cipher-3 ...</i>];   client-alive-count-max <i>seconds</i>;   client-alive-interval <i>seconds</i>;   connection-limit <i>limit</i>;   hostkey-algorithm &lt;<i>algorithm</i> no-<i>algorithm</i>&gt;;   key-exchange &lt;<i>algorithm</i>&gt;;   macs &lt;<i>algorithm</i>&gt;;   max-sessions-per-connection &lt;<i>number</i>&gt;;   no-passwords;   no-tcp-forwarding;   protocol-version [<i>v1 v2</i>];   rate-limit <i>limit</i>;   root-login (<i>allow</i>   <i>deny</i>   <i>deny-password</i>); }</pre>
<b>Hierarchy Level</b>	[edit system services]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p><b>client-alive-interval</b> and <b>client-alive-max-count</b> statements introduced in Junos OS Release 12.2.</p> <p><b>no-passwords</b> statement introduced in Junos OS Release 13.3.</p>
<b>Description</b>	<p>Allow SSH requests from remote systems to the local router or switch.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SSH Service for Remote Access to the Router or Switch on page 1361</a></li> </ul>

## telnet

---

<b>Syntax</b>	<pre>telnet {     connection-limit limit;     rate-limit limit; }</pre>
<b>Hierarchy Level</b>	[edit system services]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Provide Telnet connections from remote systems to the local router or switch.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Telnet Service for Remote Access to a Router or Switch</i></li></ul>

## tracing

<b>Syntax</b>	tracing { destination-override syslog host <i>ip-address</i> ; }
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the switch to enable remote tracing to a specified host IP address.
<div>  <b>NOTE:</b> The tracing statement is not supported on the QFX3000 QFabric system.         </div>	
<p>The following processes are supported:</p> <ul style="list-style-type: none"> <li>• <b>chassisd</b>—Chassis-control process</li> <li>• <b>eventd</b>—Event-processing process</li> <li>• <b>cosd</b>—Class-of-service process</li> </ul> <p>If you enabled remote tracing but wish to disable it for specific processes on the switch, use the <b>no-remote-trace</b> statement at the <b>[edit system process-name traceoptions]</b> hierarchy level.</p>	
<b>Default</b>	Remote tracing is disabled by default.
<b>Options</b>	<b>destination-override syslog host <i>ip-address</i></b> —Overrides the global configuration for system tracing and has no effect if the <b>tracing</b> statement is not configured.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Tracing and Logging Operations on page 6468</a></li> <li>• <a href="#">destination-override on page 271</a></li> </ul>

## allow-transients

---

<b>Syntax</b>	allow-transients;
<b>Hierarchy Level</b>	[edit system scripts commit]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS commit scripts, enable transient configuration changes to be committed.
<b>Default</b>	Transient changes are disabled by default. If you do not include the <b>allow-transients</b> statement, and an enabled script generates transient changes, the command-line interface (CLI) generates an error message and the commit operation fails.
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Generating a Persistent or Transient Change</i></li><li>• <i>Creating a Macro to Read the Custom Syntax and Generate Related Configuration Statements</i></li></ul>

## apply-macro

---

<b>Syntax</b>	<pre>apply-macro <i>apply-macro-name</i> {     <i>parameter-name parameter-value</i>; }</pre>
<b>Hierarchy Level</b>	All hierarchy levels
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	<p>With commit script macros, use custom syntax in your configuration.</p> <p>Macros work by locating <b>apply-macro</b> statements that you include in the candidate configuration and using the values specified in the <b>apply-macro</b> statement as parameters to a set of instructions (the macro) defined in a commit script. The commit script alters your configuration from one that contains custom syntax into a full configuration containing standard Junos OS statements.</p> <p>In effect, your custom configuration syntax serves a dual purpose. The syntax allows you to simplify your configuration tasks, and it provides data (or <i>hooks</i>) that are used by commit script macros.</p> <p>You can include the <b>apply-macro</b> statement at any level of the configuration hierarchy. You can include multiple <b>apply-macro</b> statements at each level of the configuration hierarchy; however, each must have a unique name.</p>
<b>Options</b>	<p><b><i>apply-macro-name</i></b>—Name of the <b>apply-macro</b> statement.</p> <p><b><i>parameter-name</i></b>—One or more parameters. Parameters can be any text you want to include in your configuration.</p> <p><b><i>parameter-value</i></b>—A value that corresponds to the parameter name. Parameter values can be any text you want to include in your configuration.</p>
<b>Required Privilege Level</b>	configure—To enter configuration mode; other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Overview of Creating Custom Configuration Syntax with Macros</i></li> </ul>

## checksum

---

<b>Syntax</b>	<code>checksum (md5   sha-256   sha1) hash;</code>
<b>Hierarchy Level</b>	[edit event-options event-script file <i>filename</i> ], [edit system <a href="#">scripts commit file filename</a> ], [edit system <a href="#">scripts op file filename</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS commit scripts and op scripts, specify the MD5, SHA-1, or SHA-256 checksum hash. When it executes a local event, commit, or op script, Junos OS verifies the authenticity of the script by using the configured checksum hash.
<b>Options</b>	<b>md5 hash</b> —MD5 checksum of this script.  <b>sha-256 hash</b> —SHA-256 checksum of this script.  <b>sha1 hash</b> —SHA-1 checksum of this script.
<b>Required Privilege Level</b>	<b>maintenance</b> —To view this statement in the configuration. <b>maintenance-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Checksum Hashes for a Commit Script</i></li><li>• <i>Configuring Checksum Hashes for an Event Script</i></li><li>• <i>Configuring Checksum Hashes for an Op Script</i></li><li>• <i>Executing an Op Script from a Remote Site</i></li><li>• <a href="#">file checksum md5 on page 363</a> command in the <i>System Basics and Services Command Reference</i></li><li>• <a href="#">file checksum sha-256 on page 365</a> command in the <i>System Basics and Services Command Reference</i></li><li>• <a href="#">file checksum sha1 on page 364</a> command in the <i>System Basics and Services Command Reference</i></li></ul>

---

## command

---

<b>Syntax</b>	<code>command <i>filename-alias</i>;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">scripts op file</a> <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS op scripts, configure a filename alias for the script file. This allows you to run the script by referencing either the script filename or the filename alias.
<b>Options</b>	<i>filename-alias</i> —Alias for the script file.
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Enabling an Op Script and Defining a Script Alias</i></li></ul>

## commit

---

**Syntax** `commit {  
 allow-transients;  
 dampen {  
 dampen-options {  
 cpu-factor cpu-factor;  
 line-interval line-interval;  
 time-interval time-interval;  
 }  
 }  
 direct-access;  
 file filename {  
 checksum (md5 | sha-256 | sha1) hash;  
 optional;  
 refresh;  
 refresh-from url;  
 source url;  
 }  
 max-datasize  
 refresh;  
 refresh-from url;  
 traceoptions {  
 file <filename> <files number> <size size> <world-readable | no-world-readable>;  
 flag flag;  
 no-remote-trace;  
 }  
}`

**Hierarchy Level** [edit system [scripts](#)]

**Release Information** Statement introduced in Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** For Junos OS commit scripts, configure the commit-time scripting mechanism.

**Options** The statements are explained separately.

**Required Privilege Level** maintenance—To view this statement in the configuration.  
maintenance-control—To add this statement to the configuration.

## description

---

<b>Syntax</b>	<code>description <i>descriptive-text</i>;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">scripts op file filename</a> ] [edit system <a href="#">scripts op file filename</a> arguments <i>argument-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS op scripts, provide a help-text string that appears in the command-line interface (CLI).
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Help Text for Op Scripts</i></li> <li>• <i>Declaring Arguments in Op Scripts</i></li> <li>• <a href="#">file (Op Scripts) on page 6655</a></li> </ul>

## direct-access

---

<b>Syntax</b>	<code>direct-access;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">scripts commit</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify that commit scripts read input configurations directly from the database when inspecting these scripts for errors.
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Executing Large Commit Scripts</i></li> </ul>

## file (Commit Scripts)

---

<b>Syntax</b>	<pre>file <i>filename</i> {     checksum (md5   sha-256   sha1) <i>hash</i>;     optional;     refresh;     refresh-from <i>url</i>;     source <i>url</i>; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">scripts commit</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS commit scripts, enable a commit script that is located in the <code>/var/db/scripts/commit</code> directory.
<b>Options</b>	<p><i>filename</i>—Name of an Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) file containing a commit script.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>maintenance—To view this statement in the configuration.</p> <p>maintenance-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li><i>Controlling Execution of Commit Scripts During Commit Operations</i></li></ul>

## file (Op Scripts)

<b>Syntax</b>	<pre> file <i>filename</i> {   arguments {     <i>argument-name</i> {       <b>description</b> <i>descriptive-text</i>;     }   }   <b>checksum</b> (md5   sha-256   sha1) <i>hash</i>;   <b>command</b> <i>filename-alias</i>;   dampen {     dampen-options {       cpu-factor <i>cpu-factor</i>;       line-interval <i>line-interval</i>;       time-interval <i>time-interval</i>;     }   }   <b>description</b> <i>descriptive-text</i>;   <b>refresh</b>;   <b>refresh-from</b> <i>url</i>;   <b>source</b> <i>url</i>; } </pre>
<b>Hierarchy Level</b>	[edit system <b>scripts op</b> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 7.6.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	For Junos OS op scripts, enable an op script that is located in the <code>/var/db/scripts/op</code> directory.
<b>Options</b>	<p><b><i>filename</i></b>—The name of an Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) file containing an op script.</p> <p>The statements are explained separately.</p>
<b>Required Privilege Level</b>	<p><b>maintenance</b>—To view this statement in the configuration.</p> <p><b>maintenance-control</b>—To add this statement to the configuration.</p>

## no-allow-url

---

<b>Syntax</b>	no-allow-url;
<b>Hierarchy Level</b>	[edit system <a href="#">scripts op</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS op scripts, prohibit the remote execution of scripts. When you include this configuration statement, the <b>op url</b> operational mode command generates an error and does not permit you to execute the op script from a remote site.
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">file (Op Scripts) on page 6655</a></li><li>• <i>Executing an Op Script from a Remote Site</i></li></ul>

## op

```
Syntax  op {
        file filename {
            arguments {
                argument-name {
                    description descriptive-text;
                }
            }
        }
        checksum (md5 | sha-256 | sha1) hash;
        command filename-alias;
        dampen {
            dampen-options {
                cpu-factor cpu-factor;
                line-interval line-interval;
                time-interval time-interval;
            }
        }
        description descriptive-text;
        max-datasize
        refresh;
        refresh-from url;
        source url;
    }
    no-allow-url
    refresh;
    refresh-from url;
    traceoptions {
        file <filename> <files number> <size size> <world-readable | no-world-readable>;
        flag flag;
        no-remote-trace;
    }
}
```

**Hierarchy Level** [edit system [scripts](#)]

**Release Information** Statement introduced in Junos OS Release 7.6.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** For Junos OS op scripts, configure an operation scripting mechanism.

**Options** The statements are explained separately.

**Required Privilege Level** maintenance—To view this statement in the configuration.  
maintenance-control—To add this statement to the configuration.

**Related Documentation**

- *Storing and Enabling Scripts*

## optional

---

<b>Syntax</b>	optional;
<b>Hierarchy Level</b>	[edit system <b>scripts commit</b> file <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS commit scripts, allow a commit operation to succeed even if the script specified in the <b>file</b> statement is missing from the <b>/var/db/scripts/commit</b> directory on the device.
<div> <b>NOTE:</b> On the QFabric system, commit scripts are stored in the <b>/pbdata/mgd_shared/partition-ip/var/db/scripts/commit/</b> directory on the Director device.</div>	
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li><i>Controlling Execution of Commit Scripts During Commit Operations</i></li></ul>

## refresh (Commit Scripts)

<b>Syntax</b>	refresh;
<b>Hierarchy Level</b>	[edit system <a href="#">scripts commit</a> ], [edit system <a href="#">scripts commit</a> file <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the <code>/var/db/scripts/commit</code> directory with the copy located at the source URL, as specified in the <b>source</b> statement at the same hierarchy level.

**NOTE:** Issuing the `set refresh` command does not add the `refresh` statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

The `set refresh` command is unique in the Junos OS CLI in that it behaves like an operational mode command and yet it can be executed from within configuration mode. All other Junos OS CLI operational mode commands can only be executed from command mode. The functionality is provided in this manner as a convenience to users developing commit scripts.

On the QFabric system, commit scripts are stored in the `/pbdata/mgd_shared/partition-ip/var/db/scripts/commit/` directory on the Director device.

<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Using a Master Source Location for a Script</i></li> <li>• <a href="#">refresh-from (Commit Scripts) on page 6661</a></li> <li>• <a href="#">source (Commit Scripts) on page 6665</a></li> </ul>

## refresh (Op Scripts)

---

<b>Syntax</b>	refresh;
<b>Hierarchy Level</b>	[edit system <a href="#">scripts op</a> ], [edit system <a href="#">scripts op file filename</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 11.1 on the QFX Series.
<b>Description</b>	<p>For Junos OS op scripts, overwrite the local copy of all enabled op scripts or a single enabled script located in the <code>/var/db/scripts/op</code> directory with the copy located at the source URL, specified in the <b>source</b> statement at the same hierarchy level.</p> <p>The update operation occurs as soon as you issue the <b>set refresh</b> configuration mode command. Issuing the <b>set refresh</b> command does not add the <b>refresh</b> statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.</p>
<hr/>	
<div> <b>NOTE:</b> On the QFabric system, op scripts are stored in the <code>/pbdata/mgd_shared/partition-ip/var/db/scripts/op/</code> directory on the Director device.</div> <hr/>	
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Using a Master Source Location for a Script</i></li><li>• <a href="#">refresh-from (Op Scripts) on page 6662</a></li><li>• <a href="#">source (Op Scripts) on page 6666</a></li></ul>

## refresh-from (Commit Scripts)

<b>Syntax</b>	<code>refresh-from url;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">scripts commit</a> ], [edit system <a href="#">scripts commit</a> file <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the <code>/var/db/scripts/commit</code> directory with the copy located at a URL other than the URL specified in the <b>source</b> statement.</p> <p>The update operation occurs as soon as you issue the <b>set refresh-from url</b> configuration mode command. Issuing the <b>set refresh-from</b> command does not add the <b>refresh-from</b> statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.</p>
<div>  <b>NOTE:</b> This statement is not supported on the QFabric system.         </div>	
<b>Options</b>	<b>url</b> —The source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Using an Alternate Source Location for a Script</i></li> <li>• <a href="#">refresh (Commit Scripts) on page 6659</a></li> <li>• <a href="#">source (Commit Scripts) on page 6665</a></li> </ul>

## refresh-from (Op Scripts)

---

<b>Syntax</b>	<code>refresh-from url;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">scripts op</a> ], [edit system <a href="#">scripts op file filename</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 11.1 on the QFX Series.
<b>Description</b>	<p>For Junos OS op scripts, overwrite the local copy of all enabled op scripts or a single enabled script located in the <code>/var/db/scripts/op</code> directory with the copy located at a URL other than the URL specified in the <b>source</b> statement.</p> <p>The update operation occurs as soon as you issue the <b>set refresh-from url</b> configuration mode command. Issuing the <b>set refresh-from</b> command does not add the <b>refresh-from</b> statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.</p>
<div> <b>NOTE:</b> This statement is not supported on the QFabric system.</div>	
<b>Options</b>	<b>url</b> —Source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.
<b>Required Privilege Level</b>	<b>maintenance</b> —To view this statement in the configuration. <b>maintenance-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Using an Alternate Source Location for a Script</i></li><li>• <a href="#">refresh (Op Scripts) on page 6660</a></li><li>• <a href="#">source (Op Scripts) on page 6666</a></li></ul>

## scripts

```

Syntax  scripts {

    }
  }
  traffic-statistics {
    file filename {
      files number-of-files;
      size size;
    }
    interval interval;
  }
}
```

**Hierarchy Level** [edit services]

**Release Information** Statement introduced in Junos OS Release 13.2 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.

**Description** Configure the network analytics feature that includes monitoring for traffic and queue statistics. The network analytics processes running on the Packet Forwarding Engine and Routing Engine collect and analyze the data, and generate reports that may be saved in log files or sent as streaming data to remote servers.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## depth-threshold

<b>Syntax</b>	depth-threshold { high <i>number</i> ; low <i>number</i> ; }
<b>Hierarchy Level</b>	[edit services analytics interfaces] [edit services analytics resource-profiles]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2 for the QFX Series. Statement in the <b>[edit services analytics resource-profiles]</b> hierarchy level introduced in Junos OS Release 13.2X51-D15. Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.
<b>Description</b>	If network analytics queue statistics monitoring is enabled, specify the high and low values (in bytes) of the queue depth (buffer) threshold. If you configure a depth threshold, you cannot configure the latency threshold. You can configure the depth threshold for one interface or all interfaces. Specify the high and low queue depth threshold numbers:
<div>  <b>NOTE:</b> The configuration for a specific interface supersedes the global configuration for all interfaces. </div>	
<b>Options</b>	<p><b>high <i>number</i></b>—Specify the maximum value for the depth threshold.</p> <p><b>Range:</b> 1 to 1,250,000,000 bytes</p> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li>Junos OS Release 13.2X51-D10 or later—0 bytes</li> <li>Junos OS Release 13.2X50-D15—14,680,064 bytes (14 MB)</li> </ul> <p><b>low <i>number</i></b>—Specify the minimum value for the depth threshold.</p> <p><b>Range:</b> 1 to 1,250,000,000 bytes</p> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li>Junos OS Release 13.2X51-D10 or later—0 bytes</li> <li>Junos OS Release 13.2X50-D15—1024 bytes (1 KB)</li> </ul>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Network Analytics Overview on page 6490</a></li> <li><a href="#">analytics on page 6667</a></li> <li><a href="#">latency-threshold on page 6674</a></li> <li><i>resource-profiles (Analytics)</i></li> </ul>

## interfaces (Analytics)

---

**Syntax**

```
interfaces {  
  all {  
    depth-threshold high number low number;  
    latency-threshold high number low number;  
    queue-statistics;  
    no-queue-statistics;  
    traffic-statistics;  
    no-traffic-statistics;  
  }  
  interface-name {  
    depth-threshold high number low number;  
    latency-threshold high number low number;  
    queue-statistics;  
    no-queue-statistics;  
    traffic-statistics;  
    no-traffic-statistics;  
  }  
}
```

**Hierarchy Level** [edit services analytics]

**Release Information** Statement introduced in Junos OS Release 13.2 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.

**Description** Configure physical interfaces for monitoring traffic and queue statistics by the network analytics processes running on the Packet Forwarding Engine and Routing Engine. You may specify one interface or all interfaces in your configuration.

**NOTE:** The configuration for a specific interface supersedes the global configuration for all interfaces. You can configure traffic and queue monitoring for physical interfaces only; logical interfaces and Virtual Chassis port (VCP) interfaces are not supported.

**NOTE:** Disabling the queue or traffic monitoring (using the `no-queue-statistics` or `no-traffic-statistics` configuration statements) supersedes the configuration (enabling) of the feature.

**Options** `all`—Configure all interfaces on the device for high-frequency monitoring.

`interface-name`—Name of the interface to configure for high-frequency monitoring.

`no-queue-statistics`—Disable the collection of queue statistics.

**NOTE:** The `no-queue-statistics` statement supersedes the `queue-statistics` statement.

**no-traffic-statistics**—Disable the collection of traffic statistics.

**NOTE:** The `no-traffic-statistics` statement supersedes the `traffic-statistics` statement.

**queue-statistics**—Enable the collection of queue statistics for a specific interface or all interfaces.

**traffic-statistics**—Enable the collection of traffic statistics for a specific interface or all interfaces.

The remaining statements are explained separately.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration.
	interface-control—To add this statement to the configuration.

	• <a href="#">analytics on page 6667</a>

## latency-threshold

---

<b>Syntax</b>	latency-threshold { high <i>number</i> ; low <i>number</i> ; }
<b>Hierarchy Level</b>	[edit services analytics interfaces] [edit services analytics resource-profiles]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2 for the QFX Series. Statement in the <b>[edit services analytics resource-profiles]</b> hierarchy level introduced in Junos OS Release 13.2X51-D15. Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.
<b>Description</b>	If network analytics queue statistics monitoring is enabled, specify the high and low values (in microseconds) of the latency threshold of the queue. If you configure a latency threshold, you cannot configure the depth threshold. You can configure the latency threshold for one interface or all interfaces. Specify the high and low latency threshold numbers:

**NOTE:** The configuration for a specific interface supersedes the global configuration for all interfaces.

---

<b>Options</b>	<b>high <i>number</i></b> —Specify the maximum value for the latency threshold. <b>Range:</b> <ul style="list-style-type: none"><li>Junos OS Release 13.2X51-D15 or later—1 to 100,000,000 nanoseconds (0.001 to 100,000 microseconds)</li><li>Junos OS Release 13.2X51-D10 or earlier—1 to 100,000 microseconds</li></ul> <b>Default:</b> <ul style="list-style-type: none"><li>Junos OS Release 13.2X51-D15 or later—1,000,000 nanoseconds (1000 microseconds or 1 millisecond)</li><li>Junos OS Release 13.2X51-D10—1000 microseconds</li><li>Junos OS Release 13.2X50-D15—900 microseconds</li></ul> <b>low <i>number</i></b> —Specify the minimum value for the latency threshold. <b>Range:</b> <ul style="list-style-type: none"><li>Junos OS Release 13.2X51-D15 or later—1 to 100,000,000 nanoseconds</li><li>Junos OS Release 13.2X51-D10 or earlier—1 to 100,000 microseconds</li></ul> <b>Default:</b> <ul style="list-style-type: none"><li>Junos OS Release 13.2X51-D15 or later—100 nanoseconds (0.1 microseconds)</li></ul>
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

- Junos OS Release 13.2X51-D10—50 microseconds
- Junos OS Release 13.2X50-D15—300 microseconds

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

## queue-statistics

---

**Syntax**    `queue-statistics {  
              file filename {  
                  files number-of-files;  
                  size size;  
              }  
              interval interval;  
          }`

**Hierarchy Level**    [edit services analytics]

**Release Information**    Statement introduced in Junos OS Release 13.2 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.

**Description**    Enable the logging of queue statistics in a local file. This statement does not enable queue statistics monitoring.

To enable queue monitoring, you must specify the **queue-statistics** configuration statement at the [edit services analytics interfaces] hierarchy level.

**Default**    This feature is disabled by default.

**Options**    `interval interval`—Configure the polling interval in milliseconds.

**NOTE:** You can configure the polling interval for queue statistics globally for all interfaces only. Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.

---

**Range:**

- Junos OS Release 13.2X50-D15—8 to 1000 milliseconds (8 milliseconds to 1 second)
- Junos OS Release 13.2X51-D10 or later—10 to 1000 milliseconds (10 milliseconds to 1 second)

**NOTE:** In Junos OS Release 13.2X51-D10 or later, if you configured an interval of less than 10 milliseconds, the following warning messages appear during the commit process: Queue statistics polling interval can not be less than 10 milliseconds and Setting Queue statistics polling interval to 10 milliseconds. These messages do not stop the commit operation, but the interval is automatically set to 10 milliseconds.

---

**Default:**

- Junos OS Release 13.2X50-D15—8 milliseconds

- Junos OS Release 13.2X51-D10 or later—10 milliseconds

The remaining statements are explained separately.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration.
	interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	• <a href="#">Network Analytics Overview on page 6490</a>
	• <a href="#">analytics on page 6667</a>

## streaming-servers

---

**Syntax**

```
streaming-servers {  
  address ip-address {  
    port number {  
      stream-format format;  
      stream-type type  
    }  
  }  
}
```

**Hierarchy Level** [edit services analytics]

**Release Information** Statement introduced in Junos OS Release 13.2 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.

**Description** Configure remote servers to receive streaming output for the network analytics monitoring of traffic and queue statistics. The streaming function supports TCP connections only, and sends records separated by a newline character.

**NOTE:** Before you use the remote server to receive streaming data, you must set up the TCP server software to process records that are separated by the newline character (\n).

You can configure multiple servers and multiple ports on each server to receive the streaming data. You can configure different streaming data types and formats for different ports on a server, but you can configure only one streaming type and one format for each port on a server.

**Options** **address *ip-address***—IP address of the remote server receiving the streaming data.

**port *number***—Port number of the remote server receiving the streaming data.

**stream-format *format***—Format of the streaming data being sent to a server. Only one format can be sent to each port on a server.

**Values:**

- **csv**—Comma-separated Values (CSV). Records sent in this format contain a “q” for a queue statistics, or a “t” for a traffic statistics.
- **json**—JavaScript Object Notification (JSON). Records sent in this format contain “queue-statistics” or “traffic-statistics” in the “record type” field.
- **tsv**—Tab-separated Values (TSV). Records sent in this format contain a “q” for a queue statistics, or a “t” for a traffic statistics.

**stream-type *type***—Type of streaming data sent to a port. You can specify different types of streaming data to be sent to different ports on the same server.

**Values:**

- `queue-statistics`
- `traffic-statistics`

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

## traceoptions (Analytics)

**Syntax**

```
traceoptions {
    file filename;
    files number-of-files;
    size size;
}
```

**Hierarchy Level** [edit services analytics]

**Release Information** Statement introduced in Junos OS Release 13.2 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.

**Description** Configure traceoptions for the network analytics daemon (analyticsd) running on the Routing Engine.

**Options** **file *filename***—Specify a filename for storing the traceoptions data. The file is stored in the `/var/log/` directory of your device.  
If you do not specify a filename, the data is not stored in a file.

**files *number-of-files***—Specify the number of files to store locally. After the number files with the maximum file size is reached, the system starts over and writes the data to the first file.

**Range:** 2 to 1,000 files.

**size *size***—Configure the file size in megabytes (MB).

**Syntax:** `xm` to specify MB.

**Range:** 10 to 4095 MB

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

## traffic-statistics

---

<b>Syntax</b>	<pre>traffic-statistics {     file <i>filename</i> {         files <i>number-of-files</i>;         size <i>size</i>;     }     interval <i>interval</i>; }</pre>
<b>Hierarchy Level</b>	[edit services analytics]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.
<b>Description</b>	<p>Enable the logging of traffic statistics in a local file. This statement does not enable traffic statistics monitoring.</p> <p>To enable the monitoring of traffic statistics, configure the <b>traffic-statistics</b> configuration statement at the [edit services analytics interfaces] hierarchy level.</p>
<b>Default</b>	This feature is disabled by default.
<b>Options</b>	<p><b>file <i>filename</i></b>—Specify a filename for storing the traffic statistics in the JavaScript Object Notification (JSON) format. The file is stored in the <b>/var/log/</b> directory of your device. If you do not specify a filename, the data is not stored in a file.</p> <p><b>files <i>number-of-files</i></b>—Specify the number of files to store locally. After the number files with the maximum file size is reached, the system starts over and writes the data to the first file.</p> <p><b>Range:</b> 2 to 1,000 files.</p> <p><b>interval <i>interval</i></b>—Configure the polling interval in seconds.</p>

**NOTE:** You can configure the polling interval for traffic statistics globally for all interfaces only. Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.

---

### Range:

- Junos OS Release 13.2X51-D10 or later—2 to 300 seconds (2 seconds to 5 minutes)
- Junos OS Release 13.2X50-D15—1 to 300 seconds (1 second to 5 minutes)

**NOTE:** In Junos OS Release 13.2X51-D10 or later, if you configured an interval of less than 2 seconds, the following warning messages appear during the commit process:

Traffic statistics polling interval can not be less than 2 seconds, and

Setting Traffic statistics polling interval to 2 seconds.

These messages do not stop the commit operation, but the interval is automatically set to 2 seconds.

**Default:**

- Junos OS Release 13.2X50-D15—1 second
- Junos OS Release 13.2X51-D10 or later—2 seconds

**size size**—Configure the file size in megabytes (MB).

**Syntax:** *xm* to specify MB.

**Range:** 10 to 4095 MB

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## agent-id

---

<b>Syntax</b>	<code>agent-id ip-address;</code>
<b>Hierarchy Level</b>	[edit protocols sflow]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the IP address of the sFlow agent. If you do not configure the sFlow agent ID, the IP address for the agent is dynamically created using the IP address of an interface configured on the QFX Series device.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring sFlow Technology on page 6596</a></li><li>• <a href="#">sflow on page 6686</a></li></ul>

## collector (sFlow Technology)

---

<b>Syntax</b>	<code>collector ip-address {     udp-port port-number; }</code>
<b>Hierarchy Level</b>	[edit <a href="#">protocols sflow</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>Configure a remote collector for sFlow network traffic monitoring. The device sends sFlow UDP datagrams to the configured collector for analysis. You can configure up to four collectors on the device. You specify the IP address for each collector you configure.</p> <p>The remaining statement is explained separately.</p>
<b>Options</b>	<i>ip-address</i> —IP address of the collector.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring sFlow Technology on page 6596</a></li><li>• <a href="#">Example: Monitoring Network Traffic Using sFlow Technology on page 6571</a></li></ul>

---

## interfaces (sFlow)

---

<b>Syntax</b>	<code>interfaces <i>interface-name</i> {     polling-interval <i>seconds</i>;     sample-rate <i>number</i>; }</code>
<b>Hierarchy Level</b>	[edit <a href="#">protocols sflow</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>Configure sFlow network traffic monitoring on the specified interface on the device. You can configure sFlow parameters (polling interval, sample rate) with different values on different interfaces.</p> <p>The remaining statements are explained separately.</p>
<b>Options</b>	<i>interface-name</i> —Name of the interface on which to configure sFlow parameters.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring sFlow Technology on page 6596</a></li><li>• <a href="#">Example: Monitoring Network Traffic Using sFlow Technology on page 6571</a></li></ul>

## polling-interval

---

<b>Syntax</b>	<code>polling-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">protocols sflow</a> ], [edit <a href="#">protocols sflow interfaces</a> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the rate (in seconds) at which successive samples of interface statistics (counters) are taken.
<b>Default</b>	If no polling interval is configured for a particular interface, the device uses the global polling interval configured at the <a href="#">[edit protocols sflow]</a> hierarchy level. If no global interval is configured, the device uses the default polling interval of 20 seconds.
<b>Options</b>	<b><i>seconds</i></b> —Number of seconds between successive samples of interface statistics. Specifying a value of <b>0</b> (zero) disables the polling. <b>Range:</b> 0 through 3600 seconds
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring sFlow Technology on page 6596</a></li><li>• <a href="#">Example: Monitoring Network Traffic Using sFlow Technology on page 6571</a></li></ul>

## sample-rate

---

<b>Syntax</b>	<code>sample-rate <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit <a href="#">protocols sflow</a>],</code> <code>[edit <a href="#">protocols sflow interfaces</a> <i>interface-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Specify the denominator ( <i>number</i> ) of the ratio that is the sample rate in sFlow traffic monitoring. For example, to configure a sample rate of 1 in 1000 packets, you specify a <i>number</i> of 1000.
<b>Default</b>	If no sample rate is configured for a particular interface, the device uses the global sample rate configured at the <code>[edit <a href="#">protocols sflow</a>]</code> hierarchy level. If no global rate is configured, the device uses the default sample rate of 1 in 2000 packets.
<b>Options</b>	<i>number</i> —Denominator of the ratio representing the sample rate (one packet out of <i>number</i> ). <b>Range:</b> 1 through 16,777,215
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring sFlow Technology on page 6596</a></li> <li>• <a href="#">Example: Monitoring Network Traffic Using sFlow Technology on page 6571</a></li> </ul>

## sflow

---

<b>Syntax</b>	<pre>sflow {   agent-id <i>ip-address</i>;   collector <i>ip-address</i> {     udp-port <i>port-number</i>;   }   interfaces <i>interface-name</i> {     polling-interval <i>number</i>;     sample-rate {       egress <i>number</i>;       ingress <i>number</i>;     }   }   polling-interval <i>number</i>;   sample-rate {     egress <i>number</i>;     ingress <i>number</i>;   }   source-ip <i>ip-address</i>;   traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;no-stamp&gt; &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;world-readable         no-world-readable&gt;;     flag <i>flag</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit protocols]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>Configure sFlow technology to monitor traffic continuously on specified interfaces simultaneously. sFlow data can be used to characterize network activity.</p> <p>The remaining statements are explained separately.</p>
<b>Default</b>	The sFlow protocol is disabled by default.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring sFlow Technology on page 6596</a></li><li>• <a href="#">Example: Monitoring Network Traffic Using sFlow Technology on page 6571</a></li></ul>

---

## source-ip

---

<b>Syntax</b>	source-ip <i>ip-address</i> ;
<b>Hierarchy Level</b>	[edit protocols sflow]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the source IP address to be used for sFlow datagrams. If you do not configure a source IP address, it is dynamically created based on the IP address of an Ethernet interface configured on the QFX Series device.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring sFlow Technology on page 6596</a></li><li>• <a href="#">sflow on page 6686</a></li></ul>

## tracoptions (sFlow Technology)

---

<b>Syntax</b>	<pre>tracoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;no-stamp&gt; &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;world-readable       no-world-readable&gt;;     flag <i>flag</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols <a href="#">sflow</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Define tracing operations for sFlow technology.
<b>Default</b>	The <b>tracoptions</b> feature is disabled.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Output files are located in the <b>/var/log/</b> directory.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>. Incoming trace file data is logged in the now empty <b>trace-file</b>. When <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify the maximum number of files, you must also specify the maximum file size using the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all sFlow monitoring events.</li><li>• <b>client-server</b>—Trace sFlow monitoring client-server events.</li><li>• <b>configuration</b>—Trace sFlow monitoring configuration events.</li><li>• <b>interface</b>—Trace sFlow monitoring interface events.</li><li>• <b>rtsock</b>—Trace routing socket code events.</li></ul> <p><b>no-stamp</b>—(Optional) Do not place timestamp information at the beginning of each line in the trace file.</p> <p><b>no-world-readable</b>—(Optional) Prevent any user from reading the trace file.</p> <p><b>replace</b>—(Optional) Replace an existing trace file if there is one.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches its maximum size, it</p>

is renamed **trace-file.0**. Incoming trace file data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size of 4 GB

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the trace file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

**Related Documentation**

- [Overview of sFlow Technology](#)

## udp-port

**Syntax** `udp-port port-number;`

**Hierarchy Level** [edit protocols [sflow collector](#)]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure the UDP port for a remote collector for sFlow network traffic monitoring. The device sends sFlow UDP datagrams to the collector for analysis.

**Default** Port 6343

**Options** *port-number*—UDP port number for this collector.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## access (SNMP)

<b>Syntax</b>	<pre> access {   group group-name {     (default-context-prefix   context-prefix <i>context-prefix</i>) {       security-model (any   usm   v1   v2c) {         security-level (authentication   none   privacy) {           notify-view <i>view-name</i>;           read-view <i>view-name</i>;           write-view <i>view-name</i>;         }       }     }   } } </pre>
<b>Hierarchy Level</b>	[edit snmp v3 vacm]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Set SNMP access limits.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>

## address (SNMP)

<b>Syntax</b>	address <i>address</i> ;
<b>Hierarchy Level</b>	[edit snmp v3 target-address <i>target-address-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the SNMP target address for receiving traps or informs.
<b>Options</b>	<b>address</b> —IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding the Implementation of SNMP on the QFabric System on page 6516</a></li> <li>• <a href="#">Configuring SNMP on page 1356</a></li> <li>• <a href="#">Example: Configuring SNMP on page 6575</a></li> </ul>

## address-mask

---

<b>Syntax</b>	<code>address-mask address-mask;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 target-address target-address-name]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 on the QFX Series.
<b>Description</b>	Define and verify the source addresses for a group of target addresses for SNMP traps and informs.
<b>Options</b>	<b>address-mask</b> —Define a range of addresses.
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Address Mask</i></li></ul>

## agent-address

---

<b>Syntax</b>	<code>agent-address outgoing-interface;</code>
<b>Hierarchy Level</b>	<code>[edit snmp trap-options]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is <b>outgoing-interface</b> , which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.
<b>Options</b>	<b>outgoing-interface</b> —Value of the agent address of all SNMPv1 traps generated by this router or switch. The <b>outgoing-interface</b> option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap. <b>Default:</b> Disabled (the agent address is not specified in SNMPv1 traps).
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Agent Address for SNMP Traps</i></li></ul>

## alarm (SNMP RMON)

<b>Syntax</b>	<pre>alarm <i>index</i> {     description <i>description</i>;     falling-event-index <i>index</i>;     falling-threshold <i>integer</i>;     falling-threshold-interval <i>seconds</i>;     interval <i>seconds</i>;     request-type (get-next-request   get-request   walk-request);     rising-event-index <i>index</i>;     rising-threshold <i>integer</i>;     sample-type (absolute-value   delta-value);     startup-alarm (falling-alarm   rising-alarm   rising-or-falling alarm);     syslog-subtag <i>syslog-subtag</i>;     variable <i>oid-variable</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp rmon]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure RMON alarm entries.
<b>Options</b>	<p><b><i>index</i></b>—Identifies this alarm entry as an integer.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring an RMON Alarm Entry and Its Attributes</a></li> <li>• <a href="#">event (SNMP)</a></li> <li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> </ul>

## authentication-md5

---

<b>Syntax</b>	<code>authentication-md5 {     authentication-password authentication-password; }</code>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure MD5 as the authentication type for the SNMPv3 user.

**NOTE:** You can only configure one authentication type for each SNMPv3 user.

---

The remaining statement is explained separately.

<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring MD5 Authentication</i></li></ul>

## authentication-none

---

<b>Syntax</b>	authentication-none;
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure that there should be no authentication for the SNMPv3 user.

**NOTE:** You can configure only one authentication type for each SNMPv3 user.

<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring No Authentication</i></li> </ul>

## authentication-password

---

<b>Syntax</b>	<code>authentication-password <i>authentication-password</i>;</code>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> authentication-md5], [edit snmp v3 usm local-engine user <i>username</i> authentication-sha], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> authentication-md5], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> authentication-sha]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the password for user authentication.
<b>Options</b>	<p><b><i>authentication-password</i></b>—Password that a user enters. The password is then converted into a key that is used for authentication.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"><li>• The password must be at least eight characters long.</li><li>• The password can include lowercase letters, uppercase letters, numbers, and the following special characters: <code>.,/\&lt;&gt;;:'[]{}~!@#\$%^*_+=-`</code></li></ul> <p>In addition, the following special characters are also supported, but you must enclose them within quotation marks ("" ) if you enter them on the CLI; if you use a Network Management System to enter the password, the quotation marks are not required:</p> <p><code>  &amp; ( ) ?</code></p> <p>Control characters—entered by simultaneously pressing the Ctrl key and additional keys—are not supported.</p>
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring MD5 Authentication</i></li><li>• <i>Configuring SHA Authentication</i></li></ul>

## authentication-sha

<b>Syntax</b>	authentication-sha { authentication-password authentication-password; }
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the secure hash algorithm (SHA) as the authentication type for the SNMPv3 user.

**NOTE:** You can configure only one authentication type for each SNMPv3 user.

The remaining statement is explained separately.

<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring SHA Authentication</li> </ul>

## authorization

---

<b>Syntax</b>	<code>authorization <i>authorization</i>;</code>
<b>Hierarchy Level</b>	[edit snmp community <i>community-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the access authorization for SNMP <b>Get</b> , <b>GetBulk</b> , <b>GetNext</b> , and <b>Set</b> requests.
<b>Options</b>	<p><i>authorization</i>—Access authorization level:</p> <ul style="list-style-type: none"><li>• <b>read-only</b>—Enable <b>Get</b>, <b>GetNext</b>, and <b>GetBulk</b> requests.</li><li>• <b>read-write</b>—Enable all requests, including <b>Set</b> requests. You must configure a view to enable <b>Set</b> requests.</li></ul>
	<div> <b>NOTE:</b> The read-write option is not supported on the QFX3000 QFabric system.</div>
	<b>Default:</b> read-only
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the SNMP Community String on page 6601</a></li></ul>

## bucket-size

---

<b>Syntax</b>	<code>bucket-size <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp rmon history <i>index</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the sampling of Ethernet statistics for network fault diagnosis, planning, and performance tuning.
<b>Default</b>	50
<b>Options</b>	<i>number</i> —Number of discrete samples of Ethernet statistics requested.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> <li>• <a href="#">Junos OS Network Management Configuration Guide</a></li> </ul>

## categories

---

<b>Syntax</b>	<code>categories {     <i>category</i>; }</code>
<b>Hierarchy Level</b>	<code>[edit snmp trap-group <i>group-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the types of traps that are sent to the targets of the named trap group.
<b>Default</b>	If you omit the <b>categories</b> statement, all trap types are included in trap notifications.
<b>Options</b>	<i>category</i> —Name of a trap type: <b>authentication</b> , <b>chassis</b> , <b>configuration</b> , <b>link</b> , <b>remote-operations</b> , <b>rmon-alarm</b> , or <b>startup</b> .
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP Trap Groups on page 6602</a></li> </ul>

## client-list

---

<b>Syntax</b>	<code>client-list <i>client-list-name</i> {     <i>ip-addresses</i>; }</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define a list of SNMP clients.
<b>Options</b>	<i>client-list-name</i> —Name of the client list.  <i>ip-addresses</i> —IP addresses of the SNMP clients to be added to the client list,
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Adding a Group of Clients to an SNMP Community on page 6603</a></li></ul>

## client-list-name

---

<b>Syntax</b>	<code>client-list-name <i>client-list-name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp community <i>community-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Add a client list or prefix list to an SNMP community.
<b>Options</b>	<i>client-list-name</i> —Name of the client list or prefix list.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Adding a Group of Clients to an SNMP Community on page 6603</a></li></ul>

## clients

<b>Syntax</b>	clients { <i>address</i> <restrict>; }
<b>Hierarchy Level</b>	[edit snmp community <i>community-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.
<b>Default</b>	If you omit the <b>clients</b> statement, all SNMP clients using this community string are authorized to access the switch.
<b>Options</b>	<p><b>address</b>—Address of an SNMP client that is authorized to access this switch. You must specify an address, not a hostname. To specify more than one client, include multiple <b>address</b> options.</p> <p><b>restrict</b>—(Optional) Do not allow the specified SNMP client to access the switch.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring SNMP Communities</i></li> </ul>

## commit-delay

<b>Syntax</b>	commit-delay <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit snmp nonvolatile]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the timer for the SNMP <b>Set</b> reply and start of the commit.
<b>Options</b>	<p><b>seconds</b>—Delay between an affirmative SNMP <b>Set</b> reply and start of the commit operation.</p> <p><b>Default:</b> 5 seconds</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Commit Delay Timer</i></li> </ul>

## community (SNMP)

---

**Syntax**    `community community-name {  
                  authorization authorization;  
                  client-list-name client-list-name;  
                  clients {  
                      address restrict;  
                  }  
                  view view-name;  
                  }`

**Hierarchy Level**    [edit snmp]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.

**NOTE:** The **authorization read-write** option is not supported on the QFX3000 QFabric system.

---

The SNMP client application specifies an SNMP community name in **Get**, **GetBulk**, **GetNext**, and **Set** SNMP requests.

**Default**    If you omit the **community** statement, all SNMP requests are denied.

**Options**    **community-name**—Community string. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                  snmp-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring the SNMP Community String on page 6601](#)

## community (RMON)

---

<b>Syntax</b>	<code>community <i>community-name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp rmon event <i>index</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure the SNMP trap group that is used when generating a trap (if the eventType object is configured to send traps). If that trap group has the rmon-alarm trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of eventCommunity). If nothing is configured, traps are sent to each group that has the rmon-alarm category configured.</p> <p>The event community is not the same as an SNMP community.</p>
<b>Options</b>	<b><i>community-name</i></b> —Name of the trap group that is used when generating a trap if the event is configured to send traps.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> <li>• <a href="#">Junos OS Network Management Configuration Guide</a></li> </ul>

## community-name (SNMP)

---

<b>Syntax</b>	<code>community-name <i>community-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 snmp-community <i>community-index</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11. for the QFX Series.
<b>Description</b>	Define an SNMP community to authorize SNMPv1 or SNMPv2c clients in an SNMPv3 system. When you configure a community in SNMPv3, you can also specify a security name. The access privileges associated with the security name determine which MIB objects are available and which operations (read, write, or notify) are allowed on those objects.
<b>Options</b>	<b><i>community-name</i></b> —Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose the name in quotation marks (" ").

**NOTE:** Community names must be unique. You cannot configure the same community name at the `[edit snmp community]` and `[edit snmp v3 snmp-community community-index]` hierarchy levels.

The community name at the `[edit snmp v3 snmp-community community-index]` hierarchy level is encrypted and not displayed in the command-line interface (CLI).

---

<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the SNMPv3 Community</i></li></ul>

## contact

<b>Syntax</b>	<code>contact <i>contact</i>;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the value of the MIB II <b>sysContact</b> object, which is the contact person for the managed system.
<b>Options</b>	<b>contact</b> —Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring the System Contact on a Device Running Junos OS</i></li> </ul>

## description (SNMP)

<b>Syntax</b>	<code>description <i>description</i>;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the value of the MIB II sysDescription object, which is the description of the system being managed.
<b>Default</b>	<p>By default, the sysDescription object includes the following information:  Juniper Networks, Inc. <i>platform</i>, <i>build</i>, Build date: <i>date</i> UTC Copyright (c) <i>date-range</i>  Juniper Networks, Inc.</p> <p>For example:</p> <pre>sysDescr.0 = Juniper Networks, Inc. m7i internet router, kernel JUNOS 13.2-20130530_ib_13_3_psd.1, Build date: 2013-05-30 22:48:07 UTC Copyright (c) 1996-2013 Juniper Networks, Inc.</pre>
<b>Options</b>	<b>description</b> —System description. If the name includes spaces, enclose it in quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring the System Description on a Device Running Junos OS</i></li> </ul>

## description (RMON)

---

<b>Syntax</b>	<code>description</code> <i>description</i> ;
<b>Hierarchy Level</b>	[edit snmp rmon alarm <i>index</i> ], [edit snmp rmon event <i>index</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Text description of alarm or event.
<b>Options</b>	<b><i>description</i></b> —Text description of an alarm or event entry. If the description includes spaces, enclose it in quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li><li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li><li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li><li>• <a href="#">Understanding RMON on page 6525</a></li><li>• <a href="#">Junos OS Network Management Configuration Guide</a></li></ul>

## destination-port (SNMP)

---

<b>Syntax</b>	<code>destination-port</code> <i>port-number</i> ;
<b>Hierarchy Level</b>	[edit snmp trap-group]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Assign a trap port number other than the default.
<b>Default</b>	If you omit this statement, the default port is 162.
<b>Options</b>	<b><i>port-number</i></b> —SNMP trap port number.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 6602</a></li></ul>

## engine-id

<b>Syntax</b>	engine-id { (local <i>engine-id-suffix</i>   use-default-ip-address   use-mac-address); }
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Define a unique identifier for an SNMPv3 engine by configuring the suffix of the engine ID. The engine ID is used for identification only and not for addressing. There are two parts of an engine ID: the prefix and the suffix. The prefix is formatted according to the specifications defined in RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i> and cannot be configured. The suffix is configured here.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> SNMPv3 authentication and encryption keys are generated based on the associated user passwords and the engine ID. If you configure or change the engine ID, you must commit the user passwords and new engine ID before you configure SNMPv3 users, or the authentication will fail.</p> <p>By default, the engine ID suffix is configured with the MAC address of the management interface (the <i>use-mac-address</i> option) on the QFX Series. You can override this configuration by using the local <i>engine-id-suffix</i> or <i>use-default-ip-address</i> option.</p> </div>
<b>Default</b>	use-mac-address
<b>Options</b>	<p><i>local engine-id-suffix</i>—The engine ID suffix is set based on the data entered.</p> <p><i>use-default-ip-address</i>—The engine ID suffix is generated from the default IP address.</p> <p><i>use-mac-address</i>—The engine ID suffix is generated from the MAC address of the management interface on the switch.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">SNMPv3 Overview on page 6523</a></li> <li>• <a href="#">Configuring SNMP on page 1356</a></li> <li>• <a href="#">Minimum SNMPv3 Configuration on a Device Running Junos OS on page 6524</a></li> </ul>

## event

---

<b>Syntax</b>	<pre>event <i>index</i> {     <b>community</b> <i>community-name</i>;     <b>description</b> <i>description</i>;     <b>type</b> (RMON Notification) <i>type</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp rmon]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure RMON event entries.
<b>Options</b>	<p><i>index</i>—Identifier for a specific event entry.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li><li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li><li>• <a href="#">Understanding RMON on page 6525</a></li><li>• <a href="#">Junos OS Network Management Configuration Guide</a></li></ul>

---

## falling-event-index (RMON)

---

<b>Syntax</b>	<code>falling-event-index <i>index</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp rmon alarm <i>index</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the index number of the event entry that is used when a falling threshold is crossed. You specify the falling-event index when you configure an SNMP RMON alarm. If this value is zero, no event is triggered.
<b>Options</b>	<b><i>index</i></b> —Index of the event entry that is used when a falling threshold is crossed. <b>Range:</b> 0 through 65,535 <b>Default:</b> 0
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li><li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li><li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li><li>• <a href="#">Understanding RMON on page 6525</a></li><li>• <a href="#">Junos OS Network Management Configuration Guide</a></li></ul>

## falling-threshold (Health Monitor)

---

<b>Syntax</b>	<code>falling-threshold <i>percentage</i>;</code>
<b>Hierarchy Level</b>	[edit snmp health-monitor]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the lower threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.
<b>Options</b>	<b><i>percentage</i></b> —Lower threshold for the alarm entry. <b>Range:</b> 1 through 100 <b>Default:</b> 70 percent of the maximum possible value
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">rising-threshold on page 1451</a></li><li>• <a href="#">Configuring Health Monitoring on page 6609</a></li></ul>

## falling-threshold (RMON)

---

<b>Syntax</b>	<code>falling-threshold <i>integer</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp rmon alarm <i>index</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the lower threshold for the sampled variable (monitored object) when you configure an SNMP RMON alarm. By setting a rising and a falling threshold for a variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.
<b>Options</b>	<p><b><i>integer</i></b>—Lower threshold for the alarm entry.</p> <p><b>Range:</b> -2,147,483,648 through 2,147,483,647</p> <p><b>Default:</b> 20 percent less than the <b>rising-threshold</b> value</p>
<b>Required Privilege Level</b>	<p><b>snmp</b>—To view this statement in the configuration.</p> <p><b>snmp-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> <li>• <a href="#">Junos OS Network Management Configuration Guide</a></li> </ul>

## falling-threshold-interval

---

<b>Syntax</b>	<code>falling-threshold-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp rmon alarm <i>index</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the interval between samples after the rising threshold is exceeded and the value of the sample starts to drop. If the value of the sample drops and exceeds the falling threshold, the regular sampling interval is used.
<b>Options</b>	<b><i>interval</i></b> —Time between samples, in seconds. <b>Range:</b> 1 through 2,147,483,647 seconds <b>Default:</b> 60 seconds
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li><li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li><li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li><li>• <a href="#">Understanding RMON on page 6525</a></li><li>• <a href="#">Junos OS Network Management Configuration Guide</a></li></ul>

## filter-duplicates

---

<b>Syntax</b>	<code>filter-duplicates;</code>
<b>Hierarchy Level</b>	<code>[edit snmp]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Filter duplicate <b>Get</b> , <b>GetNext</b> , or <b>GetBulk</b> SNMP requests.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding the Implementation of SNMP on the QFabric System on page 6516</a></li><li>• <a href="#">Example: Configuring SNMP on page 6575</a></li></ul>

## filter-interfaces

<b>Syntax</b>	<code>filter-interfaces {     all-internal-interfaces;     interfaces <i>interface</i> }</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Filter out information related to specific interfaces from the output of SNMP <b>Get</b> and <b>GetNext</b> requests performed on interface-related MIBs.
<b>Options</b>	<p><b>all-internal-interfaces</b>—Filter out information from SNMP <b>Get</b> and <b>GetNext</b> requests for all internal interfaces.</p> <p><b>interfaces</b>—Filter out information from SNMP <b>Get</b> and <b>GetNext</b> requests for the specified interface.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Filtering Interface Information Out of SNMP Get and GetNext Output</i></li> </ul>

## group (Associating a Security Name)

<b>Syntax</b>	<code>group <i>group-name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp v3 vacm security-to-group security-model (usm   v1   v2c) <i>security-name security-name</i> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Associate a security name with a group composed of users with the same access privileges. The security name is used during authentication of SNMP messages, and is mapped to a username.
<b>Options</b>	<b>group-name</b> —Collection of SNMP security names that share the same SNMPv3 access privileges.
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Group</i></li> </ul>

## group (Configuring Access Privileges)

---

**Syntax**    `group group-name {  
                  (default-context-prefix | context-prefix context-prefix){  
                    security-model (any | usm | v1 | v2c) {  
                      security-level (authentication | none | privacy) {  
                        notify-view view-name;  
                        read-view view-name;  
                        write-view view-name;  
                      }  
                    }  
                  }  
                  }  
                  }`

**Hierarchy Level**    [edit snmp v3 vacm access]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The **default-context-prefix** statement, when included, adds all the contexts configured on the device to the group, whereas the **context-prefix context-prefix** statement enables you to specify a context and to add that particular context to the group.

(Not applicable to the QFX Series.) When the context prefix is specified as default (for example, **context-prefix default**), the context associated with the master routing instance is added to the group. To specify a routing instance that is part of a logical system, specify it as **logical system/routing instance**. For example, to specify routing instance ri1 in logical system ls1, include **context-prefix ls1/ri1**.

The remaining statements under this hierarchy are explained separately.

**Options**    *group-name*—SNMPv3 group name created for the SNMPv3 group.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

**Related Documentation**    • *Configuring the Group*

---

## health-monitor

---

<b>Syntax</b>	health-monitor { falling-threshold <i>percentage</i> ; interval <i>seconds</i> ; rising-threshold <i>percentage</i> ; }
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure health monitoring.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Health Monitoring on page 6609</a></li><li>• <a href="#">Understanding Health Monitoring on page 6529</a></li></ul>

## history

---

<b>Syntax</b>	<pre>history <i>history-index</i> {     <i>bucket-size</i> <i>number</i>;     <i>interface</i> <i>interface-name</i>;     <i>interval</i> <i>seconds</i>;     <i>owner</i> <i>owner-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp rmon]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure RMON history group entries. This RMON feature can be used with the Simple Network Management Protocol (SNMP) agent on the network to monitor all the traffic flowing among devices on all connected LAN segments. The RMON history feature collects statistics in accordance with user-configurable parameters.</p> <p>The history group controls the periodic statistical sampling of data from various types of networks. This group contains configuration entries that specify an interface, polling period, and other parameters. If you use the <b>history</b> statement, you must also configure the <b>interface</b> <i>interface-name</i> statement.</p>
<b>Options</b>	<p><b>history-index</b>—Provide a number for this history entry.</p> <p><b>Range:</b> 1 through 65535</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li><li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li><li>• <a href="#">Understanding RMON on page 6525</a></li><li>• <a href="#">Junos OS Network Management Configuration Guide</a></li></ul>

---

## interface (SNMP)

---

<b>Syntax</b>	<code>interface [ <i>interface-names</i> ];</code>
<b>Hierarchy Level</b>	<code>[edit snmp]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the interfaces on which SNMP requests can be accepted.
<b>Default</b>	If you omit this statement, SNMP requests entering the router or switch through any interface are accepted.
<b>Options</b>	<i>interface-names</i> —Names of one or more logical interfaces.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Interfaces on Which SNMP Requests Can Be Accepted on page 6604</a></li></ul>

## interface (RMON)

---

<b>Syntax</b>	<code>interface <i>interface-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp rmon history <i>history-index</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Specify the interface to be monitored in the specified RMON history entry.</p> <p>Only one interface can be specified for a particular RMON history index. There is a one-to-one relationship between the interface and the history index. The interface must be specified in order for the RMON history to be created.</p>
<b>Options</b>	<i>interface-name</i> —Specify the interface to be monitored within the specified entry of the RMON history of Ethernet statistics.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li><li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li><li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li><li>• <a href="#">Understanding RMON on page 6525</a></li><li>• <a href="#">Junos OS Network Management Configuration Guide</a></li></ul>

## interval (Health Monitor)

---

<b>Syntax</b>	<code>interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp health-monitor]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the interval between sampling of the object being monitored by the health monitor.
<b>Options</b>	<i>seconds</i> —Time between samples, in seconds. <b>Range:</b> 1 through 2147483647 seconds <b>Default:</b> 300 seconds
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Health Monitoring on page 6609</a></li></ul>

---

## interval (RMON)

---

<b>Syntax</b>	<code>interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit snmp rmon alarm <i>index</i> ], [edit snmp rmon history <i>index</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the interval over which data is to be sampled for the specified alarm or interface.
<b>Default</b>	60 sec for alarm sampling.  1800 sec for history sampling.
<b>Options</b>	<i>seconds</i> —Interval at which data is to be sampled for the specified alarm or interface.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li><li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li><li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li><li>• <a href="#">Understanding RMON on page 6525</a></li><li>• <a href="#">Junos OS Network Management Configuration Guide</a></li></ul>

## local-engine

---

**Syntax**    local-engine {  
              user *username* {  
                  authentication-md5 {  
                    authentication-password *authentication-password*;  
                  }  
                  authentication-none;  
                  authentication-sha {  
                    authentication-password *authentication-password*;  
                  }  
                  privacy-aes128 {  
                    privacy-password *privacy-password*;  
                  }  
                  privacy-des {  
                    privacy-password *privacy-password*;  
                  }  
                  privacy-3des {  
                    privacy-password *privacy-password*;  
                  }  
                  privacy-none {  
                    privacy-password *privacy-password*;  
                  }  
              }  
          }

**Hierarchy Level**    [edit snmp v3 [usm](#)]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure local engine information for the user-based security model (USM).  
  
                      The remaining statements are explained separately.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                  snmp-control—To add this statement to the configuration.

**Related Documentation**    • [Creating SNMPv3 Users on page 6609](#)

## location

---

<b>Syntax</b>	<code>location <i>location</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the value of the MIB II <b>sysLocation</b> object, which is the physical location of the managed system.
<b>Options</b>	<b>location</b> —Location of the local system. You must enclose the name within quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring the System Location for a Device Running Junos OS</i></li> </ul>

## message-processing-model

---

<b>Syntax</b>	<code>message-processing-model (v1   v2c   v3);</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 target-parameters <i>target-parameter-name</i> parameters]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the message processing model to be used when generating SNMP notifications.
<b>Options</b>	<b>v1</b> —SNMPv1 message process model.  <b>v2c</b> —SNMPv2c message process model.  <b>v3</b> —SNMPv3 message process model.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring the Message Processing Model</i></li> </ul>

## name

---

<b>Syntax</b>	<code>name <i>name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the system name from the command-line interface.
<b>Options</b>	<i>name</i> —System name override.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the System Name</i></li></ul>

## nonvolatile

---

<b>Syntax</b>	<code>nonvolatile {     <code>commit-delay</code> <i>seconds</i>; }</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure options for SNMP <b>Set</b> requests.  The statement is explained separately.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Commit Delay Timer</i></li><li>• <i>commit-delay</i></li></ul>

## notify

---

<b>Syntax</b>	<pre> notify <i>name</i> {     tag <i>tag-name</i>;     type (trap   inform); } </pre>
<b>Hierarchy Level</b>	[edit snmp v3]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>type inform</b> option added in Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Select management targets for SNMPv3 notifications as well as the type of notifications. Notifications can be either traps or informs.
<b>Options</b>	<p><b><i>name</i></b>—Name assigned to the notification.</p> <p><b><i>tag-name</i></b>—Notifications are sent to all targets configured with this tag.</p> <p><b><i>type</i></b>—Notification type is <b>trap</b> or <b>inform</b>. Traps are unconfirmed notifications. Informs are confirmed notifications.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Inform Notification Type and Target Address</i></li> <li>• <i>Configuring the SNMPv3 Trap Notification</i></li> </ul>

## notify-filter (Applying to the Management Target)

---

<b>Syntax</b>	<code>notify-filter <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 <b>target-parameters</b> <i>target-parameters-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the notify filter applied to a specific set of SNMPv3 target parameters. Target parameters are the message processing and security parameters for notifications sent to a target SNMP manager.
<b>Options</b>	<b><i>profile-name</i></b> —Name of the notify filter to apply to notifications.
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Applying the Trap Notification Filter</i></li></ul>

## notify-filter (Configuring the Profile Name)

---

<b>Syntax</b>	<code>notify-filter <i>profile-name</i> {     oid <i>oid</i> (include   exclude); }</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a group of MIB objects for which you define access. The notify filter limits the type of traps or informs sent to the network management system.
<b>Options</b>	<b><i>profile-name</i></b> —Name assigned to the notify filter.  The remaining statement is explained separately.
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Trap Notification Filter</i></li><li>• <i>oid (SNMP)</i></li></ul>

## notify-view

---

<b>Syntax</b>	<code>notify-view <i>view-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix   context-prefix <i>context-prefix</i>) security-model (any   usm   v1   v2c) security-level (authentication   none   privacy)]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Associate the notify view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).
<b>Options</b>	<b><i>view-name</i></b> —Name of the view to which the SNMP user group has access.
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring MIB Views on page 6605</a></li> <li>• <a href="#">Configuring the Notify View</a></li> </ul>

## oid

---

<b>Syntax</b>	<code>oid <i>object-identifier</i> (exclude  include);</code>
<b>Hierarchy Level</b>	<code>[edit snmp view <i>view-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify an object identifier (OID) used to represent a subtree of MIB objects.
<b>Options</b>	<b>exclude</b> —Exclude the subtree of MIB objects represented by the specified OID.  <b>include</b> —Include the subtree of MIB objects represented by the specified OID.  <b><i>object-identifier</i></b> —OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring MIB Views on page 6605</a></li> </ul>

## oid (SNMPv3)

---

<b>Syntax</b>	oid <i>oid</i> (include   exclude);
<b>Hierarchy Level</b>	[edit snmp v3 notify-filter <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify an object identifier (OID) used to represent a subtree of MIB objects. This OID is a prefix that the represented MIB objects have in common.
<b>Options</b>	<p><b>exclude</b>—Exclude the subtree of MIB objects represented by the specified OID.</p> <p><b>include</b>—Include the subtree of MIB objects represented by the specified OID.</p> <p><b>oid</b>—Object identifier used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">SNMPv3 Overview on page 6523</a></li><li>• <a href="#">Minimum SNMPv3 Configuration on a Device Running Junos OS on page 6524</a></li><li>• <a href="#">Configuring SNMP on page 1356</a></li><li>• <a href="#">Configuring the SNMPv3 Trap Notification</a></li></ul>

## owner

---

<b>Syntax</b>	<code>owner owner-name;</code>
<b>Hierarchy Level</b>	<code>[edit snmp rmon history index]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the user or group responsible for this RMON history configuration.
<b>Options</b>	<p><b>owner-name</b>—User or group responsible for this configuration.</p> <p><b>Range:</b> 0 through 32 alphanumeric characters</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> <li>• <a href="#">Junos OS Network Management Configuration Guide</a></li> </ul>

## parameters

---

<b>Syntax</b>	<pre>parameters {   message-processing-model (v1   v2c   v3);   security-level (none   authentication   privacy);   security-model (usm   v1   v2c);   security-name security-name; }</pre>
<b>Hierarchy Level</b>	<code>[edit snmp v3 target-parameters target-parameters-name]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure a set of target parameters for message processing and security.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Defining and Configuring the Trap Target Parameters</a></li> </ul>

## port (SNMP)

---

<b>Syntax</b>	<code>port <i>port-number</i>;</code>
<b>Hierarchy Level</b>	[edit snmp v3 target-address <i>target-address-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a UDP port number for an SNMP target.
<b>Default</b>	If you omit this statement, the default port is 162.
<b>Options</b>	<i>port-number</i> —Port number for the SNMP target.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Port</i></li></ul>

## privacy-3des

---

<b>Syntax</b>	<pre>privacy-3des {   <b>privacy-password</b> <i>privacy-password</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the triple Data Encryption Standard (3DES) as the privacy type for the SNMPv3 user.</p>
<b>Options</b>	<p><b>privacy-password</b> <i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"> <li>• The password must be at least eight characters long.</li> <li>• The password can include alphabetic, numeric, and special characters, but it cannot include control characters.</li> </ul>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the SNMPv3 Encryption Type</i></li> </ul>

## privacy-aes128

---

<b>Syntax</b>	<pre>privacy-aes128 {     <b>privacy-password</b> <i>privacy-password</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Advanced Encryption Standard encryption algorithm (CFB128-AES-128 Privacy Protocol) for the SNMPv3 user.
<b>Options</b>	<p><b>privacy-password</b> <i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"><li>• The password must be at least eight characters long.</li><li>• The password can include alphabetic, numeric, and special characters, but it cannot include control characters.</li></ul>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the SNMPv3 Encryption Type</i></li></ul>

## privacy-des

<b>Syntax</b>	<code>privacy-des {     <b>privacy-password</b> <i>privacy-password</i>; }</code>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Data Encryption Standard (DES) as the privacy type for the SNMPv3 user.
<b>Options</b>	<p><b>privacy-password</b> <i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"> <li>• The password must be at least eight characters long.</li> <li>• The password can include alphabetic, numeric, and special characters, but it cannot include control characters.</li> </ul>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the SNMPv3 Encryption Type</i></li> </ul>

## privacy-none

<b>Syntax</b>	<code>privacy-none;</code>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> ], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure that no encryption be used for the SNMPv3 user.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the SNMPv3 Encryption Type</i></li> </ul>

## privacy-password

---

<b>Syntax</b>	<code>privacy-password <i>privacy-password</i>;</code>
<b>Hierarchy Level</b>	[edit snmp v3 usm local-engine user <i>username</i> privacy-3des], [edit snmp v3 usm local-engine user <i>username</i> privacy-aes128], [edit snmp v3 usm local-engine user <i>username</i> privacy-des], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-3des], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-aes128], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-des]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a privacy password for the SNMPv3 user.
<b>Options</b>	<p><b><i>privacy-password</i></b>—Password that a user enters. The password is then converted into a key that is used for encryption.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"><li>• The password must be at least eight characters long.</li><li>• The password can include alphabetic, numeric, and special characters, but it cannot include control characters.</li></ul>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the SNMPv3 Encryption Type</i></li></ul>

---

## read-view

---

<b>Syntax</b>	<code>read-view <i>view-name</i>;</code>
<b>Hierarchy Level</b>	[ <code>edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix   context-prefix <i>context-prefix</i>) security-model (any   usm   v1   v2c) security-level (authentication   none   privacy)</code> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Associate the read-only view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).
<b>Options</b>	<b><i>view-name</i></b> —The name of the view to which the SNMP user group has access.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Read View</i></li><li>• <a href="#">Configuring MIB Views on page 6605</a></li></ul>

## remote-engine

---

**Syntax**    `remote-engine engine-id {  
                  user username {  
                    authentication-md5 {  
                      authentication-password authentication-password;  
                    }  
                    authentication-none;  
                    authentication-sha {  
                      authentication-password authentication-password;  
                    }  
                    privacy-aes128 {  
                      privacy-password privacy-password;  
                    }  
                    privacy-des {  
                      privacy-password privacy-password;  
                    }  
                    privacy-3des {  
                      privacy-password privacy-password;  
                    }  
                    privacy-none {  
                      privacy-password privacy-password;  
                    }  
                  }  
                }`

**Hierarchy Level**    [edit snmp v3 usm]

**Release Information**    Statement introduced in Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the remote engine information for the user-based security model (USM). To send inform messages to an SNMPv3 user on a remote device, you must configure the engine identifier for the SNMP agent on the remote device where the user resides.

**Options**    *engine-id*—Specify engine identifier in hexadecimal format. Used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host.  
  
              The remaining statements are explained separately.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                  snmp-control—To add this statement to the configuration.

**Related Documentation**    • *Configuring the Remote Engine and Remote User*

## request-type

---

<b>Syntax</b>	request-type (get-next-request   get-request   walk-request);
<b>Hierarchy Level</b>	[edit snmp rmon alarm <i>index</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Extend monitoring to a specific SNMP object instance (get-request), to all object instances belonging to a MIB branch (walk-request), or to the next object instance after the instance specified in the configuration (get-next-request).
<b>Default</b>	walk-request
<b>Options</b>	<p><b>get-next-request</b>—Perform an SNMP get next request.</p> <p><b>get-request</b>—Perform an SNMP get request.</p> <p><b>walk-request</b>—Perform an SNMP walk request.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> <li>• <a href="#">Junos OS Network Management Configuration Guide</a></li> </ul>

## retry-count (SNMPv3)

---

<b>Syntax</b>	<code>retry-count <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 target-address <i>target-address-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the retry count for SNMP informs.
<b>Options</b>	<b><i>number</i></b> —Maximum number of times the inform is transmitted if no acknowledgment is received. If no acknowledgment is received after the inform is transmitted the maximum number of times, the inform message is discarded. <b>Default:</b> 3 times
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Informs on page 6614</a></li><li>• <i>timeout</i></li></ul>

## rising-event-index

---

<b>Syntax</b>	<code>rising-event-index <i>index</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">snmp rmon alarm index</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the index of the event entry that is used when a rising alarm threshold is exceeded. The rising-event index is specified when you configure an SNMP RMON alarm. If this value is zero, no event is triggered.
<b>Options</b>	<p><b><i>index</i></b>—Index of the event entry that is used when a rising threshold is exceeded.</p> <p><b>Range:</b> 0 through 65,535</p> <p><b>Default:</b> 0</p>
<b>Required Privilege Level</b>	<p><code>snmp</code>—To view this statement in the configuration.</p> <p><code>snmp-control</code>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> <li>• <a href="#">Junos OS Network Management Configuration Guide</a></li> </ul>

## rising-threshold (Health Monitor)

---

<b>Syntax</b>	<code>rising-threshold <i>percentage</i>;</code>
<b>Hierarchy Level</b>	[edit snmp health-monitor]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the upper threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored object, you can be alerted whenever the value of the variable falls outside the allowable operational range.
<b>Options</b>	<p><b><i>percentage</i></b>—Upper threshold for the alarm entry.</p> <p><b>Range:</b> 1 through 100</p> <p><b>Default:</b> 80 percent of the maximum possible value</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Health Monitoring on page 6609</a></li><li>• <a href="#">falling-threshold on page 1415</a></li></ul>

## rising-threshold (RMON)

---

<b>Syntax</b>	<code>rising-threshold <i>integer</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp rmon alarm <i>index</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the upper threshold for the sampled variable (monitored object) when you configure an SNMP RMON alarm. By setting a rising and a falling threshold for a variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.
<b>Options</b>	<p><i>integer</i>—Upper threshold for the alarm entry.</p> <p><b>Range:</b> –2,147,483,648 through 2,147,483,647</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> <li>• <a href="#">Junos OS Network Management Configuration Guide</a></li> </ul>

## rmon

```
Syntax  rmon {
        alarm index {
            description description;
            falling-event-index index;
            falling-threshold integer;
            falling-threshold-interval seconds;
            interval seconds;
            request-type;
            rising-event-index index;
            rising-threshold integer;
            sample-type (absolute-value | delta-value);
            startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
            syslog-subtag syslog-subtag;
            variable oid-variable;
        }
        event index {
            community community-name;
            description description;
            type (RMON Notification) type;
        }
        history history-index {
            bucket-size number;
            interface interface-name;
            interval seconds;
            owner owner-name;
        }
    }
```

**Hierarchy Level** [edit snmp]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Provide comprehensive network fault diagnosis, planning, and performance tuning information. RMON delivers this information in nine groups of monitoring elements, each providing specific sets of data to meet common network monitoring requirements. Each group is optional, so that vendors do not need to support all the groups within the MIB.

