## destination (Accounting)

```
Syntax destination {
 radius {
 server {
 server-address {
 accounting-port port-number;
 max-outstanding-requests value;
 port port-number;
 retry value;
 secret password;
 source-address source-address;
 timeout seconds;
 }
 }
 }
 tacplus {
 server {
 server-address {
 port port-number;
 secret password;
 single-connection;
 timeout seconds;
 }
 }
 }
}
```

**Hierarchy Level** [edit system accounting]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**radius** statement added in Junos OS Release 7.4. Support for IPv6 source address added in Junos OS Release 12.1X47-D15.

**Description** Configure the authentication server.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

## dhcp-attributes (Access IPv4 Address Pools)

 }
```

**Hierarchy Level** [edit access address-assignment pool *pool-name* family inet6]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Configure attributes for address pools that can be used by different clients.

- Options**
- **dns-server *IPv6-address***—Specify a DNS server to which clients can send DNS queries.
  - **grace-period *seconds***—Specify the grace period offered with the lease.

**Range:** 0 through 4,294,967,295 seconds

**Default:** 0 (no grace period)

- **maximum-lease-time *seconds***—Specify the maximum length of time in seconds for which a client can request and hold a lease on a DHCP server.

**Range:** 30 through 4,294,967,295 seconds

**Default:** 86,400 seconds (24 hours)

- **option *dhcp-option-identifier-code***—Specify the DHCP option identifier code.
- **propagate-ppp-settings [*interface-name*]**—Specify PPP interface name for propagating DNS or WINS settings.

- **sip-server-address** *IPv6-address*—Specify the IPv6 address of the SIP outbound proxy server.
- **sip-server-domain-name** *domain-name*—Specify the domain name of the SIP outbound proxy server.

**Required Privilege Level** access—To view this statement in the configuration.  
access-control—To add this statement to the configuration.

## dhcp-client

**Syntax**

```
dhcp-client {
 client-identifier {
 prefix {
 host-name;
 logical-system-name;
 routing-instance-name;
 }
 use-interface-description (device | logical);
 user-id (ascii string | hexadecimal string);
 }
 lease-time (length | infinite);
 retransmission-attempt value;
 retransmission-interval seconds;
 server-address server-address;
 update-server;
 vendor-id vendor-id;
}
```

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number* family *family*]

**Release Information** Statement introduced in Junos OS Release 12.1X44-D10.

**Description** Configure the Dynamic Host Configuration Protocol (DHCP) client.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

}

**Hierarchy Level** [edit system syslog]

**Release Information** Statement introduced before Junos OS Release 12.1X47 for SRX Series.

**Description** Specify the file in which to log data.

- Options**
- *filename*—Specify the name of the file in which to log data.
  - *allow-duplicates*—Do not suppress the repeated messages.
  - *any*—Specify all facilities information.
    - *alert*—Specify the conditions that should be corrected immediately.
    - *critical*—Specify the critical conditions.
    - *emergency*—Specify the conditions that cause security functions to stop.
    - *error*—Specify the general error conditions.

- *info*—Specify the information about normal security operations.
- *none*—Do not specify any messages.
- *notice*—Specify the conditions that should be handled specifically.
- *warning*—Specify the general warning conditions.
- *archive*—Specify the archive file information.
  - *archive-sites*—Specify a list of destination URLs for the archived log files.
    - *url*—Specify the primary and failover URLs to receive archive files.
  - *binary-data*—Mark file such that it contains binary data.
  - *no-binary-data*—Do not mark the file such that it contains binary data.
  - *files*—Specify the number of files to be archived. Range: 1 through 1000 files.
  - *size*—Specify the size of files to be archived. Range: 65,536 through 1,073,741,824 bytes.
  - *world-readable*—Allow any user to read the log file.
  - *no-world-readable*—Do not allow any user to read the log file.
  - *start-time*—Specify the start time for file transmission. Enter the start time in the yyyy-mm-dd.hh:mm format.
  - *transfer-interval*—Specify the frequency at which to transfer the files to archive sites.
- *authorization*—Specify the authorization system.
- *change-log*—Specify the configuration change log.
- *conflict-log*—Specify the configuration conflict log.
- *daemon*—Specify the various system processes.
- *dfc*—Specify the dynamic flow capture.
- *explicit-priority*—Include the priority and facility in messages.
- *external*—Specify the local external applications.
- *firewall*—Specify the firewall filtering system.
- *ftp*—Specify the FTP process.
- *interactive-commands*—Specify the commands executed by the UI.
- *kernel*—Specify the kernel information.
- *match*—Specify the regular expression for lines to be logged.
- *ntp*—Specify the NTP process.
- *pfe*—Specify the Packet Forwarding Engine.
- *security*—Specify the security-related information.

- *structured-data*—Log the messages in structured log format.
  - *brief*—Omit English language text from the end of the logged message.
- *user*—Specify the user processes.
  - *info*—Specify the informational messages.

## forwarding-options (Security)

**Syntax**

```
forwarding-options {
 family {
 inet6 {
 mode (drop | flow-based | packet-based);
 }
 iso {
 mode packet-based;
 }
 mpls {
 mode packet-based;
 }
 }
}
```

**Hierarchy Level** [edit security]

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Determine how the **inet6**, **iso**, and **mpls** protocol families manage security forwarding options.

### NOTE:

- Packet-based processing is not supported on the following SRX Series devices: SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800.
- On SRX Series devices, the default mode for processing traffic is flow mode. To configure an SRX Series device as a border router, you must change the mode from flow-based processing to packet-based processing. Use the **set security forwarding-options family mpls mode packet-based** statement to configure the SRX device to packet mode. You must reboot the device for the configuration to take effect.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure extended DHCP local server tracing operations that can be enabled on a specific interface or group of interfaces. You use the <b>interface <i>interface-name</i> trace</b> statement at the [edit system services group <i>group-name</i>] hierarchy level to enable the tracing operation on the specific interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>file-name</b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" "). All files are placed in a file named <b>jdhcpd</b> in the directory <b>/var/log</b>. If you include the <b>file</b> statement, you must specify a filename.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events</li> <li>• <b>dhcpv6-packet</b>—Trace DHCPv6 packet decoding operations.</li> <li>• <b>dhcpv6-packet-option</b>—Trace DHCPv6 option decoding operations.</li> <li>• <b>dhcpv6-state</b>—Trace changes in state for DHCPv6 operations.</li> <li>• <b>packet</b>—Trace packet decoding operations</li> <li>• <b>packet-option</b>—Trace DHCP option decoding operations</li> <li>• <b>state</b>—Trace changes in state</li> </ul> |

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

## internet-options

**Syntax**

```
internet-options {
 icmpv4-rate-limit {
 bucket size seconds;
 packet-rate packet-rate;
 }
 icmpv6-rate-limit {
 bucket size seconds;
 packet-rate packet-rate;
 }
 ipv6-duplicate-addr-detection-transmits number;
 no-path-mtu-discovery;
 no-source-quench;
 no-tcp-reset;
 no-tcp-rfc1323;
 no-tcp-rfc1323-paws;
 path-mtu-discovery;
 source-port {
 upper-limit range;
 }
 source-quench;
 tcp-drop-synfin-set;
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 11.1.

**Description** Configure tunable options for Internet operations.

- Options**
- **icmpv4-rate-limit**—Configure rate-limiting parameters for Internet Control Message Protocol version 4 (ICMPv4) messages.
    - **bucket-size *seconds***—Set ICMP rate-limiting maximum bucket size in seconds.
    - **packet-rate *packet-rate***— Set ICMP rate-limiting packets earned per second.
  - **icmpv6-rate-limit**—Configure rate-limiting parameters for Internet Control Message Protocol version 6 (ICMPv6) messages.
    - **bucket-size *seconds***—Set ICMP rate-limiting maximum bucket size in seconds.
    - **packet-rate *packet-rate***— Set ICMP rate-limiting packets earned per second.
  - **ipv6-duplicate-addr-detection-transmits *number***—Control the number of attempts for IPv6 duplicate address detection.
  - **no-path-mtu-discovery**—Do not enable path maximum transmission unit (MTU) discovery on TCP connections.
  - **no-source-quench**—Do not react to incoming ICMP source quench messages.
  - **no-tcp-reset**—Do not send RST TCP packets for packets sent to non-listening ports.
  - **no-tcp-rfc1323**—Disable RFC 1323 TCP extensions.

- **no-tcp-rfc1323-paws**—Disable RFC 1323 Protection Against Wrapped Sequence Number extension.
- **path-mtu-discovery**—Enable path MTU discovery on TCP connections.
- **source-port**—Configure source port selection parameters.
  - **upper-limit *range***—Specify upper limit of source port selection range.
- **source-quench**—React to incoming ICMP source quench messages.
- **tcp-drop-synfin-set**—Drop TCP packets that have both SYN and FIN flags.

 services netconf;
 }
 traceoptions {
 file filename <files number> <match regex> <size size> <world-readable |
 no-world-readable>;
 flag flag;
 no-remote-trace;
 }
 }
```

**Hierarchy Level** [edit system services]

**Release Information** Statement introduced in Release 10.4 of Junos OS.  
Support for IPv6 address added in Junos OS Release 12.1X47-D15.

**Description** Initiate outbound SSH connections.

**Options** **client** *client-id*—Defines a device-initiated connection. This value serves to uniquely identify the outbound-ssh configuration stanza. Each outbound-ssh stanza represents a single outbound SSH connection. Thus, the administrator is free to assign the client-id any meaningful unique value.

**address** *address*—Specifies the IPv4 or IPv6 address or host name of the client.

**port** *port-number*—Specifies the port at which a server listens for outbound SSH connection requests.

**retry** *number*—Specifies the maximum number of connection attempts a device can make to the specified IP address. The default is three attempts.

**timeout** *seconds*—Specifies how long the application waits between attempts to reconnect to the specified IP address, in seconds. The default is 15 seconds.

**device** *device-id*—Identifies the device to the management client. Each time the device establishes an outbound SSH connection, it first sends an initiation sequence (device-id) to the management client.

**keep-alive**—Enables the device to send SSH protocol keepalive messages to the client application. The **timeout** statement specifies how long the device waits to receive data before sending a request for acknowledgment from the application. The default is 15 seconds. The **retry** statement specifies how many keepalive messages the router sends without receiving a response from the client. When that number is exceeded, the device disconnects from the application, ending the outbound SSH connection. The default is three retries.

**reconnect-strategy (in-order|sticky)**—Specifies how the device reconnects to the server after a connection is dropped.

**in-order**—Configures the device to reconnect to the first configured server. If this server is unavailable, the device tries to connect to the next configured server. This process repeats until a connection is completed.

**sticky**—Configures the device to reconnect to the server from which it disconnected.

**secret password**—Sends the device's public SSH host key when the device connects to the client.

**services netconf**—Configures the application to accept NETCONF as an available service.

| <b>Description</b>              | For NTP, configure the SRX Series device to operate in symmetric active mode with the remote system at the specified address. In this mode, the SRX Series device and the remote system can synchronize with each other. This configuration is useful in a network in which either the SRX Series device or the remote system might be a better source of time.                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the NTP version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>         | Enable dynamic reconfiguration triggered by the DHCP local server of all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>             | <p><b>attempts <i>number</i></b>—Configure maximum number of attempts to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces before reconfiguration is considered to have failed. A group configuration takes precedence over a DHCP local server configuration.</p> <p><b>Range:</b> 1 through 10 attempts</p> <p><b>Default:</b> 8 attempts</p> <p><b>clear-on-abort</b>—Delete all DHCP clients or only the DHCP clients serviced by the specified group of interfaces when reconfiguration fails; that is, when the maximum number of retry attempts have been made without success. A group configuration takes precedence over a DHCP local server configuration.</p> <p><b>strict</b>—Configure the system to only allow packets that contain the reconfigure accept option.</p> <p><b>timeout <i>seconds</i></b>—Configure the initial value in seconds between attempts to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. Each successive attempts doubles the interval between attempts. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on. A group configuration takes precedence over a DHCP local server configuration.</p> <p><b>Range:</b> 1 through 10 seconds</p> <p><b>Default:</b> 2 seconds</p> <p><b>token <i>token-name</i></b>—Configure a plain-text token for all DHCP clients or only the clients specified by the specified group of interfaces. The default is null (empty string).</p> |

**trigger** — Specify DHCP reconfigure trigger.

|                                 |                                                                                                                                                                                                         |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.                                                                                                                                                     |
|                                 | system-control—To add this statement to the configuration.                                                                                                                                              |

| <b>Description</b>              | <p>For NTP, configure the SRX Series device to operate in client mode with the remote system at the specified address. In this mode, the SRX Series device can be synchronized with the remote system, but the remote system can never be synchronized with the SRX Series device.</p> <p>If the NTP client time drifts so that the difference in time from the NTP server exceeds 128 milliseconds, the client is automatically stepped back into synchronization. If the offset between the NTP client and server exceeds the 1000-second threshold, the client still synchronizes with the server, but it also generates a system log message noting that the threshold was exceeded.</p>     |
| <b>Options</b>                  | <p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) Use the specified key number to encrypt authentication fields in all packets sent to the specified address.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other things are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure the router or switch so that users on remote systems can access the local router or switch through the DHCP server, finger, rlogin, SSH, telnet, Web management, Junos XML protocol clear-text, Junos XML protocol SSL, and network utilities or enable Junos OS to work with the Session and Resource Control (SRC) software.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring clear-text or SSL Service for Junos XML Protocol Client Applications*
- *Configuring the Junos OS to Work with SRC Software*

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Specify a source address for each configured TACACS+ server, RADIUS server, or NTP server, or the source address to record in system log messages that are directed to a remote machine.                                                                                                                                                                                 |
| <b>Options</b>                  | <i>source-address</i> —A valid IP address configured on one of the SRX Series devices. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all <b>host <i>hostname</i></b> statements at the [edit system <b>syslog</b> ] hierarchy level, but not for messages directed to the other Routing Engine. |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                        |

## tacplus-server (System)

|                            |                                                                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre>tacplus-server server-address {     port port-number;     secret password;     single-connection;     source-address source-address;     timeoutseconds; }</pre> |
| <b>Hierarchy Level</b>     | [edit system]                                                                                                                                                         |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>                                  |
| <b>Description</b>         | Configure the TACACS+ server.                                                                                                                                         |

- Options**
- **server-address**—Address of the TACACS+ authentication server.

**NOTE:** Wildcard characters cannot be used in the TACACS server address or source address. This is because the TACACS server and source can accept both IPv4 and IPv6 addresses and, if you use wildcard characters for these addresses, Junos OS cannot validate mismatching server and source address families.

- **port**—Port number of TACACS+ authentication server.
- **secret**—Password to use with the RADIUS or TACACS+ server. The secret password used by the local router or switch must match that used by the server. Password to use; can include spaces included in quotation marks.
- **single-connection**—Optimize attempts to connect to a TACACS+ server. The software maintains one open TCP connection to the server for multiple requests rather than opening a connection for each connection attempt.
- **source-address**—Source address for each configured TACACS+ server, RADIUS server, NTP server, or the source address to record in system log messages that are directed to a remote machine. Configure a valid IP address on one of the device interfaces. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all **host hostname** statements at the **[edit system syslog]** hierarchy level.
- **timeout**—The amount of time that the local device waits to receive a response from a RADIUS or TACACS+ server. The timeout range is 1 through 90 seconds. The default is 3 seconds.

|                                 |                                                                                                                              |

| <b>Release Information</b> | Statement introduced in Release 10.4 of Junos OS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | Set the trace options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <ul style="list-style-type: none"> <li><b>file</b>—Configure the trace file information. <ul style="list-style-type: none"> <li><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. By default, the name of the file is the name of the process being traced.</li> <li><b>files <i>number</i></b>—Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed to <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.</li> </ul> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 10 files</p> </li> <li><b>match <i>regular-expression</i></b>—Refine the output to include lines that contain the regular expression.</li> <li><b>size <i>maximum-file-size</i></b>—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</li> </ul> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Syntax:</b> x K to specify KB, x m to specify MB, or x g to specify GB</p> <p><b>Range:</b> 10 KB through 1 GB</p> |

**Default:** 128 KB

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag**—Specify the tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags.
  - **all**—Trace all events.
  - **configuration**—Trace configuration events.
  - **connectivity**—Trace TCP connection handling.
- **no-remote-trace**—Disable remote tracing.

| <b>Description</b>         | Configure extended DHCP local server tracing operations for DHCP processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <ul style="list-style-type: none"> <li>• <b>file-name</b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" "). All files are placed in a file named <b>jdhcpd</b> in the directory <b>/var/log</b>. If you include the <b>file</b> statement, you must specify a filename.</li> <li>• <b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</li> </ul> <p><b>Range:</b> 2 through 1000<br/> <b>Default:</b> 3 files</p> <ul style="list-style-type: none"> <li>• <b>match regular-expression</b>—(Optional) Refine the output to include lines that contain the regular expression.</li> <li>• <b>size maximum-file-size</b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.</li> </ul> <p><b>Syntax:</b> <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify GB<br/> <b>Range:</b> 10 KB through 1 GB<br/> <b>Default:</b> 128 KB</p> <ul style="list-style-type: none"> <li>• <b>world-readable</b>—(Optional) Enable unrestricted file access.</li> <li>• <b>no-world-readable</b>—(Optional) Disable unrestricted file access.</li> <li>• <b>flag flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags: <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events.</li> </ul> </li> </ul> |

- **database**—Trace database operations.
- **dhcpv6-general**—Trace operations for DHCPv6.
- **dhcpv6-io**—Trace input/output operations for DHCPv6.
- **dhcpv6-packet**—Trace DHCPv6 packet decoding operations.
- **dhcpv6-packet-option**—Trace DHCPv6 option decoding operations.
- **dhcpv6-rpd**—Trace routing protocol process operations.
- **dhcpv6-session-db**—Trace session database operations for DHCPv6.
- **dhcpv6-state**—Trace changes in state for DHCPv6 operations.
- **fwd**—Trace firewall process operations.
- **general**—Trace miscellaneous general operations.
- **ha**—Trace high-availability related operations.
- **interface**—Trace interface operations.
- **io**—Trace input/output operations.
- **packet**—Trace packet decoding operations.
- **packet- option**—Trace DHCP option decoding operations.
- **performance**—Trace DHCP performance measurement operations.
- **profile**—Trace DHCP profile operations.
- **rpd**—Trace routing protocol process operations.
- **rtsock**—Trace routing socket operations.
- **session-db**—Trace session database operations.
- **state**—Trace changes in state.
- **statistics**—Trace changes in statistics.
- **ui**—Trace changes in user interface operations.
- **no remote-trace**—Disable remote tracing.

## web-management (System Services)

