| <b>Description</b>              | <p>List one or more tunnel-capable PICs to be used for creating multicast tunnel (<b>mt</b>) interfaces. Creating a PIC list enables you to control the load-balancing implementation.</p> <p>Tunnel-capable PICs include:</p> <ul style="list-style-type: none"> <li>• Adaptive Services PIC</li> <li>• Multiservices PIC or Multiservices DPC</li> <li>• Tunnel Services PIC</li> <li>• On MX Series routers, a PIC created with the <b>tunnel-services</b> statement at the <b>[edit chassis fpc slot-number pic number]</b> hierarchy level.</li> </ul> <p>The physical position of the PIC in the routing device determines the multicast tunnel interface name. For example, if you have an Adaptive Services PIC installed in FPC slot 0 and PIC slot 0, the corresponding multicast tunnel interface name is <b>mt-0/0/0</b>. The same is true for Tunnel Services PICs, Multiservices PICs, and Multiservices DPCs.</p> |
| <b>Default</b>                  | Multicast tunnel interfaces are created on all available tunnel-capable PICs, based on a round-robin algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <b>mt-fpc/pic/port</b> —Interface that is automatically generated when a tunnel-capable PIC is installed in the routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Specify the threshold at which a warning message is logged for the multicast groups received on a logical interface. The threshold is a percentage of the maximum number of multicast groups allowed on a logical interface.</p> <p>For example, if you configure a maximum number of 1,000 incoming multicast groups, and you configure a threshold value of 90 percent, warning messages are logged in the system log when the interface receives 900 groups.</p> <p>To confirm the configured group threshold on the interface, use the <a href="#">show igmp interface</a> command.</p> |
| <b>Default</b>                  | By default, there is no configured threshold value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>value</b>—Percentage of the maximum number of multicast groups allowed on the interface that starts triggering the warning. You configure a percentage of the <b>group-limit</b> value that starts triggering the warnings. You must explicitly configure the <a href="#">group-limit</a> to configure a threshold value.</p> <p><b>Range:</b> 1 through 100</p>                                                                                                                                                                                                                         |

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Enable IGMP on the router or switch. IGMP must be enabled for the router or switch to receive multicast packets.

The remaining statements are explained separately.

|                                 |                                                                                                                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | IGMP is disabled on the router or switch. IGMP is automatically enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP). |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                |

| <b>Description</b>              | <p>The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>Starting in Junos OS Release 9.3, both IGMP version 2 and IGMP version 3 do host tracking when the <b>immediate-leave</b> statement is configured. This means that the multicast group leaves only when the last host leaves. The routing device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.</p> |
|                                 | <div> <b>NOTE:</b> Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.</div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>Specify the minimum time interval (in seconds) between sending consecutive log messages to the system log for multicast groups. To configure the time interval, you must specify the maximum number of multicast groups allowed on the interface. You must configure the <b>group-limit</b> statement before you configure the <b>log-interval</b> statement.</p> <p>To confirm the configured log interval on the interface, use the <b>show igmp interface</b> command.</p> |
| <b>Default</b>                  | By default, there is no configured time interval.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b>seconds</b>—Minimum time interval (in seconds) between log messages. You must explicitly configure the <b>group-limit</b> to configure a time interval to send log messages.</p> <p><b>Range:</b> 6 through 32,767 seconds</p>                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | Specify that the interface accepts IGMP reports from hosts on any subnetwork. Note that when enabling promiscuous-mode, all routing devices on the ethernet segment must be configured with the promiscuous mode statement. Otherwise, only the interface configured with lowest IPv4 address acts as the querier for IGMP for this Ethernet segment. |

## static (Protocols IGMP)

---

**Syntax**    static {  
              group *multicast-group-address* {  
                  exclude;  
                  group-count *number*;  
                  group-increment *increment*;  
                  source *ip-address* {  
                      source-count *number*;  
                      source-increment *increment*;  
                  }  
              }  
          }  
      }

**Hierarchy Level**    [edit logical-systems *logical-system-name* protocols **igmp** interface *interface-name*],  
                          [edit protocols **igmp** interface *interface-name*]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**    Test multicast forwarding on an interface without a receiver host.

The **static** statement simulates IGMP joins on a routing device statically on an interface without any IGMP hosts. It is supported for both IGMPv2 and IGMPv3 joins. This statement is especially useful for testing multicast forwarding on an interface without a receiver host.

**NOTE:** To prevent joining too many groups accidentally, the **static** statement is not supported with the **interface all** statement.

---

The remaining statements are explained separately.

**Required Privilege Level**    routing and trace—To view this statement in the configuration.  
                                  routing-control and trace-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure IGMP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>To trace the paths of multicast packets, use the <b>mtrace</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>             | The default IGMP trace options are those inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the file <b>igmp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>IGMP Tracing Flags</b></p> <ul style="list-style-type: none"> <li><b>leave</b>—Leave group messages (for IGMP version 2 only).</li> <li><b>mtrace</b>—Mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software.</li> <li><b>packets</b>—All IGMP packets.</li> </ul> |

- **query**—IGMP membership query messages, including general and group-specific queries.
- **report**—Membership report messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

## [edit protocols mld] Hierarchy Level

The following statement hierarchy can also be included at the **[edit logical-systems *logical-system-name*]** hierarchy level.

```
protocols {
 mld {
 accounting;
 interface interface-name {
 disable;
 (accounting | no-accounting);
 group-policy [policy-names];
 group-threshold value;
 immediate-leave;
 log-interval seconds;
 oif-map [map-names];
 passive <allow-receive> <send-general-query> <send-group-query>;
 ssm-map ssm-map-name;
 static {
 group multicast-group-address {
 exclude;
 group-count number;
 group-increment increment;
 source source-ip-address {
 source-count number;
 source-increment number;
 }
 }
 }
 }
 version (1 | 2);
 }
 maximum-transmit-rate packets-per-second;
 query-interval seconds;
 query-last-member-interval seconds;
 query-response-interval seconds;
 robust-count number;
 traceoptions {
 file filename <files number> <size maximum-file-size> <world-readable |
 no-world-readable>;
 flag flag <flag-modifier> <disable>;
 }
}
```

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                    |
| <b>Description</b>              | When a routing device running MLD version 1 or version 2 (MLDv1 or MLDv2), receives an MLD report, the routing device compares the group against the specified group policy and performs the action configured in that policy (for example, rejects the report). |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Specify the threshold at which a warning message is logged for the multicast groups received on a logical interface. The threshold is a percentage of the maximum number of multicast groups allowed on a logical interface.</p> <p>For example, if you configure a maximum number of 1,000 incoming multicast groups, and you configure a threshold value of 90 percent, warning messages are logged in the system log when the interface receives 900 groups.</p> <p>To confirm the configured group threshold on the interface, use the <a href="#">show mld interface</a> command.</p> |
| <b>Default</b>                  | By default, there is no configured threshold value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>value</b>—Percentage of the maximum number of multicast groups allowed on the interface that starts triggering the warning. You configure a percentage of the <b>group-limit</b> value that starts triggering the warnings. You must explicitly configure the <b>group-limit</b> to configure a threshold value.</p> <p><b>Range:</b> 1 through 100</p>                                                                                                                                                                                                                                 |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>The immediate leave setting is useful for minimizing the leave latency of MLD memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>The immediate-leave setting enables host tracking, meaning that the device keeps track of the hosts that send join messages. This allows MLD to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending MLD group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the MLD leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both MLD version 1 and MLD version 2.</p> |
|                                 | <div> <b>NOTE:</b> Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.</div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>         | Enable MLD on the routing device. MLD must be enabled for the routing device to receive multicast packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>             | MLD is disabled on the routing device. MLD is automatically enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>             | The statements are explained separately.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## oif-map

---

**Syntax** oif-map *map-name*;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols **mld interface** *interface-name*],  
[edit protocols **mld interface** *interface-name*]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Associate an outgoing interface (OIF) map to an MLD logical interface. The OIF map is a routing policy statement that can contain multiple terms.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## passive (MLD)

---

|                            |                                                                                                                                                                                           |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>passive &lt;allow-receive&gt; &lt;send-general-query&gt; &lt;send-group-query&gt;;</code>                                                                                           |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols <code>mld interface interface-name</code> ],<br>[edit protocols <code>mld interface interface-name</code> ]                    |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.<br><code>allow-receive</code> , <code>send-general-query</code> , and <code>send-group-query</code> options added in Junos OS Release 10.0. |
| <b>Description</b>         | Specify that MLD run on the interface and either not send and receive control traffic or selectively send and receive control traffic such as MLD reports, queries, and leaves.           |

**NOTE:** You can selectively activate up to two out of the three available options for the `passive` statement while keeping the other functions passive (inactive). Activating all three options is equivalent to not using the `passive` statement.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>         | <p>Configure MLD tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>To trace the paths of multicast packets, use the <b>mtrace</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>             | The default MLD trace options are those inherited from the <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the file <b>mld-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>MLD Tracing Flags</b></p> <ul style="list-style-type: none"><li>• <b>leave</b>—Leave group messages.</li><li>• <b>mtrace</b>—Mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software.</li><li>• <b>packets</b>—All MLD packets.</li><li>• <b>query</b>—MLD membership query messages, including general and group-specific queries.</li></ul> |

- **report**—Membership report messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—Traces errors and significant events during normal packet processing

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

## version (Protocols MLD)

---

**Syntax** *version version;*

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols **mld interface** *interface-name*],  
[edit protocols **mld interface** *interface-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure the MLD version explicitly. MLD version 2 (MLDv2) is used only to support source-specific multicast (SSM).

**Options** **version**—MLD version to run on the interface.

**Range:** 1 or 2

**Default:** 1 (MLDv1)

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

| <b>Description</b>              | Configure a limit for the number of multicast groups (or [S,G] channels in IGMPv3) allowed on an interface. After this limit is reached, new reports are ignored and all related flows are not flooded on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Default</b>                  | By default, there is no limit to the number of multicast groups joining an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <i>limit</i> —a 32-bit number for the limit on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | Configure an interface as a host-facing interface. IGMP and MLD queries received on these interfaces are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>                  | The interface can either be a host-side or multicast-routing device interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>         | <p>The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>The immediate-leave setting enables host tracking, meaning that the device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.</p> |

**NOTE:** Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.

## interface (Bridge Domains)

---

**Syntax**

```
interface interface-name {
 group-limit limit;
 host-only-interface;
 multicast-router-interface;
 static {
 group ip-address {
 source ip-address;
 }
 }
}
```

**Release Information** Statement introduced in Junos OS Release 8.5.  
Statement introduced in Junos OS Release 13.2 for the QFX series.

**Description** Enable IGMP snooping on an interface and configure interface-specific properties.

**Options** *interface-name*—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify **all**.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | Statically configure the interface as an IGMP snooping multicast-router interface—that is, an interface that faces toward a multicast router or other IGMP querier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**NOTE:** If the specified interface is a trunk port, the interface becomes a multicast-routing device interface for all VLANs configured on the trunk port. In addition, all unregistered multicast packets, whether they are IPv4 or IPv6 packets, are forwarded to the multicast routing device interface, even if the interface is configured as a multicast routing device interface only for IGMP snooping.

Configure an interface as a bridge interface toward other multicast routing devices.

| <b>Description</b>              | Provide fine-tuning to allow for expected packet loss on a subnet. You can wait more intervals if subnet packet loss is high and IGMP report messages might be lost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>         | Define tracing operations for IGMP snooping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>             | The <b>traceoptions</b> feature is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached (<b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b> —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—All tracing operations.</li> <li>• <b>client-notification</b>—Trace notifications.</li> <li>• <b>general</b>—Trace general IGMP snooping protocol events.</li> <li>• <b>group</b>—Trace group operations.</li> <li>• <b>host-notification</b>—Trace host notifications.</li> <li>• <b>leave</b>—Trace leave group messages (IGMPv2 only).</li> <li>• <b>normal</b>—Trace normal IGMP snooping protocol events.</li> <li>• <b>packets</b>—Trace all IGMP packets.</li> </ul> |

- **policy**—Trace policy processing.
- **query**—Trace IGMP membership query messages.
- **report**—Trace membership report messages.
- **route**—Trace routing information.
- **state**—Trace IGMP state transitions.
- **task**—Trace routing protocol task processing.
- **timer**—Trace routing protocol timer processing.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify gigabytes

**Range:** 10 KB through 1 gigabytes

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Establish the graceful restart duration for multicast snooping. You can set this value between 0 and 300 seconds. If you set the duration to 0, graceful restart is effectively disabled. Set this value slightly larger than the IGMP query response interval.</p> <p>The remaining statements are explained separately.</p> |
| <b>Default</b>                  | 180 seconds                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Provide multicast snooping for multichassis link aggregation group interfaces. Replicate IGMP join and leave messages from the active link to the standby link of a dual-link multichassis link aggregation group interface, enabling faster recovery of membership information after failover. |
| <b>Default</b>                  | If not included, membership information is recovered using a standard IGMP network query.                                                                                                                                                                                                       |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                             |

| <b>Release Information</b> | Statement introduced in Junos OS Release 8.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>         | Set multicast snooping tracing options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>             | Tracing operations are disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place multicast snooping tracing output in the file <code>/var/log/multicast-snooping-log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file only</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>The following are the tracing options:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—All tracing operations</li> <li>• <b>config-internal</b>—Trace configuration internals.</li> <li>• <b>general</b>—Trace general events.</li> <li>• <b>normal</b>—All normal events.</li> </ul> <p><b>Default:</b> If you do not specify this option, only unusual or abnormal operations are traced.</p> <ul style="list-style-type: none"> <li>• <b>parse</b>—Trace configuration parsing.</li> <li>• <b>policy</b>—Trace policy operations and actions.</li> </ul> |

- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Release Information</b> | Statement introduced in Junos OS Release 13.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | <p>Allow the larger of global and family-level threshold values to take effect.</p> <p>This statement is optional when you configure a forwarding cache or PIM state limits. When this statement is included in the configuration and both a family-specific and a global configuration are present, the higher limits take precedence.</p> <p>For example:</p> <pre>[edit routing-options multicast forwarding-cache] allow-maximum; family inet {   threshold {     suppress 100;     reuse 75;   } } family inet6 {   threshold {     suppress 600;     reuse 500;   } } threshold {   suppress 400;   reuse 450; }</pre> <p>user@host# show multicast forwarding-cache statistics</p> <pre>Instance: master Family: INET Suppress Threshold          400 Reuse Value                 400 Currently Used Entries      0  Instance: master Family: INET6 Suppress Threshold          600 Reuse Value                 500 Currently Used Entries      0</pre> <p>This statement can be useful in single-stack devices on which IPv4 traffic is expected or IPv6 traffic is expected, but not both.</p> |
| <b>Default</b>             | By default, this statement is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

When this statement is omitted from the configuration, a family-specific forwarding cache configuration and a global forwarding cache configuration cannot be configured together. Either the global-specific configuration or the family-specific configuration is allowed, but not both.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## asm-override-ssm

**Syntax** asm-override-ssm;

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options [multicast](#)],  
[edit logical-systems *logical-system-name* routing-options [multicast](#)],  
[edit routing-instances *routing-instance-name* routing-options [multicast](#)],  
[edit routing-options [multicast](#)]

**Release Information** Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 9.5 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Enable the routing device to accept any-source multicast join messages (\*G) for group addresses that are within the default or configured range of source-specific multicast groups.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure multicast forwarding cache properties. These properties include threshold suppression and reuse limits, the threshold at which a warning message is logged, and timeout values.</p> <p>Specify a value for the threshold at which to suppress new multicast forwarding cache entries and an optional reuse value for the threshold at which the router begins to create new multicast forwarding cache entries. The range for both is from 1 through 200,000. If configured, the reuse value should be less than the suppression threshold value. The suppression value is mandatory. If you do not specify the optional reuse value, then the number of multicast forwarding cache entries is limited to the suppression value. A new entry is created as soon as the number of multicast forwarding cache entries falls below the suppression value.</p> <p>You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the <b>threshold</b> statement globally for the multicast forwarding cache or including the <b>family</b> statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.</p> |
| <b>Default</b>             | By default, there are no limits on the number of multicast forwarding cache entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>family (inet   inet6)</b>—(Optional) Apply the configured thresholds to either IPv4 or IPv6 multicast forwarding cache entries.</p> <p><b>Default:</b> By default, the configured thresholds are applied to both IPv4 and IPv6 multicast forwarding cache entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>When you configure multicast-only fast reroute (MoFRR) in a PIM domain, allow only a disjoint RPF (an RPF on a separate plane) to be selected as the backup RPF path.</p> <p>In a multipoint LDP MoFRR domain, the same label is shared between parallel links to the same upstream neighbor. This is not the case in a PIM domain, where each link forms a neighbor. The <b>mofrr-disjoint-upstream-only</b> statement does not allow a backup RPF path to be selected if the path goes to the same upstream neighbor as that of the primary RPF path. This ensures that MoFRR is triggered only on a topology that has multiple RPF upstream neighbors.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>When you configure multicast-only fast reroute (MoFRR) in a PIM domain, allow new primary path selection to be based on the unicast gateway selection for the unicast route to the source and to change when there is a change in the unicast selection, rather than having the backup path be promoted as primary. This ensures that the primary RPF hop is always on the best path.</p> <p>When you include the <b>mofrr-primary-selection-by-routing</b> statement, the backup path is not guaranteed to get promoted to be the new primary path when the primary path goes down.</p> |
| <b>Default</b>                  | By default, the backup path gets promoted to be the primary path when MoFRR is configured in a PIM domain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Configure the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Internet Group Management Protocol (IGMP) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the <b>pim-to-igmp-proxy</b> statement enables you to use IGMP to forward IPv4 multicast traffic across the PIM sparse mode domains.</p> <p>The remaining statement is explained separately.</p> |

| <b>Description</b>              | <p>Configure the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Multicast Listener Discovery (MLD) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the <b>pim-to-mld-proxy</b> statement enables you to use MLD to forward IPv6 multicast traffic across the PIM sparse mode domains.</p> <p>The remaining statement is explained separately.</p> |

| <b>Release Information</b> | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | When you configure multicast-only fast reroute (MoFRR), apply a routing policy that filters for a restricted set of multicast streams to be affected by your MoFRR configuration. You can apply filters that are based on source or group addresses.                                                                                                                                                                                    |

For example:

```
routing-options {
 multicast {
 stream-protection {
 policy mofrr-select;
 }
 }
}
policy-statement mofrr-select {
 term A {
 from {
 source-address-filter 225.1.1.1/32 exact;;
 }
 then {
 accept;
 }
 }
 term B {
 from {
 source-address-filter 226.0.0.0/8 orlonger;
 }
 then {
 accept;
 }
 }
 term C {
 from {
 source-address-filter 227.1.1.0/24 orlonger;
 source-address-filter 227.4.1.0/24 orlonger;
 source-address-filter 227.16.1.0/24 orlonger;
 }
 then {
 accept;
 }
 }
 term D {
 from {
```

```

 source-address-filter 227.1.1.1/32 exact
 }
 then {
 reject; #MoFRR disabled
 }
}
term E {
 from {
 route-filter 227.1.1.0/24 orlonger;
 }
 then accept;
}
...
}

```

## scope-policy

**Syntax** `scope-policy [ policy-names ];`

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-options **multicast**],  
[edit routing-options **multicast**]

**NOTE:** You can configure a scope policy at these two hierarchy levels only. You cannot apply a scope policy to a specific routing instance, because all scoping policies are applied to all routing instances. However, you can apply the `scope` statement to a specific routing instance at the [edit routing-instances *routing-instance-name* routing-options **multicast**] or [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **multicast**] hierarchy level.

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Apply policies for scoping. The policy must be correctly configured at the **edit policy-options policy-statement** hierarchy level.

**Options** *policy-names*—Name of one or more multicast scope policies.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure source-specific multicast (SSM) groups.</p> <p>By default, the SSM group multicast address is limited to the IP address range from 232.0.0.0 through 232.255.255.255. However, you can extend SSM operations into another Class D range by including the <b>ssm-groups</b> statement in the configuration. The default SSM address range from 232.0.0.0 through 232.255.255.255 cannot be used in the <b>ssm-groups</b> statement. This statement is for adding other multicast addresses to the default SSM group addresses. This statement does not override the default SSM group address range.</p> <p>IGMPv3 supports SSM groups. By utilizing inclusion lists, only sources that are specified send to the SSM group.</p> |
| <b>Options</b>                  | <i>ip-addresses</i> —List of one or more additional SSM group addresses separated by a space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Configure the global suppression, reuse, and warning log message thresholds for multicast forwarding cache limits. You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the <b>threshold</b> statement globally for the multicast forwarding cache or including the <b>family</b> statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.</p> <p>To confirm the configured threshold values, use the <b>show multicast forwarding-cache statistics</b> command.</p>                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>reuse value</b>—(Optional) Value at which to begin creating new multicast forwarding cache entries. If configured, this number should be less than the <b>suppress</b> value.</p> <p><b>Range:</b> 1 through 200,000</p> <p><b>suppress value</b>—Value at which to begin suppressing new multicast forwarding cache entries. This value is mandatory. This number should be greater than the <b>reuse</b> value.</p> <p><b>Range:</b> 1 through 200,000</p> <p>The remaining statement is explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>              | <p>Configure at least one, but not more than two, upstream interfaces on the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain. The RP routing device translates PIM join or prune messages into corresponding IGMP report or leave messages (if you include the <a href="#">pim-to-igmp-proxy</a> statement), or into corresponding MLD report or leave messages (if you include the <a href="#">pim-to-mld-proxy</a> statement). The routing device then proxies the IGMP or MLD report or leave messages to one or both upstream interfaces to forward IPv4 multicast traffic (for IGMP) or IPv6 multicast traffic (for MLD) across the PIM domains.</p>                                                                                                                                                                                                                        |
| <b>Options</b>                  | <p><b><i>interface-names</i></b>—Names of one or two upstream interfaces to which the RP routing device proxies IGMP or MLD report or leave messages for transmission of multicast traffic across PIM domains. You can specify a maximum of two upstream interfaces on the RP routing device. To configure a set of two upstream interfaces, specify the full interface names, including all physical and logical address components, within square brackets ( [ ] ).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Advertise VPN routes from the main VPN tables in the master routing instance (for example, <i>bgp.l3vpn.0</i>, <i>bgp.mvpn.0</i>) instead of advertising VPN routes from the tables in the VPN routing instances (for example, <i>instance-name.inet.0</i>, <i>instance-name.mvpn.0</i>). Enable nonstop active routing (NSR) support for BGP multicast VPN (MVPN).</p> <p>When this statement is enabled, before advertising a route for a VPN prefix, the path selection algorithm is run on all routes (local and received) that have the same route distinguisher (RD).</p> |
|                                 | <div>  <p><b>NOTE:</b> Adding or removing this statement causes all BGP sessions that have VPN address families to be removed and then added again. On the other hand, having this statement in the configuration prevents BGP sessions from going down when route reflector (RR) or autonomous system border router (ASBR) functionality is enabled or disabled on a routing device that has VPN address families configured.</p> </div>                                                        |
| <b>Default</b>                  | If you do not include this statement, VPN routes are advertised from the tables in the VPN routing instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>         | <p>Configure the maximum number of IPv4 customer multicast entries</p> <p>The purpose of the <b>cmcast-joins-limit-inet</b> statement is to supplement the multicast forwarding-cache limit when the MVPN <b>rpt-spt</b> mode is configured and when traffic is flowing through selective service provider multicast service interface (S-PMSI) tunnels and is forwarded by way of the (*G) entry, even though the forwarding cache limit has already blocked the forwarding entries from being created.</p> <p>The <b>cmcast-joins-limit-inet</b> statement limits the number of Type-6 and Type-7 routes. These routes contain customer-route control information.</p> <p>You can configure the <b>cmcast-joins-limit-inet</b> statement only when the MVPN mode is <b>rpt-spt</b>.</p> <p>This statement is independent of the <b>leaf-tunnel-limit-inet</b> statement and of the <b>forwarding-cache threshold</b> statement.</p> <p>The <b>cmcast-joins-limit-inet</b> statement is applicable on the egress PE router. It limits the customer multicast entries created in response to PIM (*G) and (S,G) join messages. This statement is applicable to both type-6 and type-7 routes because the intention is to limit the egress forwarding entries, and in <b>rpt-spt</b> mode, an MVPN creates forwarding entries for both of these route types (in other words, for both (*G) and (S,G) entries). However, this statement does not block BGP-created customer multicast entries because the purpose of this statement is to prevent the creation of forwarding entries on the egress PE router only and only for non-remote receivers. If remote-side customer multicast entries or forwarding entries need to be limited, you can use forwarding-cache threshold on the ingress routers, in which case this statement is not required.</p> <p>By placing a limit on the customer multicast entries, you can ensure that when the limit is reached or the maximum forwarding state is created, all further local join messages will be blocked by the egress PE router. This ensures that traffic is flowing for only those multicast entries that are permitted.</p> <p>If another PE router is interested in the traffic, it might pull the traffic from the ingress PE router by sending type-6 and type-7 routes. To prevent forwarding in this case, you can configure the leaf tunnel limit (<b>leaf-tunnel-limit-inet</b>). By preventing type-4 routes from being sent in response to type-3 routes, the formation of selective tunnels is blocked when the tunnel limit is reached. This ensures that traffic flows only for the routes within the tunnel limit. For all other routes, traffic flows only to the PE routers that have not reached the configured limit.</p> |

Setting the **cmcast-joins-limit-inet** statement or reducing the value of the limit does not alter or delete the already existing and installed routes. If needed, you can run the **clear pim join** command to force the limit to take effect. Those routes that cannot be processed because of the limit are added to a queue, and this queue is processed when the limit is removed or increased and when existing routes are deleted.