Junos OS supports the RMON statistics, history, alarm, and event groups.

The remaining statements are explained separately.

**Default** Disabled.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

## sample-type

---

<b>Syntax</b>	sample-type (absolute-value   delta-value);
<b>Hierarchy Level</b>	[edit snmp rmon alarm <i>index</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the method of sampling the selected variable (monitored object). When you configure an SNMP RMON alarm, you can specify the sample type.
<b>Options</b>	<p><b>absolute-value</b>—Actual value of the selected variable is used when comparing against the thresholds.</p> <p><b>delta-value</b>—Difference between samples of the selected variable is used when comparing against the thresholds.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> <li>• <a href="#">Junos OS Network Management Configuration Guide</a></li> </ul>

## security-level (Defining Access Privileges)

---

<b>Syntax</b>	<code>security-level (authentication   none   privacy) {     <b>notify-view</b> <i>view-name</i>;     <b>read-view</b> <i>view-name</i>;     <b>write-view</b> <i>view-name</i>; }</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix   context-prefix <i>context-prefix</i>) security-model (any   usm   v1   v2c)]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the security level used for access privileges.
<b>Default</b>	<code>none</code>
<b>Options</b>	<b>authentication</b> —Provide authentication but no encryption.  <b>none</b> —No authentication and no encryption.  <b>privacy</b> —Provide authentication and encryption.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Security Level</i></li></ul>

---

## security-level (Generating SNMP Notifications)

---

<b>Syntax</b>	security-level (authentication   none   privacy);
<b>Hierarchy Level</b>	[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the security level to use when generating SNMP notifications.
<b>Default</b>	none
<b>Options</b>	<b>authentication</b> —Provide authentication but no encryption.  <b>none</b> —No authentication and no encryption.  <b>privacy</b> —Provide authentication and encryption.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Security Level</i></li></ul>

## security-model (Access Privileges)

---

<b>Syntax</b>	<code>security-model (usm   v1   v2c);</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix   context-prefix <i>context-prefix</i>)]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the security model for an SNMPv3 group. The security model is used to determine access privileges for the group.
<b>Options</b>	<code>usm</code> —SNMPv3 security model.  <code>v1</code> —SNMPv1 security model.  <code>v2c</code> —SNMPv2c security model.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Security Model</i></li></ul>

## security-model (Group)

<b>Syntax</b>	<pre>security-model (usm   v1   v2c) {   security-name security-name {     group group-name;   } }</pre>
<b>Hierarchy Level</b>	[edit snmp v3 vacm <a href="#">security-to-group</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Define a security model for an SNMPv3 group and associate the security name of a user with the group. All users in the group have the same access privileges.
<b>Options</b>	<p><b>usm</b>—SNMPv3 security model.</p> <p><b>v1</b>—SNMPv1 security model.</p> <p><b>v2c</b>—SNMPv2c security model.</p>
<b>Required Privilege Level</b>	<p><b>snmp</b>—To view this statement in the configuration.</p> <p><b>snmp-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring the Security Model</i></li> </ul>

## security-model (SNMP Notifications)

---

<b>Syntax</b>	security-model (usm   v1   v2c);
<b>Hierarchy Level</b>	[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the security model for an SNMPv3 group. The security model is used for SNMP notifications.
<b>Options</b>	<b>usm</b> —SNMPv3 security model.  <b>v1</b> —SNMPv1 security model.  <b>v2c</b> —SNMPv2c security model.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Security Model</i></li></ul>

## security-name (Community String)

<b>Syntax</b>	<code>security-name <i>security-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 <i>snmp-community</i> <i>community-index</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Associate a community string with the security name of a user. The community string, which is used for SNMPv1 and SNMPv2c clients in an SNMPv3 system, is configured at the <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy level.
<b>Options</b>	<i>security-name</i> —Name that is used for messaging security and user access control.

**NOTE:** The security name must match the configured security name at the `[edit snmp v3 target-parameters target-parameters-name parameters]` hierarchy level when you configure traps or informs.

<b>Required Privilege</b>	snmp—To view this statement in the configuration.
<b>Level</b>	snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Security Names</i></li> </ul>

## security-name (Security Group)

---

<b>Syntax</b>	<code>security-name security-name {     group group-name; }</code>
<b>Hierarchy Level</b>	[edit snmp v3 vacm security-to-group <b>security-model</b> (usm   v1   v2c)]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Associate the security name of a user (for SNMPv3 clients) or a community string (for SNMPv1 and SNMPv2c clients) with a configured security group.
<b>Options</b>	<b>security-name</b> —SNMPv3 secure username configured at the [edit snmp v3 usm local-engine user <b>username</b> ] hierarchy level that is used for messaging security. For SNMPv1 and SNMPv2c, the security name is the community string configured at the [edit snmp v3 snmp-community <b>community-index</b> ] hierarchy level.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Assigning Security Names to Groups</i></li><li>• <a href="#">Assigning a Security Name to a Group on page 6612</a></li></ul>

## security-name (SNMP Notifications)

<b>Syntax</b>	<code>security-name <i>security-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the security name used when generating SNMP notifications.
<b>Options</b>	<b><i>security-name</i></b> —If the SNMPv3 USM security model is used, identify the user when generating the SNMP notification. If the v1 or v2c security models are used, identify the SNMP community used when generating the notification.
<div>  <p><b>NOTE:</b> The access privileges for the group associated with this security name must allow this notification to be sent.</p> <p>If you are using the v1 or v2 security models, the security name at the <code>[edit snmp v3 vacm security-to-group]</code> hierarchy level must match the security name at the <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy level.</p> </div>	
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Security Name</i></li> </ul>

## security-to-group

---

<b>Syntax</b>	<pre>security-to-group {   security-model (usm   v1   v2c) {     group group-name;     security-name security-name;   } }</pre>
<b>Hierarchy Level</b>	[edit snmp v3 vacm]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the group to which a specific SNMPv3 security name belongs. The security name is used for messaging security.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Assigning Security Model and Security Name to a Group</i></li></ul>

## snmp

```
Syntax  snmp {

- [Configuring SNMP on page 1356](#)

## snmp-community

<b>Syntax</b>	snmp-community <i>community-index</i> { <i>community-name</i> <i>community-name</i> ; <i>security-name</i> <i>security-name</i> ; tag <i>tag-name</i> ; }
<b>Hierarchy Level</b>	[edit snmp v3]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the SNMP community which authorizes SNMPv1 or SNMPv2c clients in an SNMPv3 system.
<b>Options</b>	<i>community-index</i> —(Optional) String that identifies an SNMP community.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the SNMPv3 Community</i></li> </ul>

## source-address (SNMP)

<b>Syntax</b>	source-address <i>address</i> ;
<b>Hierarchy Level</b>	[edit snmp trap-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the source address of every SNMP trap packet sent by this switch to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.
<b>Options</b>	<p><i>address</i>—Source address of SNMP traps. You can configure the source address of trap packets two ways: <b>lo0</b> or a valid IPv4 address configured on one of the interfaces. The value <b>lo0</b> indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface <b>lo0</b>.</p> <p><b>Default:</b> Disabled. (The source address is the address of the outgoing interface.)</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Source Address for SNMP Traps</i></li> </ul>

## startup-alarm

---

<b>Syntax</b>	startup-alarm (falling-alarm   rising-alarm   rising-or-falling-alarm);
<b>Hierarchy Level</b>	[edit snmp rmon alarm <i>index</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set an initial alarm that is sent after the configured SNMP RMON alarm becomes active.
<b>Default</b>	rising-or-falling-alarm
<b>Options</b>	<p><b>falling-alarm</b>—Generated if the first sample after the alarm becomes active is equal to or greater than the falling threshold.</p> <p><b>rising-alarm</b>—Generated if the first sample after the alarm becomes active is equal to or greater than the rising threshold.</p> <p><b>rising-or-falling-alarm</b>—Generated if the first sample after the alarm entry becomes active is equal to or greater than either the rising threshold or the falling threshold.</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li><li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li><li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li><li>• <a href="#">Understanding RMON on page 6525</a></li><li>• <a href="#">Junos OS Network Management Configuration Guide</a></li></ul>

## syslog-subtag

---

<b>Syntax</b>	<code>syslog-subtag <i>syslog-subtag</i>;</code>
<b>Hierarchy Level</b>	[edit snmp rmon alarm <i>index</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Add the <b>syslog-subtag</b> tag to the system log message. The tag should not exceed 80 uppercase characters.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> <li>• <a href="#">Junos OS Network Management Configuration Guide</a></li> </ul>

## tag (Configuring Notification Targets)

---

<b>Syntax</b>	<code>tag <i>tag-name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp v3 notify <i>name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a set of target addresses to receive SNMP traps or informs (for IPv4 packets only).
<b>Options</b>	<b>tag-name</b> —Define the target addresses to which an SNMP notification is sent. Target addresses containing the same tag in their tag list are sent the same notification. The <b>tag-name</b> is not included in the notification.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">SNMPv3 Overview on page 6523</a></li> <li>• <a href="#">Minimum SNMPv3 Configuration on a Device Running Junos OS on page 6524</a></li> <li>• <a href="#">Configuring SNMP on page 1356</a></li> <li>• <a href="#">Configuring the SNMPv3 Trap Notification</a></li> </ul>

## tag (Configuring the SNMP Community)

---

<b>Syntax</b>	<code>tag tag-name;</code>
<b>Hierarchy Level</b>	[edit snmp v3 snmp-community <i>community-index</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a set of SNMP managers that are authorized to use a community string.
<b>Options</b>	<i>tag-name</i> —Identify the set of addresses for the SNMP managers authorized to use the community string.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">SNMPv3 Overview on page 6523</a></li><li>• <a href="#">Minimum SNMPv3 Configuration on a Device Running Junos OS on page 6524</a></li><li>• <a href="#">Configuring SNMP on page 1356</a></li><li>• <a href="#">Configuring the SNMPv3 Trap Notification</a></li></ul>

## tag-list

---

<b>Syntax</b>	<code>tag-list tag-list;</code>
<b>Hierarchy Level</b>	[edit snmp v3 target-address <i>target-address-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure an SNMP tag list used to select target addresses.
<b>Options</b>	<i>tag-list</i> —Define sets of target addresses (tags). To specify more than one tag, specify the tag names as a space-separated list enclosed within double quotes.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Trap Target Address</a></li></ul>

## target-address

---

<b>Syntax</b>	<pre>target-address <i>target-address-name</i> {   address <i>address</i>;   address-mask <i>address-mask</i>;   port <i>port-number</i>;   retry-count <i>number</i>;   tag-list <i>tag-list</i>;   target-parameters <i>target-parameters-name</i>;   timeout <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp v3]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the address of an SNMP management application and the parameters to be used in sending notifications.
<b>Options</b>	<p><b><i>target-address-name</i></b>—String that identifies the target address.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding the Implementation of SNMP on page 6513</a></li> <li>• <a href="#">SNMP MIBs Support on page 6530</a></li> <li>• <a href="#">SNMP Traps Support on page 6546</a></li> <li>• <a href="#">snmp on page 1454</a></li> <li>• <a href="#">Configuring SNMP on page 1356</a></li> <li>• <a href="#">Monitoring SNMP on page 1475</a></li> <li>• <a href="#">Example: Configuring SNMP on page 6575</a></li> </ul>

## target-parameters

---

**Syntax** At the **[edit snmp v3]** hierarchy level:

```
target-parameters target-parameters-name {  
  profile-name;  
  parameters {  
    message-processing-model (v1 | v2c | V3);  
    security-level (authentication | none | privacy);  
    security-model (usm | v1 | v2c);  
    security-name security-name;  
  }  
}
```

At the **[edit snmp v3 target-address *target-address-name*]** hierarchy level:

```
target-parameters target-parameters-name;
```

**Hierarchy Level** [edit snmp v3]  
[edit snmp v3 target-address *target-address-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the **[edit snmp v3]** hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the **[edit snmp v3 target-parameters *target-parameters-name*]** hierarchy level to the target address configuration at the **[edit snmp v3]** hierarchy level.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

**Related Documentation**

- *Defining and Configuring the Trap Target Parameters*
- *Applying Target Parameters*

## targets

---

<b>Syntax</b>	<code>targets {     <i>address</i>; }</code>
<b>Hierarchy Level</b>	<code>[edit snmp trap-group <i>group-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure one or more systems to receive SNMP traps.
<b>Options</b>	<b><i>address</i></b> —IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP Trap Groups on page 6602</a></li> </ul>

## timeout

---

<b>Syntax</b>	<code>timeout <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 target-address <i>target-address-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the timeout period (in seconds) for SNMP informs.
<b>Default</b>	15 seconds
<b>Options</b>	<b><i>seconds</i></b> —Number of seconds to wait for an inform acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding the Implementation of SNMP on page 6513</a></li> <li>• <a href="#">Configuring SNMP Informs on page 6614</a></li> <li>• <a href="#">retry-count (SNMPv3) on page 6738</a></li> </ul>

## traceoptions (SNMP)

---

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regular-expression</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable           no-world-readable&gt;;     flag <i>flag</i>;     no-remote-trace; }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Track the activities of SNMP agents on the switch and record the information in log files.

**NOTE:** The **traceoptions** statement is not supported on the QFabric system.

The output of the tracing operations is placed into log files in the **/var/log** directory. Each log file is named after the SNMP agent that generates it. The following logs are created in the **/var/log** directory when the **traceoptions** statement is used:

- chassisd
- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

**Options** **file *filename***—By default, the name of the log file that records trace output is the name of the process being traced (for example, mib2d or snmpd). Use this option to specify another name.

**files *number***—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, snmpd) reaches its maximum size, it is archived by being renamed to snmpd.0. The previous snmpd.1 is renamed to snmpd.2, and so on. The oldest archived file is deleted.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Log all SNMP events.

- **configuration**—Log reading of configuration at the **[edit snmp]** hierarchy level.
- **database**—Log events involving storage and retrieval in the events database.
- **events**—Log important events.
- **general**—Log general events.
- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **policy**—Log policy processing.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **server**—Log communication with processes that are generating events.
- **subagent**—Log subagent restarts.
- **timer-events**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**size *size***—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

**Range:** 10 KB through 1 GB

**Default:** 1000 KB

**world-readable | no-world-readable**—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                      snmp-control—To add this statement to the configuration.

## trap-group

---

<b>Syntax</b>	<pre>trap-group group-name {     categories {         category;     }     destination-port port-number;     targets {         address;     } }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for QFX Series switches.
<b>Description</b>	Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.
<b>Options</b>	<p><b>group-name</b>—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 6602</a></li></ul>

---

## trap-options

---

<b>Syntax</b>	<pre>trap-options {     agent-address outgoing-interface;     source-address address; }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.</p> <p>The remaining statements are explained separately.</p>
<b>Default</b>	Disabled
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring SNMP Trap Options</i></li></ul>

## type (RMON Notification)

---

<b>Syntax</b>	<code>type type;</code>
<b>Hierarchy Level</b>	[edit snmp rmon event <i>index</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the type of notification generated when a rising or falling threshold is crossed.
<b>Default</b>	<code>log-and-trap</code>
<b>Options</b>	<p><b>type</b>—Type of notification. It can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>log</b>—Add an entry to the <b>logTable</b> object.</li><li>• <b>log-and-trap</b>—Send an SNMP trap and add a log entry.</li><li>• <b>none</b>—No notifications are sent.</li><li>• <b>snmptrap</b>—Send an SNMP trap.</li></ul>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li><li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li><li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li><li>• <a href="#">Understanding RMON on page 6525</a></li><li>• <a href="#">Junos OS Network Management Configuration Guide</a></li></ul>

## type (SNMPv3)

---

<b>Syntax</b>	<code>type (inform   trap);</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 notify <i>name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. <b>inform</b> option added in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the type of SNMP notification.
<b>Options</b>	<b>inform</b> —Defines the type of notification as an inform. SNMP informs are confirmed notifications.  <b>trap</b> —Defines the type of notification as a trap. SNMP traps are unconfirmed notifications.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP Informs on page 6614</a></li> <li>• <a href="#">Configuring the SNMPv3 Trap Notification</a></li> </ul>

## user

---

<b>Syntax</b>	<code>user <i>username</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 usm local-engine],</code> <code>[edit snmp v3 usm remote-engine <i>engine-id</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a user associated with an SNMPv3 group on a local or remote SNMP engine.
<b>Options</b>	<b><i>username</i></b> —SNMPv3 user-based security model (USM) username.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Creating SNMPv3 Users on page 6609</a></li> </ul>

## usm

---

```
Syntax  usm {
        local-engine {
            user username {
                authentication-md5 {
                    authentication-password authentication-password;
                }
                authentication-none;
                authentication-sha {
                    authentication-password authentication-password;
                }

## variable

---

<b>Syntax</b>	<code>variable <i>oid-variable</i>;</code>
<b>Hierarchy Level</b>	[edit snmp rmon alarm <i>index</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the object identifier (OID) of the MIB object (also called variable) to be monitored when you configure an SNMP RMON alarm. If the value of the monitored variable exceeds the configured rising threshold or falling threshold, an alarm is triggered and a corresponding event may be generated.
<b>Options</b>	<i>oid-variable</i> —OID of the MIB variable that is being monitored. The OID can be a dotted decimal (for example, 1.3.6.1.2.1.2.1.2.1.10.1) or the name of the MIB object—for example, <code>ifInOctets.1</code> .
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li> <li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li> <li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li> <li>• <a href="#">Understanding RMON on page 6525</a></li> <li>• <a href="#">Junos OS Network Management Configuration Guide</a></li> </ul>

## version

---

<b>Syntax</b>	version (all   v1   v2);
<b>Hierarchy Level</b>	[edit snmp trap-group <i>group-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the version number of SNMP traps.
<b>Default</b>	all—Send an SNMPv1 and SNMPv2 trap for every trap condition.
<b>Options</b>	all—Send an SNMPv1 and SNMPv2 trap for every trap condition.  v1—Send SNMPv1 traps only.  v2—Send SNMPv2 traps only.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 6602</a></li></ul>

## view (Configuring a MIB View)

<b>Syntax</b>	<code>view <i>view-name</i> {     oid <i>object-identifier</i> (include   exclude); }</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The <b>view</b> statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the <b>view</b> statement at the <b>[edit snmp community <i>community-name</i>]</b> hierarchy level.
<div>  <b>NOTE:</b> To remove an OID completely, use the <code>delete view all oid oid-number</code> command but omit the <code>include</code> parameter. </div>	
<b>Options</b>	<p><b><i>view-name</i></b>—Name of the view.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring MIB Views on page 6605</a></li> <li>• <a href="#">Associating MIB Views with an SNMP User Group</a></li> <li>• <a href="#">community on page 1411</a></li> </ul>

## view (Associating MIB View with a Community)

---

<b>Syntax</b>	<code>view view-name;</code>
<b>Hierarchy Level</b>	<code>[edit snmp community community-name]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Associate a view with a community. A view represents a group of MIB objects.
<b>Options</b>	<b>view-name</b> —Name of the view. You must use a view name already configured in the <b>view</b> statement at the <b>[edit snmp]</b> hierarchy level.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring SNMP Communities</i></li></ul>

## write-view

---

<b>Syntax</b>	<code>write-view view-name;</code>
<b>Hierarchy Level</b>	<code>[edit snmp v3 vacm access group group-name (default-context-prefix   context-prefix context-prefix) security-model (any   usm   v1   v2c) security-level (authentication   none   privacy)]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series switches.
<b>Description</b>	Associate the write view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).
<b>Options</b>	<b>view-name</b> —Name of the view for which the SNMP user group has write permission.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MIB Views on page 6605</a></li><li>• <i>Configuring the Write View</i></li></ul>

## archive (All System Log Files)

---

<b>Syntax</b>	<code>archive &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;start-time <i>time</i>&gt; &lt;transfer-interval <i>interval</i>&gt; &lt;binary-data   no-binary-data&gt;; &lt;world-readable   no-world-readable&gt; ;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">syslog</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure archiving properties for all system log files.
<b>Options</b>	<p><b>files <i>number</i></b>—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <b>logfile</b>, it closes the file, compresses it, and renames it <b>logfile.0.gz</b> (the amount of data is determined by the <b>size</b> statement at this hierarchy level). The utility then opens and writes to a new file called <b>logfile</b>. When the new file reaches the maximum size, the <b>logfile.0.gz</b> file is renamed to <b>logfile.1.gz</b>, and the new file is closed, compressed, and renamed <b>logfile.0.gz</b>. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).</p> <p><b>Range:</b> 1 through 1000</p> <p><b>Default:</b> 10 files</p> <p><b>size <i>size</i></b>—Maximum amount of data that the Junos OS logging utility writes to a log file <b>logfile</b> before archiving it (closing it, compressing it, and changing its name to <b>logfile.0.gz</b>). The utility then opens and writes to a new file called <b>logfile</b>.</p> <p><b>Syntax:</b> <i>x k</i> to specify the number of kilobytes, <i>x m</i> for the number of megabytes, or <i>x g</i> for the number of gigabytes</p> <p><b>Range:</b> 64 KB through 1 GB</p> <p><b>Default:</b></p> <ul style="list-style-type: none"><li>• 128 KB for EX Series switches and J Series routers</li><li>• 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch</li><li>• 10 MB for TX Matrix and TX Matrix Plus routers</li></ul> <p><b>binary-data   no-binary-data</b>—Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems)..</p> <p><b>Default:</b> no-binary-data</p> <p><b>world-readable   no-world-readable</b>—Grant all users permission to read archived log files, or restrict the permission only to the <b>root</b> user and users who have the Junos OS <b>maintenance</b> permission.</p> <p><b>Default:</b> no-world-readable</p>

**Required Privilege** system—To view this statement in the configuration.  
**Level** system-control—To add this statement to the configuration.

## archive (Individual System Log File)

---

Syntax	archive <archive-sites ( <i>ftp-url</i> <password <i>password</i> >)> <files <i>number</i> > <size <i>size</i> > <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval <i>minutes</i> > <world-readable   no-world-readable>;
Hierarchy Level	[edit system <b>syslog file</b> <i>filename</i> ]
Release Information	Statement introduced before Junos OS Release 7.4. <b>start-time</b> and <b>transfer-interval</b> statements introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure archiving properties for a specific system log file.
Options	<p><b>archive-sites</b> <i>site-name</i>—FTP URL representing the destination for the archived log file (for information about how to specify valid FTP URLs, see <a href="#">“Format for Specifying Filenames and URLs in Junos OS CLI Commands” on page 42</a>). If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the filename specified at the <b>[edit system syslog]</b> hierarchy level.</p> <p><b>files</b> <i>number</i>—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i>, it closes the file, compresses it, and renames it <i>logfile.0.gz</i> (the amount of data is determined by the <b>size</b> statement at this hierarchy level). The utility then opens and writes to a new file called <i>logfile</i>. When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i>, and the new file is closed, compressed, and renamed <i>logfile.0.gz</i>. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).</p> <p><b>Range:</b> 1 through 1000</p> <p><b>Default:</b> 10 files</p> <p><b>password</b> <i>password</i>—Password for authenticating with the site specified by the <b>archive-sites</b> statement.</p> <p><b>size</b> <i>size</i>—Maximum amount of data that the Junos OS logging utility writes to a log file <i>logfile</i> before archiving it (closing it, compressing it, and changing its name to <i>logfile.0.gz</i>). The utility then opens and writes to a new file called <i>logfile</i>.</p> <p><b>Syntax:</b> <b>xk</b> to specify the number of kilobytes, <b>xm</b> for the number of megabytes, or <b>xg</b> for the number of gigabytes</p> <p><b>Range:</b> 64 KB through 1 GB</p> <p><b>Default:</b> 128 KB for J Series routers; 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch; 10 MB for TX Matrix and TX Matrix Plus routers</p>

**start-time "YYYY-MM-DD.hh:mm"**—Date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

**transfer-interval *interval***—Interval at which to transfer the log file to an archive site.

**Range:** 5 through 2880 minutes

**world-readable | no-world-readable**—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

**Default:** no-world-readable

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## archive (QFabric System)

**Syntax** archive {  
size *size*;  
}

**Hierarchy Level** [edit system [syslog](#) file *filename*]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure the archiving properties for the system message log file.

**Options** **size *size***—Maximum amount of system log message data that the QFabric system stores in the log file.

**Syntax:** *xk* to specify the number of kilobytes, *xm* for the number of megabytes, or *xg* for the number of gigabytes

**Range:** 65 KB through 1 GB

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## console (System Logging)

---

<b>Syntax</b>	<code>console {     <i>facility severity</i>; }</code>
<b>Hierarchy Level</b>	[edit system <a href="#">syslog</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the logging of system messages to the system console.
<b>Options</b>	<p><b><i>facility</i></b>—Class of messages to log. To specify multiple classes, include multiple <b><i>facility severity</i></b> statements. For a list of the facilities, see <a href="#">“Junos OS System Logging Facilities and Message Severity Levels”</a> on page 6633.</p> <p><b><i>severity</i></b>—Severity of the messages that belong to the facility specified by the paired <b><i>facility</i></b> name. Messages with severities of the specified level and higher are logged. For a list of the severities, see <a href="#">“Junos OS System Logging Facilities and Message Severity Levels”</a> on page 6633.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Directing System Log Messages to the Console</a> on page 6620</li><li>• <a href="#">Junos OS System Log Messages Reference</a></li></ul>

## explicit-priority

<b>Syntax</b>	explicit-priority;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> system syslog file <i>filename</i> ], [edit logical-systems <i>logical-system-name</i> system syslog host], [edit system syslog file <i>filename</i> ], [edit system syslog host]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Record the priority (facility and severity level) in each standard-format system log message directed to a file or remote destination.  When the <b>structured-data</b> statement is also included at the [edit system syslog file <i>filename</i> ] hierarchy level, this statement is ignored for the file.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Including Priority Information in System Log Messages on page 6622</a></li> <li>• <i>Junos OS System Log Messages Reference</i></li> <li>• <a href="#">structured-data on page 6793</a></li> </ul>

## facility-override

<b>Syntax</b>	facility-override <i>facility</i> ;
<b>Hierarchy Level</b>	[edit system syslog host]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Substitute an alternate facility for the default facilities used when messages are directed to a remote destination.
<b>Options</b>	<i>facility</i> —Alternate facility to substitute for the default facilities. For a list of the possible facilities, see <a href="#">Table 638 on page 6635</a> .
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination on page 6636</a></li> <li>• <i>Junos OS System Log Messages Reference</i></li> </ul>

## file (QFabric System)

---

Syntax	<pre>file <i>filename</i> {   archive {     <i>size</i> <i>maximum-file-size</i>;   }   <i>explicit-priority</i>;   <i>facility</i> <i>severity</i>;   <i>match</i> "<i>regular-expression</i>";   <i>structured-data</i> {     <i>brief</i>;   } }</pre>
Hierarchy Level	[edit system <a href="#">syslog</a> ]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series.
Description	Configure the logging of system messages to a file.
Options	<p><i>facility</i>—Class of messages to log. To specify multiple classes, include multiple <i>facility severity</i> statements.</p> <p><i>filename</i>—Filename that you specify with the <b>show log</b> command.</p> <p><b>Default:</b> Filename <b>messages</b></p> <p><i>severity</i>—Severity of the messages that belong to the facility specified by the paired <i>facility</i> name. Messages with severities at the specified level and higher are logged.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">syslog on page 6796</a></li></ul>

## file (System Logging)

<b>Syntax</b>	<pre> file <i>filename</i> {     <i>facility severity</i>;     archive {         files <i>number</i>;         size <i>size</i>;         (no-world-readable   world-readable);     }     explicit-priority;     match "<i>regular-expression</i>";     structured-data {         brief;     } } </pre>
<b>Hierarchy Level</b>	[edit system <a href="#">syslog</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the logging of system messages to a file.
<b>Options</b>	<p><b><i>facility</i></b>—Class of messages to log. To specify multiple classes, include multiple <b><i>facility severity</i></b> statements. For a list of the facilities, see <a href="#">“Junos OS System Logging Facilities and Message Severity Levels” on page 6633</a>.</p> <p><b><i>file filename</i></b>—File in the <b><i>severity</i></b> directory in which to log messages from the specified facility. To log messages to more than one file, include more than one <b><i>file</i></b> statement.</p> <p><b><i>severity</i></b>—Severity of the messages that belong to the facility specified by the paired <b><i>facility</i></b> name. Messages with severities of the specified level and higher are logged. For a list of the severities, see <a href="#">“Junos OS System Logging Facilities and Message Severity Levels” on page 6633</a>.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Directing System Log Messages to a Log File on page 6618</a></li> <li>• <a href="#">Junos OS System Log Messages Reference</a></li> </ul>

## files

---

<b>Syntax</b>	<code>files <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit system syslog archive], [edit system syslog file <i>filename</i> <a href="#">archive</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for QFX Series switches.
<b>Description</b>	Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i> , it closes the file, compresses it, and renames it to <i>logfile.0.gz</i> (for information about the maximum file size, see <a href="#">size</a> ). The utility then opens and writes to a new file called <i>logfile</i> . When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i> , and the new file is closed, compressed, and renamed <i>logfile.0.gz</i> . By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).
<b>Options</b>	<i>number</i> —Maximum number of archived files. <b>Range:</b> 1 through 1000 <b>Default:</b> 10 files
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Specifying Log File Size, Number, and Archiving Properties on page 6629</a></li><li>• <a href="#">Junos OS System Log Messages Reference</a></li><li>• <a href="#">size on page 6792</a></li></ul>

## host (System)

<b>Syntax</b>	<pre> host (hostname   other-routing-engine) {     facility severity;     exclude-hostname     explicit-priority;     facility-override facility;     log-prefix string;     match "regular-expression";     source-address source-address;     structured-data {         brief;     } } </pre>
<b>QFX Series</b>	<pre> host (hostname {     facility severity;     explicit-priority;     facility-override facility;     log-prefix string;     match "regular-expression";     port;     source-address source-address; } </pre>
<b>TX Matrix Router and EX Series Switches</b>	<pre> host (hostname   other-routing-engine   scc-master) {     facility severity;     explicit-priority;     facility-override facility;     log-prefix string;     match "regular-expression";     port;     source-address source-address; } </pre>
<b>TX Matrix Plus Router</b>	<pre> host (hostname   other-routing-engine   sfc0-master) {     facility severity;     allow-duplicates;     explicit-priority;     facility-override facility;     log-prefix string;     match "regular-expression";     port;     source-address source-address; } </pre>
<b>Hierarchy Level</b>	<pre> [edit logical-systems logical-system-name system syslog], [edit system syslog] </pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the logging of system messages to a remote destination.

**Options** *facility*—Class of messages to log. To specify multiple classes, include multiple *facility severity* statements. For a list of the facilities, see [“Junos OS System Logging Facilities and Message Severity Levels” on page 6633](#).

*hostname*—IPv4 address, IPv6 address, or fully qualified hostname of the remote machine to which to direct messages. To direct messages to multiple remote machines, include a **host** statement for each one.

**other-routing-engine**—Direct messages to the other Routing Engine on a router or switch with two Routing Engines installed and operational.

**NOTE:** The **other-routing-engine** option is not applicable to the QFX Series.

---

**port**—Port number of the remote syslog server that can be modified.

**scc-master**—(TX Matrix routers only) On a T640 router that is part of a routing matrix, direct messages to the TX Matrix router.

*severity*—Severity of the messages that belong to the facility specified by the paired *facility* name. Messages with severities of the specified level and higher are logged. For a list of the severities, see [“Junos OS System Logging Facilities and Message Severity Levels” on page 6633](#).

**sfc0-master**—(TX Matrix Plus routers only) On a T1600 or T4000 router that is part of a routing matrix, direct messages to the TX Matrix Plus router.

The remaining statements are explained separately.

<b>Required Privilege</b>	system—To view this statement in the configuration.
<b>Level</b>	system-control—To add this statement to the configuration.

- |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## log-prefix (System)

<b>Syntax</b>	<code>log-prefix <i>string</i>;</code>
<b>Hierarchy Level</b>	[edit system syslog host]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Include a text string in each message directed to a remote destination.
<b>Options</b>	<i>string</i> —Text string to include in each message.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Adding a Text String to System Log Messages Directed to a Remote Destination on page 6617</a></li> <li>• <i>Junos OS System Log Messages Reference</i></li> </ul>

## match

<b>Syntax</b>	<code>match "regular-expression";</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> system syslog file <i>filename</i> ], [edit logical-systems <i>logical-system-name</i> system syslog user ( <i>username</i>   *)], [edit system syslog file <i>filename</i> ], [edit system syslog host <i>hostname</i>   other-routing-engine  scc-master)], [edit system syslog user ( <i>username</i>   *)]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a text string that must (or must not) appear in a message for the message to be logged to a destination.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using Regular Expressions to Refine the Set of Logged Messages on page 6637</a></li> </ul>

## size (System)

---

<b>Syntax</b>	<code>size size;</code>
<b>Hierarchy Level</b>	[edit system syslog archive], [edit system syslog file <i>filename</i> archive]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the maximum amount of data that the Junos OS logging utility writes to a log file <b>logfile</b> before archiving it (closing it, compressing it, and changing its name to <b>logfile.0.gz</b> ). The utility then opens and writes to a new file called <b>logfile</b> . For information about the number of archive files that the utility creates in this way, see <a href="#">files</a> .
<b>Options</b>	<b>size</b> —Maximum size of each system log file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). <b>Syntax:</b> <b>xk</b> to specify the number of kilobytes, <b>xm</b> for the number of megabytes, or <b>xg</b> for the number of gigabytes <b>Range:</b> 64 KB through 1 GB <b>Default:</b> 1 MB for MX Series routers and the QFX Series
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Specifying Log File Size, Number, and Archiving Properties on page 6629</a></li><li>• <a href="#">Junos OS System Log Messages Reference</a></li><li>• <a href="#">files on page 6788</a></li></ul>

## structured-data

---

<b>Syntax</b>	structured-data { brief; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> system syslog file <i>filename</i> ], [edit system syslog file <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Write system log messages to the log file in structured-data format, which complies with Internet draft draft-ietf-syslog-protocol-23, <i>The syslog Protocol</i> ( <a href="http://tools.ietf.org/html/draft-ietf-syslog-protocol-23">http://tools.ietf.org/html/draft-ietf-syslog-protocol-23</a> ).
<div>  <p><b>NOTE:</b> When this statement is included, other statements that specify the format for messages written to the file are ignored (the <code>explicit-priority</code> statement at the [edit system syslog file <i>filename</i>] hierarchy level and the <code>time-format</code> statement at the [edit system syslog] hierarchy level).</p> </div>	
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Logging Messages in Structured-Data Format</i></li> <li>• <i>Junos OS System Log Messages Reference</i></li> <li>• <a href="#">explicit-priority on page 6785</a></li> <li>• <a href="#">time-format on page 6797</a></li> </ul>

## syslog (System)

---

```
Syntax  syslog {
        allow-duplicates;
        archive {
            (binary-data | no-binary-data);
            files number;
            size maximum-file-size;

            }
            port port number;
        }
        log-rotate-frequency frequency;
        server server name;
        source-address source-address;
        time-format (millisecond | year | year millisecond);
        user (username | *) {
            facility severity;
            match "regular-expression";
        }
    }
```

Hierarchy Level    [edit system]

<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the types of system log messages to send to files, to a remote destination, to user terminals, or to the system console.</p> <p>The remaining statements are explained separately.</p>
<b>Options</b>	<p><b>archive</b>—Define parameters for archiving log messages.</p> <p><b>console</b>—Send log messages of a specified class and severity to the console.</p> <p><b>file</b>—Send log messages to a named file.</p> <p><b>host</b> —Remote location to be notified of specific log messages.</p> <p><b>log-rotate-frequency</b>—Configure the interval for checking logfile size and archiving messages.</p> <p><b>server</b>—Name of the system log server in the inet.0 routing instance.</p> <p><b>source-address</b>—Include a specified address as the source address for log messages.</p> <p><b>time-format</b>—Additional information to include in the system log time stamp.</p> <p><b>user</b>—Notify a specific user of the log event.</p>
<b>Required Privilege Level</b>	<p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Junos OS System Log Overview</i></li> <li>• <i>Junos OS System Log Messages Reference</i></li> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 6561</a></li> </ul>

## syslog (QFabric System)

---

<b>Syntax</b>	<pre>syslog {   file <i>filename</i> {     archive {       size <i>maximum-file-size</i>;     }     explicit-priority;     <i>facility severity</i>;     match "<i>regular-expression</i>";     structured-data;   }   filter all {     <i>facility severity</i>;     match "<i>regular-expression</i>";   }   host <i>hostname</i> {     explicit-priority;     <i>facility severity</i>;     facility-override <i>facility</i>;     log-prefix <i>string</i>;     match "<i>regular-expression</i>";     structured-data;   } }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>Configure system log messages for the QFabric system.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding the Implementation of System Log Messages on the QFabric System on page 6562</a></li><li>• <a href="#">Directing System Log Messages to a Remote Machine on page 6619</a></li></ul>

## time-format

<b>Syntax</b>	<code>time-format (year   millisecond   year millisecond);</code>
<b>Hierarchy Level</b>	<code>[edit system syslog]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a <b>file</b>, <b>console</b>, or <b>user</b> statement at the <code>[edit system syslog]</code> hierarchy level. As of Junos OS Release 11.4, the additional time information is also sent to destinations configured by a <b>host</b> statement.</p> <p>By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, <b>Aug 21 12:36:30</b>. However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the <code>[edit system syslog time-format]</code> statement.</p>
	<p> <b>NOTE:</b> When the <b>structured-data</b> statement is included at the <code>[edit system syslog file <i>filename</i>]</code> hierarchy level, this statement is ignored for the file.</p>
<b>Options</b>	<p><b>millisecond</b>—Include the millisecond in the timestamp.</p> <p><b>year</b>—Include the year in the timestamp.</p>
<b>Required Privilege Level</b>	<p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Including the Year or Millisecond in Timestamps on page 181</a></li> <li>• <a href="#">Junos OS System Log Messages Reference</a></li> <li>• <a href="#">structured-data on page 6793</a></li> </ul>

## user (System Logging)

---

<b>Syntax</b>	<pre>user (username   *) {     facility severity;     match "regular-expression"; }</pre>
<b>Hierarchy Level</b>	[edit system syslog]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the logging of system messages to user terminals.
<b>Options</b>	<p><b>*</b> (the asterisk)—Log messages to the terminal sessions of all users who are currently logged in.</p> <p><b>facility</b>—Class of messages to log. To specify multiple classes, include multiple <b>facility severity</b> statements. For a list of the facilities, see <a href="#">“Junos OS System Logging Facilities and Message Severity Levels” on page 6633</a>.</p> <p><b>severity</b>—Severity of the messages that belong to the facility specified by the paired <b>facility</b> name. Messages with severities the specified level and higher are logged. For a list of the severities, see <a href="#">“Junos OS System Logging Facilities and Message Severity Levels” on page 6633</a>.</p> <p><b>username</b>—Junos OS login name of the user whose terminal session is to receive system log messages. To log messages to more than one user's terminal session, include more than one <b>user</b> statement.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Directing System Log Messages to a User Terminal on page 6620</a></li><li>• <a href="#">Junos OS System Logging Facilities and Message Severity Levels on page 6633</a></li><li>• <a href="#">Junos OS System Log Messages Reference</a></li></ul>

### Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
```

```
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
process): new instance detected (variable: sysApp1ElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysApp1ElmtRunMemory.5.8.2292)
...
Nov  4 12:08:30 switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30 switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
AS 100): Can't assign requested address
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the daemon facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
SNMP trap: cold start
...
```

## Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. [Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 6800](#)
2. [Displaying Real-Time Statistics About an Interface on the Router or Switch on page 6801](#)

### Displaying Real-Time Statistics About All Interfaces on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through all interfaces on the router or switch.

**Action** To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

### Sample Output

```
user@host> monitor interface traffic
host name          Seconds:15          Time: 12:31:09
Interface  Link  Input packets  (pps)  Output packets  (pps)
so-1/0/0   Down    0             (0)      0             (0)
so-1/1/0   Down    0             (0)      0             (0)
so-1/1/1   Down    0             (0)      0             (0)
so-1/1/2   Down    0             (0)      0             (0)
so-1/1/3   Down    0             (0)      0             (0)
t3-1/2/0   Down    0             (0)      0             (0)
t3-1/2/1   Down    0             (0)      0             (0)
t3-1/2/2   Down    0             (0)      0             (0)
t3-1/2/3   Down    0             (0)      0             (0)
so-2/0/0   Up      211035        (1)      36778         (0)
so-2/0/1   Up      192753        (1)      36782         (0)
so-2/0/2   Up      211020        (1)      36779         (0)
so-2/0/3   Up      211029        (1)      36776         (0)
so-2/1/0   Up      189378        (1)      36349         (0)
so-2/1/1   Down    0             (0)      18747         (0)
so-2/1/2   Down    0             (0)      16078         (0)
so-2/1/3   Up      0             (0)      80338         (0)
at-2/3/0   Up      0             (0)      0             (0)
at-2/3/1   Down    0             (0)      0             (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D
```

**Meaning** The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the C key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

### Displaying Real-Time Statistics About an Interface on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through an interface on the router or switch.

**Action** To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

```
user@host> monitor interface interface-name
```

### Sample Output

```
user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
Interface: so-0/0/1, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: 0C3 Traffic statistics:
  Input bytes:          5856541 (88 bps)
  Output bytes:         6271468 (96 bps)
  Input packets:        157629 (0 pps)
  Output packets:       157024 (0 pps)
Encapsulation statistics:
```

```

Input keepalives:          42353
Output keepalives:        42320
LCP state: Opened
Error statistics:
Input errors:              0
Input drops:               0
Input framing errors:      0
Input runs:                0
Input giants:              0
Policed discards:          0
L3 incompletes:            0
L2 channel errors:         0
L2 mismatch timeouts:      0
Carrier transitions:       1
Output errors:             0
Output drops:              0
Aged packets:              0
Active alarms : None
Active defects: None
SONET error counts/seconds:
LOS count                  1
LOF count                  1
SEF count                  1
ES-S                       77
SES-S                      77
SONET statistics:
BIP-B1                     0
BIP-B2                     0
REI-L                      0
BIP-B3                     0
REI-P                      0
Received SONET overhead: F1      : 0x00 J0      : 0xZ

```

**Meaning** The sample output shows the input and output packets for a particular SONET interface (**so-0/0/1**). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see *Checklist for Tracking Error Conditions*.

To control the output of the command while it is running, use the keys shown in [Table 640 on page 6802](#).

**Table 640: Output Control Keys for the monitor interface Command**

Action	Key
Display information about the next interface. The <b>monitor interface</b> command scrolls through the physical or logical interfaces in the same order that they are displayed by the <b>show interfaces terse</b> command.	<b>N</b>
Display information about a different interface. The command prompts you for the name of a specific interface.	<b>I</b>
Freeze the display, halting the display of updated statistics.	<b>F</b>
Thaw the display, resuming the display of updated statistics.	<b>T</b>

**Table 640: Output Control Keys for the monitor interface Command (*continued*)**

Action	Key
Clear (zero) the current delta counters since <b>monitor interface</b> was started. It does not clear the accumulative counter.	C
Stop the <b>monitor interface</b> command.	Q

See the [CLI Explorer](#) for details on using match conditions with the **monitor traffic** command.

## Monitoring RMON MIB Tables

**Purpose** Monitor remote monitoring (RMON) alarm, event, and log tables.

**Action** To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                               Value State
      5 monitor
      jnxOperatingCPU.9.1.0.0                        5 falling threshold

Event
Index  Type                               Last Event
      1 log and trap                     2010-07-10 11:34:17 PDT
Event Index: 1
      Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
      Time: 2010-07-10 11:34:07 PDT
      Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
      Time: 2010-07-10 11:34:17 PDT
```

**Meaning** The display shows that an alarm has been defined to monitor jnxRmon MIB object jnxOperatingCPU, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the logTable in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

**Related Documentation**

- [clear snmp history on page 6856](#)

## Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
Alarm
Index  Variable description                                     Value State

32768 Health Monitor: root file system utilization
      jnxHrStoragePercentUsed.1                             58 active

32769 Health Monitor: /config file system utilization
      jnxHrStoragePercentUsed.2                             0 active

32770 Health Monitor: RE 0 CPU utilization
      jnxOperatingCPU.9.1.0.0                               0 active

32773 Health Monitor: RE 0 Memory utilization
      jnxOperatingBuffer.9.1.0.0                            35 active

32775 Health Monitor: jkernel daemon CPU utilization
      Init daemon   0 active
      Chassis daemon                                       50 active
      Firewall daemon                                       0 active
      Interface daemon                                      5 active
      SNMP daemon   11 active
      MIB2 daemon   42 active
      ...
```

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system

sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:

## Monitoring System Log Messages

**Purpose** Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

**Action** To view system log messages:

```
user@switch1> show log messages
```

## Sample Output

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K

...
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
```

```
'exit '  
Nov 4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting  
configuration mode  
Nov 4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command  
'show log messages'
```

**Meaning** The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user jsmith.

## Pinging Hosts

**Purpose** Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

**Action** To use the **ping** command to send four requests (ping count) to host3:  
**ping host count number**

## Sample Output

```
ping host3 count 4  
user@switch> ping host3 count 4  
PING host3.site.net (176.26.232.111): 56 data bytes  
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms  
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms  
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms  
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms  
  
--- host3.site.net ping statistics ---  
4 packets transmitted, 4 packets received, 0% packet loss  
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

**Meaning** • The **ping** results show the following information:

- Size of the ping response packet (in bytes).
- IP address of the host from which the response was sent.
- Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
- Time-to-live (ttl) hop-count value of the ping response packet.
- Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
- Number of ping requests (probes) sent to the host.
- Number of ping responses received from the host.
- Packet loss percentage.
- Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

## Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d
  - rmopd
  - serviced
  - snmpd
- When a trace file named **filename** reaches its maximum size, it is renamed **filename.0**, then **filename.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)

- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
traceoptions {
  file <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  memory-trace;
  no-remote-trace;
  no-default-memory-trace;
}
```

These statements are described in the following sections:

- [Configuring the Number and Size of SNMP Log Files on page 6808](#)
- [Configuring Access to the Log File on page 6808](#)
- [Configuring a Regular Expression for Lines to Be Logged on page 6809](#)
- [Configuring the Trace Operations on page 6809](#)

### Configuring the Number and Size of SNMP Log Files

---

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed **filename.0**, then **filename.1**, and so on, until there are three trace files. Then the oldest trace file (**filename.2**) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (**filename**) reaches 2 MB, **filename** is renamed **filename.0**, and a new file called **filename** is created. When the new **filename** reaches 2 MB, **filename.0** is renamed **filename.1** and **filename** is renamed **filename.0**. This process repeats until there are 20 trace files. Then the oldest file (**filename.19**) is overwritten by the newest file (**filename.0**).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

### Configuring Access to the Log File

---

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

### Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file filename]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

### Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
  configuration;
  database;
  events;
  general;
  interface-stats;
  nonvolatile-sets;
  pdu;
  policy;
  protocol-timeouts;
  routing-socket;
  server;
  subagent;
  timer;
  varbind-error;
}
```

Table 641 on page 6809 describes the meaning of the SNMP tracing flags.

**Table 641: SNMP Tracing Flags**

Flag	Description	Default Setting
<b>all</b>	Log all operations.	Off
<b>configuration</b>	Log reading of the configuration at the <b>[edit snmp]</b> hierarchy level.	Off
<b>database</b>	Log events involving storage and retrieval in the events database.	Off
<b>events</b>	Log important events.	Off

Table 641: SNMP Tracing Flags (*continued*)

Flag	Description	Default Setting
<b>general</b>	Log general events.	Off
<b>interface-stats</b>	Log physical and logical interface statistics.	Off
<b>nonvolatile-set</b>	Log nonvolatile SNMP set request handling.	Off
<b>pdu</b>	Log SNMP request and response packets.	Off
<b>policy</b>	Log policy processing.	Off
<b>protocol-timeouts</b>	Log SNMP response timeouts.	Off
<b>routing-socket</b>	Log routing socket calls.	Off
<b>server</b>	Log communication with processes that are generating events.	Off
<b>subagent</b>	Log subagent restarts.	Off
<b>timer</b>	Log internal timer events.	Off
<b>varbind-error</b>	Log variable binding errors.	Off

To display the end of the log for an agent, issue the **show log agentd | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where **agent** is the name of an SNMP agent.

## Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage

Even though the Junos OS has built-in performance metrics and monitoring options, you might need to have customized performance metrics. To make it easier for you to monitor such customized data through a standard monitoring system, the Junos OS provides you with an enterprise-specific Utility MIB that can store such data and thus extend SNMP support for managing and monitoring the data of your choice.

The enterprise-specific Utility MIB provides you with container objects of the following types: **32-bit counters**, **64-bit counters**, **signed integers**, **unsigned integers**, and **octet strings**.

You can use these container MIB objects to store the data that are otherwise not supported for SNMP operations. You can populate data for these objects either by using CLI commands or with the help of Op scripts and an RPC API that can invoke the CLI commands.

The following CLI commands enable you to set and clear Utility MIB object values:

- **request snmp utility-mib set** instance *name* object-type <counter | counter 64 | integer | string | unsigned integer> object-value *value*
- **request snmp utility-mib clear** instance *name* object-type <counter | counter 64 | integer | string | unsigned integer>

The *instance name* option of the **request snmp utility-mib <set | clear>** command specifies the name of the data instance and is the main identifier of the data. The **object-type <counter | counter 64 | integer | string | unsigned integer>** option enables you specify the object type, and the **object-value *value*** option enables you to set the value of the object.

To automate the process of populating Utility MIB data, you can use a combination of an event policy and event script. The following examples show the configuration for an event policy to run **show system buffers** every hour and to store the **show system buffers** data in Utility MIB objects by running an event script (**check-mbufs.slax**).

#### Event Policy Configuration

To configure an event policy that runs the **show system buffers** command every hour and invokes **check-mbufs.slax** to store the **show system buffers** data into Utility MIB objects, include the following statements at the **[edit]** hierarchy level:

```
event-options {
  generate-event {
    1-HOUR time-interval 3600;
  }
  policy MBUFS {
    events 1-HOUR;
    then {
      event-script check-mbufs.slax; # script stored at /var/db/scripts/event/
    }
  }
  event-script {
    file check-mbufs.slax;
  }
}
```

#### check-mbufs.slax Script

The following example shows the **check-mbufs.slax** script that is stored under **/var/db/scripts/event/**:

```
----- script START -----
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
ns ext = "http://xmlsoft.org/XSLT/namespace";

match / {
  <op-script-results>{
```

```

var $cmd = <command> "show system buffers";
var $out = jcs:invoke($cmd);

var $lines = jcs:break_lines($out);
for-each ($lines) {
    if (contains(., "current/peak/max")) {
        var $pattern = "([0-9]+)/([0-9]+)/([0-9]+) mbufs";
        var $split = jcs:regex($pattern, .);
        var $result = $split[2];

        var $rpc = <request-snmp-utility-mib-set> {
            <object-type> "integer";
            <instance> "current-mbufs";
            <object-value> $result;
        }
        var $res = jcs:invoke($rpc);
    }
}
}
----- script END -----

```

You can run the following command to check the data stored in the Utility MIB as a result of the event policy and script shown in the preceding examples:

```

user@host> show snmp mib walk jnxUtilData ascii jnxUtilIntegerValue."current-mbufs"
= 0 jnxUtilIntegerTime."current-mbufs" = 07 da 05 0c 03 14 2c 00 2d 07 00
regress@caramels>

```

**NOTE:** The `show snmp mib walk` command is not available on the QFabric system, but you can use external SNMP client applications to perform this operation.

## Displaying Commit Script Output

[Table 642 on page 6812](#) summarizes the Junos OS command-line interface (CLI) commands you can use to monitor and troubleshoot commit scripts. For more information about the `cscrip.log` file, see *Tracing Commit Script Processing*.

**NOTE:** Tracing commit script processing, including the `cscrip.log` file, is not supported on the QFX3000-G QFabric system.

**Table 642: Commit Script Configuration and Operational Mode Commands**

Task	Command
<b>Configuration Mode Commands</b>	
Display errors and warnings generated by commit scripts.	<code>commit</code> or <code>commit check</code>

**Table 642: Commit Script Configuration and Operational Mode Commands (*continued*)**

Task	Command
Display detailed information.	<b>commit   display detail</b>
Display the underlying Extensible Markup Language (XML) data.	<b>commit   display xml</b>
Display the postinheritance contents of the configuration database. This view includes transient changes, but does not include changes made in configuration groups.	<b>show   display commit-scripts</b>
Display the postinheritance contents of the configuration database. This view excludes transient changes.	<b>show   display commit-scripts no-transients</b>
Display the postinheritance configuration in XML format.  Viewing the configuration in XML format can be helpful when you are writing XML Path Language (XPath) expressions and configuration element tags.	<b>show   display commit-scripts view</b>
Display the postinheritance configuration in XML format, but exclude transient changes.	<b>show   display commit-scripts view   display commit-scripts no-transients</b>
Display all configuration groups data, including script-generated changes to the groups.	<b>show groups   display commit-scripts</b>
Display a particular configuration group, including script-generated changes to the group.	<b>show groups <i>group-name</i>   display commit-scripts</b>
<b>Operational Mode Commands</b>	
Display logging data associated with all commit script processing.	<b>show log cscript.log</b>
Display processing for only the most recent commit operation.	<b>show log cscript.log   last</b>
Display processing for script errors.	<b>show log cscript.log   match error</b>
Display processing for a particular script.	<b>show log cscript.log   match <i>filename</i></b>

## Commands for General Monitoring

---

- [monitor traffic](#)
- [ping](#)

## monitor traffic

**Syntax** monitor traffic  
 <brief | detail | extensive>  
 <absolute-sequence>  
 <count *count*>  
 <interface *interface-name*>  
 <layer2-headers>  
 <matching *matching*>  
 <no-domain-names>  
 <no-promiscuous>  
 <no-resolve>  
 <no-timestamp>  
 <print-ascii>  
 <print-hex>  
 <resolve-timeout>  
 <size *size*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display packet headers or packets received and sent from the Routing Engine.

### NOTE:

- Using the **monitor-traffic** command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the **no-resolve** option.

**NOTE:** This command is not supported on the QFabric system.

**Options** **none**—(Optional) Display packet headers transmitted through **fxp0**. On a TX Matrix Plus router, display packet headers transmitted through **em0**.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**absolute-sequence**—(Optional) Display absolute TCP sequence numbers.

**count *count***—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The monitor traffic command quits automatically after displaying the number of packets specified.

**interface *interface-name***—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

**layer2-headers**—(Optional) Display the link-level header on each line.

**matching *matching***—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

**no-domain-names**—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **team.company.net**.

**no-promiscuous**—(Optional) Do not put the interface into promiscuous mode.

**no-resolve**—(Optional) Suppress reverse lookup of the IP addresses.

**no-timestamp**—(Optional) Suppress timestamps on displayed packets.

**print-ascii**—(Optional) Display each packet in ASCII format.

**print-hex**—(Optional) Display each packet, except the link-level header, in hexadecimal format.

**resolve-timeout *timeout***—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

**size *size***—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

**Additional Information** In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

**monitor traffic matching "*expression*"**

Replace ***expression*** with one or more of the match conditions listed in [Table 643 on page 6817](#).

Table 643: Match Conditions for the monitor traffic Command

Match Type	Condition	Description
Entity	<b>host</b> [ <i>address</i>   <i>hostname</i> ]	Matches packets that contain the specified address or hostname.  The protocol match conditions <b>arp</b> , <b>ip</b> , or <b>rarp</b> , or any of the directional match conditions can be prepended to the <b>host</b> match condition.
	<b>net</b> <i>address</i>	Matches packets with source or destination addresses containing the specified network address.
	<b>net</b> <i>address mask mask</i>	Matches packets containing the specified network address and subnet mask.
	<b>port</b> ( <i>port-number</i>   <i>port-name</i> )	Matches packets containing the specified source or destination TCP or UDP port number or port name.  In place of the numeric port address, you can specify a text synonym, such as <b>bgp</b> (179), <b>dhcp</b> (67), or <b>domain</b> (53) (the port numbers are also listed).
Directional	<b>dst</b>	Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.
	<b>src</b>	Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.
	<b>src and dst</b>	Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.
	<b>src or dst</b>	Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.
Packet Length	<b>less</b> <i>value</i>	Matches packets shorter than or equal to the specified value, in bytes.
	<b>greater</b> <i>value</i>	Matches packets longer than or equal to the specified value, in bytes.

Table 643: Match Conditions for the monitor traffic Command (*continued*)

Match Type	Condition	Description
Protocol	<b>amt</b>	Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.
	<b>arp</b>	Matches all ARP packets.
	<b>ether</b>	Matches all Ethernet packets.
	<b>ether (broadcast   multicast)</b>	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with <b>src</b> and <b>dst</b> .
	<b>ether protocol (address   (arp   ip   rarp))</b>	Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The <b>ether protocol</b> arguments <b>arp</b> , <b>ip</b> , and <b>rarp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ether protocol</b> match condition.
	<b>icmp</b>	Matches all ICMP packets.
	<b>ip</b>	Matches all IP packets.
	<b>ip (broadcast   multicast)</b>	Matches broadcast or multicast IP packets.
	<b>ip protocol (address   (icmp   igmp   tcp   udp))</b>	Matches packets with the specified address or protocol type. The <b>ip protocol</b> arguments <b>icmp</b> , <b>tcp</b> , and <b>udp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ip protocol</b> match condition.
	<b>isis</b>	Matches all IS-IS routing messages.
	<b>rarp</b>	Matches all RARP packets.
	<b>tcp</b>	Matches all TCP datagrams.
	<b>udp</b>	Matches all UDP datagrams.

To combine expressions, use the logical operators listed in [Table 644 on page 6818](#).

Table 644: Logical Operators for the monitor traffic Command

Logical Operator (Highest to Lowest Precedence)	Description
<b>!</b>	Logical NOT. If the first condition does not match, the next condition is evaluated.

Table 644: Logical Operators for the monitor traffic Command (*continued*)

Logical Operator (Highest to Lowest Precedence)	Description
&&	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
()	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0"arithmetic_expression relational_operator arithmetic_expression
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are 1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in [Table 645 on page 6820](#).

**NOTE:** Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The **monitor traffic** command cannot apply match conditions to inbound traffic.
- The **monitor traffic interface** command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the match pipe option (`| match`) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see [Table 643 on page 6817](#).
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the **monitor traffic interface ae[x]** command for aggregated Ethernet interfaces (such as ae0) only shows inbound traffic data, the command does not show VLAN tag information in the output.

**Table 645: Arithmetic and Relational Operators for the monitor traffic Command**

Arithmetic or Relational Operator	Description
<b>Arithmetic Operator</b>	
+	Addition operator.
-	Subtraction operator.
/	Division operator.
&	Bitwise AND.
*	Bitwise exclusive OR.
	Bitwise inclusive OR.
<b>Relational Operator (Highest to Lowest Precedence)</b>	
<=	If the first expression is less than or equal to the second, the packet matches.
>=	If the first expression is greater than or equal to the second, the packet matches.
<	If the first expression is less than the second, the packet matches.
>	If the first expression is greater than the second, the packet matches.
=	If the compared expressions are equal, the packet matches.
!=	If the compared expressions are unequal, the packet matches.

**Required Privilege Level** trace  
maintenance

<wait *seconds*>

<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Check host reachability and network connectivity. The <b>ping</b> command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.
<b>Options</b>	<p><b>host</b>—IP address or hostname of the remote system to ping.</p> <p><b>bypass-routing</b>—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.</p> <p><b>count requests</b>—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.</p> <p><b>detail</b>—(Optional) Include in the output the interface on which the ping reply was received.</p> <p><b>do-not-fragment</b>—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.</p> <div><p><b>NOTE:</b> In Junos OS Release 11.1 and later, when issuing the <b>ping</b> command for an IPv6 route with the <b>do-not-fragment</b> option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.</p></div> <p><b>inet</b>—(Optional) Ping Packet Forwarding Engine IPv4 routes.</p> <p><b>inet6</b>—(Optional) Ping Packet Forwarding Engine IPv6 routes.</p> <p><b>interface source-interface</b>—(Optional) Interface to use to send the ping requests.</p> <p><b>interval seconds</b>—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.</p> <p><b>logical-system logical-system-name</b>—(Optional) Name of logical system from which to send the ping requests.</p> <p>Alternatively, enter the <b>set cli logical-system logical-system-name</b> command and then run the <b>ping</b> command. To return to the main router or switch, enter the <b>clear cli logical-system</b> command.</p>

**loose-source *value***—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

**mac-address *mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**pattern *string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

**rapid**—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

**record-route**—(Optional) Record and report the packet's path (IPv4).

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

**size *bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is 0 through 65,468. The default value is 56, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**strict**—(Optional) Use the strict source route option (IPv4).

**strict-source *value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

**tos *type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is 0 through 255.

If the device configuration includes the **dscp-code-point *value*** statement at the **[edit class-of-service host-outbound-traffic]** hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the **dscp-code-point** configuration statement instead of the value you specify in this command option.

**ttl *value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is 0 through 255.

**verbose**—(Optional) Display detailed output.

**vpls *instance-name***—(Optional) Ping the instance to which this VPLS belongs.

**wait *seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is 10 seconds. If this option is used without the count option, a default count of 5 packets is used.

Required Privilege Level	network
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages</a></li></ul>
List of Sample Output	<a href="#">ping hostname on page 6828</a> <a href="#">ping hostname rapid on page 6828</a> <a href="#">ping hostname size count on page 6828</a>
Output Fields	When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping hostname

```
user@host> ping skye
PING skye.net (192.168.169.254): 56 data bytes

## Commands for Network Analytics

- [monitor start \(Analytics\)](#)
- [show analytics collector](#)

- `show analytics configuration`
- `show analytics queue-statistics`
- `show analytics status`
- `show analytics streaming-servers`
- `show analytics traffic-statistics`

## monitor start (Analytics)

**Syntax** `monitor start filename`

**Release Information** Command introduced in Junos OS Release 13.2 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.

**Description** Start the display of the queue statistics or traffic statistics file if you had enabled queue or traffic monitoring on your device. The output is displayed in the JavaScript Object Notation (JSON) format.

**NOTE:** This topic describes the local file output in Junos OS Release 13.2X50-D15 and 13.2X51-D10 only. For information about 13.2X51-D15 and later, see [“Understanding Enhanced Analytics Local File Output” on page 6506](#)

**Options** *filename*—Name of the queue statistics or traffic statistics file.

**Required Privilege Level** trace

**Related Documentation**

- [Network Analytics Overview on page 6490](#)
- [analytics on page 6667](#)

**List of Sample Output**

- [monitor start Using the Queue Statistics File \(Junos OS Release 13.2X51-D10\) on page 6831](#)
- [monitor start Using the Queue Statistics File \(Junos OS Release 13.2X50-D15\) on page 6832](#)
- [monitor start Using the Traffic Statistics File \(Junos OS Release 13.2X51-D10\) on page 6832](#)
- [monitor start Using the Traffic Statistics File \(Junos OS Release 13.2X50-D15\) on page 6832](#)

**Output Fields** [Table 646 on page 6830](#) describes the output fields for the **monitor start** command. Output fields are listed in the approximate order in which they appear.

**Table 646: monitor start Command Output Fields**

Field	Description
hostname (used in Junos OS Release 13.2X50-D15 only)	Name of the network analytics host device.
record type	Type of statistics. May be queue statistics or traffic statistics.
time	Time at which the statistics were captured.
router-id	ID of the network analytics host device.

Table 646: monitor start Command Output Fields (*continued*)

Field	Description
latency	For queue statistics only. Traffic queue latency in milliseconds.
port	Name of the physical port configured for network analytics.
queue depth	For queue statistics only. Depth of the traffic queue in bytes.
rxpkt	For traffic statistics monitoring only. Total packets received.
rxpps	For traffic statistics monitoring only. Total packets received per second.
rxbyte	For traffic statistics monitoring only. Total bytes received.
rxbps	For traffic statistics monitoring only. Total bytes received per second.
rxdrop	For traffic statistics monitoring only. Total incoming packets dropped.
rxerr	For traffic statistics monitoring only. Total packets with errors.
rxutil (in Junos OS Release 13.2X50-D15 only)	For traffic statistics monitoring only. Total percent of traffic utilization for incoming traffic.
txpkt	For traffic statistics monitoring only. Total packets transmitted.
txpps	For traffic statistics monitoring only. Total packets transmitted per second.
txbyte	For traffic statistics monitoring only. Total bytes transmitted.
txbps	For traffic statistics monitoring only. Total bytes transmitted per second.
txdrop	For traffic statistics monitoring only. Total transmitted bytes dropped.
txerr	For traffic statistics monitoring only. Total transmitted packets with errors (dropped).
txutil (in Junos OS Release 13.2X50-D15 only)	For traffic statistics monitoring only. Total percent of traffic utilization for outgoing traffic.

## Sample Output

### monitor start Using the Queue Statistics File (Junos OS Release 13.2X51-D10)

```

user@host> monitor start analytics.qs

## show analytics collector

**Syntax** show analytics collector

**Release Information** Command introduced in Junos OS Release 13.2 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.

**Description** Show the list of network analytics remote collectors and related information. Remote collectors can be configured to receive streaming output for queue statistics and traffic statistics from the network analytics process (Analyticsd) running on the Routing Engine.

**NOTE:** The `show analytics collector` command is not available in Junos OS Releases prior to 13.2X51-D15.

**Required Privilege Level** interface-control

**Related Documentation**

- [Network Analytics Overview on page 6490](#)
- [analytics on page 6667](#)
- *address (Analytics Collector)*

**List of Sample Output** [show analytics collector on page 6834](#)

**Output Fields** [Table 647 on page 6833](#) describes the output fields for the `show analytics collector` command.

**Table 647: show analytics collector Command Output Fields**

Field	Description
Address	IP Address of the collector that is configured for receiving the streaming data.
Port	Port number of the collector receiving the streaming data.
Transport	Transport protocol: <ul style="list-style-type: none"> <li>• tcp—Transmission Control Protocol</li> <li>• udp—User Datagram Protocol</li> </ul> <p><b>NOTE:</b> The connection state of a port configured with the <code>udp</code> transport protocol is always displayed as <code>n/a</code>.</p>
Stream format	Format of the data that is sent to the server: <ul style="list-style-type: none"> <li>• csv—Comma-separated values</li> <li>• gpb—Google Protocol Buffer</li> <li>• json—JavaScript Object Notation</li> <li>• tsv—Tab-separated values</li> </ul>

Table 647: show analytics collector Command Output Fields (*continued*)

Field	Description
State	Connection state of the streaming server.
Sent	Number of bytes sent to the streaming server.

## Sample Output

### show analytics collector

```
user@host> show analytics collector
Address      Port    Transport Stream format State      Sent
10.94.184.25 50013   udp      gpb        n/a       8710
10.94.184.25 50040   tcp      gpb        Not initialized 0
10.94.184.25 50050   tcp      gpb        Established 405
10.94.184.62 50010   tcp      csv        Established 18
10.94.184.62 50020   udp      json       n/a       17
```

## show analytics configuration

<b>Syntax</b>	show analytics configuration
<b>Release Information</b>	Command introduced in Junos OS Release 13.2 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.
<b>Description</b>	Show the network analytics configuration details for the global and interface configurations.
<b>Required Privilege Level</b>	interface-control
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Network Analytics Overview on page 6490</a></li> <li>• <a href="#">analytics on page 6667</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show analytics configuration (Junos OS Release 13.2X51-D15 and Later) on page 6838</a> <a href="#">show analytics configuration (Junos OS Release 13.2X51-D10 and Earlier) on page 6838</a>
<b>Output Fields</b>	describes the output fields for the <b>show analytics configuration</b> command in Junos OS Release 13.2X51-D15 and later.

**Table 648: show analytics configuration Command Output Fields (Junos OS Release 13.2X51-D15 and Later)**

Field	Descriptions
<b>Global Configurations</b>	
Traffic monitoring status	Settings are enabled or disabled. If traffic statistics monitoring is not enabled, this field is not shown.
Traffic monitoring polling interval	Interval for traffic statistics polling in seconds.  <b>NOTE:</b> Due to limitations and variations in hardware capability in different devices, there might be a difference in value between the actual interval and configured interval.
Queue monitoring status	Settings are enabled or disabled. If queue statistics monitoring is not enabled, this field is not shown.
Queue monitoring polling interval	Interval for queue statistics polling in milliseconds.  <b>NOTE:</b> Due to limitations and variations in hardware capability in different devices, there might be a difference in value between the actual interval and configured interval.
Queue depth high threshold	Upper limit of the depth threshold configuration in number of bytes.  If the queue depth threshold is not configured, this field is not shown.
Queue depth low threshold	Lower limit of the depth threshold configuration in number of bytes.  If the queue depth threshold is not configured, this field is not shown.

**Table 648: show analytics configuration Command Output Fields (Junos OS Release 13.2X51-D15 and Later) (continued)**

Field	Descriptions
Queue latency high threshold	Upper limit of the latency threshold configuration in nanoseconds.  If the queue latency threshold is not configured, this field is not shown.
Queue latency low threshold	Lower limit of the latency threshold configuration in microseconds.  If the queue latency threshold is not configured, this field is not shown.
<b>Interface Configurations</b>	
Interface	Name of interface that is configured for network analytics. The interface configuration overrides the global network analytics configuration.
Traffic Statistics	Settings are Enabled or Disabled for the interface.
Queue Statistics	Settings are Enabled or Disabled for the interface.
Queue depth threshold High	Upper limit of the depth threshold configuration in number of bytes.  If the queue depth threshold is not configured, <b>n/a</b> is displayed.
Queue depth threshold Low	Lower limit of the depth threshold configuration in number of bytes.  If the queue depth threshold is not configured, <b>n/a</b> is displayed.
Latency threshold High	Upper limit of the latency threshold configuration in nanoseconds.  If the latency threshold is not configured, <b>n/a</b> is displayed.
Latency threshold Low	Lower limit of the latency threshold configuration in nanoseconds.  If the latency threshold is not configured, <b>n/a</b> is displayed.

[Table 649 on page 6836](#) describes the output fields for the **show analytics configuration** command in Junos OS Release 13.2X51-D10 and 13.2X50-D15.

**Table 649: show analytics configuration Command Output Fields (Junos OS Release 13.2X51-D10 and earlier)**

Field	Descriptions
<b>Global Configurations</b>	
Traffic statistics	Settings are Auto, Enabled, or Disabled.  If <b>Auto</b> is displayed, traffic statistics monitoring is not enabled.

**Table 649: show analytics configuration Command Output Fields (Junos OS Release 13.2X51-D10 and earlier) (continued)**

Field	Descriptions
Poll interval (traffic statistics)	<p>Interval for traffic statistics polling in seconds.</p> <p>If the output displays a setting of 0 seconds, the polling interval was not configured, and the default interval applies.</p> <p><b>NOTE:</b> The default interval is 1 second in Junos OS Release 13.2X50-D15 and later, except for EX4300 switches, on which the default interval is 5 seconds, and 2 seconds in Junos OS Release 13.2X51-D10.</p> <p><b>NOTE:</b> Due to limitations and variations in hardware capability in different devices, there might be a difference in value between the actual interval and configured interval.</p>
Queue statistics	<p>Settings are Auto, Enabled, or Disabled.</p> <p>If <b>Auto</b> is displayed, queue statistics monitoring is not enabled.</p>
Poll interval (queue statistics)	<p>Interval for queue statistics polling in milliseconds.</p> <p><b>NOTE:</b> The default interval is 8 milliseconds in Junos OS Release 13.2X50-D15 and later, and 10 milliseconds in Junos OS Release 13.2X51-D10 or later.</p> <p><b>NOTE:</b> Due to limitations and variations in hardware capability in different devices, there might be a difference in value between the actual interval and configured interval.</p>
Depth threshold high	<p>Upper limit of the depth threshold configuration in number of bytes.</p> <p>If <b>0</b> is displayed, depth threshold is not enabled.</p>
Depth threshold low	<p>Lower limit of the depth threshold configuration in number of bytes.</p> <p>If <b>0</b> is displayed, depth threshold is not enabled.</p>
Latency threshold high	<p>Upper limit of the latency threshold configuration in microseconds.</p> <p>If <b>0</b> is displayed, latency threshold is not enabled.</p>
Latency threshold low	<p>Lower limit of the latency threshold configuration in microseconds.</p> <p>If <b>0</b> is displayed, latency threshold is not enabled.</p>
<b>Interface Configurations</b>	
Interface	Name of interface that is configured for network analytics. The interface configuration overrides the global network analytics configuration.
Traffic Statistics	Settings are Enabled or Disabled for the interface.
Queue Statistics	Settings are Enabled or Disabled for the interface.
Depth-threshold High	<p>Upper limit of the depth threshold configuration in number of bytes.</p> <p>If <b>0</b> is displayed, depth threshold is not enabled.</p>

Table 649: show analytics configuration Command Output Fields (Junos OS Release 13.2X51-D10 and earlier) (continued)

Field	Descriptions
Depth-threshold Low	Lower limit of the depth threshold configuration in number of bytes.  If 0 is displayed, depth threshold is not enabled.
Latency-threshold High	Upper limit of the latency threshold configuration in microseconds.  If 0 is displayed, latency threshold is not enabled.
Latency-threshold Low	Lower limit of the latency threshold configuration in microseconds.  If 0 is displayed, latency threshold is not enabled.

## Sample Output

### show analytics configuration (Junos OS Release 13.2X51-D15 and Later)

```
user@host> show analytics configuration
Traffic monitoring status is enabled
Traffic monitoring polling interval : 5 seconds
Queue monitoring status is enabled
Queue monitoring polling interval : 1000 milliseconds
Queue depth high threshold : 99999 bytes
Queue depth low threshold : 99 bytes
```

Interface	Traffic Statistics	Queue Statistics	Queue depth threshold		Latency threshold	
			High (bytes)	Low	High (nanoseconds)	Low
xe-0/0/16	enabled	enabled	n/a	n/a	2300	20
xe-0/0/18	enabled	enabled	n/a	n/a	2300	20
xe-0/0/19	enabled	enabled	n/a	n/a	2300	20

### show analytics configuration (Junos OS Release 13.2X51-D10 and Earlier)

```
user@host> show analytics configuration
Global configurations:
  Traffic statistics: Enabled, Poll interval: 2 seconds
  Queue statistics: Auto, Poll interval: 10 milliseconds
  Depth threshold high: 0 bytes, low: 0 bytes
  Latency threshold high: 0 microseconds, low: 0 microseconds
```

Interface	Traffic Statistics	Queue Statistics	Depth-threshold		Latency-threshold	
			High (bytes)	Low	High (microseconds)	Low
xe-0/0/0	Auto	Auto	204800	10	0	0

## show analytics queue-statistics

<b>Syntax</b>	<code>show analytics queue-statistics</code> <code>&lt;interface <i>interface-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 13.2 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.
<b>Description</b>	Show the queue statistics (queue length and latency) that are collected for all interfaces that are enabled for network analytics on a device. Optionally, if you wish to see the queue statistics for one interface only, you may specify the interface.
<b>Options</b>	<code>interface <i>interface-name</i></code> —(Optional) Display the queue statistics for the specified interface only.
<b>Required Privilege Level</b>	interface-control
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Network Analytics Overview on page 6490</a></li> <li>• <a href="#">analytics on page 6667</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show analytics queue-statistics (Junos OS Release 13.2X51-D15 and Later) on page 6839</a> <a href="#">show analytics queue-statistics (Junos OS Release 13.2X51-D10) on page 6840</a> <a href="#">show analytics queue-statistics (Junos OS Release 13.2X50-D15) on page 6840</a>
<b>Output Fields</b>	<a href="#">Table 610 on page 6507</a> describes the output fields for the <code>show analytics queue-statistics</code> command.

Table 650: show analytics queue-statistics Command Output Fields

Field	Description
Time	Date and time at which the queue statistics are collected.
Interface	Name of the interface at which the queue statistics are collected.
Queue-length or queue-depth (bytes)	Queue depth (length) in number of bytes.
Latency	Queue depth in nanoseconds (Junos OS Release 13.2X51-D15 and later) or microseconds (Junos OS Release 13.2X51-D10 and earlier).

## Sample Output

### show analytics queue-statistics (Junos OS Release 13.2X51-D15 and Later)

```

user@host> show analytics queue-statistics
CLI issued at 2014-01-07 17:20:29.978561

## show analytics status

<b>Syntax</b>	show analytics status <global>
<b>Release Information</b>	Command introduced in Junos OS Release 13.2 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.
<b>Description</b>	Show the status of the network analytics components that are configured on a device.
<b>Options</b>	<b>none</b> —Show the global and interface status for network analytics.  <b>global</b> —Show the global status only for network analytics.
<div>  <p><b>NOTE:</b> The <b>global</b> option is not available in Junos OS Releases prior to 13.2X51-D15.</p> </div>	
<b>Required Privilege Level</b>	interface-control
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Network Analytics Overview on page 6490</a></li> <li>• <a href="#">analytics on page 6667</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show analytics status (Junos OS Release 13.2X51-D15 or Later) on page 6843</a> <a href="#">show analytics status global (Junos OS Release 13.2X51-D15 or Later) on page 6843</a> <a href="#">show analytics status (Junos OS Release 13.2X50-D15 and 13.2X51-D10) on page 6843</a>
<b>Output Fields</b>	<a href="#">Table 651 on page 6841</a> describes the output fields for the <b>show analytics status</b> command.