```
Syntax web-management {
 http {
 interfaces interface-names ;
 port port;
 }
 https {
 interfaces interface-names;
 system-generated-certificate name;
 port port;
 }
 management url management url;
 session {
 idle-timeout minutes;
 session-limit number;
 }
 traceoptions {
 file {
 filename;
 files number;
 match regular-expression;
 size maximum-file-size;
 (no-world-readable | world-readable);
 }
 flag flag;
 level level;
 no-remote-trace;
 }
 }
```

**Hierarchy Level** [edit system services]

**Release Information** Statement introduced in Junos OS Release 9.0.

**Description** Configure settings for HTTP or HTTPS access. HTTP access allows management of the device using the J-Web interface. HTTPS access allows secure management of the device using the J-Web interface. With HTTPS access, communication is encrypted between your browser and the webserver for your device.

**Options** **control**—Disable the SBC process.

- **max-threads**—Maximum simultaneous threads to handle requests.

**Range:** 0 through 16

**http**—Configure HTTP.

- **interface** [*value*]—Interface value that accept HTTP access.
- **port** *number*—TCP port for incoming HTTP connections.

**Range:** 1 through 65,535

**https**—Configure HTTPS.

- **interface** *[value]*—Interface value that accept HTTP access.
- **port** *number*—TCP port for incoming HTTP connections.  
**Range:** 1 through 65,535
- **local-certificate**—X.509 certificate to use from configuration.
- **pki-local-certificate**—X.509 certificate to use from PKI local store.
- **system-generated-certificate**—X.509 certificate generated automatically by system.

**management url** *management url*—URL Path for Web management access.

**session**—Configure web management session.

- **idle-timeout** *minutes*—Default timeout of web-management sessions in minutes.
- **session-limit** *number*—Maximum number of web-management sessions to allow.

**traceoptions**—Set the trace options.

- **file**—Configure the trace file information.
  - *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, the name of the file is the name of the process being traced.
  - **files number**—Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size maximum file-size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

- **match regular-expression**—Refine the output to include lines that contain the regular expression.
- **size maximum-file-size**—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

**Range:** 10 KB through 1 GB

**Default:** 128 KB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files number** option.

- **(world-readable | no-world-readable)**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag flag**—Specify which tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags.
  - **all**—Trace all areas.
  - **configuration**—Trace configuration.
  - **init**—Trace daemon init process.
  - **mgd**—Trace MGD requests.
  - **webauth**—Trace webauth requests.
- **level level**—Specify the level of debugging output.
  - **all**—Match all levels.
  - **error**—Match error conditions.
  - **info**—Match informational messages.

- **notice**—Match conditions that should be handled specially.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.
- **no-remote-trace**—Disable the remote tracing.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

### file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

## file copy

|                            |                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>file copy <i>source destination</i></code><br><code>&lt;source-address <i>source- address</i>&gt;</code>                                  |
| <b>Release Information</b> | Command introduced before Junos OS Release 7.4.                                                                                                 |
| <b>Description</b>         | Copy files from one location to another location on the local device or to a location on a remote device that is reachable by the local device. |

**WARNING:** The `ssl3-support` option is not available for configuration with the `set system services xnm-ssl` and `file copy` commands. SSLv3 is no longer supported or available.

You can use the `set system services xnm-ssl ssl3-support` command to enable SSLv3 for a Junos XML protocol client application to use as the protocol to connect to the Junos XML protocol server on a device, and you can use the `file copy source destination ssl3-support` command to enable the copying of files from an SSLv3 URL.

Using SSLv3 presents a potential security vulnerability, and we recommend that you not use SSLv3. For more details about this security vulnerability, go to <http://kb.juniper.net/InfoCenter/index?page=content&id=JSA10656>.

| <b>List of Sample Output</b>    | <a href="#">Copy a File from the Local Device to a Personal Computer on page 1208</a><br><a href="#">Copy a Configuration File Between Routing Engines on page 1209</a><br><a href="#">Copy a Log File Between Routing Engines on page 1209</a><br><a href="#">Copy a File Using FTP on page 1209</a><br><a href="#">Copy a File Using FTP and Requiring a Password on page 1209</a><br><a href="#">Copy a File Using Secure Copy on page 1209</a> |

## Sample Output

The following are examples of a variety of file copy scenarios.

### Copy a File from the Local Device to a Personal Computer

```
user@host> file copy /var/tmp/rpd.core.4 mypc:/c/junipero/tmp
...transferring.file..... | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
```

### Copy a Configuration File Between Routing Engines

The following sample command copies a configuration file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy /config/juniper.conf re1:/var/tmp/copied-juniper.conf
```

### Copy a Log File Between Routing Engines

The following sample command copies a log file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy lcc0-re0:/var/log/chassisd lcc0-re1:/var/tmp
```

### Copy a File Using FTP

To use anonymous FTP to copy a local file to a remote system:

```
user@host> file copy filename ftp://hostname/filename
```

In the following example, `/config/juniper.conf` is the local file and `hostname` is the FTP server:

```
user@host> file copy /config/juniper.conf ftp://hostname/juniper.conf
Receiving ftp: //hostname/juniper.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

### Copy a File Using FTP and Requiring a Password

To use FTP where you require more privacy and are prompted for a password:

```
root@host> file copy filename ftp://user@hostname/filename
```

In the following example, `/config/example.conf` is the local file and `hostname` is the FTP server:

```
root@host> file copy /config/example.conf ftp://user@hostname/example.conf
Password for user@hostname: *****
Receiving ftp: //user@hostname/example.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

### Copy a File Using Secure Copy

To use scp to copy a local file to a remote system:

```
root@host> file copy filename scp://user@hostname/path/filename
```

In the following example, `/config/juniper.conf` is the local file, `user` is the username, and `ssh-host` is the scp server:

```
root@host> file copy /config/juniper.conf scp://user@ssh-host/tmp/juniper.conf
user@ssh-host's password: *****
juniper.conf 100%
| ***** |
2198 00:00
```

## file delete

| <b>Release Information</b>      | Command introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Prepare the system for autorecovery of configuration, licenses, and disk information.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>save</b>—Save the current state of the disk partitioning, configuration, and licenses for autorecovery.</p> <p>The active Junos OS configuration is saved as the Junos rescue configuration, after which the rescue configuration, licenses, and disk partitioning information is saved for autorecovery. Autorecovery information must be initially saved using this command for the autorecovery feature to verify integrity of data on every bootup.</p> |
|                                 | <div>  <p><b>NOTE:</b></p> <ul style="list-style-type: none"> <li>Any recovery performed at a later stage will restore the data to the same state as it was when the save command was executed.</li> <li>A fresh rescue configuration is generated when the command is executed. Any existing rescue configuration will be overwritten.</li> </ul> </div>                        |
|                                 | <p><b>recover</b>—Recover the disk partitioning, configuration, and licenses.</p> <p>After autorecovery data has been saved, the integrity of saved items is always checked automatically on every bootup. The recovery command allows you to forcibly re-run the tests at any time if required.</p>                                                                                                                                                              |
|                                 | <p><b>clear</b>—Clear all saved autorecovery information.</p> <p>Only the autorecovery information is deleted; the original copies of the data used by the router are not affected. Clearing the autorecovery information also disables all autorecovery integrity checks performed during bootup.</p>                                                                                                                                                            |
| <b>Required Privilege Level</b> | maintenance                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## request system snapshot (Maintenance)

**Syntax** request system snapshot  
 <factory>  
 <media (compact-flash | hard-disk | internal | usb)>  
 <node (all | local | node-id | primary)>  
 <partition>  
 <slice (alternate) >

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Back up the currently running and active file system partitions on the device.

- Options**
- **factory**— (Optional) Specifies that only the files shipped from the factory are included in the snapshot.
  - **media**— (Optional) Specifies the media to be included in the snapshot:
    - **compact-flash**— Copies the snapshot to an external compact flash.
    - **hard-disk**— Copies the snapshot to a hard disk.
    - **usb**— Copies the snapshot to the USB storage device.
    - **internal**— Copies the snapshot to internal media. This is the default.

**NOTE:** USB option is available on all SRX series devices; hard disk and compact-flash options are available only on high-end SRX series devices; media internal option is available only on branch SRX series devices.

- **node**— (Optional) Specifies to archive the data and executable areas of a specific node.
  - **node-id**—Archive a specific node. The range of node ID is (0,1)
  - **all**—Archive all nodes.
  - **local**—Archive only local nodes.
  - **primary**—Archive only primary nodes.
- **partition** - (Default) Specifies that the target media should be repartitioned before the backup is saved to it.

**NOTE:**

- The target media is partitioned whether or not it is specified in the command, because this is a mandatory option.
- You cannot partition a hard-disk as it is mounted on /var directory.

- slice— (Optional) Takes a snapshot of the root partition the system has currently booted from to another slice in the same media.
- alternate— (Optional) Stores the snapshot on the other root partition in the system.

**NOTE:**

- The slice option cannot be used along with the other request system snapshot options, because the options are mutually exclusive. If you use the factory, media, or partition option, you cannot use the slice option; if you use the slice option, you cannot use any of the other options.
- The slice partition is supported only on branch SRX Series devices.

## Sample Output

### [request system snapshot media hard-disk](#)

```

user@host> request system snapshot media hard-disk
Verifying compatibility of destination media partitions...
Running newfs (880MB) on hard-disk media / partition (ad2s1a)...
Running newfs (98MB) on hard-disk media /config partition (ad2s1e)...
Copying '/dev/ad0s1a' to '/dev/ad2s1a' .. (this may take a few minutes)
...

```

### [request system snapshot media usb \(when usb device is missing](#)

```

user@host> request system snapshot media usb
Verifying compatibility of destination media partitions...
Running newfs (254MB) on usb media / partition (dals1a)...

```

```
Running newfs (47MB) on usb media /config partition (da1s1e)...
Copying '/dev/da0s2a' to '/dev/da1s1a' .. (this may take a few minutes)
Copying '/dev/da0s2e' to '/dev/da1s1e' .. (this may take a few minutes)
The following filesystems were archived: / /config
```

#### request system snapshot media compact-flash

```
user@host> request system snapshot media compact-flash
error: cannot snapshot to current boot device
```

#### request system snapshot media internal

```
user@host> request system snapshot media internal
error: cannot snapshot to current boot device
```

#### request system snapshot partition