**Default**    Unlimited

**Options**    *number*—Maximum number of customer multicast entries for IPv4.

**Required Privilege**    routing—To view this statement in the configuration.  
**Level**    routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure the maximum number of IPv4 customer multicast entries</p> <p>The purpose of the <b>cmcast-joins-limit-inet6</b> statement is to supplement the multicast forwarding-cache limit when the MVPN <b>rpt-spt</b> mode is configured and when traffic is flowing through selective service provider multicast service interface (S-PMSI) tunnels and is forwarded by way of the (*G) entry, even though the forwarding cache limit has already blocked the forwarding entries from being created.</p> <p>The <b>cmcast-joins-limit-inet6</b> statement limits the number of Type-6 and Type-7 routes. These routes contain customer-route control information.</p> <p>You can configure the <b>cmcast-joins-limit-inet6</b> statement only when the MVPN mode is <b>rpt-spt</b>.</p> <p>This statement is independent of the <b>leaf-tunnel-limit-inet6</b> statement and of the <b>forwarding-cache threshold</b> statement.</p> <p>The <b>cmcast-joins-limit-inet6</b> statement is applicable on the egress PE router. It limits the customer multicast entries created in response to PIM (*G) and (S,G) join messages. This statement is applicable to both type-6 and type-7 routes because the intention is to limit the egress forwarding entries, and in <b>rpt-spt</b> mode, an MVPN creates forwarding entries for both of these route types (in other words, for both (*G) and (S,G) entries). However, this statement does not block BGP-created customer multicast entries because the purpose of this statement is to prevent the creation of forwarding entries on the egress PE router only and only for non-remote receivers. If remote-side customer multicast entries or forwarding entries need to be limited, you can use forwarding-cache threshold on the ingress routers, in which case this statement is not required.</p> <p>By placing a limit on the customer multicast entries, you can ensure that when the limit is reached or the maximum forwarding state is created, all further local join messages will be blocked by the egress PE router. This ensures that traffic is flowing for only those multicast entries that are permitted.</p> <p>If another PE router is interested in the traffic, it might pull the traffic from the ingress PE router by sending type-6 and type-7 routes. To prevent forwarding in this case, you can configure the leaf tunnel limit (<b>leaf-tunnel-limit-inet6</b>). By preventing type-4 routes from being sent in response to type-3 routes, the formation of selective tunnels is blocked when the tunnel limit is reached. This ensures that traffic flows only for the routes within the tunnel limit. For all other routes, traffic flows only to the PE routers that have not reached the configured limit.</p> |

Setting the **cmcast-joins-limit-inet6** statement or reducing the value of the limit does not alter or delete the already existing and installed routes. If needed, you can run the **clear pim join** command to force the limit to take effect. Those routes that cannot be processed because of the limit are added to a queue, and this queue is processed when the limit is removed or increased and when existing routes are deleted.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | One of two modes for building unicast tunnels when ingress replication is configured for the provider tunnel. When this statement is configured, each time a new destination is added to the multicast distribution tree, a new unicast tunnel to the destination is created in the ingress replication tunnel. The new tunnel is deleted if the destination is no longer needed. Use this mode for RSVP LSPs using ingress replication. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>A provider tunnel type used for passing multicast traffic between routers through the MPLS cloud, or between PE routers when using MVPN. The ingress replication provider tunnel uses MPLS point-to-point LSPs to create the multicast distribution tree.</p> <p>Optionally, you can specify a label-switched path template. If you configure <b>ingress-replication label-switched-path</b> and do not include <b>label-switched-path-template</b>, ingress replication works with existing LDP or RSVP tunnels. If you include <b>label-switched-path-template</b>, the tunnels must be RSVP.</p> |
| <b>Options</b>                  | <p><b>create-new-ucast-tunnel</b>—A new unicast tunnel to the destination that is created and used for ingress replication. The unicast tunnel is deleted later if the destination is no longer included in the multicast distribution tree. A template must be specified when and only when <b>create-new-ucast-tunnel</b> is included in the configuration..</p> <p><b>template-name</b>—Name of the point-to-point LSP used for the new unicast tunnel.</p>                                                                                                                                         |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>In a multiprotocol BGP (MBGP) multicast VPN (MVPN), configure a virtual tunnel (VT) interface.</p> <p>VT interfaces are needed for multicast traffic on routing devices that function as combined provider edge (PE) and provider core (P) routers to optimize bandwidth usage on core links. VT interfaces prevent traffic replication when a P router also acts as a PE router (an exit point for multicast traffic).</p> <p>In an MBGP MVPN extranet, if there is more than one VRF routing instance on a PE router that has receivers interested in receiving multicast traffic from the same source, VT interfaces must be configured on all instances.</p> <p>Starting in Junos OS Release 12.3, you can configure multiple VT interfaces in each routing instance. This provides redundancy. A VT interface can be used in only one routing instance.</p> |
| <b>Options</b>                  | <p><i>vt-fpc/pic/port.unit-number</i>—Name of the VT interface.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Specify the LSP template. An LSP template is used as the basis for other dynamically generated LSPs. This feature can be used for a number of applications, including point-to-multipoint LSPs, flooding VPLS traffic, configuring ingress replication for IP multicast using MBGP MVPNs, and to enable RSVP automatic mesh. There is no default setting for the <b>label-switched-path-template</b> statement, so you must configure either the default-template using the <b>default-template</b> option, or you must specify the name of your preconfigured LSP template.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | <p>Configure the maximum number of selective leaf tunnels for IPv4 control-plane routes.</p> <p>The purpose of the <b>leaf-tunnel-limit-inet</b> statement is to supplement the multicast forwarding-cache limit when the MVPN <b>rpt-spt</b> mode is configured and when traffic is flowing through selective service provider multicast service interface (S-PMSI) tunnels and is forwarded by way of the (*G) entry, even though the forwarding cache limit has already blocked the forwarding entries from being created.</p> <p>The <b>leaf-tunnel-limit-inet</b> statement limits the number of Type-4 leaf autodiscovery (AD) route messages that can be originated by receiver provider edge (PE) routers in response to receiving from the sender PE router S-PMSI AD routes with the leaf-information-required flag set. Thus, this statement limits the number of leaf nodes that are created when a selective tunnel is formed.</p> <p>You can configure the statement only when the MVPN mode is <b>rpt-spt</b>.</p> <p>This statement is independent of the <b>cmcast-joins-limit-inet</b> statement and of the <b>forwarding-cache threshold</b> statement.</p> <p>Setting the <b>leaf-tunnel-limit-inet</b> statement or reducing the value of the limit does not alter or delete the already existing and installed routes. If needed, you can run the <b>clear pim join</b> command to force the limit to take effect. Those routes that cannot be processed because of the limit are added to a queue, and this queue is processed when the limit is removed or increased and when existing routes are deleted.</p> |

| <b>Description</b>              | <p>Configure the maximum number of selective leaf tunnels for IPv6 control-plane routes.</p> <p>The purpose of the <b>leaf-tunnel-limit-inet6</b> statement is to supplement the multicast forwarding-cache limit when the MVPN <b>rpt-spt</b> mode is configured and when traffic is flowing through selective service provider multicast service interface (S-PMSI) tunnels and is forwarded by way of the (*G) entry, even though the forwarding cache limit has already blocked the forwarding entries from being created.</p> <p>The <b>leaf-tunnel-limit-inet6</b> statement limits the number of Type-4 leaf autodiscovery (AD) route messages that can be originated by receiver provider edge (PE) routers in response to receiving from the sender PE router S-PMSI AD routes with the leaf-information-required flag set. Thus, this statement limits the number of leaf nodes that are created when a selective tunnel is formed.</p> <p>You can configure the statement only when the MVPN mode is <b>rpt-spt</b>.</p> <p>This statement is independent of the <b>cmcast-joins-limit-inet6</b> statement and of the <b>forwarding-cache threshold</b> statement.</p> <p>Setting the <b>leaf-tunnel-limit-inet6</b> statement or reducing the value of the limit does not alter or delete the already existing and installed routes. If needed, you can run the <b>clear pim join</b> command to force the limit to take effect. Those routes that cannot be processed because of the limit are added to a queue, and this queue is processed when the limit is removed or increased and when existing routes are deleted.</p> |

| <b>Description</b>              | <p>A nonforwarding routing instance type that supports Internet multicast over an MPLS network for the default master instance. No interfaces can be configured for it. Only one <b>mpls-internet-multicast</b> instance can be configured for each logical system.</p> <p>The <b>mpls-internet-multicast</b> configuration statement is also explicitly required under PIM in the master instance.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4.                                                                                                                                                                                                          |
| <b>Description</b>              | In a multiprotocol BGP (MBGP) multicast VPN (MVPN), configure the virtual tunnel (VT) interface to be used for multicast traffic only.                                                                                                                 |
| <b>Default</b>                  | If you omit this statement, the VT interface can be used for both multicast and unicast traffic.                                                                                                                                                       |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>In a multiprotocol BGP (MBGP) multicast VPN (MVPN), configure the virtual tunnel (VT) interface to be used as the primary interface for multicast traffic.</p> <p>Junos OS supports up to eight VT interfaces configured for multicast in a routing instance to provide redundancy for MBGP (next-generation) MVPNs. This support is for RSVP point-to-multipoint provider tunnels as well as multicast Label Distribution Protocol (MLDP) provider tunnels. This feature works for extranets as well.</p> <p>This statement allows you to configure one of the VT interfaces to be the primary interface, which is always used if it is operational. If a VT interface is configured as the primary, it becomes the nexthop that is used for traffic coming in from the core on the label-switched path (LSP) into the routing instance. When a VT interface is configured to be primary and the VT interface is used for both unicast and multicast traffic, only the multicast traffic is affected.</p> <p>If no VT interface is configured to be the primary or if the primary VT interface is unusable, one of the usable configured VT interfaces is chosen to be the nexthop that is used for traffic coming in from the core on the LSP into the routing instance. If the VT interface in use goes down for any reason, another usable configured VT interface in the routing instance is chosen. When the VT interface in use changes, all multicast routes in the instance also switch their reverse-path forwarding (RPF) interface to the new VT interface to allow the traffic to be received.</p> <p>To realize the full benefit of redundancy, we recommend that when you configure multiple VT interfaces, at least one of the VT interfaces be on a different Tunnel PIC from the other VT interfaces. However, Junos OS does not enforce this.</p> |
| <b>Default</b>                  | If you omit this statement, Junos OS chooses a VT interface to be the active interface for multicast traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.4.                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Enable you to override the Layer 3 VPN import and export route targets used for importing and exporting routes for the MBGP MVPN NLRI.                                                                                                                                                           |
| <b>Default</b>                  | The multicast VPN routing instance uses the import and export route targets configured for the Layer 3 VPN.                                                                                                                                                                                      |
| <b>Options</b>                  | The remaining statements are explained separately.                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.5.<br>The <b>ingress-replication</b> statement and substatements added in Junos OS Release 10.4.                                                                                                                                                   |
| <b>Description</b>              | Configure selective point-to-multipoint LSPs for an MBGP MVPN. Selective point-to-multipoint LSPs send traffic only to the receivers configured for the MBGP MVPNs, helping to minimize flooding in the service provider's network.<br><br>The remaining statements are explained separately. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                           |

| <b>Description</b>         | Trace traffic flowing through a Multicast BGP (MBGP) MVPN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" ").</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches this size, it is renamed <b><i>trace-file.0</i></b>. When <b><i>trace-file</i></b> again reaches its maximum size, <b><i>trace-file.0</i></b> is renamed <b><i>trace-file.1</i></b> and <b><i>trace-file</i></b> is renamed <b><i>trace-file.0</i></b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can specify any of the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All multicast VPN tracing options</li><li>• <b>cmcast-join</b>—Multicast VPN C-multicast join routes</li><li>• <b>error</b>—Error conditions</li><li>• <b>general</b>—General events</li><li>• <b>inter-as-ad</b>—Multicast VPN inter-AS automatic discovery routes</li><li>• <b>intra-as-ad</b>—Multicast VPN intra-AS automatic discovery routes</li><li>• <b>leaf-ad</b>—Multicast VPN leaf automatic discovery routes</li><li>• <b>mdt-safi-ad</b>—Multicast VPN MDT SAFI automatic discovery routes</li></ul> |

- **nlri**—Multicast VPN advertisements received or sent by means of the BGP
- **normal**—Normal events
- **policy**—Policy processing
- **route**—Routing information
- **source-active**—Multicast VPN source active routes
- **spmsi-ad**—Multicast VPN SPMSI auto discovery active routes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing
- **tunnel**—Provider tunnel events
- **umh**—Upstream multicast hop (UMH) events

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify the following modifiers:

- **detail**—Provide detailed trace information
- **disable**—Disable the tracing flag
- **receive**—Trace received packets
- **send**—Trace sent packets

**no-world-readable**—Do not allow any user to read the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify kilobytes, **xm** to specify megabytes, or **xg** to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—Allow any user to read the log file.

| <b>Description</b>              | <p>Explicitly enable IPv4 or IPv6 MVPN routes to be advertised from the VRF instance while preventing all other route types from being advertised.</p> <p>If you configure the <b>vrf-advertise-selective</b> statement without any of its options, the router or switch has the same behavior as if you configured the <b>no-vrf-advertise</b> statement. All VPN routes are prevented from being advertised from a VRF routing instance to the remote PE routers. This behavior is useful for hub-and-spoke configurations, enabling you to configure a PE router to not advertise VPN routes from the primary (hub) instance. Instead, these routes are advertised from the secondary (downstream) instance.</p> <p>The options are explained separately.</p> |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | Enable signaling in BGP. For multicast distribution tree (MDT) subaddress family identifier (SAFI) NLRI signaling, configure signaling under the <b>inet-mdt</b> family. For multiprotocol BGP (MBGP) intra-AS NLRI signaling, configure signaling under the <b>inet-mvpn</b> family.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>              | Specify an IP address prefix to use for the Automatic Multicast Tunneling (AMT) relay anycast address. The prefix is advertised by unicast routing protocols to route AMT discovery messages to the router from nearby AMT gateways. The IP address that the prefix is derived from can be configured on any interface in the system. Typically, the router's <b>lo0.0</b> loopback address prefix is used for configuring the AMT anycast prefix in the default routing instance, and the router's <b>lo0.n</b> loopback address prefix is used for configuring the AMT anycast prefix in VPN routing instances. However, the anycast address can be either the primary or secondary <b>lo0.0</b> loopback address. |
| <b>Default</b>                  | None. The anycast prefix must be configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | Specify the local unique IP address to send in Automatic Multicast Tunneling (AMT) relay advertisement messages, for use as the IP source of AMT control messages, and as the source of the data tunnel encapsulation. The address can be configured on any interface in the system. Typically, the router's <b>lo0.0</b> loopback address is used for configuring the AMT local address in the default routing instance, and the router's <b>lo0.n</b> loopback address is used for configuring the AMT local address in VPN routing instances. |
| <b>Default</b>                  | None. The local address must be configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <i>ip-address</i> —Unique unicast IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b> | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>         | <p>Configure Automatic Multicast Tunneling (AMT) tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the file <b>igmp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>AMT Tracing Flags</b></p> <ul style="list-style-type: none"><li>• <b>errors</b>—All error conditions</li><li>• <b>packets</b>—All AMT packets</li><li>• <b>tunnels</b>—All AMT tunnel-related information</li></ul> <p><b>Global Tracing Flags</b></p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations</li></ul> |

- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Release Information</b> | Statement introduced in Junos OS Release 13.2.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | <p>List one or more tunnel-capable Automatic Multicast Tunneling (AMT) PICs to be used for creating multicast tunnel (<b>ud</b>) interfaces. Creating an AMT PIC list enables you to control the load-balancing implementation.</p> <p>Tunnel-capable PICs include DPC and MPC.</p> <p>The physical position of the PIC in the routing device determines the multicast tunnel interface name.</p> |
| <b>Default</b>             | Multicast tunnel interfaces are created on all available tunnel-capable AMT PICs, based on a round-robin algorithm.                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <b>ud-fpc/pic/port</b> —Interface that is automatically generated when a tunnel-capable PIC is installed in the routing device.                                                                                                                                                                                                                                                                   |

**NOTE:** Each **tunnel-devices** statement keyword is optional. By default, all configured tunnel devices are used. The keyword selects the subset of configured tunnel devices.

Tunnel devices must be configured on MX Series routers. They are not automatically available like M Series routers that have dedicated PICs. On MX Series routers, the tunnel device port is the next highest number after the physical ports – a PIC created with the **tunnel-services** statement at the [edit chassis fpc *slot-number* pic *number*] hierarchy level.

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Define an MSDP peer group. MSDP peers within groups share common tracing options, if present and not overridden for an individual peer with the [peer](#) statement. To configure multiple MSDP groups, include multiple **group** statements.

By default, the group's options are identical to the global MSDP options. To override the global options, include group-specific options within the **group** statement.

The group must contain at least one peer.

**Options** *group-name*—Name of the MSDP group.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

[edit routing-instances *instance-name* protocols msdp peer address],

**Release Information** Statement introduced in Junos OS Release 12.3.

**Description** Specify the hold-time period to use when maintaining a connection with the MSDP peer. If a keepalive message is not received for the hold-time period, the MSDP peer connection is terminated. According to the RFC 3618, *Multicast Source Discovery Protocol (MSDP)*, the recommended value for the hold-time period is 75 seconds.

The hold-time period must be longer than the keepalive interval.

You might want to change the hold-time period and keepalive timer for consistency in a multi-vendor environment.

**Default** In Junos OS, the default hold-time period is 75 seconds, and the default keepalive interval is 60 seconds.

**Options** *seconds*—Hold time.  
**Range:** 15 through 150 seconds  
**Default:** 75 seconds

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Specify the keepalive interval to use when maintaining a connection with the MSDP peer. If a keepalive message is not received for the hold-time period, the MSDP peer connection is terminated. According to the RFC 3618, <i>Multicast Source Discovery Protocol (MSDP)</i>, the recommended value for the keepalive timer is 60 seconds.</p> <p>The hold-time period must be longer than the keepalive interval.</p> <p>You might want to change the keepalive interval and hold-time period for consistency in a multi-vendor environment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Default</b>                  | In Junos OS, the default hold-time period is 75 seconds, and the default keepalive interval is 60 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>         | <p>Define an MSDP peering relationship. An MSDP routing device must know which routing devices are its peers. You define the peer relationships explicitly by configuring the neighboring routing devices that are the MSDP peers of the local routing device. After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. To configure multiple MSDP peers, include multiple <b>peer</b> statements.</p> <p>By default, the peer's options are identical to the global or group-level MSDP options. To override the global or group-level options, include peer-specific options within the <b>peer (Protocols MSDP)</b> statement.</p> <p>At least one peer must be configured for MSDP to function. You must configure <b>address</b> and <b>local-address</b>.</p> |
| <b>Options</b>             | <p><b>address</b>—Name of the MSDP peer.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

## rib-group (Protocols MSDP)

---

**Syntax** `rib-group group-name;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols [msdp](#)],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols [msdp](#)],  
[edit protocols [msdp](#)],  
[edit routing-instances *routing-instance-name* protocols [msdp](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Associate a routing table group with MSDP.

**Options** *group-name*—Name of the routing table group. The name must be one that you defined with the **rib-groups** statement at the [edit routing-options] hierarchy level.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify the source address (SA) message hold time to use when maintaining a connection with the MSDP peer. Each entry in an SA cache has an associated hold time. The hold timer is started when an SA message is received by an MSDP peer. The timer is reset when another SA message is received before the timer expires. If another SA message is not received during the SA message hold-time period, the SA message is removed from the cache.</p> <p>You might want to change the SA message hold time for consistency in a multi-vendor environment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>         | <p>Configure MSDP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Default</b>             | <p>The default MSDP trace options are those inherited from the routing protocol's <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file</b> <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the <b>msdp-log</b> file.</p> <p><b>files</b> <i>number</i>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

**Range:** 2 through 1000 files

**Default:** 2 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### MSDP Tracing Flags

- **keepalive**—Keepalive messages
- **packets**—All MSDP packets
- **route**—MSDP changes to the routing table
- **source-active**—Source-active packets
- **source-active-request**—Source-active request packets
- **source-active-response**—Source-active response packets

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

***flag-modifier***—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow any user to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>         | <p>Configure PGM tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>             | The default PGM trace options are those inherited from the routing protocol <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>PGM Tracing Flags</b></p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all PGM packets.</li> <li>• <b>init</b>—Trace all PGM initialization events.</li> <li>• <b>packets</b>—Trace all PGM packet processing.</li> <li>• <b>parser</b>—Trace all PGM parser processing.</li> <li>• <b>route-socket</b>—Trace all PGM route-socket events.</li> <li>• <b>show</b>—Trace all PGM <b>show</b> command servicing.</li> <li>• <b>state</b>—Trace all PGM state transitions.</li> </ul> <p><b>Global Tracing Flags</b></p> <ul style="list-style-type: none"> <li>• <b>all</b>—All tracing operations</li> <li>• <b>general</b>—A combination of the <b>normal</b> and <b>route</b> trace operations</li> <li>• <b>normal</b>—All normal operations</li> </ul> <p><b>Default:</b> If you do not specify this option, only unusual or abnormal operations are traced.</p> <ul style="list-style-type: none"> <li>• <b>policy</b>—Policy operations and actions</li> </ul> |

- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

***flag-modifier***—(Optional) Modifier for the tracing flag. You can specify one or more of the following modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

## [\[edit protocols dvmrp\] Hierarchy Level](#)

---

The following statement hierarchy can also be included at the [\[edit logical-systems \*logical-system-name\*\]](#) hierarchy level.

```
protocols {
 dvmrp {
 disable;
 export [policy-names];
 import [policy-names];
 interface interface-name {
 disable;
 hold-time seconds;
 metric metric;
 mode (forwarding | unicast-routing);
 }
 rib-group group-name;
 traceoptions {
 file filename <files number> <size maximum-file-size> <world-readable |
 no-world-readable>;
 flag flag <flag-modifier> <disable>;
 }
 }
}
```

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Apply one or more policies to routes being exported from the routing table into DVMRP. If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching policy is applied to the route. If no match is found, the routing table exports into DVMRP only the routes that it learned from DVMRP and direct routes. |
| <b>Options</b>                  | <i>policy-names</i> —Name of one or more policies.                                                                                                                                                                                                                                                                                                                         |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Apply one or more policies to routes being imported into the routing table from DVMRP. If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching policy is applied to the route. If no match is found, DVMRP shares with the routing table only those routes that were learned from DVMRP routers. |
| <b>Options</b>                  | <i>policy-names</i> —Name of one or more policies.                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                 |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | <p>Configure DVMRP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>             | The default DVMRP trace options are those inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the <b>dvmrp-log</b> file.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>DVMRP Tracing Flags</b></p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations</li><li>• <b>general</b>—A combination of the <b>normal</b> and <b>route</b> trace operations</li><li>• <b>graft</b>—Graft messages</li><li>• <b>neighbor</b>—Neighbor probe messages</li><li>• <b>normal</b>—All normal operations</li></ul> |

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **packets**—All DVMRP packets
- **poison**—Poison-route-reverse packets
- **probe**—Probe packets
- **prune**—Prune messages
- **report**—DVMRP route report packets
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

|                              |                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Required Privilege</b>    | routing and trace—To view this statement in the configuration.                                               |
| <b>Level</b>                 | routing-control and trace-control—To add this statement to the configuration.                                |

| <b>Description</b>                                  | Clear the Protocol Independent Multicast (PIM) join and prune states.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                                      | <p><b>none</b>—Clear the PIM join and prune states for all groups, family addresses, and instances.</p> <p><b>group-address</b>—(Optional) Clear the PIM join and prune states for a group address.</p> <p><b>bidirectional   dense   sparse</b>—(Optional) Clear PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.</p> <p><b>exact</b>—(Optional) Clear only the group that exactly matches the specified group address.</p> <p><b>inet   inet6</b>—(Optional) Clear the PIM entries for IPv4 or IPv6 family addresses, respectively.</p> <p><b>instance instance-name</b>—(Optional) Clear the entries for a specific PIM-enabled routing instance.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>rp ip-address/prefix   source ip-address/prefix</b>—(Optional) Clear the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.</p> <p><b>sg   star-g</b>—(Optional) Clear PIM (S,G) or (*G) entries.</p> |

**Additional Information** The `clear pim join` command cannot be used to clear the PIM join and prune state on a backup Routing Engine when nonstop active routing is enabled.

**Required Privilege Level** clear

**Related Documentation** • [show pim join on page 1103](#)

**List of Sample Output** [clear pim join on page 1075](#)  
[clear pim join inet6 on page 1075](#)  
[clear pim join inet6 star-g on page 1075](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### `clear pim join`

```
user@host> clear pim join
Cleared 8 Join/Prune states
```

### `clear pim join inet6`

```
user@host> clear pim join inet6
Cleared 4 Join/Prune states
```

### `clear pim join inet6 star-g`

```
user@host> clear pim join inet6 star-g
Cleared 1 Join/Prune states
```

## clear pim join-distribution

| <b>Release Information</b>      | Command introduced in Junos OS Release 10.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Redistribute the Protocol Independent Multicast (PIM) join states.</p> <p>You can find out if there are multiple paths available for a source (for example, an RP) with the output of the <b>show pim source</b> command.</p> <p>When you include the <b>join-load-balance</b> statement in the configuration, the PIM join states are distributed evenly on available equal-cost multipath links. When an upstream neighbor link fails, Junos OS redistributes the PIM join states to the remaining links. However, when new links are added or the failed link is restored, the existing PIM joins are not redistributed to the new link. New flows will be distributed to the new links. However, in a network without new joins and prunes, the new link is not used for multicast traffic. The <b>clear pim join-distribution</b> command redistributes the existing flows to the new upstream neighbors. Redistributing the existing flows causes traffic to be disrupted, so we recommend that you run the <b>clear pim join-distribution</b> command during a maintenance window.</p> |
| <b>Options</b>                  | <p><b>none</b>—Redistribute the PIM join states for the default master instance.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Redistribute the join states for a specific PIM-enabled routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Additional Information</b>   | The <b>clear pim join-distribution</b> command cannot be used to redistribute the PIM join states on a backup Routing Engine when nonstop active routing is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Sample Output

### clear pim snooping join

The following sample output displays information about PIM snooping joins before and after the **clear pim snooping join** command is entered:

```
user@host> show pim snooping join extensive
Instance: vpls1
Learning-Domain: vlan-id 10
Learning-Domain: vlan-id 20

Group: 225.1.1.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.120.5, port: ge-1/3/7.20
Downstream port: ge-1/3/1.20
Downstream neighbors:
20.0.120.2 State: Join Flags: SRW Timeout: 185

Group: 225.1.1.3
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.120.4, port: ge-1/3/5.20
```

```
Downstream port: ge-1/3/3.20
Downstream neighbors:
20.0.120.3 State: Join Flags: SRW Timeout: 175

user@host> clear pim snooping join
Clearing the Join/Prune state for 224.0.0.0/4
Clearing the Join/Prune state for 224.0.0.0/4

user@host> show pim snooping join extensive
Instance: vpls1
Learning-Domain: vlan-id 10
Learning-Domain: vlan-id 20
```

| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Display status information about the specified multicast tunnel interface and its logical encapsulation and de-encapsulation interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b><i>interface-type</i></b>—On M Series and T Series routers, the interface type is <b><i>mt-fpc/pic/port</i></b>. On J Series routers, the interface type is <b><i>mt-pim/O/port</i></b>.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>snmp-index <i>snmp-index</i></b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p> |
| <b>Additional Information</b>   | The multicast tunnel interface has two logical interfaces: encapsulation and de-encapsulation. These interfaces are automatically created by the Junos OS for every multicast-enabled VPN routing and forwarding (VRF) instance. The encapsulation interface carries multicast traffic traveling from the edge interface to the core interface. The de-encapsulation interface carries traffic coming from the core interface to the edge interface.                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Output Fields** [Table 27 on page 1088](#) lists the output fields for the **show interfaces** (Multicast Tunnel) command. Output fields are listed in the approximate order in which they appear.