**Table 651: show analytics status Command Output Fields**

Field	Descriptions
<b>Global Configurations</b>	
Traffic statistics or Traffic monitoring status	<p>Settings are Auto, Enabled, or Disabled.</p> <p>If <b>Auto</b> is displayed, traffic statistics monitoring is not enabled.</p> <p><b>NOTE:</b> The Disabled setting always supersedes the Enabled setting.</p>
Poll interval or Traffic monitoring polling interval	<p>Interval for traffic statistics polling in seconds.</p> <p><b>NOTE:</b> Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.</p>

Table 651: show analytics status Command Output Fields (*continued*)

Field	Descriptions
Queue statistics or Queue monitoring status	<p>Can be Auto, Enabled, or Disabled.</p> <p>If <b>Auto</b> is displayed, queue statistics monitoring is not enabled.</p> <p><b>NOTE:</b> The Disabled setting always supersedes the Enabled setting.</p>
Poll interval or Queue monitoring polling interval	<p>Interval for queue statistics polling in milliseconds.</p> <p><b>NOTE:</b> Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.</p>
Depth threshold high or Queue depth high threshold	<p>Upper limit of the depth threshold configuration in number of bytes.</p> <p>In Junos OS Release 13.2X51-D15 or later, if this parameter is not configured, this field is not shown.</p> <p>In Junos OS Release 13.2X51-D10 or earlier, if this parameter is not configured, a value of <b>0</b> is displayed.</p>
Depth threshold low or Queue depth low threshold	<p>Lower limit of the depth threshold configuration in number of bytes.</p> <p>In Junos OS Release 13.2X51-D15 or later, if this parameter is not configured, this field is not shown.</p> <p>In Junos OS Release 13.2X51-D10 or earlier, if this parameter is not configured, a value of <b>0</b> is displayed.</p>
Latency threshold high	<p>Upper limit of the latency threshold configuration in microseconds.</p> <p>In Junos OS Release 13.2X51-D15 or later, if this parameter is not configured, this field is not shown.</p> <p>In Junos OS Release 13.2X51-D10 or earlier, if this parameter is not configured, a value of <b>0</b> is displayed.</p>
Latency threshold low	<p>Lower limit of the latency threshold configuration in microseconds.</p> <p>In Junos OS Release 13.2X51-D15 or later, if this parameter is not configured, this field is not shown.</p> <p>In Junos OS Release 13.2X51-D10 or earlier, if this parameter is not configured, a value of <b>0</b> is displayed.</p>
<b>Interface Configurations</b>	
Interface	Name of an interface that is configured for network analytics. The interface configuration overrides the global network analytics configuration.
Traffic Statistics	<p>Settings are Enabled or Disabled for the interface.</p> <p><b>NOTE:</b> The Disabled setting always supersedes the Enabled setting.</p>
Queue Statistics	<p>Settings are Enabled or Disabled for the interface.</p> <p><b>NOTE:</b> The Disabled setting always supersedes the Enabled setting.</p>

Table 651: show analytics status Command Output Fields (*continued*)

Field	Descriptions
Depth-threshold High or Queue depth threshold high	Upper limit of the depth threshold configuration in number of bytes.  If this parameter is not configured, an output of <b>n/a</b> or <b>0</b> is displayed in this column, depending on the software release.
Depth-threshold Low or Queue depth threshold low	Lower limit of the depth threshold configuration in number of bytes.  If this parameter is not configured, an output of <b>n/a</b> or <b>0</b> is displayed in this column, depending on the software release.
Latency-threshold High	Upper limit of the latency threshold configuration in nanoseconds or microseconds.  If this parameter is not configured, an output of <b>n/a</b> or <b>0</b> is displayed in this column, depending on the software release.
Latency-threshold Low	Lower limit of the latency threshold configuration in nanoseconds or microseconds.  If this parameter is not configured, an output of <b>n/a</b> or <b>0</b> is displayed in this column, depending on the software release.

## Sample Output

### show analytics status (Junos OS Release 13.2X51-D15 or Later)

```

user@host> show analytics status
Traffic monitoring status is auto
Traffic monitoring polling interval : 5 seconds
Queue monitoring status is enabled
Queue monitoring status polling interval : 1000 milliseconds
Queue depth high threshold : 1000000000 bytes
Queue depth low threshold : 99 bytes

```

Interface	Traffic Statistics	Queue Statistics	Queue depth threshold		Latency threshold	
			High (bytes)	Low	High (nanoseconds)	Low
xe-0/0/16	enabled	enabled	1000000000	99	n/a	n/a
xe-0/0/18	disabled	enabled	1000000000	99	n/a	n/a
xe-0/0/19	enabled	enabled	1000000000	99	n/a	n/a

### show analytics status global (Junos OS Release 13.2X51-D15 or Later)

```

user@host> show analytics status global

Traffic monitoring status is auto
Traffic monitoring polling interval : 5 seconds
Queue monitoring status is enabled
Queue monitoring status polling interval : 1000 milliseconds
Queue depth high threshold : 1000000000 bytes
Queue depth low threshold : 99 bytes

```

### show analytics status (Junos OS Release 13.2X50-D15 and 13.2X51-D10)

```

user@host> show analytics status

```

## Global configurations:

Traffic statistics: Auto, Poll interval: 2 seconds

Queue statistics: Auto, Poll interval: 10 milliseconds

Depth threshold high: 0 bytes, low: 0 bytes

Latency threshold high: 1000 microseconds, low: 50 microseconds

Interface	Traffic Statistics	Queue Statistics	Depth-threshold		Latency-threshold	
			High	Low	High	Low
			(bytes)		(microseconds)	
xe-0/0/6	Enabled	Enabled	0	0	1000	50
xe-0/0/7	Enabled	Enabled	204800	10	0	0
xe-0/0/8	Enabled	Enabled	0	0	1000	50

## show analytics streaming-servers

**Syntax** show analytics streaming-servers

**Release Information** Command introduced in Junos OS Release 13.2 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.

**Description** Show the list of streaming servers that are configured for network analytics. Streaming servers receive streaming output for queue statistics and traffic statistics from the network analytics process (Analyticsd) running on the Routing Engine.

**NOTE:** The show analytics streaming-servers command is available in Junos OS Release 13.2X50-D15 and 13.2X51-D10 only.

**Required Privilege Level** interface-control

**Related Documentation**

- [show analytics collector on page 6833](#)

**List of Sample Output** [show analytics streaming-servers on page 6846](#)

**Output Fields** [Table 652 on page 6845](#) describes the output fields for the **show analytics streaming-servers** command.

**Table 652: show analytics streaming-servers Command Output Fields**

Field	Description
Address	IP Address of the streaming server that is configured for receiving the streaming data.
Port	Port number of the streaming server receiving the streaming data.
Stream-Format	Format of the data that is sent to the server. Values are: <ul style="list-style-type: none"> <li>• csv—Comma-separated values.</li> <li>• json—JavaScript Object Notification.</li> <li>• tsv—Tab-separated values.</li> </ul>
Stream-Type	Type of data that is sent to the a port on the streaming server: <ul style="list-style-type: none"> <li>• QS—Queue statistics.</li> <li>• TS—Traffic statistics.</li> </ul>
State	Connection state of the streaming server.
Sent	Number of bytes sent to the streaming server.

## Sample Output

### show analytics streaming-servers

```
user@host> show analytics streaming-servers
```

Address	Port	Stream-Format	Stream-Type	State	Sent
10.94.198.14	50001	json	QS	Established	0
10.94.198.14	50005	csv	TS	Established	1185

## show analytics traffic-statistics

<b>Syntax</b>	<code>show analytics traffic-statistics</code> <code>&lt;interface <i>interface-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 13.2 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D25 for EX Series switches.
<b>Description</b>	Show the traffic statistics that are collected for all interfaces that are enabled for network analytics on a device. Optionally, if you wish to see the traffic statistics for one interface only, you may specify the interface.
<b>Options</b>	<code>interface <i>interface-name</i></code> —(Optional) Display the traffic statistics for the specified interface only.
<b>Required Privilege Level</b>	interface-control
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Network Analytics Overview on page 6490</a></li> <li>• <a href="#">analytics on page 6667</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show analytics traffic-statistics (Junos OS Release 13.2X51-D15 or Later) on page 6848</a> <a href="#">show analytics traffic-statistics (Junos OS Release 13.2X51-D10) on page 6848</a> <a href="#">show analytics traffic-statistics (Junos OS Release 13.2X50-D15) on page 6848</a>
<b>Output Fields</b>	<a href="#">Table 653 on page 6847</a> describes the output fields for the <code>show analytics traffic-statistics</code> command.

**Table 653: show analytics traffic-statistics Command Output Fields**

Field	Description
Time	The date and time at which the traffic statistics are generated.
Physical interface	Name of the interface at which the traffic statistics are collected.
Total octets	Total number of octets that are received and transmitted.
Total packets	Total number of packets that are received and transmitted.
Octets per second	Number of octets received and transmitted per second.
Packet per second	Number of packets received and transmitted per second.
CRC/Align errors or Octets dropped	Number of cyclic redundancy check (CRC) errors or octets dropped. <ul style="list-style-type: none"> <li>• Junos OS Release 13.2X51-D15 or later—Number of cyclic redundancy check (CRC) errors.</li> <li>• Junos OS Release 13.2X51-D10 and earlier—Number of octets dropped.</li> </ul>
Packets dropped	Number of packets dropped.

## Sample Output

### show analytics traffic-statistics (Junos OS Release 13.2X51-D15 or Later)

```

user@host> show analytics traffic-statistics
CLI issued at 2014-01-07 17:22:28.952677
Time: 00:00:03.480244 ago, Physical interface: xe-0/0/19
Traffic Statistics:

## Commands for sFlow Technology

---

- `clear sflow collector statistics`
- `show sflow`
- `show sflow collector`
- `show sflow interface`

## clear sflow collector statistics

---

**Syntax** clear sflow collector statistics

**Release Information** Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Clear the sample counters for all sFlow collectors.

**Required Privilege Level** view

**Related Documentation**

- [Example: Monitoring Network Traffic Using sFlow Technology on page 6571](#)
- [Configuring sFlow Technology on page 6596](#)
- [show sflow collector on page 6853](#)

**List of Sample Output** [clear sflow collector statistics on page 6850](#)

### Sample Output

#### clear sflow collector statistics

The following example shows two output examples for the **show sflow collector** command, one before and one after the **clear sflow collector statistics** command was issued.

```
user@host> show sflow collector
Collector      Udp-port      No. of samples
address
10.1.1.1       6343          3174
10.1.2.1       6343          3562
```

```
user@host> clear sflow collector statistics
```

```
user@host> show sflow collector
Collector      Udp-port      No. of samples
address
10.1.1.1       6343          0
10.1.2.1       6343          0
```

## show sflow

<b>Syntax</b>	show sflow <collector> <interface>
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display sFlow configuration information.
<b>Options</b>	<p><b>none</b>—Display all sFlow configuration information.</p> <p><b>collector</b>—(Optional) Display a list of configured sFlow collectors and their properties.</p> <p><b>interface</b>—(Optional) Display the interfaces on which sFlow technology is enabled and the sampling parameters.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show sflow interface on page 6854</a></li> <li>• <a href="#">show sflow collector on page 6853</a></li> <li>• <a href="#">clear sflow collector statistics on page 6850</a></li> <li>• <a href="#">Example: Monitoring Network Traffic Using sFlow Technology on page 6571</a></li> <li>• <a href="#">Configuring sFlow Technology on page 6596</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show sflow on page 6852</a>
<b>Output Fields</b>	<a href="#">Table 654 on page 6851</a> lists the output fields for the <b>show sflow</b> command. Output fields are listed in the approximate order in which they appear.

**Table 654: show sflow Output Fields**

Field Name	Field Description	Level of Output
sFlow	Status of the feature: <b>Enabled</b> or <b>Disabled</b> .	All levels
Sample limit	Number of packets sampled per second. This sample limit cannot be configured and is set to 300 packets per second.	All levels
Polling interval	Interval at which the sFlow agent polls the interface.	All levels
Sample rate egress	Rate at which egress packets are sampled.	All levels
Sample rate ingress	Rate at which ingress packets are sampled.	All levels
Agent ID	IP address assigned to the sFlow agent.	All levels
Source IP address	Source IP address for the sFlow packets.	All levels

## Sample Output

show sflow

```
user@host> show sflow
```

```
sFlow           : Enabled
Sample limit    : 300 packets/second
Polling interval : 20 second
Sample rate egress : 1:2048: Disabled
Sample rate ingress : 1:1000: Enabled
Agent ID        : 10.93.54.7
Source IP address : 10.93.54.7
```

## show sflow collector

<b>Syntax</b>	show sflow collector
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display a list of configured sFlow collectors and their properties.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear sflow collector statistics on page 6850</a></li> <li>• <a href="#">show sflow on page 6851</a></li> <li>• <a href="#">show sflow interface on page 6854</a></li> <li>• <a href="#">Example: Monitoring Network Traffic Using sFlow Technology on page 6571</a></li> <li>• <a href="#">Configuring sFlow Technology on page 6596</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show sflow collector on page 6853</a>
<b>Output Fields</b>	<a href="#">Table 655 on page 6853</a> lists the output fields for the <b>show sflow collector</b> command. Output fields are listed in the approximate order in which they appear.

**Table 655: show sflow collector Output Fields**

Field Name	Field Description	Level of Output
Collector address	IP address of the collector.	All levels
UDP-Port	UDP port number of the collector.	All levels
No. of samples	Number of samples collected.	All levels

## Sample Output

### show sflow collector

```

user@host> show sflow collector

Collector      Udp-port    No. of samples
address
10.204.32.46   6343        1000
100.204.32.76 3400        1000

```

## show sflow interface

<b>Syntax</b>	show sflow interface
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display the interfaces on which sFlow is enabled and the sampling parameters for the interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show sflow on page 6851</a></li> <li>• <a href="#">show sflow collector on page 6853</a></li> <li>• <a href="#">Example: Monitoring Network Traffic Using sFlow Technology on page 6571</a></li> <li>• <a href="#">Configuring sFlow Technology on page 6596</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show sflow interface (QFX3500 Switch in Standalone Mode) on page 6854</a> <a href="#">show sflow interface (QFabric System) on page 6855</a>
<b>Output Fields</b>	Table 656 on page 6854 lists the output fields for the <b>show sflow interface</b> command. Output fields are listed in the approximate order in which they appear.

Table 656: show sflow interface Output Fields

Field Name	Field Description	Level of Output
Interface	Interface on which sFlow technology is enabled.	All levels
Status Egress	Indicates whether an egress sample rate is enabled.	All levels
Status Ingress	Indicates whether an ingress sample rate is enabled.	All levels
Sample rate Egress	Rate at which egress packets are sampled.	All levels
Sample rate Ingress	Rate at which ingress packets are sampled.	All levels
Adapted sample rate Egress	Adapted rate at which egress packets are sampled.	All levels
Adapted sample rate Ingress	Adapted rate at which ingress packets are sampled.	All levels
Polling-interval	Interval at which the sFlow agent polls the interface.	All levels

## Sample Output

### show sflow interface (QFX3500 Switch in Standalone Mode)

```
user@host> show sflow interface
```

Interface	Status	Sample rate		Adapted sample rate		Polling-interval	
		Egress	Ingress	Egress	Ingress		
xe-0/0/0.0	Enabled	Disabled	1000	2048	1000	2048	20
xe-1/0/1.0	Enabled	Disabled	1000	2048	1000	2048	20

## Sample Output

### show sflow interface (QFabric System)

```

user@host> show sflow interface
Interface  Status      Sample rate    Adapted sample rate  Polling-interval
           Egress Ingress  Egress Ingress  Egress Ingress
node1:xe-0/0/0.0  Enabled Disabled 1000 2048 1000 2048 20
node2:xe-1/0/1.0  Enabled Disabled 1000 2048 1000 2048 20
node4:xe-1/0/0.0  Enabled Disabled 1000 2048 1000 2048 20

```

## Commands for SNMP

- clear snmp history
- clear snmp statistics
- request snmp spoof-trap
- request snmp utility-mib clear instance
- request snmp utility-mib set instance
- show snmp health-monitor
- show snmp inform-statistics
- show snmp mib
- show snmp rmon
- show snmp rmon history
- show snmp statistics
- show snmp v3

## clear snmp history

---

**Syntax**    clear snmp history (*index* | all)

**Release Information**    Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Delete the samples of Ethernet statistics collected for a history group.

**Options**    all—Clear all the entries in the history index.

*index*—Clear the contents of the specified entry in the history index.

**Required Privilege Level**    clear

**Related Documentation**    • [clear snmp statistics on page 6857](#)

## clear snmp statistics

<b>Syntax</b>	clear snmp statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear Simple Network Management Protocol (SNMP) statistics.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show snmp statistics on page 1503</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear snmp statistics on page 6857</a>
<b>Output Fields</b>	See <a href="#">show snmp statistics</a> for an explanation of output fields.

## Sample Output

### clear snmp statistics

In the following example, SNMP statistics are displayed before and after the **clear snmp statistics** command is issued:

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 8, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 8, Total set varbinds: 0,
    Get requests: 0, Get nexts: 8, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops 0
  Output:
    Packets: 2298, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 8, Traps: 2290
```

```
user@host> clear snmp statistics
```

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
```

```
Total request varbinds: 0, Total set varbinds: 0,  
Get requests: 0, Get nexts: 0, Set requests: 0,  
Get responses: 0, Traps: 0,  
Silent drops: 0, Proxy drops 0  
Output:  
Packets: 0, Too bigs: 0, No such names: 0,  
Bad values: 0, General errors: 0,  
Get requests: 0, Get nexts: 0, Set requests: 0,  
Get responses: 0, Traps: 0
```

## request snmp spoof-trap

<b>Syntax</b>	<b>request snmp spoof-trap</b> <b>&lt;trap&gt; variable-bindings &lt;object&gt; &lt;instance&gt; &lt;value&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 8.2. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Spoof (mimic) the behavior of a Simple Network Management Protocol (SNMP) trap.
<b>Options</b>	<p><b>&lt;trap&gt;</b>—Name of the trap to spoof.</p> <p><b>variable-bindings &lt;object&gt; &lt;instance&gt; &lt;value&gt;</b>—(Optional) List of variables and values to include in the trap. Each variable binding is specified as an object name, the object instance, and the value (for example, <b>ifIndex[14] = 14</b>). Enclose the list of variable bindings in quotation marks ( " ") and use a comma to separate each object name, instance, and value definition (for example, <b>variable-bindings "ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2"</b>). Objects included in the trap definition that do not have instances and values specified as part of the command are included in the trap and spoofed with automatically generated instances and values.</p> <p><b>&lt;dummy name&gt;</b>—A dummy trap name to display the list of available traps.</p> <p><b>Question mark (?)</b>—Question mark? to display possible completions.</p>
<b>Required Privilege Level</b>	request
<b>List of Sample Output</b>	<a href="#">request snmp spoof-trap (with Variable Bindings) on page 6859</a> <a href="#">request snmp spoof-trap (Illegal Trap Name) on page 6859</a> <a href="#">request snmp spoof-trap (Question Mark ?) on page 6863</a>

## Sample Output

### request snmp spoof-trap (with Variable Bindings)

```
user@host> request snmp spoof-trap linkUp variable-bindings "ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2"
Spoof trap request result: trap sent successfully
```

### request snmp spoof-trap (Illegal Trap Name)

```
user@host> request snmp spoof-trap xx
Spoof trap request result: trap not found
```

## request snmp utility-mib clear instance

---

<b>Syntax</b>	request snmp utility-mib clear instance <i>name</i> object-type <i>type</i>
<b>Release Information</b>	Command introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	Clear the data stored in the specified container object in the SNMP Utility MIB.
<b>Options</b>	<p><b><i>name</i></b>—Name of the SNMP instance that is used to identify the data stored in the container object.</p> <p><b>object-type <i>type</i></b>—Type of container object in which the data is stored. The following container object types are supported:</p> <ul style="list-style-type: none"><li>• <b>counter</b>—Stores a 32-bit counter value.</li><li>• <b>counter64</b>—Stores a 64-bit counter value.</li><li>• <b>integer</b>—Stores a 32-bit signed integer value.</li><li>• <b>unsigned-integer</b>—Stores a 32-bit unsigned integer value.</li></ul>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Utility MIB on page 6522</a></li><li>• <a href="#">Understanding the Implementation of SNMP on the QFabric System on page 6516</a></li><li>• <a href="#">request snmp utility-mib set instance on page 6866</a></li></ul>

## request snmp utility-mib set instance

---

<b>Syntax</b>	<code>request snmp utility-mib set instance <i>name</i></code> <code>object-type <i>type</i></code> <code>object-value <i>value</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	Store data in the specified container object in the SNMP Utility MIB. The data may be retrieved by SNMP operations.
<b>Options</b>	<p><b><i>name</i></b>—Name of the SNMP instance that is used to identify the data stored in the container object.</p> <p><b><i>object-type type</i></b>—Type of container object in which to store data. The following container object types are supported:</p> <ul style="list-style-type: none"><li>• <b>counter</b>—Stores a 32-bit counter value.</li><li>• <b>counter64</b>—Stores a 64-bit counter value.</li><li>• <b>integer</b>—Stores a 32-bit signed integer value.</li><li>• <b>unsigned-integer</b>—Stores a 32-bit unsigned integer value.</li><li>• <b>string</b>—Stores an octet string value.</li></ul> <p><b><i>object-value value</i></b>—Data that is stored in the container object.</p>
<b>Required Privilege Level</b>	request
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Utility MIB on page 6522</a></li><li>• <a href="#">Understanding the Implementation of SNMP on the QFabric System on page 6516</a></li><li>• <a href="#">request snmp utility-mib clear instance on page 6865</a></li></ul>

## show snmp health-monitor

<b>Syntax</b>	show snmp health-monitor <alarms (brief   detail)   logs>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about Simple Network Management Protocol (SNMP) health monitor alarms and logs.
<b>Options</b>	<p><b>none</b>—Display information about all health monitor alarms and logs.</p> <p><b>alarms (brief   detail)</b>—(Optional) Display information about health monitor alarms. Optionally, specify brief or detailed information about the alarms.</p> <p><b>logs</b>—(Optional) Display information about health monitor logs.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Health Monitoring on page 6529</a></li> <li>• <a href="#">Configuring Health Monitoring on page 6609</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show snmp health-monitor on page 6869</a></p> <p><a href="#">show snmp health-monitor alarms detail on page 6869</a></p>
<b>Output Fields</b>	Table 657 on page 6867 describes the output fields for the <b>show snmp health-monitor</b> command. Output fields are listed in the approximate order in which they appear.

**Table 657: show snmp health-monitor Output Fields**

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels
Variable description	Description of the health monitor object instance being monitored.	All levels
Variable name	Name of the health monitor object instance being monitored.	All levels
Value	Current value of the monitored variable in the most recent sample interval.	All levels

Table 657: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	<p>State of the alarm or event entry:</p> <ul style="list-style-type: none"> <li>Alarms: <ul style="list-style-type: none"> <li>active—Entry is fully configured and activated.</li> <li>falling threshold crossed—Value of the variable has crossed the lower threshold limit.</li> <li>rising threshold crossed—Value of the variable has crossed the upper threshold limit.</li> <li>under creation—Entry is being configured and is not yet activated.</li> <li>startup—Alarm is waiting for the first sample of the monitored variable.</li> <li>object not available—Monitored variable of that type is not available to the health monitor agent.</li> <li>instance not available—Monitored variable's instance is not available to the health monitor agent.</li> <li>object type invalid—Monitored variable is not a numeric value.</li> <li>object processing errored—An error occurred when the monitored variable was processed.</li> <li>unknown—State is not one of the above.</li> </ul> </li> </ul>	All levels
Variable OID	Object ID to which the variable name is resolved. The format is x.x.x.x.	detail
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value <i>absolute value</i> or <i>delta value</i> .	detail
Startup alarm	<p>Alarm that might be sent when this entry is first activated, depending on the following criteria:</p> <ul style="list-style-type: none"> <li>Alarm is sent when one of the following situations exists: <ul style="list-style-type: none"> <li>Value of the alarm is above or equal to the rising threshold and the startup type is either rising alarm or rising or falling alarm. <i>falling alarm</i></li> <li>Value of the alarm is below or equal to the falling threshold and the startup type is either <i>falling alarm</i> or <i>rising or falling alarm</i>.</li> </ul> </li> <li>Alarm is <i>not</i> sent when one of the following situations exists: <ul style="list-style-type: none"> <li>Value of the alarm is above or equal to the rising threshold and the startup type is <i>falling alarm</i>.</li> <li>Value of the alarm is below or equal to the falling threshold and the startup type is <i>rising alarm</i>.</li> <li>Value of the alarm is between the thresholds.</li> </ul> </li> </ul>	detail
Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has <b>monitor</b> prepended to it.	detail
Creator	Mechanism by which the entry was configured (Health Monitor).	detail
Sample interval	Time period between samples (in seconds).	detail
Rising threshold	Upper limit threshold value as a percentage of the maximum possible value.	detail

Table 657: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description	Level of Output
Falling threshold	Lower limit threshold value as a percentage of the maximum possible value.	detail
Rising event index	Index number of the event triggered when the rising threshold is crossed.	detail
Falling event index	Index number of the event triggered when the falling threshold is crossed. Details include the value of the falling event instance and the state of the falling event instance.	detail

## Sample Output

### show snmp health-monitor

```

user@switch> show snmp health-monitor

Alarm
Index  Variable description                                Value State
-----
32768  Health Monitor: root file system utilization
      jnxHrStoragePercentUsed.1                          59 active

32769  Health Monitor: /config file system utilization
      jnxHrStoragePercentUsed.2                          0 active

32770  Health Monitor: RE 0 CPU utilization
      jnxOperatingCPU.9.1.0.0                            9 falling threshold

32772  Health Monitor: RE 0 memory utilization
      jnxOperatingBuffer.9.1.0.0                         23 active

32774  Health Monitor: Max Kernel Memory Used (%)
      jnxBoxKernelMemoryUsedPercent.0                    3 active
Event Index: 32768
Description: Health Monitor: RE 0 CPU utilization crossed falling threshold
70 (value: 5), (variable: jnxOperatingCPU.9.1.0.0)
Time: 2011-01-09 19:18:35 PST

```

### show snmp health-monitor alarms detail

```

user@switch> show snmp health-monitor alarms detail

Alarm Index 32768:

Falling event index	32768
Instance Value:	3
Instance State:	active

## show snmp inform-statistics

<b>Syntax</b>	show snmp inform-statistics
<b>Release Information</b>	Command introduced in Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about Simple Network Management Protocol (SNMP) inform requests.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show snmp inform-statistics on page 6872</a>
<b>Output Fields</b>	<a href="#">Table 658 on page 6872</a> describes the output fields for the <b>show snmp inform-statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 658: show snmp inform-statistics Output Fields**

Field Name	Field Description
<b>Target Name</b>	Name of the device configured to receive and respond to SNMP informs.
<b>Address</b>	IP address of the target device.
<b>Sent</b>	Number of informs sent to the target device and acknowledged by the target device.
<b>Pending</b>	Number of informs held in memory pending a response from the target device.
<b>Discarded</b>	Number of informs discarded after the specified number of retransmissions to the target device were attempted.
<b>Timeouts</b>	Number of informs that did not receive an acknowledgement from the target device within the timeout specified.
<b>Probe Failures</b>	Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address).

## Sample Output

### show snmp inform-statistics

```

user@host> show snmp inform-statistics
Inform Request Statistics:
  Target Name: TA1_v3_md5_none Address: 172.17.20.184
    Sent: 176, Pending: 0
    Discarded: 0, Timeouts: 0, Probe Failures: 0
  Target Name: TA2_v3_sha_none Address: 192.168.110.59

```

Sent: 0, Pending: 4  
Discarded: 84, Timeouts: 0, Probe Failures: 258  
Target Name: TA5\_v2\_none Address: 172.17.20.184  
Sent: 0, Pending: 0  
Discarded: 2, Timeouts: 10, Probe Failures: 0

## show snmp mib

---

<b>Syntax</b>	<code>show snmp mib (get   get-next   walk) (ascii   decimal) <i>object-id</i></code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>ascii</b> and <b>decimal</b> options introduced in Junos OS Release 9.6.</p> <p><b>ascii</b> and <b>decimal</b> options introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.
<b>Options</b>	<p><b>get</b>—Retrieve and display one or more SNMP object values.</p> <p><b>get-next</b>—Retrieve and display the next SNMP object values.</p> <p><b>walk</b>—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.</p> <p><b>ascii</b>—Display the SNMP object's string indices as an ASCII-key representation.</p> <p><b>decimal</b>—Display the SNMP object values in the decimal (default) format. The <b>decimal</b> option is the default option for this command. Therefore, issuing the <b>show snmp mib (get   get-next   walk) decimal object-id</b> and the <b>show snmp mib (get   get-next   walk) object-id</b> commands display the same output.</p> <p><b>object-id</b>—The object can be represented by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as <b>interfaces</b>). When entering multiple objects, enclose the objects in quotation marks.</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration.
<b>List of Sample Output</b>	<p><a href="#">show snmp mib get on page 6875</a></p> <p><a href="#">show snmp mib get (Multiple Objects) on page 6875</a></p> <p><a href="#">show snmp mib get (Layer 2 Policer) on page 6875</a></p> <p><a href="#">show snmp mib get-next on page 6875</a></p> <p><a href="#">show snmp mib get-next (Specify an OID) on page 6875</a></p> <p><a href="#">show snmp mib walk on page 6875</a></p> <p><a href="#">show snmp mib walk (QFX Series) on page 6875</a></p> <p><a href="#">show snmp mib walk decimal on page 6876</a></p> <p><a href="#">show snmp mib walk (ASCII) on page 6876</a></p> <p><a href="#">show snmp mib walk (Multiple Indices) on page 6876</a></p> <p><a href="#">show snmp mib walk decimal (Multiple Indices) on page 6876</a></p>
<b>Output Fields</b>	<p>Table 659 on page 6875 describes the output fields for the <b>show snmp mib</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 659: show snmp mib Output Fields

Field Name	Field Description
<i>name</i>	Object name and numeric instance value.
<i>object value</i>	Object value. The Junos OS translates OIDs into the corresponding object names.

## Sample Output

### show snmp mib get

```
user@host> show snmp mib get sysObjectID.0
sysObjectID.0 = jnxProductNameM20
```

Table 660: show snmp rmon Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>State</b>	<p>State of the alarm or event entry:</p> <p>Alarms:</p> <ul style="list-style-type: none"> <li>• <b>active</b>—Entry is fully configured and activated.</li> <li>• <b>falling threshold crossed</b>—Value of the variable has crossed the lower threshold limit.</li> <li>• <b>rising threshold crossed</b>—Value of the variable has crossed the upper threshold limit.</li> <li>• <b>under creation</b>—Entry is being configured and is not yet activated.</li> <li>• <b>startup</b>—Alarm is waiting for the first sample of the monitored variable.</li> <li>• <b>object not available</b>—Monitored variable of that type is not available to the SNMP agent.</li> <li>• <b>instance not available</b>—Monitored variable's instance is not available to the SNMP agent.</li> <li>• <b>object type invalid</b>—Monitored variable is not a numeric value.</li> <li>• <b>object processing errored</b>—An error occurred when the monitored variable was processed.</li> <li>• <b>unknown</b>—State is not one of the above.</li> </ul> <p>Events:</p> <ul style="list-style-type: none"> <li>• <b>active</b>—Entry has been fully configured and activated.</li> <li>• <b>under creation</b>—Entry is being configured and is not yet activated.</li> <li>• <b>unknown</b>—State is not one of the above.</li> </ul>	All levels
<b>Variable name</b>	Name of the SNMP object instance being monitored.	All levels
<b>Event Index</b>	Event identifier.	All levels
<b>Type</b>	<p>Type of notification made when an event is triggered. It can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>log</b>—A system log message is generated and an entry is made to the log table.</li> <li>• <b>snmptrap</b>—An SNMP trap is sent to the configured destination.</li> <li>• <b>log and trap</b>—A system log message is generated, an entry is made to the log table, and an SNMP trap is sent to the configured destination.</li> <li>• <b>none</b>—Neither log nor trap will be sent.</li> </ul>	<b>detail</b>
<b>Last Event</b>	Date and time of the last event. It has the format <i>yyyy-mm-dd hh:mm:ss timezone</i> .	<b>brief</b>
<b>Community</b>	Trap group used for sending the SNMP trap.	<b>detail</b>
<b>Variable OID</b>	Object ID to which the variable name is resolved. The format is x.x.x.x.	<b>detail</b>
<b>Sample type</b>	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of <b>absolute value</b> or <b>delta value</b> .	<b>detail</b>

Table 660: show snmp rmon Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Startup alarm</b>	Alarm that might be sent when this entry is first activated, depending on the following criteria: <ul style="list-style-type: none"> <li>Alarm is sent when one of the following situations exists: <ul style="list-style-type: none"> <li>Value of the alarm is above or equal to the rising threshold and the startup type is either <b>rising alarm</b> or <b>rising or falling alarm</b>.</li> <li>Value of the alarm is below or equal to the falling threshold and the startup type is either <b>falling alarm</b> or <b>rising or falling alarm</b>.</li> </ul> </li> <li>Alarm is <i>not</i> sent when one of the following situations exists: <ul style="list-style-type: none"> <li>Value of the alarm is above or equal to the rising threshold and the startup type is <b>falling alarm</b>.</li> <li>Value of the alarm is below or equal to the falling threshold and the startup type is <b>rising alarm</b>.</li> <li>Value of the alarm is between the thresholds.</li> </ul> </li> </ul>	<b>detail</b>
<b>Owner</b>	Name of the entry configured by the user. If the entry was created through the CLI, the owner has <b>monitor</b> prepended to it.	<b>detail</b>
<b>Creator</b>	Mechanism by which the entry was configured ( <b>CLI</b> or <b>SNMP</b> ).	<b>detail</b>
<b>Sample interval</b>	Time period between samples (in seconds).	<b>detail</b>
<b>Rising threshold</b>	Upper limit threshold value configured by the user.	<b>detail</b>
<b>Falling threshold</b>	Lower limit threshold value configured by the user.	<b>detail</b>
<b>Rising event index</b>	Event triggered when the rising threshold is crossed.	<b>detail</b>
<b>Falling event index</b>	Event triggered when the falling threshold is crossed.	<b>detail</b>
<b>Current value</b>	Current value of the monitored variable in the most recent sample interval.	<b>detail</b>

## Sample Output

### show snmp rmon

```

user@host> show snmp rmon
Alarm
Index  Variable description                               Value State

      5  monitor
         jnxOperatingCPU.9.1.0.0                      5 falling threshold

Event
Index  Type                               Last Event
      1  log and trap                     2009-07-10 11:34:17 PDT

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RMON MIB Event, Alarm, Log, and History Control Tables on page 6527</a></li><li>• <a href="#">Monitoring RMON MIB Tables on page 6803</a></li><li>• <a href="#">Configuring RMON Alarms and Events on page 6606</a></li><li>• <a href="#">Understanding RMON on page 6525</a></li><li>• <a href="#">clear snmp statistics on page 6857</a></li><li>• <a href="#">clear snmp history on page 6856</a></li><li>• <a href="#">show snmp rmon on page 6877</a></li></ul>

## show snmp statistics

<b>Syntax</b>	show snmp statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display statistics about Simple Network Management Protocol (SNMP) packets sent and received by the router or switch.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear snmp statistics on page 6857</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show snmp statistics on page 6885</a>
<b>Output Fields</b>	<a href="#">Table 91 on page 1503</a> describes the output fields for the <b>show snmp statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 661: show snmp statistics Output Fields

Field Name	Field Description
<b>Input</b>	<p>Information about received packets:</p> <ul style="list-style-type: none"> <li>• <b>Packets(snmplnPkts)</b>—Total number of messages delivered to the SNMP entity from the transport service.</li> <li>• <b>Bad versions—(snmplnBadVersions)</b> Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version.</li> <li>• <b>Bad community names—(snmplnBadCommunityNames)</b> Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity.</li> <li>• <b>Bad community uses—(snmplnBadCommunityUses)</b> Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message.</li> <li>• <b>ASN parse errors—(snmplnASNParseErrs)</b> Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.</li> <li>• <b>Too big—(snmplnTooBig)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>tooBig</b>.</li> <li>• <b>No such names—(snmplnNoSuchNames)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>noSuchName</b>.</li> <li>• <b>Bad values—(snmplnBadValues)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>badValue</b>.</li> <li>• <b>Read only—(snmplnReadOnly)</b> Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of <b>readOnly</b>. Only incorrect implementations of SNMP generate this error.</li> </ul>

Table 661: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
Input (continued)	<ul style="list-style-type: none"> <li>• <b>General errors—(snmpInGenErrs)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>genErr</b>.</li> <li>• <b>Total requests varbinds—(snmpInTotalReqVars)</b> Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP <b>GetRequest</b> and <b>GetNext</b> PDUs.</li> <li>• <b>Total set varbinds—(snmpInSetVars)</b> Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP <b>SetRequest</b> PDUs.</li> <li>• <b>Get requests—(snmpInGetRequests)</b> Total number of SNMP <b>GetRequest</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Get nexts—(snmpInGetNexts)</b> Total number of SNMP <b>GetNext</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Set requests—(snmpInSetRequests)</b> Total number of SNMP <b>SetRequest</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Get responses—(snmpInGetResponses)</b> Total number of SNMP <b>GetResponse</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Traps—(snmpInTraps)</b> Total number of SNMP traps generated by the SNMP entity.</li> <li>• <b>Silent drops—(snmpSilentDrops)</b> Total number of <b>GetRequest</b>, <b>GetNextRequest</b>, <b>GetBulkRequest</b>, <b>SetRequests</b>, and <b>InformRequest</b> PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests.</li> <li>• <b>Proxy drops—(snmpProxyDrops)</b> Total number of <b>GetRequest</b>, <b>GetNextRequest</b>, <b>GetBulkRequest</b>, <b>SetRequests</b>, and <b>InformRequest</b> PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned.</li> <li>• <b>Commit pending drops</b>—Number of SNMP packets for <b>Set</b> requests dropped because of a previous pending SNMP <b>Set</b> request on the committed configuration.</li> <li>• <b>Throttle drops</b>—Number of SNMP packets for any requests dropped reaching the throttle limit.</li> </ul>

Table 661: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
V3 Input	<p>Information about SNMP version 3 packets:</p> <ul style="list-style-type: none"> <li>• <b>Unknown security models—(snmpUnknownSecurityModels)</b> Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine.</li> <li>• <b>Invalid messages—(snmpInvalidMsgs)</b> Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message.</li> <li>• <b>Unknown pdu handlers—(snmpUnknownPDUHandlers)</b> Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type.</li> <li>• <b>Unavailable contexts—(snmpUnavailableContexts)</b> Number of requests received for a context that is known to the SNMP engine, but is currently unavailable.</li> <li>• <b>Unknown contexts—(snmpUnknownContexts)</b> Total number of requests received for a context that is unknown to the SNMP engine.</li> <li>• <b>Unsupported security levels—(usmStatsUnsupportedSecLevels)</b> Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable).</li> <li>• <b>Not in time windows—(usmStatsNotInTimeWindows)</b> Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window.</li> <li>• <b>Unknown user names—(usmStatsUnknownUserNames)</b> Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine.</li> <li>• <b>Unknown engine ids—(usmStatsUnknownEngineIDs)</b> Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine.</li> <li>• <b>Wrong digests—(usmStatsWrongDigests)</b> Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value.</li> <li>• <b>Decryption errors—(usmStatsDecryptionErrors)</b> Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.</li> </ul>

Table 661: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
<b>Output</b>	<p>Information about transmitted packets:</p> <ul style="list-style-type: none"> <li>• <b>Packets—(snmpOutPkts)</b> Total number of messages passed from the SNMP entity to the transport service.</li> <li>• <b>Too big—(snmpOutTooBig)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>tooBig</b>.</li> <li>• <b>No such names—(snmpOutNoSuchNames)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>noSuchName</b>.</li> <li>• <b>Bad values—(snmpOutBadValues)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>badValue</b>.</li> <li>• <b>General errors—(snmpOutGenErrs)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>genErr</b>.</li> <li>• <b>Get requests—(snmpOutGetRequests)</b> Total number of SNMP <b>GetRequest</b> PDUs generated by the SNMP entity.</li> <li>• <b>Get nexts—(snmpOutGetNexts)</b> Total number of SNMP <b>GetNext</b> PDUs generated by the SNMP entity.</li> <li>• <b>Set requests—(snmpOutSetRequests)</b> Total number of SNMP <b>SetRequest</b> PDUs generated by the SNMP entity.</li> <li>• <b>Get responses—(snmpOutGetResponses)</b> Total number of SNMP <b>GetResponse</b> PDUs generated by the SNMP entity.</li> <li>• <b>Traps—(snmpOutTraps)</b> Total number of SNMP traps generated by the SNMP entity.</li> </ul>

## Sample Output

### show snmp statistics

```

user@host> show snmp statistics
SNMP statistics:

## show log

<b>List of Syntax</b>	<a href="#">Syntax on page 6889</a> <a href="#">Syntax (QFabric System) on page 6889</a> <a href="#">Syntax (TX Matrix Routers) on page 6889</a>
<b>Syntax</b>	<pre>show log &lt;filename   user &lt;username&gt;&gt;</pre>
<b>Syntax (QFabric System)</b>	<pre>show log filename &lt;device-type (device-id   device-alias)&gt;</pre>
<b>Syntax (TX Matrix Routers)</b>	<pre>show log &lt;all-lcc   lcc number   scc&gt; &lt;filename   user &lt;username&gt;&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option <i>device-type (device-id   device-alias)</i> is introduced in Junos OS Release 13.1 for the QFX Series.</p>
<b>Description</b>	List log files, display log file contents, or display information about users who have logged in to the router or switch.
<b>Options</b>	<p><b>none</b>—List all log files.</p> <p><b>&lt;all-lcc   lcc number   scc&gt;</b>—(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).</p> <p><b>device-type</b>—(QFabric system only) (Optional) Display log messages for only one of the following device types:</p> <ul style="list-style-type: none"> <li>• <b>director-device</b>—Display logs for Director devices.</li> <li>• <b>infrastructure-device</b>—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).</li> <li>• <b>interconnect-device</b>—Display logs for Interconnect devices.</li> <li>• <b>node-device</b>—Display logs for Node devices.</li> </ul>

**NOTE:** If you specify the *device-type* optional parameter, you must also specify either the *device-id* or *device-alias* optional parameter.

**(device-id | device-alias)**—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

**filename**—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

**NOTE:** The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

**user <username>**—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

**Required Privilege Level** trace

- [Troubleshooting Overview on page 6895](#)
- [QFX5100 Switch with Automation Enhancements Frequently Asked Questions on page 6897](#)

### Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

[Table 663 on page 6893](#) provides a list of some of the troubleshooting resources.

**Table 663: Troubleshooting Resources on the QFX Series**

Troubleshooting Resource	Description	Documentation
Chassis alarms	Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch.	<a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 7192</a>
Chassis Status LEDs and Fan Tray LEDs	A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.	<a href="#">Chassis Status LEDs on a QFX3500 Device</a>
Interface alarms	A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.	<a href="#">“Interface Alarm Messages” on page 7195</a>
System alarms	A predefined alarm is triggered by a missing rescue configuration or problem with the software license.	<a href="#">“Understanding Alarms” on page 7191</a>

Table 663: Troubleshooting Resources on the QFX Series (*continued*)

Troubleshooting Resource	Description	Documentation
System log messages	The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	<ul style="list-style-type: none"> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 6561</a></li> <li>• <a href="#">Junos OS System Log Configuration Statements on page 6616</a></li> </ul>
Junos OS operational mode commands	Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the <b>traceroute monitor</b> command to locate points of failure in a network.	<ul style="list-style-type: none"> <li>• <a href="#">Monitoring System Process Information on page 333</a></li> <li>• <a href="#">Monitoring System Properties on page 334</a></li> <li>• <a href="#">traceroute monitor</a></li> </ul>
Junos OS automation scripts (event scripts)	Event scripts can be used to automate network troubleshooting and management tasks.	<i>Junos OS Automation Library</i>
Junos OS XML operational tags	XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.	<i>Junos XML API Operational Developer Reference</i>
NETCONF XML management protocol	The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b> , <b>set</b> , and <b>commit</b> to perform those operations.	<i>NETCONF XML Management Protocol Developer Guide</i>
SNMP MIBs and traps	MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.	<ul style="list-style-type: none"> <li>• <a href="#">SNMP MIBs Support on page 6530</a></li> <li>• <a href="#">SNMP Traps Support on page 6546</a></li> <li>• <a href="#">Using the Traceroute MIB for SNMP Remote Operations</a></li> </ul>
AI-Scripts and Advanced Insight Manager (AIM)	AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.	<a href="#">Advanced Insight Scripts (AI-Scripts) Release Notes</a>
Junos Space Service Now	This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.	<i>Service Automation</i>

Table 663: Troubleshooting Resources on the QFX Series (*continued*)

Troubleshooting Resource	Description	Documentation
Junos Space Service Insight	This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now.	<i>Service Automation</i>
Juniper Networks Knowledge Base	You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.	<a href="http://kb.juniper.net">http://kb.juniper.net</a>

## Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

[Table 664 on page 6895](#) provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 664: Troubleshooting on the QFX Series

Problem Category	Symptom or Problem	Recommended Action
Switch hardware components	LCD panel shows a chassis alarm count.	See <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 7192</a> .
	Fan tray LED is blinking amber.	See <i>Fan Tray LED on a QFX3500 Device</i> .
	Chassis status LED for the power is blinking amber.	See <i>Chassis Status LEDs on a QFX3500 Device</i> .
	Chassis status LED for the fan (on the management board) is blinking amber.	Replace the management board as soon as possible. See <i>Chassis Status LEDs on a QFX3500 Device</i> .

Table 664: Troubleshooting on the QFX Series (*continued*)

Problem Category	Symptom or Problem	Recommended Action
Port configuration	Cannot configure a port as a Gigabit Ethernet port.	<p>Check whether the port is a valid Gigabit Ethernet port (6 through 41).</p> <p>See <i>QFX3500 Device Overview</i>.</p>
	Cannot configure a port as a Fibre Channel port.	<p>Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47).</p> <p>See <i>QFX3500 Device Overview</i>.</p>
	Cannot configure a port as a 10-Gigabit Ethernet port.	<p>If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports.</p> <p>If the port is a 40-Gbps QSFP+ interface, make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <i>QFX3500 Device Overview</i>.</p>
	Cannot configure a 40-Gbps QSFP+ interface.	<p>The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <i>QFX3500 Device Overview</i>.</p>
External devices (USB devices)	Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state.	Unplug the USB device and reboot the switch.
Initial device configuration	Cannot configure management Ethernet ports.	<p>Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them.</p> <p><b>NOTE:</b> The management ports are on the front panel of the QFX3500 switch. They are labeled <b>C0</b> and <b>C1</b> on the front panel. In the CLI they are referred to as <b>me0</b> and <b>me1</b>.</p> <p>See “<a href="#">Configuring a QFX3500 Device as a Standalone Switch</a>” on page 175.</p>

Table 664: Troubleshooting on the QFX Series (*continued*)

Problem Category	Symptom or Problem	Recommended Action
Software upgrade and configuration	Failed software upgrade.	See <a href="#">“Recovering from a Failed Software Installation” on page 121.</a>
	Active partition becomes inactive after upgrade.	
	Problem with the active configuration file.	See the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Loading a Previous Configuration File on page 1252</a></li> <li>• <a href="#">Reverting to the Default Factory Configuration on page 188</a></li> <li>• <a href="#">Reverting to the Rescue Configuration on page 189</a></li> <li>• <a href="#">Performing a Recovery Installation on page 116</a></li> </ul>
	Root password is lost or forgotten.	Recover the root password. See <a href="#">“Recovering the Root Password” on page 1233.</a>
Network interfaces	An aggregated Ethernet interface is down.	See <a href="#">“Troubleshooting an Aggregated Ethernet Interface” on page 1234.</a>
	Interface on built-in network port is down.	See <a href="#">“Troubleshooting Network Interfaces” on page 1234.</a>
	Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.	
Ethernet switching	A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch.	See <a href="#">“Troubleshooting Ethernet Switching” on page 1895.</a>
Firewall filter	Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.	See <a href="#">“Troubleshooting Firewall Filter Configuration” on page 5411.</a>

## QFX5100 Switch with Automation Enhancements Frequently Asked Questions

This FAQ addresses questions regarding using QFX5100 switches with automation enhancements, which were introduced at Junos OS Release 13.2X51-D15.

This FAQ covers the following questions:

- [Who Should You Contact If You Have Problems with Loading, Installing or Updating Libraries? on page 6898](#)
- [Who Should You Contact If You Have Problems with Puppet for Junos OS? on page 6898](#)
- [Who Should You Contact If You Have Problems with Chef for Junos OS? on page 6898](#)
- [What Happens to the User Partition If You Downgrade a QFX5100 Switch That Is Running the jinstall-qfx-5-flex-x.tgz Software Bundle to a QFX Switch That Is Running a Different QFX5100 Software Bundle? on page 6898](#)
- [How Do You Recover Junos OS Binaries That You Have Deleted? on page 6898](#)

- [How Do You Recover from a System Crash?](#) on page 6898
- [How Can You Verify That a QFX5100 Switch Is Running a jinstall-qfx-5-flex-x.tgz Software Bundle?](#) on page 6898

---

### Who Should You Contact If You Have Problems with Loading, Installing or Updating Libraries?

---

Contact Customer Support at <http://www.juniper.net/support>.

---

### Who Should You Contact If You Have Problems with Puppet for Junos OS?

---

You can obtain support for Puppet for Junos OS through the J-Net Forum for Puppet at [http://forums.juniper.net/t5/Puppet-for-JunOS/bd-p/puppet\\_junos](http://forums.juniper.net/t5/Puppet-for-JunOS/bd-p/puppet_junos).

---

### Who Should You Contact If You Have Problems with Chef for Junos OS?

---

You can obtain support for Chef for Junos OS through the J-Net Forum for Chef at [http://forums.juniper.net/t5/Chef-for-JunOS/bd-p/chef\\_junos](http://forums.juniper.net/t5/Chef-for-JunOS/bd-p/chef_junos).

---

### What Happens to the User Partition If You Downgrade a QFX5100 Switch That Is Running the jinstall-qfx-5-flex-x.tgz Software Bundle to a QFX Switch That Is Running a Different QFX5100 Software Bundle?

---

In this case, the user partition remains intact.

**NOTE:** If you make changes to the user partition while performing a unified in-service software upgrade (unified ISSU), the changes might be lost.

---

---

### How Do You Recover Junos OS Binaries That You Have Deleted?

---

You must reinstall the software package.

---

### How Do You Recover from a System Crash?

---

You must reinstall the software package.

---

### How Can You Verify That a QFX5100 Switch Is Running a jinstall-qfx-5-flex-x.tgz Software Bundle?

---

You cannot use the **show version** command to verify that a QFX5100 switch is running the jinstall-qfx-5-flex-x.tgz software bundle. However, there are two other ways to verify this.

- Use the **show configuration** command to check that you are running a Layer 3 configuration. See *Installing Junos OS Software with QFX5100 Switch Automation Enhancements*.
- Go to the shell and confirm that you can invoke Python. See “[Invoking the Python Interpreter](#)” on page 6587.

#### Related Documentation

## Troubleshooting Procedures

---

- [Recovering from a Failed Software Installation on page 6899](#)
- [Loading a Previous Configuration File on page 6900](#)
- [Reverting to the Default Factory Configuration on page 6900](#)
- [Reverting to the Rescue Configuration on page 6901](#)
- [Recovering the Root Password on page 6901](#)
- [Troubleshooting a Deprecated Network Analytics Configuration on page 6903](#)

### Recovering from a Failed Software Installation

**Problem** **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution** If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

3. Enter the following command:

```
loader> install [- --format] [- --external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:

- Network address of the server and the path on the server; for example, **ftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
- Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Loading a Previous Configuration File

You can use the **rollback <number>** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

### Syntax

**rollback <number>**

### Options

- **none**— Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

**Related Documentation**

- [Configuration File Terms on page 11](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

#### Related Documentation

- [Understanding Configuration Files on page 1242](#)
- [Loading a Previous Configuration File on page 1252](#)
- [Reverting to the Rescue Configuration on page 189](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.
 

```
[edit]
user@switch# load override filename
```
2. Commit your changes.
 

```
[edit]
user@switch# commit filename
```

#### Related Documentation

- [Setting or Deleting the Rescue Configuration on page 1261](#)
- [Reverting to the Default Factory Configuration on page 188](#)
- [Configuration File Terms on page 11](#)

## Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:  
  
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  
  
ok **boot -s**
12. At the following prompt, enter **recovery** to start the root password recovery procedure.  
  
Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: **recovery**
13. Enter configuration mode in the CLI.
14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: juniper1
Retype new password:
```

16. At the second prompt, reenter the new root password.

17. After you have finished configuring the password, commit the configuration.

```
root@host# commit
commit complete
```

18. Exit configuration mode in the CLI.

19. Exit operational mode in the CLI.

20. At the prompt, enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

## Troubleshooting a Deprecated Network Analytics Configuration

**Problem** **Description:** After a software upgrade to Junos OS Release 13.2X51-D15 from an earlier release, the network analytics configuration is no longer valid and the feature is disabled.

**Symptoms:** The network analytics configuration used in Junos OS Release 13.2X51-D10 has been deprecated in Release 13.2X51-D15. Issuing the **show services analytics** command results in the following output:

```
root@qfx5100# show services analytics

queue-statistics { ## Warning: 'queue-statistics' is deprecated
    interval 1;
}
```

**Cause** Junos OS Release 13.2X51-D15 added enhancements to the network analytics feature, resulting in significant changes in the CLI. The updated **[edit services analytics]** hierarchy level contains some statements that have replaced those that were previously released. As a result, the earlier configuration does not work in the new release.

**Solution** Use the new CLI statements to reconfigure the network analytics feature.

### Understanding QFX Series Virtual Chassis

This topic discusses QFX Series Virtual Chassis. A QFX Series Virtual Chassis allows you to interconnect up to ten QFX3500, QFX3600, or QFX5100 switches into one logical device and manage the device as a single chassis. EX4300 switches can also be interconnected into a Virtual Chassis with QFX3500, QFX3600, and QFX5100 switches.

This topic does not discuss Virtual Chassis Fabric (VCF). For information on understanding VCF, see [“Virtual Chassis Fabric Overview” on page 7033](#).

This topic includes:

- [QFX Virtual Chassis Overview on page 6908](#)
- [QFX5100 Switches in a Virtual Chassis on page 6908](#)
- [QFX3500 and QFX3600 Switches in a Virtual Chassis on page 6909](#)
- [EX4300 Switches in a QFX Series Virtual Chassis on page 6909](#)

## QFX Virtual Chassis Overview

---

The QFX Series Virtual Chassis brings the Virtual Chassis flexible, scaling switch solution to QFX3500, QFX3600, and QFX5100 switches. EX4300 switches can also be interconnected into a Virtual Chassis with QFX3500, QFX3600, and QFX5100 switches. You can connect up to ten standalone EX4300, QFX3500, QFX3600, or QFX5100 switches into a QFX Series Virtual Chassis and manage the interconnected switches as a single chassis. The advantages of connecting multiple switches into a Virtual Chassis include better-managed bandwidth at a network layer, simplified configuration and maintenance because multiple devices can be managed as a single device, increased fault tolerance and high availability (HA) because a Virtual Chassis can remain active and network traffic can be redirected to other member switches when a single member switch fails, and a flatter, simplified Layer 2 network topology that minimizes or eliminates the need for loop prevention protocols such as Spanning Tree Protocol (STP).

You configure a QFX Series Virtual Chassis by configuring 10-Gbps SFP+ or 40-Gbps QSFP+ interfaces into Virtual Chassis ports (VCPs). VCPs connect switches together to form a Virtual Chassis, and are responsible for passing all data and control traffic between member switches in the Virtual Chassis. All non-channelized 40-Gbps QSFP+ interfaces on QFX3500, QFX3600, and QFX5100 series switches can be configured into VCPs. All fixed 10-Gbps SFP+ interfaces, including 10-Gbps SFP+ uplink interfaces on EX4300 switches, can also be configured into VCPs.

You can increase VCP bandwidth between member switches by configuring multiple interfaces between the same two switches into VCPs. When multiple VCPs are interconnecting the same two member switches, a Link Aggregation Group (LAG) bundle is automatically formed when the VCPs are on interfaces supporting identical speeds. For instance, if you have two 40-Gbps QSFP+ interfaces configured as VCPs between member switches, a LAG with two member links with 80Gbps of total bandwidth is formed. 10-Gbps SFP+ and 40-Gbps QSFP+ interfaces configured as VCPs cannot be members of the same LAG, however.

## QFX5100 Switches in a Virtual Chassis

---

Virtual Chassis is supported on all QFX5100 switches starting in Junos OS Release 13.2X51-D20.

You can interconnect up to 10 switches into a Virtual Chassis. A QFX Series Virtual Chassis can contain up to ten total member switches, and the ten total member switches can include any combination of EX4300, QFX3500, QFX3600, and QFX5100 series switches.

**NOTE:** In Junos OS release 13.2X51-D20, you can interconnect up to ten QFX5100 switches into a Virtual Chassis with the exception of the QFX5100-96S switch, which you could configure into a non-mixed Virtual Chassis that included up to four QFX5100-96S switches only.

You can configure up to ten QFX5100-96S switches into a mixed or non-mixed Virtual Chassis starting in Junos OS release 13.2X51-D25.

---

### QFX3500 and QFX3600 Switches in a Virtual Chassis

Virtual Chassis is supported on QFX3500 and QFX3600 series switches. QFX3500 and QFX3600 series switches must be configured as standalone switches; the Virtual Chassis feature is not applicable to QFX devices in a QFabric.

QFX3500 and QFX3600 devices must be running a version of Junos OS for QFX devices that support Virtual Chassis. A QFX Series Virtual Chassis can contain up to ten total member switches and the ten total member switches can include any combination of EX4300, QFX3500, QFX3600, and QFX5100 series switches.

### EX4300 Switches in a QFX Series Virtual Chassis

Virtual Chassis is supported on EX4300 switches. Starting in Junos OS Release 13.2X51-D20, EX4300 switches can be interconnected into a Virtual Chassis with QFX3500 switches, QFX3600 switches, and QFX5100 switches.

A mixed or non-mixed Virtual Chassis that includes EX4300 switches can contain up to ten total member switches, and the ten total member switches can include any combination of EX4300, QFX3500, QFX3600, and QFX5100 series switches.

- [Configuring a QFX Series Virtual Chassis \(CLI Procedure\) on page 6931](#)

## Understanding QFX Series Virtual Chassis Components

This topic describes the components of a QFX Series Virtual Chassis. A QFX Series Virtual Chassis is up to ten standalone QFX3500, QFX3600, or QFX5100 switches interconnected and managed as a single chassis. EX4300 switches can also be interconnected into a Virtual Chassis with QFX3500, QFX3600, and QFX5100 switches.

This topic does not discuss Virtual Chassis Fabric components. For information on Virtual Chassis Fabric components, see [“Understanding Virtual Chassis Fabric Components” on page 7035](#).

This topic covers:

- [Virtual Chassis Ports \(VCPs\) on page 6909](#)
- [Maximum Switch Support on page 6910](#)
- [Master Role on page 6910](#)
- [Backup Role on page 6911](#)
- [Linecard Role on page 6911](#)
- [Member Switch and Member ID on page 6912](#)
- [Mastership Priority on page 6913](#)

### Virtual Chassis Ports (VCPs)

You configure a QFX Series Virtual Chassis by configuring 10-Gbps SFP+ or 40-Gbps QSFP+ interfaces into Virtual Chassis ports (VCPs). VCPs connect switches together to

form a Virtual Chassis, and are responsible for passing all data and control traffic between member switches in the Virtual Chassis. All non-channelized 40-Gbps QSFP+ interfaces on QFX3500, QFX3600, and QFX5100 series switches can be configured into VCPs; 40-Gbps QSFP+ interfaces that have been channelized into SFP+ interfaces using a breakout cable cannot be configured into VCPs. All other SFP+ interfaces on QFX series switches can be configured into VCPs, and can also be used to interconnect EX4300 switches into a mixed Virtual Chassis.

You can increase VCP bandwidth between member switches by configuring multiple interfaces between the same two switches into VCPs. When multiple VCPs are interconnecting the same two member switches, a Link Aggregation Group (LAG) bundle is automatically formed when the VCPs are on interfaces supporting identical speeds. For instance, if you have two 40-Gbps QSFP+ interfaces configured as VCPs between member switches, a LAG with two member links with 80Gbps of total bandwidth is formed. 10-Gigabit SFP+ and 40-Gbps QSFP+ interfaces configured as VCPs cannot be members of the same LAG, however. See [“Understanding QFX Series Virtual Chassis Port Link Aggregation” on page 6921](#)

---

### Maximum Switch Support

You can interconnect up to 10 switches into a Virtual Chassis. The Virtual Chassis can contain up to ten total member switches and the ten total member switches can include any combination of EX4300, QFX3500, QFX3600, and QFX5100 series switches.

**NOTE:** In Junos OS release 13.2X51-D20, you can interconnect up to ten QFX5100 switches into a Virtual Chassis with the exception of the QFX5100-96S switch, which you could configure into a non-mixed Virtual Chassis that included up to four QFX5100-96S switches only.

You can configure up to ten QFX5100-96S switches into a mixed or non-mixed Virtual Chassis starting in Junos OS release 13.2X51-D25.

---

### Master Role

In a Virtual Chassis, each member switch is assigned one of three roles: master, backup, or linecard.

The member that functions in the master role in the Virtual Chassis:

- Manages the member switches.
- Runs Junos OS for the switches in a master role.
- Runs the chassis management processes and control protocols.
- Represents all the member switches interconnected within the Virtual Chassis configuration. (The hostname and other properties that you assign to this switch during setup apply to all members of the Virtual Chassis configuration.)

In a Virtual Chassis, one member functions as the master and a second member functions as the backup:

- In a preprovisioned configuration, one of the two members assigned as **routing-engine** functions as the master member. The selection of which member assigned as **routing-engine** functions as master and which as backup is determined by the software based on the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917](#).
- In a configuration that is not preprovisioned, the selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm.

All switches that are not assigned the master or backup role function in the linecard role.

In a mixed Virtual Chassis, we recommend configuring the QFX5100 switches into the master and backup role. If the mixed Virtual Chassis does not contain QFX5100 switches, we recommend configuring QFX3500 or QFX3600 switches into the master and backup roles. You should only configure EX4300 switches into the master or backup role when your mixed Virtual Chassis contains one QFX series switch.

---

### Backup Role

The member that functions in the backup role in the Virtual Chassis:

- Maintains a state of readiness to take over the master role if the master fails.
- Runs Junos OS for switches in a backup role.
- Synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it is prepared to preserve routing information and maintain network connectivity without disruption in case the master is unavailable.

You must have at least two member switches in the Virtual Chassis configuration in order to have a backup member.

- In a preprovisioned configuration, one of the two members assigned as **routing-engine** functions in the backup role. The selection of which member assigned as **routing-engine** functions as master and which as backup is determined by the software based on the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917](#).
- In a configuration that is not preprovisioned, the selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm.

In a mixed Virtual Chassis, we recommend configuring the QFX5100 switches into the master and backup role. If the mixed Virtual Chassis does not contain QFX5100 switches, we recommend configuring QFX3500 or QFX3600 switches into the master and backup roles. You should only configure EX4300 switches into the master or backup role when your mixed Virtual Chassis contains one QFX series switch.

---

### Linecard Role

A member that functions in the linecard role in the Virtual Chassis:

- Runs only a subset of Junos OS.

- Does not run the chassis control protocols.
- Can detect certain error conditions (such as an unplugged cable) on any interfaces that have been configured on it through the master.

The Virtual Chassis configuration must have at least three members in order to include a linecard member.

- In a preprovisioned configuration, you can explicitly configure a member with the linecard role, which makes it ineligible for functioning as a master or backup.
- In a configuration that is not preprovisioned, the members that are not selected as master or backup function as linecard members of the Virtual Chassis configuration. The selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm. A switch with a mastership priority of 0 is always in the linecard role.

Any switch can function in the linecard role in a mixed or non-mixed Virtual Chassis.

In a mixed Virtual Chassis, we recommend configuring the QFX5100 switches into the master and backup role. If the mixed Virtual Chassis does not contain QFX5100 switches, we recommend configuring QFX3500 or QFX3600 switches into the master and backup roles. You should only configure EX4300 switches into the master or backup role when your mixed Virtual Chassis contains one QFX series switch.

---

### Member Switch and Member ID

Each standalone switch that supports Virtual Chassis is a potential member of a Virtual Chassis configuration. When one of those switches is powered on, it receives a member ID that can be seen by viewing the front-panel LCD or by entering the **show virtual-chassis** command. If the switch is powered on as a standalone switch, that member's member ID is always 0. When the switch is interconnected with other switches in a Virtual Chassis configuration, its member ID is assigned by the master based on various factors, such as the order in which the switch was added to the Virtual Chassis configuration or the member ID assigned by a preprovisioned configuration. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917](#).