```
user@host> request system snapshot partition
Verifying compatibility of destination media partitions...
Running newfs (439MB) on internal media / partition (da0s1a)...
Running newfs (46MB) on internal media /config partition (da0s1e)...
Copying '/dev/da1s1a' to '/dev/da0s1a' .. (this may take a few minutes)
Copying '/dev/da1s1e' to '/dev/da0s1e' .. (this may take a few minutes)
The following filesystems were archived: / /config
```

## request system software abort in-service-upgrade (ICU)

| <b>Release Information</b>      | Command introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Abort an in-band cluster upgrade (ICU). This command must be issued from a router session other than the one on which you issued the <b>request system in-service-upgrade</b> command that launched the ICU. If an ICU is in progress, this command aborts it. If the node is being upgraded, this command will cancel the upgrade. The command is also helpful in recovering the node in case of a failed ICU. |
| <b>Options</b>                  | This command has no options.                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>                                    | Display information about the system. Issue this command before contacting customer support, and then include the command output in your support request. Output from this command varies somewhat, depending on which platform you issue the command from. However, the command always executes a series of <b>show</b> commands, with the appropriate information for your device automatically included.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                                        | <p><b>brief</b>—(SRX Series) (Optional) Display system brief information.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers) (Optional) Display system information for all chassis.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers) (Optional) On a TX Matrix router, display system information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system information for all chassis for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX Series switches and MX Series routers) (Optional) Display system information for all members of the Virtual Chassis configuration.</p> <p><b>lcc <i>number</i></b>—(TX Matrix and TX Matrix Plus routers) (Optional) On a TX Matrix router, display system information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage information for a specific T1600 router that is connected to the TX Matrix Plus router. Replace <i>number</i> with a value from 0 through 3.</p> |

**local**—(EX Series switches and MX Series routers) (Optional) Display system information for the local Virtual Chassis member.

**member *member-id***—(EX Series switches and MX Series routers) (Optional) Display system information for the specified member of the Virtual Chassis configuration. On EX Series switches, replace ***member-id*** with a value appropriate for that Virtual Chassis configuration. On MX Series routers, replace ***member-id*** with a value of 0 or 1.

**scc**—(TX Matrix routers) (Optional) Display system information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers) (Optional) Display system information for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**Additional Information** The **show** commands issued as a result of this command vary depending on which platform you issue the command from. Output is always appropriate for the device. For example, [Table 101 on page 1235](#) lists the **show** commands that are called when you issue **request** on an MX Series router.

**Table 101: Sample show Commands Called by the request information support command on an MX Series Router**

|                                               |                                               |
|-----------------------------------------------|-----------------------------------------------|
| show chassis alarms no-forwarding             | show pfe statistics traffic                   |
| show chassis environment no-forwarding        | show route summary                            |
| show chassis firmware no-forwarding           | show system boot-messages no-forwarding       |
| show chassis fpc detail                       | show system buffer no-forwarding              |
| show chassis hardware detail no-forwarding    | show system core-dumps no-forwarding          |
| show chassis hardware extensive no-forwarding | show system processes extensive no-forwarding |
| show chassis routing-engine no-forwarding     | show system queues no-forwarding              |
| show configuration   except SECRET-DATA       | show system statistics no-forwarding          |
| show interfaces extensive no-forwarding       | show system storage no-forwarding             |
| show krt queue                                | show system uptime no-forwarding              |
| show krt state                                | show system virtual-memory no-forwarding      |
| show pfe statistics error                     | show version detail no-forwarding             |

The **no-forwarding** option ensures that all mgd processes associated with the **show** command are properly halted if you break into the output (Ctrl+C) while the command is still running.

|                                 |                                                                                                                                                                                                                                                                                                                     |

The output sample is truncated to display some of the support details.

## request system zeroize

**Syntax** `request system zeroize <media>`

**Description** Erases all configuration information and resets all key values. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories.

The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.

This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as root and start the Junos OS command-line interface (CLI) by typing `cli` at the prompt.

**Options** **media**—(Optional) In addition to removing all configuration and log files, the media option causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and the like. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the request system zeroize media operation can take considerably more time than the request system zeroize operation. However, the critical security parameters are all removed at the beginning of the process.

**NOTE:** The media option is not supported on SRX5000 line devices.

**Required Privilege Level** Not applicable.

**Release Information** Command introduced before Junos OS Release 9.2

**Description** Restart a Junos OS process.

**CAUTION:** Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router to drop calls and interrupt transmission, resulting in possible loss of data.

- Options**
- application-identification—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
  - application-security—(Optional) Restart the application security process.
  - audit-process—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, for analyzing and tracking usage patterns, and for billing a user based upon the amount of time used or the type of services accessed.
  - chassis-control—(Optional) Restart the chassis management process.
  - class-of-service—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.
  - commitd-service—(Optional) Restart the committed services.
  - database-replication—(Optional) Restart the database replication process.
  - datapath-trace-service—(Optional) Restart the Restart the packet path tracing process.
  - ddns—(Optional) Restart the dynamic domain name system, which dynamically updates IP addresses for registered domain names.

- `dhcp`—(Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.
- `dhcp-service`—(Optional) Restart the Dynamic Host Configuration Protocol process.
- `disk-monitoring`—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.
- `dynamic-flow-capture`—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on PIC3 monitoring services cards.
- `ethernet-connectivity-fault-management`—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Maintenance (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.
- `ethernet-link-fault-management`—(Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.
- `event-processing`—(Optional) Restart the event process (`eventd`).
- `extensible-subscriber-services`—(Optional) Restart the extensible subscriber services process.
- `fipsd`—(Optional) Restart the `fipsd` services.
- `firewall`—(Optional) Restart the firewall management process, which manages the firewall configuration and accepts or rejects packets that are transiting an interface on a router or switch.
- `firewall-authentication-service`—(Optional) Restart the firewall authentication service process.
- `general-authentication-service`—(Optional) Restart the general authentication process.
- `gprs-process`—(Optional) Restart the General Packet Radio Service (GPRS) process.
- `gracefully`—(Optional) Restart the software process.
- `idp-policy`—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.
- `immediately`—(Optional) Immediately restart the software process.
- `interface-control`—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.
- `ipmi`—(Optional) Restart the intelligent platform management interface process.
- `ipsec-key-management`—(Optional) Restart the IPsec key management process.
- `jflow-service`—(Optional) Restart `jflow` service process.
- `jnu-management`—(Optional) Restart `jnu` management process.
- `jnx-wmicd-service`—(Optional) Restart `jnx wmicd` service process.
- `jsrp-service`—(Optional) Restart the Juniper Services Redundancy Protocol (`jsrdp`) process, which controls chassis clustering.

- `kernel-replication`—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.
- `lACP`—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link. The LACP process allows link aggregation control instances to reach agreement on the identity of the LAG to which a link belongs, moves the link to that LAG, and enables the transmission and reception processes for the link to function in an orderly manner.
- `l2cpd-service`—(High-end SRX Series only) (Optional) Restart the Layer 2 Control Protocol (L2CP) process, which enables features such as L2 protocol tunneling and nonstop bridging.
- `l2-learning`—(Optional) Restart the Layer 2 (L2) address flooding and learning process.
- `license-service`—(Optional) Restart the feature license management process.
- `logical-system-service`—(Optional) Restart the logical system service process.
- `mib-process`—(Optional) Restart the MIB version II process, which provides the router's MIB II agent.
- `mountd-service`—(Optional) Restart the service for Network File System (NFS) mount requests.
- `named-service`—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.
- `network-security`—(Optional) Restart the network security process.
- `network-security-trace`—(Optional) Restart the network security trace process.
- `nfsd-service`—(Optional) Restart the remote NFS server process, which provides remote file access for applications that need NFS-based transport.
- `ntpd-service`—(Optional) Restart the Network Time Protocol (NTP) process.
- `pgm`—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.
- `pic-services-logging`—(Optional) Restart the logging process for some PICs. With this process, also known as `fsad` (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.
- `pki-service`—(Optional) Restart the public key infrastructure (PKI) service process.
- `profillerd`—(Optional) Restart the profiler process.
- `remote-operations`—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.
- `rest-api`—(Optional) Restart the rest api process.
- `routing`—(Optional) Restart the routing protocol process (`rpd`).
- `sampling`—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

- `sampling-route-record`—(Optional) Restart the sampling route record process.
- `scc-chassisd`—(Optional) Restart the scc chassisd process.
- `secure-neighbor-discovery`—(Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.
- `security-intelligence`—(Optional) Restart security intelligence process.
- `security-log`—(Optional) Restart the security log process.
- `service-deployment`—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.
- `services`—(Optional) Restart a service.
- `simple-mail-client-service`—(Optional) Restart the simple mail client service process.
- `snmp`—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.
- `static-routed`—(Optional) Restart the static routed process.
- `soft`—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.
- `statistics-service`—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.
- `subscriber-management`—(Optional) Restart the subscriber management process.
- `subscriber-management-helper`—(Optional) Restart the subscriber management helper process.
- `system-log-vital`—(Optional) Restart system log vital process.
- `tunnel-oamd`—(Optional) Restart the tunnel OAM process for L2 tunneled networks.
- `uac-service`—(Optional) Restart the Unified Access Control (UAC) process.
- `user-ad-authentication`—(Optional) Restart User ad Authentication process
- `vrrp`—(Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.
- `web-management`—(Optional) Restart the Web management process.

**List of Sample Output**    [restart interfaces on page 1249](#)

**Output Fields**    When you enter this command, you are provided feedback on the status of your request.

## Sample Output

restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

## Restart Commands Overview

Use the **restart** operational commands to restart software processes on the device. Operational commands are organized alphabetically.

| <b>Output Fields</b>            | Table 102 on page 1250 lists the output fields for the <b>show chassis routing-engine</b> command. Output fields are listed in the approximate order in which they appear.                                                                 |

Table 102: show chassis routing-engine Output Fields

| Field Name           | Field Description                                                    |
|----------------------|----------------------------------------------------------------------|
| Temperature          | Routing Engine temperature. (Not available for vSRX deployments.)    |
| CPU temperature      | CPU temperature. (Not available for vSRX deployments.)               |
| Total memory         | Total memory available on the system.                                |
| Control plane memory | Memory available for the control plane.                              |
| Data plane memory    | Memory reserved for data plane processing.                           |
| CPU utilization      | Current CPU utilization statistics on the control plane core.        |
| User                 | Current CPU utilization in user mode on the control plane core.      |
| Background           | Current CPU utilization in nice mode on the control plane core.      |
| Kernel               | Current CPU utilization in kernel mode on the control plane core.    |
| Interrupt            | Current CPU utilization in interrupt mode on the control plane core. |
| Idle                 | Current CPU utilization in idle mode on the control plane core.      |
| Model                | Routing Engine model.                                                |
| Start time           | Routing Engine start time.                                           |

Table 102: show chassis routing-engine Output Fields (*continued*)

| Field Name                | Field Description                                                                                                 |
|---------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Uptime</b>             | Length of time the Routing Engine has been up (running) since the last start.                                     |
| <b>Last reboot reason</b> | Reason for the last reboot of the Routing Engine.                                                                 |
| <b>Load averages</b>      | The average number of threads waiting in the run queue or currently executing over 1-, 5-, and 15-minute periods. |

## Sample Output

### show chassis routing-engine (Sample 1 - SRX240)

```

user@host> show chassis routing-engine
Routing Engine status:
 Temperature 38 degrees C / 100 degrees F
 CPU temperature 36 degrees C / 96 degrees F
 Total memory 512 MB Max 435 MB used (85 percent)
 Control plane memory 344 MB Max 296 MB used (86 percent)
 Data plane memory 168 MB Max 138 MB used (82 percent)
 CPU utilization:
 User 8 percent
 Background 0 percent
 Kernel 4 percent
 Interrupt 0 percent
 Idle 88 percent
 Model RE-SRX240-LOWMEM
 Serial ID AAP8652
 Start time 2009-09-21 00:04:54 PDT
 Uptime 52 minutes, 47 seconds
 Last reboot reason 0x200:chassis control reset
 Load averages: 1 minute 5 minute 15 minute
 0.12 0.15 0.10

```

## Sample Output

### show chassis routing-engine (Sample 2 - SRX650)

```

user@host> show chassis routing-engine
Routing Engine status:
 Temperature 46 degrees C / 114 degrees F
 CPU temperature 46 degrees C / 114 degrees F
 Total memory 1024 MB Max 737 MB used (72 percent)
 Control plane memory 600 MB Max 426 MB used (71 percent)
 Data plane memory 424 MB Max 314 MB used (74 percent)
 CPU utilization:
 User 40 percent
 Background 0 percent
 Kernel 11 percent
 Interrupt 0 percent
 Idle 49 percent
 Model RE-SRXSME-SRE6
 Start time 2009-09-19 20:04:18 PDT
 Uptime 1 day, 4 hours, 51 minutes, 11 seconds
 Last reboot reason 0x200:chassis control reset

```

|                |          |          |           |
|----------------|----------|----------|-----------|
| Load averages: | 1 minute | 5 minute | 15 minute |
|                | 0.27     | 0.53     | 0.78      |

## Sample Output

### show chassis routing-engine (Sample 3 - vSRX)

```
user@host> show chassis routing-engine
Routing Engine status:
 Total memory 1024 MB Max 358 MB used (35 percent)
 Control plane memory 1024 MB Max 358 MB used (35 percent)
 5 sec CPU utilization:
 User 2 percent
 Background 0 percent
 Kernel 4 percent
 Interrupt 6 percent
 Idle 88 percent
 Model VSRX RE
 Start time 2015-03-03 07:04:18 UTC
 Uptime 2 days, 11 hours, 51 minutes, 11 seconds
 Last reboot reason Router rebooted after a normal shutdown.
 Load averages: 1 minute 5 minute 15 minute
 0.07 0.04 0.06
```

## show cli authorization

**Syntax** show cli authorization

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display the permissions for the current user.

```
user@host> show cli authorization
Current user: 'root' login: 'boojum' class '(root)'
Permissions:
Permissions:
 admin -- Can view user accounts
 admin-control-- Can modify user accounts
 clear -- Can clear learned network info
 configure -- Can enter configuration mode
 control -- Can modify any config
 edit -- Can edit full files
 field -- Can use field debug commands
 floppy -- Can read and write the floppy
 interface -- Can view interface configuration
 interface-control-- Can modify interface configuration
 network -- Can access the network
 reset -- Can reset/restart interfaces and daemons
 routing -- Can view routing configuration
 routing-control-- Can modify routing configuration
 shell -- Can start a local shell
 snmp -- Can view SNMP configuration
 snmp-control-- Can modify SNMP configuration
 system -- Can view system configuration
 system-control-- Can modify system configuration
 trace -- Can view trace file settings
 trace-control-- Can modify trace file settings
 view -- Can view current values and statistics
 maintenance -- Can become the super-user
 firewall -- Can view firewall configuration
 firewall-control-- Can modify firewall configuration
 secret -- Can view secret statements
 secret-control-- Can modify secret statements
 rollback -- Can rollback to previous configurations
 security -- Can view security configuration
 security-control-- Can modify security configuration
 access -- Can view access configuration
 access-control-- Can modify access configuration
 view-configuration-- Can view all configuration (not including secrets)
 flow-tap -- Can view flow-tap configuration
 flow-tap-control-- Can modify flow-tap configuration
 idp-profiler-operation-- Can Profiler data
 pgcp-session-mirroring-- Can view pgcp session mirroring configuration
 pgcp-session-mirroring-control-- Can modify pgcp session mirroring configuration
 storage -- Can view fibre channel storage protocol configuration
 storage-control-- Can modify fibre channel storage protocol configuration
 all-control -- Can modify any configuration
```

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 103: show dhcp client binding Output Fields**

| Field Name       | Field Description                             |
|------------------|-----------------------------------------------|
| IP address       | IP address of the DHCP client.                |
| Hardware address | Hardware address of the DHCP client.          |
| Server           | IP address of the DHCP server.                |
| Expires          | Number of seconds in which the lease expires. |

Table 103: show dhcp client binding Output Fields (*continued*)

| Field Name        | Field Description                                             |
|-------------------|---------------------------------------------------------------|
| State             | State of the address binding table on the DHCP local server.  |
| Interface         | Interface on which the request was received.                  |
| Lease Expires     | Date and time at which the client's IP address lease expires. |
| Lease Expires in  | Number of seconds in which the lease expires.                 |
| Lease Start       | Date and time at which the client's IP address lease started. |
| Vendor Identifier | Vendor identifier.                                            |
| Server Identifier | IP address of the DHCP server.                                |
| Client IP Address | IP address of the DHCP client.                                |

## Sample Output

| <b>Output Fields</b>            | <a href="#">Table 105 on page 1259</a> lists the output fields for the <b>show dhcp relay binding</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 105: show dhcp relay binding Output Fields**

| Field Name          | Field Description                                       |
|---------------------|---------------------------------------------------------|
| IP address          | IP address of the DHCP client.                          |
| Hardware address    | Hardware address of the DHCP client.                    |
| Request received on | Interface on which the request was received.            |
| Type                | Type of DHCP packet processing performed on the device. |

Table 105: show dhcp relay binding Output Fields (*continued*)

| Field Name  | Field Description                                             |
|-------------|---------------------------------------------------------------|
| Obtained at | Date and time at which the client's IP address lease started. |
| Expires at  | Date and time at which the client's IP address lease expires. |
| State       | State of the address binding table on the DHCP local server.  |

## Sample Output

### show dhcp relay binding