**Table 27: Multicast Tunnel show interfaces Output Fields**

| Field Name                     | Field Description                                                                                                                                  | Level of Output              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b>      |                                                                                                                                                    |                              |
| <b>Physical interface</b>      | Name of the physical interface.                                                                                                                    | All levels                   |
| <b>Enabled</b>                 | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .               | All levels                   |
| <b>Interface index</b>         | Physical interface's index number, which reflects its initialization sequence.                                                                     | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>            | SNMP index number for the physical interface.                                                                                                      | <b>detail extensive none</b> |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                  | <b>detail extensive</b>      |
| <b>Type</b>                    | Type of interface.                                                                                                                                 | All levels                   |
| <b>Link-level type</b>         | Encapsulation used on the physical interface.                                                                                                      | All levels                   |
| <b>MTU</b>                     | MTU size on the physical interface.                                                                                                                | All levels                   |
| <b>Speed</b>                   | Speed at which the interface is running.                                                                                                           | All levels                   |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                | <b>detail extensive</b>      |
| <b>Device flags</b>            | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels                   |
| <b>Interface flags</b>         | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .    | All levels                   |
| <b>Input Rate</b>              | Input rate in bits per second (bps) and packets per second (pps).                                                                                  | None specified               |
| <b>Output Rate</b>             | Output rate in bps and pps.                                                                                                                        | None specified               |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                  | <b>detail extensive</b>      |

## Sample Output

### show interfaces (Multicast Tunnel)

```
user@host> show interfaces mt-1/2/0
Physical interface: mt-1/2/0, Enabled, Physical link is Up
Interface index: 145, SNMP ifIndex: 41
Type: Multicast-GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
Device flags : Present Running
Interface flags: SNMP-Traps
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)
```

### show interfaces brief (Multicast Tunnel)

```
user@host> show interfaces mt-1/2/0 brief
Physical interface: mt-1/2/0, Enabled, Physical link is Up
Type: Multicast-GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
Device flags : Present Running
Interface flags: SNMP-Traps
```

### show interfaces detail (Multicast Tunnel)

```
user@host> show interfaces mt-1/2/0 detail
Physical interface: mt-1/2/0, Enabled, Physical link is Up
Interface index: 145, SNMP ifIndex: 41, Generation: 28
Type: Multicast-GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
Hold-times : Up 0 ms, Down 0 ms
Device flags : Present Running
Interface flags: SNMP-Traps
Statistics last cleared: Never
Traffic statistics:
 Input bytes : 170664562 560000 bps
 Output bytes : 112345376 368176 bps
 Input packets: 2439107 1000 pps
 Output packets: 2439120 1000 pps
```

### show interfaces extensive (Multicast Tunnel)

```
user@host> show interfaces mt-1/2/0 extensive
Physical interface: mt-1/2/0, Enabled, Physical link is Up
Interface index: 141, SNMP ifIndex: 529, Generation: 144
Type: Multicast-GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
Hold-times : Up 0 ms, Down 0 ms
Device flags : Present Running
Interface flags: SNMP-Traps
Statistics last cleared: Never
```

```

Traffic statistics:
Input bytes : 170664562 560000 bps
Output bytes : 112345376 368176 bps
Input packets: 2439107 1000 pps
Output packets: 2439120 1000 pps
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0

```

Logical interface mt-1/2/0.32768 (Index 83) (SNMP ifIndex 556) (Generation 148)

Flags: Point-To-Point SNMP-Traps 0x4000 IP-Header  
 232.1.1.1:10.0.0.6:47:df:64:0000000800000000 Encapsulation: GRE=NULL

```

Traffic statistics:
Input bytes : 170418430
Output bytes : 112070294
Input packets: 2434549
Output packets: 2435593
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Local statistics:
Input bytes : 0
Output bytes : 80442
Input packets: 0
Output packets: 1031
Transit statistics:
Input bytes : 170418430 560000 bps
Output bytes : 111989852 368176 bps
Input packets: 2434549 1000 pps
Output packets: 2434562 1000 pps
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Protocol inet, MTU: 1572, Generation: 182, Route table: 4
Flags: None
Protocol inet6, MTU: 1572, Generation: 183, Route table: 4

| <b>Output Fields</b>            | Table 28 on page 1092 describes the output fields for the <b>show pim bidirectional df-election</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 28: show pim bidirectional df-election Output Fields

| Field Name          | Field Description                                                            | Level of Output |
|---------------------|------------------------------------------------------------------------------|-----------------|
| <b>Family</b>       | IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ). | All levels      |
| <b>Instance</b>     | Name of the routing instance.                                                | All levels      |
| <b>RPA</b>          | RP address.                                                                  | All levels      |
| <b>Group ranges</b> | Address ranges of the multicast groups mapped to this RP address.            | All levels      |

Table 28: show pim bidirectional df-election Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                           | Level of Output                                                      |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| <b>Interfaces</b> | Bidirectional PIM interfaces on this routing device. An interface can win the DF election ( <b>Win</b> ), lose the DF election ( <b>Lose</b> ), or be the RP link ( <b>RPL</b> ). The RP link is the interface directly connected to a subnet that contains a phantom RP address. A phantom RP address is an RP address that is not assigned to a routing device interface. | All levels<br><br><b>brief</b> displays the DF election winner only. |
| <b>DF</b>         | IP address of the designated forwarder.                                                                                                                                                                                                                                                                                                                                     | All levels                                                           |

## Sample Output

| <b>Output Fields</b>            | <a href="#">Table 29 on page 1095</a> describes the output fields for the <b>show pim bidirectional df-election interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                         |

**Table 29: show pim bidirectional df-election interface Output Fields**

| Field Name             | Field Description                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>        | Name of the routing instance.                                                                                                   |
| <b>Family</b>          | IPv4 address family (INET) or IPv6 address family (INET6).                                                                      |
| <b>Interface</b>       | Name of the bidirectional PIM interface.                                                                                        |
| <b>Robustnes Count</b> | Minimum number of DF election messages that must fail to be received for DF election to fail.                                   |
| <b>Offer Period</b>    | Interval between repeated DF election messages.                                                                                 |
| <b>Backoff Period</b>  | Period that the acting DF waits between receiving a better DF Offer and sending the Pass message to transfer DF responsibility. |

Table 29: show pim bidirectional df-election interface Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RPA        | RP address.                                                                                                                                                  |
| State      | For each RP address, state of each interface with respect to the DF election: <b>Offer</b> (when the election is in progress), <b>Win</b> , or <b>Lose</b> . |
| DF         | IP address of the designated forwarder.                                                                                                                      |

## Sample Output

### show pim bidirectional df-election interface

| <b>Output Fields</b>                                | <a href="#">Table 30 on page 1098</a> describes the output fields for the <b>show pim bootstrap</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                               |

**Table 30: show pim bootstrap Output Fields**

| Field Name           | Field Description                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------|
| <b>Instance</b>      | Name of the routing instance.                                                                   |
| <b>BSR</b>           | Bootstrap router.                                                                               |
| <b>Pri</b>           | Priority of the routing device as elected to be the bootstrap router.                           |
| <b>Local address</b> | Local routing device address.                                                                   |
| <b>Pri</b>           | Local routing device address priority to be elected as the bootstrap router.                    |
| <b>State</b>         | Local routing device election state: <b>Candidate</b> , <b>Elected</b> , or <b>Ineligible</b> . |

Table 30: show pim bootstrap Output Fields (*continued*)

| Field Name | Field Description                                                                                    |
|------------|------------------------------------------------------------------------------------------------------|
| Timeout    | How long until the local routing device declares the bootstrap router to be unreachable, in seconds. |

Sample Output

show pim bootstrap

```
user@host> show pim bootstrap
Instance: PIM.master

BSR Pri Local address Pri State Timeout
None 0 10.255.71.46 0 InEligible 0
feco:1:1:1:1:0:aff:785c 34 feco:1:1:1:1:0:aff:7c12 0 InEligible 0
```

show pim bootstrap instance

```
user@host> show pim bootstrap instance VPN-A
Instance: PIM.VPN-A

BSR Pri Local address Pri State Timeout
None 0 192.168.196.105 0 InEligible 0
```

## show pim interfaces

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mode</b>         | <p>PIM mode running on the interface:</p> <ul style="list-style-type: none"> <li>• <b>B</b>—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers.</li> <li>• <b>S</b>—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic.</li> <li>• <b>Dense</b>—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.)</li> <li>• <b>Sparse-Dense</b>—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as <b>dense</b> is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as <b>sparse</b> is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules. (Not supported on QFX Series.)</li> </ul> <p>When sparse-dense mode is configured, the output includes both <b>S</b> and <b>D</b>. When bidirectional-sparse mode is configured, the output includes <b>S</b> and <b>B</b>. When bidirectional-sparse-dense mode is configured, the output includes <b>B</b>, <b>S</b>, and <b>D</b>.</p> |
| <b>IP</b>           | Version number of the address family on the interface: <b>4</b> (IPv4) or <b>6</b> (IPv6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>                                  | <p>Display information about Protocol Independent Multicast (PIM) groups for all PIM modes.</p> <p>For bidirectional PIM, display information about PIM group ranges (*G-range) for each active bidirectional RP group range, in addition to each of the joined (*G) routes.</p>                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                                      | <p><b>none</b>—Display the standard information about PIM groups for all supported family addresses for all routing instances.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of output.</p> <p><b>bidirectional   dense   sparse</b>—(Optional) Display information about PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.</p> <p><b>exact</b>—(Optional) Display information about only the group that exactly matches the specified group address.</p> <p><b>inet   inet6</b>—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.</p> |

**instance *instance-name***—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**range**—(Optional) Address range of the group, specified as *prefix/prefix-length*.

**rp *ip-address/prefix* | source *ip-address/prefix***—(Optional) Display information about the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

**sg | star-g**—(Optional) Display information about PIM (S,G) or (\*G) entries.

**Required Privilege  
Level**

| <b>Instance</b>                                  | Name of the routing instance.                                                                                                                                                                                                                                                                                  | All levels        |
| <b>Interface</b>                                 | Interface through which the neighbor is reachable.                                                                                                                                                                                                                                                             | All levels        |
| <b>Neighbor addr</b>                             | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                 | All levels        |
| <b>IP</b>                                        | IP version: 4 or 6.                                                                                                                                                                                                                                                                                            | All levels        |
| <b>V</b>                                         | PIM version running on the neighbor: 1 or 2.                                                                                                                                                                                                                                                                   | All levels        |
| <b>Mode</b>                                      | PIM mode of the neighbor: <b>Sparse</b> , <b>Dense</b> , <b>SparseDense</b> , or <b>Unknown</b> . When the neighbor is running PIM version 2, this mode is always <b>Unknown</b> .                                                                                                                             | All levels        |
| <b>Option</b>                                    | Can be one or more of the following: <ul style="list-style-type: none"> <li>• <b>B</b>—Bidirectional Capable.</li> <li>• <b>H</b>—Hello Option Holdtime.</li> <li>• <b>G</b>—Generation Identifier.</li> <li>• <b>P</b>—Hello Option DR Priority.</li> <li>• <b>L</b>—Hello Option LAN Prune Delay.</li> </ul> | <b>brief</b> none |
| <b>Uptime</b>                                    | Time the neighbor has been operational since the PIM process was last initialized, in the format <b>dd:hh:mm:ss ago</b> for less than a week and <b>nwnd:hh:mm:ss ago</b> for more than a week.                                                                                                                | All levels        |
| <b>Address</b>                                   | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>BFD</b>                                       | Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: <b>Enabled</b> , <b>Operational state is up</b> , or <b>Disabled</b> .                                                                                                                                 | <b>detail</b>     |
| <b>Hello Option Holdtime</b>                     | Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>Hello Default Holdtime</b>                    | Default holdtime and the time remaining if the <b>holdtime</b> option is not in the received hello message.                                                                                                                                                                                                    | <b>detail</b>     |
| <b>Hello Option DR Priority</b>                  | Designated router election priority. The range of values is 0 through 255.                                                                                                                                                                                                                                     | <b>detail</b>     |
| <b>Hello Option Generation ID</b>                | 9-digit or 10-digit number used to tag hello messages.                                                                                                                                                                                                                                                         | <b>detail</b>     |
| <b>Hello Option Bi-Directional PIM supported</b> | Neighbor can process bidirectional PIM messages.                                                                                                                                                                                                                                                               | <b>detail</b>     |
| <b>Hello Option LAN Prune Delay</b>              | Time to wait before the neighbor receives prune messages, in the format <b>delay nnn ms override nnnn ms</b> .                                                                                                                                                                                                 | <b>detail</b>     |

Table 33: show pim neighbors Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                   | Level of Output |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Join Suppression supported | Neighbor is capable of join suppression.                                                                                                                                                                                                                                            | detail          |
| Rx Join                    | Information about joins received from the neighbor. <ul style="list-style-type: none"> <li><b>Group</b>—Group addresses in the join message.</li> <li><b>Source</b>—Address of the source in the join message.</li> <li><b>Timeout</b>—Time for which the join is valid.</li> </ul> | detail          |

## Sample Output

### show pim neighbors

```

user@host> show pim neighbors
Instance: PIM.master
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface IP V Mode Option Uptime Neighbor addr
so-1/0/0.0 4 2 HPLG 00:07:10 10.111.10.2

```

### show pim neighbors brief

The output for the **show pim neighbors brief** command is identical to that for the **show pim neighbors** command. For sample output, see [show pim neighbors on page 1126](#).

### show pim neighbors instance

```

user@host> show pim neighbors instance VPN-A
Instance: PIM.VPN-A
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface IP V Mode Option Uptime Neighbor addr
at-0/3/1.0 4 2 HPLG 00:07:54 10.111.30.2
mt-1/1/0.32768 4 2 HPLG 00:07:22 10.10.47.101
so-1/0/1.0 4 2 HPLG 00:07:50 10.111.20.2

```

### show pim neighbors detail

```

user@host> show pim neighbors detail
Instance: PIM.master
Interface: ge-0/0/1.0

Address: 10.10.1.1, IPv4, PIM v2, Mode: SparseDense, sg Join Count: 0, ts
Join Count: 2
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 2053759302
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

```

```

Address: 10.10.1.2, IPv4, PIM v2, sg Join Count: 0, tsg Join Count: 2
 BFD: Disabled
 Hello Option Holdtime: 105 seconds 93 remaining
 Hello Option DR Priority: 1
 Hello Option Generation ID: 1734018161
 Hello Option Bi-Directional PIM supported
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
 Join Suppression supported

```

```
Interface: lo0.0
```

```

Address: 10.255.179.246, IPv4, PIM v2, Mode: SparseDense, sg Join Count:
0, tsg Join Count: 0
 Hello Option Holdtime: 65535 seconds
 Hello Option DR Priority: 1
 Hello Option Generation ID: 1997462267
 Hello Option Bi-Directional PIM supported
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
 Join Suppression supported

```

#### show pim neighbors detail (With BFD)

```
user@host> show pim neighbors detail
```

```
Instance: PIM.master
```

```
Interface: fe-1/0/0.0
```

```

Address: 192.168.11.1, IPv4, PIM v2, Mode: Sparse
 Hello Option Holdtime: 65535 seconds
 Hello Option DR Priority: 1
 Hello Option Generation ID: 836607909
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

```

```

Address: 192.168.11.2, IPv4, PIM v2
 BFD: Enabled, Operational state is up
 Hello Default Holdtime: 105 seconds 104 remaining
 Hello Option DR Priority: 1
 Hello Option Generation ID: 1907549685
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

```

```
Interface: fe-1/0/1.0
```

```

Address: 192.168.12.1, IPv4, PIM v2
 BFD: Disabled
 Hello Default Holdtime: 105 seconds 80 remaining
 Hello Option DR Priority: 1
 Hello Option Generation ID: 1971554705
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

```

**Table 34: show pim snooping interface Output Fields**

| Field Name             | Field Description                                        | Level of Output |
|------------------------|----------------------------------------------------------|-----------------|
| <b>Instance</b>        | Routing instance for PIM snooping.                       | All levels      |
| <b>Learning-Domain</b> | Learning domain for snooping.                            | All levels      |
| <b>Name</b>            | Router interfaces that are part of this learning domain. | All levels      |
| <b>State</b>           | State of the interface: <b>Up</b> , or <b>Down</b> .     | All levels      |

Table 34: show pim snooping interface Output Fields (*continued*)

| Field Name | Field Description                                                        | Level of Output |
|------------|--------------------------------------------------------------------------|-----------------|
| IP-Version | Version of IP used: 4 for IPv4, or 6 for IPv6.                           | All levels      |
| NbrCnt     | Number of neighboring routers connected through the specified interface. | All levels      |
| DR address | IP address of the designated router.                                     | All levels      |

## Sample Output

### show pim snooping interfaces

```

user@host> show pim snooping interfaces
Instance: vpls1
Learning-Domain: vlan-id 10
Name State IP-Version NbrCnt
ge-1/3/1.10 Up 4 1
ge-1/3/3.10 Up 4 1
ge-1/3/5.10 Up 4 1
ge-1/3/7.10 Up 4 1
DR address: 20.0.110.5
DR flooding is ON

Learning-Domain: vlan-id 20
Name State IP-Version NbrCnt
ge-1/3/1.20 Up 4 1
ge-1/3/3.20 Up 4 1
ge-1/3/5.20 Up 4 1
ge-1/3/7.20 Up 4 1
DR address: 20.0.120.5
DR flooding is ON

```

### show pim snooping interfaces instance vpls1

```

user@host> show pim snooping interfaces instance vpls1
Instance: vpls1

Learning-Domain: vlan-id 10
Name State IP-Version NbrCnt
ge-1/3/1.10 Up 4 1
ge-1/3/3.10 Up 4 1
ge-1/3/5.10 Up 4 1
ge-1/3/7.10 Up 4 1
DR address: 20.0.110.5
DR flooding is ON

Learning-Domain: vlan-id 20
Name State IP-Version NbrCnt
ge-1/3/1.20 Up 4 1
ge-1/3/3.20 Up 4 1
ge-1/3/5.20 Up 4 1
ge-1/3/7.20 Up 4 1
DR address: 20.0.120.5
DR flooding is ON

```

**show pim snooping interfaces interface <interface-name>**

```
user@host> show pim snooping interfaces interface ge-1/3/1.10
Instance: vpls1
Learning-Domain: vlan-id 10

Name State IP-Version NbrCnt
ge-1/3/1.10 Up 4 1
DR address: 20.0.110.5
DR flooding is ON

Learning-Domain: vlan-id 20
DR address: 20.0.120.5
DR flooding is ON
```

**show pim snooping interfaces vlan-id <vlan-id>**

```

Table 35: show pim snooping join Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output  |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Flags</b>                | PIM flags: <ul style="list-style-type: none"> <li>• <b>bidirectional</b>—Bidirectional mode entry.</li> <li>• <b>dense</b>—Dense mode entry.</li> <li>• <b>rptree</b>—Entry is on the rendezvous point tree.</li> <li>• <b>sparse</b>—Sparse mode entry.</li> <li>• <b>spt</b>—Entry is on the shortest-path tree for the source.</li> <li>• <b>wildcard</b>—Entry is on the shared tree.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels       |
| <b>Upstream state</b>       | Information about the upstream interface: <ul style="list-style-type: none"> <li>• <b>Join to RP</b>—Sending a join to the rendezvous point.</li> <li>• <b>Join to Source</b>—Sending a join to the source.</li> <li>• <b>Local RP</b>—Sending neither join messages nor prune messages toward the RP, because this router is the rendezvous point.</li> <li>• <b>Local Source</b>—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device.</li> <li>• <b>Prune to RP</b>—Sending a prune to the rendezvous point.</li> <li>• <b>Prune to Source</b>—Sending a prune to the source.</li> </ul> <p><b>NOTE:</b> RP group range entries have <b>None</b> in the <b>Upstream state</b> field because RP group ranges do not trigger actual PIM join messages between routers.</p> | All levels       |
| <b>Upstream neighbor</b>    | Information about the upstream neighbor: <b>Direct</b> , <b>Local</b> , <b>Unknown</b> , or a specific IP address.<br><br>For bidirectional PIM, <b>Direct</b> means that the interface is directly connected to a subnet that contains a phantom RP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels       |
| <b>Upstream port</b>        | RPF interface toward the source address for the source-specific state (S,G) or toward the rendezvous point (RP) address for the non-source-specific state (*G).<br><br>For bidirectional PIM, <b>RP Link</b> means that the interface is directly connected to a subnet that contains a phantom RP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels       |
| <b>Downstream port</b>      | Information about downstream interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>extensive</b> |
| <b>Downstream neighbors</b> | Address of the downstream neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b> |
| <b>Timeout</b>              | Time remaining until the downstream join state is updated (in seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>extensive</b> |

## Sample Output

### show pim snooping join

```

user@host> show pim snooping join
Instance: vpls1

Learning-Domain: vlan-id 10

```

```

Group: 225.1.1.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.110.4, port: ge-1/3/5.10

```

```

Learning-Domain: vlan-id 20
Group: 225.1.1.3
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.120.4, port: ge-1/3/5.20

```

### show pim snooping join extensive

```

user@host> show pim snooping join extensive
Instance: vpls1
Learning-Domain: vlan-id 10

Group: 225.1.1.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.110.4, port: ge-1/3/5.10
Downstream port: ge-1/3/1.10
Downstream neighbors:
20.0.110.2 State: Join Flags: SRW Timeout: 166

Learning-Domain: vlan-id 20
Group: 225.1.1.3
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.120.4, port: ge-1/3/5.20
Downstream port: ge-1/3/3.20
Downstream neighbors:
20.0.120.3 State: Join Flags: SRW Timeout: 168

```

### show pim snooping join instance

```

user@host> show pim snooping join instance vpls1
Instance: vpls1

Learning-Domain: vlan-id 10
Group: 225.1.1.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.110.4, port: ge-1/3/5.10

Learning-Domain: vlan-id 20
Group: 225.1.1.3

| <b>Output Fields</b>            | Table 36 on page 1135 lists the output fields for the <b>show pim snooping neighbors</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                      |

**Table 36: show pim snooping neighbors Output Fields**

| Field Name      | Field Description                  | Level of Output |
|-----------------|------------------------------------|-----------------|
| Instance        | Routing instance for PIM snooping. | All levels      |
| Learning-Domain | Learning domain for PIM snooping.  | All levels      |

Table 36: show pim snooping neighbors Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                             | Level of Output |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>                    | Router interface for which PIM snooping neighbor details are displayed.                                                                                                                                                                                                                       | All levels      |
| <b>Option</b>                       | PIM snooping options available on the specified interface: <ul style="list-style-type: none"> <li>• H = Hello Option Holdtime</li> <li>• P = Hello Option DR Priority</li> <li>• L = Hello Option LAN Prune Delay</li> <li>• G = Generation Identifier</li> <li>• T = Tracking Bit</li> </ul> | All levels      |
| <b>Uptime</b>                       | Time the neighbor has been operational since the PIM process was last initialized, in the format <b>dd:hh:mm:ss ago</b> for less than a week and <b>nwnd:hh:mm:ss ago</b> for more than a week.                                                                                               | All levels      |
| <b>Neighbor addr</b>                | IP address of the PIM snooping neighbor connected through the specified interface.                                                                                                                                                                                                            | All levels      |
| <b>Address</b>                      | IP address of the specified router interface.                                                                                                                                                                                                                                                 | All levels      |
| <b>Hello Option Holdtime</b>        | Time for which the neighbor is available, in seconds. The range of values is <b>0</b> through <b>65,535</b> .                                                                                                                                                                                 | <b>detail</b>   |
| <b>Hello Option DR Priority</b>     | Designated router election priority. The range of values is <b>0</b> through <b>255</b> .<br><br><b>NOTE:</b> By default, every PIM interface has the lowest probability (priority 0) of being selected as the DR.                                                                            | <b>detail</b>   |
| <b>Hello Option Generation ID</b>   | 9-digit or 10-digit number used to tag hello messages.                                                                                                                                                                                                                                        | <b>detail</b>   |
| <b>Hello Option LAN Prune Delay</b> | Time to wait before the neighbor receives prune messages, in the format <b>delay nnn ms override nnnn ms</b> .                                                                                                                                                                                | <b>detail</b>   |

## Sample Output

### show pim snooping neighbors

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                             |

**Table 37: show pim snooping statistics Output Fields**

| Field Name      | Field Description                               | Level of Output |
|-----------------|-------------------------------------------------|-----------------|
| Instance        | Routing instance for PIM snooping.              | All levels      |
| Learning-Domain | Learning domain for PIM snooping.               | All levels      |
| Tx J/P messages | Total number of transmitted join/prune packets. | All levels      |
| RX J/P messages | Total number of received join/prune packets.    | All levels      |

Table 37: show pim snooping statistics Output Fields (*continued*)

| Field Name                   | Field Description                                                                 | Level of Output |
|------------------------------|-----------------------------------------------------------------------------------|-----------------|
| Rx J/P messages -- seen      | Number of join/prune packets seen but not received on the upstream interface.     | All levels      |
| Rx J/P messages -- received  | Number of join/prune packets received on the downstream interface.                | All levels      |
| Rx Hello messages            | Total number of received hello packets.                                           | All levels      |
| Rx Version Unknown           | Number of packets received with an unknown version number.                        | All levels      |
| Rx Neighbor Unknown          | Number of packets received from an unknown neighbor.                              | All levels      |
| Rx Upstream Neighbor Unknown | Number of packets received with unknown upstream neighbor information.            | All levels      |
| Rx Bad Length                | Number of packets received containing incorrect length information.               | All levels      |
| Rx J/P Busy Drop             | Number of join/prune packets dropped while the router is busy.                    | All levels      |
| Rx J/P Group Aggregate 0     | Number of join/prune packets received containing the aggregate group information. | All levels      |
| Rx Malformed Packet          | Number of malformed packets received.                                             | All levels      |
| Rx No PIM Interface          | Number of packets received without the interface information.                     | All levels      |
| Rx No Upstream Neighbor      | Number of packets received without upstream neighbor information.                 | All levels      |
| Rx Unknown Hello Option      | Number of hello packets received with unknown options.                            | All levels      |

## Sample Output

### show pim snooping statistics

```

user@host> show pim snooping statistics
Instance: vpls1
Learning-Domain: vlan-id 10

Tx J/P messages 0
RX J/P messages 8
Rx J/P messages -- seen 0
Rx J/P messages -- received 8
Rx Hello messages 37
Rx Version Unknown 0
Rx Neighbor Unknown 0

```

```
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0
Rx Malformed Packet 0
Rx No PIM Interface 0
Rx No Upstream Neighbor 0
Rx Bad Length 0
Rx Neighbor Unknown 0
Rx Unknown Hello Option 0
Rx Malformed Packet 0
```

Learning-Domain: vlan-id 20

```
Tx J/P messages 0
RX J/P messages 2
Rx J/P messages -- seen 0
Rx J/P messages -- received 2
Rx Hello messages 39
Rx Version Unknown 0
Rx Neighbor Unknown 0
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0
Rx Malformed Packet 0
Rx No PIM Interface 0
Rx No Upstream Neighbor 0
Rx Bad Length 0
Rx Neighbor Unknown 0
Rx Unknown Hello Option 0
Rx Malformed Packet 0
```

#### show pim snooping statistics instance

```
user@host> show pim snooping statistics instance vpls1
```

Instance: vpls1

Learning-Domain: vlan-id 10

```
Tx J/P messages 0
RX J/P messages 9
Rx J/P messages -- seen 0
Rx J/P messages -- received 9
Rx Hello messages 45
Rx Version Unknown 0
Rx Neighbor Unknown 0

Rx No PIM Interface 0
Rx No Upstream Neighbor 0
Rx Bad Length 0
Rx Neighbor Unknown 0
Rx Unknown Hello Option 0
Rx Malformed Packet 0
```

Learning-Domain: vlan-id 20