If the Virtual Chassis configuration previously included a member switch and that member was physically disconnected or removed from the Virtual Chassis configuration, its member ID is not available for assignment as part of the standard sequential assignment by the master. For example, you might have a Virtual Chassis configuration composed of member 0, member 2, and member 3, because member 1 was removed. When you add another member switch and power it on, the master assigns it as member 4.

The member ID distinguishes the member switches from one another. You use the member ID:

- To assign a mastership priority value to a member switch
- To configure interfaces for a member switch (The function is similar to that of a slot number on Juniper Networks routers.)

- To apply some operational commands to a member switch
- To display status or characteristics of a member switch

### Mastership Priority

In a configuration that is not preprovisioned, you can designate the role (master, backup, or linecard) that a member switch assumes by configuring its mastership priority (from **0** through **255**). The mastership priority value is the factor in the master election algorithm with the highest precedence for selecting the master of the Virtual Chassis configuration. A switch with a mastership priority of **0** never assumes the backup or master role.

The default value for mastership priority is **128**. When a standalone switch is powered on, it receives the default mastership priority value. Because it is the only member of the Virtual Chassis configuration, it is also the master. When you interconnect a standalone switch to an existing Virtual Chassis configuration (which implicitly includes its own master), we recommend that you explicitly configure the mastership priority of the members that you want to function as the master and backup.

In a preprovisioned configuration, you assign the role of each member switch.

- [Configuring a QFX Series Virtual Chassis \(CLI Procedure\) on page 6931](#)

## Understanding Mixed EX Series and QFX Series Virtual Chassis or Virtual Chassis Fabric

This topic describes the requirements for a mixed Virtual Chassis or a mixed Virtual Chassis Fabric (VCF).

A mixed Virtual Chassis includes two or more types of EX Series switches, two or more types of QFX Series switches, or a mix of EX and QFX Series switches.

A mixed VCF is any VCF that includes two or more types of member switches. Because a VCF must use a QFX5100 switch as a spine device, a mixed VCF is any VCF that includes EX4300, QFX3500, or QFX3600 member switches in addition to the required QFX5100 switches.

**NOTE:** The optimal VCF topology is to use QFX5100 devices only. A VCF composed entirely of QFX5100 devices supports the largest breadth of features at the highest scalability while also supporting the highest number of high-speed interfaces.

This topic covers:

- [Virtual Chassis Fabric Summary on page 6914](#)
- [Understanding Mixed Virtual Chassis Fabric on page 6914](#)
- [Virtual Chassis Summary for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 Switches on page 6915](#)

- [Understanding the Routing Engine Role in a Mixed Virtual Chassis Using EX4300, EX4600, QFX3500, QFX3600, or QFX5100 Member Switches on page 6915](#)
- [Understanding EX4300, QFX3500, QFX3600, and QFX5100 Switches in a Virtual Chassis on page 6916](#)
- [Understanding Mixed EX4300 and EX4600 Virtual Chassis on page 6916](#)
- [Understanding EX4200, EX4500, and EX4550 Switches in a Mixed Virtual Chassis on page 6916](#)

### Virtual Chassis Fabric Summary

[Table 665 on page 6914](#) provides a high-level overview of the permitted hardware allowed in the routing engine and line card roles of a mixed and a non-mixed VCF. The table also includes license requirements and supported configuration methods.

**Table 665: Virtual Chassis Fabric Summary**

Category	Allowed Routing Engines	Allowed Line Cards	License Requirement	Configuration Methods
Non-mixed	QFX5100	QFX5100	Yes (on two QFX5100 switches operating in master and backup Routing Engine roles)	Autoprovisioning Preprovisioning Nonprovisioning (not recommended)
Mixed	QFX5100	QFX5100 QFX3600 QFX3500 EX4300	Yes (on two QFX5100 switches operating in master and backup Routing Engine roles)	Autoprovisioning Preprovisioning Nonprovisioning (not recommended)

### Understanding Mixed Virtual Chassis Fabric

A VCF must use a QFX5100 switch in the spine role. A mixed VCF is, therefore, any VCF that includes EX4300, QFX3500, or QFX3600 member switches in addition to the required QFX5100 switch.

The optimal method of configuring a VCF is to use QFX5100 devices only. A non-mixed VCF composed entirely of QFX5100 devices supports the largest breadth of features at

the highest scalability while also supporting the highest number of high-speed interfaces. You can, however, also configure a mixed VCF.

If you use QFX3600, QFX3500, or EX4300 devices as leaf devices in your VCF, you must configure all devices in your VCF into mixed mode. If you are turning a non-mixed VCF into a mixed VCF, you have to reboot the VCF to change the mixed mode setting.

### Virtual Chassis Summary for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 Switches

Table 666 on page 6915 provides a high-level overview of the permitted hardware allowed in the routing engine and line card roles of a mixed and a non-mixed Virtual Chassis for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 switches. The table also includes license requirements and supported configuration methods.

**Table 666: Virtual Chassis Summary**

Category	Allowed Routing Engines	Allowed Line Cards	License Requirement	Configuration Methods
Non-mixed	QFX5100	QFX5100	No	Nonprovisioning Preprovisioning
	QFX3600 QFX3500	QFX3600 QFX3500	No	Nonprovisioning Preprovisioning
	EX4600	EX4600	No	Nonprovisioning Preprovisioning
	EX4300	EX4300	No	Nonprovisioning Preprovisioning
Mixed	QFX5100	QFX5100 QFX3600 QFX3500 EX4300	No	Nonprovisioning Preprovisioning
	QFX3600 QFX3500	QFX3600 QFX3500 EX4300	No	Nonprovisioning Preprovisioning
	EX4600	EX4600 EX4300	No	Nonprovisioning Preprovisioning

### Understanding the Routing Engine Role in a Mixed Virtual Chassis Using EX4300, EX4600, QFX3500, QFX3600, or QFX5100 Member Switches

In a mixed Virtual Chassis, the switch in the master Routing Engine role determines which switches are supported in the line card role of the mixed Virtual Chassis.

When a mixed Virtual Chassis is using a QFX5100 switch in the master Routing Engine role, you can use QFX5100, QFX3600, QFX3500, or EX4300 switches in the line card role.

When a mixed Virtual Chassis is using a QFX3600 or QFX3500 switch in the master Routing Engine role, you can use QFX3600, QFX3500, or EX4300 switches in the line card role.

In a mixed EX4300 and EX4600 Virtual Chassis, an EX4600 switch automatically assumes the Routing Engine role.

EX4600 switches can only be in a mixed Virtual Chassis with EX4300 switches. EX4600 switches cannot be in a mixed Virtual Chassis with QFX5100, QFX3600, or QFX3500 switches.

We recommend always configuring the same type of switch into the master and backup Routing Engine role, to ensure that the switch operating in the master role remains the same type of switch in the event of a switchover.

In most mixed Virtual Chassis, you must configure your Virtual Chassis to ensure a switch that supports the master Routing Engine assumes the master Routing Engine role. Without user configuration, any switch—with the exception of the EX4300 switch, which can never assume the master or backup Routing Engine role in a mixed Virtual Chassis or VCF—can assume the master or backup Routing Engine role.

### **Understanding EX4300, QFX3500, QFX3600, and QFX5100 Switches in a Virtual Chassis**

---

Up to ten EX4300 switches, QFX3500 switches, QFX3600 switches, and QFX5100 switches can be interconnected using Virtual Chassis ports (VCPs) to form a mixed or non-mixed Virtual Chassis. The mixed Virtual Chassis supports up to ten member switches regardless of the switches that compose the mixed Virtual Chassis.

EX4300 switches can also be interconnected into a mixed Virtual Chassis with EX4600 switches. See the following section for information on mixed EX4300 and EX4600 Virtual Chassis.

### **Understanding Mixed EX4300 and EX4600 Virtual Chassis**

---

EX4300 switches and EX4600 switches can be interconnected into the same Virtual Chassis. An EX4600 switch automatically assumes the master Routing Engine role in a mixed EX4300 and EX4600 Virtual Chassis, since EX4300 switches cannot assume the Routing Engine role in a mixed Virtual Chassis. EX4600 switches cannot be in a mixed Virtual Chassis with any other type of switch.

The mixed Virtual Chassis supports up to ten member switches.

### **Understanding EX4200, EX4500, and EX4550 Switches in a Mixed Virtual Chassis**

---

EX4200 switches, EX4500 switches, and EX4550 switches can be interconnected into the same Virtual Chassis to form a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, mixed EX4500 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, and EX4550 Virtual Chassis. The mixed Virtual Chassis supports up to 10 member switches regardless of whether the switches are EX4200 switches, EX4500 switches, or EX4550 switches. Any model of EX4200, EX4500, or EX4550 switch can be interconnected into the same mixed Virtual Chassis. The master election process that decides member switch roles in a mixed Virtual Chassis is identical to the

master election process in a non-mixed Virtual Chassis, so any member switch in a mixed Virtual Chassis can assume the master, backup, or linecard role.

EX4200 switches, EX4500 switches, and EX4550 switches cannot be interconnected into a Virtual Chassis with any other switches.

## Understanding How the Master in a Virtual Chassis Is Elected

**NOTE:** This topic does not apply to EX8200 Virtual Chassis. See *EX8200 Virtual Chassis Overview*.

All switches that are interconnected in a Virtual Chassis configuration are member switches of that Virtual Chassis. Each Virtual Chassis configuration has one member that functions as the *master* and controls the Virtual Chassis configuration.

When a Virtual Chassis configuration boots, the Juniper Networks Junos operating system (Junos OS) on the switches automatically runs a master election algorithm to determine which member switch assumes the role of master.

The algorithm proceeds from the top condition downward until the stated condition is satisfied:

1. Choose the member with the highest user-configured mastership priority (255 is the highest possible value). A switch with a mastership priority of 0 will always stay in the linecard role.
2. Choose the member that was master the last time the Virtual Chassis configuration booted.
3. Choose the member that has been included in the Virtual Chassis configuration for the longest period of time. (For this to be a deciding factor, there has to be a minimum time lapse of 1 minute between the power-ons of the individual interconnected member switches.)
4. Choose the member with the lowest MAC address.

The variations among switches and switch models do not impact the master election algorithm.

To ensure that a specific member is elected as the master:

1. Power on only the switch that you want to configure as master of the Virtual Chassis configuration.
2. Configure the mastership priority of that member to have the highest possible value (255).
3. Continue to configure other members through the master member.
4. Power on the other members.

You can also specify the switch roles by preprovisioning your Virtual Chassis. Preprovisioning a Virtual Chassis allows you to manually assign the member ID and role for each switch in the Virtual Chassis. See *Configuring an EX3300 Virtual Chassis (CLI Procedure)*, *Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)*, or [“Configuring a QFX Series Virtual Chassis \(CLI Procedure\)” on page 6931](#).

## Understanding Software Upgrades in a QFX Series Virtual Chassis

This topic discusses software upgrades on a QFX Series Virtual Chassis. For information on software upgrades on a Virtual Chassis Fabric (VCF), see [“Understanding Software Upgrades in a Virtual Chassis Fabric” on page 7050](#)

In a Virtual Chassis, each member switch must be running the same version of Juniper Networks Junos operating system (Junos OS) that supports Virtual Chassis.

You can install a new Junos OS release on the entire Virtual Chassis or on a particular member in the Virtual Chassis by using the same CLI command that you use to install Junos OS on standalone switches—the [request system software add](#) command.

You can use the automatic software update feature to automatically update the Junos OS version on member switches as you add them to a Virtual Chassis. See [“Understanding Automatic Software Update on Virtual Chassis Member Switches” on page 6925](#). If you are not configuring the automatic software update feature, we recommend that you update the new member switch to the version of Junos OS running on the Virtual Chassis before adding the member switch to the Virtual Chassis.

## Understanding Global Management of a Virtual Chassis

**NOTE:** This topic does not apply to EX8200 Virtual Chassis. See *Understanding Global Management of an EX8200 Virtual Chassis*.

A Virtual Chassis is composed of multiple switches, and it, therefore, has multiple console ports and multiple out-of-band management Ethernet ports located on the switches.

You can connect a PC or laptop directly to a console port of any member switch to set up and configure the Virtual Chassis. When you connect to the console port of any member switch, the console session is redirected to the master switch, as shown in [Figure 228 on page 6919](#).

**Figure 228: Console Session Redirection (EX4200 Virtual Chassis Pictured)**

If the master becomes unavailable, the console session is disconnected from the old master and a new session is established with the newly elected master.

An out-of-band management Ethernet port is often referred to simply as a management Ethernet port. It uses a dedicated management channel for device maintenance and allows a system administrator to monitor and manage the switch by remote control.

The Virtual Chassis configuration can be managed remotely through SSH or Telnet using a global management interface called the virtual management Ethernet (VME) interface. The VME interface is a logical interface representing all of the out-of-band management ports on the member switches. When you connect to the Virtual Chassis configuration using the VME interface's IP address, the connection is redirected to the master member as shown in [Figure 229 on page 6920](#).

**Figure 229: Management Ethernet Port Redirection to the VME Interface**

If the master management Ethernet link is unavailable, the session is redirected through the backup management Ethernet link. If there is no active management Ethernet link on the backup, the VME interface chooses a management Ethernet link on one of the linecard members, selecting the linecard member with the lowest member ID as its first choice.

You can configure an IP address for the VME global management interface at any time.

You can perform remote configuration and administration of all members of the Virtual Chassis configuration through the VME interface.

## Understanding Nonvolatile Storage in a Virtual Chassis

**NOTE:** This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See [Understanding File Storage in an EX8200 Virtual Chassis](#) for information about EX8200 Virtual Chassis.

The EX Series or QFX Series switches store the Juniper Networks Junos operating system (Junos OS) system files in internal flash memory. In the Virtual Chassis configurations, both the master and the backup switch store the configuration information for all the member switches.

- [Nonvolatile Memory Features on page 6921](#)

### Nonvolatile Memory Features

Junos OS optimizes the way the Virtual Chassis stores its configuration if a member switch or the Virtual Chassis configuration is shut down improperly:

- If the master is not available, the backup switch takes on the role of the master and its internal flash memory takes over as the alternate location for maintaining nonvolatile configuration memory.
- If a member switch is taken offline for repair, the master stores the configuration of the member switch.

## Understanding QFX Series Virtual Chassis Port Link Aggregation

You can combine physical Ethernet ports belonging to different member switches of a Virtual Chassis configuration to form a logical point-to-point link, known as a *link*

*aggregation group (LAG) or bundle*. A LAG provides more bandwidth than a single Ethernet link can provide. Additionally, link aggregation provides network redundancy by load-balancing traffic across all available links. If one of the links fails, the system automatically load-balances traffic across all remaining links.

Similarly, if a Virtual Chassis member switch that has LAG member interfaces on multiple member switches fails for any reason, the traffic traversing the LAG can be redirected through the active member switch. This setup has benefits for failover purposes and can be especially beneficial in cases when a member switch needs to be inactive for some time.

You can configure any optical uplink port that can be used to connect QFX devices configured as standalone switches together into a Virtual Chassis port (VCP). You can configure multiple optical uplink interfaces between two member switches in the same Virtual Chassis as VCPs. If you have configured two or more optical ports as VCPs connecting the same member switches, the optical uplink ports configured as VCPs automatically form a LAG provided the optical uplink ports are configured to operate at the same link speeds. Each LAG is assigned a positive-integer identifier called a *trunk ID*.

A LAG over uplink VCPs provides higher overall bandwidth for forwarding traffic between the member switches connected by the optical VCPs, faster management communications, and greater redundancy of operations among the members than would be available without the LAG. A LAG over optical VCPs provides an additional Virtual Chassis link throughput for the switches.

**NOTE:** The interfaces that are included within a bundle or LAG are sometimes referred to as *member interfaces*. Do not confuse this term with *member switches*, which refers to switches that are interconnected as a Virtual Chassis. It is possible to create a LAG that is composed of member interfaces that are located in different member switches of a Virtual Chassis.

## Understanding Split and Merge in a Virtual Chassis

In a Virtual Chassis, two or more switches are connected together to form a unit that is managed as a single chassis. If there is a disruption to the Virtual Chassis configuration due to member switches failing or being removed from the configuration, the Virtual Chassis configuration splits into two separate Virtual Chassis. This situation could cause disruptions in the network if the two separate configurations share common resources, such as global IP addresses. The split and merge feature provides a method to prevent the separate Virtual Chassis configurations from adversely affecting the network and also allows the two parts to merge back into a single Virtual Chassis configuration.

**NOTE:** If a Virtual Chassis configuration splits into separate parts, we recommend that you resolve the problem that caused the Virtual Chassis configuration to split as soon as possible.

You can also use this feature to merge two active but separate Virtual Chassis that have not previously been part of the same configuration into one Virtual Chassis configuration.

**NOTE:** The split and merge feature is enabled by default on EX Series and QFX Series Virtual Chassis. You can disable the split and merge feature by using the `set virtual-chassis no-split-detection` command.

This topic describes:

- [What Happens When a Virtual Chassis Configuration Splits on page 6923](#)
- [Merging Virtual Chassis Configurations on page 6924](#)

### What Happens When a Virtual Chassis Configuration Splits

When a Virtual Chassis configuration splits into two separate Virtual Chassis configurations, the individual member switches detect this topology change and run the master election algorithm to select a new master for each of the two Virtual Chassis configurations. The new masters then determine whether their Virtual Chassis configuration remains active. One of the configurations remains active based on the following:

- It contains both the stable master and the stable backup (that is, the master and backup from the original Virtual Chassis configuration before the split).
- It contains the stable master and the configuration is greater than half the Virtual Chassis size.
- It contains the stable backup and is at least half the Virtual Chassis size.

In accordance with the rules given in the second and third list items, if the Virtual Chassis configuration splits into two equal parts and the stable master and stable backup are in different parts, then the part that contains the stable backup becomes active.

**NOTE:** The number of members in the Virtual Chassis configuration includes all member switches connected to date minus the number whose Virtual Chassis member IDs have been recycled (that is, made available for reassignment). Therefore, the size of the Virtual Chassis configuration increases when a new member switch is detected and decreases when a member switch's ID is recycled.

These rules ensure that only one of the two separate Virtual Chassis configurations created by the split remains active. The member switches in the inactive Virtual Chassis

configuration remain in a linecard role. For the inactive members to become active again, one of the following things must happen:

- The problem that caused the original Virtual Chassis configuration to split is resolved, allowing the two Virtual Chassis configurations to merge.
- You load the factory default configuration on the inactive members, which causes the inactive members to function as standalone switches or become part of a different Virtual Chassis configuration.

**NOTE:** When you remove a member switch from a Virtual Chassis configuration, we recommend that you recycle the member ID using the `request virtual-chassis recycle` command.

---

### Merging Virtual Chassis Configurations

---

There are two scenarios in which separate Virtual Chassis merge:

- A Virtual Chassis configuration that had split into two is now merging back into a single configuration because the problem that had caused it to split has been resolved.
- You want to merge two Virtual Chassis that had not previously been configured together.

Every Virtual Chassis configuration has a unique ID (VCID) that is automatically assigned when the Virtual Chassis configuration is formed. You can also explicitly assign a VCID using the `set virtual-chassis id` command. A VCID that you assign takes precedence over automatically assigned VCIDs.

When you reconnect the separate Virtual Chassis configurations or connect them for the first time, the members determine whether or not the separate Virtual Chassis configurations can merge. The members use the following rules to determine whether a merge is possible:

- If the Virtual Chassis configurations have the same VCID, then the configurations can merge. If the two Virtual Chassis were formed as the result of a split, they have the same VCID.
- If the VCIDs are different, then the two configurations can merge only if both are active (inactive configurations cannot merge, ensuring that members removed from one Virtual Chassis configuration do not become members of another Virtual Chassis configuration). If the configurations to merge are both active and one of them has a user-configured VCID, this ID becomes the ID of the merged Virtual Chassis. If neither Virtual Chassis has a user-configured VCID, then the VCID of the configuration with the highest mastership priority becomes the ID of the merged Virtual Chassis. The resulting merged Virtual Chassis configuration is active.

When you connect two Virtual Chassis configurations, the following events occur:

1. Connecting the two split Virtual Chassis configurations triggers the shortest-path-first (SPF) algorithm. The SPF algorithm computes the network topology and then triggers the master election algorithm. The master election algorithm waits for the members to synchronize the topology information before running.
2. The master election algorithm merges the VCIDs of all the members.
3. Each member runs the master election algorithm to select a master and a backup from among all members with the same VCIDs. For more information, see [“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917](#).
4. The master determines whether the Virtual Chassis configuration is active or inactive. (See [“What Happens When a Virtual Chassis Configuration Splits” on page 6923](#).)
5. If the Virtual Chassis configuration is active, the master assigns roles to all members. If the Virtual Chassis configuration is inactive, the master assigns all members the role of linecard.
6. When the other members receive their role from the master, they change their role to backup or linecard. They also use the active or inactive state information sent by the master to set their own state to active or inactive and to construct the Virtual Chassis member list from the information sent by the master.
7. If the Virtual Chassis state is active, the master waits for messages from the members indicating that they have changed their roles to the assigned roles, and then the master changes its own role to master.

**NOTE:** When you merge two Virtual Chassis that had not previously been part of the same Virtual Chassis configuration, any configuration settings (such as the settings for Telnet and FTP services, graceful Routing Engine switchover (GRES), fast failover, VLANs, and so on) that exist on the new master become the configuration settings for all members of the new Virtual Chassis, overwriting any other configuration settings.

## Understanding Automatic Software Update on Virtual Chassis Member Switches

You can use the automatic software update feature to automatically update the Juniper Networks Junos operating system (Junos OS) version on prospective member switches as you add them to an EX Series or QFX Series Virtual Chassis.

This topic includes:

- [Automatic Software Update Basics on page 6926](#)
- [Automatic Software Update Restrictions on page 6926](#)

### [Automatic Software Update Basics](#)

---

When you have configured automatic software update on a Virtual Chassis, the Junos OS version is updated on the new member switch when you add it to the Virtual Chassis. The new member switch immediately joins the Virtual Chassis configuration and is put in the active state.

For a standalone switch to join an existing Virtual Chassis, it must be running the same version of Junos OS that is running on the Virtual Chassis master. When the master in a Virtual Chassis detects that a new switch has been added to the configuration, it checks the software version on the new switch. If the software version on the new switch is not the same as the version running on the master, the master keeps the new switch in the inactive state. If you have not enabled the automatic software update feature, you have to manually install the correct software version on each prospective member switch as it is added to the Virtual Chassis.

### [Automatic Software Update Restrictions](#)

---

You cannot use automatic software update in certain scenarios, and you must ensure that the software release version on the Virtual Chassis is supported by the release on the prospective member switch.

You cannot use the automatic software update feature to update software for a prospective member switch in the following scenarios:

- The Virtual Chassis was preprovisioned and is running Junos OS Release 10.4R2 or earlier.
- You configured the **mastership-priority** command to manually configure the mastership priority of at least one Virtual Chassis member switch and the Virtual Chassis was running Junos OS Release 10.4R2 or earlier when you committed this configuration.
- The Junos OS versions on the Virtual Chassis and the prospective member switch are different versions of the same major Junos OS release. For instance, if a Virtual Chassis is running Junos OS Release 10.4R1, the prospective member switch cannot be updated using automatic software update if it is running Junos OS Release 10.4R2, 10.4R3, or any other Junos OS Release 10.4 release version.

The automatic software update feature also has a Junos OS release dependency between the release that is already running on the Virtual Chassis and the release that is running on the prospective member switch.

[Table 667 on page 6927](#) summarizes automatic software update support for each Junos OS release combination.

Table 667: Automatic Software Update Support

Virtual Chassis Junos OS Release	Supported Junos OS Releases for Prospective Member Switches
All versions of Junos OS 9.0 through 9.6	All versions of Junos OS 9.0 through 9.6 Junos OS Releases 10.0R1 through 10.0R4 All versions of Junos OS Release 10.1 Junos OS Releases 10.2R1 through 10.2R3 Junos OS Releases 10.3R1 through 10.3R3

**Understanding MAC Address Assignment on a Virtual Chassis**

In a Virtual Chassis, multiple switches—each with its own set of interfaces with unique MAC addresses—are connected together to form one chassis that can be managed as a single switch. The MAC address assigned to each network-facing interface on the switch changes when the switch joins a Virtual Chassis. Because all Layer 2 traffic decisions are based on an interface's MAC address, understanding MAC address assignment is important to understanding how network traffic is forwarded and received by the Virtual Chassis. For additional information about how a network uses MAC addresses to forward and receive traffic, see *Understanding Bridging and VLANs on EX Series Switches*.

When a Virtual Chassis is formed, the MAC address of the switch in the master role becomes the system MAC base address. The Virtual Chassis assigns the system MAC base address as the MAC address for all Layer 3 interfaces within the Virtual Chassis. The Virtual Chassis also assigns the system MAC base address to the virtual management Ethernet (VME) interface and to all of the virtual LANs (VLANs) in the Virtual Chassis.

The system MAC base address does not change in the event of a switchover if the switch that was originally configured in the master role remains a member of the Virtual Chassis. If the switch that was originally configured in the master role is removed from the Virtual Chassis, the MAC address of the current member switch in the master role is assigned as the system MAC base address after the MAC persistence timer interval has expired. You can configure the MAC persistence timer interval.

For Layer 2 and aggregated Ethernet interfaces, the Virtual Chassis assigns a unique MAC address that is derived from the member switch MAC address to each interface. The assignment of a unique MAC address to each network interface helps ensure that functions that require MAC address differentiation—such as redundant trunk groups

(RTGs), Link Aggregation Control Protocol (LACP), and general monitoring functions—can function properly.

**NOTE:** Unique MAC address assignment for Layer 2 and aggregated Ethernet interfaces in a Virtual Chassis was introduced in Junos OS Release 11.3. The same MAC address could be assigned to interfaces on different member switches in the same Virtual Chassis prior to this release.

If you reconfigure a Layer 2 interface into a Layer 3 interface, or the reverse, within a Virtual Chassis, the MAC address of that interface changes accordingly.

MAC addresses are assigned to interfaces in a Virtual Chassis automatically—no user configuration is possible or required. You can view the MAC addresses that are assigned to the interfaces by using the **show interfaces** command.

### Configuring a QFX Series Virtual Chassis (CLI Procedure)

This topic discusses configuring a QFX Series Virtual Chassis only. It does not apply to configuring a Virtual Chassis Fabric (VCF). For information on configuring a VCF, see [“Understanding Virtual Chassis Fabric Configuration” on page 7043](#).

You configure a QFX Series Virtual Chassis—a Virtual Chassis composed of QFX3500 standalone switches, QFX3600 standalone switches, QFX5100 standalone switches, or a combination of the three—by configuring 10-Gbps SFP+ or 40-Gbps QSFP+ interfaces connecting the member switches into Virtual Chassis ports (VCPs). EX4300 switches can also be included in a Virtual Chassis with QFX3500, QFX3600, and QFX5100 switches. All non-channelized QSFP+ uplink interfaces on standalone QFX series switches can be configured into VCPs. All fixed SFP+ and QSFP+ interfaces on can also be configured into VCPs.

A Virtual Chassis can only be configured on a QFX series device configured in standalone mode. The Junos OS image that supports Virtual Chassis—the Junos OS images that support Virtual Chassis include the “jinstall-qfx-3-” text in the filename when the Junos OS image is downloaded from the Software Center—for standalone switches must be downloaded on QFX3500 or QFX3600 switches in order for the member switches to be part of a Virtual Chassis. For QFX5100 switches, you must download the software image for the standalone switch.

A QFX Series Virtual Chassis can be configured with either:

- A preprovisioned configuration—You can deterministically control the member ID and role assigned to a member switch by tying it to its serial number.
- A nonprovisioned configuration—The master sequentially assigns a member ID to other member switches. The role is determined by the mastership priority value and other factors in the master election algorithm.

.....  
**NOTE:** A Virtual Chassis configuration has two Routing Engines—the master switch and the backup switch. Therefore, we recommend that you always use `commit synchronize` rather than simply `commit` to save configuration changes made for a Virtual Chassis. This ensures that the configuration changes are saved to both switches acting as Routing Engines.  
.....

.....  
**NOTE:** In Junos OS release 13.2X51-D20, you can interconnect up to ten QFX5100 switches into a Virtual Chassis with the exception of the QFX5100-96S switch, which you could configure into a non-mixed Virtual Chassis that included up to four QFX5100-96S switches only.  
.....

You can configure up to ten QFX5100-96S switches into a mixed or non-mixed Virtual Chassis starting in Junos OS release 13.2X51-D25.  
.....

Be sure that all switches that are interconnected into a Virtual Chassis are running the same version of Junos OS. See [“Upgrading Software” on page 134](#).

This topic includes:

- [Configuring a QFX Series Virtual Chassis with a Preprovisioned Configuration File on page 6932](#)
- [Configuring a QFX Series Virtual Chassis with a Nonprovisioned Configuration File on page 6934](#)

### [Configuring a QFX Series Virtual Chassis with a Preprovisioned Configuration File](#)

Preprovisioning a Virtual Chassis configuration allows you to assign the member ID and role for each switch in the Virtual Chassis.

To configure a Virtual Chassis using a preprovisioned configuration:

**NOTE:** You can configure a QFX Series Virtual Chassis while the cables are or are not physically connected.

1. Make a list of the serial numbers of all the switches to be connected in a Virtual Chassis configuration.
2. Note the desired role (**routing-engine** or **line-card**) of each switch. If you configure the member with a **routing-engine** role, it is eligible to function in the master or backup role. If you configure the member with a **line-card** role, it is not eligible to function in the master or backup role.
3. Power on only the switch that you plan to use as the master switch.
4. Specify the identification parameters for the switch by completing the initial configuration. See [“Configuring a QFX3500 Device as a Standalone Switch” on page 175](#) or *Configuring a QFX3600 Device as a Standalone Switch*, or *Configuring a QFX5100 Device*.

**NOTE:** The properties that you specify for the master switch apply to the entire Virtual Chassis configuration.

5. (Optional) Configure the master switch with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis:  

```
user@switch# set interfaces vme unit 0 family inet address /ip-address/mask/
```
6. (Required for a mixed Virtual Chassis only) Set the master switch into mixed mode, and reboot the switch to complete the configuration:

**NOTE:** You do not have to complete this step if you are configuring a Virtual Chassis that includes QFX3500 and QFX3600 switches only.

You must complete this step if your Virtual Chassis includes a mix of QFX5100, EX4300, and QFX3500 or QFX3600 switches.

```
user@device> request virtual-chassis mode mixed reboot
```

7. After the reboot is complete, specify the preprovisioned configuration mode:

```
[edit virtual-chassis]
user@switch# set preprovisioned
```

8. Specify all the members that you want included in the Virtual Chassis, listing each switch's serial number with the desired member ID and role:

```
[edit virtual-chassis]
user@switch# set member 0 serial-number abc123 role routing-engine
user@switch# set member 1 serial-number def456 role routing-engine
user@switch# set member 2 serial-number ghi789 role line-card
user@switch# set member 3 serial-number jkl012 role line-card
```

9. (Optional. Recommended for a two-member Virtual Chassis) Disable the split and merge feature:

```
[edit virtual-chassis]
```

user@switch# **set no-split-detection**

10. Power on the other member switches. The member IDs and roles have been determined by the configuration, so you can power on the member switches in any order.
11. (Required if you are configuring a mixed Virtual Chassis) Set each individual switch into mixed mode, and reboot the switch to complete the configuration:

**NOTE:** You do not have to complete this step if you are configuring a Virtual Chassis that includes QFX3500 and QFX3600 switches only.

You must complete this step if your Virtual Chassis includes a mix of QFX5100, EX4300, and QFX3500 or QFX3600 switches.

user@device> **request virtual-chassis mode mixed reboot**

12. (Optional) On each individual member switch, configure the ports that will be used to interconnect the member switches into VCPs using the following command:

**NOTE:** SFP+ and QSFP+ links are automatically turned into VCPs when the preprovisioned configuration is set.

This step is, therefore, optional and should only be used when a VCP is not automatically created.

user@switch> **request virtual-chassis vc-port set pic-slot *pic-slot-number* port *port-number***  
where *pic-slot-number* is the PIC slot number.

For instance, if you wanted to set port 0 on the QSFP+ interface on PIC slot 2 as a VCP:

user@switch> **request virtual-chassis vc-port set pic-slot 2 port 0**

The VCPs automatically bundle into a Link Aggregation Group when two or more interfaces of the same speed are configured into VCPs between the same two member switches. See *Understanding EX Series Virtual Chassis Port Link Aggregation*.

**NOTE:** You cannot modify the mastership priority when you are using a preprovisioned configuration. The mastership priority values are generated automatically and controlled by the role that is assigned to the member switch in the configuration file. The two Routing Engines are assigned the same mastership priority value. However, the member that was powered on first has higher prioritization according to the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917](#).

---

## Configuring a QFX Series Virtual Chassis with a Nonprovisioned Configuration File

You can use nonprovisioned configuration to configure a QFX Series Virtual Chassis.

To configure the Virtual Chassis using a nonprovisioned configuration:

**NOTE:** You can configure a QFX Series Virtual Chassis while the cables are or are not physically connected.

1. Power on only the switch that you plan to use as the master switch.
2. (Required for a mixed Virtual Chassis only) Set the master switch into mixed mode, and reboot the switch to complete the configuration:

**NOTE:** You do not have to complete this step if you are configuring a Virtual Chassis that includes QFX3500 and QFX3600 switches only.

You must complete this step if your Virtual Chassis includes a mix of QFX5100, EX4300, and QFX3500 or QFX3600 switches.

```
user@device> request virtual-chassis mode mixed reboot
```

3. After the master switch reboots, specify the identification parameters for the switch by completing the initial configuration. See [“Configuring a QFX3500 Device as a Standalone Switch” on page 175](#) or *Configuring a QFX3600 Device as a Standalone Switch* for details.

**NOTE:** The properties that you specify for the master switch apply to the entire Virtual Chassis configuration.

4. (Optional) Configure the master switch with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis:

```
user@switch# set interfaces vme unit 0 family inet address /ip-address/mask/
```

5. (Optional) Configure mastership priority for the other member switches:

```
[edit virtual-chassis]
user@switch# set member 0 mastership-priority 255
user@switch# set member 1 mastership-priority 255
```

6. (Optional. Recommended for a two-member Virtual Chassis) On the master switch, disable the split and merge feature:

```
[edit virtual-chassis]
user@switch# set no-split-detection
```

7. Power on the other member switches.
8. (Required for a mixed Virtual Chassis only) Set each individual switch into mixed mode, and reboot the switch to complete the configuration:

**NOTE:** You do not have to complete this step if you are configuring a Virtual Chassis that includes QFX3500 and QFX3600 switches only.

You must complete this step if your Virtual Chassis includes a mix of QFX5100, EX4300, and QFX3500 or QFX3600 switches.

```
user@device> request virtual-chassis mode mixed reboot
```

9. On each individual member switch, configure the ports that will be used to interconnect the member switches into VCPs using the following command:

```
user@switch> request virtual-chassis vc-port set pic-slot pic-slot-number port port-number
```

where *pic-slot-number* is the PIC slot number.

For instance, if you wanted to set port 0 on the QSFP+ interface on PIC slot 2 as a VCP:

```
user@switch> request virtual-chassis vc-port set pic-slot 2 port 0
```

The VCPs automatically bundle into a Link Aggregation Group when two or more interfaces of the same speed are configured into VCPs between the same two member switches. See *Understanding EX Series Virtual Chassis Port Link Aggregation*.

**NOTE:** If you do not edit the Virtual Chassis configuration file, a nonprovisioned configuration is generated by default. The mastership priority value for each member switch is 128. The master role is selected by default. You can change the role that is performed by the members by modifying the mastership priority. See [“Configuring Mastership of a Virtual Chassis \(CLI Procedure\)” on page 6941](#). We recommend that you specify the same mastership priority value for the desired master and backup members. In this example, the highest possible mastership priority has been assigned to two members. However, the member that was powered on first has higher prioritization according to the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917](#). The other members use the default mastership priority in this example, which configures them to function in the role of linecard.

**NOTE:** If you want to change the member ID that the master has assigned to a member switch, use the `request virtual-chassis renumber` command.

#### Related Documentation

## Adding a New Switch to an Existing QFX Series Virtual Chassis (CLI Procedure)

This procedure applies to QFX Series Virtual Chassis only. For the procedure on adding a switch to a Virtual Chassis Fabric (VCF), see [“Adding a Device to a Virtual Chassis Fabric” on page 7062](#).

You can use this procedure to add an EX4300, QFX3500, QFX3600, or QFX5100 device to an existing QFX Series Virtual Chassis. A QFX Series Virtual Chassis is a Virtual Chassis composed of QFX3500 series switches, QFX3600 series switches, QFX5100 switches, or a mix of QFX Series switches. A QFX Series Virtual Chassis can also include EX4300 switches.

Before you begin, be sure you have:

- Mounted the new switch in a rack.
- Enabled automatic software update on the Virtual Chassis. See [“Configuring Automatic Software Update on Virtual Chassis Member Switches \(CLI Procedure\)” on page 6944](#).
- If you are expanding a preprovisioned configuration, made a note of the serial number (the number is on the back of the switch). You will need to edit the Virtual Chassis configuration to include the serial number of the new member switch.
- If you are expanding a preprovisioned configuration, edited the existing Virtual Chassis configuration to include the serial number of the new member switch. The parameters specified in the master Virtual Chassis configuration file are applied to the new switch after it has been interconnected to an existing member switch.

**NOTE:** If you are expanding a preprovisioned Virtual Chassis configuration, you can use the autoprovisioning feature to add member switches to that configuration.

- (Optional) Configured Ethernet interfaces on different member switches into the same LAG. See [“Configuring Link Aggregation” on page 2593](#).

An active member switch might temporarily go down before coming back up as part of this procedure. Having traffic load-balanced across member switches using a LAG helps alleviate traffic loss during this procedure.

To add a new member switch to an existing Virtual Chassis configuration:

1. If the new member switch has been previously configured, revert that switch's configuration to the factory defaults before interconnecting it into the Virtual Chassis. See [“Reverting to the Default Factory Configuration” on page 188](#).
2. (Required for a mixed Virtual Chassis only) Set the new switch into mixed mode, and reboot the switch to complete the configuration:

**NOTE:** You do not need to configure your Virtual Chassis into mixed mode if the Virtual Chassis is composed of QFX3500 and QFX3600 switches only.

```
user@device> request virtual-chassis mode mixed reboot
```

If you are adding a switch that converts a non-mixed Virtual Chassis into a mixed Virtual Chassis, you must also log onto the Virtual Chassis and enter the **request virtual-chassis mode mixed all-members reboot** command either before or after interconnecting the new switch into your Virtual Chassis.

3. Interconnect the new switch to one member of the existing Virtual Chassis. You interconnect the new member switch using a non-channelized QSFP+ interface or SFP+ interface.

Connect only one interface on the unpowered new switch to a VCP on a member switch in the existing Virtual Chassis at this point of the procedure.

4. Set the interface on the new member switch as a Virtual Chassis Port (VCP):  
`user@switch> request virtual-chassis vc-port set pic-slot slot-number port port-number`
5. Confirm that the new member switch is now included within the Virtual Chassis configuration by entering the `show virtual-chassis` command. The new member switch should be listed in the output and the **Status** is **Prsnt**.
6. Cable the next port into the Virtual Chassis, using Steps 2 through 5.

**CAUTION:** If you immediately cable both VCPs on the new switch into the existing Virtual Chassis at the same time, a member switch that was already part of the Virtual Chassis might become nonoperational for several seconds. Network traffic to this switch is dropped during the downtime.

The member switch will return to the normal operational state with no user intervention, and normal operation of the Virtual Chassis will resume after this downtime.

7. If further Virtual Chassis configuration is needed, see [“Configuring a QFX Series Virtual Chassis \(CLI Procedure\)”](#) on page 6931.

- [Configuring a QFX Series Virtual Chassis \(CLI Procedure\)](#) on page 6931

## Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure)

---

**NOTE:** This topic does not apply to Virtual Chassis Fabric (VCF) or EX8200 Virtual Chassis. See [“Removing a Device From a Virtual Chassis Fabric”](#) on page 7069 or [Adding or Replacing a Member Switch or an External Routing Engine in an EX8200 Virtual Chassis \(CLI Procedure\)](#).

You can replace a member switch in a Virtual Chassis without disrupting network service on the other members. You can retain the existing configuration of the member switch and apply it to a new member switch, or you can free up the member ID and make it available for assignment to a new member switch.

If you want to replace a member switch of a *mixed* Virtual Chassis that contains EX4200, EX4500, or EX4550 switches, see [Removing an EX4200, EX4500, or EX4550 Switch From a Mixed Virtual Chassis \(CLI Procedure\)](#).

To replace a member switch, use the procedure that matches what you need to accomplish:

- [Remove, Repair, and Reinstall the Same Switch on page 6939](#)
- [Remove a Member Switch, Replace It with a Different Switch, and Reapply the Old Configuration on page 6939](#)
- [Remove a Member Switch and Make Its Member ID Available for Reassignment to a Different Switch on page 6940](#)

### Remove, Repair, and Reinstall the Same Switch

If you need to repair a member switch, you can remove it from the Virtual Chassis configuration without disrupting network service for the other members. The master stores the configuration for the member ID so that it can be reapplied when the member switch (with the same base MAC address) is reconnected.

To remove, repair, and reinstall the member switch:

1. Power off and disconnect the member switch to be repaired.
2. Repair, as necessary.
3. Reconnect the switch and power it on.

### Remove a Member Switch, Replace It with a Different Switch, and Reapply the Old Configuration

If you are unable to repair a member switch, you can replace it with a different member switch while retaining the previous configuration. The master stores the configuration of the member that was removed. When you connect a different member switch, the master assigns a new member ID. But the old configuration is still stored under the previous member ID of the previous member switch.

**NOTE:** If you have used a preprovisioned configuration, you can use the `replace` command to change the serial number in the Virtual Chassis configuration file. Substitute the serial number of the replacement member switch (on the back of the switch) for the serial number of the member switch that was removed.

To remove and replace a switch and reapply the old configuration:

1. Power off and disconnect the member switch to be replaced.
2. If the replacement member switch has been previously configured, revert that switch's configuration to the factory defaults. See *Reverting to the Default Factory Configuration for the EX Series Switch* for information on reverting to the factory default configuration on an EX Series switch or [“Reverting to the Default Factory Configuration” on page 188](#) for information on reverting to the factory default configuration on a QFX Series switch.
3. If you are interconnecting a switch using a dedicated VCP, connect one VCP on the replacement member switch to a VCP of another Virtual Chassis member switch.

If you are interconnecting a switch using an optical port configured as a VCP, cable the optical ports together then configure the port on the Virtual Chassis as a VCP:

```
user@switch> request virtual-chassis vc-port set pic-slot 1 port port-number
```

4. Power on the new member switch.
5. Confirm that the new member switch is now included in the Virtual Chassis configuration by checking the front-panel LCD or the for the member ID. It should display a member ID in the range from 0 through 9.

If you are using a switch that does not have an LCD interface, confirm the switch is part of the Virtual Chassis configuration by entering the **show virtual-chassis** and reviewing the output.

6. Cable the other VCP on the new member switch into the Virtual Chassis. Use the instruction in step 3 to complete this step.

**CAUTION:** If you immediately cable both VCPs on the new switch into the existing Virtual Chassis at the same time, a member switch that was already part of the Virtual Chassis might become nonoperational for several seconds. Network traffic to this switch is dropped during the downtime.

The member switch will return to the normal operational state with no user intervention, and normal operation of the Virtual Chassis will resume after this downtime.

7. On the master switch, Issue the **request virtual-chassis renumber** command from the Virtual Chassis master to change the member switch's current member ID to the member ID of the member switch that was removed from the Virtual Chassis configuration.

### Remove a Member Switch and Make Its Member ID Available for Reassignment to a Different Switch

---

When you remove a member switch from the Virtual Chassis configuration, the master keeps that member switch's member ID in reserve. To make that member switch's member ID available for reassignment, issue the **request virtual-chassis recycle** command from the Virtual Chassis master.

**NOTE:** When you add or delete members in a Virtual Chassis configuration, internal routing changes might cause temporary traffic loss for a few seconds.

- *Adding an EX4500 Switch to a Nonprovisioned EX4200 Virtual Chassis (CLI Procedure)*

## Configuring Mastership of a Virtual Chassis (CLI Procedure)

**NOTE:** This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See *Configuring an EX8200 Virtual Chassis (CLI Procedure)* for information about EX8200 Virtual Chassis.

You can designate the role (master, backup, or linecard) that a member switch performs within any Virtual Chassis, whether or not you are using a preprovisioned configuration.

**NOTE:** A Virtual Chassis configuration has two Routing Engines—one is the switch in the master role and the other is the switch in the backup role. Therefore, we recommend that you always use `commit synchronize` rather than `commit` to save configuration changes made for a Virtual Chassis. This ensures that the configuration changes are saved in both Routing Engines.

This topic describes:

- [Configuring Mastership Using a Preprovisioned Configuration File on page 6941](#)
- [Configuring Mastership Using a Configuration File That Is Not Preprovisioned on page 6942](#)

### Configuring Mastership Using a Preprovisioned Configuration File

To configure mastership using a preprovisioned configuration:

1. Note the serial numbers of the switches that you want to function in the master role and backup role.
2. Power on only the switch that you want to function in the master role.
3. Edit the configuration to specify the preprovisioned configuration mode:

```
[edit virtual-chassis]
user@switch# set preprovisioned
```

4. Specify the serial numbers of the member switches that you want to function as master and backup, specifying their role as **routing-engine**:

```
[edit]
user@switch# set virtual-chassis member 0 serial-number abc123 role routing-engine
user@switch# set virtual-chassis member 1 serial-number def456 role routing-engine
```

**NOTE:** You cannot directly modify the mastership priority value when you are using a preprovisioned configuration. The mastership priority values are generated automatically and controlled by the role that is assigned to the member switch in the configuration file. The two members assigned the **routing-engine** role are assigned the same mastership priority value (128). However, the member that was powered on first has higher priority for the master role election according to the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917](#). Only two members can be configured with the **routing-engine** role.

5. Specify the serial numbers of any other member switches that you are including in the Virtual Chassis configuration. You can also explicitly configure their role as **line-card**.

### Configuring Mastership Using a Configuration File That Is Not Preprovisioned

To configure mastership of the Virtual Chassis through a configuration that is not preprovisioned:

1. Power on only the switch that you want to function in the master role.
2. Configure the highest possible mastership priority value (**255**) for the member that you want to function in the master role:  

```
[edit virtual-chassis]
user@switch# set member 0 mastership-priority 255
```
3. Configure the same mastership priority value (continue to edit the Virtual Chassis configuration on the master) for the member that you want to be in the backup role:  

```
[edit virtual-chassis]
user@switch# set member 1 mastership-priority 255
```

**NOTE:** We recommend that the master and backup have the same mastership priority value to prevent the master and backup status from switching back and forth between master and backup members in failover conditions.

4. Use the default mastership priority value (**128**) for the remaining member switches or configure the mastership priority to a value that is lower than the value specified for members functioning in the master and backup roles.

## Configuring the Timer for the Backup Member to Start Using Its Own MAC Address, as Master of a Virtual Chassis (CLI Procedure)

When a backup member takes control of a Virtual Chassis because of a reset or other temporary failure, the backup member uses the MAC address of the old master switch as the system MAC base address. This process helps ensure a smooth transition of mastership with no disruption to network connectivity.

The MAC persistence timer is used in situations in which the master switch is no longer a member of the Virtual Chassis because it has been physically disconnected or removed. If the old master switch does not rejoin the Virtual Chassis before the timer elapses, the new master switch starts using its own MAC address as the system's MAC base address. For information regarding how the system MAC base address is used to assign MAC addresses to ports in a Virtual Chassis, see ["Understanding MAC Address Assignment on a Virtual Chassis" on page 6928](#).

The default timer value is 10 minutes. The maximum timer value is 60 minutes.

You can disable the MAC persistence timer starting in Junos OS Release 12.2. When the MAC persistence timer is disabled, the MAC address of the old master switch is used as the system MAC base address; no MAC address changes occur within the Virtual Chassis even when the old master switch is no longer a member of the Virtual Chassis because it has been physically disconnected or removed.

To configure or modify the MAC persistence timer:

```
[edit virtual-chassis]
user@switch# set mac-persistence-timer minutes
```

To disable the MAC persistence timer:

```
[edit virtual-chassis]
user@switch# set mac-persistence-timer disable
```

## Disabling Split and Merge in a Virtual Chassis (CLI Procedure)

The split and merge feature is enabled by default on all EX Series switches and QFX Series devices in a Virtual Chassis. You can disable the split and merge feature. If you disable the split and merge feature and the Virtual Chassis splits, both parts of the split Virtual Chassis configuration remain active.

In a preprovisioned Virtual Chassis, if both of the Routing Engines end up in the same Virtual Chassis configuration after a split, the other part of the split Virtual Chassis configuration remains inactive. If the Routing Engines end up in different parts of the split Virtual Chassis configuration and the rest of the member switches are configured as having linecard roles, then a backup Routing Engine might not be selected for either part.

We recommend disabling split and merge on a Virtual Chassis with two member switches. A two-member switch Virtual Chassis that has disabled split and merge can reform more quickly and with less complications as a result of the feature being disabled.

To disable the split and merge feature in a Virtual Chassis:

```
[edit]
user@switch# set virtual-chassis no-split-detection
```

### Related Documentation

- [Example: Assigning the Virtual Chassis ID to Determine Precedence During an EX4200 Virtual Chassis Merge](#)
- [Understanding Split and Merge in a Virtual Chassis on page 6922](#)

## Configuring Automatic Software Update on Virtual Chassis Member Switches (CLI Procedure)

The automatic software update feature allows you to automatically update the software version on prospective member switches as they are added so that they can join the Virtual Chassis.

**NOTE:** The version of Junos OS running on the Virtual Chassis must be compatible with the software running on the prospective member switch for an automatic software update to occur. For information on Junos OS compatibility and other automatic software update restrictions, see [“Understanding Automatic Software Update on Virtual Chassis Member Switches” on page 6925](#).

Before you begin, ensure that you know the name or the URL of the software package to be used by the automatic software update feature.

To configure the automatic software update feature for an EX Series or QFX Series Virtual Chassis with the exception of a mixed Virtual Chassis containing at least one EX4200 switch and at least one EX4500 or EX4550 switch:

[edit]

```
user@switch# set virtual-chassis auto-sw-update package-name package-name
```

To configure the automatic software update feature on a mixed Virtual Chassis containing at least one EX4200 switch and at least one EX4500 or EX4550 switch:

[edit]

```
user@switch# set virtual-chassis auto-sw-update ex-4200 package-name package-name
```

```
user@switch# set virtual-chassis auto-sw-update ex-4500 package-name package-name
```

If the software package is located on a local directory on the switch, use the following format for **package-name**:

***/pathname/package-name***

If the software package is to be downloaded and installed from a remote location, use one of the following formats:

***ftp://hostname/pathname/package-name***

***ftp://username:prompt@ftp.hostname.net/package-name***

***http://hostname/pathname/package-name***

If you are configuring a mixed Virtual Chassis containing at least one EX4200 switch and at least one EX4500 or EX4550 switch, use the **ex-4200** keyword when you are specifying a path to a package for the EX4200 switches and the **ex-4500** when you are specifying a path to a package for the EX4500 or EX4550 switches. You do not need to specify the **ex4500** keyword when configuring automatic software update for a mixed EX4500 and EX4550 Virtual Chassis, however, because the Junos OS package for an EX4500 switch updates the software for both EX4500 and EX4550 switches.

#### Related Documentation

- *Example: Configuring Automatic Software Update on EX4200 Virtual Chassis Member Switches*
- [Understanding Automatic Software Update on Virtual Chassis Member Switches on page 6925](#)

## Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge (CLI Procedure)

Every Virtual Chassis has a unique ID that is automatically assigned when the Virtual Chassis configuration is formed. You can also explicitly assign a Virtual Chassis ID using the **set virtual-chassis id** command. When two Virtual Chassis configurations attempt to merge, the Virtual Chassis ID that you assigned takes precedence over the automatically assigned Virtual Chassis IDs and becomes the ID for the newly merged Virtual Chassis configuration.

To configure the Virtual Chassis ID:

```
[edit]
user@switch# set virtual-chassis id id
```

### Related Documentation

## [edit virtual-chassis] Configuration Statement Hierarchy

This topic lists supported and unsupported configuration statements in the **[edit virtual-chassis]** hierarchy level on EX Series and QFX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms.

For detailed information about feature support on specific EX Series or QFX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit virtual-chassis\] Hierarchy Level on page 6947](#)
- [Unsupported Statements in the \[edit virtual-chassis\] Hierarchy Level on page 6948](#)

### Supported Statements in the [edit virtual-chassis] Hierarchy Level

The following hierarchy shows the **[edit virtual-chassis]** configuration statements supported on EX Series or QFX Series switches:

```
virtual-chassis {
  aliases {
    serial-number serial-number {
      alias-name alias-name;
    }
  }
  auto-provisioned;
  auto-sw-update {
    (ex-4200 | ex-4300 | ex-4500 | ex-4600 | qfx-3 | qfx-5)
    package-name package-name;
  }
  fast-failover (ge | vcp disable | xe);
  graceful-restart {
    disable;
  }
  id id;
  mac-persistence-timer [minutes | disable];;
  member member-id {
    location location;
    mastership-priority number;
    no-management-vlan;
    role (line-card | routing-engine);
    serial-number;
  }
  no-split-detection;
  preprovisioned;
  traceoptions {
```

```
file filename <files number> <size size> <world-readable | no-world-readable> <match
  regex>;
flag flag ;
}
vc-port {
  lag-hash (packet-based | source-port-based);
}
vcp-no-hold-time;
}
```

---

### Unsupported Statements in the [edit virtual-chassis] Hierarchy Level

All statements in the [edit virtual-chassis] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

## aliases (Virtual Chassis)

<b>Syntax</b>	<pre>aliases {   serial-number serial-number {     alias-name alias-name;   } }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1X53-D10 for EX Series and QFX Series switches.
<b>Description</b>	<p>Create an alias for a member switch in a Virtual Chassis or Virtual Chassis Fabric (VCF). An alias allows you to more clearly identify the member switches in your Virtual Chassis or VCF by assigning a text label to a member switch's serial number.</p> <p>An alias is not specified for a device until the alias name is specified using the <b>alias-name</b> keyword.</p> <p>The alias appears in the <b>Alias-Name</b> field in the <b>show virtual-chassis</b> command.</p> <p>Alias usage is optional and aliases are used for administrative purposes only. Setting an alias has no effect on the operation of the member switch.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li> <li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li> <li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li> <li>• <a href="#">Understanding Virtual Chassis Fabric Components on page 7035</a></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis Components on page 6909</a></li> </ul>

## alias-name (Virtual Chassis aliases)

---

**Syntax** `alias-name alias-name;`

**Hierarchy Level** `[edit virtual-chassis aliases serial-number serial-number]`

**Release Information** Statement introduced in Junos OS Release 14.1X53-D10 for EX Series and QFX Series switches.

**Description** Create an alias for a member switch in a Virtual Chassis or Virtual Chassis Fabric (VCF). An alias allows you to more clearly identify the member switches in your Virtual Chassis or VCF by assigning a text label to a member switch's serial number.

The alias appears in the **Alias-Name** field in the **show virtual-chassis** command.

Alias usage is optional and aliases are used for administrative purposes only. Setting an alias has no effect on the operation of the member switch.

In the following example, the **dc-floor-1** alias name is assigned to the member switch with the serial number AB0123456789.

### set serial-number

```
[edit virtual-chassis aliases]
user@switch# set serial-number AB0123456789 alias-name dc-floor-1
```

### show virtual-chassis

```
user@switch> show virtual-chassis
Preprovisioned Virtual Chassis Fabric
Fabric ID: 9d5d.5556.919a
Fabric Mode: Enabled

Member ID  Status   Serial No   Alias-Name   Model          Mstr  prio  Role
0 (FPC 0)  Prsnt    AB0123456789 dc-floor-1   qfx5100-48s-6q 129   Master
<additional output removed for brevity>
```

**Options** *alias-name*—The text label, or alias, assigned to the member switch by the user.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

## auto-sw-update

<b>Syntax</b>	<pre> auto-sw-update {   (ex-4200   ex-4300   ex-4500   ex-4600   qfx-3   qfx-5)   package-name package-name; } </pre>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>The <b>ex-4200</b> and <b>ex-4500</b> options introduced in Junos OS Release 12.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>The <b>ex-4300</b>, <b>qfx-3</b>, and <b>qfx-5</b> options introduced in Junos OS Release 13.2X51-D20.</p> <p>The <b>ex-4600</b> option introduced in Junos OS Release 13.2X51-D25.</p>
<b>Description</b>	<p>Enable the automatic software update feature for Virtual Chassis or Virtual Chassis Fabric (VCF) configurations.</p> <p>You should only use the keywords that specify a device—<b>ex-4300</b>, <b>ex-4600</b>, <b>qfx-3</b>, and <b>qfx-5</b>—when configuring automatic software update on a mixed Virtual Chassis or Virtual Chassis Fabric (VCF). You can simply specify the <i>package-name</i> without specifying the device keywords in non-mixed Virtual Chassis or VCF topologies.</p> <p>You must enter the <b>auto-sw-update</b> statement multiple times—once for each device family in your mixed Virtual Chassis or VCF—in most scenarios when enabling the automatic software update for a mixed Virtual Chassis or VCF.</p> <p>The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. You do not, therefore, need to specify the <b>ex-4500</b> keyword when configuring automatic software update for a mixed Virtual Chassis that include EX4500 and EX4550 switches only. You also only have to enter the <b>ex-4500</b> keyword once to configure automatic software update for all EX4500 and EX4550 member switches in the same mixed Virtual Chassis.</p> <p>The Junos OS package for a QFX3500 device updates the software for QFX3500 and QFX3600 devices. You do not, therefore, need to specify the <b>qfx-3</b> keyword when configuring automatic software update for a Virtual Chassis composed entirely of QFX3500 and QFX3600 devices. You also have to enter the <b>qfx-3</b> keyword only once to configure automatic software update for all QFX3500 and QFX3600 member devices in the same mixed Virtual Chassis.</p> <p>The remaining statement is explained separately.</p>
<b>Default</b>	The automatic software update feature is disabled.
<b>Options</b>	<p><b>package-name package-name</b>—Specify a path to a Junos OS software image.</p> <p><b>ex-4200</b>—Specify a path to a Junos OS image for an EX4200 switch when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed</p>

EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

**ex-4300**—Specify a path to a Junos OS image for an EX4300 switch when enabling automatic software update for a mixed Virtual Chassis or VCF.

**ex-4500**—Specify a path to a Junos OS image for an EX4500 switch, an EX4550 switch, or both types of switches when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. Therefore, you only enter this command once to upgrade the EX4500 and EX4550 member switches in the same mixed Virtual Chassis.

The **ex-4500** keyword also does not need to be specified when configuring automatic software update for a mixed EX4500 and EX4550 Virtual Chassis.

**ex-4600**—Specify a path to a Junos OS image for an EX4600 switch when enabling automatic software update for a mixed Virtual Chassis.

**qfx-3**—Specify a path to a Junos OS image for a QFX3500, QFX3600, or both types of devices when enabling automatic software update for a mixed VCF.

**qfx-5**—Specify a path to a Junos OS image for a QFX5100 device when enabling automatic software update for a mixed VCF.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## id

---

<b>Syntax</b>	<code>id id;</code>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Configure the alphanumeric string that identifies a Virtual Chassis or Virtual Chassis Fabric (VCF) configuration.
<b>Options</b>	<i>id</i> —Virtual Chassis ID (VCID), which uses the ISO family address format—for example, <b>9622.6ac8.5345</b> .
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Assigning the Virtual Chassis ID to Determine Precedence During an EX4200 Virtual Chassis Merge</i></li> <li>• <a href="#">Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge (CLI Procedure) on page 6946</a></li> <li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li> <li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li> <li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li> <li>• <i>Configuring an EX8200 Virtual Chassis (CLI Procedure)</i></li> <li>• <i>Understanding Virtual Chassis Member ID Numbering in an EX8200 Virtual Chassis</i></li> </ul>

## location (Virtual Chassis)

---

<b>Syntax</b>	<code>location location;</code>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis member member-id</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>Set a description of the location of the Virtual Chassis or VCF member switch or external Routing Engine.</p> <p>The <b>Location</b> field is visible to users who enter the <b>show virtual-chassis status detail</b> command.</p> <p>Setting this description has no effect on the operation of the member device.</p>
<b>Options</b>	<b>location</b> —Location of the current member switch or external Routing Engine. The <b>location</b> can be any single word.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li><li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li><li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li><li>• <i>Example: Configuring an EX4200 Virtual Chassis Using a Preprovisioned Configuration File</i></li><li>• <i>Example: Configuring a Preprovisioned Mixed EX4200 and EX4500 Virtual Chassis</i></li><li>• <i>Example: Setting Up a Full Mesh EX8200 Virtual Chassis with Two EX8200 Switches and Redundant XRE200 External Routing Engines</i></li><li>• <a href="#">Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)</a></li><li>• <a href="#">Configuring a Mixed Virtual Chassis with EX4200, EX4500, and EX4550 Member Switches (CLI Procedure)</a></li><li>• <a href="#">Configuring an EX8200 Virtual Chassis (CLI Procedure)</a></li></ul>

## mac-persistence-timer

<b>Syntax</b>	mac-persistence-timer [ <i>minutes</i>   <b>disable</b> ];
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>disable</b> introduced in Junos OS Release 12.2 for EX Series switches.</p> <p>The maximum timer limit changed from no maximum timer limit to 60 minutes in Junos OS Release 12.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>Specify how long the Virtual Chassis or VCF continues to use the MAC address of the switch that was originally configured in the master role as the system MAC base address after the original master switch is removed from the Virtual Chassis or VCF. The system MAC base address does not change in the event of a switchover provided the switch originally configured in the master role remains a member of the Virtual Chassis or VCF.</p> <p>The maximum timer limit is 60 minutes starting in Junos OS Release 12.2. There are no minimum or maximum timer limits in prior Junos OS releases.</p>
<b>Default</b>	The MAC persistence timer is set to 10 minutes by default.
<b>Options</b>	<p><b>minutes</b>—Time in minutes that the member switch in the backup role continues to use the system MAC base address of the old master before using its own system MAC base address after the switch in the master role is physically disconnected or removed from the Virtual Chassis or VCF.</p> <p><b>disable</b>—Disable the MAC persistence timer. The system MAC base address never changes when the MAC persistence timer is disabled, even when the switch in the master role is physically disconnected or removed from the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Timer for the Backup Member to Start Using Its Own MAC Address, as Master of a Virtual Chassis (CLI Procedure) on page 6943</a></li> <li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li> <li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li> </ul>

## mastership-priority

---

<b>Syntax</b>	<code>mastership-priority <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis member</a> <i>member-id</i> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Mastership priority option <b>0</b> introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>The mastership priority value is the most important factor in determining the role of the member switch within a nonprovisioned Virtual Chassis or VCF configuration. Other factors (see <a href="#">“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917</a>) also affect the election of the master.</p> <p>The mastership priority value takes the highest precedence in the master election algorithm. The member switch with highest mastership priority assumes the master Routing Engine role of the Virtual Chassis or VCF. Toggling back and forth between master and backup status in failover conditions is undesirable, so we recommend that you assign the same mastership priority value to both the master and the backup. Secondary factors in the master election algorithm determine which of these two members (that is, the two members that are assigned the highest mastership priority value) functions as the master of the Virtual Chassis or VCF.</p> <p>This statement is not used for the EX8200 Virtual Chassis, which determines mastership by external Routing Engine uptime. See <i>Understanding Virtual Chassis Roles in an EX8200 Virtual Chassis</i>.</p> <p>A switch with a mastership priority of <b>0</b> never takes the master or backup role.</p>
<b>Default</b>	128
<b>Options</b>	<p><i>number</i>—Mastership priority value.</p> <p><b>Range:</b> 0 through 255</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li><li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li><li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li><li>• <a href="#">Configuring an EX4300 Virtual Chassis (CLI Procedure)</a></li><li>• <a href="#">Example: Configuring an EX3300 Virtual Chassis with a Master and Backup</a></li><li>• <a href="#">Example: Configuring an EX4200 Virtual Chassis with a Master and Backup in a Single Wiring Closet</a></li></ul>

- *Example: Configuring an EX4200 Virtual Chassis Interconnected Across Multiple Wiring Closets*
- *Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)*

## member

---

<b>Syntax</b>	<pre>member <i>member-id</i> {     <i>location</i> <i>location</i>;     <i>mastership-priority</i> <i>number</i>;     <i>no-management-vlan</i>;     <i>serial-number</i> <i>serial-number</i>;     <i>role</i> <i>role</i>; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Configure a switch or an XRE200 External Routing Engine as a member of a Virtual Chassis or a Virtual Chassis Fabric (VCF).
<b>Default</b>	<p>When an EX Series switch or a QFX Series devices configured in standalone mode is powered on but not interconnected through its Virtual Chassis ports (VCPs) with other member switches, its default member ID is 0.</p> <p>There is no default member ID in an EX8200 or EX9200 Virtual Chassis. An EX8200 or EX9200 Virtual Chassis must be preprovisioned, and that process configures the member IDs.</p>
<b>Options</b>	<p><b><i>member-id</i></b>—Identifies a specific member switch of a Virtual Chassis or VCF configuration.</p> <p>The exact range for a specific Virtual Chassis or VCF depends on the number of switches allowed in the Virtual Chassis or VCF.</p> <p>In an EX8200 Virtual Chassis, member IDs 0 through 7 are reserved for EX8200 member switches and member IDs 8 and 9 are reserved for the master and backup external Routing Engines.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li><li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li><li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li><li>• <a href="#">Example: Configuring an EX4200 Virtual Chassis Using a Preprovisioned Configuration File</a></li><li>• <a href="#">Example: Setting Up a Full Mesh EX8200 Virtual Chassis with Two EX8200 Switches and Redundant XRE200 External Routing Engines</a></li></ul>

## no-management-vlan

<b>Syntax</b>	no-management-vlan;
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis member member-id</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	<p>Remove the specified member's out-of-band management port from the virtual management Ethernet (VME) global management VLAN of the Virtual Chassis or VCF configuration.</p> <p>For a member that is functioning in a linecard role, you can use this configuration to reserve the member's management Ethernet port for local troubleshooting:</p> <pre>virtual-chassis {   member 2 {     no-management-vlan;   } }</pre> <p>You cannot configure the IP address for a local management Ethernet port using the CLI or the J-Web interface. To do this, you need to use the shell <b>ifconfig</b> command.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Setting Up a Multimember EX4200 Virtual Chassis Access Switch with a Default Configuration</a></li> <li>• <a href="#">Configuring the Virtual Management Ethernet Interface for Global Management of an EX Series Virtual Chassis (CLI Procedure)</a></li> <li>• <a href="#">Understanding Global Management of a Virtual Chassis on page 6919</a></li> <li>• <a href="#">Understanding Virtual Chassis Fabric Configuration on page 7043</a></li> </ul>

## no-split-detection

---

<b>Syntax</b>	no-split-detection;
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	<p>Disable the split and merge feature in a Virtual Chassis or VCF configuration.</p> <p>We recommend using this statement to disable the split and merge feature when configuring a two-member Virtual Chassis. Enabling this statement on a two-member Virtual Chassis ensures that both switches remain in the correct Virtual Chassis roles in the event of a Virtual Chassis split.</p>
<b>Default</b>	The split and merge feature is enabled.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Assigning the Virtual Chassis ID to Determine Precedence During an EX4200 Virtual Chassis Merge</i></li><li>• <a href="#">Disabling Split and Merge in a Virtual Chassis (CLI Procedure) on page 6944</a></li><li>• <a href="#">Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge (CLI Procedure) on page 6946</a></li><li>• <a href="#">Understanding Split and Merge in a Virtual Chassis on page 6922</a></li></ul>

## package-name

<b>Syntax</b>	<code>package-name <i>package-name</i>;</code>
<b>Hierarchy Level</b>	[edit virtual-chassis <a href="#">auto-sw-update</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Specify the software package name or location of the software package to be used by the automatic software update feature for Virtual Chassis or VCF.
<b>Default</b>	No package name is specified.
<b>Options</b>	<p><b><i>package-name</i></b>—Name of the software package or the URL to the software package to be used.</p> <ul style="list-style-type: none"> <li>If the software package is located on a local directory on the switch, use the following format for <b><i>package-name</i></b>:  <b><i>/pathname/package-name</i></b></li> <li>If the software package is to be downloaded and installed from a remote location, use one of the following formats:  <b><i>ftp://hostname/pathname/package-name</i></b> <b><i>ftp://username:prompt@ftp.hostname.net/package-name</i></b> <b><i>http://hostname/pathname/package-name</i></b></li> </ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Example: Configuring Automatic Software Update on EX4200 Virtual Chassis Member Switches</i></li> <li><a href="#">Configuring Automatic Software Update on Virtual Chassis Member Switches (CLI Procedure)</a> on page 6944</li> <li><a href="#">Understanding Software Upgrades in a Virtual Chassis Fabric</a> on page 7050</li> </ul>

## preprovisioned

---

<b>Syntax</b>	preprovisioned;
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>Enable the preprovisioned configuration mode for a Virtual Chassis or Virtual Chassis Fabric (VCF) configuration.</p> <p>When the preprovisioned configuration mode is enabled, you cannot use the CLI or the J-Web interface to change the mastership priority or member ID of member switches.</p> <p>You must use this statement to configure an EX8200 Virtual Chassis. Nonprovisioned configuration of an EX8200 Virtual Chassis is not supported.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li><li>• <i>Example: Configuring an EX4200 Virtual Chassis Using a Preprovisioned Configuration File</i></li><li>• <i>Example: Setting Up a Full Mesh EX8200 Virtual Chassis with Two EX8200 Switches and Redundant XRE200 External Routing Engines</i></li><li>• <i>Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)</i></li><li>• <i>Configuring an EX8200 Virtual Chassis (CLI Procedure)</i></li><li>• <i>Configuring an EX9200 Virtual Chassis</i></li><li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li><li>• <a href="#">Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure) on page 6938</a></li></ul>

## role

<b>Syntax</b>	<code>role (line-card   routing-engine);</code>
<b>Hierarchy Level</b>	[edit <b>virtual-chassis</b> <b>preprovisioned member</b> <i>member-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Specify the roles of the members of the Virtual Chassis or a Virtual Chassis Fabric (VCF) in a preprovisioned Virtual Chassis.

### Virtual Chassis Fabric

Specify the role to be performed by each switch. In a VCF, the spine devices are configured into the Routing Engine role and the leaf devices are configured into the line card role. You can configure several devices into the Routine Engine role, but only two will operate in the Routing Engine role at a time. The role must be associated with the member's serial number.

### EX Series (except EX8200 Virtual Chassis) and QFX Series Virtual Chassis

Specify the role to be performed by each member switch. Associate the role with the member's serial number.

When you use a preprovisioned configuration, you cannot modify the mastership priority or member ID of member switches through the user interfaces. The mastership priority value is generated by the software, based on the assigned role:

- A member configured as **routing-engine** is assigned the mastership priority **129**.
- A member configured as **line-card** is assigned the mastership priority **0**.
- A member listed in the preprovisioned configuration without an explicitly specified role is assigned the mastership priority **128**.