```

user@host> show dhcp relay binding detail
IP address Hardware address Type Lease expires State
100.20.32.1 90:00:00:01:00:01 active 2007-01-17 11:38:47 PST
rebind
100.20.32.3 90:00:00:02:00:01 active 2007-01-17 11:38:41 PST
rebind
100.20.32.4 90:00:00:03:00:01 active 2007-01-17 11:38:01 PST
rebind
100.20.32.5 90:00:00:04:00:01 active 2007-01-17 11:38:07 PST
rebind
100.20.32.6 90:00:00:05:00:01 active 2007-01-17 11:38:47 PST
rebind

```

```

user@host> show dhcp relay binding 100.20.32.1
Active binding information:
 IP address 100.20.32.1
 Hardware address 90:00:00:01:00:01

Lease information:
 Type DHCP
 Obtained at 2007-01-17 11:28:47 PST
 Expires at 2007-01-17 11:38:47 PST

> show dhcp relay binding 100.20.32.1 detail
Active binding information:
 IP address 100.20.32.1
 Hardware address 90:00:00:01:00:01
 Request received on fe-0/0/2.0, relayed by 100.20.32.2

Lease information:
 Type DHCP
 Obtained at 2007-01-17 11:28:47 PST
 Expires at 2007-01-17 11:38:47 PST
 State rebind

```

## show dhcp relay statistics

|                                 |                                                                                                                                                                                           |

| Field Name  | Field Description                                             |
|-------------|---------------------------------------------------------------|
| Obtained at | Date and time at which the client's IP address lease started. |
| Expires at  | Date and time at which the client's IP address lease expires. |
| State       | State of the address binding table on the DHCP local server.  |

## Sample Output

### show dhcp server binding

```
user@host> show dhcp server binding 100.20.32.1 detail
Active binding information:
 IP address 100.20.32.1
 Hardware address 90:00:00:01:00:01
 Request received on fe-0/0/2.0, relayed by 100.20.32.2

Lease information:
 Type DHCP
 Obtained at 2007-01-17 11:28:47 PST
 Expires at 2007-01-17 11:38:47 PST
 State rebind
```

## show dhcp server statistics

Table 109: show dhcpv6 client binding Output Fields

| Field Name       | Field Description                                              |
|------------------|----------------------------------------------------------------|
| Hardware Address | Hardware address of the DHCPv6 client.                         |
| State            | State of the address-binding table on the DHCPv6 local server. |
| Lease Expires    | Date and time at which the client's IP address lease expires.  |
| Lease Expires in | Number of seconds until the lease expires.                     |
| Lease Start      | Date and time at which the client's IP address lease started.  |
| Client DUID      | The DHCPv6 client's unique identifier.                         |
| Bind type        | The bind type.                                                 |

Table 109: show dhcpv6 client binding Output Fields (*continued*)

| Field Name        | Field Description                                                         |
|-------------------|---------------------------------------------------------------------------|
| Client Type       | The type of DHCPv6 client. The client type can be autoconfig or stateful. |
| Rapid Commit      | Two-message exchange option for address assignment.                       |
| Server IP Address | IP address of the DHCPv6 server.                                          |
| Client IP Address | IP address of the DHCPv6 client.                                          |

## Sample Output

### show dhcpv6 client statistics

```

user@host> show dhcpv6 client statistics
Dhcpv6 Packets dropped:
 Total 0

Messages sent:
 DHCPV6_DECLINE 0
 DHCPV6_SOLICIT 3
 DHCPV6_INFORMATION_REQUEST 6
 DHCPV6_RELEASE 1
 DHCPV6_REQUEST 2
 DHCPV6_CONFIRM 0
 DHCPV6_RENEW 0
 DHCPV6_REBIND 0

Messages received:
 DHCPV6_ADVERTISE 3
 DHCPV6_REPLY 3
 DHCPV6_RECONFIGURE 0

```

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                         |

**Table 116: show system license Output Fields**

| Field Name           | Field Description                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Feature name</b>  | Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.                                                                |
| <b>Licenses used</b> | Number of licenses used by the device. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used. |

Table 116: show system license Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Licenses installed            | Information about the installed license key: <ul style="list-style-type: none"> <li>• <b>License identifier</b>—Identifier associated with a license key.</li> <li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li> <li>• <b>Valid for device</b>—Device that can use a license key.</li> <li>• <b>Features</b>—Feature associated with a license.</li> </ul> |
| Licenses needed               | Number of licenses required for features being used but not yet properly licensed.                                                                                                                                                                                                                                                                                                                                                                                             |
| Expiry                        | Time remaining in the grace period before a license is required for a feature being used.                                                                                                                                                                                                                                                                                                                                                                                      |
| Logical system license status | Displays whether a license is enabled for a logical system.                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Sample Output

### show system license

```
user@host> show system license
```

```

| <b>List of Sample Output</b>    | <a href="#">show system login logout on page 1287</a>                                                                                                                                                                                                                                                              |
| <b>Output Fields</b>            | Table 117 on page 1287 lists the output fields for the <b>show system login logout</b> command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the <b>detail</b> keyword is used. |

Table 117: show system login logout

| Field Name    | Field Description                       | Level of Output |
|---------------|-----------------------------------------|-----------------|
| User          | Username                                | All levels      |
| Lockout start | Date and time the username was locked   | All levels      |
| Lockout end   | Date and time the username was unlocked | All levels      |

## Sample Output

### show system login logout

```
user@host>show system login logout
```

```
User Lockout start Lockout end
root 2011-05-11 09:11:15 UTC 2011-05-11 09:13:15 UTC
```

| Packets dropped   | Total packets dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Messages received | <p>Number of the following DHCP messages received:</p> <ul style="list-style-type: none"> <li>• <b>DHCPOFFER</b>—First packet received on a logical interface when DHCP is enabled.</li> <li>• <b>DHCPACK</b>—When received from the server, the client sends an ARP request for that address and adds a (ARP response) timer for 4 seconds and stops the earlier timer added for DHCPACK.</li> <li>• <b>DHCPNAK</b>—When a DHCPNAK is received instead of DHCPACK, the logical interface sends a DHCPDISCOVER packet.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Messages sent     | <p>Number of the following DHCP messages sent:</p> <ul style="list-style-type: none"> <li>• <b>DHCPDECLINE</b>—Packet sent when ARP response is received and there is a conflict. The logical interface sends a new DHCPDISCOVER packet.</li> <li>• <b>DHCPDISCOVER</b>—Packet sent on the interface for which the DHCP client is enabled.</li> <li>• <b>DHCPREQUEST</b>—Packet sent to the DHCP server after accepting the DHCPOFFER. After sending the DHCPREQUEST, the device adds a retransmission-interval timer.</li> <li>• <b>DHCPINFORM</b>—Packet sent to the DHCP server for local configuration parameters.</li> <li>• <b>DHCPRELEASE</b>—Packet sent to the DHCP server to relinquish network address and cancel remaining lease.</li> <li>• <b>DHCPRENEW</b>—Packet sent to the DHCP server to renew the address. The next message to be sent will be a DHCPREQUEST message, which will be unicast directly to the server.</li> <li>• <b>DHCPREBIND</b>—Packet sent to any server to renew the address. The next message to be sent will be a DHCPREQUEST message, which will be broadcast.</li> </ul> |

## Sample Output

### show system services dhcp client

```

user@host> show system services dhcp client
Logical Interface Name ge-0/0/1.0
Hardware address 00:0a:12:00:12:12
Client Status bound
Vendor Identifier ether
Server Address 10.1.1.1
Address obtained 10.1.1.89
update server enabled
Lease Obtained at 2006-08-24 18:13:04 PST
Lease Expires at 2006-08-25 18:13:04 PST
DHCP Options :
 Name: name-server, Value: [10.209.194.131, 2.2.2.2, 3.3.3.3]
 Name: server-identifier, Value: 10.1.1.1
 Name: router, Value: [10.1.1.80]
 Name: domain-name, Value: netscreen-50

```

## Sample Output

### show system services dhcp client ge-0/0/1.0

```

user@host> show system services dhcp client ge-0/0/1.0

```

```
Logical Interface name ge-0/0/1.0
Hardware address 00:12:1e:a9:7b:81
Client status bound
Address obtained 30.1.1.20
Update server disabled
Lease obtained at 2007-05-10 18:16:18 UTC
Lease expires at 2007-05-11 18:16:18 UTC
DHCP options:
 Name: server-identifier, Value: 30.1.1.2
 Code: 1, Type: ip-address, Value: 255.255.255.0
 Name: name-server, Value: [77.77.77.77, 55.55.55.55]
 Name: domain-name, Value: mylab.example.net
```

## Sample Output

### show system services dhcp client statistics

```
user@host> show system services dhcp client statistics
Packets dropped:
 Total 0
Messages received:
 DHCPPOFFER 0
 DHCPACK 8
 DHCPNAK 0
Messages sent:
 DHCPDECLINE 0
 DHCPDISCOVER 0
 DHCPREQUEST 1
 DHCPINFORM 0
 DHCPRELEASE 0
 DHCPRENEW 7
 DHCPREBIND 0
```

## show system services dhcp relay-statistics

|                                 |                                                                                                                                                                                                           |

| Dropped packets   | <p>Total DHCP packets dropped for the following reasons:</p> <ul style="list-style-type: none"> <li>• <b>Due to a missing interface in the relay database</b>—Number of packets discarded because they did not belong to a configured interface.</li> <li>• <b>Due to a missing matching routing instance</b>—Number of packets discarded because they did not belong to a configured routing instance.</li> <li>• <b>Due to an error during packet read</b>—Number of packets discarded because of a system read error.</li> <li>• <b>Due to an error during packet send</b>—Number of packets that the DHCP relay application could not send.</li> <li>• <b>Due to an invalid server address</b>—Number of packets discarded because an invalid server address was specified.</li> <li>• <b>Due to a missing valid local address</b>—Number of packets discarded because there was no valid local address.</li> <li>• <b>Due to a missing route to the server or client</b>—Number of packets discarded because there were no addresses available for assignment.</li> </ul> |

## Sample Output

### show system services dhcp relay-statistics

```

user@host> show system services dhcp relay-statistics
Received packets: 4
Forwarded packets: 4
Dropped packets: 4

```

Due to missing interface in relay database: 4  
Due to missing matching routing instance: 0  
Due to an error during packet read: 0  
Due to an error during packet send: 0  
Due to invalid server address: 0  
Due to missing valid local address: 0  
Due to missing route to server/client: 0

### Monitoring Overview

---

Junos OS supports a suite of J-Web tools and CLI operational mode commands for monitoring the system health and performance of your device. Monitoring tools and commands display the current state of the device. To use the J-Web user interface and CLI operational tools, you must have the appropriate access privileges.

You can use the J-Web Monitor option to monitor a device. J-Web results appear in the browser.

You can also monitor the device with CLI operational mode commands. CLI command output appears on the screen of your console or management device, or you can filter the output to a file. For operational commands that display output, such as the **show** commands, you can redirect the output into a filter or a file. When you display help about these commands, one of the options listed is **|**, called a *pipe*, which allows you to filter the command output.

For example, if you enter the **show configuration** command, the complete device configuration appears on the screen. To limit the display to only those lines of the configuration that contain **address**, enter the **show configuration** command using a pipe into the **match** filter:

```
user@host> show configuration | match address
address-range low 192.168.3.2 high 192.168.3.254;
address-range low 192.168.71.71 high 192.168.71.254;
address 192.168.71.70/21;
address 192.168.2.1/24;
address 127.0.0.1/32;
```

For a complete list of the filters, type a command, followed by the pipe, followed by a question mark (?):

```
user@host> show configuration | ?
Possible completions:
compare Compare configuration changes with prior version
count Count occurrences
display Show additional kinds of information
except Show only text that does not match a pattern
find Search for first occurrence of pattern
hold Hold text without exiting the prompt
last Display end of output only
match Show only text that matches a pattern
no-more Don't paginate output
request Make system-level requests
resolve Resolve IP addresses
save Save output text to file
trim Trim specified number of columns from start of line
```

You can specify complex expressions as an option for the **match** and **except** filters.

**NOTE:** To filter the output of configuration mode commands, use the filter commands provided for the operational mode commands. In configuration mode, an additional filter is supported.

### Diagnostic Tools Overview

Juniper Networks devices support a suite of J-Web tools and CLI operational mode commands for evaluating system health and performance. Diagnostic tools and commands test the connectivity and reachability of hosts in the network.

- Use the J-Web Diagnose options to diagnose a device. J-Web results appear in the browser.
- Use CLI operational mode commands to diagnose a device. CLI command output appears on the screen of your console or management device, or you can filter the output to a file.

To use the J-Web user interface and CLI operational tools, you must have the appropriate access privileges.

This section contains the following topics:

- [J-Web Diagnostic Tools on page 1301](#)
- [CLI Diagnostic Commands on page 1301](#)

### *J-Web Diagnostic Tools*

The J-Web diagnostic tools consist of the options that appear when you select **Troubleshoot** and **Maintain** in the task bar. [Table 120 on page 1301](#) describes the functions of the Troubleshoot options.

**Table 120: J-Web Interface Troubleshoot Options**

| Option                      | Function                                                                                                                           |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Troubleshoot Options</b> |                                                                                                                                    |
| <b>Ping Host</b>            | Allows you to ping a remote host. You can configure advanced options for the ping operation.                                       |
| <b>Ping MPLS</b>            | Allows you to ping an MPLS endpoint using various options.                                                                         |
| <b>Traceroute</b>           | Allows you to trace a route between the device and a remote host. You can configure advanced options for the traceroute operation. |
| <b>Packet Capture</b>       | Allows you to capture and analyze router control traffic.                                                                          |
| <b>Maintain Options</b>     |                                                                                                                                    |
| <b>Files</b>                | Allows you to manage log, temporary, and core files on the device.                                                                 |
| <b>Upgrade</b>              | Allows you to upgrade and manage Junos OS packages.                                                                                |
| <b>Licenses</b>             | Displays a summary of the licenses needed and used for each feature that requires a license. Allows you to add licenses.           |
| <b>Reboot</b>               | Allows you to reboot the device at a specified time.                                                                               |

### *CLI Diagnostic Commands*

The CLI commands available in operational mode allow you to perform the same monitoring, troubleshooting, and management tasks you can perform with the J-Web user interface. Instead of invoking the tools through a graphical interface, you use operational mode commands to perform the tasks.

You can perform certain tasks only through the CLI. For example, you can use the **mtrace** command to display trace information about a multicast path from a source to a receiver, which is a feature available only through the CLI.

To view a list of top-level operational mode commands, type a question mark (?) at the command-line prompt.

At the top level of operational mode are the broad groups of CLI diagnostic commands listed in [Table 121 on page 1302](#).