```

Tx J/P messages 0
RX J/P messages 3
Rx J/P messages -- seen 0
Rx J/P messages -- received 3
Rx Hello messages 47
Rx Version Unknown 0
Rx Neighbor Unknown 0
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0
Rx Malformed Packet 0
Rx No PIM Interface 0
Rx No Upstream Neighbor 0
Rx Bad Length 0
Rx Neighbor Unknown 0
Rx Unknown Hello Option 0
Rx Malformed Packet 0

```

#### show pim snooping statistics interface

```

user@host> show pim snooping statistics interface ge-1/3/1.20
Instance: vpls1
Learning-Domain: vlan-id 10
Learning-Domain: vlan-id 20

PIM Interface statistics for ge-1/3/1.20
Tx J/P messages 0
RX J/P messages 0
Rx J/P messages -- seen 0
Rx J/P messages -- received 0
Rx Hello messages 13
Rx Version Unknown 0
Rx Neighbor Unknown 0
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0
Rx Malformed Packet 0

```

#### show pim snooping statistics vlan-id

```

user@host> show pim snooping statistics vlan-id 10
Instance: vpls1
Learning-Domain: vlan-id 10

Tx J/P messages 0
RX J/P messages 11
Rx J/P messages -- seen 0
Rx J/P messages -- received 11
Rx Hello messages 64
Rx Version Unknown 0
Rx Neighbor Unknown 0
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0
Rx Malformed Packet 0
Rx No PIM Interface 0
Rx No Upstream Neighbor 0

```

Rx Bad Length 0  
Rx Neighbor Unknown 0

| <b>Anycast-PIM Register State</b> | <p>If anycast RP is configured, the current register state for each group:</p> <ul style="list-style-type: none"> <li>• <b>Group</b>—Multicast group address.</li> <li>• <b>Source</b>—Multicast source address for which the PIM register is sent or received, depending on whether this routing device is a designated router facing an RP router, or is the local RP, respectively.</li> <li>• <b>Origin</b>—How the information was obtained: <ul style="list-style-type: none"> <li>• <b>DIRECT</b>—From a local attachment</li> <li>• <b>MSDP</b>—From the Multicast Source Discovery Protocol (MSDP)</li> <li>• <b>DR</b>—From the designated router</li> </ul> </li> </ul> | <b>extensive</b>     |
| <b>RP selected</b>                | For sparse mode and bidirectional mode, the identity of the RP for the specified group address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <i>group-address</i> |

## Sample Output

### show pim rps

```

user@host> show pim rps
Instance: PIM.master
Address family INET
RP address Type Mode Holdtime Timeout Groups Group prefixes
10.10.1.3 static bidir 150 None 2 224.1.3.0/24
 225.1.3.0/24
10.10.13.2 static bidir 150 None 2 224.1.1.0/24
 225.1.1.0/24

```

### show pim rps brief

The output for the **show pim rps brief** command is identical to that for the **show pim rps** command. For sample output, see [show pim rps on page 1148](#).

### show pim rps <group-address> (Bidirectional PIM)

```

user@host> show pim rps 224.1.1.1
Instance: PIM.master

224.1.0.0/16
 11.4.12.75 (Bidirectional)

RP selected: 11.4.12.75

```

### show pim rps <group-address> (PIM Dense Mode)

```

user@host> show pim rps 224.1.1.1
Instance: PIM.master

Dense Mode active for group 224.1.1.1

```

### show pim rps <group-address> (SSM Range Without asm-override-ssm Configured)

```

user@host> show pim rps 224.1.1.1

```

Instance: PIM.master

Source-specific Mode (SSM) active for group 224.1.1.1

#### show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Sparse-Mode RP)

user@host> show pim rps 224.1.1.1

Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16  
11.4.12.75

RP selected: 11.4.12.75

#### show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Bidirectional RP)

user@host> show pim rps 224.1.1.1

Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16  
11.4.12.75 (Bidirectional)

RP selected: (null)

#### show pim rps instance

user@host> show pim rps instance VPN-A

Instance: PIM.VPN-A

Address family INET

| RP address   | Type   | Holdtime | Timeout | Groups | Group prefixes |
|--------------|--------|----------|---------|--------|----------------|
| 10.10.47.100 | static | 0        | None    | 1      | 224.0.0.0/4    |

Address family INET6

#### show pim rps extensive (PIM Sparse Mode)

user@host> show pim rps extensive

Instance: PIM.master

Family: INET

RP: 10.255.245.91

Learned via: static configuration

Time Active: 00:05:48

Holdtime: 45 with 36 remaining

Device Index: 122

Subunit: 32768

Interface: pd-6/0/0.32768

Group Ranges:

224.0.0.0/4, 36s remaining

Active groups using RP:

225.1.1.1

total 1 groups active

Register State for RP:

| Group     | Source         | FirstHop      | RP Address    | State   | Timeout |
|-----------|----------------|---------------|---------------|---------|---------|
| 225.1.1.1 | 192.168.195.78 | 10.255.14.132 | 10.255.245.91 | Receive | 0       |

**show pim rps extensive (Bidirectional PIM)**

| <b>Output Fields</b>                                | <a href="#">Table 39 on page 1153</a> describes the output fields for the <b>show pim source</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 39: show pim source Output Fields

| Field Name                | Field Description                                                                                                                                                                     |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>           | Name of the routing instance.                                                                                                                                                         |
| <b>Source</b>             | Address of the source or reverse path.                                                                                                                                                |
| <b>Prefix/length</b>      | Prefix and prefix length for the route used to reach the RPF address.                                                                                                                 |
| <b>Upstream Protocol</b>  | Protocol toward the source address.                                                                                                                                                   |
| <b>Upstream interface</b> | RPF interface toward the source address.<br><br>A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.            |
| <b>Upstream Neighbor</b>  | Address of the RPF neighbor used to reach the source address.<br><br>The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling. |

## Sample Output

### show pim source

```

user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
 Prefix 10.255.14.144/32
 Upstream interface Local
 Upstream neighbor Local

Source 10.255.70.15
 Prefix 10.255.70.15/32
 Upstream interface so-1/0/0.0
 Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6

```

### show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see [show pim source on page 1153](#).

### show pim source detail

```

user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
 Prefix 10.255.14.144/32
 Upstream interface Local
 Upstream neighbor Local
 Active groups:228.0.0.0
 239.1.1.1

```

239.1.1.1

Source 10.255.70.15  
Prefix 10.255.70.15/32  
Upstream interface so-1/0/0.0  
Upstream neighbor 10.111.10.2  
Active groups:239.1.1.1

Instance: PIM.master Family: INET6

#### show pim source (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs)

user@host> show pim source

Instance: PIM.master Family: INET

Source 1.1.1.1  
Prefix 1.1.1.1/32  
Upstream interface Local  
Upstream neighbor Local

Source 1.2.7.7  
Prefix 1.2.7.0/24  
Upstream protocol MLDP  
Upstream interface Pseudo MLDP  
Upstream neighbor MLDP LSP root <1.1.1.2>

Source 192.168.219.11  
Prefix 192.168.219.0/28  
Upstream protocol MLDP  
Upstream interface Pseudo MLDP  
Upstream neighbor MLDP LSP root <1.1.1.2>

Instance: PIM.master Family: INET6

Source abcd::1:2:7:7  
Prefix abcd::1:2:7:0/120  
Upstream protocol MLDP  
Upstream interface Pseudo MLDP  
Upstream neighbor MLDP LSP root <1.1.1.2>

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                          |

Table 40: show pim statistics Output Fields

| Field Name       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Instance         | <p>Name of the routing instance.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> <li>• <b>inet interface <i>interface-name</i></b></li> <li>• <b>inet6 interface <i>interface-name</i></b></li> <li>• <b>interface <i>interface-name</i></b></li> </ul>                                                                                                 |
| Family           | <p>Output is for IPv4 or IPv6 PIM statistics. <b>INET</b> indicates IPv4 statistics, and <b>INET6</b> indicates IPv6 statistics.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> <li>• <b>inet interface <i>interface-name</i></b></li> <li>• <b>inet6 interface <i>interface-name</i></b></li> <li>• <b>interface <i>interface-name</i></b></li> </ul> |
| PIM statistics   | PIM statistics for all interfaces or for the specified interface.                                                                                                                                                                                                                                                                                                                                                       |
| PIM message type | Message type for which statistics are displayed.                                                                                                                                                                                                                                                                                                                                                                        |
| Received         | Number of received statistics.                                                                                                                                                                                                                                                                                                                                                                                          |
| Sent             | Number of messages sent of a certain type.                                                                                                                                                                                                                                                                                                                                                                              |
| Rx errors        | Number of received packets that contained errors.                                                                                                                                                                                                                                                                                                                                                                       |
| V2 Hello         | PIM version 2 hello packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| V2 Register      | PIM version 2 register packets.                                                                                                                                                                                                                                                                                                                                                                                         |
| V2 Register Stop | PIM version 2 register stop packets.                                                                                                                                                                                                                                                                                                                                                                                    |
| V2 Join Prune    | PIM version 2 join and prune packets.                                                                                                                                                                                                                                                                                                                                                                                   |
| V2 Bootstrap     | PIM version 2 bootstrap packets.                                                                                                                                                                                                                                                                                                                                                                                        |
| V2 Assert        | PIM version 2 assert packets.                                                                                                                                                                                                                                                                                                                                                                                           |
| V2 Graft         | PIM version 2 graft packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| V2 Graft Ack     | PIM version 2 graft acknowledgment packets.                                                                                                                                                                                                                                                                                                                                                                             |
| V2 Candidate RP  | PIM version 2 candidate RP packets.                                                                                                                                                                                                                                                                                                                                                                                     |
| V2 State Refresh | <p>PIM version 2 control messages related to PIM dense mode (PIM-DM) state refresh.</p> <p>State refresh is an extension to PIM-DM. It not supported in Junos OS.</p>                                                                                                                                                                                                                                                   |

Table 40: show pim statistics Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                   |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| V2 DF Election                   | PIM version 2 send and receive messages associated with bidirectional PIM designated forwarder election.            |
| V1 Query                         | PIM version 1 query packets.                                                                                        |
| V1 Register                      | PIM version 1 register packets.                                                                                     |
| V1 Register Stop                 | PIM version 1 register stop packets.                                                                                |
| V1 Join Prune                    | PIM version 1 join and prune packets.                                                                               |
| V1 RP Reachability               | PIM version 1 RP reachability packets.                                                                              |
| V1 Assert                        | PIM version 1 assert packets.                                                                                       |
| V1 Graft                         | PIM version 1 graft packets.                                                                                        |
| V1 Graft Ack                     | PIM version 1 graft acknowledgment packets.                                                                         |
| AutoRP Announce                  | Auto-RP announce packets.                                                                                           |
| AutoRP Mapping                   | Auto-RP mapping packets.                                                                                            |
| AutoRP Unknown type              | Auto-RP packets with an unknown type.                                                                               |
| Anycast Register                 | Auto-RP announce packets.                                                                                           |
| Anycast Register Stop            | Auto-RP announce packets.                                                                                           |
| Global Statistics                | Summary of PIM statistics for all interfaces.                                                                       |
| Hello dropped on neighbor policy | Number of hello packets dropped because of a configured neighbor policy.                                            |
| Unknown type                     | Number of PIM control packets received with an unknown type.                                                        |
| V1 Unknown type                  | Number of PIM version 1 control packets received with an unknown type.                                              |
| Unknown Version                  | Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.          |
| Neighbor unknown                 | Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.              |
| Bad Length                       | Number of PIM control packets received for which the packet size does not match the PIM length field in the packet. |

Table 40: show pim statistics Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                         |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Bad Checksum                    | Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet. |
| Bad Receive If                  | Number of PIM control packets received on an interface that does not have PIM configured.                                 |
| Rx Bad Data                     | Number of PIM control packets received that contain data for TCP Bad register packets.                                    |
| Rx Intf disabled                | Number of PIM control packets received on an interface that has PIM disabled.                                             |
| Rx V1 Require V2                | Number of PIM version 1 control packets received on an interface configured for PIM version 2.                            |
| Rx V2 Require V1                | Number of PIM version 2 control packets received on an interface configured for PIM version 1.                            |
| Rx Register not RP              | Number of PIM register packets received when the routing device is not the RP for the group.                              |
| Rx Register no route            | Number of PIM register packets received when the RP does not have a unicast route back to the source.                     |
| Rx Register no decap if         | Number of PIM register packets received when the RP does not have a de-encapsulation interface.                           |
| Null Register Timeout           | Number of NULL register timeout packets.                                                                                  |
| RP Filtered Source              | Number of PIM packets received when the routing device has a source address filter configured for the RP.                 |
| Rx Unknown Reg Stop             | Number of register stop messages received with an unknown type.                                                           |
| Rx Join/Prune no state          | Number of join and prune messages received for which the routing device has no state.                                     |
| Rx Join/Prune on upstream if    | Number of join and prune messages received on the interface used to reach the upstream routing device, toward the RP.     |
| Rx Join/Prune for invalid group | Number of join or prune messages received for invalid multicast group addresses.                                          |
| Rx Join/Prune messages dropped  | Number of join and prune messages received and dropped.                                                                   |
| Rx sparse join for dense group  | Number of PIM sparse mode join messages received for a group that is configured for dense mode.                           |

Table 40: show pim statistics Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx Graft/Graft Ack no state | Number of graft and graft acknowledgment messages received for which the router or switch has no state.                                                                     |
| Rx Graft on upstream if     | Number of graft messages received on the interface used to reach the upstream routing device, toward the RP.                                                                |
| Rx CRP not BSR              | Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.                                                                 |
| Rx BSR when BSR             | Number of BSR messages received in which the PIM message type is Bootstrap.                                                                                                 |
| Rx BSR not RPF if           | Number of BSR messages received on an interface that is not the RPF interface.                                                                                              |
| Rx unknown hello opt        | Number of PIM hello packets received with options that Junos OS does not support.                                                                                           |
| Rx data no state            | Number of PIM control packets received for which the routing device has no state for the data type.                                                                         |
| Rx RP no state              | Number of PIM control packets received for which the routing device has no state for the RP.                                                                                |
| Rx aggregate                | Number of PIM aggregate MDT packets received.                                                                                                                               |
| Rx malformed packet         | Number of PIM control packets received with a malformed IP unicast or multicast address family.                                                                             |
| No RP                       | Number of PIM control packets received with no RP address.                                                                                                                  |
| No register encap if        | Number of PIM register packets received when the first-hop routing device does not have an encapsulation interface.                                                         |
| No route upstream           | Number of PIM control packets received when the routing device does not have a unicast route to the the interface used to reach the upstream routing device, toward the RP. |
| Nexthop Unusable            | Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.                                                  |
| RP mismatch                 | Number of PIM control packets received for which the routing device has an RP mismatch.                                                                                     |
| RP mode mismatch            | RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.                                                                           |
| RPF neighbor unknown        | Number of PIM control packets received for which the routing device has an unknown RPF neighbor for the source.                                                             |

Table 40: show pim statistics Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx Joins/Prunes filtered            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Tx Joins/Prunes filtered            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Embedded-RP invalid addr            | Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Embedded-RP limit exceed            | Number of times the limit configured with the <b>maximum-rps</b> statement is exceeded. The <b>maximum-rps</b> statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Embedded-RP added                   | <p>Number of packets in which the embedded RP for IPv6 is added.</p> <p>The following receive events trigger extraction of an IPv6 embedded RP address on the routing device:</p> <ul style="list-style-type: none"> <li>• Multicast Listener Discovery (MLD) report for an embedded RP multicast group address</li> <li>• PIM join message with an embedded RP multicast group address</li> <li>• Static embedded RP multicast group address associated with an interface</li> <li>• Packets sent to an embedded RP multicast group address received on the DR</li> </ul> <p>An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.</p> |
| Embedded-RP removed                 | Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Rx Register msgs filtering drop     | Number of received register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Tx Register msgs filtering drop     | Number of register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Rx Bidir Join/Prune on non-Bidir if | Error counter for join and prune messages received on non-bidirectional PIM interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Rx Bidir Join/Prune on non-DF if    | Error counter for join and prune messages received on non-designated forwarder interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| V4 (S,G) Maximum                    | Maximum number of (S,G) IPv4 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| V6 Register Accepted                  | Number of accepted IPv6 PIM registers.                                                                                                                                                                                                            |
| V6 Register Threshold                 | Threshold at which a warning message is logged (percentage of the maximum number of IPv6 PIM registers accepted by the device).                                                                                                                   |
| V6 Register Log Interval              | Time (in seconds) between consecutive log messages.                                                                                                                                                                                               |
| (*G) Join drop due to SSM range check | PIM join messages that are dropped because the multicast addresses are outside of the SSM address range of 232.0.0.0 through 232.255.255.255. You can extend the accepted SSM address range by configuring the <code>ssm-groups</code> statement. |

| <b>Description</b>              | Display backup PE router group information when ingress PE redundancy is configured. Ingress PE redundancy provides a backup resource when point-to-multipoint LSPs are configured for multicast distribution.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b>none</b>—Display standard information about all backup PE groups.</p> <p><b>address <i>pe-address</i></b>—(Optional) Display the groups that a PE address is associated with.</p> <p><b>group <i>group</i></b>—(Optional) Display the backup PE group information for a particular group.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display backup PE group information for a specific multicast instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |

| <b>Output Fields</b>            | <a href="#">Table 41 on page 1176</a> describes the output fields for the <b>show multicast backup-pe-groups</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 41: show multicast backup-pe-groups Output Fields**

| Field Name      | Field Description                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Backup PE Group | Group name.                                                                                                                                                          |
| Designated PE   | Primary PE router. Address of the PE router that is currently forwarding traffic on the static route.                                                                |
| Transitions     | Number of times that the designated PE router has transitioned from the most eligible PE router to a backup PE router and back again to the most eligible PE router. |
| Last Transition | Time of the most recent transition.                                                                                                                                  |
| Local Address   | Address of the local PE router.                                                                                                                                      |
| Backup PE List  | List of PE routers that are configured to be backups for the group.                                                                                                  |

## Sample Output

### show multicast backup-pe-groups

```
user@host> show multicast backup-pe-groups
Instance: master

Backup PE group: b1
 Designated PE: 10.255.165.7
 Transitions: 1
 Last Transition: 03:15:01
 Local Address: 10.255.165.7
 Backup PE List:
 10.255.165.8

Backup PE group: b2
 Designated PE: 10.255.165.7
 Transitions: 2
 Last Transition: 02:58:20
 Local Address: 10.255.165.7
 Backup PE List:
 10.255.165.9
 10.255.165.8
```

|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>           | Name of the routing instance for which multicast forwarding cache statistics are displayed.                                                                                                                                                                                                 |
| <b>Family</b>             | Protocol family for which multicast forwarding cache statistics are displayed: <b>ALL</b> , <b>INET</b> , or <b>INET6</b> .                                                                                                                                                                 |
| <b>Suppress Threshold</b> | Maximum number of multicast forwarding cache entries that can be added to the cache. When the number of entries reaches the configured threshold, the device suspends adding new multicast forwarding cache entries.                                                                        |
| <b>Reuse Value</b>        | Number of multicast forwarding cache entries that must be reached before the device creates new multicast forwarding cache entries. When the total number of multicast forwarding cache entries is below the reuse value, the device resumes adding new multicast forwarding cache entries. |

Table 42: show multicast forwarding-cache statistics Output Fields (*continued*)

| Field Name                    | Field Description                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------|
| <b>Warning Threshold</b>      | Threshold at which a warning message is logged (percentage of the suppress threshold). |
| <b>Currently Used Entries</b> | Number of currently used multicast forwarding cache entries.                           |

## Sample Output

### show multicast forwarding-cache statistics

```

user@host> show multicast forwarding-cache statistics
Instance: master Family: INET
Suppress Threshold 100
Reuse Value 80
Warning Threshold 90
Currently Used Entries 101

Instance: master Family: INET6
Suppress Threshold 50
Reuse Value 50
Warning Threshold 80
Currently Used Entries 3

```

### show multicast forwarding-cache statistics instance

```

user@host> show multicast forwarding-cache statistics instance VPN-A
Instance: VPN-A Family: ALL
Suppress Threshold 20
Reuse Value 16
Warning Threshold 50
Currently Used Entries 17

```

## show multicast flow-map

|                                                     |                                                                                                                                                                                                                                                                                                                                          |

**Table 43: show multicast flow-map Output Fields**

| Field Name                | Field Description                                         | Levels of Output |
|---------------------------|-----------------------------------------------------------|------------------|
| <b>Name</b>               | Name of the flow map.                                     | All levels       |
| <b>Policy</b>             | Name of the policy associated with the flow map.          | All levels       |
| <b>Cache-timeout</b>      | Cache timeout value assigned to the flow map.             | All levels       |
| <b>Bandwidth</b>          | Bandwidth setting associated with the flow map.           | All levels       |
| <b>Adaptive</b>           | Whether or not adaptive mode is enabled for the flow map. | none             |
| <b>Flow-map</b>           | Name of the flow map.                                     | <b>detail</b>    |
| <b>Adaptive Bandwidth</b> | Whether or not adaptive mode is enabled for the flow map. | <b>detail</b>    |
| <b>Redundant Sources</b>  | Redundant sources defined for the same destination group. | <b>detail</b>    |

## Sample Output

### show multicast flow-map

```
user@host> show multicast flow-map
Instance: master
Name Policy Cache timeout Bandwidth Adaptive
map2 policy2 never 2000000 no
map1 policy1 60 seconds 2000000 no
```

## Sample Output

### show multicast flow-map detail

```
user@host> show multicast flow-map detail
Instance: master
Flow-map: map1
 Policy: policy1
 Cache Timeout: 600 seconds
 Bandwidth: 2000000
 Adaptive Bandwidth: yes
 Redundant Sources: 11.11.11.11
 Redundant Sources: 11.11.11.12
 Redundant Sources: 11.11.11.13
```

## show multicast interface

| <b>Output Fields</b>                                | <a href="#">Table 46 on page 1187</a> describes the output fields for the <b>show multicast next-hops</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 46: show multicast next-hops Output Fields

| Field Name                     | Field Description                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Family</b>                  | Protocol family (such as <b>INET</b> ).                                                                                                                |
| <b>ID</b>                      | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.                                        |
| <b>Refcount</b>                | Number of cache entries that are using this next hop.                                                                                                  |
| <b>KRefcount</b>               | Kernel reference count for the next hop.                                                                                                               |
| <b>Downstream interface</b>    | Interface names associated with each multicast next-hop ID.                                                                                            |
| <b>Incoming interface list</b> | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM. |

## Sample Output

### show multicast next-hops

```

user@host> show multicast next-hops
Family: INET
ID Refcount KRefcount Downstream interface
262142 4 2 so-1/0/0.0
262143 2 1 mt-1/1/0.49152
262148 2 1 mt-1/1/0.32769

```

### show multicast next-hops (Bidirectional PIM)

```

user@host> show multicast next-hops
Family: INET
ID Refcount KRefcount Downstream interface
2097151 8 4 ge-0/0/1.0

Family: INET6
ID Refcount KRefcount Downstream interface
2097157 2 1 ge-0/0/1.0

Family: Incoming interface list
ID Refcount KRefcount Downstream interface
513 5 2 lo0.0
 ge-0/0/1.0
514 5 2 lo0.0
 ge-0/0/1.0
 xe-4/1/0.0
515 3 1 lo0.0
 ge-0/0/1.0
 xe-4/1/0.0
544 1 0 lo0.0
 xe-4/1/0.0

```

### show multicast next-hops brief

The output for the **show multicast next-hops brief** command is identical to that for the **show multicast next-hops** command. For sample output, see [show multicast next-hops on page 1187](#).

### show multicast next-hops detail

```
user@host> show multicast next-hops detail
Family: INET
ID Refcount KRefCount Downstream interface
1048577 2 1 fe-0/1/2.0-(1048574)
 ge-0/2/3.0-(1048576)
```

## show multicast route

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Output Fields** [Table 47 on page 1190](#) describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

**Table 47: show multicast route Output Fields**

| Field Name                    | Field Description                                                                                                                                                                               | Level of Output         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| family                        | IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ).                                                                                                                    | All levels              |
| Group                         | Group address.<br><br>For any-source multicast routes, for example for bidirectional PIM, the group address includes the prefix length.                                                         | All levels              |
| Source                        | Prefix and length of the source as it is in the multicast forwarding table.                                                                                                                     | All levels              |
| Incoming interface list       | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                          | All levels              |
| Upstream interface            | Name of the interface on which the packet with this source prefix is expected to arrive.                                                                                                        | All levels              |
| Upstream rpf interface list   | When multicast-only fast reroute (MoFRR) is enabled, a PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. | All levels              |
| Downstream interface list     | List of interface names to which the packet with this source prefix is forwarded.                                                                                                               | All levels              |
| Number of outgoing interfaces | Total number of outgoing interfaces for each (S,G) entry.                                                                                                                                       | <b>extensive</b>        |
| Session description           | Name of the multicast session.                                                                                                                                                                  | <b>detail extensive</b> |

Table 47: show multicast route Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Statistics                             | Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays <b>Forwarding statistics are not available</b> .<br><br><b>NOTE:</b> On QFX Series switches, this field does not report valid statistics. | detail extensive  |
| Next-hop ID                            | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the <b>show multicast nexthops</b> command.                                                                                                                                                                                                                                     | detail extensive  |
| Incoming interface list ID             | For bidirectional PIM, incoming interface list identifier.<br><br>Identifiers for interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                                                                                                                                                                                      | detail extensive  |
| Upstream protocol or source            | The protocol that maintains the active multicast forwarding route for this group or source.<br><br>When the <b>show multicast route extensive</b> command is used with the <b>display-origin-protocol</b> option, the field name is only <b>Protocol</b> and not <b>Upstream Protocol</b> . However, this field also displays the protocol that installed the active route.                                                           | detail extensive  |
| Route type                             | Type of multicast route. Values can be (S,G) or (*,G).                                                                                                                                                                                                                                                                                                                                                                                | summary           |

| Route count                            | Number of multicast routes.                                                                                                                                                                                                                                                                                                                                                                                                           | summary           |
| Forwarding state                       | Whether the prefix is pruned or forwarding.                                                                                                                                                                                                                                                                                                                                                                                           | extensive         |
| Cache lifetime/timeout                 | Number of seconds until the prefix is removed from the multicast forwarding table. A value of <b>never</b> indicates a permanent forwarding entry. A value of <b>forever</b> indicates routes that do not have keepalive times.                                                                                                                                                                                                       | extensive         |
| Wrong incoming interface notifications | Number of times that the upstream interface was not available.                                                                                                                                                                                                                                                                                                                                                                        | extensive         |
| Uptime                                 | Time since the creation of a multicast route.                                                                                                                                                                                                                                                                                                                                                                                         | extensive         |

## Sample Output

### show multicast route

```

user@host> show multicast route
Family: INET

Group: 228.0.0.0
Source: 10.255.14.144/32

```

```
Upstream interface: local
Downstream interface list:
 so-1/0/0.0

Group: 239.1.1.1
Source: 10.255.14.144/32
Upstream interface: local
Downstream interface list:
 so-1/0/0.0

Group: 239.1.1.1
Source: 10.255.70.15/32
Upstream interface: so-1/0/0.0
Downstream interface list:
 mt-1/1/0.1081344

Family: INET6
```

### show multicast route (Bidirectional PIM)

```
user@host> show multicast route
Family: INET

Group: 224.1.1.0/24
Source: *
Incoming interface list:
 lo0.0 ge-0/0/1.0
Downstream interface list:
 ge-0/0/1.0

Group: 224.1.3.0/24
Source: *
Incoming interface list:
 lo0.0 ge-0/0/1.0 xe-4/1/0.0
Downstream interface list:
 ge-0/0/1.0

Group: 225.1.1.0/24
Source: *
Incoming interface list:
 lo0.0 ge-0/0/1.0
Downstream interface list:
 ge-0/0/1.0

Group: 225.1.3.0/24

 lo0.0 ge-0/0/1.0 xe-4/1/0.0
Downstream interface list:
 ge-0/0/1.0

Family: INET6
```

### show multicast route brief

The output for the **show multicast route brief** command is identical to that for the **show multicast route** command. For sample output, see [show multicast route on page 1191](#) or [show multicast route \(Bidirectional PIM\) on page 1192](#).

**show multicast route detail**

```

user@host> show multicast route detail
Family: INET

Group: 228.0.0.0
 Source: 10.255.14.144/32
 Upstream interface: local
 Downstream interface list:
 so-1/0/0.0

**Output Fields** Table 48 on page 1197 describes the output fields for the **show multicast rpf** command. Output fields are listed in the approximate order in which they appear.