The configured role specifications are permanent. If both **routing-engine** members fail, a **line-card** member cannot take over as master of the Virtual Chassis configuration. You must delete the preprovisioned configuration to change the specified roles in a Virtual Chassis.

Explicitly configure two members as **routing-engine** and configure additional switches as members of the preprovisioned Virtual Chassis by specifying only their serial numbers. If you do not explicitly configure the role of the additional members, they function in a linecard role by default. In that case, a member that is functioning in a linecard role can take over mastership if the members functioning as master and backup (**routing-engine** role) both fail.

### EX8200 Virtual Chassis

Specify the role to be performed by each XRE200 External Routing Engine and each EX8200 member switch. Associate the role with the member's serial number. An EX8200 Virtual Chassis cannot function when both external Routing Engines, which must be configured in the **routing-engine** role, have failed.

- Options**
- **line-card**—Enables the member to be eligible to function only in the linecard role. Any member of the Virtual Chassis or VCF configuration other than the master or backup functions in the linecard role and runs only a subset of Junos OS for EX Series switches. A member functioning in the linecard role does not run the control protocols or the chassis management processes.

A Virtual Chassis must have at least three members for one member to function in the linecard role.

In an EX8200 Virtual Chassis configuration, all member switches must be in the linecard role.

- **routing-engine**—Enables the member to function as a master or backup of the Virtual Chassis or VCF configuration. The master manages all members and runs the chassis management processes and control protocols. The backup synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it is prepared to preserve routing information and maintain network connectivity without disruption in case the master is unavailable.

(All Virtual Chassis composed of EX Series switches, except EX8200 switches, or QFX Series devices) Specify two and only two members as **routing-engine**. The software determines which of the two members assigned the **routing-engine** role functions as master, based on the master election algorithm. See ["Understanding How the Master in a Virtual Chassis Is Elected" on page 6917](#). In these Virtual Chassis, the **routing-engine** role is associated with a switch.

(EX8200 Virtual Chassis) All XRE200 External Routing Engines must be in the **routing-engine** role.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
---------------------------------	-------------------------------------------------------------------------------------------------------------------

## serial-number

---

<b>Syntax</b>	<code>serial-number serial-number;</code>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis preprovisioned member member-id</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>In a preprovisioned Virtual Chassis or Virtual Chassis Fabric (VCF), specify the serial number of each member switch to be included in the configuration. If you do not include the serial number within the configuration, the switch cannot be recognized as a member of a preprovisioned configuration.</p> <p>In an EX8200 Virtual Chassis configuration, specify the serial number of each XRE200 External Routing Engine and each EX8200 member switch to be included in the Virtual Chassis configuration. If you do not include the serial number within the Virtual Chassis configuration, the external Routing Engine or switch cannot be recognized as a member of the configuration.</p>
<b>Options</b>	<b>serial-number</b> —Permanent serial number for the external Routing Engine or for the member switch.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li><li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li><li>• <i>Configuring an EX2200 Virtual Chassis (CLI Procedure)</i></li><li>• <i>Configuring an EX3300 Virtual Chassis (CLI Procedure)</i></li><li>• <i>Configuring an EX4300 Virtual Chassis (CLI Procedure)</i></li><li>• <i>Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)</i></li><li>• <i>Configuring an EX8200 Virtual Chassis (CLI Procedure)</i></li><li>• <i>Configuring an EX9200 Virtual Chassis</i></li><li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li><li>• <i>Configuring a Virtual Chassis on an EX Series Switch (J-Web Procedure)</i></li></ul>

## serial-number (Virtual Chassis aliases)

---

<b>Syntax</b>	<code>serial-number <i>serial-number</i> {     <i>alias-name alias-name</i>; }</code>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis aliases</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1X53-D10 for EX Series and QFX Series Virtual Chassis and Virtual Chassis Fabric (VCF).
<b>Description</b>	Specify the serial number that will be labeled with an alias in a Virtual Chassis or Virtual Chassis Fabric (VCF).  The remaining statements are explained separately.
<b>Options</b>	<b><i>serial-number</i></b> —Permanent serial number for the member switch in the Virtual Chassis or VCF.  You can retrieve the serial number for any device in your Virtual Chassis or VCF by entering the <b>show virtual-chassis</b> command and reviewing the output in the <b>Serial No</b> field.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li> <li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li> <li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li> <li>• <a href="#">Understanding Virtual Chassis Fabric Components on page 7035</a></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis Components on page 6909</a></li> </ul>

## traceoptions (Virtual Chassis)

---

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;no-stamp&gt; &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;world-readable       no-world-readable&gt;;     flag <i>flag</i> &lt;detail&gt; &lt;disable&gt; &lt;receive&gt; &lt;send&gt;; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>detail</b> added in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	Define tracing operations for the Virtual Chassis or VCF.
<b>Default</b>	Tracing operations are disabled.
<b>Options</b>	<p><b>detail</b>—(Optional) Generate detailed trace information for a flag.</p> <p><b>disable</b>—(Optional) Disable a flag.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations.</li></ul> <div><p><b>TIP:</b> The <b>all</b> flag displays a subset of logs that are useful in debugging most issues. For more detailed information, use <b>all detail</b>.</p></div> <ul style="list-style-type: none"><li>• <b>auto-configuration</b>—Trace Virtual Chassis ports (VCPs) that have been automatically configured.</li><li>• <b>csn</b>—Trace Virtual Chassis complete sequence number (CSN) packets.</li><li>• <b>error</b>—Trace Virtual Chassis errored packets.</li></ul>

- **hello**—Trace Virtual Chassis hello packets.
- **krt**—Trace Virtual Chassis KRT events.
- **lsp**—Trace Virtual Chassis link-state packets.
- **lsp-generation**—Trace Virtual Chassis link-state packet generation.
- **me**—Trace Virtual Chassis ME events.
- **normal**—Trace normal events.
- **packets**—Trace Virtual Chassis packets.
- **parse**—Trace reading of the configuration.
- **psn**—Trace partial sequence number (PSN) packets.
- **route**—Trace Virtual Chassis routing information.
- **spf**—Trace Virtual Chassis SPF events.
- **state**—Trace Virtual Chassis state transitions.
- **task**—Trace Virtual Chassis task operations.

**no-stamp**—(Optional) Do not place a timestamp on any trace file.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**receive**—(Optional) Trace received packets.

**replace**—(Optional) Replace a trace file rather than appending information to it.

**send**—(Optional) Trace transmitted packets.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege</b>	system—To view this statement in the configuration.
<b>Level</b>	system-control—To add this statement to the configuration.

## vcp-no-hold-time

<b>Syntax</b>	vcp-no-hold-time;
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.
<b>Description</b>	<p>Disable the Virtual Chassis port (VCP) holddown timer for all VCPs in the Virtual Chassis or Virtual Chassis Fabric (VCF).</p> <p>The VCP holddown timer is an internal mechanism that delays a Virtual Chassis reconvergence for several seconds when a VCP becomes inactive. The purpose of this delay is to provide the VCP time to return online without having to reconverge the Virtual Chassis to adjust to the inactive VCP. All traffic to the VCP is dropped while the VCP is inactive. If the VCP remains down for a time that exceeds the VCP holddown timer, a Virtual Chassis reconvergence occurs.</p> <p>When this statement is enabled, the VCP holddown timer is disabled and the Virtual Chassis reconvergence occurs when a VCP becomes inactive. The period of time where traffic is dropped waiting for the VCP to return online is avoided.</p> <p>We recommend enabling this statement after a Virtual Chassis is operational. We recommend disabling this statement when you are adding or removing member switches from your Virtual Chassis.</p> <p>The VCP holddown timer cannot be viewed and is not user-configurable. You can only control whether the VCP holddown timer is enabled or disabled by configuring this statement.</p>
	<p> <b>NOTE:</b> For the EX4300 Virtual Chassis, you should enable the <code>vcp-no-hold-time</code> statement before performing a software upgrade using NSSU. If you do not enable the <code>vcp-no-hold-time</code> statement, the Virtual Chassis may split during the upgrade. A split Virtual Chassis can cause disruptions to your network, and you may have to manually reconfigure your Virtual Chassis after the NSSU if the split and merge feature was disabled. For more information about a split Virtual Chassis, see <a href="#">“Understanding Split and Merge in a Virtual Chassis” on page 6922</a></p>
<b>Default</b>	The VCP holddown timer is enabled by default on all devices that support this statement.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding EX4300 Virtual Chassis</a></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis on page 6907</a></li> </ul>

<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>Configure a Virtual Chassis or a Virtual Chassis Fabric (VCF).</p> <p>The remaining statements are explained separately.</p>
<b>Default</b>	A standalone EX Series switch is a Virtual Chassis by default. It has a default member ID of 0, a default mastership priority of 128, and a default role as master.

A QFX Series device configured in standalone mode is a Virtual Chassis by default. It has a default member ID of 0, a default mastership priority of 128, and a default role as master.

A standalone XRE200 External Routing Engine or EX8200 switch is not part of an EX8200 Virtual Chassis until a Virtual Chassis configuration is set up.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## Routine Monitoring

---

- [Verifying the Member ID, Role, and Neighbor Member Connections of a Virtual Chassis Member on page 6975](#)

### Verifying the Member ID, Role, and Neighbor Member Connections of a Virtual Chassis Member

**Purpose** You can designate the role that a member performs within a Virtual Chassis or you can allow the role to be assigned by default. You can designate the member ID that is assigned to a specific switch by creating a permanent association between the switch's serial number and a member ID, using a preprovisioned configuration. Or you can let the member ID be assigned by the master, based on the sequence in which the member switch is powered on and on which member IDs are currently available.

The role and member ID of the member switch are displayed on the front-panel LCD.

Each member switch can be cabled to one or two other member switches, using either the dedicated Virtual Chassis ports (VCPs) on the rear panel, an uplink port that has been configured as a VCP, or an optical port that has been configured as a VCP. The members that are cabled together are considered neighbor members.

**Action** To display the role and member ID assignments using the CLI:

```
user@switch> show virtual-chassis
```

```
Virtual Chassis ID: 0000.e255.00e0
```

Member ID	Status	Serial No	Model	Mastership Priority	Role	Neighbor List ID, Interface
0 (FPC 0)	Prsnt	abc123	ex4200-48p	255	Master*	1 vcp-0 2 vcp-1
1 (FPC 1)	Prsnt	def456	ex4200-24t	255	Backup	2 vcp-0 0 vcp-1
2 (FPC 2)	Prsnt	abd231	ex4200-24p	128	Linecard	0 vcp-0 1 vcp-1

**Meaning** This output verifies that three EX4200 switches have been interconnected as a Virtual Chassis configuration through their dedicated VCPs to create an EX4200 Virtual Chassis. The display shows which of the VCPs is connected to which neighbor. The first port (**vcp-0**) of member **0** is connected to member **1** and the second port of member **0** (**vcp-1**) is connected to member **2**. The FPC slots for the switches are the same as the member IDs.

The **Mastership Priority** values indicate that the master and backup members have been explicitly configured, because they are not using the default value (**128**).

**NOTE:** This example uses output from an EX4200 Virtual Chassis. The output, with the exception of the **Model** column, would be identical on all other Virtual Chassis.

## clear virtual-chassis vc-port statistics

---

<b>Syntax</b>	<code>clear virtual-chassis vc-port statistics</code> <code>&lt;all-members&gt;</code> <code>&lt;interface-name&gt;</code> <code>&lt;local&gt;</code> <code>&lt;member member-id&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. The options <b>all-members</b> and <b>local</b> were added in Junos OS Release 9.3 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric.
<b>Description</b>	Clear—reset to zero (0)—the traffic statistics counters on Virtual Chassis ports (VCPs).
<b>Options</b>	<b>none</b> —Clear traffic statistics for VCPs of all members of a Virtual Chassis or VCF.  <b>all-members</b> —(Optional) Clear traffic statistics for VCPs of all members of a Virtual Chassis or VCF.  <b>interface-name</b> —(Optional) Clear traffic statistics for the specified VCP.  <b>local</b> —(Optional) Clear traffic statistics for VCPs from the switch or external Routing Engine on which this command is entered.  <b>member member-id</b> —(Optional) Clear traffic statistics for VCPs from the specified member of a Virtual Chassis or VCF.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show virtual-chassis vc-port statistics on page 7024</a></li><li>• <a href="#">show virtual-chassis vc-port on page 7020</a></li><li>• <i>Monitoring the Virtual Chassis Status and Statistics on EX Series Virtual Chassis</i></li></ul>
<b>List of Sample Output</b>	<a href="#">clear virtual-chassis vc-port statistics (EX4200 Virtual Chassis) on page 6978</a> <a href="#">clear virtual-chassis vc-port statistics (EX8200 Virtual Chassis) on page 6979</a> <a href="#">clear virtual-chassis vc-port statistics member 3 on page 6979</a>

### Sample Output

#### clear virtual-chassis vc-port statistics (EX4200 Virtual Chassis)

```
user@switch> clear virtual-chassis vc-port statistics
fpc0:
-----
Statistics cleared
```

**clear virtual-chassis vc-port statistics (EX8200 Virtual Chassis)**

```
user@external-routing-engine> clear virtual-chassis vc-port statistics
```

```
member0:
```

```

```

**clear virtual-chassis vc-port statistics member 3**

```
user@switch> clear virtual-chassis vc-port statistics member 3
```

```
Cleared statistics on member 3
```

## request session member

---

<b>Syntax</b>	<code>request session member <i>member-id</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Start a session with the specified member of a Virtual Chassis or a VCF.
<b>Options</b>	<i>member-id</i> —Member ID for the specific member of the Virtual Chassis or VCF.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">member on page 6958</a></li><li>• <i>Understanding EX Series Virtual Chassis Components</i></li><li>• <a href="#">Understanding QFX Series Virtual Chassis Components on page 6909</a></li></ul>

## request virtual-chassis recycle

<b>Syntax</b>	<code>request virtual-chassis recycle member-id <i>member-id</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.
<b>Description</b>	<p>Make a previously used member ID available for reassignment.</p> <p>When you remove a member switch from the Virtual Chassis configuration, the master reserves that member ID. To make the member ID available for reassignment, you must use this command.</p>
	<div>  <p><b>NOTE:</b> You must run this command from the Virtual Chassis member in the master role.</p> </div>
<b>Options</b>	<code>member-id <i>member-id</i></code> —Specify the member ID that you want to make available for reassignment to a different member.
<b>Required Privilege Level</b>	system-control
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request virtual-chassis renumber on page 6982</a></li> <li>• <a href="#">Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure) on page 6938</a></li> <li>• <a href="#">Adding or Replacing a Member Switch or an External Routing Engine in an EX8200 Virtual Chassis (CLI Procedure)</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request virtual-chassis recycle member-id 3 on page 6981</a> <a href="#">request virtual-chassis recycle member-id 1 on page 6981</a>

### Sample Output

`request virtual-chassis recycle member-id 3`

```
user@switch> request virtual-chassis recycle member-id 3
```

### Sample Output

`request virtual-chassis recycle member-id 1`

```
user@external-routing-engine> request virtual-chassis recycle member-id 1
```

## request virtual-chassis renumber

---

<b>Syntax</b>	<code>request virtual-chassis renumber member-id <i>old-member-id</i> new-member-id <i>new-member-id</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.
<b>Description</b>	Renumber a member of a Virtual Chassis configuration.
<div> <b>NOTE:</b> You must run this command from the Virtual Chassis member in the master role.</div>	
<b>Options</b>	<code>member-id <i>old-member-id</i></code> —Specify the ID of the member that you wish to renumber. <code>new-member-id <i>new-member-id</i></code> —Specify an unassigned member ID.
<b>Required Privilege Level</b>	system-control
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request virtual-chassis recycle on page 6981</a></li><li>• <a href="#">Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure) on page 6938</a></li><li>• <a href="#">Adding or Replacing a Member Switch or an External Routing Engine in an EX8200 Virtual Chassis (CLI Procedure)</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request virtual-chassis renumber member-id 5 new-member-id 4 on page 6982</a> <a href="#">request virtual-chassis renumber member-id 1 new-member-id 0 on page 6982</a>

### Sample Output

`request virtual-chassis renumber member-id 5 new-member-id 4`

```
user@switch> request virtual-chassis renumber member-id 5 new-member-id 4
```

`request virtual-chassis renumber member-id 1 new-member-id 0`

```
user@external-routing-engine> request virtual-chassis renumber member-id 1 new-member-id 0
```

## request virtual-chassis vc-port

<b>Syntax</b>	<code>request virtual-chassis vc-port set   delete &lt;fpc-slot <i>fpc-slot</i>&gt; pic-slot <i>pic-slot</i> port <i>port-number</i> &lt;member <i>member-id</i>&gt;</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>fpc-slot</b> introduced in Junos OS Release 10.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>Enable or disable an optical port as a Virtual Chassis port (VCP).</p> <p>If you omit <b>member <i>member-id</i></b>, this command defaults to enabling or disabling the uplink VCP or SFP network port configured as a VCP on the switch where the command is issued.</p> <p>On an EX3300 switch, uplink ports 2 and 3 are configured as VCPs by default. No other uplink ports on any other EX Series switches are configured as VCPs by default.</p> <p>You might experience a temporary traffic disruption immediately after creating or deleting a user-configured VCP in an EX8200 Virtual Chassis.</p>
<b>Options</b>	<p><b>pic-slot <i>pic-slot</i></b>—Number of the PIC slot for the port on the switch.</p> <p><b>port <i>port-number</i></b>—Number of the port that is to be enabled or disabled as a VCP.</p> <p><b>member <i>member-id</i></b>—(Optional) Enable or disable the specified VCP on the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	system-control
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request virtual-chassis vc-port</a> (dedicated port)</li> <li>• <a href="#">show virtual-chassis vc-port on page 7020</a></li> <li>• <a href="#">show virtual-chassis vc-port statistics on page 7024</a></li> <li>• <a href="#">clear virtual-chassis vc-port statistics on page 6978</a></li> <li>• <a href="#">Virtual Chassis Port (VCP) Interface Names in an EX8200 Virtual Chassis</a></li> <li>• <a href="#">Understanding EX Series Virtual Chassis Components</a></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis Components on page 6909</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">request virtual-chassis vc-port set pic-slot 1 port 0 on page 6984</a></p> <p><a href="#">request virtual-chassis vc-port set pic-slot 1 port 1 member 3 on page 6984</a></p> <p><a href="#">request virtual-chassis vc-port delete pic-slot 1 port 1 member 3 on page 6984</a></p>

## Sample Output

**request virtual-chassis vc-port set pic-slot 1 port 0**

user@switch> **request virtual-chassis vc-port set pic-slot 1 port 0**

To check the results of this command, use the [show virtual-chassis vc-port](#) command.

**request virtual-chassis vc-port set pic-slot 1 port 1 member 3**

user@switch> **request virtual-chassis vc-port set pic-slot 1 port 1 member 3**

To check the results of this command, use the [show virtual-chassis vc-port](#) command.

**request virtual-chassis vc-port delete pic-slot 1 port 1 member 3**

user@switch> **request virtual-chassis vc-port delete pic-slot 1 port 1 member 3**

To check the results of this command, use the [show virtual-chassis vc-port](#) command.

## show virtual-chassis active-topology

<b>Syntax</b>	show virtual-chassis active-topology <all-members> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the active topology of the Virtual Chassis or VCF with next-hop reachability information.
<b>Options</b>	<p><b>none</b>—Display the active topology of the member switch where the command is issued.</p> <p><b>all-members</b>—(Optional) Display the active topology of all members of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display the active topology of the switch or external Routing Engine on which this command is entered.</p> <p><b>member <i>member-id</i></b>—(Optional) Display the active topology of the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Monitoring the Virtual Chassis Status and Statistics on EX Series Virtual Chassis</i></li> <li>• <i>Understanding EX Series Virtual Chassis Configuration</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis active-topology (EX4200 Virtual Chassis) on page 6986</a> <a href="#">show virtual-chassis active-topology (EX8200 Virtual Chassis) on page 6986</a> <a href="#">show virtual-chassis active-topology (Virtual Chassis Fabric) on page 6987</a>
<b>Output Fields</b>	<a href="#">Table 668 on page 6985</a> lists the output fields for the <b>show virtual-chassis active-topology</b> command. Output fields are listed in the approximate order in which they appear.

**Table 668: show virtual-chassis active-topology Output Fields**

Field Name	Field Description
<b>Destination ID</b>	Specifies the member ID of the destination.
<b>Next-hop</b>	<p>Specifies the member ID and Virtual Chassis port (VCP) of the next hop to which packets for the destination ID are forwarded.</p> <p>The next hop can be more than one device in a VCF.</p>

## Sample Output

### show virtual-chassis active-topology (EX4200 Virtual Chassis)

```
user@switch> show virtual-chassis active-topology
1                               1(vcp-1)

2                               1(vcp-1)

3                               1(vcp-1)

4                               1(vcp-1)

5                               8(vcp-0) 1(vcp-1)

6                               8(vcp-0)

7                               8(vcp-0)

8                               8(vcp-0)
```

### show virtual-chassis active-topology (EX8200 Virtual Chassis)

```
user@external-routing-engine> show virtual-chassis active-topology

## show virtual-chassis device-topology

<b>Syntax</b>	show virtual-chassis device-topology <all-members> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the device topology—the member and system IDs, the VCP numbers, and device status—for all hardware devices in the Virtual Chassis or VCF.
<b>Options</b>	<p><b>none</b>—Display the device topology for all members of the Virtual Chassis or VCF.</p> <p><b>all-members</b>—(Optional) Display the device topology for all members of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display the device topology for the switch or external Routing Engine on which this command is entered.</p> <p><b>member <i>member-id</i></b>—(Optional) Display the device topology for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding EX Series Virtual Chassis Port Link Aggregation</i></li> <li>• <i>Understanding EX8200 Virtual Chassis Topologies</i></li> </ul>
<b>Output Fields</b>	<a href="#">Table 669 on page 6990</a> lists the output fields for the <b>show virtual-chassis device-topology</b> command. Output fields are listed in the approximate order in which they appear.

**Table 669: show virtual-chassis device-topology Output Fields**

Field Name	Field Description
<b>Member</b>	Assigned member ID.
<b>Device</b>	Assigned device ID.  For an EX8200 Virtual Chassis, the member ID and the device ID are always identical.
<b>Status</b>	The status of the device within the Virtual Chassis or VCF. Outputs include: <ul style="list-style-type: none"> <li>• <b>Prsnt</b>—Device is currently connected to and participating in the Virtual Chassis or VCF.</li> <li>• <b>NotPrsnt</b>—Device is assigned but is not currently connected.</li> </ul>

Table 669: show virtual-chassis device-topology Output Fields (*continued*)

Field Name	Field Description
<b>System ID</b>	System ID of the device.  The system ID of the device is the device's MAC address.
<b>Member (Neighbor List)</b>	Assigned member ID of the neighbor device.
<b>Device (Neighbor List)</b>	Assigned device ID of the neighbor device.  For an EX8200 Virtual Chassis, the member ID and the device ID are always identical.
<b>Interface (Neighbor List)</b>	The interface connecting the device to the neighbor.

## show virtual-chassis protocol adjacency

---

<b>Syntax</b>	<code>show virtual-chassis protocol adjacency</code> <code>&lt;brief   detail   extensive&gt;</code> <code>&lt;all-members&gt;</code> <code>&lt;local&gt;</code> <code>&lt;member <i>member-id</i>&gt;</code> <code>&lt;system-id&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the Virtual Chassis Control Protocol (VCCP) adjacency statistics in the Virtual Chassis or VCF for all hardware devices.
<b>Options</b>	<p><b>none</b>—Display VCCP adjacency statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output. Using the <b>brief</b> option is equivalent to entering the command with no options (the default). The <b>detail</b> and <b>extensive</b> options provide identical displays.</p> <p><b>all-members</b>—(Optional) Display VCCP adjacency statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display VCCP adjacency statistics for the switch or external Routing Engine on which this command is entered.</p> <p><b>member <i>member-id</i></b>—(Optional) Display VCCP adjacency statistics for the specified member of the Virtual Chassis or VCF.</p> <p><b>system-id</b>—(Optional) Display VCCP adjacency statistics for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Understanding EX Series Virtual Chassis Port Link Aggregation</i></li><li>• <i>Understanding the Virtual Chassis Control Protocol in an EX8200 Virtual Chassis</i></li></ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis protocol adjacency on page 6997</a> <a href="#">show virtual-chassis protocol adjacency detail on page 6998</a>
<b>Output Fields</b>	<a href="#">Table 670 on page 6997</a> lists the output fields for the <b>show virtual-chassis protocol adjacency</b> command. Output fields are listed in the approximate order in which they appear.

Table 670: show virtual-chassis protocol adjacency Output Fields

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of the Virtual Chassis port (VCP) interface.	All levels
<b>System</b>	The MAC address of the device on the receiving side of the VCP link.	All levels
<b>State</b>	State of the link. Outputs include: <ul style="list-style-type: none"> <li>• <b>Up</b>—The link is up.</li> <li>• <b>Down</b>—The link is down.</li> <li>• <b>New</b>—The link is new.</li> <li>• <b>One-way</b>—The link is transmitting traffic in one direction.</li> <li>• <b>Initializing</b>—The link is initializing.</li> <li>• <b>Rejected</b>—The link is rejected.</li> </ul>	All levels
<b>Hold, Expires in</b>	Remaining holdtime of the adjacency.	All levels
<b>Priority</b>	Priority to become the designated intermediary system.	detail
<b>Up/Down Transitions</b>	Count of adjacency status transition changes from up to down or down to up.	detail
<b>Last transition</b>	Time of the last up/down transition.	detail

## Sample Output

## show virtual-chassis protocol database

<b>Syntax</b>	show virtual-chassis protocol database <brief   detail   extensive> <all-members> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the Virtual Chassis Control Protocol (VCCP) database statistics for all hardware devices within the Virtual Chassis or VCF.
<b>Options</b>	<p><b>none</b>—Display VCCP database statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output. Using the <b>brief</b> option is equivalent to entering the command with no options (the default). The <b>detail</b> option provides more output than the <b>brief</b> option. The <b>extensive</b> option provides all output and is most useful for customer support personnel.</p> <p><b>all-members</b>—(Optional) Display VCCP database statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display VCCP database statistics for the switch or external Routing Engine on which this command is entered.</p> <p><b>member <i>member-id</i></b>—(Optional) Display VCCP database statistics for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding the Virtual Chassis Control Protocol in an EX8200 Virtual Chassis</i></li> <li>• <i>Understanding EX Series Virtual Chassis Components</i></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis Components on page 6909</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis protocol database on page 7001</a> <a href="#">show virtual-chassis protocol database detail on page 7002</a>
<b>Output Fields</b>	<a href="#">Table 671 on page 7000</a> lists the output fields for the <b>show virtual-chassis protocol database</b> command. Output fields are listed in the approximate order in which they appear.

Table 671: show virtual-chassis protocol database Output Fields

Field Name	Field Description	Level of Output
LSP ID	Link-state protocol (LSP) data unit identifier.	All levels

Table 671: show virtual-chassis protocol database Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Sequence</b>	Sequence number of the LSP.	All levels
<b>Checksum</b>	Checksum value of the LSP.	All levels
<b>Lifetime</b>	Remaining lifetime of the LSP, in seconds.	All levels
<b>Neighbor</b>	MAC address of the neighbor on the advertising system.	detail
<b>Interface</b>	Virtual Chassis port (VCP) interface name.	detail
<b>Metric</b>	Metric of the prefix or neighbor.	detail

The **extensive** output was omitted from this list. The **extensive** output is useful for customer support personnel only.

## show virtual-chassis protocol interface

---

<b>Syntax</b>	<code>show virtual-chassis protocol interface</code> <code>&lt;brief   detail&gt;</code> <code>&lt;all-members&gt;</code> <code>&lt;interface-name&gt;</code> <code>&lt;local&gt;</code> <code>&lt;member member-id&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display information about Virtual Chassis Control Protocol (VCCP) statistics for VCCP-enabled interfaces within the Virtual Chassis or VCF.
<b>Options</b>	<p><b>none</b>—Display the VCCP interface statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>brief   detail</b> —(Optional) Display the specified level of output. Using the <b>brief</b> option is equivalent to entering the command with no options (the default). The <b>detail</b> option provides more output than the <b>brief</b> option.</p> <p><b>all-members</b>—(Optional) Display VCCP interface statistics for all members of the Virtual Chassis or VCF.</p> <p><b>interface-name</b>—(Optional) Display VCCP interface statistics for the specified interface.</p> <p><b>local</b>—(Optional) Display VCCP interface statistics for the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display VCCP interface statistics for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>EX Series Virtual Chassis Overview</i></li><li>• <a href="#">Understanding QFX Series Virtual Chassis on page 6907</a></li><li>• <i>Understanding Virtual Chassis Ports in an EX8200 Virtual Chassis</i></li><li>• <i>Understanding the Virtual Chassis Control Protocol in an EX8200 Virtual Chassis</i></li></ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis protocol interface on page 7005</a>
<b>Output Fields</b>	<a href="#">Table 672 on page 7005</a> lists the output fields for the <b>show virtual-chassis protocol interface</b> command. Output fields are listed in the approximate order in which they appear.

Table 672: show virtual-chassis protocol interface Output Fields

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of the VCP.	All levels
<b>State</b>	State of the link. Outputs include: <ul style="list-style-type: none"> <li>• <b>Up</b>—The link is up.</li> <li>• <b>Down</b>—The link is down.</li> </ul>	All levels
<b>Metric</b>	Metric of the prefix or neighbor.	All levels

## show virtual-chassis protocol route

<b>Syntax</b>	show virtual-chassis protocol route <all-members> <destination-id> <local> <member member-id>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the unicast and multicast Virtual Chassis Control Protocol (VCCP) routing tables within the Virtual Chassis or VCF.
<b>Options</b>	<p><b>none</b>—Display the unicast and multicast routing tables for all members of the Virtual Chassis.</p> <p><b>all-members</b>—(Optional) Display the unicast and multicast routing tables for all members of the Virtual Chassis or VCF.</p> <p><b>destination-id</b>—(Optional) Display the unicast and multicast routing tables to the specified destination member ID for each member of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display the unicast and multicast routing tables on the device where this command is entered.</p> <p><b>member member-id</b>—(Optional) Display the unicast and multicast routing tables for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>EX Series Virtual Chassis Overview</i></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis on page 6907</a></li> <li>• <i>Understanding the Virtual Chassis Control Protocol in an EX8200 Virtual Chassis</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis protocol route on page 7008</a>
<b>Output Fields</b>	<a href="#">Table 673 on page 7007</a> lists the output fields for the <b>show virtual-chassis protocol route</b> command. Output fields are listed in the approximate order in which they appear.

**Table 673: show virtual-chassis protocol route Output Fields**

Field Name	Field Description
<b>Dev</b>	MAC address of the member storing the VCCP routing table.
<b>Version</b>	Version of the shortest-path-first algorithm that generated the routing table.

Table 673: show virtual-chassis protocol route Output Fields (*continued*)

Field Name	Field Description
<b>System ID</b>	MAC address of the device.
<b>Version</b>	Version of the shortest-path-first (SPF) algorithm that generated the route.
<b>Metric</b>	The metric number to get to that device.
<b>Interface</b>	Name of the Virtual Chassis port (VCP) interface connecting the devices.
<b>Via</b>	MAC address of the next-hop device, if applicable.

## Sample Output

## show virtual-chassis protocol statistics

<b>Syntax</b>	show virtual-chassis protocol statistics <all-members> <interface-name> <local> <member member-id>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the Virtual Chassis Control Protocol (VCCP) statistics for all hardware devices within the Virtual Chassis or VCF.
<b>Options</b>	<p><b>none</b>—Display VCCP statistics for all members of the Virtual Chassis or VCF.</p> <p><b>all-members</b>—(Optional) Display VCCP statistics for all members of the Virtual Chassis or VCF.</p> <p><b>interface-name</b>—(Optional) Display VCCP statistics for the specified interface.</p> <p><b>local</b>—(Optional) Display VCCP statistics for the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display VCCP statistics for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>EX Series Virtual Chassis Overview</i></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis on page 6907</a></li> <li>• <i>Understanding the Virtual Chassis Control Protocol in an EX8200 Virtual Chassis</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis protocol statistics on page 7011</a>
<b>Output Fields</b>	<a href="#">Table 674 on page 7010</a> lists the output fields for the <b>show virtual-chassis protocol interface</b> command. Output fields are listed in the approximate order in which they appear.

**Table 674: show virtual-chassis protocol statistics Output Fields**

Field Name	Field Description
<b>PDU type</b>	Protocol data unit type.
<b>Received</b>	Number of PDUs received since VCCP started or since the statistics were set to zero.
<b>Processed</b>	Number of PDUs received minus the number of PDUs dropped.

Table 674: show virtual-chassis protocol statistics Output Fields (*continued*)

Field Name	Field Description
<b>Drops</b>	Number of PDUs dropped.
<b>Sent</b>	Number of PDUs transmitted since VCCP started or since the statistics were set to zero.
<b>Rexmit</b>	Number of PDUs retransmitted since VCCP started or since the statistics were set to zero.
<b>Total Packets Received</b>	Number of PDUs received since VCCP started or since the statistics were set to zero.
<b>Total Packets Sent</b>	Number of PDUs sent since VCCP started or since the statistics were set to zero.
<b>LSP queue length</b>	Number of link-state PDUs waiting in the queue for processing. This value is almost always 0.
<b>SPF runs</b>	Number of shortest-path-first (SPF) calculations that have been performed.
<b>Fragments Rebuilt</b>	Number of link-state PDU fragments that the local system has computed.
<b>LSP Regenerations</b>	Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.
<b>Purges initiated</b>	Number of purges that the system initiated. A purge is initiated if the software determines that a link-state PDU must be removed from the network.

<b>Output Fields</b>	<p><a href="#">Table 675 on page 7014</a> lists the output fields for the <b>show virtual-chassis</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 675: show virtual-chassis Output Fields**

Field Name	Field Description
<b>Fabric ID</b>	Assigned ID used to identify the VCF.
<b>Fabric Mode</b>	Mode of the VCF: Enabled, Disabled, or Mixed.
<b>Virtual Chassis ID</b>	Assigned ID that applies to the entire Virtual Chassis or VCF.
<b>Virtual Chassis Mode</b>	Mode of the Virtual Chassis or VCF: Enabled, Disabled, or Mixed.

Table 675: show virtual-chassis Output Fields (*continued*)

Field Name	Field Description
<b>Member ID</b>	Assigned member ID and FPC: <ul style="list-style-type: none"> <li>On all EX Series Virtual Chassis except EX8200 Virtual Chassis, and on a VCF, the FPC number refers to the member ID assigned to the switch.</li> <li>On EX8200 Virtual Chassis, member IDs are numbered 0 through 9. The FPC number indicates the slot number of the line card within the Virtual Chassis. The FPC number on member 0 is always 0 through 15. The FPC number on member 1 is always 16 through 31. The FPC number on member 2 is always 32 through 47; and so on for the members.</li> </ul>
<b>Status</b>	For a nonprovisioned configuration: <ul style="list-style-type: none"> <li><b>Prsnt</b> for a member that is currently connected to the Virtual Chassis or VCF configuration.</li> <li><b>NotPrsnt</b> for a member ID that has been assigned but is not currently connected.</li> </ul> For a preprovisioned configuration: <ul style="list-style-type: none"> <li><b>Prsnt</b> for a member that is specified in the preprovisioned configuration file and is currently connected to the Virtual Chassis or VCF.</li> <li><b>Unprvsnd</b> for a member that is interconnected with the Virtual Chassis or VCF configuration but is not specified in the preprovisioned configuration file.</li> </ul>
<b>Serial No</b>	Serial number of the member device.
<b>Alias-Name</b>	The user-configured alias of the member device.  The <b>Alias-Name</b> field appears only if an alias has been configured for at least one device in the Virtual Chassis or VCF. Aliases are configured using the <b>alias-name</b> statement in the <code>[edit virtual-chassis aliases serial-number serial-number]</code> hierarchy.
<b>Model</b>	Model number of the member device.
<b>Mastership Priority</b>	Mastership priority value of the member device.
<b>Role</b>	Role of the member device: master, backup, or linecard.
<b>Mixed Mode</b>	Mixed mode configuration status: <ul style="list-style-type: none"> <li><b>Y</b> for a member device configured in mixed mode.</li> <li><b>N</b> for a member device not configured in mixed mode.</li> <li><b>NA</b> for a member device that cannot be configured in mixed mode.</li> </ul>
<b>Route Mode</b>	The route mode of the member device: fabric (F) or Virtual Chassis (V).
<b>Location</b>	Location of the member device.  If this field is empty, the location field was not set for the device.
<b>Neighbor List</b>	Member ID of the neighbor member to which this member's Virtual Chassis port (VCP) is connected.

## Sample Output

### show virtual-chassis (EX4200 Virtual Chassis)

```

user@switch> show virtual-chassis
Virtual Chassis ID: 0019.e250.47a0
Virtual Chassis Mode: Enabled

```

## show virtual-chassis vc-path

<b>Syntax</b>	<b>show virtual-chassis vc-path source-interface <i>interface-name</i> destination-interface <i>interface-name</i></b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.6 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.
<b>Description</b>	Show the path a packet takes when going from a source interface to a destination interface in a Virtual Chassis configuration.
<b>Options</b>	<b>source-interface <i>interface-name</i></b> —Name of the interface from which the packet originates <b>destination-interface <i>interface-name</i></b> —Name of the interface to which the packet is delivered
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Monitoring the Virtual Chassis Status and Statistics on EX Series Virtual Chassis</i></li> <li>• <i>Understanding EX Series Virtual Chassis Configuration</i></li> <li>• <i>EX8200 Virtual Chassis Overview</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis vc-path source-interface destination-interface on page 7019</a>
<b>Output Fields</b>	<a href="#">Table 676 on page 7018</a> lists the output fields for the <b>show virtual-chassis vc-path</b> command. Output fields are listed in the approximate order in which they appear.

**Table 676: show virtual-chassis vc-path Output Fields**

Field Name	Field Description
<b>Hop</b>	The number of hops between the source and destination interfaces.
<b>Member</b>	The Virtual Chassis ID of the member switch that contains the Packet Forwarding Engine for each intermediate hop.
<b>PFE-Device</b>	The number of the Packet Forwarding Engine in each Virtual Chassis member through which a packet passes. Each Packet Forwarding Engine is the next hop of the preceding Packet Forwarding Engine.
<b>Interface</b>	The name of the interface through which the Packet Forwarding Engines are connected. The interface for the first hop is always the source interface and the interface for the last hop is always the destination interface. For intermediate hops, the <b>Interface</b> field denotes the Packet Forwarding Engines through which the packet passes on its way to the next hop.

## Sample Output

show virtual-chassis vc-path source-interface destination-interface

```
user@switch> show virtual-chassis vc-path source-interface ge-0/0/0 destination-interface
ge-1/0/1
vc-path from ge-0/0/0 to ge-1/0/1
Hop      Member    PFE-Device    Interface
0         0          1              ge-0/0/0
1         0          0              internal-1/24
2         1          3              vcp-0
3         1          4              ge-1/0/1
```

## show virtual-chassis vc-port

<b>Syntax</b>	show virtual-chassis vc-port <all-members> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the status of the Virtual Chassis ports (VCPs), including both the dedicated VCPs and the uplink ports configured as VCPs.
<b>Options</b>	<p><b>none</b>—Display the operational status of all VCPs of the member switch where the command is issued.</p> <p><b>all-members</b>—(Optional) Display the operational status of all VCPs on all members of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display the operational status of the switch or external Routing Engine on which this command is entered.</p> <p><b>member <i>member-id</i></b>—(Optional) Display the operational status of all VCPs for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show virtual-chassis vc-port statistics on page 7024</a></li> <li>• <i>Monitoring the Virtual Chassis Status and Statistics on EX Series Virtual Chassis</i></li> <li>• <i>Verifying Virtual Chassis Ports in an EX8200 Virtual Chassis</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis vc-port (EX4200 Virtual Chassis) on page 7022</a> <a href="#">show virtual-chassis vc-port (EX8200 Virtual Chassis) on page 7022</a> <a href="#">show virtual-chassis vc-port all-members on page 7023</a>
<b>Output Fields</b>	Table 677 on page 7020 lists the output fields for the <b>show virtual-chassis vc-port</b> command. Output fields are listed in the approximate order in which they appear.

Table 677: show virtual-chassis vc-port Output Fields

Field Name	Field Description
<i>fpcnumber</i>	The FPC number is the same as the member ID.

Table 677: show virtual-chassis vc-port Output Fields (*continued*)

Field Name	Field Description
Interface or PIC/Port	<p>VCP name.</p> <ul style="list-style-type: none"> <li>The dedicated VCPs in an EX4200 or EX4500 Virtual Chassis are <b>vcp-0</b> and <b>vcp-1</b>. The dedicated VCPs in an EX4550 Virtual Chassis are <b>VCP-1/0</b>, <b>VCP-1/1</b>, <b>VCP-2/0</b>, and <b>VCP-2/1</b>.</li> <li>Optical ports set as VCPs are named <b>1/0</b> and <b>1/1</b>, representing the PIC number and the port number.</li> <li>The native VCP (port 0) on an XRE200 External Routing Engine in an EX8200 Virtual Chassis is named <b>vcp-0</b>.</li> <li>The VCPs on each Virtual Chassis Control Interface (VCCI) module in an XRE200 External Routing Engine are named using the <b>vcp-slot-number/port-number</b> convention; for instance, <b>vcp-1/0</b>.</li> <li>The VCPs on EX8200 member switches are named using the <b>vcp-slot-number/pic-number/interface-number</b> convention; for instance, <b>vcp-3/0/2</b>.</li> <li>A <b>255</b> as the first number in your port number indicates that your VCP is part of a Link Aggregation group (LAG) bundle. For instance, a display of <b>vcp-255/1/0</b> indicates that the dedicated VCP named <b>vcp-1/0</b> is part of a LAG bundle. A display of <b>vcp-255/1/0</b> indicates that an uplink port that was previously named <b>xe-0/1/0</b> is now part of a VCP LAG bundle.</li> </ul>
Type	<p>Type of VCP:</p> <ul style="list-style-type: none"> <li><b>Dedicated</b>—The rear panel VCP on an EX4200, EX4500, or EX4550 switch, or any VCP link connected to an XRE200 External Routing Engine in an EX8200 Virtual Chassis.</li> <li><b>Configured</b>—Optical port configured as a VCP.</li> <li><b>Auto-Configured</b>—Optical port autoconfigured as a VCP.</li> </ul> <p>See <i>Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)</i> or <i>Setting a 10-Gigabit Ethernet Port as a Virtual Chassis Port in an EX8200 Virtual Chassis (CLI Procedure)</i> for information about configuring VCPs.</p>
Trunk ID	<p>A positive-number ID assigned to a link aggregation group (LAG) formed by the Virtual Chassis. The trunk ID value is –1 if no trunk is formed. A LAG between uplink VCPs requires that the link speed be the same on connected interfaces and that at least two VCPs on one member be connected to at least two VCPs on the other member in an EX4200 or EX4500 Virtual Chassis.</p> <p>Dedicated VCP LAGs are assigned trunk IDs 1 and 2. Trunk IDs for LAGs formed with uplink VCPs therefore have values of 3 or greater.</p> <p>The trunk ID value changes if the link-adjacency state between LAG members changes; trunk membership is then allocated or deallocated.</p>
Status	<p>Interface status:</p> <ul style="list-style-type: none"> <li><b>absent</b>—Interface is not a VCP link.</li> <li><b>down</b>—VCP link is down.</li> <li><b>up</b>—VCP link is up.</li> </ul>
Speed (mbps)	Speed of the interface in megabits per second.
Neighbor ID/Interface	The Virtual Chassis member ID and interface of a VCP on a member that is connected to the interface or PIC/Port field in the same row as this interface.

## Sample Output

## show virtual-chassis vc-port statistics

---

<b>Syntax</b>	<pre>show virtual-chassis vc-port statistics &lt;all-members&gt; &lt;brief   detail   extensive &gt; &lt;interface-name&gt; &lt;local&gt; &lt;member member-id&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>The options <b>all-members</b>, <b>brief</b>, <b>detail</b>, <b>extensive</b>, and <b>local</b> were added in Junos OS Release 9.3 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	Display the traffic statistics collected on Virtual Chassis ports (VCPs).
<b>Options</b>	<p><b>none</b>—Display traffic statistics for VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output. Using the <b>brief</b> option is equivalent to entering the command with no options (the default). The <b>detail</b> and <b>extensive</b> options provide identical displays.</p> <p><b>all-members</b>—(Optional) Display traffic statistics for VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>interface-name</b>—(Optional) Display traffic statistics for the specified VCP.</p> <p><b>local</b>—(Optional) Display traffic statistics for VCPs on the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display traffic statistics for VCPs on the specified member of a Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	view

**Output Fields** Table 678 on page 7025 lists the output fields for the **show virtual-chassis vc-port statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 678: show virtual-chassis vc-port statistics Output Fields**

Field Name	Field Description	Level of Output
<b>fpcnumber</b>	(All Virtual Chassis except EX8200 Virtual Chassis. VCF) ID of the Virtual Chassis member. The FPC number is the same as the member ID.	All levels
<b>member number</b>	(EX8200 Virtual Chassis only) Member ID of the Virtual Chassis member.	All levels
<b>Interface</b>	VCP name.	<b>brief</b>
<b>Input Octets/Packets</b>	Number of octets and packets received on the VCP.	<b>brief, member, none</b>
<b>Output Octets/Packets</b>	Number of octets and packets transmitted on the VCP.	<b>brief, member, none</b>
<b>master: number</b>	Member ID of the master Routing Engine.	All levels
<b>Port</b>	VCP for which <b>RX</b> (Receive) statistics, <b>TX</b> (Transmit) statistics, or both are reported by the VCP subsystem during a sampling interval—since the statistics counter was last cleared.	<b>detail, extensive</b>
<b>Total octets</b>	Total number of octets received and transmitted on the VCP.	<b>detail, extensive</b>
<b>Total packets</b>	Total number of packets received and transmitted on the VCP.	<b>detail, extensive</b>
<b>Unicast packets</b>	Number of unicast packets received and transmitted on the VCP.	<b>detail, extensive</b>
<b>Broadcast packets</b>	Number of broadcast packets received and transmitted on the VCP.	<b>detail, extensive</b>
<b>Multicast packets</b>	Number of multicast packets received and transmitted on the VCP.	<b>detail, extensive</b>
<b>MAC control frames</b>	Number of media access control (MAC) control frames received and transmitted on the VCP.	<b>detail, extensive</b>

Table 678: show virtual-chassis vc-port statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>CRC alignment errors</b>	<p>Number of packets received on the VCP that had a length—excluding framing bits, but including frame check sequence (FCS) octets—of between 64 and 1518 octets, inclusive, and had one of the following errors:</p> <ul style="list-style-type: none"> <li>Invalid FCS with an integral number of octets (FCS error)</li> <li>Invalid FCS with a nonintegral number of octets (alignment error)</li> </ul>	<b>detail, extensive</b>
<b>Oversize packets</b>	Number of packets received on the VCP that were longer than 1518 octets (excluding framing bits, but including FCS octets) but were otherwise well formed.	<b>detail, extensive</b>
<b>Undersize packets</b>	Number of packets received on the VCP that were shorter than 64 octets (excluding framing bits but including FCS octets) and were otherwise well formed..	<b>detail, extensive</b>
<b>Jabber packets</b>	<p>Number of packets received on the VCP that were longer than 1518 octets—excluding framing bits, but including FCS octets—and that had either an FCS error or an alignment error.</p> <p><b>NOTE:</b> This definition of <i>jabber</i> is different from the definition in IEEE-802.3 section 8.2.1.5 (10Base5) and section 10.3.1.4 (10Base2). These documents define <i>jabber</i> as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.</p>	<b>detail, extensive</b>
<b>Fragments received</b>	<p>Number of packets received on the VCP that were shorter than 64 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error.</p> <p>Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</p>	<b>detail, extensive</b>
<b>Ifout errors</b>	Number of outbound packets received on the VCP that could not be transmitted because of errors.	<b>detail, extensive</b>
<b>Packet drop events</b>	Number of outbound packets received on the VCP that were dropped, rather than being encapsulated and sent out of the switch as fragments. The packet drop counter is incremented if a temporary shortage of packet memory causes packet fragmentation to fail.	<b>detail, extensive</b>
<b>64 octets frames</b>	Number of packets received on the VCP (including invalid packets) that were 64 octets in length (excluding framing bits, but including FCS octets).	<b>detail, extensive</b>

Table 678: show virtual-chassis vc-port statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>65–127 octets frames</b>	Number of packets received on the VCP (including invalid packets) that were between 65 and 127 octets in length, inclusive (excluding framing bits, but including FCS octets).	<b>detail, extensive</b>
<b>128–255 octets frames</b>	Number of packets received on the VCP (including invalid packets) that were between 128 and 255 octets in length, inclusive (excluding framing bits, but including FCS octets).	<b>detail, extensive</b>
<b>256–511 octets frames</b>	Number of packets received on the VCP (including invalid packets) that were between 256 and 511 octets in length, inclusive (excluding framing bits, but including FCS octets).	<b>detail, extensive</b>
<b>512–1023 octets frames</b>	Number of packets received on the VCP (including invalid packets) that were between 512 and 1023 octets in length, inclusive (excluding framing bits, but including FCS octets).	<b>detail, extensive</b>
<b>1024–1518 octets frames</b>	Number of packets received on the VCP (including invalid packets) that were between 1024 and 1518 octets in length, inclusive (excluding framing bits, but including FCS octets).	<b>detail, extensive</b>
<b>Rate packets per second</b>	Number of packets per second received and transmitted on the VCP.	<b>detail, extensive</b>
<b>Rate bytes per second</b>	Number of bytes per second received and transmitted on the VCP.	<b>detail, extensive</b>

## Virtual Chassis Fabric Overview

The Juniper Networks Virtual Chassis Fabric (VCF) provides a low-latency, high-performance fabric architecture that can be managed as a single device. VCF is an evolution of the Virtual Chassis feature, which enables you to interconnect multiple devices into a single logical device, inside of a fabric architecture. The VCF architecture is optimized to support small and medium-sized data centers that contain a mix of 1-Gbps, 10-Gbps, and 40-Gbps Ethernet interfaces.

Video: [What is Virtual Chassis Fabric?](#)

A VCF is constructed using a spine-and-leaf architecture. In the spine-and-leaf architecture, each spine device is interconnected to each leaf device. A VCF supports up to twenty total devices, and up to four devices can be configured as spine devices. See [Figure 230 on page 7034](#) for an illustration of the VCF spine-and-leaf architecture.

Figure 230: VCF Spine-and-Leaf Architecture

Each spine device must be a QFX5100 device. In an optimal VCF configuration, the leaf devices are also QFX5100 devices. You can, however, also create a mixed VCF by configuring QFX3600, QFX3500, and EX4300 switches as leaf devices. See [“Understanding Virtual Chassis Fabric Components” on page 7035](#) for more information about the spine-and-leaf architecture.

A VCF provides the following benefits:

- **Latency**—VCF provides predictable low latency because it uses a fabric architecture that ensures each device is one or two hops away from every other device in the fabric. The weighted algorithm that makes traffic-forwarding decisions in a VCF is designed to avoid congestion and ensures low latency by intelligently forwarding traffic over all paths within the VCF to any destination device., ensuring predictable low latency for all traffic traversing the VCF.
- **Resiliency**—The VCF architecture provides a resilient framework because traffic has multiple paths across the fabric. Traffic is, therefore, easily diverted within the fabric when a device or link fails.
- **Flexibility**—You can easily expand the size of your VCF by adding devices to the fabric as your networking needs grow.
- **Investment protection**—In environments that need to expand because the capabilities of a traditional QFX5100, QFX3600, QFX3500, or EX4300 Virtual Chassis are maximized, a VCF is often a logical upgrade option because it enables the system to evolve without having to remove the existing, previously purchased devices from the network.
- **Manageability**—VCF provides multiple features that simplify configuration and management. VCF, for instance, has an autoprovisioning feature that enables you to plug and play devices into the fabric after minimal initial configuration. VCF leverages many of the existing configuration procedures from a Virtual Chassis, so that you can configure and maintain a VCF easily if you are already familiar with the procedures for configuring and maintaining a Virtual Chassis.

### Spine-and-Leaf Topology

The VCF uses a spine-and-leaf architecture where each device in the fabric is either a spine device or a leaf device.

A VCF can have up to four spine devices, and up to twenty total devices. Each spine device has at least one direct Virtual Chassis port (VCP) connection to each leaf device in the VCF.

All traffic entering a leaf device can, therefore, be forwarded to any directly connected spine device and is always two hops away from any other leaf device—leaf device to leaf device traffic travels from the source leaf device to a spine device to the destination leaf device—within the VCF.

See [Figure 231 on page 7036](#) for an illustration of the VCF spine-and-leaf architecture:

Figure 231: VCF Spine-and-Leaf Architecture

Traffic is forwarded through a VCF using a weighted algorithm designed to avoid congestion. Traffic travelling across the VCF from one leaf device to another leaf device is forwarded using the best path available at the time, so any connection to a spine device can be used to transport traffic from one leaf device to another leaf device.

### Spine Devices

A spine device:

- Must be a QFX5100 device.
- Is configured into the Routing Engine role, but can operate in the Routing Engine role or the linecard role..

**NOTE:** Only two devices can simultaneously operate in the Routing Engine role within a VCF. A VCF, however, supports up to four spine devices. In scenarios where a VCF has three or more spine devices, the devices that are not operating in the Routing Engine role operate in the linecard role.

A spine device that is configured into the Routing Engine role but is operating in the linecard role assumes the Routing Engine role when an active Routing Engine fails.

- Has a direct connection to each leaf device.
- Typically connects a router, firewall, or other data center networking device to the VCF.

A VCF should always have at least two active spine devices. A VCF supports up to four spine devices.

You can configure any QFX5100 device as a spine device. In the most common VCF configurations, QFX5100-24Q devices are used as spine devices.

### Leaf Devices

A leaf device:

- Is optimally a QFX5100 device, but can also be a QFX3500, QFX3600, or EX4300 device.
- Has a direct connection to each spine device.
- Always operates in the linecard role.
- Typically connects an endpoint device—for instance, a server or other storage device in a data center—to the VCF.

A VCF can have up to twenty total devices and up to four devices can be configuring into spine devices. The devices that are not spine devices in a VCF operate as leaf devices.

In the most common VCF configurations, QFX5100-48S devices are used as leaf devices.

### Routing Engine Role

A VCF has two devices operating in the Routing Engine role—a master Routing Engine and a backup Routing Engine.

The device that functions as the master Routing Engine:

- Is a spine device.
- Manages the member devices.
- Runs the chassis management processes and control protocols.
- Represents all the member devices interconnected within the VCF configuration. (The hostname and other parameters that you assign to this device during setup apply to all members of the VCF.)

The device that functions as the backup Routing Engine:

- Is a spine device.
- Maintains a state of readiness to take over the master role if the master fails.
- Synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it preserves routing information and maintains network connectivity without disruption when the master is unavailable.

All spine devices in a VCF are configured into the Routing Engine role.

**NOTE:** Only two devices can simultaneously operate in the Routing Engine role within a VCF. A VCF, however, supports up to four spine devices. In scenarios where a VCF has three or more spine devices, the devices that are not operating in the Routing Engine role operate in the linecard role.

A spine device that is configured into the Routing Engine role but is operating in the linecard role assumes the Routing Engine role when an active Routing Engine fails.

The master and backup Routing Engines are selected by the master election algorithm. If a VCF has more than two spine devices, the spine devices that are not selected as the master or backup Routing Engine operate in the linecard role even though the devices are configured into the Routing Engine role.

A spine device operating in the linecard role can complete all spine-related functions with no limitations within a VCF. A spine device operating in the linecard role assumes the backup Routing Engine role when the master or backup Routing Engine fails.

### Linecard Role

---

All leaf devices in a VCF operate in the linecard role. In autoprovisioned configurations, leaf devices are assigned the linecard role when they are cabled into the VCF. In preprovisioned configurations, leaf devices are manually configured into the linecard role. In nonprovisioned configurations, leaf devices are assigned the linecard role according to the master election algorithm, which uses the mastership priority values to set the roles of each device in the VCF.

All spine devices in a VCF are configured into the Routing Engine role, but operate in the linecard role when they are not selected as the master or backup Routing Engine by the master election algorithm. A spine device operating in the linecard role can complete all spine-related functions with no limitations within a VCF. A spine device operating in the linecard role becomes the new backup Routing Engine when the master or backup Routing Engine fails.

A member that functions in the linecard role in a VCF:

- Runs only a subset of Junos OS.
- Detects certain error conditions (such as an unplugged cable) on any interfaces that have been configured on it through the device functioning as the master Routing Engine.

### Master Routing Engine Election Process

---

The device in the master Routing Engine role in a VCF is always a spine device.

In a preprovisioned or autoprovisioned VCF, up to four spine devices are assigned the Routing Engine role during the configuration process. The spine device that has been powered on the longest assumes the master Routing Engine role; the spine device that has been powered on the second longest assumes the backup Routing Engine role. The remaining spine devices assume the linecard role.

In a nonprovisioned VCF, the master and backup Routing Engines are selected using the following algorithm:

1. Choose the QFX5100 device with the highest user-configured mastership priority (255 is the highest possible value) as the master Routing Engine, and the QFX5100 switch with the second highest mastership priority value as the backup Routing Engine.  
A QFX5100 switch with a mastership priority of 0 will always stay in the linecard role.
2. Choose the QFX5100 device that was master the last time the VCF booted.

3. Choose the QFX5100 device that has been included in the VCF configuration for the longest period of time.
4. Choose the QFX5100 device with the lowest MAC address.

QFX3500, QFX3600, and EX4300 devices never assume the master or backup Routing Engine role in a VCF.

We strongly recommend that you configure the mastership priority of the QFX5100 devices in your VCF to ensure that the correct devices assume their intended roles when you configure your VCF using a nonprovisioned configuration.

### Virtual Chassis Ports (VCPs)

---

Virtual Chassis ports (VCPs) are used in a VCF to interconnect leaf devices to spine devices. All control and data traffic in a VCF is transported over VCPs.

VCPs in a VCF are either SFP+ connections that support 10-Gbps or QSFP+ connections that support 40-Gbps.

10-Gbps SFP+ and 40-Gbps QSFP+ links are automatically converted into VCPs in most scenarios when a device is added to an autoprovisioned or preprovisioned VCF. Automatic VCP conversion is discussed in more detail in the following section.

You can manually configure a 10-Gbps SFP+ and 40-Gbps QSFP+ link into a VCP.

Channelized interfaces cannot be configured into VCPs.

### Automatic Virtual Chassis Port (VCP) Conversion

---

10-Gbps SFP+ and 40-Gbps QSFP+ links are not configured into VCPs, by default.

10-Gbps SFP+ and 40-Gbps QSFP+ links are automatically converted into VCPs when:

- Link Layer Discovery Protocol (LLDP) is enabled on the interfaces on both ends of the link. LLDP is enabled by default.
- the device being added to the VCF is configured into fabric mode.
- The interfaces on both ends of the link are not configured as VCPs. The following interfaces are configured as VCPs:
  - The 40-Gbps QSFP+ port on an EX4300 switch, by default.
  - Any interface in the VCF that has been a VCP. If a device is removed from a VCF, the interface that was interconnected to the removed device remains configured as a VCP until it is configured into a network port using the **request virtual-chassis vc-port delete** command.
  - Any interface that has been configured into a VCP using the **request virtual-chassis vc-port set** command.

To change any of the above interfaces into a network interface so that the interface can become eligible for automatic VCP conversion, use the **request virtual-chassis vc-port delete** command.

- one of the devices is already part of a VCF that was autoprovisioned or preprovisioned.

Automatic VCP conversion does not work in nonprovisioned VCFs.

Automatic VCP conversion does not convert a VCP interface into a network interface when a device is removed from a VCF. If automatic VCP conversion has converted an interface into a VCP and you want the interface to function as a network interface, you must manually disable the VCP interface.

---

### VCF Configuration Options

You can configure a VCF using autoprovisioned, preprovisioned, or nonprovisioned configuration.

Autoprovisioned configuration allows you to *plug and play* leaf devices into a VCF after completing a minimal initial configuration procedure.

In a preprovisioned configuration, you deterministically control the devices in your VCF by associating each device's serial number to a member ID and role.

Nonprovisioned configuration is possible, but not recommended for most VCF installations. Nonprovisioned configuration is a highly manual procedure that should only be performed by expert users.

See [“Understanding Virtual Chassis Fabric Configuration” on page 7043](#) for additional information on the VCF configuration options.

---

### Fabric Mode

A device must be configured into fabric mode in order for it to join a VCF. You should always configure a device into fabric mode before interconnecting it into a VCF.

In preprovisioned and nonprovisioned configurations, a device is not participating as a VCF member until it is configured into fabric mode.

In autoprovisioned configurations, a spine device is not participating as a VCF member until it is configured into fabric mode. A spine device that is not configured into fabric mode is configured into fabric mode when it is interconnected into the VCF. The final step of the process of configuring the device into fabric mode is a device reboot. We strongly recommend configuring the spine device into fabric mode before interconnecting it into the VCF to eliminate this reboot.

A leaf device in an autoprovisioned configuration is also rebooted to complete the fabric mode configuration when it is interconnected into a VCF without being set into fabric mode. You can avoid the downtime that accompanies the reboot by setting the device into fabric mode before interconnecting it into the VCF.

A standalone device that is not part of a VCF should never be configured into fabric mode. A device is not in fabric mode, by default.

### Mixed Mode

---

The optimal method of configuring a VCF is to use QFX5100 devices only. A VCF composed entirely of QFX5100 devices supports the largest breadth of features at the highest scalability while also supporting the highest number of high-speed interfaces.

You can, however, configure other devices as leaf devices in your VCF. QFX5100, QFX3600, QFX3500, or EX4300 devices can be used as leaf devices in a VCF.

If you use QFX3600, QFX3500, or EX4300 devices as leaf devices in your VCF, you must configure all devices in your VCF into mixed mode.

A device that is not part of a Virtual Chassis or a VCF with other devices should never be configured into mixed mode. A device is not configured into mixed mode, by default.

### Virtual Management Ethernet Interface

---

VCF configuration can be managed remotely using a global management interface called the virtual management Ethernet (VME) interface. The VME interface is a logical interface representing all of the out-of-band management ports on the member devices. When you connect to the VCF using the VME interface's IP address, the connection is always redirected to the device acting in the master Routing Engine role.

A VME interface should always be used to configure a VCF. The VME interface is not tied to a device, so it can always be used to log in to the VCF even after the master Routing Engine changes.

We strongly recommend cabling the management port on all spine devices to the network to ensure that you always have a direct connection to the master Routing Engine through the VME interface, regardless of which spine device assumes the master Routing Engine role. The management ports on leaf devices can also be used by the VME interface to access the VCF, so you can also cable leaf device management ports to the network, if desired.

### Virtual Chassis Fabric Port Link Aggregation Group Bundles

---

You can increase the bandwidth on links configured as VCPs within a VCF between two devices by configuring multiple same-speed links between two devices into VCPs. If, for instance, you configure two 40-Gbps QSFP+ links that are connecting the same devices in a VCF into VCPs, the two VCP links form one LAG bundle with two member links and 80-Gbps of total available bandwidth.

A VCP LAG bundle provides more bandwidth than a single VCP link can provide. A VCP LAG bundle also improves performance by load-sharing traffic across links within the bundle, and provides redundancy because traffic can be forwarded across another member link in the VCP LAG bundle when one VCP link fails.

VCP LAG bundling occurs automatically when same-speed VCP links are configured between two devices. No user configuration is required. VCP LAG bundling works only on same-speed VCP links; 10-Gbps and 40-Gbps links cannot be in the same VCP LAG bundle.

### Virtual Chassis Fabric License Requirements

---

A feature license is required to configure a VCF. The VCF feature license is an independent feature license; the enhanced feature licenses (EFLs) or advanced feature licenses (AFLs) that must be purchased to enable some features on some Juniper switches cannot be purchased to enable VCF.

For a VCF deployment, two license keys are recommended for redundancy—one for the device in the master Routing Engine role and the other for the device in the backup Routing Engine role.

To purchase a feature license for VCF, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). The Juniper sales representative will provide you with the feature license files and license keys. You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the **show virtual-chassis** command.

### Hardware Requirements for a Virtual Chassis Fabric

---

A VCF can contain up to four devices configured as spines and up to twenty total devices.

All spine devices must be QFX5100 devices. We recommend optimizing the performance of your VCF by also configuring QFX5100 devices as your leaf devices. A non-mixed VCF has the highest port density and feature support for a VCF in addition to supporting more spine devices. Nevertheless, you can configure any combination of QFX5100, QFX3600, QFX3500, or EX4300 devices into leaf devices within your VCF.

You can configure any QFX5100 device as a spine device. In the most common VCF configurations, the QFX5100-24Q devices are used as spine devices and QFX5100-48S devices are used as leaf devices.

### Software Requirements in a Virtual Chassis Fabric

---

All devices in a VCF must be running the same version of Junos OS software that supports VCF. VCF is initially supported for twenty total member devices in Junos OS Release 13.2X51-D20 for QFX5100, QFX3600, QFX3500, and EX4300 devices.

The devices in the VCF must be using the version of software for standalone switches.

The flex software bundle is supported on non-mixed VCFs using QFX5100 member switches only. You cannot use the flex software bundle in mixed VCFs. The flex software bundle is the software that includes “jinstall-qfx-5-flex” text in the filename when it is downloaded from the Software Center.

We recommend configuring a device to the Junos OS release running on the VCF before interconnecting it into the VCF. For additional information on VCF software upgrades, see “[Understanding Software Upgrades in a Virtual Chassis Fabric](#)” on page 7050.

For information on software upgrade options for an operational VCF, see “[Understanding Software Upgrades in a Virtual Chassis Fabric](#)” on page 7050.

## Understanding Virtual Chassis Fabric Configuration

This topic describes the configuration options available for your Virtual Chassis Fabric (VCF).

This topic covers:

- [Virtual Chassis Fabric Setup on page 7043](#)
- [Configuration File Management in a VCF on page 7045](#)
- [Logging into a Virtual Chassis Fabric on page 7045](#)
- [Understanding Interface Numbering on page 7045](#)

### Virtual Chassis Fabric Setup

You must setup your VCF using one of the following options:

- [Autoprovisioned Virtual Chassis Fabric Configuration on page 7043](#)
- [Preprovisioned Virtual Chassis Fabric Configuration on page 7044](#)
- [Nonprovisioned Virtual Chassis Fabric Configuration on page 7044](#)

#### ***Autoprovisioned Virtual Chassis Fabric Configuration***

Autoprovisioned configuration allows you to “plug and play” leaf devices into a VCF after minimal initial configuration.

The minimal configuration requirements for autoprovioning a VCF include setting the configuration mode to autoprovioned and explicitly identifying the spine devices in your VCF by serial number. After this minimal configuration is complete, all supported devices—supported devices are either devices that have been zeroized or devices in factory default mode that have never been configured into a Virtual Chassis or VCF—are automatically added to the VCF as leaf devices when they are cabled to spine devices using supported 10-Gbps SFP+ ports or 40-Gbps QSFP+ ports. The Virtual Chassis ports (VCPs) are created automatically. Other parameters such as fabric and mixed mode are automatically detected and set.

A spine device in an autoprovioned configuration should be configured into fabric mode before being interconnected into a VCF. A spine device in an autoprovioned VCF must also have the same mixed mode setting as other member devices in the VCF. You should

configure your spine device into fabric mode and, if necessary, mixed mode before interconnecting it into the VCF.

A leaf device in an autoprovisioned configuration is rebooted to complete the fabric mode configuration when it is interconnected into a VCF without being set into fabric mode. The leaf device is also rebooted if the device needs to be configured into or out of mixed mode to participate in the VCF. You can avoid the downtime that accompanies the reboot of the leaf device by setting the leaf device into fabric mode and into or out of mixed mode before interconnecting it into the VCF.

### ***Preprovisioned Virtual Chassis Fabric Configuration***

In a preprovisioned configuration, you deterministically control the devices in your VCF by associating each device's serial number to a member ID and role.

The advantage of configuring a VCF using a preprovisioned configuration is that you can explicitly control which devices are added to your VCF, and in what roles. VCF configuration, notably, occurs automatically when two devices that have been configured into fabric mode (and mixed mode, if applicable) are interconnected by a supported 10-Gbps SFP+ port or a 40-Gbps QSFP+ port after the preprovisioned configuration is defined.

The disadvantage of using a preprovisioned configuration is that the configuration process is more manual than the autoprovisioned configuration process.

### ***Nonprovisioned Virtual Chassis Fabric Configuration***

**CAUTION:** We discourage nonprovisioned VCF configuration. You can configure all aspects of a VCF using autoprovisioned or preprovisioned configuration. Nonprovisioned VCF configuration should only be used by VCF experts in specialized scenarios.

A nonprovisioned VCF is the default method for creating a VCF; it is the configuration mode used when a VCF has not been configured into autoprovisioned or preprovisioned mode.

In a nonprovisioned VCF, member roles are determined by a mastership election algorithm. The first value checked by the mastership election algorithm is the mastership priority value. The devices with the highest mastership priority values assume the Routing Engine role, which is used by the spine devices in a VCF. All other devices assume the linecard role.

If two or more devices have the same mastership priority value and are candidates for the Routing Engine role, the mastership election algorithm uses other parameters to determine which device is elected as the Routing Engine. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917](#).

The default mastership priority value for all devices is 128. You should always configure your spine devices with the highest mastership priority to ensure a spine device assumes the Routing Engine role.

In a nonprovisioned VCF, you must manually configure every VCP.

### Configuration File Management in a VCF

You configure a VCF by logging onto the master Routing Engine and making configuration changes. See the next section for information on logging into a VCF.

The configuration file that is modified when you are on the master Routing Engine is automatically shared with all other devices in the VCF when it is committed. Each device stores its own copy of the configuration file.

### Logging into a Virtual Chassis Fabric

The recommended method of logging into a VCF is through the use of a Virtual Management Ethernet (VME) interface. The VME interface is a logical interface representing all of the out-of-band management ports on the member devices. When you connect to the VCF configuration using the VME interface's IP address, the connection is always redirected to the management port on device in the master Routing Engine role. The VME interface is not tied to a device, so it can always be used to log in to the VCF even after the master Routing Engine changes. We recommend cabling the management ports—an *me* or *em* interface—on each spine device in your VCF to support the VME interface.

If you log in to the console port of any member device in a VCF, your session is automatically redirected to the device acting in the master Routing Engine role.

### Understanding Interface Numbering

Interfaces in Junos OS are specified as follows:

*type-fpc/pic/port*

A VCF applies this convention as follows:

- *type*—The interface type.
- *fpc*—Flexible PIC Concentrator. In a VCF, the *fpc* is the member ID of the switch. For instance, the *fpc* of member 16 in the VCF is 16.
- *pic*—the number of the PIC (Physical Interface Card) on the member device.
- *port*—the port number.

For more detailed information on interface numbering, see [“Understanding Interface Naming Conventions” on page 2401](#).

## Understanding Mixed EX Series and QFX Series Virtual Chassis or Virtual Chassis Fabric

This topic describes the requirements for a mixed Virtual Chassis or a mixed Virtual Chassis Fabric (VCF).

A mixed Virtual Chassis includes two or more types of EX Series switches, two or more types of QFX Series switches, or a mix of EX and QFX Series switches.

A mixed VCF is any VCF that includes two or more types of member switches. Because a VCF must use a QFX5100 switch as a spine device, a mixed VCF is any VCF that includes EX4300, QFX3500, or QFX3600 member switches in addition to the required QFX5100 switches.

**NOTE:** The optimal VCF topology is to use QFX5100 devices only. A VCF composed entirely of QFX5100 devices supports the largest breadth of features at the highest scalability while also supporting the highest number of high-speed interfaces.

This topic covers:

- [Virtual Chassis Fabric Summary on page 7046](#)
- [Understanding Mixed Virtual Chassis Fabric on page 7047](#)
- [Virtual Chassis Summary for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 Switches on page 7047](#)
- [Understanding the Routing Engine Role in a Mixed Virtual Chassis Using EX4300, EX4600, QFX3500, QFX3600, or QFX5100 Member Switches on page 7048](#)
- [Understanding EX4300, QFX3500, QFX3600, and QFX5100 Switches in a Virtual Chassis on page 7049](#)
- [Understanding Mixed EX4300 and EX4600 Virtual Chassis on page 7049](#)
- [Understanding EX4200, EX4500, and EX4550 Switches in a Mixed Virtual Chassis on page 7049](#)

### Virtual Chassis Fabric Summary

---

[Table 665 on page 6914](#) provides a high-level overview of the permitted hardware allowed in the routing engine and line card roles of a mixed and a non-mixed VCF. The table also includes license requirements and supported configuration methods.

Table 679: Virtual Chassis Fabric Summary

Category	Allowed Routing Engines	Allowed Line Cards	License Requirement	Configuration Methods
Non-mixed	QFX5100	QFX5100	Yes (on two QFX5100 switches operating in master and backup Routing Engine roles)	Autoprovisioning Preprovisioning Nonprovisioning (not recommended)
Mixed	QFX5100	QFX5100 QFX3600 QFX3500 EX4300	Yes (on two QFX5100 switches operating in master and backup Routing Engine roles)	Autoprovisioning Preprovisioning Nonprovisioning (not recommended)

### Understanding Mixed Virtual Chassis Fabric

A VCF must use a QFX5100 switch in the spine role. A mixed VCF is, therefore, any VCF that includes EX4300, QFX3500, or QFX3600 member switches in addition to the required QFX5100 switch.

The optimal method of configuring a VCF is to use QFX5100 devices only. A non-mixed VCF composed entirely of QFX5100 devices supports the largest breadth of features at the highest scalability while also supporting the highest number of high-speed interfaces. You can, however, also configure a mixed VCF.

If you use QFX3600, QFX3500, or EX4300 devices as leaf devices in your VCF, you must configure all devices in your VCF into mixed mode. If you are turning a non-mixed VCF into a mixed VCF, you have to reboot the VCF to change the mixed mode setting.

### Virtual Chassis Summary for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 Switches

Table 666 on page 6915 provides a high-level overview of the permitted hardware allowed in the routing engine and line card roles of a mixed and a non-mixed Virtual Chassis for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 switches. The table also includes license requirements and supported configuration methods.

**Table 680: Virtual Chassis Summary**

Category	Allowed Routing Engines	Allowed Line Cards	License Requirement	Configuration Methods
Non-mixed	QFX5100	QFX5100	No	Nonprovisioning Preprovisioning
	QFX3600 QFX3500	QFX3600 QFX3500	No	Nonprovisioning Preprovisioning
	EX4600	EX4600	No	Nonprovisioning Preprovisioning
	EX4300	EX4300	No	Nonprovisioning Preprovisioning
Mixed	QFX5100	QFX5100 QFX3600 QFX3500 EX4300	No	Nonprovisioning Preprovisioning
	QFX3600 QFX3500	QFX3600 QFX3500 EX4300	No	Nonprovisioning Preprovisioning
	EX4600	EX4600 EX4300	No	Nonprovisioning Preprovisioning

#### **Understanding the Routing Engine Role in a Mixed Virtual Chassis Using EX4300, EX4600, QFX3500, QFX3600, or QFX5100 Member Switches**

In a mixed Virtual Chassis, the switch in the master Routing Engine role determines which switches are supported in the line card role of the mixed Virtual Chassis.

When a mixed Virtual Chassis is using a QFX5100 switch in the master Routing Engine role, you can use QFX5100, QFX3600, QFX3500, or EX4300 switches in the line card role.

When a mixed Virtual Chassis is using a QFX3600 or QFX3500 switch in the master Routing Engine role, you can use QFX3600, QFX3500, or EX4300 switches in the line card role.

In a mixed EX4300 and EX4600 Virtual Chassis, an EX4600 switch automatically assumes the Routing Engine role.

EX4600 switches can only be in a mixed Virtual Chassis with EX4300 switches. EX4600 switches cannot be in a mixed Virtual Chassis with QFX5100, QFX3600, or QFX3500 switches.

We recommend always configuring the same type of switch into the master and backup Routing Engine role, to ensure that the switch operating in the master role remains the same type of switch in the event of a switchover.

In most mixed Virtual Chassis, you must configure your Virtual Chassis to ensure a switch that supports the master Routing Engine assumes the master Routing Engine role. Without user configuration, any switch—with the exception of the EX4300 switch, which can never assume the master or backup Routing Engine role in a mixed Virtual Chassis or VCF—can assume the master or backup Routing Engine role.

### **Understanding EX4300, QFX3500, QFX3600, and QFX5100 Switches in a Virtual Chassis**

Up to ten EX4300 switches, QFX3500 switches, QFX3600 switches, and QFX5100 switches can be interconnected using Virtual Chassis ports (VCPs) to form a mixed or non-mixed Virtual Chassis. The mixed Virtual Chassis supports up to ten member switches regardless of the switches that compose the mixed Virtual Chassis.

EX4300 switches can also be interconnected into a mixed Virtual Chassis with EX4600 switches. See the following section for information on mixed EX4300 and EX4600 Virtual Chassis.

### **Understanding Mixed EX4300 and EX4600 Virtual Chassis**

EX4300 switches and EX4600 switches can be interconnected into the same Virtual Chassis. An EX4600 switch automatically assumes the master Routing Engine role in a mixed EX4300 and EX4600 Virtual Chassis, since EX4300 switches cannot assume the Routing Engine role in a mixed Virtual Chassis. EX4600 switches cannot be in a mixed Virtual Chassis with any other type of switch.

The mixed Virtual Chassis supports up to ten member switches.

### **Understanding EX4200, EX4500, and EX4550 Switches in a Mixed Virtual Chassis**

EX4200 switches, EX4500 switches, and EX4550 switches can be interconnected into the same Virtual Chassis to form a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, mixed EX4500 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, and EX4550 Virtual Chassis. The mixed Virtual Chassis supports up to 10 member switches regardless of whether the switches are EX4200 switches, EX4500 switches, or EX4550 switches. Any model of EX4200, EX4500, or EX4550 switch can be interconnected into the same mixed Virtual Chassis. The master election process that decides member switch roles in a mixed Virtual Chassis is identical to the master election process in a non-mixed Virtual Chassis, so any member switch in a mixed Virtual Chassis can assume the master, backup, or linecard role.

EX4200 switches, EX4500 switches, and EX4550 switches cannot be interconnected into a Virtual Chassis with any other switches.

## Understanding Traffic Flow Through a Virtual Chassis Fabric

A Virtual Chassis Fabric (VCF) forwards unicast traffic using a smart trunking algorithm that sends all traffic across multiple paths based on end-to-end available bandwidth. The smart trunking algorithm avoids unnecessary congestion due to improper traffic allocation while optimizing fabric bandwidth utilization because traffic is forwarded through the VCF relative to available bandwidth.

The smart trunking algorithm works by considering the overall available path bandwidth of each path in the VCF when making traffic-forwarding decisions, and then forwarding traffic across the paths relative to available path bandwidth. If a VCF with two spine devices, for instance, has one path from leaf device 1 to leaf device 4 that contains two 40-Gbps QSFP+ links and a second path from leaf device 1 to leaf device 4 that contains two 10-Gbps SFP+ links, the algorithm tries to balance traffic sent on the paths so that four times more packets are sent on the first path with 40 Gbps of available bandwidth across the entire path than are sent on the second path with 10 Gbps of total bandwidth.

You can optimize how traffic is forwarded through the VCF by adding spine devices to maximize the number of available paths between all leaf devices, and by using as many 40-Gbps QSFP+ interfaces as Virtual Chassis ports (VCPs) as possible.

VCF also supports adaptive load balancing (ALB). ALB enables the VCF trunking algorithm to use dynamic load information on interfaces and traffic queues to make forwarding decisions within the VCF. When ALB is implemented using flowlets, traffic flows that enter the VCF are spliced into smaller flows—flowlets—and individually forwarded across the VCF to the same destination device over different paths when the inactivity time between packet bursts on the sending interface exceeds the user-configurable inactivity interval. When ALB is implemented using per-packet mode, the sending interface actively monitors all paths available between two member devices and forwards traffic through the VCF using the best available path at the moment.

Implementing ALB using flowlets is effective in environments that periodically experience extremely large traffic flows—*elephant flows*—that are substantially larger than the majority of other traffic flowing through the VCF. The VCF is better able to manage the elephant flows by splicing them into smaller flowlets using ALB.

ALB is supported on a non-mixed VCF composed entirely of QFX5100 switches only. You should enable ALB using flowlets in non-mixed VCFs in environments where a small number of traffic flows are disproportionately larger than the majority of the other traffic flows.

## Understanding Software Upgrades in a Virtual Chassis Fabric

This topic provides an overview of software upgrades on Virtual Chassis Fabric (VCF).

It contains the following sections:

- [Virtual Chassis Fabric Software Basics on page 7051](#)
- [Nonstop Software Upgrade \(NSSU\) on page 7051](#)
- [Automatic Software Update on page 7051](#)
- [Traditional Software Upgrade on page 7051](#)

---

### Virtual Chassis Fabric Software Basics

---

VCF is initially supported in Junos OS Release 13.2X51-D20. All devices in a VCF must be running the same version of Junos OS that supports VCF.

At initial VCF configuration, you should configure all devices to the same Junos OS release before interconnecting them into a VCF.

When you are adding a device to an existing VCF, you should update the Junos OS release on the new device to the Junos OS release running in the VCF before interconnecting it into the VCF. Updating the Junos OS on the device before interconnecting it helps ensure the device is gracefully added to the VCF, without the downtime that is required to reboot the device after an automatic software update or the troubleshooting that is required if the device isn't added to the VCF due to mismatched software releases.

Before you interconnect a device into a VCF, you should upgrade the software on the device being added to the VCF to the version of Junos OS running on the VCF.

---

### Nonstop Software Upgrade (NSSU)

---

Nonstop software upgrade (NSSU) enables you to upgrade the software running on all member devices in a VCF with minimal network traffic disruption during the upgrade.

NSSU upgrades the software on each device individually while all other devices continue normal operations.

For additional information on NSSU in a VCF, see [“Understanding Nonstop Software Upgrade on a Virtual Chassis Fabric” on page 26](#).

---

### Automatic Software Update

---

Automatic software update automatically upgrades the Junos OS running on a device joining a VCF to the version of Junos OS running on the VCF at the moment the new device is cabled into the VCF.

Automatic software update is enabled using the **set virtual-chassis auto-sw-update** statement.

---

### Traditional Software Upgrade

---

You can upgrade software on a VCF using the traditional method of upgrading software for Junos OS by logging onto the master Routing Engine and using the **request system software add** command to initiate the upgrade on a non-mixed VCF or the **request system software add set [package-name package-name ...]** to initiate the upgrade on a mixed VCF, where *package-name* is the path to an image for one device family.

When you upgrade Junos OS on a VCF using the traditional software upgrade, the entire system is down until the upgrade is complete.

### Autoprovisioning a Virtual Chassis Fabric

Autoprovisioning a Virtual Chassis Fabric (VCF) enables you to “plug and play” devices into your VCF after minimal initial configuration.

Update all devices to the same version of Junos OS that supports VCF. See [“Upgrading Software” on page 134](#) or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To configure a VCF using autoprovisioning:

1. Make a list of the serial numbers of all the spine devices in the VCF. The spine devices must be QFX5100 devices. You can configure up to four spine devices in a VCF. You can get the device’s serial number in the **show virtual-chassis** output or by following the instructions in *Locating the Serial Number on a QFX5100 Device or Component*.
2. Configure each device into fabric mode. If needed, configure the devices into mixed mode.

Configure the device to reboot as part of the procedure to complete this configuration step.

Configure mixed mode if your VCF includes QFX3600, QFX3500, or EX4300 devices as leaf devices.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF composed of two or more types of devices:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** A spine device whose fabric or mixed mode setting is improperly set cannot join a VCF. You can check the mode settings by using the `show virtual-chassis mode` command.

We recommend that you set the fabric and mixed mode settings before you interconnect your spine devices into the VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

You can, however, use the `request virtual-chassis mode fabric local` or `request virtual-chassis mode mixed local` commands to set a spine device into fabric or mixed mode after interconnecting your VCF.

The fabric and mixed mode settings are automatically updated for a leaf device when it is interconnected into an autoprovisioned VCF. If the fabric or mixed mode settings are changed when a leaf device is interconnected into a VCF, the leaf device reboots before joining the VCF.

---

3. When the reboot is complete, log in to one of the spine devices in your VCF.

4. Set the configuration mode to autoprovisioned:

```
[edit]
```

```
user@device# set virtual-chassis auto-provisioned
```

5. Configure your spine devices into the Routing Engine role:

```
[edit virtual-chassis]
```

```
user@device# set member member-id serial-number serial-number role routing-engine
```

For instance, to configure the four spine devices with the serial numbers “SERIALNUMB00”, “SERIALNUMB01”, “SERIALNUMB02”, and “SERIALNUMB03” into the Routing Engine role as members 0 through 3:

```
[edit virtual-chassis]
```

```
user@device# set member 0 serial-number SERIALNUMB00 role routing-engine
```

```
user@device# set member 1 serial-number SERIALNUMB01 role routing-engine
```

```
user@device# set member 2 serial-number SERIALNUMB02 role routing-engine
```

```
user@device# set member 3 serial-number SERIALNUMB03 role routing-engine
```

6. (Recommended) Configure a virtual management Ethernet (VME) interface for management of the VCF configuration:

```
[edit]
```

```
user@device# set interfaces vme unit 0 family inet address /ip-address/mask/
```

**NOTE:** A VME accesses the device in the master Routing Engine role using a management port, so cable management port em0 or em1 on each spine device in your VCF so the VME is available regardless of which spine device assumes the master Routing Engine role. See *Connecting a QFX Series Device to a Management Console*

7. Commit the configuration:

```
user@device# commit
```

8. Cable your VCF.

After your autoprovisioned VCF configuration is committed, you can cable any EX4300, QFX3500, QFX3600, or QFX5100 device that is zeroized or that has never been configured to a spine device using a supported SFP+ or QSFP+ interface. The device that is zeroized or in factory-default mode is added to the VCF as a leaf device. All VCPs are configured as part of this process.

**NOTE:** Mixed mode and fabric mode are checked and, if needed, set automatically on the device as part of this process. If the mixed or fabric mode has to be changed to become part of the VCF, the device reboots. The device participates in the VCF with no further user intervention after this reboot is complete.

**NOTE:** Automatic VCP conversion only works when the interfaces on both ends of the link are not configured into VCPs.

The 40-Gbps QSFP+ interfaces on EX4300 switches are configured as VCPs, by default. You must, therefore, delete the VCP on the 40-Gbps QSFP+ interface using the `request virtual-chassis vc-port delete` command before interconnecting it into the VCF in order for the link to be converted into a VCP. You can also manually configure the link into a VCP using the `request virtual-chassis vc-port set` command.

The device joins the VCF immediately without a reboot if the mixed or fabric mode setting does not need to be changed.

9. Install the VCF feature licenses.

For a VCF deployment, two license keys are recommended for redundancy—one for the device in the master role and the other for the device in the backup role.

To purchase a feature license for VCF, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). The Juniper sales representative will provide you with the feature license files and license keys. You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the `show virtual-chassis` command.

After obtaining the licenses, follow the instructions in [“Generating License Keys” on page 75](#).

- [Preprovisioning a Virtual Chassis Fabric on page 7056](#)

## Preprovisioning a Virtual Chassis Fabric

Preprovisioning a Virtual Chassis Fabric (VCF) configuration allows you to assign the member ID and role for each device in the VCF.

Update all devices to the same version of Junos OS that supports VCF. See [“Upgrading Software” on page 134](#) or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To preprovision a VCF:

1. Make a list of the serial numbers of all the devices to be connected in the VCF. You can get a device's serial number in the **show virtual-chassis** output or by following the instructions in *Locating the Serial Number on a QFX5100 Device or Component*, *Locating the Serial Number on a QFX3600 or QFX3600-I Device or Component*, *Locating the Serial Number on a QFX3500 Device or Component*, or *Locating the Serial Number on an EX4300 Switch or Component*.
2. Decide the desired role (**routing-engine** or **line-card**) for each device.

In a VCF, you configure up to four QFX5100 devices into the Routing Engine role as spine devices. All other devices are configured into the linecard role as leaf devices.

**NOTE:** Only two devices can simultaneously operate in the Routing Engine role within a VCF. A VCF, however, supports up to four spine devices. In scenarios where a preprovisioned VCF has three or more spine devices, the devices that are not operating in the Routing Engine role operate in the linecard role.

A spine device operating in the linecard role assumes the Routing Engine role when an active Routing Engine fails.

3. Configure each individual device into fabric mode. If needed, configure the devices into mixed mode.

Reboot each device to complete this configuration step.

Mixed mode must be configured if your VCF includes QFX3500, QFX3600, or EX4300 devices as leaf nodes.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF that includes EX4300, QFX3500, or QFX3600 devices as leaf nodes:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** A device whose fabric or mixed mode setting is improperly set cannot join a VCF. You can check the mode settings using the `show virtual-chassis mode` command.

We recommend that you set the fabric and mixed mode before you interconnect your devices into a VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

You can, however, use the `request virtual-chassis mode fabric local` or `request virtual-chassis mode mixed local` commands to set a device into fabric or mixed mode after interconnecting your VCF.

4. Log in to one of your spine devices after the reboot has completed.

5. Specify the preprovisioned configuration mode:

```
[edit virtual-chassis]
user@device# set preprovisioned
```

6. Associate a member ID with a serial number for each device in your VCF, and configure the role for each device:

```
[edit virtual-chassis]
user@device# set member member-id serial-number serial-number role (line-card |
routing-engine)
```

Configure your spine devices into the Routing Engine role. You must use QFX5100 devices as your spine devices.

Configure your leaf devices into the linecard role.

For instance, if you wanted to preprovision a VCF with twenty member devices:

```
[edit virtual-chassis]
user@device# set member 0 serial-number SERIALNUMB00 role routing-engine
user@device# set member 1 serial-number SERIALNUMB01 role routing-engine
user@device# set member 2 serial-number SERIALNUMB02 role routing-engine
user@device# set member 3 serial-number SERIALNUMB03 role routing-engine
user@device# set member 4 serial-number SERIALNUMB04 role line-card
user@device# set member 5 serial-number SERIALNUMB05 role line-card
user@device# set member 6 serial-number SERIALNUMB06 role line-card
user@device# set member 7 serial-number SERIALNUMB07 role line-card
user@device# set member 8 serial-number SERIALNUMB08 role line-card
user@device# set member 9 serial-number SERIALNUMB09 role line-card
user@device# set member 10 serial-number SERIALNUMB10 role line-card
user@device# set member 11 serial-number SERIALNUMB11 role line-card
```

```

user@device# set member 12 serial-number SERIALNUMB12 role line-card
user@device# set member 13 serial-number SERIALNUMB13 role line-card
user@device# set member 14 serial-number SERIALNUMB14 role line-card
user@device# set member 15 serial-number SERIALNUMB15 role line-card
user@device# set member 16 serial-number SERIALNUMB16 role line-card
user@device# set member 17 serial-number SERIALNUMB17 role line-card
user@device# set member 18 serial-number SERIALNUMB18 role line-card
user@device# set member 19 serial-number SERIALNUMB19 role line-card

```

7. (Recommended) Configure a virtual management Ethernet (VME) interface for management of the VCF configuration:

```

[edit]
user@device# set interfaces vme unit 0 family inet address /ip-address/mask/

```

**NOTE:** A VME accesses the device in the master Routing Engine role using a management port, so cable management port em0 or em1 on each spine device in your VCF so the VME is available regardless of which spine device assumes the master Routing Engine role. See *Connecting a QFX Series Device to a Management Console*

8. Commit the configuration:

```

user@device# commit

```

9. Interconnect the spine device that you configured in the previous steps to all leaf devices by using the supported SFP+ and QSFP+ interfaces.

**NOTE:** The automatic Virtual Chassis port (VCP) conversion feature is enabled and automatically configures SFP+ and QSFP+ interfaces into VCPs when the VCF configuration mode is set to **preprovisioned**. You do not need to manually configure VCPs.

If you want to configure an SFP+ or QSFP+ interface into a network interface, disable LLDP on that interface. See [“Configuring LLDP” on page 1345](#).

**NOTE:** Automatic VCP conversion only works when the interfaces on both ends of the link are not configured into VCPs.

The 40-Gbps QSFP+ interfaces on EX4300 switches are configured as VCPs, by default. You must, therefore, delete the VCP on the 40-Gbps QSFP+ interface using the `request virtual-chassis vc-port delete` command before interconnecting it into the VCF in order for the link to be converted into a VCP. You can also manually configure the link into a VCP using the `request virtual-chassis vc-port set` command.

10. Interconnect all other spine devices to all other leaf devices using the supported SFP+ and QSFP+ interfaces.
11. Install the VCF feature licenses.

For a VCF deployment, two license keys are recommended for redundancy—one for the device in the master role and the other for the device in the backup role.

To purchase a feature license for VCF, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). The Juniper sales representative will provide you with the feature license files and license keys. You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the **show virtual-chassis** command.

After obtaining the licenses, follow the instructions in “[Generating License Keys](#)” on [page 75](#).

- [Removing a Device From a Virtual Chassis Fabric on page 7069](#)
- [Understanding Virtual Chassis Fabric Components on page 7035](#)
- [Autoprovisioning a Virtual Chassis Fabric on page 7053](#)

## Configuring a Nonprovisioned Virtual Chassis Fabric

**CAUTION:** Configure your Virtual Chassis Fabric (VCF) using autoprovisioning or preprovisioning unless you have a compelling reason to use nonprovisioned configuration. You can configure all aspects of a VCF using autoprovisioned or preprovisioned configuration. The process for autoprovisioning your VCF is described in “[Autoprovisioning a Virtual Chassis Fabric](#)” on [page 7053](#) and the process for preprovisioning your VCF is described in “[Preprovisioning a Virtual Chassis Fabric](#)” on [page 7056](#).

Nonprovisioned VCF configuration is highly discouraged. Nonprovisioned VCF configuration should only be used by VCF experts in specialized scenarios.

A nonprovisioned VCF is the configuration mode used when a VCF has not been configured into autoprovisioned or preprovisioned mode.

In a nonprovisioned VCF, you configure the device roles by setting the mastership priority value of each device. If no mastership priority values are set, a master election algorithm process runs and selects the role for each device.

You must manually configure all Virtual Chassis ports (VCPs) in a nonprovisioned VCF. The automatic VCP conversion feature, which automatically configures supported 10-Gbps SFP+ links and 40-Gbps QSFP+ links into VCPs on autoprovisioned and preprovisioned VCFs, is not supported on nonprovisioned VCFs.

Update all devices to the same version of Junos OS that supports VCF. See “[Upgrading Software](#)” on [page 134](#) or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To configure a nonprovisioned VCF:

1. Power on the devices.
2. Configure each individual device into fabric mode. If needed, configure the devices into mixed mode.

Reboot each device to complete this configuration step.

A VCF must have QFX5100 devices in the spine role, and operates most efficiently when the leaf nodes are also QFX5100 devices. Mixed mode must be configured if your VCF also includes at least one QFX3600, QFX3500, or EX4300 device in the leaf role.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF using at least one QFX3600, QFX3500, or EX4300 device as a leaf device:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** A device whose fabric or mixed mode setting is improperly set cannot join a VCF. You can check the mode settings using the `show virtual-chassis mode` command.

We recommend setting the fabric and mixed mode settings before interconnecting your devices into a VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

We strongly recommend configuring the mixed and fabric settings before you interconnect a device into a VCF. You can, however, use the `request virtual-chassis mode fabric local` or `request virtual-chassis mode mixed local` commands to set a device into fabric or mixed mode after you have interconnected your VCF.

- 
3. After the device reboots are complete, cable your spine devices to your leaf devices using supported SFP+ and QSFP+ interfaces.
  4. (Recommended) Configure a virtual management Ethernet (VME) interface for management of the VCF configuration:

[edit]

```
user@device# set interfaces vme unit 0 family inet address /ip-address/mask/
```

**NOTE:** A VME accesses the device in the master Routing Engine role using a management port, so cable management port em0 or em1 on each spine device in your VCF so the VME is available regardless of which spine device assumes the master Routing Engine role. See *Connecting a QFX Series Device to a Management Console*

5. Configure the desired SFP+ and QSFP+ interfaces into Virtual Chassis ports (VCPs):

```
user@device> request virtual-chassis vc-port set pic-slot pic-slot-number port port-number
user@device> request virtual-chassis vc-port set pic-slot pic-slot-number port port-number
```

The `show virtual-chassis vc-port` must be issued on the ports at both ends of the link in order for that link to be configured into a VCP.

6. Enter the `show virtual-chassis` command to confirm that the VCPs are operational and to learn the member ID of each member device in your VCF.

If you want to change the member ID that has been assigned to a member device, use the `request virtual-chassis renumber` command.

7. (Optional) Configure the mastership priority for each member device:

```
[edit virtual-chassis]
user@device# set member member-id mastership-priority number
```

In a nonprovisioned VCF, member roles are determined by a mastership election algorithm. The first value checked by the mastership election algorithm is the mastership priority value. The two QFX5100 devices with the highest mastership priority values assume the master and backup Routing Engine role, which must be used by the spine devices in a VCF. All other devices assume the linecard role.

QFX5100 devices assume the Routing Engine role, regardless of mastership priority settings. QFX5100 devices can also assume the linecard role.

QFX3600, QFX3500, and EX4300 devices always assume the linecard role in a VCF, regardless of the mastership priority settings.

**NOTE:** A spine device that isn't selected as master or backup Routing Engine assumes the linecard role. The spine devices should still be configured with a higher mastership priority value than the leaf devices to assure a spine device assumes the Routing Engine role when the master or backup Routing Engine fails.

If two or more devices have the same mastership priority value and are candidates for the Routing Engine role, the mastership election algorithm uses other parameters to determine which device is elected into the Routing Engine role. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917](#).

A device with a mastership priority of 0 never assumes the master or backup role.

For instance, to configure the mastership priority for member devices 0 through 19 in your VCF.

```
[edit virtual-chassis]
```

```
user@device# set member 0 mastership-priority 255
user@device# set member 1 mastership-priority 255
user@device# set member 2 mastership-priority 255
user@device# set member 3 mastership-priority 255
user@device# set member 4 mastership-priority 100
user@device# set member 5 mastership-priority 95
user@device# set member 6 mastership-priority 90
user@device# set member 7 mastership-priority 85
user@device# set member 8 mastership-priority 80
user@device# set member 9 mastership-priority 75
user@device# set member 10 mastership-priority 70
user@device# set member 11 mastership-priority 65
user@device# set member 12 mastership-priority 60
user@device# set member 13 mastership-priority 55
user@device# set member 14 mastership-priority 50
user@device# set member 15 mastership-priority 45
user@device# set member 16 mastership-priority 40
user@device# set member 17 mastership-priority 35
user@device# set member 18 mastership-priority 30
user@device# set member 19 mastership-priority 25
```

8. Install the VCF feature licenses.

For a VCF deployment, two license keys are recommended for redundancy—one for the device in the master role and the other for the device in the backup role.

To purchase a feature license for VCF, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). The Juniper sales representative will provide you with the feature license files and license keys. You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the **show virtual-chassis** command.

After obtaining the licenses, follow the instructions in “[Generating License Keys](#)” on [page 75](#).

## Adding a Device to a Virtual Chassis Fabric

This topic describes how to add a device to a Virtual Chassis Fabric (VCF).

It contains the following sections:

- [Adding a Leaf Device to an Autoprovisioned Virtual Chassis Fabric on page 7063](#)
- [Adding a Spine Device to an Autoprovisioned Virtual Chassis Fabric on page 7064](#)
- [Adding a Spine or Leaf Device to a Preprovisioned Virtual Chassis Fabric on page 7065](#)
- [Adding a Spine or Leaf Device to a Nonprovisioned Virtual Chassis Fabric on page 7067](#)

### Adding a Leaf Device to an Autoprovisioned Virtual Chassis Fabric

Update your device to the same version of Junos OS running on the devices in the VCF. See [“Upgrading Software” on page 134](#) or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To add a leaf device to an autoprovisioned VCF:

1. Log onto the device that you are adding to the VCF.
2. (Optional) Perform this step if you want to avoid the downtime associated with an extra reboot when your device is interconnected into your VCF. If you do not perform this step, the VCF auto-detects the fabric and mixed mode settings and, if needed, reboots the device as part of the process of changing these settings.

Configure the leaf device into fabric mode. Configure your device into mixed mode if your VCF includes QFX3600, QFX3500, or EX4300 devices as leaf devices..

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local
```

If you are configuring a VCF composed of two or more types of devices:

```
user@device> request virtual-chassis mode fabric mixed local
```

3. If the leaf device that you are adding to the VCF has not previously been configured, proceed to the next step.

If your device has been configured, zeroize your device and reboot:

```
user@device> request system zeroize
```

```
warning: System will be rebooted and may not boot without configuration
Erase all data, including configuration and log files? [yes,no] (yes) yes
```

**NOTE:** You must zeroize your device if you have previously entered one or more configuration commands, including basic configuration commands.

Your device will not join the VCF if it contains any configuration until it has been zeroized.

**NOTE:** The `request virtual-chassis mode fabric local` and `request virtual-chassis mode fabric mixed local` commands are entered in operational mode, so those settings are maintained when the device is zeroized.

You cannot use other methods to set a device into factory default mode before inserting it into a VCF if it was previously configured in another Virtual Chassis or VCF. You must use **`request system zeroize`**.

For additional information on this procedure, see *Reverting to the Default Factory Configuration for the EX Series Switch* or [“Reverting to the Default Factory Configuration” on page 188](#).

4. (Required only if you are adding a device that turns a non-mixed VCF into a mixed VCF) Log in to the VCF and set all devices in the VCF to mixed mode. Configure all devices to reboot to complete this procedure.

```
user@device> request virtual-chassis mode mixed all-members reboot
```

The VCF experiences downtime as part of the reboot procedure.

5. Interconnect your leaf device into the existing spine devices, using at least one 10-Gbps SFP+ interface or 40-Gbps QSFP+ interface to connect to each spine device in the VCF.

An autoprovisioned VCF automatically adds a supported device in factory-default mode to the VCF when it is connected to a spine devices using a supported SFP+ or QSFP+ link. The SFP+ or QSFP+ link is automatically converted into a Virtual Chassis port (VCP) as part of this process.

No further configuration is required.

---

### Adding a Spine Device to an Autoprovisioned Virtual Chassis Fabric

---

Update your device to the same version of Junos OS running on the devices in the VCF before interconnecting it into the VCF. See [“Upgrading Software” on page 134](#) or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To add a spine device to an autoprovisioned VCF:

1. Log in to your VCF.
2. If you are replacing a spine device that is already part of the VCF, power off the spine device in the VCF.

Follow the steps in [“Removing a Device From a Virtual Chassis Fabric” on page 7069](#) to remove the device from the VCF.

3. Modify the configuration.

If your new spine device is replacing an existing spine, modify the configuration to remove the old spine.

You can skip this step if you are not replacing an existing spine device.

```
[edit virtual-chassis]
```

```
user@device# delete member member-id
```

where *member-id* is the member ID of the spine that is removed from this procedure.

Add the spine device to the configuration:

```
[edit virtual-chassis]
```

```
user@device# set member member-id serial-number serial-number role routing-engine
```

For instance, to configure a spine device with the serial number OU81234567890 as member 3:

```
[edit virtual-chassis]
```

```
user@device# set member 3 serial-number OU81234567890 role routing-engine
```

4. Commit the configuration.

```
[edit]
```

```
user@device# commit
```

5. Log in to the device that is going to be added to the VCF.
6. Configure the device into fabric mode. If needed, also configure the device into mixed mode.

Reboot the device to complete this configuration step.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF composed of QFX5100 devices and at least one other type of device:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** We recommend setting the fabric and mixed mode settings before interconnecting your devices into a VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

You can, however, use the `request virtual-chassis mode fabric local` or `request virtual-chassis mode mixed local` commands to set a device into fabric or mixed mode after interconnecting your VCF.

7. (Required only if you are adding a device that turns a non-mixed VCF into a mixed VCF) Log in to the VCF and set all devices in the VCF to mixed mode. Configure all devices to reboot to complete this procedure.

```
user@device> request virtual-chassis mode mixed all-members reboot
```

The VCF experiences downtime as part of the reboot procedure.

8. After the device reboots, interconnect the new device into the VCF by cabling the device to the leaf devices in the VCF using supported SFP+ or QSFP+ interfaces.

The SFP+ or QSFP+ links are converted into VCPs automatically.

The new spine device should be operational once the cabling is complete.

### Adding a Spine or Leaf Device to a Preprovisioned Virtual Chassis Fabric

Update your device to the same version of Junos OS running on the devices in the VCF before interconnecting it into the VCF. See [“Upgrading Software” on page 134](#) or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To add a spine or leaf device to a preprovisioned VCF:

1. Log in to your VCF.
2. If you are replacing a device that is already part of the VCF, power off the device in the VCF.

Follow the steps in [“Removing a Device From a Virtual Chassis Fabric”](#) on page 7069 to remove the device from the VCF.

3. Modify the configuration.

If your new device is replacing an existing device, modify the configuration to remove the old device.

You can skip this portion of the procedure if you are not replacing an existing device.

```
[edit virtual-chassis]
user@device# delete member member-id
```

where *member-id* is the member ID of the spine that is removed from this procedure.

Add the new device to the configuration:

```
[edit virtual-chassis]
user@device# set member member-id serial-number serial-number role routing-engine
```

For instance, to configure a device with the serial number OU81234567890 into the Routine Engine role as member 3:

```
[edit virtual-chassis]
user@device# set member 3 serial-number OU81234567890 role routing-engine
```

4. Commit the configuration.

```
[edit]
user@device# commit
```

5. Log in to the device that is going to be added to the VCF.

6. Configure the device into fabric mode. If needed, also configure the device into mixed mode.

Reboot the device to complete this configuration step.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF composed of two or more types of devices:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** If you are adding a QFX3600, QFX3500, or EX4300 device to a VCF that is composed entirely of QFX5100 devices, you must also log in to the VCF and set all of the devices in the VCF into mixed mode.

Log in to the VCF and enter the **request virtual-chassis mode mixed all-members reboot** command to perform this task.

The VCF reboots and incurs downtime to complete this procedure.

---

**NOTE:** We recommend that you set the fabric and mixed mode settings before you interconnect your devices into a VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

You can, however, use the `request virtual-chassis mode fabric local` or `request virtual-chassis mode mixed local` commands to recover a device that was not set into fabric or mixed mode before you interconnect it into your VCF.

7. (Required only if you are adding a device that turns a non-mixed VCF into a mixed VCF) Log in to the VCF and set all devices in the VCF to mixed mode. Configure all devices to reboot to complete this procedure.

```
user@device> request virtual-chassis mode mixed all-members reboot
```

The VCF experiences downtime as part of the reboot procedure.

8. After the device reboots, interconnect the new device into the VCF using supported SFP+ or QSFP+ interfaces.

The SFP+ or QSFP+ links are converted into VCPs automatically.

The new device should be operational shortly after the cabling is complete.

### Adding a Spine or Leaf Device to a Nonprovisioned Virtual Chassis Fabric

**CAUTION:** Configure your VCF using autoprovisioning or preprovisioning unless you have a compelling reason to use nonprovisioned configuration. You can configure all aspects of a VCF using autoprovisioned or preprovisioned configuration.

Nonprovisioned VCF configuration is highly discouraged. Nonprovisioned VCF configuration should only be used by VCF experts in specialized scenarios.

Update your device to the same version of Junos OS running on the devices in the VCF before interconnecting it into the VCF. See [“Upgrading Software” on page 134](#) or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To add a spine or leaf device to a nonprovisioned VCF:

1. Log in to your VCF.
2. If you are replacing a device that is already part of the VCF, power off the device in the VCF. Uncable the device once the power off is complete.

You can skip this step if you are adding a new device without replacing an existing device. You must skip this step if there is no configuration for the device that you are removing from the VCF.

If the device is configured, delete the device from the VCF configuration:

```
[edit virtual-chassis]
user@device# delete member member-id
```

where *member-id* is the member ID of the device that you are removing.

3. Log in to the device that you are going to add to the VCF.
4. Configure the device into fabric mode. If needed, also configure the device into mixed mode.

Reboot the device to complete this configuration step.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF that includes at least one QFX3600, QFX3500, or EX4300 devices as a leaf device:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** If you are adding a QFX3600, QFX3500, or EX4300 device to a VCF that is composed entirely of QFX5100 devices, you must also log in to the VCF and set all of the devices in the VCF into mixed mode.

Log in to the VCF and enter the **request virtual-chassis mode mixed all-members reboot** command to perform this task.

The VCF reboots and incurs downtime to complete this procedure.

**NOTE:** We recommend that you set the fabric and mixed mode settings before you interconnect your devices into a VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

You can, however, use the **request virtual-chassis mode fabric local** or **request virtual-chassis mode mixed local** commands to set a device into fabric or mixed mode after interconnecting your VCF.

5. (Required only if you are adding a device that turns a non-mixed VCF into a mixed VCF) Log in to the VCF and set all devices in the VCF to mixed mode, Configure all devices to reboot to complete this procedure.

```
user@device> request virtual-chassis mode mixed all-members reboot
```

The VCF experiences downtime as part of the reboot procedure.

6. After the device reboots, interconnect it into the VCF using supported SFP+ or QSFP+ interfaces.

7. Configure the SFP+ or QSFP+ interfaces into Virtual Chassis ports (VCPs):

```
user@device> request virtual-chassis vc-port set pic-slot pic-slot-number port port-number
user@device> request virtual-chassis vc-port set pic-slot pic-slot-number port port-number
```

The **request virtual-chassis vc-port** must be configured on the ports at both ends of the link in order for that link to be configured into a VCP.

8. (Optional) Log in to the VCF and set the mastership priority of the new device:

```
[edit virtual-chassis]
user@device# set member member-id mastership-priority number
```

If needed, enter the **show virtual-chassis** command to learn the member ID of the new member device in the VCF.

## Removing a Device From a Virtual Chassis Fabric

This topic describes how to remove a device from a Virtual Chassis Fabric (VCF):

To remove a device from a VCF:

1. Power off the device that you are removing from the VCF.
2. Uncable the device that you are removing from the VCF.
3. Log in to the Virtual Management ethernet (VME) interface. Remove the device from the VCF configuration.

You can skip this step if you are removing a device that was never configured.

```
[edit virtual-chassis]
user@device# delete member member-id
```

4. Delete the Virtual Chassis port (VCP) or ports on the devices that are still in the VCF but were connected to the removed device.

```
user@device> request virtual-chassis vc-port delete pic-slot pic-slot port port-number member member-id
```

When a device is removed from a VCF, the interface on the other end of the VCP link that was connected to the removed device remains configured as a VCP.

You can check the results of this command using the **show virtual-chassis vc-port** command.

5. (Required only if you are removing a device that turns a mixed VCF into a homogenous VCF) Log in to the VCF and disable mixed mode for all of the devices in the VCF, Configure all devices to reboot to complete this procedure.

```
user@device> request virtual-chassis mode mixed disable all-members reboot
```

This step should only be taken if you are removing a QFX3600, QFX3500, or EX4300 device from a mixed VCF and the only devices remaining in the VCF are QFX5100 devices.

The VCF experiences downtime as part of the reboot procedure.

6. Commit the configuration.

```
[edit]
user@device# commit
```

7. Power on the device that was removed from the VCF, and log in to it.
8. (Optional, but recommended) Delete the VCP or VCPs on the device that was removed:

```
user@device> request virtual-chassis vc-port delete pic-slot pic-slot port port-number member member-id
```

9. (Optional, but recommended) Reset the fabric and mixed mode settings.

If you are removing a device that was part of a VCF composed entirely of the same device:

```
user@device> request virtual-chassis mode fabric disable reboot
```

If you are removing a device that was part of a VCF composed of two or more device types:

```
user@device> request virtual-chassis mode fabric mixed disable reboot
```

Reboot the device to complete the process.

We recommend resetting the fabric and mixed mode settings immediately after removing it from the VCF to avoid any potential issues with your device if it is placed in your network in another role.

## Upgrading Software for a Virtual Chassis Fabric

This topic describes the processes that can be used to update software on an operational Virtual Chassis Fabric (VCF).

You should update the software on each device before initially interconnecting your VCF. This process describes the options that are available for upgrading software after a VCF is setup.

It contains the following sections:

- [NSSU on page 7071](#)
- [Automatic Software Update on page 7071](#)
- [Standard Upgrade on page 7071](#)

## NSSU

Nonstop software upgrade (NSSU) enables you to upgrade the software running on all member devices in a VCF with minimal network traffic disruption during the upgrade.

See “Upgrading Software on a Virtual Chassis Fabric Using Nonstop Software Upgrade” on page 139.

## Automatic Software Update

Automatic software update automatically upgrades the Junos OS running on a device joining a VCF to the version of Junos OS running on the VCF at the moment the new device is cabled into the VCF.

To configure the automatic software update feature for a VCF composed entirely of QFX5100 devices:

[edit]

```
user@device# set virtual-chassis auto-sw-update package-name package-name
```

To configure the automatic software update feature on a VCF composed of QFX5100 devices and at least one other type of device:

[edit]

```
user@device# set virtual-chassis auto-sw-update qfx-5 package-name package-name
```

```
user@device# set virtual-chassis auto-sw-update qfx-3 package-name package-name
```

```
user@device# set virtual-chassis auto-sw-update ex-4300 package-name package-name
```

where **qfx-5** specifies the path to the Junos OS used to run a QFX5100 devices, **qfx-3** specifies the path to the Junos OS used to run QFX3600 and QFX3500 devices, and **ex4300** specifies the path to the Junos OS used to run EX4300 switches.

If the software package is located on a local directory on the switch, use the following format for *package-name*:

***/pathname/package-name***

If the software package is to be downloaded and installed from a remote location, use one of the following formats:

***ftp://hostname/pathname/package-name***

***ftp://username:prompt@ftp.hostname.net/package-name***

***http://hostname/pathname/package-name***

## Standard Upgrade

You can upgrade software on a VCF using the traditional method of upgrading software for Junos OS by logging onto the master Routing Engine and using the **request system software add** command to initiate the upgrade on a non-mixed VCF or the **request system**

**software add set** [*package-name package-name ...*] to initiate the upgrade on a mixed VCF, where *package-name* is the path to an image for one device family.

When you upgrade Junos OS on a VCF using the traditional software upgrade, each device in the VCF must reboot. The entire system is down until the upgrade process is complete.

For information on performing this procedure, see [“Upgrading Software” on page 134](#).

### [edit virtual-chassis] Configuration Statement Hierarchy

This topic lists supported and unsupported configuration statements in the **[edit virtual-chassis]** hierarchy level on EX Series and QFX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.

- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms.

For detailed information about feature support on specific EX Series or QFX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit virtual-chassis\] Hierarchy Level on page 7073](#)
- [Unsupported Statements in the \[edit virtual-chassis\] Hierarchy Level on page 7074](#)

### Supported Statements in the [edit virtual-chassis] Hierarchy Level

The following hierarchy shows the **[edit virtual-chassis]** configuration statements supported on EX Series or QFX Series switches:

```
virtual-chassis {
  aliases {
    serial-number serial-number {
      alias-name alias-name;
    }
  }
  auto-provisioned;
  auto-sw-update {
    (ex-4200 | ex-4300 | ex-4500 | ex-4600 | qfx-3 | qfx-5)
    package-name package-name;
  }
  fast-failover (ge | vcp disable | xe);
  graceful-restart {
    disable;
  }
  id id;
  mac-persistence-timer [minutes | disable];;
  member member-id {
    location location;
    mastership-priority number;
    no-management-vlan;
    role (line-card | routing-engine);
    serial-number;
  }
  no-split-detection;
  preprovisioned;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable> <match
      regex>;
    flag flag ;
  }
  vc-port {
    lag-hash (packet-based | source-port-based);
  }
  vcp-no-hold-time;
}
```

### Unsupported Statements in the [edit virtual-chassis] Hierarchy Level

All statements in the **[edit virtual-chassis]** hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

## aliases (Virtual Chassis)

<b>Syntax</b>	<pre>aliases {   serial-number serial-number {     alias-name alias-name;   } }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1X53-D10 for EX Series and QFX Series switches.
<b>Description</b>	<p>Create an alias for a member switch in a Virtual Chassis or Virtual Chassis Fabric (VCF). An alias allows you to more clearly identify the member switches in your Virtual Chassis or VCF by assigning a text label to a member switch's serial number.</p> <p>An alias is not specified for a device until the alias name is specified using the <b>alias-name</b> keyword.</p> <p>The alias appears in the <b>Alias-Name</b> field in the <b>show virtual-chassis</b> command.</p> <p>Alias usage is optional and aliases are used for administrative purposes only. Setting an alias has no effect on the operation of the member switch.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li> <li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li> <li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li> <li>• <a href="#">Understanding Virtual Chassis Fabric Components on page 7035</a></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis Components on page 6909</a></li> </ul>

## alias-name (Virtual Chassis aliases)

---

**Syntax** `alias-name alias-name;`

**Hierarchy Level** `[edit virtual-chassis aliases serial-number serial-number]`

**Release Information** Statement introduced in Junos OS Release 14.1X53-D10 for EX Series and QFX Series switches.

**Description** Create an alias for a member switch in a Virtual Chassis or Virtual Chassis Fabric (VCF). An alias allows you to more clearly identify the member switches in your Virtual Chassis or VCF by assigning a text label to a member switch's serial number.

The alias appears in the **Alias-Name** field in the **show virtual-chassis** command.

Alias usage is optional and aliases are used for administrative purposes only. Setting an alias has no effect on the operation of the member switch.

In the following example, the **dc-floor-1** alias name is assigned to the member switch with the serial number AB0123456789.

### [set serial-number](#)

```
[edit virtual-chassis aliases]
user@switch# set serial-number AB0123456789 alias-name dc-floor-1
```

### [show virtual-chassis](#)

```
user@switch> show virtual-chassis
Preprovisioned Virtual Chassis Fabric
Fabric ID: 9d5d.5556.919a
Fabric Mode: Enabled

Member ID  Status  Serial No  Alias-Name  Model  Mstr  prio  Role
0 (FPC 0)  Prsnt    AB0123456789  dc-floor-1  qfx5100-48s-6q  129  Master
<additional output removed for brevity>
```

**Options** *alias-name*—The text label, or alias, assigned to the member switch by the user.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## auto-provisioned

---

<b>Syntax</b>	auto-provisioned;
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2X51-D20 for EX Series switches and QFX Series devices in a Virtual Chassis Fabric (VCF).
<b>Description</b>	<p>Enable the auto-provisioned configuration mode for a Virtual Chassis Fabric (VCF).</p> <p>When a VCF is autoprovisioned, you can plug and play leaf devices that have not been configured or are zeroized into your VCF without user configuration. The leaf devices are automatically configured into the linecard role and all other VCF configuration—configuring Virtual Chassis ports (VCPs), the member ID, fabric mode, mixed mode (if applicable), and other parameters—is completed without further user action when a supported spine device interconnects to the leaf device by using a 10-Gbps SFP+ or 40-Gbps QSFP+ link that can be converted into a VCP.</p> <p>A leaf device whose fabric or mixed mode setting is changed as part of the autoprovisioning process automatically reboots. You can avoid this reboot by configuring the fabric or mixed mode setting on the leaf device before interconnecting into the VCF.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li> <li>• <a href="#">Understanding Virtual Chassis Fabric Configuration on page 7043</a></li> </ul>

## auto-sw-update

---

<b>Syntax</b>	<pre>auto-sw-update {     (ex-4200   ex-4300   ex-4500   ex-4600   qfx-3   qfx-5)     package-name package-name; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>The <b>ex-4200</b> and <b>ex-4500</b> options introduced in Junos OS Release 12.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>The <b>ex-4300</b>, <b>qfx-3</b>, and <b>qfx-5</b> options introduced in Junos OS Release 13.2X51-D20.</p> <p>The <b>ex-4600</b> option introduced in Junos OS Release 13.2X51-D25.</p>
<b>Description</b>	<p>Enable the automatic software update feature for Virtual Chassis or Virtual Chassis Fabric (VCF) configurations.</p> <p>You should only use the keywords that specify a device—<b>ex-4300</b>, <b>ex-4600</b>, <b>qfx-3</b>, and <b>qfx-5</b>—when configuring automatic software update on a mixed Virtual Chassis or Virtual Chassis Fabric (VCF). You can simply specify the <i>package-name</i> without specifying the device keywords in non-mixed Virtual Chassis or VCF topologies.</p> <p>You must enter the <b>auto-sw-update</b> statement multiple times—once for each device family in your mixed Virtual Chassis or VCF—in most scenarios when enabling the automatic software update for a mixed Virtual Chassis or VCF.</p> <p>The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. You do not, therefore, need to specify the <b>ex-4500</b> keyword when configuring automatic software update for a mixed Virtual Chassis that include EX4500 and EX4550 switches only. You also only have to enter the <b>ex-4500</b> keyword once to configure automatic software update for all EX4500 and EX4550 member switches in the same mixed Virtual Chassis.</p> <p>The Junos OS package for a QFX3500 device updates the software for QFX3500 and QFX3600 devices. You do not, therefore, need to specify the <b>qfx-3</b> keyword when configuring automatic software update for a Virtual Chassis composed entirely of QFX3500 and QFX3600 devices. You also have to enter the <b>qfx-3</b> keyword only once to configure automatic software update for all QFX3500 and QFX3600 member devices in the same mixed Virtual Chassis.</p> <p>The remaining statement is explained separately.</p>
<b>Default</b>	The automatic software update feature is disabled.
<b>Options</b>	<p><b>package-name package-name</b>—Specify a path to a Junos OS software image.</p> <p><b>ex-4200</b>—Specify a path to a Junos OS image for an EX4200 switch when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed</p>

EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

**ex-4300**—Specify a path to a Junos OS image for an EX4300 switch when enabling automatic software update for a mixed Virtual Chassis or VCF.

**ex-4500**—Specify a path to a Junos OS image for an EX4500 switch, an EX4550 switch, or both types of switches when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. Therefore, you only enter this command once to upgrade the EX4500 and EX4550 member switches in the same mixed Virtual Chassis.

The **ex-4500** keyword also does not need to be specified when configuring automatic software update for a mixed EX4500 and EX4550 Virtual Chassis.

**ex-4600**—Specify a path to a Junos OS image for an EX4600 switch when enabling automatic software update for a mixed Virtual Chassis.

**qfx-3**—Specify a path to a Junos OS image for a QFX3500, QFX3600, or both types of devices when enabling automatic software update for a mixed VCF.

**qfx-5**—Specify a path to a Junos OS image for a QFX5100 device when enabling automatic software update for a mixed VCF.

<b>Required Privilege Level</b>	system—To view this statement in the configuration.
	system-control—To add this statement to the configuration.

      }

**Hierarchy Level**    [edit forwarding-options]

**Release Information**    Statement introduced in Junos OS Release 13.2X51-D15 for EX Series switches.  
                              Statement introduced in Junos OS Release 13.2X51-D20 for QFX Series devices.  
                              The **fabric-load-balance** statement introduced in Junos OS Release 14.1X53-D10.

**Description**    Configure the hashing key used to hash link aggregation group (LAG) and equal-cost multipath (ECMP) traffic, or enable adaptive load balancing (ALB) in a Virtual Chassis Fabric (VCF).

The hashing algorithm is used to make traffic-forwarding decisions for traffic entering a LAG bundle or for traffic exiting a switch when ECMP is enabled.

For LAG bundles, the hashing algorithm determines how traffic entering a LAG bundle is placed onto the bundle's member links. The hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.

When ECMP is enabled, the hashing algorithm determines how incoming traffic is forwarded to the next-hop device.

The remaining statements are explained separately.

<b>Required Privilege</b>	interface—To view this statement in the configuration.
<b>Level</b>	interface-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Fields in the Algorithm Used To Hash LAG Bundle and ECMP Traffic (CLI Procedure) on page 2590</a></li><li>• <a href="#">Understanding the Algorithm Used to Hash LAG Bundle and Egress Next-Hop ECMP Traffic on page 2396</a></li></ul>
------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## fabric-load-balance

---

<b>Syntax</b>	<pre>fabric-load-balance {     flowlet {         inactivity-interval interval;     }     per-packet; }</pre>
<b>Hierarchy Level</b>	[edit forwarding-options <b>enhanced-hash-key</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1X53-D10.
<b>Description</b>	<p>Enable adaptive load balancing (ALB) for a VCF, and specify how ALB is implemented.</p> <p>When ALB is enabled, the Virtual Chassis ports (VCPs) are reset. Packets are dropped and might potentially arrive out of order for a brief period of time as a result of this VCP reset. Normal operation of the VCF resumes after the VCP reset with no further user action.</p>
<b>Default</b>	<p>ALB is disabled, by default.</p> <p>If you do not specify a mode when enabled ALB, ALB is enabled using flowlet mode with an inactivity timer of 16 microseconds.</p>
<b>Options</b>	<p><b>flowlet</b>—Implement ALB by using flowlets.</p> <p>When ALB is implemented using flowlets, traffic flows that enter the VCF are spliced into smaller flows—flowlets—and individually forwarded across the VCF to the same destination device over different paths when the inactivity time between packet bursts on the sending interface exceeds the user-configurable inactivity interval.</p> <p>The inactivity interval is 16 microseconds by default, and can be configured using the <b>inactivity-interval</b> statement. You should configure the inactivity interval to ensure in-order packet delivery, so that overall performance is not negatively impacted by the packet reordering process at the receiving device. To ensure in-order packet delivery, the inactivity interval should be larger than the largest latency skew among all the paths in the VCF from any node to any other node.</p> <p>Implementing ALB using flowlets is especially effective in environments that periodically experience extremely large traffic flows—<i>elephant flows</i>—that are substantially larger than the majority of other traffic flowing through the VCF. The VCF is better able to manage elephant flows by splicing them into smaller flowlets using ALB.</p> <p><b>per-packet</b>—Implement ALB using per-packet mode.</p> <p>When per-packet mode is enabled, the VCF forwarding algorithm dynamically monitors all paths in the VCF and forwards packets to destination devices using the best available path at that moment. Flows are reordered at the destination node when per-packet mode is used to enable ALB, so some performance impact due to packet reordering is experienced.</p>

## mac-persistence-timer

---

<b>Syntax</b>	<code>mac-persistence-timer [<i>minutes</i>   <b>disable</b>];</code>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>disable</b> introduced in Junos OS Release 12.2 for EX Series switches.</p> <p>The maximum timer limit changed from no maximum timer limit to 60 minutes in Junos OS Release 12.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>Specify how long the Virtual Chassis or VCF continues to use the MAC address of the switch that was originally configured in the master role as the system MAC base address after the original master switch is removed from the Virtual Chassis or VCF. The system MAC base address does not change in the event of a switchover provided the switch originally configured in the master role remains a member of the Virtual Chassis or VCF.</p> <p>The maximum timer limit is 60 minutes starting in Junos OS Release 12.2. There are no minimum or maximum timer limits in prior Junos OS releases.</p>
<b>Default</b>	The MAC persistence timer is set to 10 minutes by default.
<b>Options</b>	<p><b>minutes</b>—Time in minutes that the member switch in the backup role continues to use the system MAC base address of the old master before using its own system MAC base address after the switch in the master role is physically disconnected or removed from the Virtual Chassis or VCF.</p> <p><b>disable</b>—Disable the MAC persistence timer. The system MAC base address never changes when the MAC persistence timer is disabled, even when the switch in the master role is physically disconnected or removed from the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	<p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Timer for the Backup Member to Start Using Its Own MAC Address, as Master of a Virtual Chassis (CLI Procedure) on page 6943</a></li><li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li><li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li></ul>

## mastership-priority

<b>Syntax</b>	<code>mastership-priority <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis member</a> <i>member-id</i> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Mastership priority option <b>0</b> introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>The mastership priority value is the most important factor in determining the role of the member switch within a nonprovisioned Virtual Chassis or VCF configuration. Other factors (see <a href="#">“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917</a>) also affect the election of the master.</p> <p>The mastership priority value takes the highest precedence in the master election algorithm. The member switch with highest mastership priority assumes the master Routing Engine role of the Virtual Chassis or VCF. Toggling back and forth between master and backup status in failover conditions is undesirable, so we recommend that you assign the same mastership priority value to both the master and the backup. Secondary factors in the master election algorithm determine which of these two members (that is, the two members that are assigned the highest mastership priority value) functions as the master of the Virtual Chassis or VCF.</p> <p>This statement is not used for the EX8200 Virtual Chassis, which determines mastership by external Routing Engine uptime. See <i>Understanding Virtual Chassis Roles in an EX8200 Virtual Chassis</i>.</p> <p>A switch with a mastership priority of <b>0</b> never takes the master or backup role.</p>
<b>Default</b>	128
<b>Options</b>	<p><i>number</i>—Mastership priority value.</p> <p><b>Range:</b> 0 through 255</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li> <li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li> <li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li> <li>• <a href="#">Configuring an EX4300 Virtual Chassis (CLI Procedure)</a></li> <li>• <a href="#">Example: Configuring an EX3300 Virtual Chassis with a Master and Backup</a></li> <li>• <a href="#">Example: Configuring an EX4200 Virtual Chassis with a Master and Backup in a Single Wiring Closet</a></li> </ul>

## no-management-vlan

---

<b>Syntax</b>	no-management-vlan;
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis member member-id</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	<p>Remove the specified member's out-of-band management port from the virtual management Ethernet (VME) global management VLAN of the Virtual Chassis or VCF configuration.</p> <p>For a member that is functioning in a linecard role, you can use this configuration to reserve the member's management Ethernet port for local troubleshooting:</p> <pre>virtual-chassis {   member 2 {     no-management-vlan;   } }</pre> <p>You cannot configure the IP address for a local management Ethernet port using the CLI or the J-Web interface. To do this, you need to use the shell <b>ifconfig</b> command.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Setting Up a Multimember EX4200 Virtual Chassis Access Switch with a Default Configuration</a></li><li>• <a href="#">Configuring the Virtual Management Ethernet Interface for Global Management of an EX Series Virtual Chassis (CLI Procedure)</a></li><li>• <a href="#">Understanding Global Management of a Virtual Chassis on page 6919</a></li><li>• <a href="#">Understanding Virtual Chassis Fabric Configuration on page 7043</a></li></ul>

## no-split-detection

---

<b>Syntax</b>	no-split-detection;
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	<p>Disable the split and merge feature in a Virtual Chassis or VCF configuration.</p> <p>We recommend using this statement to disable the split and merge feature when configuring a two-member Virtual Chassis. Enabling this statement on a two-member Virtual Chassis ensures that both switches remain in the correct Virtual Chassis roles in the event of a Virtual Chassis split.</p>
<b>Default</b>	The split and merge feature is enabled.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Assigning the Virtual Chassis ID to Determine Precedence During an EX4200 Virtual Chassis Merge</i></li> <li>• <a href="#">Disabling Split and Merge in a Virtual Chassis (CLI Procedure) on page 6944</a></li> <li>• <a href="#">Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge (CLI Procedure) on page 6946</a></li> <li>• <a href="#">Understanding Split and Merge in a Virtual Chassis on page 6922</a></li> </ul>

## package-name

---

<b>Syntax</b>	<code>package-name <i>package-name</i>;</code>
<b>Hierarchy Level</b>	[edit virtual-chassis <a href="#">auto-sw-update</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Specify the software package name or location of the software package to be used by the automatic software update feature for Virtual Chassis or VCF.
<b>Default</b>	No package name is specified.
<b>Options</b>	<p><b><i>package-name</i></b>—Name of the software package or the URL to the software package to be used.</p> <ul style="list-style-type: none"><li>If the software package is located on a local directory on the switch, use the following format for <b><i>package-name</i></b>:  <b><i>/pathname/package-name</i></b></li><li>If the software package is to be downloaded and installed from a remote location, use one of the following formats:  <b><i>ftp://hostname/pathname/package-name</i></b> <b><i>ftp://username:prompt@ftp.hostname.net/package-name</i></b> <b><i>http://hostname/pathname/package-name</i></b></li></ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## preprovisioned

---

<b>Syntax</b>	preprovisioned;
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>Enable the preprovisioned configuration mode for a Virtual Chassis or Virtual Chassis Fabric (VCF) configuration.</p> <p>When the preprovisioned configuration mode is enabled, you cannot use the CLI or the J-Web interface to change the mastership priority or member ID of member switches.</p> <p>You must use this statement to configure an EX8200 Virtual Chassis. Nonprovisioned configuration of an EX8200 Virtual Chassis is not supported.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li> <li>• <i>Example: Configuring an EX4200 Virtual Chassis Using a Preprovisioned Configuration File</i></li> <li>• <i>Example: Setting Up a Full Mesh EX8200 Virtual Chassis with Two EX8200 Switches and Redundant XRE200 External Routing Engines</i></li> <li>• <i>Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)</i></li> <li>• <i>Configuring an EX8200 Virtual Chassis (CLI Procedure)</i></li> <li>• <i>Configuring an EX9200 Virtual Chassis</i></li> <li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li> <li>• <a href="#">Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure) on page 6938</a></li> </ul>

## role

---

<b>Syntax</b>	<code>role (line-card   routing-engine);</code>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis preprovisioned member</a> <i>member-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Specify the roles of the members of the Virtual Chassis or a Virtual Chassis Fabric (VCF) in a preprovisioned Virtual Chassis.

### Virtual Chassis Fabric

Specify the role to be performed by each switch. In a VCF, the spine devices are configured into the Routing Engine role and the leaf devices are configured into the line card role. You can configure several devices into the Routine Engine role, but only two will operate in the Routing Engine role at a time. The role must be associated with the member's serial number.

### EX Series (except EX8200 Virtual Chassis) and QFX Series Virtual Chassis

Specify the role to be performed by each member switch. Associate the role with the member's serial number.

When you use a preprovisioned configuration, you cannot modify the mastership priority or member ID of member switches through the user interfaces. The mastership priority value is generated by the software, based on the assigned role:

- A member configured as **routing-engine** is assigned the mastership priority **129**.
- A member configured as **line-card** is assigned the mastership priority **0**.
- A member listed in the preprovisioned configuration without an explicitly specified role is assigned the mastership priority **128**.

The configured role specifications are permanent. If both **routing-engine** members fail, a **line-card** member cannot take over as master of the Virtual Chassis configuration. You must delete the preprovisioned configuration to change the specified roles in a Virtual Chassis.

Explicitly configure two members as **routing-engine** and configure additional switches as members of the preprovisioned Virtual Chassis by specifying only their serial numbers. If you do not explicitly configure the role of the additional members, they function in a linecard role by default. In that case, a member that is functioning in a linecard role can take over mastership if the members functioning as master and backup (**routing-engine** role) both fail.

### EX8200 Virtual Chassis

Specify the role to be performed by each XRE200 External Routing Engine and each EX8200 member switch. Associate the role with the member's serial number. An EX8200 Virtual Chassis cannot function when both external Routing Engines, which must be configured in the **routing-engine** role, have failed.

- Options**
- **line-card**—Enables the member to be eligible to function only in the linecard role. Any member of the Virtual Chassis or VCF configuration other than the master or backup functions in the linecard role and runs only a subset of Junos OS for EX Series switches. A member functioning in the linecard role does not run the control protocols or the chassis management processes.

A Virtual Chassis must have at least three members for one member to function in the linecard role.

In an EX8200 Virtual Chassis configuration, all member switches must be in the linecard role.

- **routing-engine**—Enables the member to function as a master or backup of the Virtual Chassis or VCF configuration. The master manages all members and runs the chassis management processes and control protocols. The backup synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it is prepared to preserve routing information and maintain network connectivity without disruption in case the master is unavailable.

(All Virtual Chassis composed of EX Series switches, except EX8200 switches, or QFX Series devices) Specify two and only two members as **routing-engine**. The software determines which of the two members assigned the **routing-engine** role functions as master, based on the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 6917](#). In these Virtual Chassis, the **routing-engine** role is associated with a switch.

(EX8200 Virtual Chassis) All XRE200 External Routing Engines must be in the **routing-engine** role.

<b>Required Privilege</b>	system—To view this statement in the configuration.
<b>Level</b>	system-control—To add this statement to the configuration.

## serial-number

<b>Syntax</b>	<code>serial-number serial-number;</code>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis preprovisioned member member-id</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	<p>In a preprovisioned Virtual Chassis or Virtual Chassis Fabric (VCF), specify the serial number of each member switch to be included in the configuration. If you do not include the serial number within the configuration, the switch cannot be recognized as a member of a preprovisioned configuration.</p> <p>In an EX8200 Virtual Chassis configuration, specify the serial number of each XRE200 External Routing Engine and each EX8200 member switch to be included in the Virtual Chassis configuration. If you do not include the serial number within the Virtual Chassis configuration, the external Routing Engine or switch cannot be recognized as a member of the configuration.</p>
<b>Options</b>	<i>serial-number</i> —Permanent serial number for the external Routing Engine or for the member switch.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Autoprovisioning a Virtual Chassis Fabric on page 7053</a></li> <li>• <a href="#">Preprovisioning a Virtual Chassis Fabric on page 7056</a></li> <li>• <a href="#">Configuring an EX2200 Virtual Chassis (CLI Procedure)</a></li> <li>• <a href="#">Configuring an EX3300 Virtual Chassis (CLI Procedure)</a></li> <li>• <a href="#">Configuring an EX4300 Virtual Chassis (CLI Procedure)</a></li> <li>• <a href="#">Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)</a></li> <li>• <a href="#">Configuring an EX8200 Virtual Chassis (CLI Procedure)</a></li> <li>• <a href="#">Configuring an EX9200 Virtual Chassis</a></li> <li>• <a href="#">Configuring a QFX Series Virtual Chassis (CLI Procedure) on page 6931</a></li> <li>• <a href="#">Configuring a Virtual Chassis on an EX Series Switch (J-Web Procedure)</a></li> </ul>

## serial-number (Virtual Chassis aliases)

---

<b>Syntax</b>	<code>serial-number <i>serial-number</i> {     <i>alias-name</i> <i>alias-name</i>; }</code>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis aliases</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1X53-D10 for EX Series and QFX Series Virtual Chassis and Virtual Chassis Fabric (VCF).
<b>Description</b>	<p>Specify the serial number that will be labeled with an alias in a Virtual Chassis or Virtual Chassis Fabric (VCF).</p> <p>The remaining statements are explained separately.</p>
<b>Options</b>	<p><b><i>serial-number</i></b>—Permanent serial number for the member switch in the Virtual Chassis or VCF.</p> <p>You can retrieve the serial number for any device in your Virtual Chassis or VCF by entering the <b>show virtual-chassis</b> command and reviewing the output in the <b>Serial No</b> field.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## traceoptions (Virtual Chassis)

<b>Syntax</b>	<pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;no-stamp&gt; &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;world-readable       no-world-readable&gt;;     flag <i>flag</i> &lt;detail&gt; &lt;disable&gt; &lt;receive&gt; &lt;send&gt;; } </pre>
<b>Hierarchy Level</b>	[edit <a href="#">virtual-chassis</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>detail</b> added in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	Define tracing operations for the Virtual Chassis or VCF.
<b>Default</b>	Tracing operations are disabled.
<b>Options</b>	<p><b>detail</b>—(Optional) Generate detailed trace information for a flag.</p> <p><b>disable</b>—(Optional) Disable a flag.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li><b>all</b>—All tracing operations.</li> </ul>
	<p> <b>TIP:</b> The <b>all</b> flag displays a subset of logs that are useful in debugging most issues. For more detailed information, use <b>all detail</b>.</p>
	<ul style="list-style-type: none"> <li><b>auto-configuration</b>—Trace Virtual Chassis ports (VCPs) that have been automatically configured.</li> <li><b>csn</b>—Trace Virtual Chassis complete sequence number (CSN) packets.</li> <li><b>error</b>—Trace Virtual Chassis errored packets.</li> </ul>

- **hello**—Trace Virtual Chassis hello packets.
- **krt**—Trace Virtual Chassis KRT events.
- **lsp**—Trace Virtual Chassis link-state packets.
- **lsp-generation**—Trace Virtual Chassis link-state packet generation.
- **me**—Trace Virtual Chassis ME events.
- **normal**—Trace normal events.
- **packets**—Trace Virtual Chassis packets.
- **parse**—Trace reading of the configuration.
- **psn**—Trace partial sequence number (PSN) packets.
- **route**—Trace Virtual Chassis routing information.
- **spf**—Trace Virtual Chassis SPF events.
- **state**—Trace Virtual Chassis state transitions.
- **task**—Trace Virtual Chassis task operations.

**no-stamp**—(Optional) Do not place a timestamp on any trace file.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**receive**—(Optional) Trace received packets.

**replace**—(Optional) Replace a trace file rather than appending information to it.

**send**—(Optional) Trace transmitted packets.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege Level</b>	<b>system</b> —To view this statement in the configuration. <b>system-control</b> —To add this statement to the configuration.

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).

**Description** Configure a Virtual Chassis or a Virtual Chassis Fabric (VCF).

The remaining statements are explained separately.

**Default** A standalone EX Series switch is a Virtual Chassis by default. It has a default member ID of 0, a default mastership priority of 128, and a default role as master.

A QFX Series device configured in standalone mode is a Virtual Chassis by default. It has a default member ID of 0, a default mastership priority of 128, and a default role as master.

A standalone XRE200 External Routing Engine or EX8200 switch is not part of an EX8200 Virtual Chassis until a Virtual Chassis configuration is set up.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

- [Operational Commands on page 7107](#)

## Routine Monitoring

---

- [Verifying the Member ID, Role, Status, and Neighbor Member Connections of a Virtual Chassis Fabric Member Device on page 7105](#)
- [Verifying Virtual Chassis Port Connections in a Virtual Chassis Fabric on page 7106](#)
- [Verifying the Virtual Chassis Fabric Mode Settings on page 7107](#)

### Verifying the Member ID, Role, Status, and Neighbor Member Connections of a Virtual Chassis Fabric Member Device

**Purpose** Use this procedure to learn the current member ID, role, status, Virtual Chassis port (VCP) connections, and other information for the devices in your VCF.

Understanding the current member IDs, roles, device statuses, and VCP connections is required for routine monitoring of your VCF. You'll often need to identify this basic operational information to confirm a device or a VCP is working properly in the VCF, or how the VCF topology changed as a result of a configuration change or network error.