**Table 121: CLI Diagnostic Command Summary**

| Command                                    | Function                                                                                                                            |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Controlling the CLI Environment</b>     |                                                                                                                                     |
| <b>set option</b>                          | Configures the CLI display.                                                                                                         |
| <b>Diagnosis and Troubleshooting</b>       |                                                                                                                                     |
| <b>clear</b>                               | Clears statistics and protocol database information.                                                                                |
| <b>mtrace</b>                              | Traces information about multicast paths from source to receiver.                                                                   |
| <b>monitor</b>                             | Performs real-time debugging of various Junos OS components, including the routing protocols and interfaces.                        |
| <b>ping</b>                                | Determines the reachability of a remote network host.                                                                               |
| <b>ping mpls</b>                           | Determines the reachability of an MPLS endpoint using various options.                                                              |
| <b>test</b>                                | Tests the configuration and application of policy filters and AS path regular expressions.                                          |
| <b>traceroute</b>                          | Traces the route to a remote network host.                                                                                          |
| <b>Connecting to Other Network Systems</b> |                                                                                                                                     |
| <b>ssh</b>                                 | Opens secure shell connections.                                                                                                     |
| <b>telnet</b>                              | Opens Telnet sessions to other hosts on the network.                                                                                |
| <b>Management</b>                          |                                                                                                                                     |
| <b>copy</b>                                | Copies files from one location on the device to another, from the device to a remote system, or from a remote system to the device. |
| <b>restart option</b>                      | Restarts the various system processes, including the routing protocol, interface, and SNMP processes.                               |
| <b>request</b>                             | Performs system-level operations, including stopping and rebooting the device and loading Junos OS images.                          |
| <b>start</b>                               | Exits the CLI and starts a UNIX shell.                                                                                              |
| <b>configuration</b>                       | Enters configuration mode.                                                                                                          |
| <b>quit</b>                                | Exits the CLI and returns to the UNIX shell.                                                                                        |

## Accounting Options, Source Class Usage, and Destination Class Usage Overview

- [Accounting Options Overview on page 1303](#)
- [Understanding Source Class Usage and Destination Class Usage Options on page 1304](#)

### Accounting Options Overview

An accounting profile represents common characteristics of collected accounting data, including the following:

- Collection interval
- File to contain accounting data
- Specific fields and counter names on which to collect statistics

You can configure multiple accounting profiles, as described in [Table 122 on page 1303](#).

**Table 122: Types of Accounting Profiles**

| Type of Profile        | Description                                                                                |
|------------------------|--------------------------------------------------------------------------------------------|
| Interface profile      | Collects the specified error and statistic information.                                    |
| Filter profile         | Collects the byte and packet counts for the counter names specified in the filter profile. |
| MIB profile            | Collects selected MIB statistics and logs them to a specified file.                        |
| Routing Engine profile | Collects selected Routing Engine statistics and logs them to a specified file.             |
| Class usage profile    | Collects class usage statistics and logs them to a specified file.                         |

## Understanding Source Class Usage and Destination Class Usage Options

You can maintain packet counts based on the entry and exit points for traffic passing through your network. Entry and exit points are identified by source and destination prefixes grouped into disjoint sets defined as source classes and *destination classes*. You can define classes based on a variety of parameters, such as routing neighbors, autonomous systems, and route filters.

Source class usage (SCU) counts packets sent to customers by performing lookups on the IP source address and the IP destination address. SCU makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. You must enable SCU accounting on both the inbound and outbound physical interfaces.

Destination class usage (DCU) counts packets from customers by performing lookups of the IP destination address. DCU makes it possible to track traffic originating from the customer edge and destined for specific prefixes on the provider core router.

On T Series Core Routers and M320 Multiservice Edge Routers, the source class and destination classes are not carried across the platform fabric. The implications of this are as follows:

- On T Series and M320 routers, SCU and DCU accounting is performed before the packet enters the fabric.
- On T Series and M320 routers, DCU is performed before output filters are evaluated. On M Series platforms, DCU is performed after output filters are evaluated.
- If an output filter drops traffic on M Series devices, the dropped packets are excluded from DCU statistics. If an output filter drops traffic on T Series and M320 routers, the dropped packets are included in DCU statistics.

On Enhanced Scaling FPCs (T640-FPC1-ES, T640-FPC2-ES, T640-FPC3-ES, T640-FPC4-1P-ES, and T1600-FPC4-ES), the source class accounting is performed at ingress. On a T4000 Type 5 FPC, the source class accounting is performed at egress. The implications of this are as follows:

- SCU accounting is *not* performed when packets traverse from T4000 Type 5 FPC (ingress FPC) to Enhanced Scaling FPCs (egress FPC).
- SCU accounting is performed when packets traverse from Enhanced Scaling FPCs (ingress FPC) to T4000 Type 5 FPC (egress FPC).

### Accounting Options Configuration

This topic contains the following sections:

- [Accounting Options—Full Configuration on page 1305](#)
- [Minimum Accounting Options Configuration on page 1306](#)

#### ***Accounting Options—Full Configuration***

To configure accounting options, include the following statements at the **[edit accounting-options]** hierarchy level:

```
accounting-options {
 class-usage-profile profile-name {
 file filename;
 interval minutes;
 destination-classes {
 destination-class-name;
 }
 source-classes {
 source-class-name;
 }
 file filename {
 archive-sites {
 site-name;
 }
 files number;
 nonpersistent;
 size bytes;
 source-classes time
 transfer-interval minutes;
 }
 filter-profile profile-name {
 counters {
 counter-name;
 }
 }
 }
}
```

```

 file filename;
 interval minutes;
 }
}
interface-profile profile-name {
 fields {
 field-name;
 }
 file filename;
 interval minutes;
}
mib-profile profile-name {
 file filename;
 interval seconds;
 object-names {
 mib-object-name;
 }
 operation operation-name;
}
routing-engine-profile profile-name {
 fields {
 field-name;
 }
 file filename;
 interval minutes;
}
}

```

By default, accounting options are disabled.

**NOTE:** Do not configure MIB objects related to interface octets or packets for a MIB profile, because it can cause the SNMP walk or a CLI show command to time out.

### Minimum Accounting Options Configuration

To enable accounting options on the router, you must perform at least the following tasks:

- Configure accounting options by including a **file** statement and one or more **source-class-usage**, **destination-class-profile**, **filter-profile**, **interface-profile**, **mib-profile**, or **routing-engine-profile** statements at the **[edit accounting-options]** hierarchy level:

```

[edit]
accounting-options {
 class-usage-profile profile-name {
 file filename;
 interval minutes;
 }
 source-classes {
 source-class-name;
 destination-classes {
 destination-class-name;
 }
 }
}

```

```

file filename {
 archive-sites {
 site-name;
 }
 files number;
 size bytes;
 transfer-interval minutes;
}
filter-profile profile-name {
 counters {
 counter-name;
 }
 file filename;
 interval minutes;
}
interface-profile profile-name {
 fields {
 field-name;
 }
 file filename;
 interval minutes;
}
mib-profile profile-name {
 file filename;
 interval minutes;
 object-names {
 mib-object-name;
 }
 operation operation-name;
}
routing-engine-profile profile-name {
 fields {
 field-name;
 }
 file filename;
 interval minutes;
}
}
}

```

- Apply the profiles to the chosen interfaces or filters.

Apply an interface profile to a physical or logical interface by including the **accounting-profile** statement at either the **[edit interfaces *interface-name*]** or the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level.

```

[edit interfaces]
interface-name {
 accounting-profile profile-name;
 unit logical-unit-number {
 accounting-profile profile-name;
 }
}

```

**NOTE:** You do not apply destination class profiles to interfaces. Although the interface needs to have the **destination-class-usage** statement configured, the destination class profile automatically finds all interfaces with the destination class configured.

Apply a filter profile to a firewall filter by including the **accounting-profile** statement at the **[edit firewall filter *filter-name*]** hierarchy level:

```
[edit firewall]
filter filter-name {
 accounting-profile profile-name;
}
```

You do not need to apply the Routing Engine profile to an interface because the statistics are collected on the Routing Engine itself.

- [Configuring Accounting-Data Log Files on page 1308](#)
- [Configuring the Interface Profile on page 1311](#)
- [Configuring the Filter Profile on page 1314](#)
- [Configuration Statements at the \[edit accounting-options\] Hierarchy Level](#)

### Configuring Accounting-Data Log Files

An accounting profile specifies what statistics should be collected and written to a log file. To configure an accounting-data log file, include the **file** statement at the **[edit accounting-options]** hierarchy level:

```
[edit accounting-options]
file filename {
 archive-sites {
 site-name;
 }
 files number;
 nonpersistent;
 size bytes;
 start-time time;
 transfer-interval minutes;
}
```

***filename*** is the name of the file in which to write accounting data.

If the filename contains spaces, enclose it in quotation marks (" "). The filename cannot contain a forward slash (/). The file is created in the **/var/log** directory and can contain data from multiple profiles.

All accounting-data log files include header and trailer sections that start with a **#** in the first column. The header contains the file creation time, the hostname, and the columns that appear in the file. The trailer contains the time that the file was closed.

Whenever any configured value changes that affects the columns in a file, the file creates a new profile layout record that contains a new list of columns.

You must configure the file size; all other properties are optional.

- [Configuring the Storage Location of the File on page 1309](#)
- [Configuring the Maximum Size of the File on page 1309](#)
- [Configuring the Maximum Number of Files on page 1309](#)
- [Configuring the Start Time for File Transfer on page 1310](#)
- [Configuring the Transfer Interval of the File on page 1310](#)
- [Configuring Archive Sites on page 1310](#)

### **Configuring the Storage Location of the File**

```
[edit accounting-options file filename]
 nonpersistent;
```

This feature is useful for minimizing read/write traffic on the router's compact flash drive.

**NOTE:** If log files for accounting data are stored on DRAM, these files are lost when you reboot the router. Therefore, you should back up these files periodically.

### **Configuring the Maximum Size of the File**

To configure the maximum size of the files, include the **size** statement at the **[edit accounting-options file *filename*]** hierarchy level:

```
[edit accounting-options file filename]
 size bytes;
```

The **size** statement is the maximum size of the log file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). The minimum value for **bytes** is 256 KB. You must configure **bytes**; the remaining attributes are optional.

### **Configuring the Maximum Number of Files**

To configure the maximum number of files, include the **files** statement at the **[edit accounting-options file *filename*]** hierarchy level:

```
[edit accounting-options file filename]
 files number;
```

When a log file (for example, **profilelog**) reaches its maximum size, it is renamed **profilelog.0**, then **profilelog.1**, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. The minimum value for **number** is 3 and the default value is 10.

### Configuring the Start Time for File Transfer

To configure the start time for transferring files, include the **start-time** statement at the **[edit accounting-options file *filename*]** hierarchy level:

```
[edit accounting-options file filename]
start-time time;
```

The start-time statement specifies a start time for file transfer (**YYYY-MM-DD.hh:mm**). For example, 10:00 a.m. on January 30, 2007 is represented as **2007-01-30.10:00**.

### Configuring the Transfer Interval of the File

To configure the transfer interval of the files, include the **transfer-interval** statement at the **[edit accounting-options file *filename*]** hierarchy level:

```
[edit accounting-options file filename]
transfer-interval minutes;
```

The range for **transfer-interval** is 5 through 2880 minutes. The default is 30 minutes.

#### TIP:

Junos OS saves the existing log file and creates a new file at the configured transfer-intervals irrespective of:

- Whether the file has reached the maximum size or not
- Whether an archive site is configured or not

When you have a relatively smaller transfer-interval configured and if no archive site is configured, there is a possibility of losing data as Junos OS overwrites the log files when the maximum number of log files is reached. To ensure that the log information is saved for a reasonably long time:

- Configure an archive site to archive the log files every time a new log file is created.
- Configure the maximum value (2880 minutes) for transfer-interval so that new files are created less frequently; that is, only when the file exceeds the maximum size limit or once in 2 days.

### Configuring Archive Sites

After a file reaches its maximum size or the **transfer-interval** time is exceeded, the file is closed, renamed, and, if you configured an archive site, transferred to a remote host. To configure archive sites, include the **archive-sites** statement at the **[edit accounting-options file *filename*]** hierarchy level:

```
[edit accounting-options file filename]
archive-sites {
 site-name;
}
```

**site-name** is any valid FTP URL. You can specify more than one URL, in any order. When a file is archived, the router or switch attempts to transfer the file to the first URL in the

list, trying the next site in the list only if the transfer does not succeed. The log file is stored at the archive site with a filename of the format ***router-name\_log-filename\_timestamp***.

#### Related Documentation

- [Accounting Options Overview on page 1303](#)
- [Understanding Device Management Functions in Junos OS](#)
- [Accounting Options Configuration on page 1305](#)
- [Configuring the Interface Profile on page 1311](#)
- [Configuring the Filter Profile on page 1314](#)
- [Configuration Statements at the \[edit accounting-options\] Hierarchy Level](#)

### Configuring the Interface Profile

An interface profile specifies the information collected and written to a log file. You can configure a profile to collect error and statistic information for input and output packets on a particular physical or logical interface.

To configure an interface profile, include the **interface-profile** statement at the **[edit accounting-options]** hierarchy level:

```
[edit accounting-options]
interface-profile profile-name {
 fields {
 field-name;
 }
 file filename;
 interval minutes;
}
```

By default, the Packet Forwarding Engine (PFE) periodically collects the statistics for all interfaces. To improve the performance, you can optionally disable the periodic refresh by including the **periodic-refresh disable** statement at the **[edit accounting-options]** hierarchy level.

Each accounting profile must have a unique **profile-name**. To apply a profile to a physical or logical interface, include the **accounting-profile** statement at either the **[edit interfaces interface-name]** or the **[edit interfaces interface-name unit logical-unit-number]** hierarchy level. You can also apply an accounting profile at the **[edit firewall family family-type filter filter-name]** hierarchy level.

To configure an interface profile, perform the tasks described in the following sections:

- [Configuring Fields on page 1312](#)
- [Configuring the File Information on page 1312](#)
- [Configuring the Interval on page 1312](#)
- [Example: Configuring the Interface Profile on page 1312](#)

### Configuring Fields

An interface profile must specify what statistics are collected. To configure which statistics should be collected for an interface, include the **fields** statement at the **[edit accounting-options interface-profile *profile-name*]** hierarchy level:

```
[edit accounting-options interface-profile profile-name]
 fields {
 field-name;
 }
```

### Configuring the File Information

Each accounting profile logs its statistics to a file in the **/var/log** directory.

To configure which file to use, include the **file** statement at the **[edit accounting-options interface-profile *profile-name*]** hierarchy level:

```
[edit accounting-options interface-profile profile-name]
 file filename;
```

You must specify a **file** statement for the interface profile that has already been configured at the **[edit accounting-options]** hierarchy level.

### Configuring the Interval

Each interface with an accounting profile enabled has statistics collected once per interval time specified for the accounting profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the **interval** statement at the **[edit accounting-options interface-profile *profile-name*]** hierarchy level:

```
[edit accounting-options interface-profile profile-name]
 interval minutes;
```

**NOTE:** The minimum interval allowed is 1 minute. Configuring a low interval in an accounting profile for a large number of interfaces might cause serious performance degradation.

The range for the **interval** statement is 1 through 2880 minutes. The default is 30 minutes.