**Table 48: show multicast rpf Output Fields**

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>      | Name of the routing instance. (Displayed when multicast is configured within a routing instance.)                                                                                                                                                                                                                                                                                                             |
| <b>Source prefix</b> | Prefix and length of the source as it exists in the multicast forwarding table.                                                                                                                                                                                                                                                                                                                               |
| <b>Protocol</b>      | How the route was learned.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Interface</b>     | Upstream RPF interface.<br><br><b>NOTE:</b> The displayed interface information does not apply to bidirectional PIM RP addresses. This is because the <b>show multicast rpf</b> command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF interface information, always use the <b>show pim join extensive</b> command when bidirectional PIM is configured. |
| <b>Neighbor</b>      | Upstream RPF neighbor.<br><br><b>NOTE:</b> The displayed neighbor information does not apply to bidirectional PIM. This is because the <b>show multicast rpf</b> command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF neighbor information, always use the <b>show pim join extensive</b> command when bidirectional PIM is configured.                 |

## Sample Output

### show multicast rpf

```

user@host> show multicast rpf

Multicast RPF table: inet.0, 12 entries

0.0.0.0/0
 Protocol: Static

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 49: show multicast scope Output Fields**

| Field Name      | Field Description                                           |
|-----------------|-------------------------------------------------------------|
| Scope name      | Name of the multicast scope.                                |
| Group Prefix    | Range of multicast groups that are scoped.                  |
| Interface       | Interface that is the boundary of the administrative scope. |
| Resolve Rejects | Number of kernel resolve rejects.                           |

## Sample Output

### show multicast scope

```
user@host> show multicast scope
```

| Scope name | Group Prefix   | Interface  | Resolve<br>Rejects |
|------------|----------------|------------|--------------------|
| 232-net    | 232.232.0.0/16 | fe-0/0/0.1 | 0                  |
| local      | 239.255.0.0/16 | fe-0/0/0.1 | 0                  |
| local      | ff05::/16      | fe-0/0/0.1 | 0                  |
| larry      | ff05::1234/128 | fe-0/0/0.1 | 0                  |

### show multicast scope inet

```
user@host> show multicast scope inet
```

| Scope name | Group Prefix   | Interface  | Resolve<br>Rejects |
|------------|----------------|------------|--------------------|
| 232-net    | 232.232.0.0/16 | fe-0/0/0.1 | 0                  |
| local      | 239.255.0.0/16 | fe-0/0/0.1 | 0                  |

### show multicast scope inet6

```
user@host> show multicast scope inet6
```

| Scope name | Group Prefix   | Interface  | Resolve<br>Rejects |
|------------|----------------|------------|--------------------|
| local      | ff05::/16      | fe-0/0/0.1 | 0                  |
| larry      | ff05::1234/128 | fe-0/0/0.1 | 0                  |

## show multicast sessions

---

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | Display IP multicast statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>none</b>—Display multicast statistics for all supported address families for all routing instances.</p> <p><b>inet   inet6</b>—(Optional) Display multicast statistics for IPv4 or IPv6 family addresses, respectively.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display statistics for a specific routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| <b>Additional Information</b>   | The input and output interface multicast statistics are consistent, but not timely. They are constructed from the forwarding statistics, which are gathered at 30-second intervals. Therefore, the output from this command always lags the true count by up to 30 seconds.                                                                                                                                                                                                                              |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 52: show multicast statistics Output Fields**

| Field Name       | Field Description                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------|
| Family           | Protocol family for which multicast statistics are displayed: <b>INET</b> or <b>INET6</b> .                               |
| Interface        | Name of the interface for which statistics are being reported.                                                            |
| Routing Protocol | Primary multicast protocol on the interface: <b>PIM</b> , <b>DVMRP</b> for <b>INET</b> , or <b>PIM</b> for <b>INET6</b> . |
| Mismatch         | Number of multicast packets that did not arrive on the correct upstream interface.                                        |
| Kernel Resolve   | Number of resolve requests processed by the primary multicast protocol on the interface.                                  |

Table 52: show multicast statistics Output Fields (*continued*)

| Field Name                                                                    | Field Description                                                                                                                                                      |
|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resolve No Route</b>                                                       | Number of resolve requests that were ignored because there was no route to the source.                                                                                 |
| <b>In Kbytes</b>                                                              | Total accumulated incoming packets (in KB) since the last time the <b>clear multicast statistics</b> command was issued.                                               |
| <b>Out Kbytes</b>                                                             | Total accumulated outgoing packets (in KB) since the last time the <b>clear multicast statistics</b> command was issued.                                               |
| <b>Mismatch error</b>                                                         | Number of mismatches that were ignored because of internal errors.                                                                                                     |
| <b>Mismatch No Route</b>                                                      | Number of mismatches that were ignored because there was no route to the source.                                                                                       |
| <b>Routing Notify</b>                                                         | Number of times that the multicast routing system has been notified of a new multicast source by a multicast routing protocol .                                        |
| <b>Resolve Error</b>                                                          | Number of resolve requests that were ignored because of internal errors.                                                                                               |
| <b>In Packets</b>                                                             | Total number of incoming packets since the last time the <b>clear multicast statistics</b> command was issued.                                                         |
| <b>Out Packets</b>                                                            | Total number of outgoing packets since the last time the <b>clear multicast statistics</b> command was issued.                                                         |
| <b>Resolve requests on interfaces not enabled for multicast <i>n</i></b>      | Number of resolve requests on interfaces that are not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued. |
| <b>Resolve requests with no route to source <i>n</i></b>                      | Number of resolve requests with no route to the source that have accumulated since the <b>clear multicast statistics</b> command was last issued.                      |
| <b>Routing notifications on interfaces not enabled for multicast <i>n</i></b> | Number of routing notifications on interfaces not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued.     |
| <b>Routing notifications with no route to source <i>n</i></b>                 | Number of routing notifications with no route to the source that have accumulated since the <b>clear multicast statistics</b> command was last issued.                 |
| <b>Interface Mismatches on interfaces not enabled for multicast <i>n</i></b>  | Number of interface mismatches on interfaces not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued.      |
| <b>Group Membership on interfaces not enabled for multicast <i>n</i></b>      | Number of group memberships on interfaces not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued.         |

## Sample Output

### show multicast statistics

```

user@host> show multicast statistics

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                |

**Table 53: show policy Output Fields**

| Field Name         | Field Description               |
|--------------------|---------------------------------|
| <i>policy-name</i> | Name of the policy listed.      |
| <i>term</i>        | Policy term listed.             |
| <i>from</i>        | Match condition for the policy. |
| <i>then</i>        | Action for the policy.          |

## Sample Output

### show policy

```
user@host> show policy
```

```
Configured policies:
__vrf-export-red-internal__
__vrf-import-red-internal__
red-export
all_routes
```

#### show policy policy-name

```
user@host> show policy test-statics
Policy test-statics:
 from
 3.0.0.0/8 accept
 3.1.0.0/16 accept
 then reject
```

#### show policy (Multicast Scoping)

```
user@host> show policy test-statics
Policy test-statics:
 from
 multicast-scoping == 8
```

## CHAPTER 36

# IGMP Operational Commands

- `clear igmp statistics`
- `mtrace`
- `mtrace from-source`
- `mtrace monitor`
- `mtrace to-gateway`
- `show igmp group`
- `show igmp interface`
- `show multicast pim-to-igmp-proxy`

## clear igmp statistics

---

| <b>Output Fields</b>            | <a href="#">Table 54 on page 1216</a> describes the output fields for the <b>mtrace</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                               |

**Table 54: mtrace Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <i>number-of-hops</i>             | Number of hops from the source to the named router or switch. |
| <i>router-name</i>                | Name of the router or switch for this hop.                    |
| <i>address</i>                    | Address of the router or switch for this hop.                 |

Table 54: mtrace Output Fields (*continued*)

| Field Name      | Field Description                              |
|-----------------|------------------------------------------------|
| <i>protocol</i> | Protocol used (for example, PIM).              |
| Round trip time | Average round-trip time, in milliseconds (ms). |
| total ttl of    | Time-to-live (TTL) threshold.                  |

## Sample Output

### mtrace source

```
user@host> mtrace 192.1.4.2
Mtrace from 192.1.4.2 to 192.1.1.2 via group 0.0.0.0
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)
-1 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
-2 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
-3 hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.
```

## mtrace from-source

**Syntax** `mtrace from-source source source`  
`<brief | detail>`  
`<extra-hops extra-hops>`  
`<group group>`  
`<interval interval>`  
`<loop>`  
`<max-hops max-hops>`  
`<max-queries max-queries>`  
`<multicast-response | unicast-response>`  
`<no-resolve>`  
`<no-router-alert>`  
`<response response>`  
`<routing-instance routing-instance-name>`  
`<ttl tll>`  
`<wait-time wait-time>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display trace information about an IP multicast path from a source to this router or switch. If you specify a group address with this command, Junos OS returns additional information, such as packet rates and losses.

**Options** **brief | detail**—(Optional) Display the specified level of output.

**extra-hops *extra-hops***—(Optional) Number of hops to take after reaching a nonresponsive router. You can specify a number between **0** and **255**.

**group *group***—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

**interval *interval***—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10** seconds.

**loop**—(Optional) Loop indefinitely, displaying rate and loss statistics.

**max-hops *max-hops***—(Optional) Maximum hops to trace toward the source. The range of values is **0** through **255**. The default value is **32** hops.

**max-queries *max-queries***—(Optional) Maximum number of query attempts for any hop. The range of values is 1 through **32**. The default is **3**.

**multicast-response**—(Optional) Always request the response using multicast.

**no-resolve**—(Optional) Do not attempt to display addresses symbolically.

**no-router-alert**—(Optional) Do not use the router-alert IP option.

**response *response***—(Optional) Send trace response to a host or multicast address.

**routing-instance** *routing-instance-name*—(Optional) Trace a particular routing instance.

**source** *source*—Source hostname or address.

**ttl** *tll*—(Optional) IP time-to-live (TTL) value. You can specify a number between 0 and 255. Local queries to the multicast group use a value of 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time** *wait-time*—(Optional) Number of seconds to wait for a response. The default value is 3.

**Required Privilege Level**

## mtrace to-gateway

---

**Syntax** `mtrace to-gateway gateway gateway`  
`<brief | detail>`  
`<extra-hops extra-hops>`  
`<group group>`  
`<interface interface-name>`  
`<interval interval>`  
`<loop>`  
`<max-hops max-hops>`  
`<max-queries max-queries>`  
`<multicast-response | unicast-response>`  
`<no-resolve>`  
`<no-router-alert>`  
`<response response>`  
`<routing-instance routing-instance-name>`  
`<ttl ttl>`  
`<unicast-response>`  
`<wait-time wait-time>`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display trace information about a multicast path from this router or switch to a gateway router or switch.

**Options** `gateway gateway`—Send the trace query to a gateway multicast address.

`brief | detail`—(Optional) Display the specified level of output.

`extra-hops extra-hops`—(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between **0** and **255**.

`group group`—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

`interface interface-name`—(Optional) Source address for sending the trace query.

`interval interval`—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10**.

`loop`—(Optional) Loop indefinitely, displaying rate and loss statistics.

`max-hops max-hops`—(Optional) Maximum hops to trace toward the source. You can specify a number between **0** and **255**. The default value is **32**.

`max-queries max-queries`—(Optional) Maximum number of query attempts for any hop. You can specify a number between **0** and **255**. The default value is **3**.

`multicast-response`—(Optional) Always request the response using multicast.

`no-resolve`—(Optional) Do not attempt to display addresses symbolically.

- no-router-alert**—(Optional) Do not use the router-alert IP option.
- response *response***—(Optional) Send trace response to a host or multicast address.
- routing-instance *routing-instance-name***—(Optional) Trace a particular routing instance.
- ttl *ttl***—(Optional) IP time-to-live value. You can specify a number between 0 and 225. Local queries to the multicast group use TTL 1. Otherwise, the default value is 127.
- unicast-response**—(Optional) Always request the response using unicast.
- wait-time *wait-time***—(Optional) Number of seconds to wait for a response. The default value is 3.

| <b>Output Fields</b>                                  | Table 59 on page 1231 describes the output fields for the <b>show igmp interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                      |

**Table 59: show igmp interface Output Fields**

| Field Name | Field Description                                                               | Level of Output |
|------------|---------------------------------------------------------------------------------|-----------------|
| Interface  | Name of the interface.                                                          | All levels      |
| Querier    | Address of the routing device that has been elected to send membership queries. | All levels      |
| State      | State of the interface: <b>Up</b> or <b>Down</b> .                              | All levels      |

Table 59: show igmp interface Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>SSM Map Policy</b>     | Name of the source-specific multicast (SSM) map policy that has been applied to the IGMP interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| <b>Timeout</b>            | How long until the IGMP querier is declared to be unreachable, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels      |
| <b>Version</b>            | IGMP version being used on the interface: 1, 2, or 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| <b>Groups</b>             | Number of groups on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | All levels      |
| <b>Group limit</b>        | Maximum number of groups allowed on the interface. Any joins requested after the limit is reached are rejected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels      |
| <b>Group threshold</b>    | Configured threshold at which a warning message is generated.<br><br>This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels      |
| <b>Group log-interval</b> | Time (in seconds) between consecutive log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| <b>Immediate Leave</b>    | State of the immediate leave option: <ul style="list-style-type: none"> <li><b>On</b>—Indicates that the router removes a host from the multicast group as soon as the router receives a leave group message from a host associated with the interface.</li> <li><b>Off</b>—Indicates that after receiving a leave group message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |

| SSM map               | Name of the source-specific multicast (SSM) map (if configured) used on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| Configured Parameters | Information configured by the user: <ul style="list-style-type: none"> <li><b>IGMP Query Interval</b>—Interval (in seconds) at which this router sends membership queries when it is the querier.</li> <li><b>IGMP Query Response Interval</b>—Time (in seconds) that the router waits for a report in response to a general query.</li> <li><b>IGMP Last Member Query Interval</b>—Time (in seconds) that the router waits for a report in response to a group-specific query.</li> <li><b>IGMP Robustness Count</b>—Number of times the router retries a query.</li> </ul> | All levels      |
| Derived Parameters    | Derived information: <ul style="list-style-type: none"> <li><b>IGMP Membership Timeout</b>—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed.</li> <li><b>IGMP Other Querier Present Timeout</b>—Time (in seconds) that the router waits for the IGMP querier to send a query.</li> </ul>                                                                                                                                                                              | All levels      |

## Sample Output

### show igmp interface

```

user@host> show igmp interface
Interface: at-0/3/1.0
 Querier: 10.111.30.1
 State: Up Timeout: None Version: 2 Groups: 4
 SSM Map Policy: ssm-policy-A
Interface: so-1/0/0.0
 Querier: 10.111.10.1
 State: Up Timeout: None Version: 2 Groups: 2
 SSM Map Policy: ssm-policy-B
Interface: so-1/0/1.0
 Querier: 10.111.20.1
 State: Up Timeout: None Version: 2 Groups: 4
 SSM Map Policy: ssm-policy-C
Immediate Leave: On
Promiscuous Mode: Off

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0

```

### show igmp interface brief

The output for the **show igmp interface brief** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 1233](#).

### show igmp interface detail

The output for the **show igmp interface detail** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 1233](#).

### show igmp interface <interface-name>

```
user@host# show igmp interface ge-3/2/0.0
Interface: ge-3/2/0.0
Querier: 20.1.1.1
State: Up Timeout: None Version: 3 Groups: 1
Group limit: 8
Group threshold: 60
Group log-interval: 10
Immediate leave: Off
Promiscuous mode: Off
```

## show multicast pim-to-igmp-proxy

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Output Fields</b>                                | <a href="#">Table 60 on page 1235</a> describes the output fields for the <b>show multicast pim-to-igmp-proxy</b> command. Output fields are listed in the order in which they appear.                                                                                                                                                                                                                                                              |

**Table 60: show multicast pim-to-igmp-proxy Output Fields**

| Field Name                   | Field Description                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>              | Routing instance. Default instance is <b>master</b> (inet.0 routing table).                                                                           |
| <b>Proxy state</b>           | State of PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> . |
| <b><i>interface-name</i></b> | Name of upstream interface (no more than two allowed) on which PIM-to-IGMP message translation is configured.                                         |

## Sample Output

### show multicast pim-to-igmp-proxy

```
user@host> show multicast pim-to-igmp-proxy
Instance: master Proxy state: enabled
ge-0/1/0.1
ge-0/1/0.2
```

### show multicast pim-to-igmp-proxy instance

```
user@host> show multicast pim-to-igmp-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/1/0.1
```

## CHAPTER 37

# MLD Operational Commands

- `clear mld membership`
- `clear mld statistics`
- `mtrace`
- `mtrace from-source`
- `mtrace monitor`
- `mtrace to-gateway`
- `show mld group`
- `show mld interface`
- `show mld statistics`
- `show multicast pim-to-mld-proxy`

## clear mld membership

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                               |

**Table 61: mtrace Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <b>number-of-hops</b>             | Number of hops from the source to the named router or switch. |
| <b>router-name</b>                | Name of the router or switch for this hop.                    |
| <b>address</b>                    | Address of the router or switch for this hop.                 |

Table 61: mtrace Output Fields (*continued*)

| Field Name      | Field Description                              |
|-----------------|------------------------------------------------|
| <i>protocol</i> | Protocol used (for example, PIM).              |
| Round trip time | Average round-trip time, in milliseconds (ms). |
| total ttl of    | Time-to-live (TTL) threshold.                  |

## Sample Output

### mtrace source

```
user@host> mtrace 192.1.4.2
Mtrace from 192.1.4.2 to 192.1.1.2 via group 0.0.0.0
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)
-1 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
-2 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
-3 hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.
```

## mtrace from-source

**Syntax** `mtrace from-source source source`  
`<brief | detail>`  
`<extra-hops extra-hops>`  
`<group group>`  
`<interval interval>`  
`<loop>`  
`<max-hops max-hops>`  
`<max-queries max-queries>`  
`<multicast-response | unicast-response>`  
`<no-resolve>`  
`<no-router-alert>`  
`<response response>`  
`<routing-instance routing-instance-name>`  
`<ttl tll>`  
`<wait-time wait-time>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display trace information about an IP multicast path from a source to this router or switch. If you specify a group address with this command, Junos OS returns additional information, such as packet rates and losses.

**Options** `brief | detail`—(Optional) Display the specified level of output.

`extra-hops extra-hops`—(Optional) Number of hops to take after reaching a nonresponsive router. You can specify a number between **0** and **255**.

`group group`—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

`interval interval`—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10** seconds.

`loop`—(Optional) Loop indefinitely, displaying rate and loss statistics.

`max-hops max-hops`—(Optional) Maximum hops to trace toward the source. The range of values is **0** through **255**. The default value is **32** hops.

`max-queries max-queries`—(Optional) Maximum number of query attempts for any hop. The range of values is 1 through **32**. The default is **3**.

`multicast-response`—(Optional) Always request the response using multicast.

`no-resolve`—(Optional) Do not attempt to display addresses symbolically.

`no-router-alert`—(Optional) Do not use the router-alert IP option.

`response response`—(Optional) Send trace response to a host or multicast address.

**routing-instance** *routing-instance-name*—(Optional) Trace a particular routing instance.

**source** *source*—Source hostname or address.

**ttl** *tll*—(Optional) IP time-to-live (TTL) value. You can specify a number between 0 and 255. Local queries to the multicast group use a value of 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time** *wait-time*—(Optional) Number of seconds to wait for a response. The default value is 3.

**Required Privilege Level**

| Field Name              | Field Description                                             |
|-------------------------|---------------------------------------------------------------|
| <b>Mtrace query at</b>  | Date and time of the query.                                   |
| <b>by</b>               | Address of the host issuing the query.                        |
| <b>resp to</b>          | Response destination.                                         |
| <b>qid</b>              | Query ID number.                                              |
| <b>packet from...to</b> | IP address of the query source and default group destination. |
| <b>from...to</b>        | IP address of the multicast source and the response address.  |
| <b>via group</b>        | IP address of the group to trace.                             |
| <b>mxhop</b>            | Maximum hop setting.                                          |

## Sample Output

### mtrace monitor

```
user@host> mtrace monitor
Mtrace query at Oct 22 13:36:14 by 192.1.3.2, resp to 224.0.1.32, qid 74a5b8
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:17 by 192.1.3.2, resp to 224.0.1.32, qid 1d07ba
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:20 by 192.1.3.2, resp to same, qid 2fea1d
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:30 by 192.1.3.2, resp to same, qid 7c88ad
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)
```

## mtrace to-gateway

---

**Syntax** `mtrace to-gateway gateway gateway`  
`<brief | detail>`  
`<extra-hops extra-hops>`  
`<group group>`  
`<interface interface-name>`  
`<interval interval>`  
`<loop>`  
`<max-hops max-hops>`  
`<max-queries max-queries>`  
`<multicast-response | unicast-response>`  
`<no-resolve>`  
`<no-router-alert>`  
`<response response>`  
`<routing-instance routing-instance-name>`  
`<ttl ttl>`  
`<unicast-response>`  
`<wait-time wait-time>`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display trace information about a multicast path from this router or switch to a gateway router or switch.

**Options** `gateway gateway`—Send the trace query to a gateway multicast address.

`brief | detail`—(Optional) Display the specified level of output.

`extra-hops extra-hops`—(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between **0** and **255**.

`group group`—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

`interface interface-name`—(Optional) Source address for sending the trace query.

`interval interval`—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10**.

`loop`—(Optional) Loop indefinitely, displaying rate and loss statistics.

`max-hops max-hops`—(Optional) Maximum hops to trace toward the source. You can specify a number between **0** and **255**. The default value is **32**.

`max-queries max-queries`—(Optional) Maximum number of query attempts for any hop. You can specify a number between **0** and **255**. The default value is **3**.

`multicast-response`—(Optional) Always request the response using multicast.

`no-resolve`—(Optional) Do not attempt to display addresses symbolically.

**no-router-alert**—(Optional) Do not use the router-alert IP option.

**response *response***—(Optional) Send trace response to a host or multicast address.

**routing-instance *routing-instance-name***—(Optional) Trace a particular routing instance.

**ttl *tll***—(Optional) IP time-to-live value. You can specify a number between 0 and 225.

Local queries to the multicast group use TTL 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time *wait-time***—(Optional) Number of seconds to wait for a response. The default value is 3.

**Required Privilege Level** view

**List of Sample Output** [mtrace to-gateway on page 1249](#)

**Output Fields** [Table 57 on page 1225](#) describes the output fields for the **mtrace to-gateway** command. Output fields are listed in the approximate order in which they appear.

**Table 64: mtrace to-gateway Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <b><i>number-of-hops</i></b>      | Number of hops from the source to the named router or switch. |
| <b><i>router-name</i></b>         | Name of the router or switch for this hop.                    |
| <b><i>address</i></b>             | Address of the router or switch for this hop.                 |
| <b><i>protocol</i></b>            | Protocol used (for example, PIM).                             |
| <b>Round trip time</b>            | Average round-trip time, in milliseconds (ms).                |
| <b>total ttl of</b>               | Time-to-live (TTL) threshold.                                 |

## Sample Output

### mtrace to-gateway

```
user@host> mtrace to-gateway gateway 192.1.3.2 group 225.1.1.1 interface 192.1.1.73 brief
```

```
Mtrace from 192.1.1.73 to 192.1.1.2 via group 225.1.1.1
```

```
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)
-1 routerA.lab.mycompany.net (192.1.1.2) PIM thresh^ 1
-2 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
-3 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
Round trip time 2 ms; total ttl of 3 required.
```

### show mld group brief

The output for the **show mld group brief** command is identical to that for the **show mld group** command. For sample output, see [show mld group \(Include Mode\) on page 1252](#) and [show mld group \(Exclude Mode\) on page 1253](#).