**Action** To display VCF status using the CLI:

#### `show virtual-chassis (Virtual Chassis Fabric)`

```
user@switch> show virtual-chassis
Preprovisioned Virtual Chassis Fabric
Fabric ID: 0282.5fa0.3f08
Fabric Mode: Enabled
```

				Mstr		Mixed Route Neighbor			
List				prio	Role	Mode	Mode	ID	
Member ID	Status	Serial No	Model						
Interface									
0 (FPC 0)	Prsnt	AB3112430001	qfx5100-48s	129	Master*	N	F	3	
vcp-255/1/0									2
vcp-255/1/1									4
vcp-255/1/2									4
vcp-255/1/3									4

1 (FPC 1)	Prsnt	AB3112230001	qfx5100-48s	129	Backup	N	F	3
vcp-255/1/0								2
vcp-255/1/1								4
vcp-255/1/2								4
vcp-255/1/3								1
2 (FPC 2)	Prsnt	AB3112460011	qfx5100-48s	0	Linecard	N	F	0
vcp-255/1/0								1
vcp-255/1/1								0
3 (FPC 3)	Prsnt	AB3112460011	qfx5100-48s	0	Linecard	N	F	1
vcp-255/1/0								0
vcp-255/1/1								1
4 (FPC 4)	Prsnt	AB3112430011	qfx5100-48s	0	Linecard	N	F	0
vcp-255/1/0								1
vcp-255/1/1								0

**Meaning** This output verifies that fabric mode is enabled and that all devices in the VCF are participating in the fabric, as shown by the **Prsnt** status output for each device.

The Neighbor ID and Interface outputs show that all VCPs are operating correctly.

  - [Preprovisioning a Virtual Chassis Fabric on page 7056](#)

## Verifying Virtual Chassis Port Connections in a Virtual Chassis Fabric

**Purpose** Verify the Virtual Chassis Ports (VCPs) in your Virtual Chassis Fabric (VCF).

You should use this command if you suspect a VCP link in your VCF is broken.

**Action** To display the VCPs of a device:

```
user@switch> show virtual-chassis vc-port member 4 fpc4:
```

Interface or PIC / Port	Type	Trunk ID	Status	Speed (mbps)	Neighbor ID	Interface
0/48	Auto-Configured	-1	Up	40000	0	vcp-255/0/2
0/49	Auto-Configured	-1	Up	40000	1	vcp-255/0/2
0/50	Auto-Configured	-1	Up	40000	2	vcp-255/0/2
0/51	Auto-Configured	-1	Up	40000	3	vcp-255/0/2

**Meaning** All of the VCPs on this device are up and active.

If the **Status** of an interface is **Absent** or the interface that you thought was a VCP does not appear in the command output, you likely have a problem with a link that has not been converted into a VCP. In this scenario, configure the interface on the link into a VCP using the **request virtual-chassis vc-port** command.

- Related Documentation**
- [Autoprovisioning a Virtual Chassis Fabric on page 7053](#)
  - [Preprovisioning a Virtual Chassis Fabric on page 7056](#)

## Verifying the Virtual Chassis Fabric Mode Settings

**Purpose** Verify the Virtual Chassis Fabric (VCF) mode settings on a device.

You must configure all devices in a VCF into fabric mode using the **request virtual-chassis mode fabric** command for the devices to operate in a VCF.

All VCFs use QFX5100 devices in the spine role. If a VCF uses a QFX3500, QFX3600, or EX4300 devices as a leaf node, you must also configure each device into mixed mode using the **request virtual-chassis mode mixed** command.

You must also configure a device out of mixed and fabric mode if it is removed from a VCF and placed into your network in a different role.

**Action** To display the current mode of a device:

```
user@switch> show virtual-chassis mode
fpc0:
```

```
-----
Current mode : Fabric with mixed devices
Future mode after reboot : Fabric with mixed devices
```

**Meaning** The output indicates that the switch is currently in mixed and fabric mode.

The output also indicates that the mode will not change when the device is rebooted without further configuration. You must reboot the device to change the fabric or mixed mode, so the **Future mode after reboot** output differs from the **Current mode** output when the mode has been changed but the device has not been rebooted.

## request virtual-chassis mode

---

**Syntax**    request virtual-chassis mode  
              fabric  
              mixed  
              <disable>  
              <reboot>  
              <all-members>  
              <local>  
              <member *member-id*>

**Release Information**    Command introduced in Junos OS Release 11.1 for EX Series switches.  
                             Command introduced in Junos OS Release 13.2X51-D20 for QFX Series devices.  
                             The **fabric** keyword introduced in Junos OS Release 13.2X51-D20 for EX Series switches and QFX Series devices in a Virtual Chassis Fabric (VCF).  
                             Command introduced in Junos OS Release 13.2X51-D20 for VCF.

**Description**    Configure the mode for a device or multiple devices in a Virtual Chassis or a VCF.

A device must be configured in fabric mode to participate as a member device in a VCF.

A device must be configured in mixed mode when it is participating in a Virtual Chassis or a VCF with different types of devices.

Do not enable the **request virtual-chassis mode mixed** command for a standalone device or for a member switch that is intended to remain in a non-mixed Virtual Chassis or VCF. Enabling this command reduces the maximum scaling numbers for some features on the switch, Virtual Chassis, or VCF.

You do not need to configure mixed mode if the only devices in your Virtual Chassis are EX4500 and EX4550 switches.

To avoid potential traffic disruptions and configuration issues for a mixed Virtual Chassis, we recommend configuring mixed mode on your device before cabling it into your Virtual Chassis. We recommend rebooting your device to complete this configuration procedure before interconnecting your device into the Virtual Chassis.

To avoid potential traffic disruptions and configuration issues, we recommend configuring the fabric and, if applicable, the mixed mode settings on your device before cabling it into a VCF. We recommend rebooting your device to complete this configuration procedure before interconnecting your device into the VCF. You can change the fabric and mixed mode settings after the device has been added to a Virtual Chassis or VCF, however.

If you set some of the devices in a mixed Virtual Chassis or VCF to mixed mode using this command but not others, the mixed Virtual Chassis or VCF might not form. If you experience this issue, enter the **request virtual-chassis mode mixed all-members** command to set the Virtual Chassis mode to mixed for all devices in the Virtual Chassis or VCF. You then need to reboot the devices that have been set into mixed mode to complete the procedure. The Virtual Chassis or VCF forms after the devices have rebooted.

When you do not use this command to set any of the switches in a mixed EX4200 and EX4500 Virtual Chassis to mixed mode, a mixed EX4200 and EX4500 Virtual Chassis

forms with one of the switches assuming the master role if the switches are running Junos OS Release 11.4 or later. All other switches in the mixed EX4200 and EX4500 Virtual Chassis are placed into the linecard role. If you experience this behavior, enter the **request virtual-chassis mode mixed all-members** command to set the Virtual Chassis mode to mixed for all switches in the Virtual Chassis. You will then need to reboot the switches to complete the procedure. The Virtual Chassis will form after all of the switches have rebooted.

The Virtual Chassis mode setting is maintained through reboots even though it is set in operational mode.

- Options**
- none**—Set the Virtual Chassis mode for all members of the Virtual Chassis or VCF.
  - all-members**—(Optional) Set the Virtual Chassis mode for all members of the Virtual Chassis or VCF.
  - disable**—Disable the Virtual Chassis fabric or mixed mode setting if it was previously enabled.
  - fabric**—Set the device into fabric mode so that the device can participate in a VCF.
  - local**—(Optional) Set the Virtual Chassis mode on the member device where the command is issued.
  - member *member-id***—(Optional) Set the Virtual Chassis mode to mixed on the specified member of the Virtual Chassis or VCF.
  - mixed**—Set the device into mixed mode so that the device can participate in a mixed Virtual Chassis or mixed VCF.

**NOTE:** You do not need to set mixed mode if the only devices in your Virtual Chassis are QFX3500 and QFX3600 devices.

You do not need to configure mixed mode if the only devices in your Virtual Chassis are EX4500 and EX4550 switches.

**Required Privilege Level** system-control

**List of Sample Output** [request virtual-chassis mode mixed on page 7114](#)  
[request virtual-chassis mode fabric mixed reboot on page 7114](#)

## Sample Output

request virtual-chassis mode mixed

```
user@switch> request virtual-chassis mode mixed
```

## Sample Output

request virtual-chassis mode fabric mixed reboot

```
user@switch> request virtual-chassis mode fabric mixed reboot
```

## request virtual-chassis reactivate

---

<b>Syntax</b>	<code>request virtual-chassis reactivate</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>Reactivate a device that has been assigned a member ID but is not currently connected to the Virtual Chassis or VCF.</p> <p>You can use this command to reactivate a device that was previously part of the Virtual Chassis or VCF but whose status is no longer <b>Prsnt</b>.</p>
<b>Required Privilege Level</b>	system-control
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying the Member ID, Role, and Neighbor Member Connections of a Virtual Chassis Member on page 6975</a></li> <li>• <i>Verifying the Member ID, Role, and Neighbor Member Connections of an EX8200 Virtual Chassis Member</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request virtual-chassis reactivate on page 7115</a>

### Sample Output

#### request virtual-chassis reactivate

```
user@switch> request virtual-chassis reactivate
```

## request virtual-chassis vc-port

---

<b>Syntax</b>	<b>request virtual-chassis vc-port set   delete</b> <fpc-slot <i>fpc-slot</i> > pic-slot <i>pic-slot</i> port <i>port-number</i> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>fpc-slot</b> introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	<p>Enable or disable an optical port as a Virtual Chassis port (VCP).</p> <p>If you omit <b>member <i>member-id</i></b>, this command defaults to enabling or disabling the uplink VCP or SFP network port configured as a VCP on the switch where the command is issued.</p> <p>On an EX3300 switch, uplink ports 2 and 3 are configured as VCPs by default. No other uplink ports on any other EX Series switches are configured as VCPs by default.</p> <p>You might experience a temporary traffic disruption immediately after creating or deleting a user-configured VCP in an EX8200 Virtual Chassis.</p>
<b>Options</b>	<p><b>pic-slot <i>pic-slot</i></b>—Number of the PIC slot for the port on the switch.</p> <p><b>port <i>port-number</i></b>—Number of the port that is to be enabled or disabled as a VCP.</p> <p><b>member <i>member-id</i></b>—(Optional) Enable or disable the specified VCP on the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	system-control
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request virtual-chassis vc-port</a> (dedicated port)</li><li>• <a href="#">show virtual-chassis vc-port on page 7020</a></li><li>• <a href="#">show virtual-chassis vc-port statistics on page 7024</a></li><li>• <a href="#">clear virtual-chassis vc-port statistics on page 6978</a></li><li>• <a href="#">Virtual Chassis Port (VCP) Interface Names in an EX8200 Virtual Chassis</a></li><li>• <a href="#">Understanding EX Series Virtual Chassis Components</a></li><li>• <a href="#">Understanding QFX Series Virtual Chassis Components on page 6909</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request virtual-chassis vc-port set pic-slot 1 port 0 on page 7117</a> <a href="#">request virtual-chassis vc-port set pic-slot 1 port 1 member 3 on page 7117</a> <a href="#">request virtual-chassis vc-port delete pic-slot 1 port 1 member 3 on page 7117</a>

## Sample Output

**request virtual-chassis vc-port set pic-slot 1 port 0**

user@switch> request virtual-chassis vc-port set pic-slot 1 port 0

To check the results of this command, use the [show virtual-chassis vc-port](#) command.

**request virtual-chassis vc-port set pic-slot 1 port 1 member 3**

user@switch> request virtual-chassis vc-port set pic-slot 1 port 1 member 3

To check the results of this command, use the [show virtual-chassis vc-port](#) command.

**request virtual-chassis vc-port delete pic-slot 1 port 1 member 3**

user@switch> request virtual-chassis vc-port delete pic-slot 1 port 1 member 3

To check the results of this command, use the [show virtual-chassis vc-port](#) command.

## request virtual-chassis vc-port diagnostics optics

---

<b>Syntax</b>	<b>request virtual-chassis vc-port diagnostics optics</b>
<b>Release Information</b>	Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	<p>Run a digital optical monitoring (DOM) scan on the optical ports configured as Virtual Chassis ports (VCPs).</p> <p>Enter the <b>show virtual-chassis vc-port diagnostics optics</b> command to view the results of the diagnostic scan.</p> <p>On certain EX Series switches, the <b>request virtual-chassis vc-port diagnostics optics</b> command must be entered to run a diagnostic scan before you can gather the <b>show virtual-chassis vc-port diagnostics optics</b> output.</p>
<b>Required Privilege Level</b>	system-control
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show virtual-chassis vc-port diagnostics optics on page 7162</a></li></ul>

## Sample Output

### request virtual-chassis vc-port diagnostics optics

```
user@switch> request virtual-chassis vc-port diagnostics optics
fpc0:
-----
vc-port Diagnostics Optics Done
```

## show forwarding-options enhanced-hash-key

<b>Syntax</b>	<b>show forwarding-options enhanced-hash-key</b>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 13.2X51-D15 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X51-D20 for QFX Series devices.</p> <p><b>Fabric Load Balancing Options</b> output fields introduced in Junos OS Release 14.1X53-D10.</p>
<b>Description</b>	<p>Display information about which packet fields are used by the hashing algorithm to make hashing decisions.</p> <p>You can configure the fields that are inspected by the hashing algorithm to make hashing decisions for traffic entering a LAG bundle using the <b>forwarding-options enhanced-hash-key</b> statement.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Fields in the Algorithm Used To Hash LAG Bundle and ECMP Traffic (CLI Procedure) on page 2590</a></li> <li>• <a href="#">Understanding the Algorithm Used to Hash LAG Bundle and Egress Next-Hop ECMP Traffic on page 2396</a></li> <li>• <a href="#">enhanced-hash-key on page 2644</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show forwarding-options enhanced-hash-key (Layer 2 Payload Hash Mode) on page 7120</a></p> <p><a href="#">show forwarding-options enhanced-hash-key (Layer 2 Header Hash Mode) on page 7121</a></p> <p><a href="#">show forwarding-options enhanced-hash-key (Fabric Load Balancing Options) on page 7121</a></p>
<b>Output Fields</b>	<p><a href="#">Table 250 on page 2763</a> lists the output fields for the <b>show forwarding-options enhanced-hash-key</b> command. Output fields are listed in the approximate order in which they first appear.</p>

**Table 681: show forwarding-options enhanced-hash-key Output Fields**

Field Name	Field Description
<b>Hash-Mode</b>	Current hash mode: Layer 2 header or Layer 2 payload.
<b>Protocol</b>	Indicates whether the Protocol field is or is not used by the hashing algorithm: Yes or No.
<b>Destination L4 Port</b>	Indicates whether the Destination L4 Port field is or is not used by the hashing algorithm: Yes or No.
<b>Source L4 Port</b>	Indicates whether the Source L4 Port field is or is not used by the hashing algorithm: Yes or No.
<b>Destination IPv4 Addr</b>	Indicates whether the Destination IPv4 Addr field is or is not used by the hashing algorithm: Yes or No.

Table 681: show forwarding-options enhanced-hash-key Output Fields (*continued*)

Field Name	Field Description
<b>Source IPv4 Addr</b>	Indicates whether the Source IPv4 Addr field is or is not used by the hashing algorithm: Yes or No.
<b>Vlan id</b>	Indicates whether the Vlan id field is or is not used by the hashing algorithm: Yes or No.
<b>Next Hdr</b>	Indicates whether the Next Hdr field is or is not used by the hashing algorithm: Yes or No.
<b>Destination IPv6 Addr</b>	Indicates whether the Destination IPv6 Addr field is or is not used by the hashing algorithm: Yes or No.
<b>Source IPv6 Addr</b>	Indicates whether the Source IPv6 Addr field is or is not used by the hashing algorithm: Yes or No.
<b>Ether Type</b>	Indicates whether the Ether Type field is or is not used by the hashing algorithm: Yes or No.
<b>Destination MAC Address</b>	Indicates whether the Destination MAC Address field is or is not used by the hashing algorithm: Yes or No.
<b>Source MAC Address</b>	Indicates whether the Source MAC Address field is or is not used by the hashing algorithm: Yes or No.
<b>Load Balancing Method</b>	Indicates the load balancing method for adaptive load balancing (ALB): flowlet or per-packet.  The load balancing method is flowlet by default, and can be configured using the <a href="#">fabric-load-balance</a> statement.
<b>Fabric Link Scale</b>	Indicates the fabric link scale, in mbps.
<b>Inactivity Interval</b>	Indicates the fabric load balance inactivity interval, in microseconds (us).  The inactivity interval is 16 microseconds by default, and can be configured using the <a href="#">inactivity-interval</a> statement.
<b>Hash Region Size/Trunk</b>	Indicates the hash region size, in buckets per fabric trunk.

## show virtual-chassis device-topology

<b>Syntax</b>	show virtual-chassis device-topology <all-members> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the device topology—the member and system IDs, the VCP numbers, and device status—for all hardware devices in the Virtual Chassis or VCF.
<b>Options</b>	<p><b>none</b>—Display the device topology for all members of the Virtual Chassis or VCF.</p> <p><b>all-members</b>—(Optional) Display the device topology for all members of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display the device topology for the switch or external Routing Engine on which this command is entered.</p> <p><b>member <i>member-id</i></b>—(Optional) Display the device topology for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding EX Series Virtual Chassis Port Link Aggregation</i></li> <li>• <i>Understanding EX8200 Virtual Chassis Topologies</i></li> </ul>
<b>Output Fields</b>	<a href="#">Table 669 on page 6990</a> lists the output fields for the <b>show virtual-chassis device-topology</b> command. Output fields are listed in the approximate order in which they appear.

**Table 683: show virtual-chassis device-topology Output Fields**

Field Name	Field Description
<b>Member</b>	Assigned member ID.
<b>Device</b>	Assigned device ID.  For an EX8200 Virtual Chassis, the member ID and the device ID are always identical.
<b>Status</b>	The status of the device within the Virtual Chassis or VCF. Outputs include: <ul style="list-style-type: none"> <li>• <b>Prsnt</b>—Device is currently connected to and participating in the Virtual Chassis or VCF.</li> <li>• <b>NotPrsnt</b>—Device is assigned but is not currently connected.</li> </ul>

Table 683: show virtual-chassis device-topology Output Fields (*continued*)

Field Name	Field Description
<b>System ID</b>	System ID of the device.  The system ID of the device is the device's MAC address.
<b>Member (Neighbor List)</b>	Assigned member ID of the neighbor device.
<b>Device (Neighbor List)</b>	Assigned device ID of the neighbor device.  For an EX8200 Virtual Chassis, the member ID and the device ID are always identical.
<b>Interface (Neighbor List)</b>	The interface connecting the device to the neighbor.

## Sample Output

### show virtual-chassis device-topology

```
user@switch> show virtual-chassis device-topology
```

```

## show virtual-chassis login

<b>Syntax</b>	<b>show virtual-chassis login</b>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	<p>Supply the address of the host that logged into the Virtual Chassis or VCF, or identify the location of the member switch that redirected the current session to a different member switch.</p> <p>You might need this information for tracing or troubleshooting purposes.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request session member on page 6980</a></li> <li>• <a href="#">Understanding Global Management of a Virtual Chassis on page 6919</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show virtual-chassis login (Direct Login to the Master Console Port) on page 7133</a></p> <p><a href="#">show virtual-chassis login (Backup Console Session Redirected to the Master Console Port) on page 7133</a></p>

### Sample Output

#### show virtual-chassis login (Direct Login to the Master Console Port)

```
user@switch> show virtual-chassis login
Current login session initiated from host 248.1.2.3
```

#### show virtual-chassis login (Backup Console Session Redirected to the Master Console Port)

```
user@switch> show virtual-chassis login
Current login session initiated from host backup
```

## show virtual-chassis mode

<b>Syntax</b>	<b>show virtual-chassis mode</b> <all-members> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for EX Series switches. Command introduced in Junos OS Release 13.2X51-D20 for QFX Series devices. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF). <b>Current mode</b> and <b>Future mode after reboot</b> fields introduced in Junos OS Release 13.2X51-D20.
<b>Description</b>	Display the Virtual Chassis or Virtual Chassis Fabric (VCF) mixed mode status.
<b>Options</b>	<p><b>none</b>—Display the Virtual Chassis or VCF mixed mode status for the device on which the command is entered.</p> <p><b>all-members</b>—(Optional) Display the Virtual Chassis or VCF mixed mode status for all member devices in the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display the Virtual Chassis or VCF mixed mode status for the device on which the command is entered.</p> <p><b>member <i>member-id</i></b>—(Optional) Display the Virtual Chassis or VCF mixed mode status for the specified member device..</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request virtual-chassis mode on page 7112</a></li> <li>• <a href="#">Verifying the Virtual Chassis Fabric Mode Settings on page 7107</a></li> <li>• <a href="#">Configuring a Mixed Virtual Chassis with EX4200, EX4500, and EX4550 Member Switches (CLI Procedure)</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis mode (EX4200) on page 7135</a> <a href="#">show virtual-chassis mode (QFX5100) on page 7135</a>
<b>Output Fields</b>	<a href="#">Table 684 on page 7134</a> lists the output fields for the <b>show virtual-chassis mode</b> command.

Table 684: show virtual-chassis mode Output Fields

Field Name	Field Description
<b>Mixed Mode</b>	Specifies the mixed mode status of the member switch. Mixed mode is either <b>Enabled</b> or <b>Disabled</b> .

Table 684: show virtual-chassis mode Output Fields (*continued*)

Field Name	Field Description
<b>Current mode</b>	<p>Specifies the current mixed and fabric mode settings running on the member device or devices.</p> <p>A device reboot is required to change the fabric or mixed mode. The <b>Current mode</b> and <b>Future mode after reboot</b> are different when the mode has been changed but the device has not been rebooted.</p> <p>Outputs include:</p> <ul style="list-style-type: none"> <li>• <b>Fabric with mixed devices</b>—Fabric mode and mixed mode are enabled.</li> <li>• <b>Fabric with similar devices</b>—Fabric mode is enabled and mixed mode is disabled.</li> <li>• <b>Virtual Chassis with mixed devices</b>—Fabric mode is disabled and mixed mode is enabled.</li> <li>• <b>Virtual Chassis with similar devices</b>—Fabric mode is disabled and mixed mode is disabled.</li> </ul>
<b>Future mode after reboot</b>	<p>Specifies the mixed and fabric mode settings running on the member device or devices.</p> <p>A device reboot is required to change the fabric or mixed mode. The <b>Current mode</b> and <b>Future mode after reboot</b> are different when the mode has been changed but the device has not been rebooted.</p> <p>Outputs include:</p> <ul style="list-style-type: none"> <li>• <b>Fabric with mixed devices</b>—Fabric mode and mixed mode are enabled.</li> <li>• <b>Fabric with similar devices</b>—Fabric mode is enabled and mixed mode is disabled.</li> <li>• <b>Virtual Chassis with mixed devices</b>—Fabric mode is disabled and mixed mode is enabled.</li> <li>• <b>Virtual Chassis with similar devices</b>—Fabric mode is disabled and mixed mode is disabled.</li> </ul>

## Sample Output

### show virtual-chassis mode (EX4200)

```
user@switch>show virtual-chassis mode
fpc0:
-----
Mixed Mode: Disabled
```

## Sample Output

### show virtual-chassis mode (QFX5100)

```
user@switch>show virtual-chassis mode
fpc0:
-----
Current mode : Fabric with similar devices
Future mode after reboot : Fabric with similar devices

fpc1:
-----
Current mode : Fabric with similar devices
Future mode after reboot : Fabric with similar devices

fpc2:
-----
Current mode : Fabric with similar devices
Future mode after reboot : Fabric with similar devices

fpc3:
```

```
-----  
Current mode : Fabric with similar devices  
Future mode after reboot : Fabric with similar devices
```

fpc4:

```
-----  
Current mode : Fabric with similar devices  
Future mode after reboot : Fabric with similar devices
```

## show virtual-chassis protocol adjacency

<b>Syntax</b>	<pre>show virtual-chassis protocol adjacency &lt;brief   detail   extensive&gt; &lt;all-members&gt; &lt;local&gt; &lt;member member-id&gt; &lt;system-id&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 10.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	Display the Virtual Chassis Control Protocol (VCCP) adjacency statistics in the Virtual Chassis or VCF for all hardware devices.
<b>Options</b>	<p><b>none</b>—Display VCCP adjacency statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output. Using the <b>brief</b> option is equivalent to entering the command with no options (the default). The <b>detail</b> and <b>extensive</b> options provide identical displays.</p> <p><b>all-members</b>—(Optional) Display VCCP adjacency statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display VCCP adjacency statistics for the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display VCCP adjacency statistics for the specified member of the Virtual Chassis or VCF.</p> <p><b>system-id</b>—(Optional) Display VCCP adjacency statistics for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding EX Series Virtual Chassis Port Link Aggregation</i></li> <li>• <i>Understanding the Virtual Chassis Control Protocol in an EX8200 Virtual Chassis</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show virtual-chassis protocol adjacency on page 7138</a></p> <p><a href="#">show virtual-chassis protocol adjacency detail on page 7139</a></p>
<b>Output Fields</b>	Table 670 on page 6997 lists the output fields for the <b>show virtual-chassis protocol adjacency</b> command. Output fields are listed in the approximate order in which they appear.

Table 685: show virtual-chassis protocol adjacency Output Fields

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of the Virtual Chassis port (VCP) interface.	All levels
<b>System</b>	The MAC address of the device on the receiving side of the VCP link.	All levels
<b>State</b>	State of the link. Outputs include: <ul style="list-style-type: none"> <li>• <b>Up</b>—The link is up.</li> <li>• <b>Down</b>—The link is down.</li> <li>• <b>New</b>—The link is new.</li> <li>• <b>One-way</b>—The link is transmitting traffic in one direction.</li> <li>• <b>Initializing</b>—The link is initializing.</li> <li>• <b>Rejected</b>—The link is rejected.</li> </ul>	All levels
<b>Hold, Expires in</b>	Remaining holdtime of the adjacency.	All levels
<b>Priority</b>	Priority to become the designated intermediary system.	detail
<b>Up/Down Transitions</b>	Count of adjacency status transition changes from up to down or down to up.	detail
<b>Last transition</b>	Time of the last up/down transition.	detail

## Sample Output

## show virtual-chassis protocol database

<b>Syntax</b>	show virtual-chassis protocol database <brief   detail   extensive> <all-members> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the Virtual Chassis Control Protocol (VCCP) database statistics for all hardware devices within the Virtual Chassis or VCF.
<b>Options</b>	<p><b>none</b>—Display VCCP database statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output. Using the <b>brief</b> option is equivalent to entering the command with no options (the default). The <b>detail</b> option provides more output than the <b>brief</b> option. The <b>extensive</b> option provides all output and is most useful for customer support personnel.</p> <p><b>all-members</b>—(Optional) Display VCCP database statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display VCCP database statistics for the switch or external Routing Engine on which this command is entered.</p> <p><b>member <i>member-id</i></b>—(Optional) Display VCCP database statistics for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding the Virtual Chassis Control Protocol in an EX8200 Virtual Chassis</a></li> <li>• <a href="#">Understanding EX Series Virtual Chassis Components</a></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis Components on page 6909</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis protocol database on page 7142</a> <a href="#">show virtual-chassis protocol database detail on page 7143</a>
<b>Output Fields</b>	<a href="#">Table 671 on page 7000</a> lists the output fields for the <b>show virtual-chassis protocol database</b> command. Output fields are listed in the approximate order in which they appear.

**Table 686: show virtual-chassis protocol database Output Fields**

Field Name	Field Description	Level of Output
LSP ID	Link-state protocol (LSP) data unit identifier.	All levels

Table 686: show virtual-chassis protocol database Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Sequence</b>	Sequence number of the LSP.	All levels
<b>Checksum</b>	Checksum value of the LSP.	All levels
<b>Lifetime</b>	Remaining lifetime of the LSP, in seconds.	All levels
<b>Neighbor</b>	MAC address of the neighbor on the advertising system.	detail
<b>Interface</b>	Virtual Chassis port (VCP) interface name.	detail
<b>Metric</b>	Metric of the prefix or neighbor.	detail

The **extensive** output was omitted from this list. The **extensive** output is useful for customer support personnel only.

## show virtual-chassis protocol route

<b>Syntax</b>	show virtual-chassis protocol route <all-members> <destination-id> <local> <member member-id>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the unicast and multicast Virtual Chassis Control Protocol (VCCP) routing tables within the Virtual Chassis or VCF.
<b>Options</b>	<p><b>none</b>—Display the unicast and multicast routing tables for all members of the Virtual Chassis.</p> <p><b>all-members</b>—(Optional) Display the unicast and multicast routing tables for all members of the Virtual Chassis or VCF.</p> <p><b>destination-id</b>—(Optional) Display the unicast and multicast routing tables to the specified destination member ID for each member of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display the unicast and multicast routing tables on the device where this command is entered.</p> <p><b>member member-id</b>—(Optional) Display the unicast and multicast routing tables for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>EX Series Virtual Chassis Overview</i></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis on page 6907</a></li> <li>• <i>Understanding the Virtual Chassis Control Protocol in an EX8200 Virtual Chassis</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis protocol route on page 7149</a>
<b>Output Fields</b>	<a href="#">Table 673 on page 7007</a> lists the output fields for the <b>show virtual-chassis protocol route</b> command. Output fields are listed in the approximate order in which they appear.

**Table 688: show virtual-chassis protocol route Output Fields**

Field Name	Field Description
<b>Dev</b>	MAC address of the member storing the VCCP routing table.
<b>Version</b>	Version of the shortest-path-first algorithm that generated the routing table.

Table 688: show virtual-chassis protocol route Output Fields (*continued*)

Field Name	Field Description
<b>System ID</b>	MAC address of the device.
<b>Version</b>	Version of the shortest-path-first (SPF) algorithm that generated the route.
<b>Metric</b>	The metric number to get to that device.
<b>Interface</b>	Name of the Virtual Chassis port (VCP) interface connecting the devices.
<b>Via</b>	MAC address of the next-hop device, if applicable.

## Sample Output

### show virtual-chassis protocol route

```

user@switch> show virtual-chassis protocol route

## show virtual-chassis protocol statistics

<b>Syntax</b>	show virtual-chassis protocol statistics <all-members> <interface-name> <local> <member member-id>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the Virtual Chassis Control Protocol (VCCP) statistics for all hardware devices within the Virtual Chassis or VCF.
<b>Options</b>	<p><b>none</b>—Display VCCP statistics for all members of the Virtual Chassis or VCF.</p> <p><b>all-members</b>—(Optional) Display VCCP statistics for all members of the Virtual Chassis or VCF.</p> <p><b>interface-name</b>—(Optional) Display VCCP statistics for the specified interface.</p> <p><b>local</b>—(Optional) Display VCCP statistics for the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display VCCP statistics for the specified member of the Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>EX Series Virtual Chassis Overview</i></li> <li>• <a href="#">Understanding QFX Series Virtual Chassis on page 6907</a></li> <li>• <i>Understanding the Virtual Chassis Control Protocol in an EX8200 Virtual Chassis</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show virtual-chassis protocol statistics on page 7152</a>
<b>Output Fields</b>	<a href="#">Table 674 on page 7010</a> lists the output fields for the <b>show virtual-chassis protocol interface</b> command. Output fields are listed in the approximate order in which they appear.

**Table 689: show virtual-chassis protocol statistics Output Fields**

Field Name	Field Description
<b>PDU type</b>	Protocol data unit type.
<b>Received</b>	Number of PDUs received since VCCP started or since the statistics were set to zero.
<b>Processed</b>	Number of PDUs received minus the number of PDUs dropped.

Table 689: show virtual-chassis protocol statistics Output Fields (*continued*)

Field Name	Field Description
<b>Drops</b>	Number of PDUs dropped.
<b>Sent</b>	Number of PDUs transmitted since VCCP started or since the statistics were set to zero.
<b>Rexmit</b>	Number of PDUs retransmitted since VCCP started or since the statistics were set to zero.
<b>Total Packets Received</b>	Number of PDUs received since VCCP started or since the statistics were set to zero.
<b>Total Packets Sent</b>	Number of PDUs sent since VCCP started or since the statistics were set to zero.
<b>LSP queue length</b>	Number of link-state PDUs waiting in the queue for processing. This value is almost always 0.
<b>SPF runs</b>	Number of shortest-path-first (SPF) calculations that have been performed.
<b>Fragments Rebuilt</b>	Number of link-state PDU fragments that the local system has computed.
<b>LSP Regenerations</b>	Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.
<b>Purges initiated</b>	Number of purges that the system initiated. A purge is initiated if the software determines that a link-state PDU must be removed from the network.

<b>Output Fields</b>	<p><a href="#">Table 675 on page 7014</a> lists the output fields for the <b>show virtual-chassis</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 690: show virtual-chassis Output Fields**

Field Name	Field Description
<b>Fabric ID</b>	Assigned ID used to identify the VCF.
<b>Fabric Mode</b>	Mode of the VCF: Enabled, Disabled, or Mixed.
<b>Virtual Chassis ID</b>	Assigned ID that applies to the entire Virtual Chassis or VCF.
<b>Virtual Chassis Mode</b>	Mode of the Virtual Chassis or VCF: Enabled, Disabled, or Mixed.

Table 690: show virtual-chassis Output Fields (*continued*)

Field Name	Field Description
<b>Member ID</b>	Assigned member ID and FPC: <ul style="list-style-type: none"> <li>On all EX Series Virtual Chassis except EX8200 Virtual Chassis, and on a VCF, the FPC number refers to the member ID assigned to the switch.</li> <li>On EX8200 Virtual Chassis, member IDs are numbered 0 through 9. The FPC number indicates the slot number of the line card within the Virtual Chassis. The FPC number on member 0 is always 0 through 15. The FPC number on member 1 is always 16 through 31. The FPC number on member 2 is always 32 through 47; and so on for the members.</li> </ul>
<b>Status</b>	For a nonprovisioned configuration: <ul style="list-style-type: none"> <li><b>Prsnt</b> for a member that is currently connected to the Virtual Chassis or VCF configuration.</li> <li><b>NotPrsnt</b> for a member ID that has been assigned but is not currently connected.</li> </ul> For a preprovisioned configuration: <ul style="list-style-type: none"> <li><b>Prsnt</b> for a member that is specified in the preprovisioned configuration file and is currently connected to the Virtual Chassis or VCF.</li> <li><b>Unprvsnd</b> for a member that is interconnected with the Virtual Chassis or VCF configuration but is not specified in the preprovisioned configuration file.</li> </ul>
<b>Serial No</b>	Serial number of the member device.
<b>Alias-Name</b>	The user-configured alias of the member device.  The <b>Alias-Name</b> field appears only if an alias has been configured for at least one device in the Virtual Chassis or VCF. Aliases are configured using the <b>alias-name</b> statement in the <code>[edit virtual-chassis aliases serial-number serial-number]</code> hierarchy.
<b>Model</b>	Model number of the member device.
<b>Mastership Priority</b>	Mastership priority value of the member device.
<b>Role</b>	Role of the member device: master, backup, or linecard.
<b>Mixed Mode</b>	Mixed mode configuration status: <ul style="list-style-type: none"> <li><b>Y</b> for a member device configured in mixed mode.</li> <li><b>N</b> for a member device not configured in mixed mode.</li> <li><b>NA</b> for a member device that cannot be configured in mixed mode.</li> </ul>
<b>Route Mode</b>	The route mode of the member device: fabric (F) or Virtual Chassis (V).
<b>Location</b>	Location of the member device.  If this field is empty, the location field was not set for the device.
<b>Neighbor List</b>	Member ID of the neighbor member to which this member's Virtual Chassis port (VCP) is connected.

## show virtual-chassis vc-port

<b>Syntax</b>	show virtual-chassis vc-port <all-members> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	Display the status of the Virtual Chassis ports (VCPs), including both the dedicated VCPs and the uplink ports configured as VCPs.
<b>Options</b>	<p><b>none</b>—Display the operational status of all VCPs of the member switch where the command is issued.</p> <p><b>all-members</b>—(Optional) Display the operational status of all VCPs on all members of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display the operational status of the switch or external Routing Engine on which this command is entered.</p> <p><b>member <i>member-id</i></b>—(Optional) Display the operational status of all VCPs for the specified member of the Virtual Chassis or VCF.</p>

<b>Output Fields</b>	Table 677 on page 7020 lists the output fields for the <b>show virtual-chassis vc-port</b> command. Output fields are listed in the approximate order in which they appear.

Table 691: show virtual-chassis vc-port Output Fields

Field Name	Field Description
<b>fpcnumber</b>	The FPC number is the same as the member ID.

Table 691: show virtual-chassis vc-port Output Fields (*continued*)

Field Name	Field Description
Interface or PIC/Port	<p>VCP name.</p> <ul style="list-style-type: none"> <li>The dedicated VCPs in an EX4200 or EX4500 Virtual Chassis are <b>vcp-0</b> and <b>vcp-1</b>. The dedicated VCPs in an EX4550 Virtual Chassis are <b>VCP-1/0</b>, <b>VCP-1/1</b>, <b>VCP-2/0</b>, and <b>VCP-2/1</b>.</li> <li>Optical ports set as VCPs are named <b>1/0</b> and <b>1/1</b>, representing the PIC number and the port number.</li> <li>The native VCP (port 0) on an XRE200 External Routing Engine in an EX8200 Virtual Chassis is named <b>vcp-0</b>.</li> <li>The VCPs on each Virtual Chassis Control Interface (VCCI) module in an XRE200 External Routing Engine are named using the <b>vcp-slot-number/port-number</b> convention; for instance, <b>vcp-1/0</b>.</li> <li>The VCPs on EX8200 member switches are named using the <b>vcp-slot-number/pic-number/interface-number</b> convention; for instance, <b>vcp-3/0/2</b>.</li> <li>A <b>255</b> as the first number in your port number indicates that your VCP is part of a Link Aggregation group (LAG) bundle. For instance, a display of <b>vcp-255/1/0</b> indicates that the dedicated VCP named <b>vcp-1/0</b> is part of a LAG bundle. A display of <b>vcp-255/1/0</b> indicates that an uplink port that was previously named <b>xe-0/1/0</b> is now part of a VCP LAG bundle.</li> </ul>
Type	<p>Type of VCP:</p> <ul style="list-style-type: none"> <li><b>Dedicated</b>—The rear panel VCP on an EX4200, EX4500, or EX4550 switch, or any VCP link connected to an XRE200 External Routing Engine in an EX8200 Virtual Chassis.</li> <li><b>Configured</b>—Optical port configured as a VCP.</li> <li><b>Auto-Configured</b>—Optical port autoconfigured as a VCP.</li> </ul> <p>See <i>Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)</i> or <i>Setting a 10-Gigabit Ethernet Port as a Virtual Chassis Port in an EX8200 Virtual Chassis (CLI Procedure)</i> for information about configuring VCPs.</p>
Trunk ID	<p>A positive-number ID assigned to a link aggregation group (LAG) formed by the Virtual Chassis. The trunk ID value is <b>-1</b> if no trunk is formed. A LAG between uplink VCPs requires that the link speed be the same on connected interfaces and that at least two VCPs on one member be connected to at least two VCPs on the other member in an EX4200 or EX4500 Virtual Chassis.</p> <p>Dedicated VCP LAGs are assigned trunk IDs 1 and 2. Trunk IDs for LAGs formed with uplink VCPs therefore have values of 3 or greater.</p> <p>The trunk ID value changes if the link-adjacency state between LAG members changes; trunk membership is then allocated or deallocated.</p>
Status	<p>Interface status:</p> <ul style="list-style-type: none"> <li><b>absent</b>—Interface is not a VCP link.</li> <li><b>down</b>—VCP link is down.</li> <li><b>up</b>—VCP link is up.</li> </ul>
Speed (mbps)	Speed of the interface in megabits per second.
Neighbor ID/Interface	The Virtual Chassis member ID and interface of a VCP on a member that is connected to the interface or PIC/Port field in the same row as this interface.

## Sample Output

## show virtual-chassis vc-port diagnostics optics

---

<b>Syntax</b>	<code>show virtual-chassis vc-port diagnostics optics</code> <code>&lt;all-members&gt;</code> <code>&lt;interface-name&gt;</code> <code>&lt;local&gt;</code> <code>&lt;member member-id&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 12.2 for EX Series switches. Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).
<b>Description</b>	<p>Display diagnostics data and alarms for Ethernet optical transceivers installed in ports configured as Virtual Chassis Ports (VCPs) in an EX Series switches. The information provided by this command is known as digital optical monitoring (DOM) information.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that a transceiver is not operating properly. DOM information can be used to diagnose why a transceiver is not working.</p> <p>On some EX Series switches, the <b>request virtual-chassis vc-port diagnostics optics</b> command must be entered to run a diagnostic scan before you can gather the <b>show virtual-chassis vc-port diagnostics optics</b> output.</p>
<b>Options</b>	<p><b>none</b>—Display diagnostics information for transceivers installed in VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>all-members</b>—(Optional) Display diagnostics information for transceivers installed in VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>interface-name</b>—(Optional) Display diagnostics information for the transceiver installed in a specified VCP.</p> <p><b>local</b>—(Optional) Display diagnostics information for transceivers installed in VCPs on the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display diagnostics information for transceivers installed in VCPs on a specified member of a Virtual Chassis or VCF.</p>

[show virtual-chassis vc-port diagnostics optics \(member member-id\) on page 7174](#)

**Output Fields** [Table 678 on page 7025](#) lists the output fields for the **show virtual-chassis vc-port diagnostics optics** command. Output fields are listed in the approximate order in which they appear.

**Table 692: show virtual-chassis vc-port diagnostics optics Output Fields**

Field Name	Field Description
FPC	Displays the FPC slot number.
Virtual chassis port	Displays the name of the VCP.
Laser bias current	Displays the magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Module temperature	Displays the temperature, in Celsius and Fahrenheit.
Module voltage	Displays the voltage, in Volts.
Receiver signal average optical power	Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Laser bias current high alarm	Displays whether the laser bias power setting high alarm is <i>On</i> or <i>Off</i> .
Laser bias current low alarm	Displays whether the laser bias power setting low alarm is <i>On</i> or <i>Off</i> .
Laser bias current high warning	Displays whether the laser bias power setting high warning is <i>On</i> or <i>Off</i> .
Laser bias current low warning	Displays whether the laser bias power setting low warning is <i>On</i> or <i>Off</i> .
Laser output power high alarm	Displays whether the laser output power high alarm is <i>On</i> or <i>Off</i> .
Laser output power low alarm	Displays whether the laser output power low alarm is <i>On</i> or <i>Off</i> .
Laser output power high warning	Displays whether the laser output power high warning is <i>On</i> or <i>Off</i> .
Laser output power low warning	Displays whether the laser output power low warning is <i>On</i> or <i>Off</i> .
Module temperature high alarm	Displays whether the module temperature high alarm is <i>On</i> or <i>Off</i> .
Module temperature low alarm	Displays whether the module temperature low alarm is <i>On</i> or <i>Off</i> .
Module temperature high warning	Displays whether the module temperature high warning is <i>On</i> or <i>Off</i> .
Module temperature low warning	Displays whether the module temperature low warning is <i>On</i> or <i>Off</i> .

Table 692: show virtual-chassis vc-port diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Module voltage high alarm	Displays whether the module voltage high alarm is <i>On</i> or <i>Off</i> .
Module voltage low alarm	Displays whether the module voltage low alarm is <i>On</i> or <i>Off</i> .
Module voltage high warning	Displays whether the module voltage high warning is <i>On</i> or <i>Off</i> .
Module voltage low warning	Displays whether the module voltage low warning is <i>On</i> or <i>Off</i> .
Laser rx power high alarm	Displays whether the receive laser power high alarm is <i>On</i> or <i>Off</i> .
Laser rx power low alarm	Displays whether the receive laser power low alarm is <i>On</i> or <i>Off</i> .
Laser rx power high warning	Displays whether the receive laser power high warning is <i>On</i> or <i>Off</i> .
Laser rx power low warning	Displays whether the receive laser power low warning is <i>On</i> or <i>Off</i> .
Laser bias current high alarm threshold	Displays the vendor-specified threshold for the laser bias current high alarm.
Laser bias current low alarm threshold	Displays the vendor-specified threshold for the laser bias current low alarm.
Laser bias current high warning threshold	Displays the vendor-specified threshold for the laser bias current high warning.
Laser bias current low warning threshold	Displays the vendor-specified threshold for the laser bias current low warning.
Laser output power high alarm threshold	Displays the vendor-specified threshold for the laser output power high alarm.
Laser output power low alarm threshold	Displays the vendor-specified threshold for the laser output power low alarm.
Laser output power high warning threshold	Displays the vendor-specified threshold for the laser output power high warning.
Laser output power low warning threshold	Displays the vendor-specified threshold for the laser output power low warning.
Module temperature high alarm threshold	Displays the vendor-specified threshold for the module temperature high alarm.
Module temperature low alarm threshold	Displays the vendor-specified threshold for the module temperature low alarm.
Module temperature high warning threshold	Displays the vendor-specified threshold for the module temperature high warning.
Module temperature low warning threshold	Displays the vendor-specified threshold for the module temperature low warning.

Table 692: show virtual-chassis vc-port diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Module voltage high alarm threshold	Displays the vendor-specified threshold for the module voltage high alarm.
Module voltage low alarm threshold	Displays the vendor-specified threshold for the module voltage low alarm.
Module voltage high warning threshold	Displays the vendor-specified threshold for the module voltage high warning.
Module voltage low warning threshold	Displays the vendor-specified threshold for the module voltage low warning.
Laser rx power high alarm threshold	Displays the vendor-specified threshold for the laser rx power high alarm.
Laser rx power low alarm threshold	Displays the vendor-specified threshold for the laser rx power low alarm.
Laser rx power high warning threshold	Displays the vendor-specified threshold for the laser rx power high warning.
Laser rx power low warning threshold	Displays the vendor-specified threshold for the laser rx power low warning.

## show virtual-chassis vc-port statistics

---

<b>Syntax</b>	<pre>show virtual-chassis vc-port statistics &lt;all-members&gt; &lt;brief   detail   extensive &gt; &lt;interface-name&gt; &lt;local&gt; &lt;member member-id&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>The options <b>all-members</b>, <b>brief</b>, <b>detail</b>, <b>extensive</b>, and <b>local</b> were added in Junos OS Release 9.3 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Command introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	Display the traffic statistics collected on Virtual Chassis ports (VCPs).
<b>Options</b>	<p><b>none</b>—Display traffic statistics for VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output. Using the <b>brief</b> option is equivalent to entering the command with no options (the default). The <b>detail</b> and <b>extensive</b> options provide identical displays.</p> <p><b>all-members</b>—(Optional) Display traffic statistics for VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>interface-name</b>—(Optional) Display traffic statistics for the specified VCP.</p> <p><b>local</b>—(Optional) Display traffic statistics for VCPs on the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display traffic statistics for VCPs on the specified member of a Virtual Chassis or VCF.</p>
<b>Required Privilege Level</b>	view

**Output Fields** Table 678 on page 7025 lists the output fields for the **show virtual-chassis vc-port statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 693: show virtual-chassis vc-port statistics Output Fields**

Field Name	Field Description	Level of Output
<b>fpcnumber</b>	(All Virtual Chassis except EX8200 Virtual Chassis. VCF) ID of the Virtual Chassis member. The FPC number is the same as the member ID.	All levels
<b>member number</b>	(EX8200 Virtual Chassis only) Member ID of the Virtual Chassis member.	All levels
<b>Interface</b>	VCP name.	<b>brief</b>
<b>Input Octets/Packets</b>	Number of octets and packets received on the VCP.	<b>brief, member, none</b>
<b>Output Octets/Packets</b>	Number of octets and packets transmitted on the VCP.	<b>brief, member, none</b>
<b>master: number</b>	Member ID of the master Routing Engine.	All levels
<b>Port</b>	VCP for which <b>RX</b> (Receive) statistics, <b>TX</b> (Transmit) statistics, or both are reported by the VCP subsystem during a sampling interval—since the statistics counter was last cleared.	<b>detail, extensive</b>
<b>Total octets</b>	Total number of octets received and transmitted on the VCP.	<b>detail, extensive</b>
<b>Total packets</b>	Total number of packets received and transmitted on the VCP.	<b>detail, extensive</b>
<b>Unicast packets</b>	Number of unicast packets received and transmitted on the VCP.	<b>detail, extensive</b>
<b>Broadcast packets</b>	Number of broadcast packets received and transmitted on the VCP.	<b>detail, extensive</b>
<b>Multicast packets</b>	Number of multicast packets received and transmitted on the VCP.	<b>detail, extensive</b>
<b>MAC control frames</b>	Number of media access control (MAC) control frames received and transmitted on the VCP.	<b>detail, extensive</b>

Table 693: show virtual-chassis vc-port statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>CRC alignment errors</b>	<p>Number of packets received on the VCP that had a length—excluding framing bits, but including frame check sequence (FCS) octets—of between 64 and 1518 octets, inclusive, and had one of the following errors:</p> <ul style="list-style-type: none"> <li>Invalid FCS with an integral number of octets (FCS error)</li> <li>Invalid FCS with a nonintegral number of octets (alignment error)</li> </ul>	<b>detail, extensive</b>
<b>Oversize packets</b>	Number of packets received on the VCP that were longer than 1518 octets (excluding framing bits, but including FCS octets) but were otherwise well formed.	<b>detail, extensive</b>
<b>Undersize packets</b>	Number of packets received on the VCP that were shorter than 64 octets (excluding framing bits but including FCS octets) and were otherwise well formed..	<b>detail, extensive</b>
<b>Jabber packets</b>	<p>Number of packets received on the VCP that were longer than 1518 octets—excluding framing bits, but including FCS octets—and that had either an FCS error or an alignment error.</p> <p><b>NOTE:</b> This definition of <i>jabber</i> is different from the definition in IEEE-802.3 section 8.2.1.5 (10Base5) and section 10.3.1.4 (10Base2). These documents define <i>jabber</i> as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.</p>	<b>detail, extensive</b>
<b>Fragments received</b>	<p>Number of packets received on the VCP that were shorter than 64 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error.</p> <p>Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</p>	<b>detail, extensive</b>
<b>Ifout errors</b>	Number of outbound packets received on the VCP that could not be transmitted because of errors.	<b>detail, extensive</b>
<b>Packet drop events</b>	Number of outbound packets received on the VCP that were dropped, rather than being encapsulated and sent out of the switch as fragments. The packet drop counter is incremented if a temporary shortage of packet memory causes packet fragmentation to fail.	<b>detail, extensive</b>
<b>64 octets frames</b>	Number of packets received on the VCP (including invalid packets) that were 64 octets in length (excluding framing bits, but including FCS octets).	<b>detail, extensive</b>

Table 693: show virtual-chassis vc-port statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
65–127 octets frames	Number of packets received on the VCP (including invalid packets) that were between 65 and 127 octets in length, inclusive (excluding framing bits, but including FCS octets).	detail, extensive
128–255 octets frames	Number of packets received on the VCP (including invalid packets) that were between 128 and 255 octets in length, inclusive (excluding framing bits, but including FCS octets).	detail, extensive
256–511 octets frames	Number of packets received on the VCP (including invalid packets) that were between 256 and 511 octets in length, inclusive (excluding framing bits, but including FCS octets).	detail, extensive
512–1023 octets frames	Number of packets received on the VCP (including invalid packets) that were between 512 and 1023 octets in length, inclusive (excluding framing bits, but including FCS octets).	detail, extensive
1024–1518 octets frames	Number of packets received on the VCP (including invalid packets) that were between 1024 and 1518 octets in length, inclusive (excluding framing bits, but including FCS octets).	detail, extensive
Rate packets per second	Number of packets per second received and transmitted on the VCP.	detail, extensive
Rate bytes per second	Number of bytes per second received and transmitted on the VCP.	detail, extensive

# Troubleshooting Procedures

- [Troubleshooting Virtual Chassis Fabric on page 7183](#)

## Troubleshooting Virtual Chassis Fabric

---

This topic describes some of the following common troubleshooting issues for a Virtual Chassis Fabric (VCF):

- [Virtual Chassis Port Link Does Not Form on page 7183](#)
- [QFX5100 Leaf Device Assumes Routing Engine Role on page 7184](#)

### Virtual Chassis Port Link Does Not Form

**Problem** **Description:** You connect a 40-Gbps QSFP+ port or a 10-Gbps SFP+ port between a leaf device and a spine device in an autoprovisioned or preprovisioned VCF. You expect the automatic Virtual Chassis port (VCP) conversion feature to convert the link into a VCP link, but the conversion doesn't occur.

The [show virtual-chassis vc-port](#) output indicates that the status of the interface is **Absent** or one or both of interfaces don't appear in the [show virtual-chassis vc-port](#) output.

**Cause** If one end of a link is configured as a VCP and the other is not configured as a VCP, the VCP link does not form.

The automatic VCP conversion feature, therefore, does not work in the following situations:

- a 40-Gbps QSFP+ or 10-Gbps SFP+ interface on one end of the link is already configured as a VCP.

If you have previously removed a device from a VCF but haven't used the **request virtual-chassis vc-port delete** command to convert the interface that was connected to the removed device out of VCP mode, the interface is still configured as a VCP.

If you have removed a device from one Virtual Chassis or VCF and not changed the VCP port setting, the device being added to the VCF might also be configured as a VCP.

- a 40-Gbps QSFP+ port on an EX4300 switch, which is configured as a VCP by default, is interconnecting to a spine device.

**Solution** Manually configure the interface that is not configured as a VCP into a VCP using the **request virtual-chassis vc-port set** command.

### QFX5100 Leaf Device Assumes Routing Engine Role

**Problem** **Description:** A QFX5100 device configured as a leaf device assumes the Routing Engine role during VCF setup. The **show virtual-chassis** output confirms the role.

**Solution** The device can assume the Routing Engine role for several minutes during setup before it receives the configuration from the master Routing Engine, but eventually returns to the linecard role with no user intervention.

## Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

[Table 663 on page 6893](#) provides a list of some of the troubleshooting resources.

**Table 694: Troubleshooting Resources on the QFX Series**

Troubleshooting Resource	Description	Documentation
Chassis alarms	Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch.	<a href="#">"Chassis Alarm Messages on a QFX3500 Device" on page 7192</a>
Chassis Status LEDs and Fan Tray LEDs	A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.	<i>Chassis Status LEDs on a QFX3500 Device</i>
Interface alarms	A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.	<a href="#">"Interface Alarm Messages" on page 7195</a>
System alarms	A predefined alarm is triggered by a missing rescue configuration or problem with the software license.	<a href="#">"Understanding Alarms" on page 7191</a>

Table 694: Troubleshooting Resources on the QFX Series (*continued*)

Troubleshooting Resource	Description	Documentation
System log messages	The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	<ul style="list-style-type: none"> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 6561</a></li> <li>• <a href="#">Junos OS System Log Configuration Statements on page 6616</a></li> </ul>
Junos OS operational mode commands	Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the <b>traceroute monitor</b> command to locate points of failure in a network.	<ul style="list-style-type: none"> <li>• <a href="#">Monitoring System Process Information on page 333</a></li> <li>• <a href="#">Monitoring System Properties on page 334</a></li> <li>• <a href="#">traceroute monitor</a></li> </ul>
Junos OS automation scripts (event scripts)	Event scripts can be used to automate network troubleshooting and management tasks.	<i>Junos OS Automation Library</i>
Junos OS XML operational tags	XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.	<i>Junos XML API Operational Developer Reference</i>
NETCONF XML management protocol	The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b> , <b>set</b> , and <b>commit</b> to perform those operations.	<i>NETCONF XML Management Protocol Developer Guide</i>
SNMP MIBs and traps	MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.	<ul style="list-style-type: none"> <li>• <a href="#">SNMP MIBs Support on page 6530</a></li> <li>• <a href="#">SNMP Traps Support on page 6546</a></li> <li>• <a href="#">Using the Traceroute MIB for SNMP Remote Operations</a></li> </ul>
AI-Scripts and Advanced Insight Manager (AIM)	AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.	<a href="#">Advanced Insight Scripts (AI-Scripts) Release Notes</a>
Junos Space Service Now	This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.	<i>Service Automation</i>

Table 694: Troubleshooting Resources on the QFX Series (*continued*)

Troubleshooting Resource	Description	Documentation
Junos Space Service Insight	This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now.	<i>Service Automation</i>
Juniper Networks Knowledge Base	You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.	<a href="http://kb.juniper.net">http://kb.juniper.net</a>

## Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

[Table 664 on page 6895](#) provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 695: Troubleshooting on the QFX Series

Problem Category	Symptom or Problem	Recommended Action
Switch hardware components	LCD panel shows a chassis alarm count.	See <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 7192</a> .
	Fan tray LED is blinking amber.	See <i>Fan Tray LED on a QFX3500 Device</i> .
	Chassis status LED for the power is blinking amber.	See <i>Chassis Status LEDs on a QFX3500 Device</i> .
	Chassis status LED for the fan (on the management board) is blinking amber.	Replace the management board as soon as possible. See <i>Chassis Status LEDs on a QFX3500 Device</i> .

Table 695: Troubleshooting on the QFX Series (*continued*)

Problem Category	Symptom or Problem	Recommended Action
Port configuration	Cannot configure a port as a Gigabit Ethernet port.	<p>Check whether the port is a valid Gigabit Ethernet port (6 through 41).</p> <p>See <i>QFX3500 Device Overview</i>.</p>
	Cannot configure a port as a Fibre Channel port.	<p>Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47).</p> <p>See <i>QFX3500 Device Overview</i>.</p>
	Cannot configure a port as a 10-Gigabit Ethernet port.	<p>If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports.</p> <p>If the port is a 40-Gbps QSFP+ interface, make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <i>QFX3500 Device Overview</i>.</p>
	Cannot configure a 40-Gbps QSFP+ interface.	<p>The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <i>QFX3500 Device Overview</i>.</p>
External devices (USB devices)	Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state.	Unplug the USB device and reboot the switch.
Initial device configuration	Cannot configure management Ethernet ports.	<p>Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them.</p> <p><b>NOTE:</b> The management ports are on the front panel of the QFX3500 switch. They are labeled <b>C0</b> and <b>C1</b> on the front panel. In the CLI they are referred to as <b>me0</b> and <b>me1</b>.</p> <p>See “<a href="#">Configuring a QFX3500 Device as a Standalone Switch</a>” on page 175.</p>

Table 695: Troubleshooting on the QFX Series (*continued*)

Problem Category	Symptom or Problem	Recommended Action
Software upgrade and configuration	Failed software upgrade.	See <a href="#">“Recovering from a Failed Software Installation” on page 121.</a>
	Active partition becomes inactive after upgrade.	
	Problem with the active configuration file.	See the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Loading a Previous Configuration File on page 1252</a></li> <li>• <a href="#">Reverting to the Default Factory Configuration on page 188</a></li> <li>• <a href="#">Reverting to the Rescue Configuration on page 189</a></li> <li>• <a href="#">Performing a Recovery Installation on page 116</a></li> </ul>
	Root password is lost or forgotten.	Recover the root password. See <a href="#">“Recovering the Root Password” on page 1233.</a>
Network interfaces	An aggregated Ethernet interface is down.	See <a href="#">“Troubleshooting an Aggregated Ethernet Interface” on page 1234.</a>
	Interface on built-in network port is down.	See <a href="#">“Troubleshooting Network Interfaces” on page 1234.</a>
	Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.	
Ethernet switching	A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch.	See <a href="#">“Troubleshooting Ethernet Switching” on page 1895.</a>
Firewall filter	Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.	See <a href="#">“Troubleshooting Firewall Filter Configuration” on page 5411.</a>

## Alarms

- [Understanding Alarms on page 7191](#)
- [Chassis Alarm Messages on a QFX3500 Device on page 7192](#)
- [Interface Alarm Messages on page 7195](#)
- [System Utilization Alarms on page 7195](#)

## Understanding Alarms

The QFX Series support different alarm types and severity levels. [Table 696 on page 7192](#) provides a list of alarm terms and definitions that may help you in monitoring the device.

Table 696: Alarm Terms and Definitions

Term	Definition
Alarm	Signal alerting you to conditions that might prevent normal operation. On the device, alarm indicators might include the LCD panel and LEDs on the device. The LCD panel (if present on the device) displays the chassis alarm message count. Blinking amber LEDs indicate yellow alarm conditions for chassis components.
Alarm condition	Failure event that triggers an alarm.
Alarm severity levels	<p>Seriousness of the alarm. The level of severity can be either major (red) or minor (yellow).</p> <ul style="list-style-type: none"> <li>Major (red)—Indicates a critical situation on the device that has resulted from one of the following conditions. A red alarm condition requires immediate action. <ul style="list-style-type: none"> <li>One or more hardware components have failed.</li> <li>One or more hardware components have exceeded temperature thresholds.</li> <li>An alarm condition configured on an interface has triggered a critical warning.</li> </ul> </li> <li>Minor (yellow or amber)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance. For example, a missing rescue configuration generates a yellow system alarm.</li> </ul>
Alarm types	<p>Alarms include the following types:</p> <ul style="list-style-type: none"> <li>Chassis alarm—Predefined alarm triggered by a physical condition on the device such as a power supply failure or excessive component temperature.</li> <li>Interface alarm—Alarm you configure to alert you when an interface link is down. Applies to <b>ethernet</b>, <b>fibre-channel</b>, and <b>management-ethernet</b> interfaces. You can configure a red (major) or yellow (minor) alarm for the link-down condition, or have the condition ignored.</li> <li>System alarm—Predefined alarm that might be triggered by a missing rescue configuration, failure to install a license for a licensed software feature, or high disk usage.</li> </ul>

## Chassis Alarm Messages on a QFX3500 Device

Chassis alarms indicate a failure on the device or one of its components. Chassis alarms are preset and cannot be modified.

The chassis alarm message count is displayed on the LCD panel on the front of the device. To view the chassis alarm message text remotely, use the **show chassis lcd** CLI command.

Chassis alarms on QFX3500 devices have two severity levels:

- Major (red)—Indicates a critical situation on the device that has resulted from one of the conditions described in [Table 697 on page 7193](#). A red alarm condition requires immediate action.

- Minor (yellow or amber)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

Table 697 on page 7193 describes the chassis alarm messages on QFX3500 devices.

**Table 697: QFX3500 Chassis Alarm Messages**

Component	Alarm Type	CLI Message	Recommended Action
Fans	Major (red)	Fan/Blower Absent	The fan is missing. Install a fan.
		Fan Failure	Replace the fan and report the failure to customer support.
		Fan I2C Failure	Check the system log for one of the following messages and report the error message to customer support: <ul style="list-style-type: none"> <li>• CM ENV Monitor: Get fan speed failed.</li> <li>• CM ENV Monitor: Get fan speed failed <i>Fan-number</i> is NOT spinning @ correct speed, where <i>fan-number</i> may be 1, 2, or 3.</li> </ul>
		<i>fan-number</i> Not Spinning Fan	Remove and check the fan for obstructions, and then reinsert the fan. If the problem persists, replace the fan.
Power Supplies	Major (red)	PEM <i>pem-number</i> Airflow not matching Chassis Airflow	The power supply airflow direction is the opposite of the chassis airflow direction. Replace the power supply with a power supply that supports the same airflow direction as the chassis.
		PEM <i>pem-number</i> I2C Failure	Check the system log for one of the following messages and report the error message to customer support: <ul style="list-style-type: none"> <li>• I2C Read failed for device <i>number</i>, where <i>number</i> may be from 123 to 125.</li> <li>• PS <i>number</i>: Transitioning from online to offline, where power supply (PS) <i>number</i> may be 1 or 2.</li> </ul>
		PEM <i>pem-number</i> is not supported	Indicates a power supply problem, or the power supply is not supported on the device. Report the problem to customer support.
		PEM <i>pem-number</i> Not OK	Indicates a problem with the incoming AC or outgoing DC power. Replace the power supply.

Table 697: QFX3500 Chassis Alarm Messages (*continued*)

Component	Alarm Type	CLI Message	Recommended Action
	Minor (yellow)	<b>PEM <i>pem-number</i> Absent</b>	For information only. Indicates the device was powered on with two power supplies installed, but now one is missing. The device can continue to operate with a single power supply. If you wish to remove this alarm message, reboot the device with one power supply.
		<b>PEM <i>pem-number</i> is not powered</b>	For information only. Check the power cord connection and reconnect it if necessary.
		<b>PEM <i>pem-number</i> Power Supply Type Mismatch</b>	For information only. Indicates that an AC power supply and DC power supply have been installed in the same chassis. If you wish to remove this alarm message, reboot the device with two AC power supplies or two DC power supplies.
		<b>PEM <i>pem-number</i> Removed</b>	For information only. Indicates the device was powered on with two power supplies installed, but one has been removed. The device can continue to operate with a single power supply. If you wish to remove this alarm message, reboot the device with one power supply.
Temperature Sensors	Major (red)	<b><i>sensor-location</i> Temp Sensor Fail</b>	Check the system log for the following message and report it to customer support:  <b>Temp sensor <i>sensor-number</i> failed</b> , where <i>sensor-number</i> may range from 1 through 10.
		<b><i>sensor-location</i> Temp Sensor Too Hot</b>	Check environmental conditions and alarms on other devices. Ensure that environmental factors (such as hot air blowing around the equipment) are not affecting the temperature sensor. If the condition persists, the device may shut down.
	Minor (yellow)	<b><i>sensor-location</i> Temp Sensor Too Warm</b>	For information only. Check environmental conditions and alarms on other devices. Ensure that environmental factors (such as hot air blowing around the equipment) are not affecting the temperature sensor.

**Related Documentation**

- [Front Panel of a QFX3500 Device](#)

- [Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types on page 161](#)
- [alarm on page 2630](#)

## Interface Alarm Messages

Interface alarms are alarms that you configure to alert you when an interface is down.

To configure an interface link-down condition to trigger a red or yellow alarm, or to configure the link-down condition to be ignored, use the **alarm** statement at the **[edit chassis]** hierarchy level. You can specify the **ethernet**, **fibre-channel**, or **management-ethernet** interface type.

**NOTE:** Fibre Channel alarms are only valid on QFX3500 devices.

**NOTE:** When red alarms or major alarms are issued on QFX5100 and EX4600 switches, the alarm LED glows amber instead of red.

By default, major alarms are configured for interface link-down conditions on the control plane and management network interfaces in a QFabric system. The link-down alarms indicate that connectivity to the control plane network is down. You can configure these alarms to be ignored using the **alarm** statement at the **[edit chassis]** hierarchy level.

**NOTE:** If you configure a yellow alarm on the QFX3008-I Interconnect device, it will be handled as a red alarm.

## System Utilization Alarms

QFX Series devices provide system alarms that alert you when disk usage in the **/var** partition exceeds acceptable levels.

You can display the messages for these alarms by issuing the **show system alarms** operational mode command if the **/var** partition usage exceeds 75 percent. A usage level between 76 and 90 percent indicates high usage and raises a minor alarm condition, whereas a usage level above 90 percent indicates that the partition is full and raises a major alarm condition.

The following sample output from the **show system alarms** command shows system alarm messages that are displayed when disk usage is exceeded on the switch.

```
user@host> show system alarms
4 alarms currently active
Alarm time          Class  Description
```

```
2013-10-08 20:08:20 UTC Minor RE 0 /var partition usage is high
2013-10-08 20:08:20 UTC Major RE 0 /var partition is full
2013-10-08 20:08:08 UTC Minor FPC 1 /var partition usage is high
2013-10-08 20:08:08 UTC Major FPC 1 /var partition is full
```

**BEST PRACTICE:** We recommend that you regularly request a system file storage cleanup to optimize the performance of the switch and prevent generating system alarms.

## CHAPTER 88

# Administration

- [Routine Monitoring Using the CLI on page 7197](#)

### Routine Monitoring Using the CLI

---

- [Monitoring SNMP on page 7197](#)
- [Tracing SNMP Activity on a Device Running Junos OS on page 7199](#)
- [Monitoring RMON MIB Tables on page 7202](#)
- [Displaying a Log File from a Single-Chassis System on page 7203](#)
- [Monitoring System Log Messages on page 7204](#)
- [Monitoring Traffic Through the Router or Switch on page 7205](#)
- [Pinging Hosts on page 7207](#)

### Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
```

```
Alarm
```

Index	Variable description	Value	State
32768	Health Monitor: root file system utilization jnxHrStoragePercentUsed.1	58	active
32769	Health Monitor: /config file system utilization jnxHrStoragePercentUsed.2	0	active

```
32770 Health Monitor: RE 0 CPU utilization
      jnxOperatingCPU.9.1.0.0                0 active

32773 Health Monitor: RE 0 Memory utilization
      jnxOperatingBuffer.9.1.0.0            35 active

32775 Health Monitor: jkernel daemon CPU utilization
      Init daemon                          0 active
      Chassis daemon                      50 active
      Firewall daemon                     0 active
      Interface daemon                    5 active
      SNMP daemon                         11 active
      MIB2 daemon                         42 active
      ...
```

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system
```

```
sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx
```

```
Build date: 2010-09-26 06:00:10 U
sysObjectID.0 = jnxProductQFX3500
sysUpTime.0   = 24444184
sysContact.0  = J Smith
sysName.0     = Lab QFX3500
sysLocation.0 = Lab
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

```
user@switch> show snmp statistics
```

```
SNMP statistics:
Input:
  Packets: 0, Bad versions: 0, Bad community names: 0,
  Bad community uses: 0, ASN parse errors: 0,
  Too bigs: 0, No such names: 0, Bad values: 0,
  Read onlys: 0, General errors: 0,
  Total request varbinds: 0, Total set varbinds: 0,
  Get requests: 0, Get nexts: 0, Set requests: 0,
  Get responses: 0, Traps: 0,
  Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,
  Throttle drops: 0, Duplicate request drops: 0
Output:
  Packets: 0, Too bigs: 0, No such names: 0,
  Bad values: 0, General errors: 0,
  Get requests: 0, Get nexts: 0, Set requests: 0,
  Get responses: 0, Traps: 0
```

## Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d
  - rmopd
  - serviced
  - snmpd
- When a trace file named **filename** reaches its maximum size, it is renamed **filename.0**, then **filename.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
traceoptions {
  file <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  memory-trace;
  no-remote-trace;
  no-default-memory-trace;
}
```

These statements are described in the following sections:

- [Configuring the Number and Size of SNMP Log Files on page 7200](#)
- [Configuring Access to the Log File on page 7200](#)
- [Configuring a Regular Expression for Lines to Be Logged on page 7200](#)
- [Configuring the Trace Operations on page 7200](#)

### Configuring the Number and Size of SNMP Log Files

---

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed *filename.0*, then *filename.1*, and so on, until there are three trace files. Then the oldest trace file (*filename.2*) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (*filename*) reaches 2 MB, *filename* is renamed *filename.0*, and a new file called *filename* is created. When the new *filename* reaches 2 MB, *filename.0* is renamed *filename.1* and *filename* is renamed *filename.0*. This process repeats until there are 20 trace files. Then the oldest file (*filename.19*) is overwritten by the newest file (*filename.0*).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

### Configuring Access to the Log File

---

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

### Configuring a Regular Expression for Lines to Be Logged

---

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file filename]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

### Configuring the Trace Operations

---

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
```

```

configuration;
database;
events;
general;
interface-stats;
nonvolatile-sets;
pdu;
policy;
protocol-timeouts;
routing-socket;
server;
subagent;
timer;
varbind-error;
}

```

Table 641 on page 6809 describes the meaning of the SNMP tracing flags.

**Table 698: SNMP Tracing Flags**

Flag	Description	Default Setting
<b>all</b>	Log all operations.	Off
<b>configuration</b>	Log reading of the configuration at the <b>[edit snmp]</b> hierarchy level.	Off
<b>database</b>	Log events involving storage and retrieval in the events database.	Off
<b>events</b>	Log important events.	Off
<b>general</b>	Log general events.	Off
<b>interface-stats</b>	Log physical and logical interface statistics.	Off
<b>nonvolatile-set</b>	Log nonvolatile SNMP set request handling.	Off
<b>pdu</b>	Log SNMP request and response packets.	Off
<b>policy</b>	Log policy processing.	Off
<b>protocol-timeouts</b>	Log SNMP response timeouts.	Off
<b>routing-socket</b>	Log routing socket calls.	Off
<b>server</b>	Log communication with processes that are generating events.	Off
<b>subagent</b>	Log subagent restarts.	Off
<b>timer</b>	Log internal timer events.	Off

Table 698: SNMP Tracing Flags (*continued*)

Flag	Description	Default Setting
<b>varbind-error</b>	Log variable binding errors.	Off

To display the end of the log for an agent, issue the **show log agentd | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where **agent** is the name of an SNMP agent.

  - [Example: Tracing SNMP Activity](#)
  - [Configuring SNMP on page 1356](#)

## Monitoring RMON MIB Tables

**Purpose** Monitor remote monitoring (RMON) alarm, event, and log tables.

**Action** To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                               Value State

      5 monitor
      jnxOperatingCPU.9.1.0.0                        5 falling threshold

Event
Index  Type                               Last Event
      1 log and trap                     2010-07-10 11:34:17 PDT
Event Index: 1
      Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
      Time: 2010-07-10 11:34:07 PDT
      Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
      Time: 2010-07-10 11:34:17 PDT
```

**Meaning** The display shows that an alarm has been defined to monitor jnxRmon MIB object jnxOperatingCPU, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the logTable in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

## Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent

## Monitoring System Log Messages

**Purpose** Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

**Action** To view system log messages:

```
user@switch1> show log messages
```

## Sample Output

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Management process): new instance detected (variable:
sysApp1ElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApp1ElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

**Meaning** The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user jsmith.

## Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. [Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 7205](#)
2. [Displaying Real-Time Statistics About an Interface on the Router or Switch on page 7206](#)

### Displaying Real-Time Statistics About All Interfaces on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through all interfaces on the router or switch.