### Example: Configuring the Interface Profile

Configure the interface profile:

```
[edit]
accounting-options {
 file if_stats {
 size 40 files 5;
 }
 interface-profile if_profile1 {
 file if_stats;
 interval 30;
 fields {
 input-bytes;
 output-bytes;
 input-packets;
```

```

 output-packets;
 input-multicast;
 output-multicast;
 }
}
interface-profile if_profile2 {
 file if_stats;
 interval 30;
 fields {
 input-bytes;
 output-bytes;
 input-packets;
 output-packets;
 input-multicast;
 output-multicast;
 }
}
interfaces {
 xe-1/0/0 {
 accounting-profile if_profile1;
 unit 0 {
 accounting-profile if_profile2;
 ...
 }
 }
}
}

```

The two interface profiles, **if-profile1** and **if-profile2**, write data to the same file, **if-stats**. The **if-stats** file might look like the following:

```

#FILE CREATED 976823478 2000-12-14-19:51:18
#hostname host
#profile-layout
if_profile2,epoch-timestamp,interface-name,snmp-index,input-bytes,output-bytes,
input-packets,output-packets,input-multicast,output-multicast
#profile-layout
if_profile1,epoch-timestamp,interface-name,snmp-index,input-bytes,output-bytes,
input-packets
if_profile2,976823538,xe-1/0/0.0,8,134696815,3681534,501088,40723,0,0
if_profile1,976823538,xe-1/0/0,7,134696815,3681534,501088
...
#FILE CLOSED 976824378 2000-12-14-20:06:18

```

#### Related Documentation

- [Accounting Options Overview on page 1303](#)
- *Understanding Device Management Functions in Junos OS*
- [Accounting Options Configuration on page 1305](#)
- [Configuring Accounting-Data Log Files on page 1308](#)
- [Configuring the Filter Profile on page 1314](#)
- *Configuration Statements at the [edit accounting-options] Hierarchy Level*

## Configuring the Filter Profile

A filter profile specifies error and statistics information collected and written to a file. A filter profile must specify counter names for which statistics are collected.

To configure a filter profile, include the **filter-profile** statement at the **[edit accounting-options]** hierarchy level:

```
[edit accounting-options]
filter-profile profile-name {
 counters {
 counter-name;
 }
 file filename;
 interval minutes;
}
```

To apply the filter profile, include the **accounting-profile** statement at the **[edit firewall filter filter-name]** hierarchy level.

To configure a filter profile, perform the tasks described in the following sections:

- [Configuring the Counters on page 1314](#)
- [Configuring the File Information on page 1314](#)
- [Configuring the Interval on page 1315](#)

### Configuring the Counters

Statistics are collected for all counters specified in the filter profile. To configure the counters, include the **counters** statement at the **[edit accounting-options filter-profile profile-name]** hierarchy level:

```
[edit accounting-options filter-profile profile-name]
counters {
}
```

### Configuring the File Information

Each accounting profile logs its statistics to a file in the **/var/log** directory.

To configure which file to use, include the **file** statement at the **[edit accounting-options filter-profile profile-name]** hierarchy level:

```
[edit accounting-options filter-profile profile-name]
file filename;
```

You must specify a filename for the filter profile that has already been configured at the **[edit accounting-options]** hierarchy level.

**NOTE:** The limit on the total number of characters per line in a log file equals 1023. If this limit is exceeded, the output written to the log file is incomplete. Ensure that you limit the number of counters or requested data so that this character limit is not exceeded.

**NOTE:** If the configured file size or transfer interval is exceeded, Junos OS closes the file and starts a new one. By default, the transfer interval value is 30 minutes. If the transfer interval is not configured, Junos OS closes the file and starts a new one when the file size exceeds its configured value or the default transfer interval value exceeds 30 minutes. To avoid transferring files every 30 minutes, specify a different value for the transfer interval.

### Configuring the Interval

Each filter with an accounting profile enabled has statistics collected once per interval time specified for the accounting profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the `interval` statement at the `[edit accounting-options filter-profile profile-name]` hierarchy level:

```
[edit accounting-options filter-profile profile-name]
interval;
```

**NOTE:** The minimum interval allowed is 1 minute. Configuring a low interval in an accounting profile for a large number of filters might cause serious performance degradation.

The range for the `interval` statement is 1 through 2880 minutes. The default is 30 minutes.

#### Related Documentation

- [Accounting Options Overview on page 1303](#)
- [Understanding Device Management Functions in Junos OS](#)
- [Accounting Options Configuration on page 1305](#)
- [Configuring Accounting-Data Log Files on page 1308](#)
- [Example: Configuring a Filter Profile on page 1315](#)
- [Example: Configuring Interface-Specific Firewall Counters and Filter Profiles on page 1316](#)

### Example: Configuring a Filter Profile

Configure a filter profile:

```
[edit]
accounting-options {
 file fw_accounting {
 size 500k files 4;
 }
 filter-profile fw_profile1 {
 file fw_accounting;
 interval 60;
 counters {
 counter1;
 counter2;
 counter3;
 }
 }
}
```

```

 }
 }
 firewall {
 filter myfilter {
 accounting-profile fw_profile1;
 ...
 term accept-all {
 then {
 count counter1;
 accept;
 }
 }
 }
 }
}

```

The filter profile, **fw-profile1**, writes data to the file **fw\_accounting**. The file might look like the following:

```

#FILE CREATED 976825278 2000-12-14-20:21:18
#hostname host
#profile-layout
fw_profile1,epoch-timestamp,filter-name,counter-name,packet-count,byte-count
fw_profile1,976826058,myfilter,counter1,163,10764
...
#FILE CLOSED 976826178 2000-12-14-20:36:18

```

#### Related Documentation

- [Configuring the Filter Profile on page 1314](#)
- [Example: Configuring Interface-Specific Firewall Counters and Filter Profiles on page 1316](#)

### Example: Configuring Interface-Specific Firewall Counters and Filter Profiles

To collect and log count statistics collected by firewall filters on a per-interface basis, you must configure a filter profile and include the interface-specific statement at the **[edit firewall filter *filter-name*]** hierarchy level.

Configure the firewall filter accounting profile:

```

[edit accounting-options]
file cust1_accounting {
 size 500k;
}
filter-profile cust1_profile {
 file cust1_accounting;
 interval 1;
 counters {
 r1;
 }
}

```

Configure the interface-specific firewall counter:

```

[edit firewall]
filter f3 {
 accounting-profile cust1_profile;
 interface-specific;
 term f3-term {

```

```

 then {
 count r1;
 accept;
 }
 }
}

```

Apply the firewall filter to an interface:

```

[edit interfaces]
xe-1/0/0 {
 unit 0 {
 family inet {
 filter {
 input f3;
 output f3;
 }
 address 20.20.20.30/24;
 }
 }
}

```

The following example shows the contents of the **cust1\_accounting** file in the **/var/log** folder that might result from the preceding configuration:

```

#FILE CREATED 995495212 2001-07-18-22:26:52
#hostname host
#profile-layout cust1_profile,epoch-timestamp,interfaces,filter-name,
counter-name,packet-count,byte-count
cust1_profile,995495572,xe-1/0/0.0,f3-xe-1/0/0.0-i,r1-xe-1/0/0.0-i,5953,1008257
cust1_profile,995495602,xe-1/0/0.0,f3-xe-1/0/0.0-o,r1-xe-1/0/0.0-o,5929,1006481
...

```

If the **interface-specific** statement is not included in the configuration, the following output might result:

```

#FILE CREATED 995495212 2001-07-18-22:26:52
#hostname host
#profile-layout cust1_profile,epoch-timestamp,interfaces,filter-name,
counter-name,packet-count,byte-count
cust1_profile,995495572,xe-1/0/0.0,f3,r1,5953,1008257
cust1_profile,995495632,xe-1/0/0.0,f3,r1,5929,1006481

```

#### Related Documentation

- [Configuring the Interface Profile on page 1311](#)

### Configuring SCU or DCU

To configure SCU or DCU, perform the following tasks described in this section:

**NOTE:** We recommend that you stop the network traffic on an interface before you modify the DCU or SCU configuration for that interface. Modifying the DCU or SCU configuration without stopping the traffic might corrupt the DCU or SCU statistics. Before you restart the traffic after modifying the configuration, enter the `clear interfaces statistics` command.

- [Creating Prefix Route Filters in a Policy Statement on page 1318](#)
- [Applying the Policy to the Forwarding Table on page 1318](#)
- [Enabling Accounting on Inbound and Outbound Interfaces on page 1318](#)

### ***Creating Prefix Route Filters in a Policy Statement***

To define prefix router filters:

```
[edit policy-options]
policy-statement scu-1 {
 term term1;
 from {
 route-filter 192.168.1.0/24 orlonger;
 }
 then source-class gold;
}
```

### ***Applying the Policy to the Forwarding Table***

To apply the policy to the forwarding table:

```
[edit]
routing-options {
 forwarding-table {
 export scu-1;
 }
}
```

### ***Enabling Accounting on Inbound and Outbound Interfaces***

To enable accounting on inbound and outbound interfaces:

```
[edit]
interfaces {
 so-6/1/0 {
 unit 0 {
 family inet;
 accounting {
 destination-class-usage;
 source-class-usage {
 output;
 }
 }
 }
 }
}
[edit]
interfaces {
 xe-0/1/0 {
```

```

unit 0 {
 family inet6 {
 accounting {
 source-class-usage {
 input;
 }
 }
 }
}

```

Optionally, you can include the input and output statements on a single interface as shown:

```

[edit]
interfaces {
 xe-0/1/2 {
 unit 0 {
 family inet6 {
 accounting {
 source-class-usage {
 input;
 output;
 }
 }
 }
 }
 }
}

```

#### Related Documentation

- [Understanding Source Class Usage and Destination Class Usage Options on page 1304](#)
- [Configuring SCU on a Virtual Loopback Tunnel Interface on page 1319](#)
- [Configuring Class Usage Profiles on page 1321](#)
- [Configuring the MIB Profile on page 1323](#)
- [Configuring the Routing Engine Profile on page 1325](#)

#### Configuring SCU on a Virtual Loopback Tunnel Interface

To configure source class usage on the virtual loopback tunnel interface, perform the tasks described in the following sections:

- [Example: Configuring a Virtual Loopback Tunnel Interface on a Provider Edge Router Equipped with a Tunnel PIC on page 1320](#)
- [Example: Mapping the VRF Instance Type to the Virtual Loopback Tunnel Interface on page 1320](#)
- [Example: Sending Traffic Received from the Virtual Loopback Interface Out the Source Class Output Interface on page 1320](#)

**Example: Configuring a Virtual Loopback Tunnel Interface on a Provider Edge Router Equipped with a Tunnel PIC**

Define a virtual loop interface on a provider edge router with a Tunnel PIC:

```
[edit interfaces]
vt-0/3/0 {
 unit 0 {
 family inet {
 accounting {
 source-class-usage {
 input;
 }
 }
 }
 }
}
```

**Example: Mapping the VRF Instance Type to the Virtual Loopback Tunnel Interface**

Map the VRF instance type to the virtual loopback tunnel interface:

```
[edit]
routing-instances {
 VPN-A {
 instance-type vrf;
 interface at-2/1/1.0;
 interface vt-0/3/0.0;
 route-distinguisher 10.255.14.225:100;
 vrf-import import-policy-name;
 vrf-export export-policy-name;
 protocols {
 bgp {
 group to-r4 {
 local-address 10.27.253.1;
 peer-as 400;
 neighbor 10.27.253.2;
 }
 }
 }
 }
}
```

**NOTE:** For SCU and DCU to work, do not include the `vrf-table-label` statement at the `[edit routing-instances instance-name]` hierarchy level.

**Example: Sending Traffic Received from the Virtual Loopback Interface Out the Source Class Output Interface**

Send traffic received from the virtual loopback tunnel interface out of the source class output interface:

```
[edit interfaces]
at-1/1/0 {
 unit 0 {
```

```

family inet {
 accounting {
 source-class-usage {
 output;
 }
 }
}
}
}

```

#### Related Documentation

- [Understanding Source Class Usage and Destination Class Usage Options on page 1304](#)
- [Configuring SCU or DCU on page 1317](#)
- [Configuring Class Usage Profiles on page 1321](#)
- [Configuring the MIB Profile on page 1323](#)
- [Configuring the Routing Engine Profile on page 1325](#)

### Configuring Class Usage Profiles

To collect class usage statistics, perform the tasks described in these sections:

- [Configuring a Class Usage Profile on page 1321](#)
- [Configuring the File Information on page 1321](#)
- [Configuring the Interval on page 1322](#)
- [Creating a Class Usage Profile to Collect Source Class Usage Statistics on page 1322](#)
- [Creating a Class Usage Profile to Collect Destination Class Usage Statistics on page 1322](#)

#### Configuring a Class Usage Profile

You can configure the class usage profile to collect statistics for particular source and destination classes.

To configure the class usage profile to filter by source classes, include the **source-classes** statement at the **[edit accounting-options class-usage-profile *profile-name*]** hierarchy level:

```

[edit accounting-options class-usage-profile profile-name]
source-classes {
 source-class-name;
}

```

To configure the class usage profile to filter by destination classes, include the **destination-classes** statement at the **[edit accounting-options class-usage-profile *profile-name*]** hierarchy level:

```

[edit accounting-options class-usage-profile profile-name]
destination-classes {
 destination-class-name;
}

```

#### Configuring the File Information

Each accounting profile logs its statistics to a file in the **/var/log** directory.

To specify which file to use, include the **file** statement at the **[edit accounting-options class-usage-profile *profile-name*]** hierarchy level:

```
[edit accounting-options class-usage-profile profile-name]
file filename;
```

You must specify a filename for the source class usage profile that has already been configured at the **[edit accounting-options]** hierarchy level. You can also specify a filename for the destination class usage profile configured at the **[edit accounting-options]** hierarchy level.

### Configuring the Interval

Each interface with a class usage profile enabled has statistics collected once per interval specified for the accounting profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the **interval** statement at the **[edit accounting-options class-usage-profile *profile-name*]** hierarchy level:

```
[edit accounting-options class-usage-profile profile-name]
interval;
```

### Creating a Class Usage Profile to Collect Source Class Usage Statistics

To create a class usage profile to collect source class usage statistics:

```
[edit]
accounting-options {
 class-usage-profile scu-profile1;
 file usage-stats;
 interval 15;
 source-classes {
 gold;
 silver;
 bronze;
 }
}
```

The class usage profile, **scu-profile1**, writes data to the file **usage\_stats**. The file might look like the following:

```
#FILE CREATED 976825278 2000-12-14-20:21:18
#profile-layout, scu_profile,epoch-timestamp,interface-name,source-class,
packet-count,byte-count
scu_profile,980313078,xe-1/0/0.0,gold,82,6888
scu_profile,980313078,xe-1/0/0.0,silver,164,13776
scu_profile,980313078,xe-1/0/0.0,bronze,0,0
scu_profile,980313678,xe-1/0/0.0,gold,82,6888
scu_profile,980313678,xe-1/0/0.0,silver,246,20664
scu_profile,980313678,xe-1/0/0.0,bronze,0,0
```

### Creating a Class Usage Profile to Collect Destination Class Usage Statistics

To create a class usage profile to collect destination class usage statistics:

```
[edit]
accounting-options {
 class-usage-profile dcu-profile1;
 file usage-stats
 interval 15;
```

```

destination-classes {
 gold;
 silver;
 bronze;
}

```

The class usage profile, **dcu-profile1**, writes data to the file **usage-stats**. The file might look like the following:

```

#FILE CREATED 976825278 2000-12-14-20:21:18
#profile-layout, dcu_profile,epoch-timestamp,interface-name,destination-class,
packet-count,byte-count
dcu_profile,980313078,xe-1/0/0.0,gold,82,6888
dcu_profile,980313078,xe-1/0/0.0,silver,164,13776
dcu_profile,980313078,xe-1/0/0.0,bronze,0,0
dcu_profile,980313678,xe-1/0/0.0,gold,82,6888
dcu_profile,980313678,xe-1/0/0.0,silver,246,20664
dcu_profile,980313678,xe-1/0/0.0,bronze,0,0
...
#FILE CLOSED 976826178 2000-12-14-20:36:18

```

#### Related Documentation

- [Understanding Source Class Usage and Destination Class Usage Options on page 1304](#)

- [Configuring the Routing Engine Profile on page 1325](#)

### Configuring the MIB Profile

The MIB profile collects MIB statistics and logs them to a file. The MIB profile specifies the SNMP operation and MIB object names for which statistics are collected.