### show mld group detail (Include Mode)

```

user@host> show mld group detail
Interface: fe-0/1/2.0

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                             |

**Table 66: show mld interface Output Fields**

| Field Name            | Field Description                                                                              | Level of Output |
|-----------------------|------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>      | Name of the interface.                                                                         | All levels      |
| <b>Querier</b>        | Address of the router that has been elected to send membership queries.                        | All levels      |
| <b>State</b>          | State of the interface: <b>Up</b> or <b>Down</b> .                                             | All levels      |
| <b>SSM Map Policy</b> | Name of the source-specific multicast (SSM) map policy that has been applied to the interface. | All levels      |
| <b>SSM Map Policy</b> | Name of the source-specific multicast (SSM) map policy at the MLD interface.                   | All levels      |
| <b>Timeout</b>        | How long until the MLD querier is declared to be unreachable, in seconds.                      | All levels      |
| <b>Version</b>        | MLD version being used on the interface: 1 or 2.                                               | All levels      |

Table 66: show mld interface Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Groups</b>             | Number of groups on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels      |
| <b>Passive</b>            | <p>State of the passive mode option:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router can run IGMP or MLD on the interface but not send or receive control traffic such as IGMP or MLD reports, queries, and leaves.</li> <li>• <b>Off</b>—Indicates that the router can run IGMP or MLD on the interface and send or receive control traffic such as IGMP or MLD reports, queries, and leaves.</li> </ul> <p>The <b>passive</b> statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the <b>on</b> state declaration:</p> <ul style="list-style-type: none"> <li>• <b>send-general-query</b>—The interface sends general queries.</li> <li>• <b>send-group-query</b>—The interface sends group-specific and group-source-specific queries.</li> <li>• <b>allow-receive</b>—The interface receives control traffic</li> </ul> | All levels      |
| <b>OIF map</b>            | Name of the OIF map associated to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>SSM map</b>            | Name of the source-specific multicast (SSM) map used on the interface, if configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Group limit</b>        | Maximum number of groups allowed on the interface. Any memberships requested after the limit is reached are rejected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Group threshold</b>    | <p>Configured threshold at which a warning message is generated.</p> <p>This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Group log-interval</b> | Time (in seconds) between consecutive log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Immediate Leave</b>    | <p>State of the immediate leave option:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router removes a host from the multicast group as soon as the router receives a multicast listener done message from a host associated with the interface.</li> <li>• <b>Off</b>—Indicates that after receiving a multicast listener done message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels      |

Table 66: show mld interface Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Configured Parameters</b> | Information configured by the user. <ul style="list-style-type: none"> <li>• <b>MLD Query Interval (.1 secs)</b>—Interval at which this router sends membership queries when it is the querier.</li> <li>• <b>MLD Query Response Interval (.1 secs)</b>—Time that the router waits for a report in response to a general query.</li> <li>• <b>MLD Last Member Query Interval (.1 secs)</b>—Time that the router waits for a report in response to a group-specific query.</li> <li>• <b>MLD Robustness Count</b>—Number of times the router retries a query.</li> </ul> | All levels      |

If no report is received for these groups before the timeout expires, the group membership will be removed.</li> <li>• <b>MLD Other Querier Present Timeout (.1 secs)</b>—Time that the router waits for the IGMP querier to send a query.</li> </ul>                                                                                                                                                                        | All levels      |

## Sample Output

### show mld interface

```

user@host> show mld interface
Interface: fe-0/0/0
 Querier: None
 State: Up Timeout: 0 Version: 1 Groups: 0
 SSM Map Policy: ssm-policy-A
Interface: at-0/3/1.0
 Querier: 8038::c0a8:c345
 State: Up Timeout: None Version: 1 Groups: 0
 SSM Map Policy: ssm-policy-B
Interface: fe-1/0/1.0
 Querier: ::192.168.195.73
 State: Up Timeout: None Version: 1 Groups: 3
 SSM Map Policy: ssm-policy-C
 SSM map: ipv6map1
Immediate Leave: On

Configured Parameters:
MLD Query Interval (.1 secs): 1250
MLD Query Response Interval (.1 secs): 100
MLD Last Member Query Interval (.1 secs): 10
MLD Robustness Count: 2

Derived Parameters:
MLD Membership Timeout (.1secs): 2600
MLD Other Querier Present Timeout (.1 secs): 2550

```

### show mld interface brief

The output for the **show mld interface brief** command is identical to that for the **show mld interface** command. For sample output, see [show mld interface on page 1257](#).

### show mld interface detail

The output for the **show mld interface detail** command is identical to that for the **show mld interface** command. For sample output, see [show mld interface on page 1257](#).

### show mld interface <interface-name>

```
user@host# show mld interface ge-3/2/0.0
Interface: ge-3/2/0.0
Querier: 20.1.1.1
State: Up Timeout: None Version: 3 Groups: 1
Group limit: 8
Group threshold: 60
Group log-interval: 10
Immediate leave: Off
Promiscuous mode: Off
```

show mld statistics

| Output Fields            | <a href="#">Table 67 on page 1259</a> describes the output fields for the <b>show mld statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                            |

Table 67: show mld statistics Output Fields

| Field Name | Field Description                                 |
|------------|---------------------------------------------------|
| Received   | Number of received packets.                       |
| Sent       | Number of transmitted packets.                    |
| Rx errors  | Number of received packets that contained errors. |

Table 67: show mld statistics Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MLD Message type</b>      | Summary of MLD statistics. <ul style="list-style-type: none"> <li>• <b>Listener Query (v1/v2)</b>—Number of membership queries sent and received.</li> <li>• <b>Listener Report (v1)</b>—Number of version 1 membership reports sent and received.</li> <li>• <b>Listener Done (v1/v2)</b>—Number of Listener Done messages sent and received.</li> <li>• <b>Listener Report (v2)</b>—Number of version 2 membership reports sent and received.</li> <li>• <b>Other Unknown types</b>—Number of unknown message types received.</li> <li>• <b>MLD v2 source required for SSM</b>—Number of MLD version 2 messages received that contained no source.</li> <li>• <b>MLD v2 mode not applicable for SSM</b>—Number of MLD version 2 messages received that did not contain a mode applicable for source-specific multicast (SSM).</li> </ul>          |
| <b>MLD Global Statistics</b> | Summary of MLD statistics for all interfaces. <ul style="list-style-type: none"> <li>• <b>Bad Length</b>—Number of messages received with length errors so severe that further classification could not occur.</li> <li>• <b>Bad Checksum</b>—Number of messages received with an invalid IP checksum. No further classification was performed.</li> <li>• <b>Bad Receive If</b>—Number of messages received on an interface not enabled for MLD.</li> <li>• <b>Rx non-local</b>—Number of messages received from nonlocal senders.</li> <li>• <b>Timed out</b>—Number of groups that timed out as a result of not receiving an explicit leave message.</li> <li>• <b>Rejected Report</b>—Number of reports dropped because of the MLD group policy.</li> <li>• <b>Total Interfaces</b>—Number of interfaces configured to support IGMP.</li> </ul> |

## Sample Output

### show mld statistics

```

user@host> show mld statistics
MLD packet statistics for all interfaces
MLD Message type Received Sent Rx errors
Listener Query (v1/v2) 0 2 0
Listener Report (v1) 0 0 0
Listener Done (v1/v2) 0 0 0
Listener Report (v2) 0 0 0
Other Unknown types 0 0 0
MLD v2 source required for SSM 2
MLD v2 mode not applicable for SSM 0

MLD Global Statistics
Bad Length 0
Bad Checksum 0
Bad Receive If 0
Rx non-local 0
Timed out 0

```

|                  |   |
|------------------|---|
| Rejected Report  | 0 |
| Total Interfaces | 2 |

#### show mld statistics interface

```
user@host> show mld statistics interface fe-1/0/1.0
MLD interface packet statistics for fe-1/0/1.0
MLD Message type Received Sent Rx errors
Listener Query (v1/v2) 0 2 0
Listener Report (v1) 0 0 0
Listener Done (v1/v2) 0 0 0
Listener Report (v2) 0 0 0
Other Unknown types 0
MLD v2 source required for SSM 2
MLD v2 mode not applicable for SSM 0

MLD Global Statistics
Bad Length 0
Bad Checksum 0
Bad Receive If 0
Rx non-local 0
Timed out 0
Rejected Report 0
Total Interfaces 2
```

| Field Name                   | Field Description                                                                              | Level of Output |
|------------------------------|------------------------------------------------------------------------------------------------|-----------------|
| Routing-instance             | Routing instance for IGMP snooping.                                                            | All levels      |
| Learning Domain              | Learning domain for snooping.                                                                  | All levels      |
| IGMP Query Interval          | Frequency (in seconds) with which this router sends membership queries when it is the querier. | detail          |
| IGMP Query Response Interval | Time (in seconds) that the router waits for a response to a general query.                     | detail          |

Table 69: show igmp snooping interface Output Fields (*continued*)

| Field Name                         | Field Description                                                                                                                    | Level of Output |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| IGMP Last Member Query Interval    | Time (in seconds) that the router waits for a report in response to a group-specific query.                                          | detail          |
| IGMP Robustness Count              | Number of times the router retries a query.                                                                                          | detail          |
| immediate-leave                    | State of immediate leave: <b>On</b> or <b>Off</b> .                                                                                  | All levels      |
| router-interface                   | Router interfaces that are part of this learning domain.                                                                             | All levels      |
| Group limit                        | Maximum number of (source,group) pairs allowed per interface. When a group limit is not configured, this field is not shown.         | All levels      |
| interface                          | Interfaces that are being snooped in this learning domain.                                                                           | All levels      |
| Groups                             | Number of groups on the interface.                                                                                                   | none            |
| State                              | State of the interface: <b>Up</b> or <b>Down</b> .                                                                                   | none            |
| Up Groups                          | Number of active multicast groups attached to the logical interface.                                                                 | All levels      |
| IGMP Membership Timeout            | Timeout for group membership. If no report is received for these groups before the timeout expires, the group membership is removed. | none            |
| IGMP Other Querier Present Timeout | Time that the router waits for the IGMP querier to send a query.                                                                     | none            |

## Sample Output

### show igmp snooping interface

```

user@host> show igmp snooping interface
Instance: bridge-domain bar

Learning-Domain: default
Interface: ge-0/1/0.200
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: yes
Interface: ge-0/1/2.200
 State: Up Groups: 2
 Immediate leave: On
 Router interface: no
Interface: ge-0/1/3.200
 State: Up Groups: 1
 Immediate leave: Off
 Router interface: no

Configured Parameters:
IGMP Query Interval: 130.0
IGMP Query Response Interval: 15.0

```

```
IGMP Last Member Query Interval: 2.0
IGMP Robustness Count: 3

Derived Parameters:
IGMP Membership Timeout: 405.0
IGMP Other Querier Present Timeout: 397.500
```

## Sample Output

### show igmp snooping interface (Group Limit Configured)

```
user@host> show igmp snooping interface instance vpls1
Instance: vpls1

Learning-Domain: default
Interface: ge-1/3/9.0
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: yes
Interface: ge-1/3/8.0
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: yes
 Group limit: 1000

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

## CHAPTER 39

# Multicast Snooping Operational Commands

- `show multicast snooping route`
- `show route table`

## show multicast snooping route

---

**Syntax**    show multicast snooping route  
              <brief | detail | extensive>  
              <active | all | inactive>  
              <bridge-domain *bridge-domain-name*>  
              <control>  
              <data>  
              <group *group*>  
              <instance *instance-name*>  
              <mesh-group *mesh-group-name*>  
              <qualified-vlan *vlan-id*>  
              <*regular-expression*>  
              <source-prefix *source-prefix*>  
              <vlan *vlan-id*>

**Release Information**    Command introduced in Junos OS Release 8.5.  
                              Support for **control**, **data**, **qualified-vlan** and **vlan** options introduced in Junos OS Release 13.3 for EX Series switches.

**Description**            Display the entries in the IP multicast snooping forwarding table. You can display some of this information with the **show route table inet.1** command.

**Options**                **none**—Display standard information about all entries in the multicast snooping table for all virtual switches and all bridge domains.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**active | all | inactive**—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast snooping table.

**bridge-domain *bridge-domain***—(Optional) Display the entries for a particular bridge domain.

**control**—(Optional) Display control route entries.

**data**—(Optional) Display data route entries.

**group *group***—(Optional) Display the entries for a particular group.

**instance *instance-name***—(Optional) Display the entries for a multicast instance.

**mesh-group *mesh-group-name***—(Optional) Display the entries for a particular mesh group.

**qualified-vlan *vlan-id***—(Optional) Display the entries for a particular qualified VLAN.

***regular-expression***—(Optional) Display information about the multicast forwarding table entries that match a UNIX-style regular expression.

**source-prefix *source-prefix***—(Optional) Display the entries for a particular source prefix.

**vlan *vlan-id***—(Optional) Display the entries for a particular VLAN.

**Required Privilege Level** view

**List of Sample Output** [show multicast snooping route bridge-domain on page 1281](#)  
[show multicast snooping route instance vs on page 1282](#)

**Output Fields** [Table 72 on page 1281](#) describes the output fields for the **show multicast snooping route** command. Output fields are listed in the approximate order in which they appear.

**Table 72: show multicast snooping route Output Fields**

| Field Name                    | Field Description                                                                                                                                                                         | Level of Output         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Nexthop Bulking</b>        | Displays whether next-hop bulk updating is <b>ON</b> or <b>OFF</b> (only for routing-instance type of <b>virtual switch</b> or <b>vpls</b> ).                                             | All levels              |
| <b>Family</b>                 | IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ).                                                                                                              | All levels              |
| <b>Group</b>                  | Group address.                                                                                                                                                                            | All levels              |
| <b>Source</b>                 | Prefix and length of the source as it is in the multicast forwarding table.                                                                                                               | All levels              |
| <b>Routing-instance</b>       | Name of the routing instance to which this routing information applies. (Displayed when multicast is configured within a routing instance.)                                               | All levels              |
| <b>Learning Domain</b>        | Name of the learning domain to which this routing information applies.                                                                                                                    | <b>detail extensive</b> |
| <b>Statistics</b>             | Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix.                               | <b>detail extensive</b> |
| <b>Next-hop ID</b>            | Next-hop identifier of the prefix. The identifier is returned by the router's Packet Forwarding Engine and is also displayed in the output of the <b>show multicast nexthops</b> command. | <b>detail extensive</b> |
| <b>Route state</b>            | Whether the group is <b>Active</b> or <b>Inactive</b> .                                                                                                                                   | <b>extensive</b>        |
| <b>Forwarding state</b>       | Whether the prefix is <b>Pruned</b> or <b>Forwarding</b> .                                                                                                                                | <b>extensive</b>        |
| <b>Cache lifetime/timeout</b> | Number of seconds until the prefix is removed from the multicast forwarding table. A value of <b>never</b> indicates a permanent forwarding entry.                                        | <b>extensive</b>        |

## Sample Output

### [show multicast snooping route bridge-domain](#)

```

user@host> show multicast snooping route bridge-domain br-dom-1 extensive
Family: INET

Group: 232.1.1.1
Source: 192.168.3.100/32
Downstream interface list:
 ge-0/1/0.200
Statistics: 0 kbps, 0 pps, 1 packets
Next-hop ID: 1048577

```

```
Route state: Active
Forwarding state: Forwarding
Cache lifetime/timeout: 240 seconds
```

#### show multicast snooping route instance vs

```
user@host> show multicast snooping route instance vs
NextHop Bulking: ON
```

```

**Output Fields** Table 73 on page 1299 describes the output fields for the **show bgp group** command. Output fields are listed in the approximate order in which they appear.

**Table 73: show bgp group Output Fields**

| Field Name                                | Field Description                                                                                                                                                                                                                                      | Level of Output             |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|
| <b>Group Type or Group</b>                | Type of BGP group: <b>Internal</b> or <b>External</b> .                                                                                                                                                                                                | All levels                  |
| <b>group-index</b>                        | Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.                                                          | <b>rtf detail</b>           |
| <b>AS</b>                                 | AS number of the peer. For internal BGP (IBGP), this number is the same as <b>Local AS</b> .                                                                                                                                                           | <b>brief detail</b><br>none |
| <b>Local AS</b>                           | AS number of the local routing device.                                                                                                                                                                                                                 | <b>brief detail</b><br>none |
| <b>Name</b>                               | Name of a specific BGP group.                                                                                                                                                                                                                          | <b>brief detail</b><br>none |
| <b>Index</b>                              | Unique index number of a BGP group.                                                                                                                                                                                                                    | <b>brief detail</b><br>none |
| <b>Flags</b>                              | Flags associated with the BGP group. This field is used by Juniper Networks customer support.                                                                                                                                                          | <b>brief detail</b><br>none |
| <b>Remove-private options</b>             | Options associated with the <b>remove-private</b> statement.                                                                                                                                                                                           | <b>brief detail</b><br>none |
| <b>Holdtime</b>                           | Maximum number of seconds allowed to elapse between successive keepalive or update messages that BGP receives from a peer in the BGP group, after which the connection to the peer is closed and routing devices through that peer become unavailable. | <b>brief detail</b><br>none |
| <b>Export</b>                             | Export policies configured for the BGP group with the <b>export</b> statement.                                                                                                                                                                         | <b>brief detail</b><br>none |
| <b>MED tracks IGP metric update delay</b> | Time, in seconds, that updates to multiple exit discriminator (MED) are delayed. Also displays the time remaining before the interval is set to expire                                                                                                 | All levels                  |
| <b>Traffic Statistics Interval</b>        | Time between sample periods for labeled-unicast traffic statistics, in seconds.                                                                                                                                                                        | <b>brief detail</b><br>none |
| <b>Total peers</b>                        | Total number of peers in the group.                                                                                                                                                                                                                    | <b>brief detail</b><br>none |
| <b>Established</b>                        | Number of peers in the group that are in the established state.                                                                                                                                                                                        | All levels                  |

Table 73: show bgp group Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Active/Received/Accepted/Damped</b> | <p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established in the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> <li>If a peer is not established, the field shows the state of the peer session: <b>Active</b>, <b>Connect</b>, or <b>Idle</b>.</li> <li>If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <b>inet.0</b> (main) and <b>inet.2</b> (multicast) routing tables. For example, <b>8/10/10/2</b> and <b>2/4/4/0</b> indicate the following: <ul style="list-style-type: none"> <li>8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> <li>2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.2</b> routing table.</li> </ul> </li> </ul> | <b>summary</b>  |
| <b>ip-addresses</b>                    | List of peers who are members of the group. The address is followed by the peer's port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels      |
| <b>Route Queue Timer</b>               | Number of seconds until queued routes are sent. If this time has already elapsed, this field displays the number of seconds by which the updates are delayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail</b>   |
| <b>Route Queue</b>                     | Number of prefixes that are queued up for sending to the peers in the group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail</b>   |
| <b>inet.number</b>                     | <p>Number of active, received, accepted, and damped routes in the routing table. For example, <b>inet.0: 7/10/9/0</b> indicates the following:</p> <ul style="list-style-type: none"> <li>7 active routes, 10 received routes, 9 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | none            |

| <b>Act Paths</b>         | Number of active routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>brief</b> , none |
| <b>Suppressed</b>        | Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>brief</b> , none |

Table 73: show bgp group Output Fields (*continued*)

| Field Name   | Field Description                                                                                                                                                                                           | Level of Output |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| History      | Number of withdrawn routes stored locally to keep track of damping history.                                                                                                                                 | brief, none     |
| Damp State   | Number of active routes with a figure of merit greater than zero, but lower than the threshold at which suppression occurs.                                                                                 | brief, none     |
| Pending      | Routes being processed by the BGP import policy.                                                                                                                                                            | brief, none     |
| Group        | Group the peer belongs to in the BGP configuration.                                                                                                                                                         | detail          |
| Receive mask | Mask of the received target included in the advertised route.                                                                                                                                               | detail          |
| Entries      | Number of route entries received.                                                                                                                                                                           | detail          |
| Target       | Route target that is to be passed by route-target filtering. If a route advertised from the provider edge (PE) routing device matches an entry in the route-target filter, the route is passed to the peer. | detail          |
| Mask         | Mask which specifies that the peer receive routes with the given route target.                                                                                                                              | detail          |

## show ingress-replication mvpn

|                                 |                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show ingress-replication mvpn                                                                                                                                                               |
| <b>Release Information</b>      | Command introduced in Junos OS Release 10.4.                                                                                                                                                |
| <b>Description</b>              | Display the state and configuration of the ingress replication tunnels created for the MVPN application when using the <b>mpls-internet-multicast</b> routing instance type.                |
| <b>Required Privilege Level</b> | View                                                                                                                                                                                        |
| <b>List of Sample Output</b>    | <a href="#">show ingress-replication mvpn on page 1305</a>                                                                                                                                  |
| <b>Output Fields</b>            | <a href="#">Table 74 on page 1305</a> lists the output fields for the <b>show ingress-replication mvpn</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 74: show ingress-replication mvpn**

| Field Name             | Field Description                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Ingress tunnel</b>  | Identifies the MVPN ingress replication tunnel.                                                                          |
| <b>Application</b>     | Identifies the application (MVPN).                                                                                       |
| <b>Unicast tunnels</b> | List of unicast tunnels in use.                                                                                          |
| <b>Leaf address</b>    | Address of the tunnel.                                                                                                   |
| <b>Tunnel type</b>     | Identifies the unicast tunnel type.                                                                                      |
| <b>Mode</b>            | Indicates whether the tunnel was created as a new tunnel for the ingress replication, or if an existing tunnel was used. |
| <b>State</b>           | Indicates whether the tunnel is Up or Down.                                                                              |

## Sample Output

### show ingress-replication mvpn

| <b>Release Information</b>         | <p>Command introduced before Junos OS Release 7.4.</p> <p><b>defaults</b> option added in Junos OS Release 8.5.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p><b>autobandwidth</b> option added in Junos OS Release 11.4.</p> <p><b>externally-controlled</b> option added in Junos OS Release 12.3.</p> <p><b>externally-provisioned</b> option added in Junos OS Release 13.3.</p> <p>Command introduced in Junos OS Release 13.2X51-D15 for QFX Series.</p> |
| <b>Description</b>                 | Display information about configured and active dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                     | <p><b>none</b>—Display standard information about all configured and active dynamic MPLS LSPs.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.</p>                                                                                                                                                                              |

**autobandwidth**—(Optional) Display automatic bandwidth information. This option is explained separately (see **show mpls lsp autobandwidth**).

**bidirectional | unidirectional**—(Optional) Display bidirectional or unidirectional LSP information, respectively.

**bypass**—(Optional) Display LSPs used for protecting other LSPs.

**count-active-routes**—(Optional) Display active routes for LSPs.

**defaults**—(Optional) Display the MPLS LSP default settings.

**descriptions**—(Optional) Display the MPLS label-switched path (LSP) descriptions. To view this information, you must configure the description statement at the **[edit protocol mpls lsp]** hierarchy level. Only LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

**down | up**—(Optional) Display only LSPs that are inactive or active, respectively.

**externally-controlled**—(Optional) Display the LSPs that are under the control of an external Path Computation Element (PCE).

**externally-provisioned**—(Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type***—(Optional) Display information about a particular LSP type:

- **bypass**—Sessions for bypass LSPs.
- **egress**—Sessions that terminate on this routing device.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that pass through this routing device.

**name *name***—(Optional) Display information about the specified LSP or group of LSPs.

**p2mp**—(Optional) Display information about point-to-multipoint LSPs.

**statistics**—(Optional) (Ingress and transit routers only) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

**NOTE:** If a bypass LSP is configured for the primary static LSP, display cumulative statistics of packets traversing through the protected LSP and bypass LSP when traffic is re-optimized when the protected LSP link is restored. (Bypass LSPs are not supported on QFX Series switches.)

When used with the **bypass** option (**show mpls lsp bypass statistics**), display statistics for the traffic that flows only through the bypass LSP.

**transit**—(Optional) Display LSPs transiting this routing device.

**Output Fields** [Table 75 on page 1309](#) describes the output fields for the **show mpls lsp** command. Output fields are listed in the approximate order in which they appear.

**Table 75: show mpls lsp Output Fields**

| Field Name         | Field Description                                                                                                                                                                                                                                                                     | Level of Output |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Ingress LSP</b> | Information about LSPs on the ingress routing device. Each session has one line of output.                                                                                                                                                                                            | All levels      |
| <b>Egress LSP</b>  | Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output.                                                                              | All levels      |
| <b>Transit LSP</b> | Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.                                                                                                | All levels      |
| <b>P2MP name</b>   | Name of the point-to-multipoint LSP. Dynamically generated P2MP LSPs used for VPLS flooding use dynamically generated P2MP LSP names. The name uses the format <i>identifier:vpls:router-id:routing-instance-name</i> . The <i>identifier</i> is automatically generated by Junos OS. | All levels      |

Table 75: show mpls lsp Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                 | Level of Output         |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>P2MP branch count</b>    | Number of destination LSPs the point-to-multipoint LSP is transmitting to.                                                                                                                                                                                        | All levels              |
| <b>P</b>                    | An asterisk (*) under this heading indicates that the LSP is a primary path.                                                                                                                                                                                      | All levels              |
| <b>address</b>              | ( <b>detail</b> and <b>extensive</b> ) Destination (egress routing device) of the LSP.                                                                                                                                                                            | <b>detail extensive</b> |
| <b>To</b>                   | Destination (egress routing device) of the session.                                                                                                                                                                                                               | <b>brief</b>            |
| <b>From</b>                 | Source (ingress routing device) of the session.                                                                                                                                                                                                                   | <b>brief detail</b>     |
| <b>State</b>                | State of the LSP handled by this RSVP session: <b>Up</b> , <b>Dn</b> (down), or <b>Restart</b> .                                                                                                                                                                  | <b>brief detail</b>     |
| <b>Active Route</b>         | Number of active routes (prefixes) installed in the forwarding table. For ingress LSPs, the forwarding table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table ( <b>mpls.0</b> ). | <b>detail extensive</b> |
| <b>Rt</b>                   | Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the routing table is the primary MPLS table ( <b>mpls.0</b> ). | <b>brief</b>            |
| <b>P</b>                    | Path. An asterisk (*) underneath this column indicates that the LSP is a primary path.                                                                                                                                                                            | <b>brief</b>            |
| <b>ActivePath</b>           | (Ingress LSP) Name of the active path: <b>Primary</b> or <b>Secondary</b> .                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>LSPname</b>              | Name of the LSP.                                                                                                                                                                                                                                                  | <b>brief detail</b>     |
| <b>Statistics</b>           | Displays the number of packets and the number of bytes transmitted over the LSP. These counters are reset to zero whenever the LSP path is optimized (for example, during an automatic bandwidth allocation).                                                     | <b>extensive</b>        |
| <b>Aggregate statistics</b> | Displays the number of packets and the number of bytes transmitted over the LSP. These counters continue to iterate even if the LSP path is optimized. You can reset these counters to zero using the <b>clear mpls lsp statistics</b> command.                   | <b>extensive</b>        |
| <b>Packets</b>              | Displays the number of packets transmitted over the LSP.                                                                                                                                                                                                          | <b>brief extensive</b>  |
| <b>Bytes</b>                | Displays the number of bytes transmitted over the LSP.                                                                                                                                                                                                            | <b>brief extensive</b>  |
| <b>DiffServeInfo</b>        | Type of LSP: multiclass LSP ( <b>multiclass diffServ-TE LSP</b> ) or Differentiated-Services-aware traffic engineering LSP ( <b>diffServ-TE LSP</b> ).                                                                                                            | <b>detail</b>           |
| <b>LSPtype</b>              | Type of LSP: static <b>Static configured</b> or dynamic <b>Dynamic configured</b> . Also indicates if the LSP is a <b>Penultimate hop popping</b> LSP or an <b>Ultimate hop popping</b> LSP.                                                                      | <b>detail extensive</b> |
| <b>Bypass</b>               | (Bypass LSP) Destination address (egress routing device) for the bypass LSP.                                                                                                                                                                                      | All levels              |

| Field Name                      | Field Description                                                                                                                                                                                                      | Level of Output         |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>LSPpath</b>                  | Indicates whether the RSVP session is for the primary or secondary LSP path. <b>LSPpath</b> can be either <b>primary</b> or <b>secondary</b> and can be displayed on the ingress, egress, and transit routing devices. | <b>detail</b>           |
| <b>Bidir</b>                    | (GMPLS) The LSP allows data to travel in both directions between GMPLS devices.                                                                                                                                        | All levels              |
| <b>Bidirectional</b>            | (GMPLS) The LSP allows data to travel both ways between GMPLS devices.                                                                                                                                                 | All levels              |
| <b>FastReroute desired</b>      | Fast reroute has been requested by the ingress routing device.                                                                                                                                                         | <b>detail</b>           |
| <b>Link protection desired</b>  | Link protection has been requested by the ingress routing device.                                                                                                                                                      | <b>detail</b>           |
| <b>LoadBalance</b>              | (Ingress LSP) CSPF load-balancing rule that was configured to select the LSP's path among equal-cost paths: <b>Most-fill</b> , <b>Least-fill</b> , or <b>Random</b> .                                                  | <b>detail extensive</b> |
| <b>Signal type</b>              | Signal type for GMPLS LSPs. The signal type determines the peak data rate for the LSP: <b>DS0</b> , <b>DS3</b> , <b>STS-1</b> , <b>STM-1</b> , or <b>STM-4</b> .                                                       | All levels              |
| <b>Encoding type</b>            | LSP encoding type: <b>Packet</b> , <b>Ethernet</b> , <b>PDH</b> , <b>SDH/SONET</b> , <b>Lambda</b> , or <b>Fiber</b> .                                                                                                 | All levels              |
| <b>Switching type</b>           | Type of switching on the links needed for the LSP: <b>Fiber</b> , <b>Lambda</b> , <b>Packet</b> , <b>TDM</b> , or <b>PSC-1</b> .                                                                                       | All levels              |
| <b>GPID</b>                     | Generalized Payload Identifier (identifier of the payload carried by an LSP): <b>HDLC</b> , <b>Ethernet</b> , <b>IPv4</b> , <b>PPP</b> , or <b>Unknown</b> .                                                           | All levels              |
| <b>Protection</b>               | Configured protection capability desired for the LSP: <b>Extra</b> , <b>Enhanced</b> , <b>none</b> , <b>One plus one</b> , <b>One to one</b> , or <b>Shared</b> .                                                      | All levels              |
| <b>Upstream label in</b>        | (Bidirectional LSPs) Incoming label for reverse direction traffic for this LSP.                                                                                                                                        | All levels              |
| <b>Upstream label out</b>       | (Bidirectional LSPs) Outgoing label for reverse direction traffic for this LSP.                                                                                                                                        | All levels              |
| <b>Suggested label received</b> | (Bidirectional LSPs) Label the upstream node suggests to use in the Resv message that is sent.                                                                                                                         | All levels              |
| <b>Suggested label sent</b>     | (Bidirectional LSPs) Label the downstream node suggests to use in the Resv message that is returned.                                                                                                                   | All levels              |
| <b>Autobandwidth</b>            | (Ingress LSP) The LSP is performing autobandwidth allocation.                                                                                                                                                          | <b>detail extensive</b> |
| <b>MinBW</b>                    | (Ingress LSP) Configured minimum value of the LSP, in bps.                                                                                                                                                             | <b>detail extensive</b> |
| <b>MaxBW</b>                    | (Ingress LSP) Configured maximum value of the LSP, in bps.                                                                                                                                                             | <b>detail extensive</b> |

Table 75: show mpls lsp Output Fields (*continued*)

| Field Name                                          | Field Description                                                                                                                                                                                                | Level of Output         |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Dynamic MinBW</b>                                | (Ingress LSP) Displays the current dynamically specified minimum bandwidth allocation for the LSP, in bps.                                                                                                       | <b>detail extensive</b> |
| <b>Adjustment Timer</b>                             | (Ingress LSP) Configured value for the <b>adjust-timer</b> statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds.                                       | <b>detail extensive</b> |
| <b>Adjustment Threshold</b>                         | (Ingress LSP) Configured value for the <b>adjust-threshold</b> statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization.                          | <b>detail extensive</b> |
| <b>Time for Next Adjustment</b>                     | (Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken.                                                                                                                     | <b>detail extensive</b> |
| <b>Time of Last Adjustment</b>                      | (Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed.                                                                                                                         | <b>detail extensive</b> |
| <b>Max AvgBW util</b>                               | (Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps.                                                                                                                         | <b>detail extensive</b> |
| <b>Overflow limit</b>                               | (Ingress LSP) Configured value of the threshold overflow limit.                                                                                                                                                  | <b>detail extensive</b> |
| <b>Overflow sample count</b>                        | (Ingress LSP) Current value for the overflow sample count.                                                                                                                                                       | <b>detail extensive</b> |
| <b>Bandwidth Adjustment in <i>nnn</i> second(s)</b> | (Ingress LSP) Current value of the bandwidth adjustment timer, indicating the amount of time remaining until the bandwidth adjustment will take place, in seconds.                                               | <b>detail extensive</b> |
| <b>Underflow limit</b>                              | (Ingress LSP) Configured value of the threshold underflow limit.                                                                                                                                                 | <b>detail extensive</b> |
| <b>Underflow sample count</b>                       | (Ingress LSP) Current value for the underflow sample count.                                                                                                                                                      | <b>detail extensive</b> |
| <b>Underflow Max AvgBW</b>                          | (Ingress LSP) The highest sample bandwidth among the underflow samples recorded currently. This is the signaling bandwidth if an adjustment occurs because of an underflow.                                      | <b>detail extensive</b> |
| <b>Active path indicator</b>                        | (Ingress LSP) A value of * indicates that the path is active. The absence of * indicates that the path is not active. In the following example, "long" is the active path.<br><br>*Primary long<br>Standby short | <b>detail extensive</b> |
| <b>Primary</b>                                      | (Ingress LSP) Name of the primary path.                                                                                                                                                                          | <b>detail extensive</b> |
| <b>Secondary</b>                                    | (Ingress LSP) Name of the secondary path.                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Standby</b>                                      | (Ingress LSP) Name of the path in standby mode.                                                                                                                                                                  | <b>detail extensive</b> |

Table 75: show mpls lsp Output Fields (*continued*)

| Field Name                                              | Field Description                                                                                                                                                                                                                                                                                                                           | Level of Output         |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>State</b>                                            | (Ingress LSP) State of the path: <b>Up</b> or <b>Dn</b> (down).                                                                                                                                                                                                                                                                             | <b>detail extensive</b> |
| <b>COS</b>                                              | (Ingress LSP) Class-of-service value.                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>Bandwidth per class</b>                              | (Ingress LSP) Active bandwidth for the LSP path for each MPLS class type, in bps.                                                                                                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Priorities</b>                                       | (Ingress LSP) Configured value of the setup priority and the hold priority respectively (the setup priority is displayed first), where 0 is the highest priority and 7 is the lowest priority. If you have not explicitly configured these values, the default values are displayed (7 for the setup priority and 0 for the hold priority). | <b>detail extensive</b> |
| <b>OptimizeTimer</b>                                    | (Ingress LSP) Configured value of the optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>SmartOptimizeTimer</b>                               | (Ingress LSP) Configured value of the smart optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.                                                                                                                                                                                             | <b>detail extensive</b> |
| <b>Reoptimization in xxx seconds</b>                    | (Ingress LSP) Current value of the optimize timer, indicating the amount of time remaining until the path will be reoptimized, in seconds.                                                                                                                                                                                                  | <b>detail extensive</b> |
| <b>Computed ERO (S [L] denotes strict [loose] hops)</b> | (Ingress LSP) Computed explicit route. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict (S) or loose (L).                                                                                                                                                                   | <b>detail extensive</b> |
| <b>CSPF metric</b>                                      | (Ingress LSP) Constrained Shortest Path First metric for this path.                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |

Table 75: show mpls lsp Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output               |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| <b>Received RRO</b> | <p>(Ingress LSP) Received record route. A series of hops, each with an address followed by a flag. (In most cases, the received record route is the same as the computed explicit route. If <b>Received RRO</b> is different from <b>Computed ERO</b>, there is a topology change in the network, and the route is taking a detour.) The following flags identify the protection capability and status of the downstream node:</p> <ul style="list-style-type: none"> <li>• <b>0x01</b>—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the Local protection flag was set in the <b>SESSION_ATTRIBUTE</b> object of the corresponding Path message.</li> <li>• <b>0x02</b>—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).</li> <li>• <b>0x03</b>—Combination of <b>0x01</b> and <b>0x02</b>.</li> <li>• <b>0x04</b>—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.</li> <li>• <b>0x08</b>—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the <b>Local protection available</b> bit is set but the <b>Node protection</b> bit is cleared.</li> <li>• <b>0x09</b>—Detour is established. Combination of <b>0x01</b> and <b>0x08</b>.</li> <li>• <b>0x10</b>—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted.</li> <li>• <b>0x20</b>—Node ID. Indicates that the address specified in the RRO's IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently.</li> <li>• <b>0xb</b>—Detour is in use. Combination of <b>0x01</b>, <b>0x02</b>, and <b>0x08</b>.</li> </ul> | <b>detail extensive</b>       |
| <b>Index number</b> | (Ingress LSP) Log entry number of each LSP path event. The numbers are in chronological descending order, with a maximum of 50 index numbers displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>extensive</b>              |

| <b>Time left</b>               | Number of seconds remaining in the lifetime of the reservation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail</b>       |
| <b>Since</b>                   | Date and time when the RSVP session was initiated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail</b>       |
| <b>Tspec</b>                   | Sender's traffic specification, which describes the sender's traffic parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail</b>       |
| <b>Port number</b>             | Protocol ID and sender or receiver port used in this RSVP session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail</b>       |
| <b>PATH rcvfrom</b>            | Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this router, and number of packets received from the upstream neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail</b>       |
| <b>PATH sentto</b>             | Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor, and number of packets sent to the downstream routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail</b>       |
| <b>RESV rcvfrom</b>            | Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor. The output in this field, which is consistent with that in the <b>PATH rcvfrom</b> field, indicates that the RSVP negotiation is complete.                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail</b>       |
| <b>Record route</b>            | Recorded route for the session, taken from the record route object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail</b>       |
| <b>Soft preempt</b>            | Number of soft preemptions that occurred on a path and when the last soft preemption occurred. Only successful soft preemptions are counted (those that actually resulted in a new path being used).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail</b>       |
| <b>Soft preemption pending</b> | Path is in the process of being soft preempted. This display is removed once the ingress router has calculated a new path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail</b>       |
| <b>MPLS-TE LSP Defaults</b>    | Default settings for MPLS traffic engineered LSPs: <ul style="list-style-type: none"> <li>• <b>LSP Holding Priority</b>—Determines the degree to which an LSP holds on to its session reservation after the LSP has been set up successfully.</li> <li>• <b>LSP Setup Priority</b>—Determines whether a new LSP that preempts an existing LSP can be established.</li> <li>• <b>Hop Limit</b>—Specifies the maximum number of routers the LSP can traverse (including the ingress and egress).</li> <li>• <b>Bandwidth</b>—Specifies the bandwidth in bits per second for the LSP.</li> <li>• <b>LSP Retry Timer</b>—Length of time in seconds that the ingress router waits between attempts to establish the primary path.</li> </ul> | <b>defaults</b>     |

The XML tag name of the **bandwidth** tag under the **auto-bandwidth** tag has been updated to **maximum-average-bandwidth**. You can see the new tag when you issue the **show mpls lsp extensive** command with the **| display xml** pipe option. If you have any scripts that use the **bandwidth** tag, ensure that they are updated to **maximum-average-bandwidth**.

## Sample Output

### show mpls lsp defaults