**Action** To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

## Sample Output

```
user@host> monitor interface traffic
host name                               Seconds: 15                               Time: 12:31:09
Interface  Link  Input packets  (pps)  Output packets  (pps)
so-1/0/0   Down    0              (0)      0              (0)
so-1/1/0   Down    0              (0)      0              (0)
so-1/1/1   Down    0              (0)      0              (0)
so-1/1/2   Down    0              (0)      0              (0)
so-1/1/3   Down    0              (0)      0              (0)
t3-1/2/0   Down    0              (0)      0              (0)
t3-1/2/1   Down    0              (0)      0              (0)
t3-1/2/2   Down    0              (0)      0              (0)
t3-1/2/3   Down    0              (0)      0              (0)
so-2/0/0   Up      211035         (1)      36778          (0)
so-2/0/1   Up      192753         (1)      36782          (0)
so-2/0/2   Up      211020         (1)      36779          (0)
so-2/0/3   Up      211029         (1)      36776          (0)
so-2/1/0   Up      189378         (1)      36349          (0)
so-2/1/1   Down    0              (0)      18747          (0)
so-2/1/2   Down    0              (0)      16078          (0)
so-2/1/3   Up      0              (0)      80338          (0)
at-2/3/0   Up      0              (0)      0              (0)
```

```
at-2/3/1    Down          0          (0)          0          (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D
```

**Meaning** The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the **C** key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

### Displaying Real-Time Statistics About an Interface on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through an interface on the router or switch.

**Action** To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

```
user@host> monitor interface interface-name
```

### Sample Output

```
user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
Interface: so-0/0/1, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: OC3 Traffic statistics:
  Input bytes:          5856541 (88 bps)
  Output bytes:         6271468 (96 bps)
  Input packets:        157629 (0 pps)
  Output packets:       157024 (0 pps)
Encapsulation statistics:
  Input keepalives:     42353
  Output keepalives:    42320
  LCP state: Opened
Error statistics:
  Input errors:         0
  Input drops:          0
  Input framing errors: 0
  Input runs:           0
  Input giants:         0
  Policed discards:     0
  L3 incompletes:       0
  L2 channel errors:    0
  L2 mismatch timeouts: 0
  Carrier transitions:  1
  Output errors:        0
  Output drops:         0
  Aged packets:         0
Active alarms : None
Active defects: None
SONET error counts/seconds:
  LOS count             1
  LOF count             1
  SEF count             1
  ES-S                  77
  SES-S                 77
SONET statistics:
  BIP-B1                0
  BIP-B2                0
```

```

REI-L                0
BIP-B3               0
REI-P                0
Received SONET overhead:  F1          : 0x00  J0          : 0xZ

```

**Meaning** The sample output shows the input and output packets for a particular SONET interface (**so-0/0/1**). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see *Checklist for Tracking Error Conditions*.

To control the output of the command while it is running, use the keys shown in [Table 640 on page 6802](#).

**Table 699: Output Control Keys for the monitor interface Command**

Action	Key
Display information about the next interface. The <b>monitor interface</b> command scrolls through the physical or logical interfaces in the same order that they are displayed by the <b>show interfaces terse</b> command.	<b>N</b>
Display information about a different interface. The command prompts you for the name of a specific interface.	<b>I</b>
Freeze the display, halting the display of updated statistics.	<b>F</b>
Thaw the display, resuming the display of updated statistics.	<b>T</b>
Clear (zero) the current delta counters since <b>monitor interface</b> was started. It does not clear the accumulative counter.	<b>C</b>
Stop the <b>monitor interface</b> command.	<b>Q</b>

See the [CLI Explorer](#) for details on using match conditions with the **monitor traffic** command.

## Pinging Hosts

**Purpose** Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

**Action** To use the **ping** command to send four requests (ping count) to host3:  
**ping host count number**

## Sample Output

```

ping host3 count 4
user@switch> ping host3 count 4
PING host3.site.net (176.26.232.111): 56 data bytes
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms

```

```
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

**Meaning** • The **ping** results show the following information:

- Size of the ping response packet (in bytes).
- IP address of the host from which the response was sent.
- Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
- Time-to-live (ttl) hop-count value of the ping response packet.
- Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
- Number of ping requests (probes) sent to the host.
- Number of ping responses received from the host.
- Packet loss percentage.
- Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

- [Loading a Previous Configuration File on page 7209](#)
- [Reverting to the Default Factory Configuration on page 7210](#)
- [Reverting to the Rescue Configuration on page 7211](#)
- [Cleaning Up the System File Storage Space on page 7211](#)

### Loading a Previous Configuration File

You can use the **rollback** *<number>* command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

#### Syntax

**rollback** *<number>*

#### Options

- **none**— Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

**Related  
Documentation**

- [Configuration File Terms on page 11](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

**Related  
Documentation**

- [Understanding Configuration Files on page 1242](#)
- [Loading a Previous Configuration File on page 1252](#)
- [Reverting to the Rescue Configuration on page 189](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```

2. Commit your changes.

```
[edit]
user@switch# commit filename
```

### Related Documentation

## Cleaning Up the System File Storage Space

**Problem**    **Description:** The system file storage space on the switch is full. Rebooting the switch does not solve the problem.

The following error message is displayed during a typical operation on the switch after the file storage space is full.

```
user@switch% cli
user@switch> configure
/var: write failed, filesystem is full
```

**Solution**    Clean up the file storage on the switch by deleting system files.

1. Request to delete system files on the switch.

```
user@switch> request system storage cleanup
```

The list of files to be deleted is displayed.

List of files to delete:

	Size	Date	Name
	11B	Jul 26 20:55	/var/jail/tmp/alarmd.ts
	124B	Aug 4 18:05	/var/log/default-log-messages.0.gz
	1301B	Jul 26 20:42	/var/log/install.0.gz
	387B	Jun 3 14:37	/var/log/install.1.gz
	4920B	Aug 4 18:05	/var/log/messages.0.gz
	20.0K	Jul 26 21:00	/var/log/messages.1.gz
	16.3K	Jun 25 13:45	/var/log/messages.2.gz
	804B	Aug 4 18:05	/var/log/security.0.gz
	16.8K	Aug 3 11:15	/var/log/security.1.gz

```
487B Aug  4 18:04 /var/log/wtmp.0.gz
855B Jul 29 22:54 /var/log/wtmp.1.gz
920B Jun 30 16:32 /var/log/wtmp.2.gz
94B Jun  3 14:36 /var/log/wtmp.3.gz
353.2K Jun  3 14:37 /var/sw/pkg/jloader-qfx-11.2I20110303_1117_dc-builder.tgz

124.0K Jun  3 14:30 /var/tmp/gres-tp/env.dat
0B Apr 14 16:20 /var/tmp/gres-tp/lock
0B Apr 14 17:37 /var/tmp/if-rtbdb/env.lock
12.0K Jul 26 20:55 /var/tmp/if-rtbdb/env.mem
2688.0K Jul 26 20:55 /var/tmp/if-rtbdb/shm_usr1.mem
132.0K Jul 26 20:55 /var/tmp/if-rtbdb/shm_usr2.mem
2048.0K Jul 26 20:55 /var/tmp/if-rtbdb/trace.mem
155B Jul 26 20:55 /var/tmp/krt_gencfg_filter.txt
0B Jul 26 20:55 /var/tmp/rtbdb/if-rtbdb
1400.6K Aug  3 10:13 /var/tmp/sfid.core.0.gz
1398.9K Aug  3 17:01 /var/tmp/sfid.core.1.gz
Delete these files ? [yes,no] (no)
```

2. Enter **yes** to delete the files.

3. Reboot the switch.

**BEST PRACTICE:** We recommend that you regularly request a system file storage cleanup to optimize the performance of the switch.

## Ethernet Switching

---

- [Troubleshooting Ethernet Switching on page 7212](#)
- [Troubleshooting Layer 2 Protocol Tunneling on page 7213](#)
- [Troubleshooting Private VLANs on page 7214](#)
- [Troubleshooting Q-in-Q and VLAN Translation Configuration on page 7217](#)

## Troubleshooting Ethernet Switching

**Problem**    **Description:** Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table.

Sometimes silent devices, such as syslog servers or SNMP trap receivers that receive UDP traffic but do not return acknowledgment (ACK) messages to the traffic source, fail to send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by

issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

**Solution** Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. The range of the ARP aging timer is from 1 through 240 minutes.)

```
[edit system arp]
user@switch# set aging-timer 3
```

2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)

```
[edit vlans]
user@switch# set vlans sales mac-table-aging-time 180
```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP message, thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table.

- [arp](#)
- [mac-table-aging-time on page 1794](#)

## Troubleshooting Layer 2 Protocol Tunneling

- [Drop Threshold Statistics Might Be Incorrect on page 7213](#)
- [Egress Filtering of L2PT Traffic Not Supported on page 7213](#)

### Drop Threshold Statistics Might Be Incorrect

**Problem** **Description:** L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets will not be reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit are not reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

**Solution** This is expected behavior.

### Egress Filtering of L2PT Traffic Not Supported

**Problem** **Description:** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a

firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

**Solution** This is expected behavior.

**Related Documentation**

- [Understanding Layer 2 Protocol Tunneling](#)
- [Configuring Layer 2 Protocol Tunneling](#)

## Troubleshooting Private VLANs

Use the following information to troubleshoot a private VLAN configuration.

- [Limitations of Private VLANs on page 7214](#)
- [Forwarding with Private VLANs on page 7214](#)
- [Egress Firewall Filters with Private VLANs on page 7215](#)
- [Egress Port Mirroring with Private VLANs on page 7216](#)

### Limitations of Private VLANs

---

The following constraints apply to private VLAN configurations:

- IGMP snooping is not supported with private VLANs.
- Routed VLAN interfaces are not supported on private VLANs
- Routing between secondary VLANs in the same primary VLAN is not supported.

### Forwarding with Private VLANs

---

**Problem Description:**

- When isolated VLAN or community VLAN tagged traffic is received on a PVLAN trunk port, MAC addresses are learned from the primary VLAN. This means that output from the [show ethernet-switching table](#) command shows that MAC addresses are learned from the primary VLAN and replicated to secondary VLANs. This behavior has no effect on forwarding decisions.
- If a packet with a secondary VLAN tag is received on a promiscuous port, it is accepted and forwarded.
- If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.
  - The packet has a community VLAN tag.
  - The packet is destined to a unicast MAC address or multicast group MAC address that was learned on an isolated VLAN.
- If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.

- The packet has an isolated VLAN tag.
- The packet is destined to a unicast MAC address or multicast group MAC address that was learned on a community VLAN.
- If a packet with a primary VLAN tag is received by a secondary (isolated or community) VLAN port, the secondary port forwards the packet.
- If you configure a community VLAN on one device and configure another community VLAN on a second device and both community VLANs use the same VLAN ID, traffic for one of the VLANs can be forwarded to the other VLAN. For example, assume the following configuration:
  - Community VLAN comm1 on switch 1 has VLAN ID 50 and is a member of primary VLAN pvlan100.
  - Community VLAN comm2 on switch 2 also has VLAN ID 50 and is a member of primary VLAN pvlan200.
  - Primary VLAN pvlan100 exists on both switches.

If traffic for comm1 is sent from switch 1 to switch 2, it will be sent to the ports participating in comm2. (The traffic will also be forwarded to the ports in comm1, as you would expect.)

**Solution** These are expected behaviors.

### Egress Firewall Filters with Private VLANs

**Problem Description:** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port

- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

**Solution** These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

---

#### Egress Port Mirroring with Private VLANs

---

**Problem** **Description:** If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.
- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

**Solution** This is expected behavior.

## Troubleshooting Q-in-Q and VLAN Translation Configuration

- [Firewall Filter Match Condition Not Working with Q-in-Q Tunneling on page 7217](#)
- [Egress Port Mirroring with VLAN Translation on page 7217](#)

### Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

**Problem** **Description:** If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

**Solution** This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statement at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same EtherType.

### Egress Port Mirroring with VLAN Translation

**Problem** **Description:** If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

**Solution** This is expected behavior.

- Related Documentation**
- [Understanding Q-in-Q Tunneling and VLAN Translation](#)
  - [Example: Setting Up Q-in-Q Tunneling](#)

## Hardware

- [Troubleshooting QFX3100 Director Device Isolation on page 7218](#)

## Troubleshooting QFX3100 Director Device Isolation

**Problem**    **Description:** Both connections between the QFX3100 Director devices are broken so that one of the Director devices in a Director group becomes isolated from the group.

The redundant patch cables interconnecting the Director devices are critical links required for the operation of the Director group. The two inter-Director device links must remain connected when the Director devices are online. After the Director devices are installed and the Director group is active, if a single inter-Director device link loses and regains its connection, the operation of the Director group remains intact. However, the loss of both inter-Director device links causes one Director device to isolate itself from the Director group.

**WARNING:** Do not reconnect the inter-Director patch cables before properly restarting the isolated Director device. Restarting the active Director device instead of the isolated Director device can result in both Director devices rebooting, with a subsequent data loss.

**Environment:** This problem occurs between the two QFX3100 Director devices found in QFabric systems.

**Symptoms:** Symptoms of this problem include an unscheduled rebooting of one of the Director devices.

---

### Resolution    *Determine Which Director Device Is Isolated*

Before restoring the inter-Director device links, determine which one of the Director devices is in isolation.

To locate an isolated Director device, use one of the following methods:

- Review logs or management tools for standard SNMP traps issued from the Director group before the Director device became isolated.
  - If eth-2/6 links are down, the Director group cannot communicate. Normally, one of the devices reboots.
  - If both eth-2/6 and eth-7/8/9 links are down, the Director device is isolated from the control plane and is not providing fabric services.
  - Issue **show fabric session-host**.
- Use the CLI to determine the serial numbers of the active Director device.
  - Issue the **show fabric session-host** command.

```
root@qfabric>show fabric session-host
Identifier: 0281042010000013
```

- Issue the **show fabric administration inventory director-group status | grep “dg0|dg1”** command.

```
root@qfabrid> show fabric administration inventory director-group status | grep
“dg0|dg1”
```

```
dg0 online master 10.94.214.80 0% 13597976k 4 4 days, 22:36 hrs
dg1 online master 10.94.214.81 0% 18677380k 3 4 days, 22:25 hrs
dg0 0281042010000013 online master
dg1 0281042010000018 online backup
```

When the Director devices cannot communicate, the **show fabric administration inventory director-group** command only displays the Director device that is online.

### *Power Off the Isolated Director Device and Restore the Inter-Director Device Links*

**CAUTION:** Be sure you know which Director device is active and which is isolated. If you power off the active Director device, both Director devices reboot and cause potential data loss on the system.

To restore communication within the Director group:

1. Power off the isolated Director device.
2. Restore the inter-Director device links (port 3 to port 3) by firmly inserting the redundant patch cables.
3. Power on the previously isolated Director device. The Director device reboots.

#### Related Documentation

## High Availability

- [Troubleshooting VRRP on page 7219](#)

## Troubleshooting VRRP

**Problem** **Description:** If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).

**Solution** Configure a failover delay so that the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.

**Related Documentation**

- [failover-delay on page 2324](#)

## Interfaces

---

- [Troubleshooting an Aggregated Ethernet Interface on page 7220](#)
- [Troubleshooting Network Interfaces on page 7220](#)
- [Troubleshooting Multichassis Link Aggregation on page 7221](#)

### Troubleshooting an Aggregated Ethernet Interface

**Problem**     **Description:** The **show interfaces terse** command shows that the LAG is down.

**Solution**     Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

**Related Documentation**

- [Verifying the Status of a LAG Interface on page 2750](#)
- [Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch on page 2462](#)

### Troubleshooting Network Interfaces

**The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down**

---

**Problem**     **Description:** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

**Symptoms:** When you check the status with the CLI command **show interfaces interface-name**, the disabled port is not listed.

**Cause**     By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

**Solution**     Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

## Troubleshooting Multichassis Link Aggregation

Use the following information to troubleshoot multichassis link aggregation configuration.

- [Flooding of Upstream Traffic on page 7226](#)

### MAC Addresses Learned on MC-AE Interfaces Are Not Removed from the MAC Address Table

**Problem Description:** When both of the multichassis aggregated Ethernet (MC-AE) interfaces on both connected multichassis link aggregation group (MC-LAG) peers are down, the MAC addresses learned on the MC-AE interfaces are not removed from the MAC address table. For example, if you disable the MC-AE interface (ae0) on both MC-LAG peers by issuing the **set interfaces ae0 disable** command and commit the configuration, the MAC table still shows the MAC addresses as being learned on the MC-AE interfaces of both MC-LAG peers:

```
user@switchA> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
v10       *                Flood     - All-members
v10       00:10:94:00:00:01 Learn(L)    3:55 ae0.0 (MCAE)
```

v10	00:10:94:00:00:02	Learn(R)	0 xe-0/0/9.0
v20	*	Flood	- All-members
v30	*	Flood	- All-members
v30	84:18:88:de:b1:2e	Static	- Router

user@switchB> show ethernet-switching table

Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries

VLAN	MAC address	Type	Age	Interfaces
v10	*	Flood		- All-members
v10	00:10:94:00:00:01	Learn(R)	0	ae0.0 (MCAE)
v10	00:10:94:00:00:02	Learn	40	xe-0/0/10.0
v20	*	Flood		- All-members
v30	*	Flood		- All-members
v30	84:18:88:df:83:0a	Static		- Router

**Solution** This is expected behavior.

---

#### MC-LAG Peer Does Not Go into Standby Mode

**Problem** **Description:** A multichassis link aggregation group (MC-LAG) peer does not go into standby mode if the MC-LAG peer IP address specified in the Interchassis Control Protocol (ICCP) configuration and the IP address specified in the multichassis protection configuration are different.

**Solution** To prevent failure to enter standby mode, make sure the peer IP address in the ICCP configurations and the IP address in multichassis protection configurations are the same.

---

#### Secondary MC-LAG Peer with Status Control Set to Standby Becomes Inactive

**Problem** **Description:** When the interchassis control link-protection link (ICL-PL) and multichassis aggregated Ethernet (MC-AE) interfaces go down on the primary multichassis link aggregation group (MC-LAG) peer, the secondary MC-LAG peer's MC-AE interfaces with status control set to standby become inactive instead of active.

**Solution** This is expected behavior.

---

#### Redirect Filters Take Priority over User-Defined Filters

**Problem** **Description:** Multichassis link aggregation group (MC-LAG) implicit failover redirection filters take precedence over user-configured explicit filters. This is expected behavior.

**Solution** This is expected behavior.

### Operational Command Output Is Wrong

**Problem Description:** After you deactivate the Interchassis Control Protocol (ICCP), the **show iccp** operational command output still shows registered client daemons, such as mcsnoopd, lacpd, and eswd.

For example:

```
user@switch> show iccp
Client Application: MCSNOOPD
Redundancy Group IDs Joined: None
```

```
Client Application: lacpd
Redundancy Group IDs Joined: 1
```

```
Client Application: eswd
Redundancy Group IDs Joined: 1
```

The **show iccp** command output always shows registered modules regardless of whether or not ICCP peers are configured.

**Solution** This is expected behavior.

### ICCP Connection Might Take Up to 60 Seconds to Become Active

**Problem Description:** When the Interchassis Control Protocol (ICCP) configuration and the routed VLAN interface (RVI) configuration are committed together, the ICCP connection might take up to 60 seconds to become active.

**Solution** This is expected behavior.

### MAC Address Age Learned on an MC-AE Interface Is Reset to Zero

**Problem Description:** When you activate and then deactivate an interchassis control link-protection link (ICL-PL), the MAC address age learned on the multichassis aggregated Ethernet (MC-AE) interface is reset to zero. The next-hop interface changes trigger MAC address updates in the hardware, which then triggers aging updates in the Packet Forwarding Engine (PFE). The result is that the MAC address age is updated to zero.

For example, the ICL-PL has been deactivated, and the **show ethernet-switching table** command output shows that the MAC addresses have an age of 0.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 2 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
v100      *                Flood     - All-members
v100      00:10:00:00:00:01 Learn(L)    0 ae0.0 (MCAE)
v100      00:10:00:00:00:02 Learn(L)    0 ae0.0 (MCAE)
```

**Solution** This is expected behavior.

### MAC Address Is Not Learned Remotely in a Default VLAN

**Problem**    **Description:** If a multichassis link aggregation group (MC-LAG) peer learns a MAC address in the default VLAN, the Interchassis Control Protocol (ICCP) does not synchronize the MAC address with the MAC address of the other MC-LAG peer.

**Solution**    This is expected behavior.

### Snooping Entries Learned on MC-AE Interfaces Are Not Removed

**Problem**    **Description:** When multichassis aggregated Ethernet (MC-AE) interfaces are configured on a VLAN that is enabled for multicast snooping, the membership entries learned on the MC-AE interfaces on the VLAN are not cleared when the MC-AE interfaces go down. This is done to speed up convergence time when the interfaces come up, or come up and go down.

**Solution**    This is expected behavior.

### ICCP Does Not Come Up After You Add or Delete an Authentication Key

**Problem**    **Description:** The Interchassis Control Protocol (ICCP) connection is not established when you add an authentication key and then delete it only at the global ICCP level. However, authentication works correctly at the ICCP peer level.

**Solution**    Delete the ICCP configuration , and then add the ICCP configuration.

### Local Status Is Standby When It Should Be Active

**Problem**    **Description:** If the multichassis aggregated Ethernet (MC-AE) interface is down when the state machine is in a synchronized state, the multichassis link aggregation group (MC-LAG) peer local status is standby. If the MC-AE interface goes down after the state machine is in an active state, then the local status remains active, and the local state indicates that the interface is down.

**Solution**    This is expected behavior.

### Packets Loop on the Server When ICCP Fails

**Problem**    **Description:** When you enable backup liveness detection for a multichassis link aggregation group (MC-LAG), and the backup liveness detection packets are lost because of a temporary failure on the MC-LAG, then both of the peers in the MC-LAG remain active. If this happens, both of the MC-LAG peers send packets to the connected server.

**Solution**    This is expected behavior.

### Both MC-LAG Peers Use the Default System ID After a Reboot or an ICCP Configuration Change

---

**Problem**    **Description:** After a reboot or after a new Interchassis Control Protocol (ICCP) configuration has been committed, and the ICCP connection does not become active, the Link Aggregation Control Protocol (LACP) messages transmitted over the multichassis aggregated Ethernet (MC-AE) interfaces use the default system ID. The configured system ID is used instead of the default system ID only after the MC-LAG peers synchronize with each other.

**Solution**    This is expected behavior.

### No Commit Checks Are Done for ICL-PL Interfaces

---

**Problem**    **Description:** There are no commit checks on the interface being configured as an interchassis control link-protection link (ICL-PL), so you must provide a valid interface name for the ICL-PL.

**Solution**    This is expected behavior.

### Double Failover Scenario

---

**Problem**    **Description:** If the following events happen in this exact order—the Interchassis Control Protocol (ICCP) goes down, and the multichassis aggregated Ethernet (MC-AE) interface on the multichassis link aggregation group (MC-LAG) peer in active mode goes down—a double failover occurs. In this scenario, the MC-LAG peer in standby mode does not detect what happens on the active MC-LAG peer. The MC-LAG peer in standby mode operates as if the MC-AE interface on the MC-LAG in active mode were up and blocks the interchassis control protocol-protection link (ICL-PL) traffic. The ICL-PL traffic is not forwarded.

**Solution**    This is expected behavior.

### Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up

---

**Problem**    **Description:** When the interchassis control link-protection link (ICL-PL) goes down and up, multicast traffic is flooded to all of the interfaces in the VLAN. The Packet Forwarding Engine (PFE) flag `Ip4McastFloodMode` for the VLAN is changed to `MCAST_FLOOD_ALL`. This problem only occurs when a multichassis link aggregation group (MC-LAG) is configured for Layer 2.

**Solution**    This is expected behavior.

### Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer

---

**Problem** **Description:** When the Interchassis Control Protocol (ICCP) is down, the status of a remote MC-LAG peer is unknown. Even if the MC-LAG peer is configured as standby, the traffic is not redirected to this peer because it is assumed that this peer is down.

**Solution** This is expected behavior.

### AE Interfaces Go Down

---

**Problem** **Description:** When a multichassis aggregated Ethernet (MC-AE) interface is converted to an aggregated Ethernet (AE) interface, it retains some MC-AE properties. For example, the AE interface might retain the administrative key of the MC-AE. When this happens, the AE interface goes down.

**Solution** Restart the Link Aggregation Control Protocol (LACP) on the multichassis link aggregation group (MC-LAG) peer hosting the AE interface to bring up the AE interface. Restarting LACP removes the MC-AE properties of the AE interface.

### Flooding of Upstream Traffic

---

**Problem** **Description:** When MAC synchronization is enabled, the multichassis link aggregation group (MC-LAG) peer can resolve Address Resolution Protocol (ARP) entries for the MC-LAG routed VLAN interface (RVI) with either of the MC-LAG peer MAC addresses. If the downstream traffic is sent with one MAC address (MAC1) but the peer has resolved the MAC address with a different MAC address (MAC2), the MAC2 address might not be learned by any of the access layer switches. Flooding of the upstream traffic for the MAC2 address might then occur.

**Solution** Make sure that downstream traffic is sent from the MC-LAG peers periodically to prevent the MAC addresses from aging out.

- [Performing a QFabric System Recovery Installation on the Director Group on page 7233](#)
- [Troubleshooting Network Interfaces on page 7240](#)
- [Troubleshooting an Aggregated Ethernet Interface on page 7240](#)

## Rebooting and Halting a Device

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
<[Enter]>      Execute this command
all-members    Reboot all virtual chassis members
at             Time at which to perform the operation
both-routing-engines  Reboot both the Routing Engines
fast-boot      Enable fast reboot
in            Number of minutes to delay before operation
local         Reboot local virtual chassis member
member        Reboot specific virtual chassis member (0..9)
message       Message to display to all users
other-routing-engine  Reboot the other Routing Engine
|            Pipe through a command
{master:0}
```

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

**NOTE:** Not all options shown in the preceding command output are available on all QFX Series and EX4600 devices. For example, the **fast-boot** option is available only on QFX5100. See the documentation for the [request system reboot](#) command for details about options.

Similarly, to halt the switch, issue the **request system halt** command.

**CAUTION:** Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
<[Enter]>      Execute this command
all-members    Halt all virtual chassis members
at             Time at which to perform the operation
backup-routing-engine  Halt backup Routing Engine
both-routing-engines  Halt both Routing Engines
in            Number of minutes to delay before operation
local         Halt local virtual chassis member
member        Halt specific virtual chassis member (0..9)
message       Message to display to all users
other-routing-engine  Halt other Routing Engine
|            Pipe through a command
```

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the `member` option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

**Related Documentation**

- [clear system reboot on page 355](#)
- [request system reboot on page 415](#)
- [request system halt on page 400](#)
- [request system power-off on page 410](#)

## Recovering from a Failed Software Installation

**Problem**    **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution**    If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

3. Enter the following command:

```
loader> install [--format] [--external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).

- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None

- Stop bits: 1
  - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.  
  
The terminal emulation screen on your management device displays the device's boot sequence.
  10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:  
  

```
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
```
  11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  
  

```
ok boot -s
```
  12. At the following prompt, enter **recovery** to start the root password recovery procedure.  
  

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN  
for /bin/sh: recovery
```
  13. Enter configuration mode in the CLI.
  14. Set the root password. For example:  
  

```
user@switch# set system root-authentication plain-text-password
```
  15. At the following prompt, enter the new root password. For example:  
  

```
New password: juniper1  
Retype new password:
```
  16. At the second prompt, reenter the new root password.
  17. After you have finished configuring the password, commit the configuration.  
  

```
root@host# commit  
commit complete
```
  18. Exit configuration mode in the CLI.
  19. Exit operational mode in the CLI.
  20. At the prompt, enter **y** to reboot the device.  
  

```
Reboot the system? [y/n] y
```

**Related Documentation** • [Configuring the Root Password on page 1354](#)

## Creating an Emergency Boot Device

If Junos OS on the device is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

**NOTE:** In the following procedure, we assume that you are creating the emergency boot device on a QFX device or EX4600 device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device:

1. Use FTP to copy the installation media image into the `/var/tmp` directory on the device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the `su` command:

```
% su
Password: password
```

**NOTE:** The password is the root password for the device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the QFX3500, QFX3600, and QFX3600-I devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Enter the following command on the QFX5100 and EX4600 devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

## Performing a Recovery Installation

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device” on page 176](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

**WARNING:** The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

**NOTE:** Do not power off the device if it is already on.

```
[edit system]
user@device> request system reboot
```

If you do not have access to the CLI, power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.
You can load Junos from this media onto an internal drive.
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

If you do not want to format the internal flash storage, type **y**.

The following messages are displayed:

```
Installing packages from external USB drive da1
Packages will be installed to da0, media size: 8G
```

```
Processing format options
Fri September  4 01:18:44 UTC 2012
```

```
-- IMPORTANT INFORMATION --
Installer has detected settings to format system boot media.
This operation will erase all data from your system.
```

```
Formatting installation disk .. this will take a while, please wait
Disabling platform watchdog - threshold 12 mins
```

```
Determining installation slice
Fri September  4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September  4 01:19:00 UTC 2012***
Installation successful..
Please select one of the following options:
Reboot to installed Junos after removing install media (default) ... 1
Reboot to installed Junos by disabling install media ..... 2
Exit to installer debug shell ..... 3
Install Junos to alternate slice ..... 4
Your choice: 4
NOTE: System installer will now install Junos to alternate slice
Do not power off or remove the external installer media or
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.
7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

## Performing a QFabric System Recovery Installation on the Director Group

If the software on your QFabric system is damaged in some way that prevents the software from loading correctly, or you need to upgrade the software on your QFabric system, you may need to perform a recovery installation on the Director group.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.

You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.

2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

```
user@switch> request system software configuration-backup path
```

**NOTE:** To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 7234
- Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 7236

#### (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

---

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the *Switchingbox*, click *Junos OS Platforms*.
4. In the *QFX Series* section, click the name of the platform for which you want to download software.

5. Click the *Software* tab and select the release number from the *Release* drop-down list.
6. Select the complete install media you want to download in the *QFabric System Install Media* section.  
A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Log in and save the install media file to your UNIX workstation.
10. Use FTP to access the UNIX workstation where the install media resides.  
`ftp ftp://hostname/pathname install-media-qfabric-<version>.img.tgz`
11. When prompted, enter your username and password.
12. Make sure you are in binary mode by entering **binary** at the prompt.  
`binary`
13. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.  
`get install-media-qfabric-<version>.img.tgz`
14. Close the FTP session:  
`bye`
15. Untar the *install-media-qfabric-<version>.img.tgz* file on your UNIX workstation.  
`tar -xvzf install-media-qfabric-11.3X30.6.img.tgz`
16. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.
17. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:  
`dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k`  
250880+0 records in  
250880+0 records out  
4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s
18. Perform the steps in [“Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software” on page 7236](#) to continue with the recovery installation.

## Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

---

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

**NOTE:** Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
  - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
  - If you do not have access to the default partition, power cycle the Director device.

The following menu appears on the Director device console when the Director device boots up:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

3. Type **install** and then press **Enter** to install the software on the Director device.

Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

4. Press **Enter**.

The Director device reboots from the local disk on which the software was just installed.

5. Log in as root on the Director device.

The following menu appears on the Director device console:

```
Before you can access the QFabric system, you must complete the initial setup
of the Director group by using the steps that follow.
If the initial setup procedure does not complete successfully, log out of the
Director device and then log back in to restart
this setup menu.
```

```
Continue?[y/n]
```

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.

7. Issue the **ls /mnt** command to list the *mount* directory.

```
root@dg0 ~]# ls /mnt
```

8. Issue the **mkdir** command to create a directory within the mount directory.

```
root@dg0 ~]# mkdir /mnt/myusb
```

9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

```
root@dg0 ~]# mount /dev/sdb2 /mnt/myusb/
```

10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

```
root@dg0 ~]# ls -la /mnt/myusb/
total 1770884
drwxr-xr-x 2 root root      4096 Sep  7 05:16 .
drwxr-xr-x 3 root root      4096 Sep  7 10:15 ..
-rw-r--r-- 1 root root    4249 Sep  7 03:52 mybackup-20110907
```

11. Exit the Director device and log back in as root on the Director device.

The following menu appears:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.

If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

```
Continue?[y/n] y
Initial Configuration
```

You may enter the configuration manually or restore from a backup.

```
Specify a backup file? [y/n] : y
Please specify the full path of the configuration backup file. :
/mnt/myusb/mybackup-20110907
```

12. Enter **y** to continue.

13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

```
/mnt/myusb/mybackup-20110907
```

The following messages appear:

```
Saving temporary configuration...
Configuring peer...
connect error for 1.1.1.2:9001
Configuring local interfaces...
Configuring interface eth0 with [10.49.213.163/24:10.49.213.254]

Configuring QFabric address [10.49.213.50]
Reconfiguring QFabric software static configuration
Applying the new Director Device password
Applying the QFabric component password
```

```
First install initial configuration, generating and sharing SSH keys.  
First install initial configuration, generating SSH keys.  
connect error for 1.1.1.2:9001  
Shared SSH keys.  
Configuration complete. Director Group services will auto start within 30  
seconds.
```

The Director device reboots from the local disk on which the software was just installed.  
Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.

15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

```
user@switch> request system reboot node-group all
```

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

```
user@switch> request system reboot fabric
```

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```
user@switch> show version component all

## Troubleshooting Network Interfaces

### The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

---

**Problem**    **Description:** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

**Symptoms:** When you check the status with the CLI command **show interfaces *interface-name***, the disabled port is not listed.

**Cause**    By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

**Solution**    Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

## Troubleshooting an Aggregated Ethernet Interface

**Problem**    **Description:** The **show interfaces terse** command shows that the LAG is down.

**Solution**    Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).

- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

**Related  
Documentation**

## Layer 3 Protocols

- [Troubleshooting Virtual Routing Instances on page 7241](#)

### Troubleshooting Virtual Routing Instances

- [Direct Routes Not Leaked Between Routing Instances on page 7241](#)

#### Direct Routes Not Leaked Between Routing Instances

**Problem** **Description:** Direct routes are not exported (leaked) between virtual routing instances. For example, consider the following scenario:

- Switch with two virtual routing instances:
  - Routing instance 1 connects to downstream device through interface xe-0/0/1.
  - Routing instance 2 connects to upstream device through interface xe-0/0/2.

If you enable route leaking between the routing instances (by using the **rib-group** statement, for example), the downstream device cannot connect to the upstream device because the switch connects to the upstream device over a direct route and these routes are not leaked between instances.

**NOTE:** You can see a route to the upstream device in the routing table of the downstream device, but this route is not functional.

Indirect routes *are* leaked between routing instances, so the downstream device can connect to any upstream devices that are connected to the switch over indirect routes.

**Solution** This is expected behavior.

## MPLS

---

- [Issues and Limitations in Operation of MPLS Features on the QFX Series and on the EX4600 Switch on page 7242](#)

### Issues and Limitations in Operation of MPLS Features on the QFX Series and on the EX4600 Switch

The following issues exist in the operation of MPLS features on QFX Series devices and on the EX4600 switch. In each case, the described behavior is the expected behavior.

- Configuring an MPLS firewall filter on a switch that is deployed as an egress provider edge (PE) switch has no effect.
- Configuring the **revert-timer** statement at the **[edit protocols mpls]** hierarchy level has no effect.
- If you configure the BGP labeled unicast address family (using the **labeled-unicast** statement at the **[edit protocols bgp family inet]** hierarchy level) on a QFX switch or on an EX4600 switch deployed as a route reflector for BGP labeled routes, path selection will occur at the route reflector, and a single best path will be advertised. This will result in loss of BGP multipath information.

### Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

[Table 663 on page 6893](#) provides a list of some of the troubleshooting resources.

Table 700: Troubleshooting Resources on the QFX Series

Troubleshooting Resource	Description	Documentation
Chassis alarms	Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch.	<a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 7192</a>
Chassis Status LEDs and Fan Tray LEDs	A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.	<i>Chassis Status LEDs on a QFX3500 Device</i>
Interface alarms	A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.	<a href="#">“Interface Alarm Messages” on page 7195</a>
System alarms	A predefined alarm is triggered by a missing rescue configuration or problem with the software license.	<a href="#">“Understanding Alarms” on page 7191</a>
System log messages	The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	<ul style="list-style-type: none"> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 6561</a></li> <li>• <a href="#">Junos OS System Log Configuration Statements on page 6616</a></li> </ul>
Junos OS operational mode commands	Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the <b>tracroute monitor</b> command to locate points of failure in a network.	<ul style="list-style-type: none"> <li>• <a href="#">Monitoring System Process Information on page 333</a></li> <li>• <a href="#">Monitoring System Properties on page 334</a></li> <li>• <a href="#">tracroute monitor</a></li> </ul>
Junos OS automation scripts (event scripts)	Event scripts can be used to automate network troubleshooting and management tasks.	<i>Junos OS Automation Library</i>
Junos OS XML operational tags	XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.	<i>Junos XML API Operational Developer Reference</i>
NETCONF XML management protocol	The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b> , <b>set</b> , and <b>commit</b> to perform those operations.	<i>NETCONF XML Management Protocol Developer Guide</i>

Table 700: Troubleshooting Resources on the QFX Series (*continued*)

Troubleshooting Resource	Description	Documentation
SNMP MIBs and traps	MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.	<ul style="list-style-type: none"> <li>• <a href="#">SNMP MIBs Support on page 6530</a></li> <li>• <a href="#">SNMP Traps Support on page 6546</a></li> <li>• <a href="#">Using the Traceroute MIB for SNMP Remote Operations</a></li> </ul>
AI-Scripts and Advanced Insight Manager (AIM)	AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.	<a href="#">Advanced Insight Scripts (AI-Scripts) Release Notes</a>
Junos Space Service Now	This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.	<i>Service Automation</i>
Junos Space Service Insight	This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now.	<i>Service Automation</i>
Juniper Networks Knowledge Base	You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.	<a href="http://kb.juniper.net">http://kb.juniper.net</a>

## Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

[Table 664 on page 6895](#) provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 701: Troubleshooting on the QFX Series

Problem Category	Symptom or Problem	Recommended Action
Switch hardware components	LCD panel shows a chassis alarm count.	See <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 7192.</a>
	Fan tray LED is blinking amber.	See <a href="#">Fan Tray LED on a QFX3500 Device.</a>
	Chassis status LED for the power is blinking amber.	See <a href="#">Chassis Status LEDs on a QFX3500 Device.</a>
	Chassis status LED for the fan (on the management board) is blinking amber.	Replace the management board as soon as possible. See <a href="#">Chassis Status LEDs on a QFX3500 Device.</a>
Port configuration	Cannot configure a port as a Gigabit Ethernet port.	Check whether the port is a valid Gigabit Ethernet port (6 through 41).  See <a href="#">QFX3500 Device Overview.</a>
	Cannot configure a port as a Fibre Channel port.	Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47).  See <a href="#">QFX3500 Device Overview.</a>
	Cannot configure a port as a 10-Gigabit Ethernet port.	If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports.  If the port is a 40-Gbps QSFP+ interface, make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.  See <a href="#">QFX3500 Device Overview.</a>
	Cannot configure a 40-Gbps QSFP+ interface.	The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.  See <a href="#">QFX3500 Device Overview.</a>
External devices (USB devices)	Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state.	Unplug the USB device and reboot the switch.

Table 701: Troubleshooting on the QFX Series (*continued*)

Problem Category	Symptom or Problem	Recommended Action
Initial device configuration	Cannot configure management Ethernet ports.	Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them.  <b>NOTE:</b> The management ports are on the front panel of the QFX3500 switch. They are labeled <b>C0</b> and <b>C1</b> on the front panel. In the CLI they are referred to as <b>me0</b> and <b>me1</b> .  See <a href="#">“Configuring a QFX3500 Device as a Standalone Switch”</a> on page 175.
	Failed software upgrade.	See <a href="#">“Recovering from a Failed Software Installation”</a> on page 121.
Software upgrade and configuration	Active partition becomes inactive after upgrade.	
	Problem with the active configuration file.	See the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Loading a Previous Configuration File</a> on page 1252</li> <li>• <a href="#">Reverting to the Default Factory Configuration</a> on page 188</li> <li>• <a href="#">Reverting to the Rescue Configuration</a> on page 189</li> <li>• <a href="#">Performing a Recovery Installation</a> on page 116</li> </ul>
	Root password is lost or forgotten.	Recover the root password. See <a href="#">“Recovering the Root Password”</a> on page 1233.
Network interfaces	An aggregated Ethernet interface is down.	See <a href="#">“Troubleshooting an Aggregated Ethernet Interface”</a> on page 1234.
	Interface on built-in network port is down.	See <a href="#">“Troubleshooting Network Interfaces”</a> on page 1234.
	Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.	
Ethernet switching	A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch.	See <a href="#">“Troubleshooting Ethernet Switching”</a> on page 1895.
Firewall filter	Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.	See <a href="#">“Troubleshooting Firewall Filter Configuration”</a> on page 5411.

## QFX5100 Switch with Automation Enhancements Frequently Asked Questions

This FAQ addresses questions regarding using QFX5100 switches with automation enhancements, which were introduced at Junos OS Release 13.2X51-D15.

This FAQ covers the following questions:

- [Who Should You Contact If You Have Problems with Loading, Installing or Updating Libraries? on page 7247](#)
- [Who Should You Contact If You Have Problems with Puppet for Junos OS? on page 7247](#)
- [Who Should You Contact If You Have Problems with Chef for Junos OS? on page 7247](#)
- [What Happens to the User Partition If You Downgrade a QFX5100 Switch That Is Running the jinstall-qfx-5-flex-x.tgz Software Bundle to a QFX Switch That Is Running a Different QFX5100 Software Bundle? on page 7247](#)
- [How Do You Recover Junos OS Binaries That You Have Deleted? on page 7247](#)
- [How Do You Recover from a System Crash? on page 7247](#)
- [How Can You Verify That a QFX5100 Switch Is Running a jinstall-qfx-5-flex-x.tgz Software Bundle? on page 7248](#)

### Who Should You Contact If You Have Problems with Loading, Installing or Updating Libraries?

Contact Customer Support at <http://www.juniper.net/support>.

### Who Should You Contact If You Have Problems with Puppet for Junos OS?

You can obtain support for Puppet for Junos OS through the J-Net Forum for Puppet at [http://forums.juniper.net/t5/Puppet-for-JunOS/bd-p/puppet\\_junos](http://forums.juniper.net/t5/Puppet-for-JunOS/bd-p/puppet_junos).

### Who Should You Contact If You Have Problems with Chef for Junos OS?

You can obtain support for Chef for Junos OS through the J-Net Forum for Chef at [http://forums.juniper.net/t5/Chef-for-JunOS/bd-p/chef\\_junos](http://forums.juniper.net/t5/Chef-for-JunOS/bd-p/chef_junos).

### What Happens to the User Partition If You Downgrade a QFX5100 Switch That Is Running the jinstall-qfx-5-flex-x.tgz Software Bundle to a QFX Switch That Is Running a Different QFX5100 Software Bundle?

In this case, the user partition remains intact.

**NOTE:** If you make changes to the user partition while performing a unified in-service software upgrade (unified ISSU), the changes might be lost.

### How Do You Recover Junos OS Binaries That You Have Deleted?

You must reinstall the software package.

### How Do You Recover from a System Crash?

You must reinstall the software package.

### How Can You Verify That a QFX5100 Switch Is Running a jinstall-qfx-5-flex-x.tgz Software Bundle?

---

You cannot use the **show version** command to verify that a QFX5100 switch is running the jinstall-qfx-5-flex-x.tgz software bundle. However, there are two other ways to verify this.

- Use the **show configuration** command to check that you are running a Layer 3 configuration. See *Installing Junos OS Software with QFX5100 Switch Automation Enhancements*.
- Go to the shell and confirm that you can invoke Python. See “[Invoking the Python Interpreter](#)” on page 6587.

### Recovering from a Failed Software Installation

**Problem**    **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution**    If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

3. Enter the following command:

```
loader> install [- --format] [- --external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.

- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Loading a Previous Configuration File

You can use the **rollback <number>** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

### Syntax

**rollback <number>**

### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

**Related Documentation**

- [Configuration File Terms on page 11](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

### Related Documentation

- [Understanding Configuration Files on page 1242](#)
- [Loading a Previous Configuration File on page 1252](#)
- [Reverting to the Rescue Configuration on page 189](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```
2. Commit your changes.

```
[edit]
user@switch# commit filename
```

### Related Documentation

- [Setting or Deleting the Rescue Configuration on page 1261](#)
- [Reverting to the Default Factory Configuration on page 188](#)
- [Configuration File Terms on page 11](#)

## Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.
Booting [kernel] in 9 seconds...
```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  

```
ok boot -s
```
12. At the following prompt, enter **recovery** to start the root password recovery procedure.  

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery
```
13. Enter configuration mode in the CLI.
14. Set the root password. For example:  

```
user@switch# set system root-authentication plain-text-password
```
15. At the following prompt, enter the new root password. For example:  

```
New password: juniper1
Retype new password:
```
16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.  

```
root@host# commit
commit complete
```
18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the device.  

```
Reboot the system? [y/n] y
```

**Related Documentation** • [Configuring the Root Password on page 1354](#)

## Troubleshooting a Deprecated Network Analytics Configuration

**Problem** **Description:** After a software upgrade to Junos OS Release 13.2X51-D15 from an earlier release, the network analytics configuration is no longer valid and the feature is disabled.

**Symptoms:** The network analytics configuration used in Junos OS Release 13.2X51-D10 has been deprecated in Release 13.2X51-D15. Issuing the **show services analytics** command results in the following output:

```
root@qfx5100# show services analytics

queue-statistics { ## Warning: 'queue-statistics' is deprecated
  interval 1;
}
```

**Cause** Junos OS Release 13.2X51-D15 added enhancements to the network analytics feature, resulting in significant changes in the CLI. The updated **[edit services analytics]** hierarchy level contains some statements that have replaced those that were previously released. As a result, the earlier configuration does not work in the new release.

**Solution** Use the new CLI statements to reconfigure the network analytics feature.

### Troubleshooting Firewall Filter Configuration

Use the following information to troubleshoot your firewall filter configuration.

- [Firewall Filter Configuration Returns a No Space Available in TCAM Message on page 7253](#)
- [Filter Counts Previously Dropped Packet on page 7255](#)
- [Matching Packets Not Counted on page 7255](#)
- [Counter Reset When Editing Filter on page 7256](#)
- [Cannot Include loss-priority and policer Actions in Same Term on page 7256](#)
- [Cannot Egress Filter Certain Traffic Originating on QFX Switch on page 7256](#)
- [Firewall Filter Match Condition Not Working with Q-in-Q Tunneling on page 7257](#)
- [Egress Firewall Filters with Private VLANs on page 7257](#)
- [Egress Filtering of L2PT Traffic Not Supported on page 7258](#)
- [Cannot Drop BGP Packets in Certain Circumstances on page 7258](#)
- [Invalid Statistics for Policer on page 7258](#)
- [Policers can Limit Egress Filters on page 7258](#)

#### Firewall Filter Configuration Returns a No Space Available in TCAM Message

**Problem** **Description:** When a firewall filter configuration exceeds the amount of available Ternary Content Addressable Memory (TCAM) space, the system returns the following **syslogd** message:

```
No space available in tcam.
Rules for filter filter-name will not be installed.
```

A switch returns this message during the commit operation if the firewall filter that has been applied to a port, VLAN, or Layer 3 interface exceeds the amount of space available in the TCAM table. The filter is not applied, but the commit operation for the firewall filter configuration is completed in the CLI module.

**Solution** When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms so that the space requirements for the filter do not exceed the available space in the TCAM table.

You can perform either of the following procedures to correct the problem:

To delete the filter and its binding and apply the new smaller firewall filter to the same binding:

1. Delete the filter and its binding to ports, VLANs, or Layer 3 interfaces. For example:

```
[edit]
user@switch# delete firewall family ethernet-switching filter ingress-vlan-rogue-block
user@switch# delete vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# delete vlans employee-vlan filter input ingress-vlan-rogue-block
```

2. Commit the changes:

```
[edit]
user@switch# commit
```

3. Configure a smaller filter with fewer terms that does not exceed the amount of available TCAM space. For example:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block ...
```

4. Apply (bind) the new firewall filter to a port, VLAN, or Layer 3 interface. For example:

```
[edit]
user@switch# set vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

5. Commit the changes:

```
[edit]
user@switch# commit
```

To apply a new firewall filter and overwrite the existing binding but not delete the original filter:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the binding of the original filter—for example:

```
[edit]
user@switch# set vlans employee-vlan description "smaller filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

Because you can apply no more than one firewall filter per VLAN per direction, the binding of the original firewall filter to the VLAN is overwritten with the new firewall filter **new-ingress-vlan-rogue-block**.

3. Commit the changes:

```
[edit]
user@switch# commit
```

**NOTE:** The original filter is not deleted and is still available in the configuration.

---

### Filter Counts Previously Dropped Packet

- Problem** **Description:** If you configure two or more filters in the same direction for a physical interface and one of the filters includes a counter, the counter will be incorrect if the following circumstances apply:
- You configure the filter that is applied to packets first to discard certain packets. For example, imagine that you have a VLAN filter that accepts packets sent to 10.10.1.0/24 addresses and implicitly discards packets sent to any other addresses. You apply the filter to the **admin** VLAN in the output direction, and interface xe-0/0/1 is a member of that VLAN.
  - You configure a subsequent filter to accept and count packets that are dropped by the first filter. In this example, you have a port filter that accepts and counts packets sent to 192.168.1.0/24 addresses that is also applied to xe-0/0/1 in the output direction.

The egress VLAN filter is applied first and correctly discards packets sent to 192.168.1.0/24 addresses. The egress port filter is applied next and counts the discarded packets as matched packets. The packets are not forwarded, but the counter displayed by the egress port filter is incorrect.

Remember that the order in which filters are applied depends on the direction in which they are applied, as indicated here:

Ingress filters:

1. Port (Layer 2) filter
2. VLAN filter
3. Router (Layer 3) filter

Egress filters:

1. Router (Layer 3) filter
2. VLAN filter
3. Port (Layer 2) filter

**Solution** This is expected behavior.

### Matching Packets Not Counted

**Problem** **Description:** If you configure two egress filters with counters for a physical interface and a packet matches both of the filters, only one of the counters includes that packet. For example:

- You configure an egress port filter with a counter for interface xe-0/0/1.
- You configure an egress VLAN filter with a counter for the **admin** VLAN, and interface xe-0/0/1 is a member of that VLAN.

- A packet matches both filters.

In this case, the packet is counted by only one of the counters even though it matched both filters.

**Solution** This is expected behavior.

---

#### Counter Reset When Editing Filter

**Problem Description:** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

**Solution** This is expected behavior.

---

#### Cannot Include loss-priority and policer Actions in Same Term

**Problem Description:** You cannot include both of the following actions in the same firewall filter term in a QFX Series switch:

- **loss-priority**
- **policer**

If you do so, you see the following error message when you attempt to commit the configuration: "cannot support policer action if loss-priority is configured."

**Solution** This is expected behavior.

---

#### Cannot Egress Filter Certain Traffic Originating on QFX Switch

**Problem Description:** On a QFX Series switch, you cannot filter certain traffic with a firewall filter applied in the output direction if the traffic originates on the QFX switch. This limitation applies to control traffic for protocols such as ICMP (ping), STP, LACP, and so on.

**Solution** This is expected behavior.

### Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

**Problem** **Description:** If you create a firewall filter that includes a match condition of `dot1q-tag` or `dot1q-user-priority` and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

**Solution** This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the `set dot1q-tunneling ethertype 0x8100` statement at the `[edit ethernet-switching-options]` hierarchy level. You must also configure the other end of the link to use the same Ethertype.

### Egress Firewall Filters with Private VLANs

**Problem** **Description:** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).

- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

**Solution** These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

---

#### Egress Filtering of L2PT Traffic Not Supported

---

**Problem** **Description:** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

**Solution** This is expected behavior.

---

#### Cannot Drop BGP Packets in Certain Circumstances

---

**Problem** **Description:** BGP packets with a time-to-live (TTL) value greater than 1 cannot be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface. BGP packets with TTL value of 1 or 0 can be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface.

**Solution** This is expected behavior.

---

#### Invalid Statistics for Policer

---

**Problem** **Description:** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

**Solution** This is expected behavior.

---

#### Policers can Limit Egress Filters

---

**Problem** **Description:** The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional

egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

**Solution** You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

- [Policers Can Limit Egress Filters on page 7262](#)

---

### Incomplete Count of Packet Drops

---

**Problem**    **Description:** Under certain circumstances, Junos OS might display a misleading number of packets dropped by an ingress policer.

If packets are dropped because of ingress admission control, policer statistics might not show the number of packet drops you would expect by calculating the difference between ingress and egress packet counts. This might happen if you apply an ingress policer to multiple interfaces, and the aggregate ingress rate of those interfaces exceeds the line rate of a common egress interface. In this case, packets might be dropped from the ingress buffer. These drops are not included in the count of packets dropped by the policer, which causes policer statistics to underreport the total number of drops.

**Solution**    This is expected behavior.

---

### Counter Reset When Editing Filter

---

**Problem**    **Description:** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

**Solution**    This is expected behavior.

---

### Invalid Statistics for Policer

---

**Problem**    **Description:** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

**Solution**    This is expected behavior.

---

### Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

---

**Problem**    **Description:** If you configure a policer to rate-limit throughput and apply it on egress to multiple interfaces on a QFX3500 switch or Node, the measured aggregate policed rate

might be twice the configured rate, depending on which interfaces you apply the policer to. The doubling of the policed rate occurs if you apply a policer to multiple interfaces and *both* of the following are true:

- There is at least one policed interface in the range xe-0/0/0 to xe-0/0/23 or the range xe-0/1/1 to xe-0/1/7.
- There is at least one policed interface in the range xe-0/0/24 to xe-0/0/47 or the range xe-0/1/8 to xe-0/1/15.

For example, if you configure a policer to rate-limit traffic at 1 Gbps and apply the policer (by using a firewall filter) to xe-0/0/0 and xe-0/0/24 in the output direction, each interface is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps. The same behavior occurs if you apply the policer to xe-0/1/1 and xe-0/0/24—each interface is rate-limited at 1 Gbps.

If you apply the same policer on egress to multiple interfaces in these groups, each *group* is rate-limited at 1 Gbps. For example, if you apply the policer to xe-0/0/0 through xe-0/0/4 (five interfaces) and xe-0/0/24 through xe-0/0/33 (ten interfaces), each group is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps.

Here is another example: If you apply the policer to xe-0/0/0 through xe-0/0/4 and xe-0/1/1 through xe-0/1/5 (a total of ten interfaces), that group is rate-limited at 1 Gbps in aggregate. If you also apply the policer to xe-0/0/24, that one interface is rate-limited at 1 Gbps while the other ten are still rate-limited at 1 Gbps in aggregate.

Interfaces xe-0/1/1 through xe-0/1/15 are physically located on the QSFP+ uplink ports, according to the following scheme:

- xe-0/1/1 through xe-0/1/3 are on Q0.
- xe-0/1/4 through xe-0/1/7 are on Q1.
- xe-0/1/8 through xe-0/1/11 are on Q2.
- xe-0/1/12 through xe-0/1/15 are on Q3.

The doubling of the policed rate occurs only if the policer is applied in the output direction. If you configure a policer as described above but apply it in the input direction, the total allowed throughput for all interfaces is 1 Gbps.

**Solution** This is expected behavior.

### Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

**Problem** **Description:** You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and

reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

**Solution** To prevent this unexpected behavior, use the information about TCAM slices presented in [“Planning the Number of Firewall Filters to Create” on page 5236](#) to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

### **Policers Can Limit Egress Filters**

---

**Problem** **Description:** The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters. Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

**Solution** You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.

- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

- [Egress Port Mirroring with Private VLANs on page 7265](#)

#### Port Mirroring Constraints and Limitations

- [Local and Remote Port Mirroring on page 7263](#)
- [Remote Port Mirroring Only on page 7265](#)

#### *Local and Remote Port Mirroring*

The following constraints and limitations apply to local and remote port mirroring:

- You can create a total of four port-mirroring configurations.
- You can create a total of four port-mirroring configurations on each Node group in a QFabric system, subject to the following constraints:
  - As many as four of the configurations can be for local port mirroring.
  - As many as three of the configurations can be for remote port mirroring.
- Regardless of whether you are configuring a standalone switch or a Node group, the following limits apply:
  - There can be no more than two configurations that mirror ingress traffic. (If you configure a firewall filter to send traffic to a port mirror—that is, you use the **analyzer** action modifier in a filter term—this counts as an ingress mirroring configuration for switch or Node group on which the filter is applied.)
  - There can be no more than two configurations that mirror egress traffic.

**NOTE:** On QFabric systems, there is no system-wide limit on the total number of mirror sessions.

- You can configure no more than one type of output in one port-mirroring configuration. That is, you can use no more than one of the following to complete a **set analyzer name output** statement:

- **interface**
- **ip-address**
- **vlan**
- If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs on a standalone switch or QFabric system. If you do so, some VLAN packets might contain incorrect VLAN IDs. This applies to any VLAN packets—not only the mirrored copies.
- The **ratio** and **loss-priority** options are not supported.
- Packets with physical layer errors are filtered out and are not sent to the output port or VLAN.
- If you use sFlow monitoring to sample traffic, it does not sample the mirror copies when they exit from the output interface.
- You cannot mirror packets exiting or entering the following ports:
  - Dedicated Virtual Chassis interfaces
  - Management interfaces (me0 or vme0)
  - Fibre Channel interfaces
  - Routed VLAN interfaces
- An aggregated Ethernet interface cannot be an output interface if the input is a VLAN or if traffic is sent to the analyzer by a firewall filter.
- Do not include an 802.1Q subinterface that has a unit number other than 0 in a port mirroring configuration. Port mirroring does not work with subinterfaces if their unit number is not 0. (You configure 802.1Q subinterfaces using the **vlan-tagging** statement.)
- When packet copies are sent out the output interface, they are not modified for any changes that are normally applied on egress, such as CoS rewriting.
- An interface can be the input interface for only one mirroring configuration. Do not use the same interface as the input interface for multiple mirroring configurations.
- CPU-generated packets (such as ARP, ICMP, BPDU, and LACP packets) cannot be mirrored on egress.
- VLAN-based mirroring is not supported for STP traffic.
- (QFabric systems only) If you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on different Node devices, the mirrored copies have incorrect VLAN IDs. This limitation does not apply if you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on the *same* Node device. In this case the mirrored copies have the correct VLAN IDs (as long as you do not configure more than 2000 VLANs on the QFabric system).

**Remote Port Mirroring Only**

The following constraints and limitations apply to remote port mirroring:

- If you configure an output IP address, the address cannot be in the same subnetwork as any of the switch's management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).
- An output VLAN cannot be a private VLAN or VLAN range.
- An output VLAN cannot be shared by multiple **analyzer** statements.
- An output VLAN interface cannot be a member of any other VLAN.
- An output VLAN interface cannot be an aggregated Ethernet interface.
- On the source (monitored) switch, only one interface can be a member of the analyzer VLAN.

**Egress Port Mirroring with VLAN Translation**

**Problem** **Description:** If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

**Solution** This is expected behavior.

**Egress Port Mirroring with Private VLANs**

**Problem** **Description:** If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.
- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

**Solution** This is expected behavior.

- [Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic on page 7273](#)

## Troubleshooting Dropped FCoE Traffic

- Problem** **Description:** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.
- Cause** There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):
1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
  2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
  3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
  4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.

5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

---

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

**Solution** The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

If you explicitly configured a forwarding class for FCoE traffic, ensure that:

- You specified the **no-loss** packet drop attribute in the forwarding class configuration
- The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
- The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority  PFC      MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Disabled
  100      Disabled
  101      Enabled   2500
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  101      5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces interface-name**.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the *scheduler-name*) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the *traffic-control-profile*) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.
7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See “[Example: Configuring CoS PFC for FCoE Traffic](#)” on page 5606 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

## Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth

**Problem**    **Description:** The maximum bandwidth of a queue when measured at the egress port exceeds the maximum bandwidth (shaping rate) configured for the queue.

**Cause**        When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not rate-shape the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its maximum bandwidth calculations.

The measured egress bandwidth can exceed the configured maximum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**Solution** When you calculate the bandwidth requirements for queues on which you expect a significant amount of traffic with small packet sizes, consider the shaping rate as the maximum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined maximum data rate (shaping rate) and the preamble and IFG.

If the maximum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to the queue, reduce the shaping rate for that queue.

## Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth

**Problem** **Description:** The minimum bandwidth of a queue or a priority group when measured at the egress port exceeds the minimum bandwidth configured for the queue (transmit-rate) or for the priority group (guaranteed-rate).

**Cause** When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not include the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its minimum bandwidth calculations.

The measured egress bandwidth can exceed the configured minimum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**NOTE:** The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

---

**Solution** When you calculate the bandwidth requirements for queues and priority groups on which you expect a significant amount of traffic with small packet sizes, consider the transmit

rate and the guaranteed rate as the minimum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined minimum data rate and the preamble and IFG.

If the minimum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to a queue or to a priority group, reduce the transmit rate for that queue and reduce the guaranteed rate of the priority group that contains the queue.

## Troubleshooting Egress Queue Bandwidth Impacted by Congestion

**Problem** **Description:** Congestion on an egress port causes egress queues to receive less bandwidth than expected. Egress port congestion can impact the amount of bandwidth allocated to queues on the congested port and, in some cases, on ports that are not congested.

**Cause** Egress queue congestion can cause the ingress port buffer to fill above a certain threshold and affect the flow to the queues on the egress port. One queue receives its configured bandwidth, but the other queues on the egress port are affected and do not receive their configured share of bandwidth.

**Solution** The solution is to configure a drop profile to apply weighted random early detection (WRED) to the queue or queues on the congested ports.

Configure a drop profile on the queue that is receiving its configured bandwidth. This queue is preventing the other queues from receiving their expected bandwidth. The drop profile prevents the queue from affecting the other queues on the port.

To configure a WRED profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

## Troubleshooting an Unexpected Rewrite Value

**Problem**    **Description:** Traffic from one or more forwarding classes on an egress port is assigned an unexpected rewrite value.

**NOTE:** For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rules rewrite only the outer VLAN tag.

**Cause**    If you configure a rewrite rule for a forwarding class on an egress port but you do not configure a rewrite rule for every forwarding class on that egress port, then the forwarding classes that do not have a configured rewrite rule are assigned random rewrite values.

For example:

1. Configure forwarding classes **fc1**, **fc2**, and **fc3**.
2. Configure rewrite rules for forwarding classes **fc1** and **fc2**, but not for forwarding class **fc3**.
3. Assign forwarding classes **fc1**, **fc2**, and **fc3** to a port.

When traffic for these forwarding classes flows through the port, traffic for forwarding classes **fc1** and **fc2** is rewritten correctly. However, traffic for forwarding class **fc3** is assigned a random rewrite value.

**Solution**    If any forwarding class on an egress port has a configured rewrite rule, then all forwarding classes on that egress port must have a configured rewrite rule. Configuring a rewrite rule for any forwarding class that is assigned a random rewrite value solves the problem.

**TIP:** If you want the forwarding class to use the same code point value assigned to it by the ingress classifier, specify that value as the rewrite rule value. For example, if a forwarding class has the IEEE 802.1 ingress classifier code point value 011, configure a rewrite rule for that forwarding class that uses the IEEE 802.1p code point value 011.

**NOTE:** There are no default rewrite rules. You can bind one rewrite rule for each type (DSCP and IEEE 802.1) to a given interface. A rewrite rule can contain multiple forwarding-class-to-rewrite-value associations.

1. Assign a rewrite value to a forwarding class. Add the new rewrite value to the same rewrite rule as the other forwarding classes on the port:  
  
[edit class-of-service rewrite-rules]

```
user@switch# set (dscp | ieee-802.1) rewrite-name forwarding-class class-name loss-priority
priority code-point (alias | bits)
```

For example, if the other forwarding classes on the port use rewrite values defined in the rewrite rule **custom-rw**, the forwarding class **fcoe** is being randomly rewritten, and you want to use IEEE 802.1 code point **011** for the **fcoe** forwarding class:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 custom-rw forwarding-class fcoe loss-priority high code-point
011
```

2. Enable the rewrite rule on an interface if it is not already enabled on the desired interface:

```
[edit]
user@switch# set class-of-service interfaces interface-name unit unit rewrite-rules (dscp |
ieee-802.1) rewrite-rule-name
```

For example, to enable the rewrite rule **custom-rw** on interface **xe-0/0/24.0**:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/24 unit 0 rewrite-rules ieee-802.1
custom-rw
```

## Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic

**Problem**    **Description:** In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets.

**Cause**    Failure of a queue to transmit packets for 12 consecutive seconds may be due to:

- A strict-high priority queue consuming all of the port bandwidth
- Several queues consuming all of the port bandwidth
- Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
- Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

**Solution**    If the cause is a strict-high priority queue or other queues consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the queues that are using all of the port bandwidth and preventing other queues from obtaining bandwidth on the port. You configure a maximum rate by creating a scheduler, using a scheduler map to apply it to a forwarding class (which maps to an output queue), and applying the scheduler map to the port using a forwarding class set and a traffic control profile.

To configure rate shaping using the CLI:

1. Name the existing scheduler or create a scheduler and define the maximum bandwidth as a rate or as a percentage:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name shaping-rate (rate | percent percentage)
```

2. Configure a scheduler map to associate the scheduler with the forwarding class (queue) that is consuming all of the port bandwidth:

```
[edit class-of-service]
user@switch# set scheduler-maps scheduler-map-name forwarding-class
forwarding-class-name scheduler scheduler-name
```

3. Associate the scheduler map with a traffic control profile:

```
[edit class-of-service]
user@switch# set traffic-control-profiles traffic-control-profile-name scheduler-map
scheduler-map-name
```

4. Associate the traffic control profile (and thus the scheduler map that contains the rate shaping queue scheduler) with a forwarding class set and apply them to the interface that is being reset:

```
[edit class-of-service]
user@switch# set interfaces interface-name forwarding-class-set fc-set-name
output-traffic-control-profile traffic-control-profile-name
```

For example, a strict-high priority queue is using all of the bandwidth on interface **shpnode:xe-0/0/10** and preventing other queues from transmitting for 12 consecutive seconds. You decide to set a maximum rate of 7 Gbps on the strict-high priority queue to ensure that at least 3 Gbps of the port bandwidth is available to service other queues.

[Table 600 on page 6459](#) shows the topology for this example:

**Table 702: Components of the Rate Shaping Troubleshooting Example**

Component	Settings
Affected interface	<b>shpnode:xe-0/0/10</b>
Scheduler (strict-high priority scheduler)	Name: <b>shp-sched</b> Shaping rate: <b>7g</b> Priority: <b>strict-high</b>  <b>NOTE:</b> This example assumes that the scheduler already exists and has been configured as <b>strict-high</b> priority, but that rate shaping to prevent the strict-high priority traffic from using all of the port bandwidth has not been applied.
Scheduler map	Name: <b>shp-map</b> Forwarding class to associate with the <b>shp-sched</b> scheduler: <b>strict-high</b>  <b>NOTE:</b> This example assumes that a strict-high priority forwarding class has been configured and assigned the name <b>strict-high</b> .
Traffic control profile	Name: <b>shp-tcp</b>  <b>NOTE:</b> This example does not describe how to define a complete traffic control profile.

## Virtual Chassis Fabric

- [Troubleshooting Virtual Chassis Fabric on page 7275](#)

### Troubleshooting Virtual Chassis Fabric

This topic describes some of the following common troubleshooting issues for a Virtual Chassis Fabric (VCF):

- [Virtual Chassis Port Link Does Not Form on page 7276](#)
- [QFX5100 Leaf Device Assumes Routing Engine Role on page 7276](#)

### Virtual Chassis Port Link Does Not Form

---

**Problem**    **Description:** You connect a 40-Gbps QSFP+ port or a 10-Gbps SFP+ port between a leaf device and a spine device in an autoprovisioned or preprovisioned VCF. You expect the automatic Virtual Chassis port (VCP) conversion feature to convert the link into a VCP link, but the conversion doesn't occur.

The [show virtual-chassis vc-port](#) output indicates that the status of the interface is **Absent** or one or both of interfaces don't appear in the [show virtual-chassis vc-port](#) output.

**Cause**    If one end of a link is configured as a VCP and the other is not configured as a VCP, the VCP link does not form.

The automatic VCP conversion feature, therefore, does not work in the following situations:

- a 40-Gbps QSFP+ or 10-Gbps SFP+ interface on one end of the link is already configured as a VCP.

If you have previously removed a device from a VCF but haven't used the **request virtual-chassis vc-port delete** command to convert the interface that was connected to the removed device out of VCP mode, the interface is still configured as a VCP.

If you have removed a device from one Virtual Chassis or VCF and not changed the VCP port setting, the device being added to the VCF might also be configured as a VCP.

- a 40-Gbps QSFP+ port on an EX4300 switch, which is configured as a VCP by default, is interconnecting to a spine device.

**Solution**    Manually configure the interface that is not configured as a VCP into a VCP using the **request virtual-chassis vc-port set** command.

### QFX5100 Leaf Device Assumes Routing Engine Role

---

**Problem**    **Description:** A QFX5100 device configured as a leaf device assumes the Routing Engine role during VCF setup. The **show virtual-chassis** output confirms the role.

**Solution**    The device can assume the Routing Engine role for several minutes during setup before it receives the configuration from the master Routing Engine, but eventually returns to the linecard role with no user intervention.