To configure a MIB profile, include the **mib-profile** statement at the **[edit accounting-options]** hierarchy level:

```

[edit accounting-options]
mib-profile profile-name {
 file filename;
 interval minutes;
 object-names {
 mib-object-name;
 }
 operation operation-name;
}

```

To configure a MIB profile, perform the tasks described in the following sections:

- [Configuring the File Information on page 1324](#)
- [Configuring the Interval on page 1324](#)
- [Configuring the MIB Operation on page 1324](#)
- [Configuring MIB Object Names on page 1324](#)
- [Example: Configuring a MIB Profile on page 1325](#)

### Configuring the File Information

Each accounting profile logs its statistics to a file in the `/var/log` directory.

To configure which file to use, include the **file** statement at the **[edit accounting-options mib-profile *profile-name*]** hierarchy level:

```
[edit accounting-options mib-profile profile-name]
file filename;
```

You must specify a ***filename*** for the MIB profile that has already been configured at the **[edit accounting-options]** hierarchy level.

### Configuring the Interval

A MIB profile has statistics collected once per interval time specified for the profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the **interval** statement at the **[edit accounting-options mib-profile *profile-name*]** hierarchy level:

```
[edit accounting-options mib-profile profile-name]
interval;
```

The range for the **interval** statement is 1 through 2880 minutes. The default is 30 minutes.

### Configuring the MIB Operation

A MIB profile must specify the operation that is used to collect MIB statistics. To configure which operation is used to collect MIB statistics, include the **operation** statement at the **[edit accounting-options mib-profile *profile-name*]** hierarchy level:

```
[edit accounting-options mib-profile profile-name]
operation operation-name;
```

You can configure a **get**, **get-next**, or **walk** operation. The default operation is **walk**.

### Configuring MIB Object Names

A MIB profile must specify the MIB objects for which statistics are to be collected. To configure the MIB objects for which statistics are collected, include the **objects-names** statement at the **[edit accounting-options mib-profile *profile-name*]** hierarchy level:

```
[edit accounting-options mib-profile profile-name]
object-names {
 mib-object-name;
}
```

You can include multiple MIB object names in the configuration.

**NOTE:** Do not configure MIB objects related to interface octets or packets for a MIB profile, because it can cause the SNMP walk or a CLI show command to time out.

---

**Example: Configuring a MIB Profile**

Configure a MIB profile:

```
[edit accounting-options]
mib-profile mstatistics {
 file stats;
 interval 60;
 operation walk;
 objects-names {
 ipCidrRouteStatus;
 ifOutOctets;
 }
}
```

- [Configuring Class Usage Profiles on page 1321](#)
- [Configuring the Routing Engine Profile on page 1325](#)

**Configuring the Routing Engine Profile**

The Routing Engine profile collects Routing Engine statistics and logs them to a file. The Routing Engine profile specifies the fields for which statistics are collected.

To configure a Routing Engine profile, include the **routing-engine-profile** statement at the **[edit accounting-options]** hierarchy level:

```
[edit accounting-options]
routing-engine-profile profile-name {
 fields {
 field-name;
 }
 file filename;
 interval minutes;
}
```

To configure a Routing Engine profile, perform the tasks described in the following sections:

- [Configuring Fields on page 1326](#)
- [Configuring the File Information on page 1326](#)
- [Configuring the Interval on page 1326](#)
- [Example: Configuring a Routing Engine Profile on page 1326](#)

### Configuring Fields

A Routing Engine profile must specify what statistics are collected. To configure which statistics should be collected for the Routing Engine, include the **fields** statement at the **[edit accounting-options routing-engine-profile *profile-name*]** hierarchy level:

```
[edit accounting-options routing-engine-profile profile-name]
fields {
 field-name;
}
```

### Configuring the File Information

Each accounting profile logs its statistics to a file in the **/var/log** directory.

To configure which file to use, include the **file** statement at the **[edit accounting-options routing-engine-profile *profile-name*]** hierarchy level:

```
[edit accounting-options routing-engine-profile profile-name]
file filename;
```

You must specify a ***filename*** for the Routing Engine profile that has already been configured at the **[edit accounting-options]** hierarchy level.

### Configuring the Interval

A Routing Engine profile has statistics collected once per interval time specified for the profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the **interval** statement at the **[edit accounting-options routing-engine-profile *profile-name*]** hierarchy level:

```
[edit accounting-options routing-engine-profile profile-name]
interval;
```

The range for **interval** is 1 through 2880 minutes. The default is 30 minutes.

### Example: Configuring a Routing Engine Profile

Configure a Routing Engine profile:

```
[edit accounting-options]
file my-file {
 size 300k;
}
routing-engine-profile profile-1 {
 file my-file;
 fields {
 host-name;
 date;
 time-of-day;
 uptime;
 cpu-load-1;
 cpu-load-5;
 cpu-load-15;
 }
}
```

## Configuring Monitoring Options

- [Configuring Interface Alarms on page 1327](#)
- [Using RPM to Measure Network Performance on page 1337](#)
- [Configuring IP Monitoring on page 1362](#)

### Configuring Interface Alarms

- [Alarm Overview on page 1327](#)
- [Example: Configuring Interface Alarms on page 1332](#)
- [Monitoring Active Alarms on a Device on page 1334](#)
- [Monitoring Alarms on page 1335](#)

---

#### Alarm Overview

Alarms alert you to conditions on a network interface, on the device chassis, or in the system software that might prevent the device from operating normally. You can set the conditions that trigger alarms on an interface. Chassis and system alarm conditions are preset.

An active alarm lights the **ALARM** LED on the front panel of the device. You can monitor active alarms from the J-Web user interface or the CLI. When an alarm condition triggers an alarm, the device lights the yellow (amber) **ALARM** LED on the front panel. When the condition is corrected, the light turns off.

This section contains the following topics:

- [Alarm Types on page 1327](#)
- [Alarm Severity on page 1328](#)
- [Alarm Conditions on page 1328](#)

#### **Alarm Types**

The device supports three types of alarms:

- Interface alarms indicate a problem in the state of the physical links on fixed or installed Physical Interface Modules (PIMs). To enable interface alarms, you must configure them.
- Chassis alarms indicate a failure on the device or one of its components. Chassis alarms are preset and cannot be modified.

- System alarms indicate a missing rescue configuration or software license, where valid. System alarms are preset and cannot be modified, although you can configure them to appear automatically in the J-Web user interface or CLI.

### **Alarm Severity**

Alarms have two severity levels:

- Major (red)—Indicates a critical situation on the device that has resulted from one of the following conditions. A red alarm condition requires immediate action.
  - One or more hardware components have failed.
  - One or more hardware components have exceeded temperature thresholds.
  - An alarm condition configured on an interface has triggered a critical warning.
- Minor (yellow)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

A missing rescue configuration or software license generates a yellow system alarm.

### **Alarm Conditions**

To enable alarms on a device interface, you must select an alarm condition and an alarm severity. In contrast, alarm conditions and severity are preconfigured for chassis alarms and system alarms.

**NOTE:** For information about chassis alarms for your device, see the *Hardware Guide* for your device.

---

This section contains the following topics:

- [Interface Alarm Conditions on page 1328](#)
- [System Alarm Conditions on page 1331](#)

### **Interface Alarm Conditions**

[Table 123 on page 1329](#) lists the interface conditions, sorted by interface type, that you can configure for an alarm. You can configure each alarm condition to trigger either a major (red) alarm or minor (yellow) alarm. The corresponding configuration option is included.

For the services stateful firewall filters (NAT, IDP, and IPsec), which operate on an internal adaptive services module within a device, you can configure alarm conditions on the integrated services and services interfaces.

Table 123: Interface Alarm Conditions

| Interface           | Alarm Condition                         | Description                                                                                                                                                                                                                                                                             | Configuration Option    |
|---------------------|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| DS1 (T1)            | Alarm indication signal (AIS)           | The normal T1 traffic signal contained a defect condition and has been replaced by the AIS. A transmission interruption occurred at the remote endpoint or upstream of the remote endpoint. This all-ones signal is transmitted to prevent consequential downstream failures or alarms. | <b>ais</b>              |
|                     | Yellow alarm                            | The remote endpoint is in yellow alarm failure. This condition is also known as a far-end alarm failure.                                                                                                                                                                                | <b>ylw</b>              |
| Ethernet            | Link is down                            | The physical link is unavailable.                                                                                                                                                                                                                                                       | <b>link-down</b>        |
| Integrated services | Hardware or software failure            | On the adaptive services module, either the hardware associated with the module or the software that drives the module has failed.                                                                                                                                                      | <b>failure</b>          |
| Serial              | Clear-to-send (CTS) signal absent       | The remote endpoint of the serial link is not transmitting a CTS signal. The CTS signal must be present before data can be transmitted across a serial link.                                                                                                                            | <b>cts-absent</b>       |
|                     | Data carrier detect (DCD) signal absent | The remote endpoint of the serial link is not transmitting a DCD signal. Because the DCD signal transmits the state of the device, no signal probably indicates that the remote endpoint of the serial link is unavailable.                                                             | <b>dcd-absent</b>       |
|                     | Data set ready (DSR) signal absent      | The remote endpoint of the serial link is not transmitting a DSR signal. The DSR signal indicates that the remote endpoint is ready to receive and transmit data across the serial link.                                                                                                | <b>dsr-absent</b>       |
|                     | Loss of receive clock                   | The clock signal from the remote endpoint is not present. Serial connections require clock signals to be transmitted from one endpoint and received by the other endpoint of the link.                                                                                                  | <b>loss-of-rx-clock</b> |
|                     | Loss of transmit clock                  | The local clock signal is not present. Serial connections require clock signals to be transmitted from one endpoint and received by the other endpoint of the link.                                                                                                                     | <b>loss-of-tx-clock</b> |

Table 123: Interface Alarm Conditions (*continued*)

| Interface | Alarm Condition               | Description                                                                                                                                                                                                                                                                             | Configuration Option  |
|-----------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| Services  | Services module hardware down | A hardware problem has occurred on the device's services module. This error typically means that one or more of the CPUs on the module has failed.                                                                                                                                      | <b>hw-down</b>        |
|           | Services link down            | The link between the device and its services module is unavailable.                                                                                                                                                                                                                     | <b>linkdown</b>       |
|           | Services module held in reset | The device's services module is stuck in reset mode. If the services module fails to start up five or more times in a row, the services module is held in reset mode. Startup fails when the amount of time from CPU release to CPU halt is less than 300 seconds.                      | <b>pic-hold-reset</b> |
|           | Services module reset         | The device's services module is resetting. The module resets after it crashes or is reset from the CLI, or when it takes longer than 60 seconds to start up.                                                                                                                            | <b>pic-reset</b>      |
|           | Services module software down | A software problem has occurred on the device's services module.                                                                                                                                                                                                                        | <b>sw-down</b>        |
| E3        | Alarm indication signal (AIS) | The normal E3 traffic signal contained a defect condition and has been replaced by the AIS. A transmission interruption occurred at the remote endpoint or upstream of the remote endpoint. This all-ones signal is transmitted to prevent consequential downstream failures or alarms. | <b>ais</b>            |
|           | Loss of signal (LOS)          | No remote E3 signal is being received at the E3 interface.                                                                                                                                                                                                                              | <b>los</b>            |
|           | Out of frame (OOF)            | An OOF condition has existed for 10 seconds. This alarm applies only to E3 interfaces configured in frame mode. The OOF failure is cleared when no OOF or LOS defects have occurred for 20 seconds.                                                                                     | <b>oof</b>            |
|           | Remote defect indication      | An AIS, LOS, or OOF condition exists. This alarm applies only to E3 interfaces configured in frame mode.                                                                                                                                                                                | <b>rdi</b>            |

Table 123: Interface Alarm Conditions (*continued*)

| Interface | Alarm Condition                | Description                                                                                                                                                                                                                                                                             | Configuration Option |
|-----------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| T3 (DS3)  | Alarm indication signal        | The normal T3 traffic signal contained a defect condition and has been replaced by the AIS. A transmission interruption occurred at the remote endpoint or upstream of the remote endpoint. This all-ones signal is transmitted to prevent consequential downstream failures or alarms. | <b>ais</b>           |
|           | Excessive number of zeros      | The bit stream received from the upstream host has more consecutive zeros than are allowed in a T3 frame.                                                                                                                                                                               | <b>exz</b>           |
|           | Far-end receive failure (FERF) | The remote endpoint of the connection has failed. A FERF differs from a yellow alarm, because the failure can be any failure, not just an OOF or LOS failure.                                                                                                                           | <b>ferf</b>          |
|           | Idle alarm                     | The Idle signal is being received from the remote endpoint.                                                                                                                                                                                                                             | <b>idle</b>          |
|           | Line code violation            | Either the line encoding along the T3 link is corrupted or a mismatch between the encoding at the local and remote endpoints of a T3 connection occurred.                                                                                                                               | <b>lcv</b>           |
|           | Loss of frame (LOF)            | An OOF or loss-of-signal LOS condition has existed for 10 seconds. The LOF failure is cleared when no OOF or LOS defects have occurred for 20 seconds. A LOF failure is also called a red failure.                                                                                      | <b>lof</b>           |
|           | Loss of signal (LOS)           | No remote T3 signal is being received at the T3 interface.                                                                                                                                                                                                                              | <b>los</b>           |
|           | Phase-locked loop out of lock  | The clocking signals for the local and remote endpoints no longer operate in lock-step.                                                                                                                                                                                                 | <b>pll</b>           |
|           | Yellow alarm                   | The remote endpoint is in yellow alarm failure. This condition is also known as a far-end alarm failure.                                                                                                                                                                                | <b>ylw</b>           |

**System Alarm Conditions**

[Table 124 on page 1331](#) lists the two preset system alarms, the condition that triggers each alarm, and the action you take to correct the condition.

Table 124: System Alarm Conditions and Corrective Actions

| Alarm Type    | Alarm Condition                      | Corrective Action             |
|---------------|--------------------------------------|-------------------------------|
| Configuration | The rescue configuration is not set. | Set the rescue configuration. |

Table 124: System Alarm Conditions and Corrective Actions (*continued*)

| Alarm Type | Alarm Condition                                                                                                                                                                                                                                                                                                                            | Corrective Action            |

### Example: Configuring Interface Alarms

This example shows how to configure interface alarms.

- [Requirements on page 1332](#)
- [Overview on page 1332](#)
- [Configuration on page 1333](#)
- [Verification on page 1334](#)

#### Requirements

Before you begin:

- Establish basic connectivity. See the *Getting Started Guide for Branch SRX Series* for your device.
- Configure network interfaces. See *Interfaces Feature Guide for Security Devices*.
- Select the network interface on which to apply an alarm and the condition you want to trigger the alarm. See [“Alarm Overview” on page 1327](#).

#### Overview

In this example, you enable interface alarms by explicitly setting alarm conditions. You configure the system to generate a red interface alarm when a yellow alarm is detected on a DS1 link. You configure the system to generate a red interface alarm when a link-down failure is detected on an Ethernet link.

For a serial link, you set cts-absent and dcd-absent to yellow to signify either the CST or the DCD signal is not detected. You set loss-of-rx-clock and loss-of-tx-clock to red alarm to signify either the receiver clock signal or the transmission clock signal is not detected.