```
user@host> show mpls lsp defaults
MPLS-TE LSP Defaults
 LSP Holding Priority 0
 LSP Setup Priority 7
 Hop Limit 255
 Bandwidth 0
 LSP Retry Timer 30 seconds
```

### show mpls lsp descriptions

```
user@host> show mpls lsp descriptions

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | *bridge-domain-name*)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc *interface-name***—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination *destination-prefix***—(Optional) Destination prefix.

**family *family***—(Optional) Display routing table entries for the specified family: **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name *interface-name***—(Optional) Display routing table entries for the specified interface.

**label *name***—(Optional) Display route entries for the specified label.

**lcc *number***—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id** *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching** *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** (default | *logical-system-name/routing-instance-name* | *routing-instance-name*)—(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the **show route instance** command.

**vlan** (all | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn*—(Optional) Display routing table entries for a specified VPN.

**Required Privilege Level** view

**Output Fields** [Table 79 on page 1336](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

Table 79: show route forwarding-table Output Fields

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output         |

| Next hop Type (Type)       | <p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>discard (dscd)</b>—Discard.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcr)</b>—Regular multicast next hop.</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b>—Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul> | <b>detail extensive</b>      |
| Index                      | Software index of the next hop that is used to route the traffic for a given prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |
| Route interface-index      | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>             |
| Reference (NhRef)          | Number of routes that refer to this next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| Next-hop interface (Netif) | Interface used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive none</b> |
| Weight                     | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>extensive</b>             |
| Balance                    | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>             |
| RPF interface              | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |

#### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```

so-1/1/0 {
 unit 0 {
 family inet {
 rpf-check;
 address 15.95.1.2/30;
 }
 }
}

```

```

user@host> show route forwarding-table extensive
Routing table: inet [Index 0]
Internet:
...
...
Destination: 15.95.1.3/32
Route type: destination
Route reference: 0
Route interface-index: 67

```

```

Flags: sent to PFE
Nexthop: 15.95.1.3
Next-hop type: broadcast Index: 328 Reference: 1
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0

| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Display status information about the specified multicast tunnel interface and its logical encapsulation and de-encapsulation interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b><i>interface-type</i></b>—On M Series and T Series routers, the interface type is <b><i>mt-fpc/pic/port</i></b>. On J Series routers, the interface type is <b><i>mt-pim/0/port</i></b>.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>snmp-index <i>snmp-index</i></b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p> |
| <b>Additional Information</b>   | The multicast tunnel interface has two logical interfaces: encapsulation and de-encapsulation. These interfaces are automatically created by the Junos OS for every multicast-enabled VPN routing and forwarding (VRF) instance. The encapsulation interface carries multicast traffic traveling from the edge interface to the core interface. The de-encapsulation interface carries traffic coming from the core interface to the edge interface.                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**List of Sample Output** [show interfaces \(Multicast Tunnel\) on page 1366](#)  
[show interfaces brief \(Multicast Tunnel\) on page 1366](#)

[show interfaces extensive \(Multicast Tunnel\) on page 1366](#)  
[show interfaces \(Multicast Tunnel Encapsulation\) on page 1368](#)  
[show interfaces \(Multicast Tunnel De-Encapsulation\) on page 1368](#)

**Output Fields** [Table 27 on page 1088](#) lists the output fields for the **show interfaces** (Multicast Tunnel) command. Output fields are listed in the approximate order in which they appear.

**Table 80: Multicast Tunnel show interfaces Output Fields**

| Field Name                     | Field Description                                                                                                                                  | Level of Output              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b>      |                                                                                                                                                    |                              |
| <b>Physical interface</b>      | Name of the physical interface.                                                                                                                    | All levels                   |
| <b>Enabled</b>                 | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .               | All levels                   |
| <b>Interface index</b>         | Physical interface's index number, which reflects its initialization sequence.                                                                     | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>            | SNMP index number for the physical interface.                                                                                                      | <b>detail extensive none</b> |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                  | <b>detail extensive</b>      |
| <b>Type</b>                    | Type of interface.                                                                                                                                 | All levels                   |
| <b>Link-level type</b>         | Encapsulation used on the physical interface.                                                                                                      | All levels                   |
| <b>MTU</b>                     | MTU size on the physical interface.                                                                                                                | All levels                   |
| <b>Speed</b>                   | Speed at which the interface is running.                                                                                                           | All levels                   |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                | <b>detail extensive</b>      |
| <b>Device flags</b>            | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels                   |
| <b>Interface flags</b>         | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .    | All levels                   |
| <b>Input Rate</b>              | Input rate in bits per second (bps) and packets per second (pps).                                                                                  | None specified               |
| <b>Output Rate</b>             | Output rate in bps and pps.                                                                                                                        | None specified               |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                  | <b>detail extensive</b>      |

Table 80: Multicast Tunnel show interfaces Output Fields (*continued*)

## Sample Output

### show interfaces (Multicast Tunnel)

```
user@host> show interfaces mt-1/2/0
Physical interface: mt-1/2/0, Enabled, Physical link is Up
Interface index: 145, SNMP ifIndex: 41
Type: Multicast-GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
Device flags : Present Running
Interface flags: SNMP-Traps
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)
```

### show interfaces brief (Multicast Tunnel)

```
user@host> show interfaces mt-1/2/0 brief
Physical interface: mt-1/2/0, Enabled, Physical link is Up
Type: Multicast-GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
Device flags : Present Running
Interface flags: SNMP-Traps
```

### show interfaces detail (Multicast Tunnel)

```
user@host> show interfaces mt-1/2/0 detail
Physical interface: mt-1/2/0, Enabled, Physical link is Up
Interface index: 145, SNMP ifIndex: 41, Generation: 28
Type: Multicast-GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
Hold-times : Up 0 ms, Down 0 ms
Device flags : Present Running
Interface flags: SNMP-Traps
Statistics last cleared: Never
Traffic statistics:
 Input bytes : 170664562 560000 bps
 Output bytes : 112345376 368176 bps
 Input packets : 2439107 1000 pps
 Output packets: 2439120 1000 pps
```

### show interfaces extensive (Multicast Tunnel)

```
user@host> show interfaces mt-1/2/0 extensive
Physical interface: mt-1/2/0, Enabled, Physical link is Up
Interface index: 141, SNMP ifIndex: 529, Generation: 144
Type: Multicast-GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
Hold-times : Up 0 ms, Down 0 ms
Device flags : Present Running
Interface flags: SNMP-Traps
Statistics last cleared: Never
```

```

Traffic statistics:
Input bytes : 170664562 560000 bps
Output bytes : 112345376 368176 bps
Input packets: 2439107 1000 pps
Output packets: 2439120 1000 pps
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0

```

Logical interface mt-1/2/0.32768 (Index 83) (SNMP ifIndex 556) (Generation 148)

Flags: Point-To-Point SNMP-Traps 0x4000 IP-Header  
 232.1.1.1:10.0.0.6:47:df:64:0000000800000000 Encapsulation: GRE=NULL

```

Traffic statistics:
Input bytes : 170418430
Output bytes : 112070294
Input packets: 2434549
Output packets: 2435593
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Local statistics:
Input bytes : 0
Output bytes : 80442
Input packets: 0
Output packets: 1031
Transit statistics:
Input bytes : 170418430 560000 bps
Output bytes : 111989852 368176 bps
Input packets: 2434549 1000 pps
Output packets: 2434562 1000 pps
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Protocol inet, MTU: 1572, Generation: 182, Route table: 4
Flags: None
Protocol inet6, MTU: 1572, Generation: 183, Route table: 4
Flags: None

```

Logical interface mt-1/2/0.1081344 (Index 84) (SNMP ifIndex 560) (Generation 149)

```

Flags: Point-To-Point SNMP-Traps 0x6000 Encapsulation: GRE=NULL
Traffic statistics:
Input bytes : 246132
Output bytes : 355524
Input packets: 4558
Output packets: 4558
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Local statistics:
Input bytes : 246132
Output bytes : 0

```

```
Input packets: 4558
Output packets: 0
Transit statistics:
Input bytes : 0 0 bps
Output bytes : 355524 0 bps
Input packets: 0 0 pps
Output packets: 4558 0 pps
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Protocol inet, MTU: Unlimited, Generation: 184, Route table: 4
Flags: None
Protocol inet6, MTU: Unlimited, Generation: 185, Route table: 4
Flags: None
```

#### show interfaces (Multicast Tunnel Encapsulation)

```
user@host> show interfaces mt-3/1/0.32768
Logical interface mt-3/1/0.32768 (Index 67) (SNMP ifIndex 0)
 Flags: Point-To-Point SNMP-Traps 0x4000
 IP-Header 239.1.1.1:10.255.70.15:47:df:64:0000000800000000
 Encapsulation: GRE-NULL
Input packets : 0
Output packets: 2
 Protocol inet, MTU: Unlimited
 Flags: None
```

#### show interfaces (Multicast Tunnel De-Encapsulation)

```
user@host> show interfaces mt-3/1/0.49152
Logical interface mt-3/1/0.49152 (Index 74) (SNMP ifIndex 0)
 Flags: Point-To-Point SNMP-Traps 0x6000 Encapsulation: GRE-NULL
Input packets : 0
Output packets: 2
 Protocol inet, MTU: Unlimited
 Flags: None
```

## show pim mdt

```

## show pim mdt data-mdt-joins

**Syntax** `show pim mdt data-mdt-joins`  
`<logical-system (all | logical-system-name)> instance instance-name`

**Release Information** Command introduced in Junos OS Release 11.2.

**Description** In a draft-rosen Layer 3 multicast virtual private network (MVPN) configured with service provider tunnels, display the advertisements of new multicast distribution tree (MDT) group addresses cached by the provider edge (PE) routers in the specified VPN routing and forwarding (VRF) instance that is configured to use the Protocol Independent Multicast (PIM) protocol.

**Options** `instance instance-name`—Display data MDT join packets cached by PE routers in a specific PIM instance.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**NOTE:** Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

**Required Privilege Level** view

**List of Sample Output** [show pim mdt data-mdt-joins on page 1374](#)

**Output Fields** [Table 82 on page 1373](#) describes the output fields for the `show pim mdt data-mdt-joins` command. Output fields are listed in the approximate order in which they appear.

**Table 82: show pim mdt data-mdt-joins Output Fields**

| Field Name      | Field Description                                                                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>C-Group</b>  | IPv4 group address in the address space of the customer's VPN-specific PIM-enabled routing instance of the multicast traffic destination. This 32-bit value is carried in the C-group field of the MDT join TLV packet. |
| <b>C-Source</b> | IPv4 address in the address space of the customer's VPN-specific PIM-enabled routing instance of the multicast traffic source. This 32-bit value is carried in the C-source field of the MDT join TLV packet.           |

Table 82: show pim mdt data-mdt-joins Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>P-Group</b>  | IPv4 group address in the service provider's address space of the new data MDT that the PE router will use to encapsulate the VPN multicast traffic flow (C-Source, C-Group). This 32-bit value is carried in the P-group field of the MDT join TLV packet. |
| <b>P-Source</b> | IPv4 address of the PE router.                                                                                                                                                                                                                              |
| <b>Timeout</b>  | Timeout, in seconds, remaining for this cache entry. When the cache entry is created, this field is set to 180 seconds. After an entry times out, the PE router deletes the entry from its cache and prunes itself off the data MDT.                        |

## Sample Output

### show pim mdt data-mdt-joins

```

user@host show pim mdt data-mdt-joins instance VPN-A
C-Source C-Group P-Source P-Group Timeout
20.2.15.9 225.1.1.2 20.0.0.5 239.10.10.0 172
20.2.15.9 225.1.1.3 20.0.0.5 239.10.10.1 172

```

## show pim mdt data-mdt-limit

**Syntax** `show pim mdt data-mdt-limit instance instance-name`  
`<logical-system (all | logical-system-name)>`

**Release Information** Command introduced in Junos OS Release 12.2.

**Description** Display the maximum number configured and the currently active data multicast distribution trees (MDTs) for a specific VPN routing and forwarding (VRF) instance.

**Options** `instance instance-name`—Display data MDT information for the specified VRF instance.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**NOTE:** Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

**Required Privilege Level** view

**Table 86: show amt summary Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                         | Level of Output |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>AMT anycast prefix</b>  | Prefix advertised by unicast routing protocols to route AMT discovery messages to the router from nearby AMT gateways.                                                                                    | All levels      |
| <b>AMT anycast address</b> | Anycast address configured from which the anycast prefix is derived.                                                                                                                                      | All levels      |
| <b>AMT local address</b>   | Local unique AMT relay IP address configured. Used to send AMT relay advertisement messages, it is the IP source address of AMT control messages and the source address of the data tunnel encapsulation. | All levels      |
| <b>AMT tunnel limit</b>    | Maximum number of AMT tunnels that can be created.                                                                                                                                                        | All levels      |
| <b>active tunnels</b>      | Number of active AMT tunnel interfaces.                                                                                                                                                                   | All levels      |

## Sample Output

show amt summary

```
user@host> show amt summary
 AMT anycast prefix : 20.0.0.4/32
 AMT anycast address : 20.0.0.4
 AMT local address : 20.0.0.4
 AMT tunnel limit : 1000, active tunnels : 2
```

## show amt tunnel

| Field Name                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>port</b>                          | Client port used by the AMT tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| <b>AMT tunnel interface</b>          | Dynamically created AMT logical interfaces used by the AMT tunnel in the format <b>ud-FPC/PIC/Port.unit</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | All levels      |
| <b>AMT tunnel state</b>              | State of the AMT tunnel. The state is normally <b>Active</b> . <ul style="list-style-type: none"> <li><b>Active</b>—The tunnel is active.</li> <li><b>Pending</b>—The tunnel creation is pending. This is a transient state.</li> <li><b>Down</b>—The tunnel is in the down state.</li> <li><b>Graceful restart pending</b>—Graceful restart is in progress.</li> <li><b>Reviving</b>—The routing protocol daemon or Routing Engine was restarted (not gracefully). The tunnel remains in the reviving state until the AMT gateway sends a control message. When the message is received the tunnel is moved to the <b>Active</b> state. If no message is received before the AMT tunnel inactivity timer expires, the tunnel is deleted.</li> </ul> | All levels      |
| <b>AMT tunnel inactivity timeout</b> | Number of seconds since the most recent control message was received from an AMT gateway. If no message is received before the AMT tunnel inactivity timer expires, the tunnel is deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels      |
| <b>Number of groups</b>              | Number of multicast groups using the tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels      |
| <b>Group</b>                         | Multicast group address or addresses using the tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail</b>   |
| <b>Include Source</b>                | Multicast source address for each IGMPv3 group using the tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail</b>   |
| <b>AMT message count</b>             | Statistics for AMT messages: <ul style="list-style-type: none"> <li><b>AMT Request</b>—Number of AMT relay tunnel request messages received.</li> <li><b>AMT membership update</b>—Number of AMT membership update messages received.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |

## Sample Output

### show amt tunnel

```

user@host> show amt tunnel
AMT gateway address : 11.11.11.2, port : 2268
AMT tunnel interface : ud-5/1/10.1120256
AMT tunnel state : Active
AMT tunnel inactivity timeout : 15
Number of groups : 1

AMT message count:
AMT Request AMT membership update
2 2

```

### show amt tunnel detail

```

user@host> show amt tunnel detail
AMT gateway address : 11.11.11.2, port : 2268
AMT tunnel interface : ud-5/3/10.1120512

```

```

AMT tunnel state : Active
AMT tunnel inactivity timeout : 62
Number of groups : 1
Group: 226.2.3.2

AMT message count:
AMT Request AMT membership update
2 2

AMT gateway address : 11.11.11.3, port : 2268
AMT tunnel interface : ud-5/2/10.1120513
AMT tunnel state : Active
AMT tunnel inactivity timeout : 214
Number of groups : 1
Group: 226.2.3.3

AMT message count:
AMT Request AMT membership update
2 2

```

#### show amt tunnel tunnel-interface

```

user@host> show amt tunnel tunnel-interface ud-5/3/10.1120512
AMT gateway address : 11.11.11.2, port : 2268
AMT tunnel interface : ud-5/3/10.1120512
AMT tunnel state : Active
AMT tunnel inactivity timeout : 145
Number of groups : 1

AMT message count:
AMT Request AMT membership update
2 2

```

#### show amt tunnel gateway-address

```

user@host> show amt tunnel gateway-address 11.11.11.3 port 2268
AMT gateway address : 11.11.11.3, port : 2268
AMT tunnel interface : ud-5/2/10.1120513
AMT tunnel state : Active
AMT tunnel inactivity timeout : 214
Number of groups : 1
Group: 226.2.3.3

AMT message count:
AMT Request AMT membership update
2 2

```

#### show amt tunnel gateway-address detail

```

user@host> show amt tunnel gateway-address 11.11.11.2 detail
AMT gateway address : 11.11.11.2, port : 2268
AMT tunnel interface : ud-5/3/10.1120512
AMT tunnel state : Active
AMT tunnel inactivity timeout : 234
Number of groups : 1
Group: 226.2.3.2

AMT message count:
AMT Request AMT membership update
2 2

```

## CHAPTER 43

# Session Announcement Protocol Operational Commands

- `show sap listen`

## show sap listen

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>List of Sample Output</b>    | <a href="#">show sap listen on page 1392</a><br><a href="#">show sap listen brief on page 1392</a><br><a href="#">show sap listen detail on page 1393</a>                                                                                                                                                                                                                                               |
| <b>Output Fields</b>            | <a href="#">Table 88 on page 1392</a> describes the output fields for the <b>show sap listen</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                       |

**Table 88: show sap listen Output Fields**

| Field Name           | Field Description                                                            |
|----------------------|------------------------------------------------------------------------------|
| <b>Group address</b> | Address of the group that the local router is listening to for SAP messages. |
| <b>Port</b>          | UDP port number used for SAP.                                                |

## Sample Output

### show sap listen

```
user@host> show sap listen
Group address Port
224.2.127.254 9875
239.255.255.255 9875
```

### show sap listen brief

The output for the **show sap listen brief** command is identical to that for the **show sap listen** command. For sample output, see [show sap listen on page 1392](#).

### show sap listen detail

The output for the **show sap listen detail** command is identical to that for the **show sap listen** command. For sample output, see [show sap listen on page 1392](#).

## CHAPTER 44

| <b>Output Fields</b>            | Table 89 on page 1398 describes the output fields for the <b>show msdp</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                 |

Table 89: show msdp Output Fields

| Field Name    | Field Description                                                                        | Level of Output |
|---------------|------------------------------------------------------------------------------------------|-----------------|
| Peer address  | IP address of the peer.                                                                  | All levels      |
| Local address | Local address of the peer.                                                               | All levels      |
| State         | Status of the MSDP connection: <b>Listen</b> , <b>Established</b> , or <b>Inactive</b> . | All levels      |
| Last up/down  | Time at which the most recent peer-state change occurred.                                | All levels      |

Table 89: show msdp Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                   | Level of Output |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Peer-Group           | Peer group name.                                                                                                                                                                    | All levels      |
| SA Count             | Number of source-active cache entries advertised by each peer that were accepted, compared to the number that were received, in the format <i>number-accepted/number-received</i> . | All levels      |
| Peer Connect Retries | Number of peer connection retries.                                                                                                                                                  | detail          |
| State timer expires  | Number of seconds before another message is sent to a peer.                                                                                                                         | detail          |
| Peer Times out       | Number of seconds to wait for a response from the peer before the peer is declared unavailable.                                                                                     | detail          |
| SA accepted          | Number of entries in the source-active cache accepted from the peer.                                                                                                                | detail          |
| SA received          | Number of entries in the source-active cache received by the peer.                                                                                                                  | detail          |

## Sample Output

### show msdp

```

user@host> show msdp
Peer address Local address State Last up/down Peer-Group SA Count
198.32.8.193 198.32.8.195 Established 5d 19:25:44 North23 120/150
198.32.8.194 198.32.8.195 Established 3d 19:27:27 North23 300/345
198.32.8.196 198.32.8.195 Established 5d 19:39:36 North23 10/13
198.32.8.197 198.32.8.195 Established 5d 19:32:27 North23 5/6
198.32.8.198 198.32.8.195 Established 3d 19:33:04 North23 2305/3000

```

### show msdp brief

The output for the **show msdp brief** command is identical to that for the **show msdp** command. For sample output, see [show msdp on page 1399](#).

### show msdp detail

```

user@host> show msdp detail
Peer: 10.255.70.15
Local address: 10.255.70.19
State: Established
Peer Connect Retries: 0
State timer expires: 22
Peer Times out: 49
SA accepted: 0
SA received: 0

```

## show msdp source

**Output Fields** Table 90 on page 1401 describes the output fields for the **show msdp source** command. Output fields are listed in the approximate order in which they appear.

**Table 90: show msdp source Output Fields**

| Field Name     | Field Description                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source address | IP address of the source.                                                                                                                                                                                                                                               |
| /Len           | Length of the prefix for this IP address.                                                                                                                                                                                                                               |
| Type           | Discovery method for this multicast source: <ul style="list-style-type: none"> <li>• <b>Configured</b>—Source-active limit explicitly configured for this source.</li> <li>• <b>Dynamic</b>—Source-active limit established when this source was discovered.</li> </ul> |
| Maximum        | Source-active limit applied to this source.                                                                                                                                                                                                                             |
| Threshold      | Source-active threshold applied to this source.                                                                                                                                                                                                                         |
| Exceeded       | Number of source-active messages received from this source exceeding the established maximum.                                                                                                                                                                           |

## Sample Output

**show msdp source**

```

user@host> show msdp source
Source address /Len Type Maximum Threshold Exceeded
0.0.0.0 /0 Configured 5 none 0
10.1.0.0 /16 Configured 500 none 0
10.1.1.1 /32 Configured 10000 none 0
10.1.1.2 /32 Dynamic 6936 none 0
10.1.5.5 /32 Dynamic 500 none 123
10.2.1.1 /32 Dynamic 2 none 0

```

## show msdp source-active

---

| <b>Output Fields</b>            | <a href="#">Table 91 on page 1403</a> describes the output fields for the <b>show msdp source-active</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 91: show msdp source-active Output Fields

| Field Name                              | Field Description                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                                                   |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                                                        |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.                                         |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).                                |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                                                        |
| Group address                           | Multicast address of the group.                                                                                                                            |
| Source address                          | IP address of the source.                                                                                                                                  |
| Peer address                            | IP address of the peer.                                                                                                                                    |
| Originator                              | Router ID configured on the source of the rendezvous point (RP) that originated the message, or the loopback address when the router ID is not configured. |
| Flags                                   | Flags: Accept, Reject, or Filtered.                                                                                                                        |

## Sample Output

### show msdp source-active

```

user@host> show msdp source-active
Group address Source address Peer address Originator Flags
230.0.0.0 192.168.195.46 local 10.255.14.30 Accept
230.0.0.1 192.168.195.46 local 10.255.14.30 Accept
230.0.0.2 192.168.195.46 local 10.255.14.30 Accept
230.0.0.3 192.168.195.46 local 10.255.14.30 Accept
230.0.0.4 192.168.195.46 local 10.255.14.30 Accept

```

### show msdp source-active brief

The output for the **show msdp source-active brief** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 1403](#).

### show msdp source-active detail

The output for the **show msdp source-active detail** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 1403](#).

### show msdp source-active source

```
user@host> show msdp source-active source 192.168.215.246
```

```
Global active source limit exceeded: 0
```

```
Global active source limit maximum: 25000
```

```
Global active source limit threshold: 24000
```

```
Global active source limit log-warning: 100
```

```
Global active source limit log interval: 0
```

| Group address | Source address  | Peer address   | Originator     | Flags  |
|---------------|-----------------|----------------|----------------|--------|
| 226.2.2.1     | 192.168.215.246 | 10.255.182.140 | 10.255.182.140 | Accept |

| <b>Output Fields</b>            | Table 92 on page 1405 describes the output fields for the <b>show msdp statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                         |

**Table 92: show msdp statistics Output Fields**

| Field Name                              | Field Description                                                                                                           |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                    |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                         |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.          |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device). |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                         |
| Peer                                    | Address of peer.                                                                                                            |

Table 92: show msdp statistics Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Last State Change                   | How long ago the peer state changed.                                                                                                                |
| Last message received from the peer | How long ago the last message was received from the peer.                                                                                           |
| RPF Failures                        | Number of reverse path forwarding (RPF) failures.                                                                                                   |
| Remote Closes                       | Number of times the remote peer closed.                                                                                                             |
| Peer Timeouts                       | Number of peer timeouts.                                                                                                                            |
| SA messages sent                    | Number of source-active messages sent.                                                                                                              |
| SA messages received                | Number of source-active messages received.                                                                                                          |
| SA request messages sent            | Number of source-active request messages sent.                                                                                                      |
| SA request messages received        | Number of source-active request messages received.                                                                                                  |
| SA response messages sent           | Number of source-active response messages sent.                                                                                                     |
| SA response messages received       | Number of source-active response messages received.                                                                                                 |
| Active source exceeded              | Number of times this peer has exceeded configured source-active limits.                                                                             |
| Active source Maximum               | Configured number of active source messages accepted by this peer.                                                                                  |
| Active source threshold             | Configured threshold on this peer for applying random early discard (RED) to drop some but not all MSDP active source messages.                     |
| Active source log-warning           | Configured threshold on this peer at which a warning message is logged (percentage of the number of active source messages accepted by the device). |
| Active source log-interval          | Time (in seconds) between consecutive log messages on this peer.                                                                                    |
| Keepalive messages sent             | Number of keepalive messages sent.                                                                                                                  |
| Keepalive messages received         | Number of keepalive messages received.                                                                                                              |
| Unknown messages received           | Number of unknown messages received.                                                                                                                |

Table 92: show msdp statistics Output Fields (*continued*)

| Field Name              | Field Description                  |
|-------------------------|------------------------------------|
| Error messages received | Number of error messages received. |

## Sample Output

### show msdp statistics

```

user@host> show msdp statistics
Global active source limit exceeded: 0
Global active source limit maximum: 10
Global active source limit threshold: 8
Global active source limit log-warning: 60
Global active source limit log interval: 60

Peer: 10.255.245.39
Last State Change: 11:54:49 (00:24:59)
Last message received from peer: 11:53:32 (00:26:16)
RPF Failures: 0
Remote Closes: 0
Peer Timeouts: 0
SA messages sent: 376
SA messages received: 459
SA request messages sent: 0
SA request messages received: 0
SA response messages sent: 0
SA response messages received: 0
Active source exceeded: 0
Active source Maximum: 10
Active source threshold: 8
Active source log-warning: 60
Active source log-interval 120
Keepalive messages sent: 17
Keepalive messages received: 19
Unknown messages received: 0
Error messages received: 0

```

### show msdp statistics peer

```

user@host> show msdp statistics peer 10.255.182.140
Peer: 10.255.182.140
 Last State Change: 8:19:23 (00:01:08)
 Last message received from peer: 8:20:05 (00:00:26)
 RPF Failures: 0
 Remote Closes: 0
 Peer Timeouts: 0
 SA messages sent: 17
 SA messages received: 16
 SA request messages sent: 0
 SA request messages received: 0
 SA response messages sent: 0
 SA response messages received: 0
 Active source exceeded: 20
 Active source Maximum: 10
 Active source threshold: 8
 Active source log-warning: 60
 Active source log-interval: 120
 Keepalive messages sent: 0

```

Keepalive messages received: 0  
Unknown messages received: 0  
Error messages received: 0

## show multicast usage

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Output Fields</b>                                | <p><a href="#">Table 93 on page 1409</a> describes the output fields for the <b>show multicast usage</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 93: show multicast usage Output Fields**

| Field Name      | Field Description                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------|
| <b>Instance</b> | Name of the routing instance. (Displayed when multicast is configured within a routing instance.) |

Table 93: show multicast usage Output Fields (*continued*)

| Field Name     | Field Description                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>   | Group address.                                                                                                                                                                           |
| <b>Sources</b> | Number of sources.                                                                                                                                                                       |
| <b>Packets</b> | Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays <b>unavailable</b> . |
| <b>Bytes</b>   | Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays <b>unavailable</b> .     |
| <b>Prefix</b>  | IP address.                                                                                                                                                                              |
| <b>/len</b>    | Prefix length.                                                                                                                                                                           |
| <b>Groups</b>  | Number of multicast groups.                                                                                                                                                              |

## Sample Output

### show multicast usage

```

user@host> show multicast usage
Group Sources Packets Bytes
228.0.0.0 1 52847 4439148
239.1.1.1 2 13450 1125530

Prefix /len Groups Packets Bytes
10.255.14.144 /32 2 66254 5561304
10.255.70.15 /32 1 43 3374...
```

### show multicast usage brief

The output for the **show multicast usage brief** command is identical to that for the **show multicast usage** command. For sample output, see [show multicast usage on page 1410](#).

### show multicast usage instance

```

user@host> show multicast usage instance VPN-A
Group Sources Packets Bytes
224.2.127.254 1 5538 509496
224.0.1.39 1 13 624
224.0.1.40 1 13 624

Prefix /len Groups Packets Bytes
192.168.195.34 /32 1 5538 509496
10.255.14.30 /32 1 13 624
10.255.245.91 /32 1 13 624
...
```

**show multicast usage detail**

```
user@host> show multicast usage detail
```

| Group                                                   | Sources | Packets | Bytes   |

```

## show pgm negative-acknowledgments

|                                 |                                                                                                                                                                                                               |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show pgm negative-acknowledgments                                                                                                                                                                             |
| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                                                                                                                               |
| <b>Description</b>              | Display the sent or received Pragmatic General Multicast (PGM) negative acknowledgments (NAKs), the source-path message (SPM) sequence number being negatively acknowledged, and the current state of repair. |
| <b>Options</b>                  | This command has no options.                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                          |
| <b>List of Sample Output</b>    | <a href="#">show pgm negative-acknowledgments on page 1432</a>                                                                                                                                                |
| <b>Output Fields</b>            | <a href="#">Table 94 on page 1431</a> describes the output fields for the <b>show pgm negative-acknowledgments</b> command. Output fields are listed in the approximate order in which they appear.           |

**Table 94: show pgm negative-acknowledgments Output Fields**

| Field Name                                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Global source id</b>                   | Global source identifier (GSI), which combines with the source port to determine the transport session identifier (TSI).                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Network layer address</b>              | Network layer address of the local system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Source port</b>                        | Source port number, which is combined with the GSI to determine the TSI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SPM sequence number</b>                | Numeric sequence identifier of the source-path message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Window (trailing/leading sequence)</b> | Range of sequence numbers used by the source for sequentially numbering and transmitting the most recent packets. The trailing (or left) edge of the transmit window is the sequence number of the oldest data packet available for repair from a source. The leading (or right) edge of the transmit window is defined as the sequence number of the most recent data packet a source has transmitted.                                                                                                                                   |
| <b>Outstanding NAKS</b>                   | <p>Total number of outstanding negative acknowledgments sent or received by the local system. NAK packets indicate that a packet in the expected original data sequence has been detected as missing.</p> <ul style="list-style-type: none"> <li>• <b>Sequence number</b>—Numeric sequence identifier of the source-path message.</li> <li>• <b>Group</b>—Group address.</li> <li>• <b>Source</b>—Multicast source.</li> <li>• <b>Interface</b>—Interface name.</li> <li>• <b>Receiver</b>—IP address receiving the multicast.</li> </ul> |

## Sample Output

`show pgm negative-  
acknowledgments`

```
user@host> show pgm negative-acknowledgments
Global source ID: 010203040506 Source port: 1111
 Network layer address: 10.38.0.1
 SPM sequence number: 1
 Window (trailing/leading sequence): 0/1
 Outstanding NAKs:
 Sequence number: 1
 Group: 225.1.1.1
 Source: 192.168.195.121
 Interface: t3-0/2/0:0 Receiver: 10.38.0.10
```

## show pgm source-path-messages

|                                 |                                                                                                                                                                                                 |

| <b>Output Fields</b>            | <a href="#">Table 96 on page 1434</a> describes the output fields for the <b>show pgm statistics</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 96: show pgm statistics Output Fields**

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PGM type, # received, # sent                   | <p>Number of packets received and sent for the following PGM packet types:</p> <ul style="list-style-type: none"> <li>• <b>SPM</b>—Number of total source path messages received and sent by the local system. Source path messages (SPMs) are sent by a source to establish the source path state in network elements and to provide the transmit-window state to receivers.</li> <li>• <b>POLL</b>—Total number of poll requests received and sent by the local system.</li> <li>• <b>POLR</b>—Total number of poll responses received and sent by the local system.</li> <li>• <b>ODATA</b>—Total number of original data packets received and sent by the local system.</li> <li>• <b>RDATA</b>—Total number of repair data packets received and sent by the local system. RDATA packets are generated in response to negative acknowledgments (NAKs), which indicate a missing packet from the original data sequence.</li> <li>• <b>NAK</b>—Total number of negative acknowledgments received and sent by the local system. NAK packets indicate that a packet in the expected original data sequence has been detected as missing.</li> <li>• <b>NULLNAK</b>—Total number of null negative acknowledgments received and sent by the local system. NULLNAKs are transmitted by a designated local repairer that receives NAKs redirected to it by either receivers or network elements to provide flow-control feedback to a source.</li> <li>• <b>NCF</b>—Total number of NAK confirmations received and sent by the local system. NAK confirmations are generated in response to NAK packets that are received.</li> <li>• <b>SPMR</b>—Total number of source path message requests (SPMRs) received and sent by the local system. SPMRs are used to solicit a source path message from a source in a nonimplosive way. The typical application is for late-joining receivers to solicit source path messages directly from a source in order to be able to send NAKs for missing packets, without having to wait for a regularly scheduled source path message from that source.</li> <li>• <b>OTHER</b>—Total number of other PGM packets received and sent by the local system.</li> </ul> |
| packets shorter than minimum PGM header length | Total number of packets received with headers that are shorter than the minimum required PGM header length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 96: show pgm statistics Output Fields (*continued*)

| Field Name                                       | Field Description                                                                                                                                                                                       |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| packets received with incorrect check sum        | Total number of packets received with an incorrect checksum. The checksum field is the 1's complement of the 1's complement sum of the entire PGM packet, including the header.                         |
| packets received with zero check sum             | Total number of packets received with a zero checksum. If the computed checksum is zero, it is transmitted as all ones. A value of zero in this field means that the transmitter generated no checksum. |
| packets received with TSDU length incorrect      | Total number of packets received with an incorrect Transport Service Data Unit (TSDU) length (16 bits).                                                                                                 |
| packets received with SPM length incorrect       | Total number of packets received with an incorrect source path message length.                                                                                                                          |
| packets received with unknown SPM address family | Total number of packets received with an unknown source path message address family indicator (AFI).                                                                                                    |
| packets received with NAK length incorrect       | Total number of packets received with an incorrect NAK length.                                                                                                                                          |
| packets received with unknown NAK address family | Total number of packets received with an unknown NAK address family indicator (AFI).                                                                                                                    |
| packets received with NAK for unknown TSI        | Total number of NAK packets received with an unknown transport session identifier (TSI).                                                                                                                |
| packets received when NAK throttled              | Total number of packets received when NAK is throttled.                                                                                                                                                 |
| packets received with NCF length incorrect       | Total number of packets received with an incorrect NAK confirmation length.                                                                                                                             |
| packets received with unknown NCF address family | Total number of packets received with an unknown NAK confirmation address family indicator (AFI).                                                                                                       |
| packets received with NCF for unknown TSI        | Total number of NAK confirmation packets received with an unknown transport session identifier (TSI).                                                                                                   |
| packets received with RDATA length incorrect     | Total number of packets received with an incorrect RDATA length.                                                                                                                                        |
| packets received with RDATA for unknown TSI      | Total number of RDATA packets received with an unknown transport session identifier (TSI).                                                                                                              |

## Sample Output

### show pgm statistics

```
user@host> show pgm statistics

| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                                                                                                                                                                                        |
| <b>Description</b>              | Display information about Distance Vector Multicast Routing Protocol (DVMRP)–enabled interfaces.                                                                                                                                                                       |
| <b>Options</b>                  | <p><b>none</b>—(Same as <b>logical-system all</b>) Display information about DVMRP-enabled interfaces.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                   |
| <b>List of Sample Output</b>    | <a href="#">show dvmrp interfaces on page 1439</a>                                                                                                                                                                                                                     |
| <b>Output Fields</b>            | Table 97 on page 1438 describes the output fields for the <b>show dvmrp interfaces</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                |

**Table 97: show dvmrp interfaces Output Fields**

| Field Name       | Field Description                                                                                                                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b> | Name of the interface.                                                                                                                                                                                                                                                                                 |
| <b>State</b>     | State of the interface: <b>up</b> or <b>down</b> .                                                                                                                                                                                                                                                     |
| <b>Leaf</b>      | Whether the interface is a leaf (that is, whether it has no neighbors) or whether it has neighbors.                                                                                                                                                                                                    |
| <b>Metric</b>    | Interface metric: a value from 1 through 31.                                                                                                                                                                                                                                                           |
| <b>Announce</b>  | Number of routes the interface is announcing.                                                                                                                                                                                                                                                          |
| <b>Mode</b>      | DVMRP mode: <ul style="list-style-type: none"> <li>• <b>Forwarding</b>—DVMRP does both the routing and the multicast data forwarding.</li> <li>• <b>Unicast-routing</b>—DVMRP does only the routing. Forwarding of the multicast data packets can be done by enabling PIM on the interface.</li> </ul> |

## Sample Output

### show dvmrp interfaces

```
user@host> show dvmrp interfaces
Interface State Leaf Metric Announce Mode
fxp0.0 Up N 1 4 Forwarding
fxp1.0 Up N 1 4 Forwarding
fxp2.0 Up N 1 3 Forwarding
lo0.0 Up Y 1 0 Unicast-routing
```

## show dvmrp neighbors

| <b>Output Fields</b>            | Table 99 on page 1442 describes the output fields for the <b>show dvmrp prefix</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                               |

Table 99: show dvmrp prefix Output Fields

| Field Name             | Field Description                                                    | Level of Output |
|------------------------|----------------------------------------------------------------------|-----------------|
| Prefix                 | DVMRP route.                                                         | All levels      |
| Next hop               | Next hop from which the route was learned.                           | All levels      |
| Age                    | Last time that the route was refreshed.                              | All levels      |
| <i>multicast-group</i> | Multicast group address.                                             | <b>detail</b>   |
| Prunes sent            | Number of prune messages sent to the multicast group.                | <b>detail</b>   |
| Grafts sent            | Number of grafts sent to the multicast group.                        | <b>detail</b>   |
| Cache lifetime         | Lifetime of the group in the multicast cache, in seconds.            | <b>detail</b>   |
| Prune lifetime         | Lifetime remaining and total lifetime of prune messages, in seconds. | <b>detail</b>   |

## Sample Output

### show dvmprefix

```
user@host> show dvmprefix

| <b>Output Fields</b>            | <a href="#">Table 100 on page 1444</a> describes the output fields for the <b>show dvmrp prunes</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                          |

**Table 100: show dvmrp prunes Output Fields**

| Field Name           | Field Description                                                          |
|----------------------|----------------------------------------------------------------------------|
| <b>Group</b>         | Group address.                                                             |
| <b>Source prefix</b> | Prefix for the prune.                                                      |
| <b>Timeout</b>       | How long until the prune message expires, in seconds.                      |
| <b>Neighbor</b>      | Neighbor to which the prune was sent or from which the prune was received. |

## Sample Output

### show dvmrp prunes

```

user@host> show dvmrp prunes
Group Source prefix Timeout Neighbor
224.0.1.1 128.112.0.0 /12 7077 192.168.1.1
224.0.1.32 160.0.0.0 /3 7087 192.168.1.1
224.2.123.4 136.0.0.0 /5 6955 192.168.1.1
224.2.127.1 129.0.0.0 /8 7046 192.168.1.1

```

```
224.2.135.86 128.102.128.0 /17 7071 192.168.1.1
224.2.135.86 129.0.0.0 /8 7074 192.168.1.1
224.2.135.86 130.0.0.0 /7 7071 192.168.1.1
...
```

## PART 4

# Troubleshooting

- [Knowledge Base on page 1449](#)

# Knowledge Base

- [Verifying a Multicast Configuration on page 1449](#)

## Verifying a Multicast Configuration

---

To verify a multicast configuration, perform these tasks:

- [Verifying SAP and SDP Addresses and Ports on page 1449](#)
- [Verifying the IGMP Version on page 1449](#)
- [Verifying the PIM Mode and Interface Configuration on page 1450](#)
- [Verifying the PIM RP Configuration on page 1450](#)
- [Verifying the RPF Routing Table Configuration on page 1451](#)

### Verifying SAP and SDP Addresses and Ports

**Purpose** Verify that SAP and SDP are configured to listen on the correct group addresses and ports.

**Action** From the CLI, enter the **show sap listen** command.

### Sample Output

```
user@host> show sap listen
Group Address Port
224.2.127.254 9875
```

**Meaning** The output shows a list of the group addresses and ports that SAP and SDP listen on. Verify the following information:

- Each group address configured, especially the default **224.2.127.254**, is listed.
- Each port configured, especially the default **9875**, is listed.

### Verifying the IGMP Version

**Purpose** Verify that IGMP version 2 is configured on all applicable interfaces.

**Action** From the CLI, enter the **show igmp interface** command.

## Sample Output

```
user@host> show igmp interface
Interface: ge-0/0/0.0
 Querier: 192.168.4.36
 State: Up Timeout: 197 Version: 2 Groups: 0

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0
```

**Meaning** The output shows a list of the interfaces that are configured for IGMP. Verify the following information:

- Each interface on which IGMP is enabled is listed.
- Next to **Version**, the number 2 appears.

## Verifying the PIM Mode and Interface Configuration

**Purpose** Verify that PIM sparse mode is configured on all applicable interfaces.

**Action** From the CLI, enter the **show pim interfaces** command.

## Sample Output

```
user@host> show pim interfaces
Instance: PIM.master
Name Stat Mode IP V State Count DR address
1o0.0 Up Sparse 4 2 DR 0 127.0.0.1
pim.32769 Up Sparse 4 2 P2P 0
```

**Meaning** The output shows a list of the interfaces that are configured for PIM. Verify the following information:

- Each interface on which PIM is enabled is listed.
- The network management interface, either **ge-0/0/0** or **fe-0/0/0**, is *not* listed.
- Under **Mode**, the word **Sparse** appears.

## Verifying the PIM RP Configuration

**Purpose** Verify that the PIM RP is statically configured with the correct IP address.

**Action** From the CLI, enter the **show pim rps** command.

## Sample Output

```
user@host> show pim rps
```

```

Instance: PIM.master
Address family INET
RP address Type Holdtime Timeout Active groups Group prefixes
192.168.14.27 static 0 None 2 224.0.0.0/4

```

**Meaning** The output shows a list of the RP addresses that are configured for PIM. At least one RP must be configured. Verify the following information:

- The configured RP is listed with the proper IP address.
- Under **Type**, the word **static** appears.

## Verifying the RPF Routing Table Configuration

**Purpose** Verify that the PIM RPF routing table is configured correctly.

**Action** From the CLI, enter the **show multicast rpf** command.

## Sample Output

```

user@host> show multicast rpf
Multicast RPF table: inet.0 , 2 entries...

```

**Meaning** The output shows the multicast RPF table that is configured for PIM. If no multicast RPF routing table is configured, RPF checks use **inet.0**. Verify the following information:

- The configured multicast RPF routing table is **inet.0**.
- The **inet.0** table contains entries.