For a T3 link, you set the interface alarm to red when the remote endpoint is experiencing a failure. You set exz to yellow alarm when the upstream bit has more consecutive zeros than are permitted in a T3 interface. You then set a red alarm when there is loss-of-signal on the interface.

Finally, you configure the system to display active system alarms whenever a user with the login class admin logs in to the device.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set chassis alarm ds1 ylw red
set chassis alarm ethernet link-down red
set chassis alarm serial cts-absent yellow dcd-absent yellow
set chassis alarm serial loss-of-rx-clock red loss-of-tx-clock red
set chassis alarm t3 ylw red exz yellow los red
set system login class admin login-alarms
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure interface alarms:

1. Configure an alarm.  

```
[edit]
user@host# edit chassis alarm
```
2. Specify the interface alarms on a DS1 and an Ethernet link.  

```
[edit chassis alarm]
user@host# set ds1 ylw red
user@host# set ethernet link-down red
```
3. Specify the interface alarms on a serial link.  

```
[edit chassis alarm]
user@host# set serial cts-absent yellow
user@host# set serial dcd-absent yellow
user@host# set serial loss-of-rx-clock red
user@host# set serial loss-of-tx-clock red
```
4. Specify the interface alarms on a T3 link.  

```
[edit chassis alarm]
user@host# set t3 ylw red
user@host# set t3 exz yellow
user@host# set t3 los red
```
5. Configure the system to display active system alarms.  

```
[edit]
user@host# edit system login
```

```
user@host# set class admin login-alarms
```

**Results** From configuration mode, confirm your configuration by entering the **show chassis alarms** and **show system login** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show chassis alarms
t3 {
 exz yellow;
 los red;
 ylw red;
}
ds1 {
 ylw red;
}
ethernet {
 link-down red;
}
serial {
 loss-of-rx-clock red;
 loss-of-tx-clock red;
 dcd-absent yellow;
 cts-absent yellow;
}
[edit]
user@host# show system login
show system login
show system login
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### *Verification*

#### *Verifying the Alarm Configurations*

**Purpose** Confirm that the configuration is working properly.

Verify that the alarms are configured.

**Action** From configuration mode, enter the **show chassis alarms** command. Verify that the output shows the intended configuration of the alarms.

---

### **Monitoring Active Alarms on a Device**

**Purpose** Use to monitor and filter alarms on a Juniper Networks device.

**Action** Select **Monitor>Events and Alarms>View Alarms** in the J-Web user interface. The J-Web View Alarms page displays the following information about preset system and chassis alarms:

- Type—Type of alarm: System, Chassis, or All.
- Severity—Severity class of the alarm: Minor or Major.
- Description—Description of the alarm.
- Time—Time that the alarm was registered.

To filter which alarms appear, use the following options:

- Alarm Type—Specifies which type of alarm to monitor: System, Chassis, or All. System alarms include FRU detection alarms (power supplies removed, for instance). Chassis alarms indicate environmental alarms such as temperature.
- Severity—Specifies the alarm severity that you want to monitor: Major, Minor, or All. A major (red) alarm condition requires immediate action. A minor (yellow) condition requires monitoring and maintenance.
- Description—Specifies the alarms you want to monitor. Enter a brief synopsis of the alarms that you want to monitor.
- Date From—Specifies the beginning of the date range that you want to monitor. Set the date using the calendar pick tool.
- To—Specifies the end of the date range that you want to monitor. Set the date using the calendar pick tool.
- Go—Executes the options that you specified.
- Reset—Clears the options that you specified.

Alternatively, you can enter the following **show** commands in the CLI editor:

- **show chassis alarms**
- **show system alarms**

### Monitoring Alarms

---

**Purpose** Use the monitoring functionality to view the alarms page.

**Action** To monitor alarms select **Monitor>Events and Alarms>View Alarms** in the J-Web user interface.

**Meaning** [Table 125 on page 1336](#) summarizes key output fields in the alarms page.

Table 125: Alarms Monitoring Page

| Field               | Value                                                                                                                                                                                                                                                                                                                                                           | Additional Information |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| <b>Alarm Filter</b> |                                                                                                                                                                                                                                                                                                                                                                 |                        |

### RPM Overview

The real-time performance monitoring (RPM) feature allows network operators and their customers to accurately measure the performance between two network endpoints. With the RPM tool, you configure and send probes to a specified target and monitor the analyzed results to determine packet loss, round-trip time, and jitter.

RPM allows you to perform service-level monitoring. When RPM is configured on a device, the device calculates network performance based on packet response time, jitter, and packet loss. These values are gathered by Hypertext Transfer Protocol (HTTP) GET requests, Internet Control Message Protocol (ICMP) requests, and TCP and UDP requests, depending on the configuration.

This section contains the following topics:

- [RPM Probes on page 1337](#)
- [RPM Tests on page 1338](#)
- [Probe and Test Intervals on page 1338](#)
- [Jitter Measurement with Hardware Timestamping on page 1338](#)
- [RPM Statistics on page 1339](#)
- [RPM Thresholds and Traps on page 1340](#)
- [RPM for BGP Monitoring on page 1340](#)

### ***RPM Probes***

You gather RPM statistics by sending out probes to a specified probe target, identified by an IP address or URL. When the target receives the probe, it generates responses,

which are received by the device. By analyzing the transit times to and from the remote server, the device can determine network performance statistics.

The device sends out the following probe types:

- HTTP GET request at a target URL
- HTTP GET request for metadata at a target URL
- ICMP echo request to a target address (the default)
- ICMP timestamp request to a target address
- UDP ping packets to a target device
- UDP timestamp requests to a target address
- TCP ping packets to a target device

UDP and TCP probe types require that the remote server be configured as an RPM receiver so that it generates responses to the probes.

The RPM probe results are also available in the form of MIB objects through the SNMP protocol.

### ***RPM Tests***

Each probed target is monitored over the course of a test. A test represents a collection of probes, sent out at regular intervals, as defined in the configuration. Statistics are then returned for each test. Because a test is a collection of probes that have been monitored over some amount of time, test statistics such as standard deviation and jitter can be calculated and included with the average probe statistics.

### ***Probe and Test Intervals***

Within a test, RPM probes are sent at regular intervals, configured in seconds. When the total number of probes has been sent and the corresponding responses received, the test is complete. You can manually set the probe interval for each test to control how the RPM test is conducted.

After all the probes for a particular test have been sent, the test begins again. The time between tests is the test interval. You can manually set the test interval to tune RPM performance.

**NOTE:** On SRX240 Low Memory devices and SRX240 High Memory devices, the RPM server operation does not work when the probe is configured with the option `destination-interface`.

---

### ***Jitter Measurement with Hardware Timestamping***

Jitter is the difference in relative transit time between two consecutive probes.

You can timestamp the following RPM probes to improve the measurement of latency or jitter:

- ICMP ping
- ICMP ping timestamp
- UDP ping
- UDP ping timestamp

**NOTE:** The device supports hardware timestamping of UDP ping and UDP ping timestamp RPM probes only if the destination port is UDP-ECHO (port 7).

Timestamping takes place during the forwarding process of the device originating the probe (the RPM client), but not on the remote device that is the target of the probe (the RPM server).

The supported encapsulations on a device for timestamping are Ethernet including VLAN, synchronous PPP, and Frame Relay. The only logical interface supported is an *lt* services interface.

RPM probe generation with hardware timestamp can be retrieved through the SNMP protocol.

#### ***RPM Statistics***

At the end of each test, the device collects the statistics for packet round-trip time, packet inbound and outbound times (for ICMP timestamp probes only), and probe loss as shown in [Table 126 on page 1339](#).

**Table 126: RPM Statistics**

| RPM Statistics                                                 | Description                                                                                                                               |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Round-Trip Times</b>                                        |                                                                                                                                           |
| Minimum round-trip time                                        | Shortest round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test                   |
| Maximum round-trip time                                        | Longest round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test                    |
| Average round-trip time                                        | Average round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test                    |
| Standard deviation round-trip time                             | Standard deviation of the round-trip times from the Juniper Networks device to the remote server, as measured over the course of the test |
| Jitter                                                         | Difference between the maximum and minimum round-trip times, as measured over the course of the test                                      |
| <b>Inbound and Outbound Times (ICMP Timestamp Probes Only)</b> |                                                                                                                                           |
| Minimum egress time                                            | Shortest one-way time from the Juniper Networks device to the remote server, as measured over the course of the test                      |

Table 126: RPM Statistics (*continued*)

| RPM Statistics                  | Description                                                                                                                            |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Maximum ingress time            | Shortest one-way time from the remote server to the Juniper Networks device, as measured over the course of the test                   |
| Average egress time             | Average one-way time from the Juniper Networks device to the remote server, as measured over the course of the test                    |
| Average ingress time            | Average one-way time from the remote server to the Juniper Networks device, as measured over the course of the test                    |
| Standard deviation egress time  | Standard deviation of the one-way times from the Juniper Networks device to the remote server, as measured over the course of the test |
| Standard deviation ingress time | Standard deviation of the one-way times from the remote server to the Juniper Networks device, as measured over the course of the test |
| Egress jitter                   | Difference between the maximum and minimum outbound times, as measured over the course of the test                                     |
| Ingress jitter                  | Difference between the maximum and minimum inbound times, as measured over the course of the test                                      |
| <b>Probe Counts</b>             |                                                                                                                                        |
| Probes sent                     | Total number of probes sent over the course of the test                                                                                |
| Probe responses received        | Total number of probe responses received over the course of the test                                                                   |
| Loss percentage                 | Percentage of probes sent for which a response was not received                                                                        |

***RPM Thresholds and Traps***

You can configure RPM threshold values for the round-trip times, ingress (inbound) times, and egress (outbound) times that are measured for each probe, as well as for the standard deviation and jitter values that are measured for each test. Additionally, you can configure threshold values for the number of successive lost probes within a test and the total number of lost probes within a test.

If the result of a probe or test exceeds any threshold, the device generates a system log message and sends any Simple Network Management Protocol (SNMP) notifications (traps) that you have configured.

***RPM for BGP Monitoring***

When managing peering networks that are connected using Border Gateway Protocol (BGP), you might need to find out if a path exists between the Juniper Networks device and its configured BGP neighbors. You can ping each BGP neighbor manually to determine the connection status, but this method is not practical when the device has a large number of BGP neighbors configured.

In the device, you can configure RPM probes to monitor the BGP neighbors and determine if they are active.

### IPv6 RPM Probes

A probe request is a standard IPv6 packet with corresponding TCP, UDP, and ICMPv6 headers. A probe response is also a standard IPv6 packet with corresponding TCP, UDP, and ICMPv6 headers. No RPM header is appended to the standard packet for RE-based RPM. An IPv6-based RPM test occurs between an IPv6 RPM client and IPv6 RPM server.

**NOTE:** You can have both IPv4 tests and IPv6 tests in the same probe.

### Guidelines for Configuring RPM Probes for IPv6

Keep the following guidelines in mind when you configure IPv6 addresses for RPM destinations or servers:

- IPv6 RPM uses ICMPv6 probe requests. You cannot configure ICMP or ICMP timestamp probe types.
- Only Routing Engine-based RPM is supported for IPv6 targets including VRF support, specification of the size of the data portion of ICMPv6 probes, data pattern, and traffic class.
- You can configure probes with a combination of IPv4 and IPv6 tests. However, an individual test must be either IPv4 or IPv6.
- Routing Engine-based RPM does not support hardware-based, or one-way hardware-based timestamping.
- We recommend that you include the **probe-limit** statement at the **[edit services rpm]** hierarchy level to set the limit on concurrent probes to 10. Higher concurrent probes can result in higher spikes.
- SNMP set operation is permitted only on ICMP probes and it is not supported for other probe types.

- The following table describes the IPv6 special address prefixes that you cannot configure in a probe.

| IPv6 Address Type         | IPv6 Address Prefix                                                  |
|---------------------------|----------------------------------------------------------------------|
| Node-Scoped Unicast       | ::1/128 is the loopback address<br>::/128 is the unspecified address |
| IPv4-Mapped Addresses     | ::FFFF:0:0/96                                                        |
| IPv4-Compatible Addresses | :<ipv4-address>/96                                                   |
| Link-Scoped Unicast       | fe80::/10                                                            |
| Unique-Local              | fc00::/7                                                             |
| Documentation Prefix      | 2001:db8::/32                                                        |
| 6to4                      | 2002::/16                                                            |
| 6bone                     | 5f00::/8                                                             |
| ORCHID                    | 2001:10::/28                                                         |
| Teredo                    | 2001::/32                                                            |
| Default Route             | ::/0                                                                 |
| Multicast                 | ff00::/8                                                             |

- In Routing Engine-based RPM, route-trip time (RTT) spikes might occur because of queuing delays, even with a single test.
- Since RPM might open TCP and UDP ports to communicate between the RPM server and RPM client, we recommend that you use firewalls and distributed denial-of-service (DDoS) attack filters to protect against security threats.

### RPM Support for VPN Routing and Forwarding

Real-time performance monitoring (RPM) is supported on all Juniper Network devices.

VRF in a Layer 3 VPN implementation allows multiple instances of a routing table to coexist within the same device at the same time. Because the routing instances are independent, the same or overlapping IPv4 or IPv6 addresses can be used without conflicting each other.

RPM ICMP and UDP probe with VPN routing and forwarding (VRF) has been improved. In previous releases, the RPM probes specified to a VRF table were not handled by the

real-time forwarding process (FWDD-RT). In Junos OS Release 10.0, RPM probes specified to a VRF table are handled by the FWDD-RT, thereby providing more accurate results.

This feature supports RPM ICMP and UDP probes configured with routing instances of type VRF.

### Example: Configuring Basic RPM Probes

This example shows how to configure basic RPM probes to measure performance between two network endpoints.

- [Requirements on page 1343](#)
- [Overview on page 1343](#)
- [Configuration on page 1343](#)
- [Verification on page 1345](#)

#### Requirements

Before you begin:

- Establish basic connectivity. See the *Getting Started Guide for Branch SRX Series* for your device.
- Configure network interfaces. See *Interfaces Feature Guide for Security Devices*.

#### Overview

In this example, you configure basic probes for two RPM owners, customerA and customerB. You configure the RPM test as icmp-test for customerA with a test interval of 15 seconds and specify a probe type as icmp-ping-timestamp, a probe timestamp, and a target address as 192.178.16.5. You then configure the RPM thresholds and corresponding SNMP traps to catch ingress (inbound) times greater than 3000 microseconds.

Then you configure the RPM test as http-test for customerB with a test interval of 30 seconds and specify a probe type as http-get and a target URL as http://customerB.net. Finally, you configure RPM thresholds and corresponding SNMP traps as probe-failure and test-failure to catch three or more successive lost probes and total lost probes of 10.

#### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set services rpm probe customerA test icmp-test probe-interval 15
```

```
set services rpm probe customerA test icmp-test probe-type icmp-ping-timestamp
set services rpm probe customerA test icmp-test hardware-timestamp
set services rpm probe customerA test icmp-test target address 192.178.16.5
set services rpm probe customerA test icmp-test thresholds ingress-time 3000
set services rpm probe customerA test icmp-test traps ingress-time-exceeded
set services rpm probe customerB test http-test probe-interval 30
set services rpm probe customerB test http-test probe-type http-get
set services rpm probe customerB test http-test target url http://customerB.net
set services rpm probe customerB test http-test thresholds successive-loss 3
set services rpm probe customerB test http-test thresholds total-loss 10
set services rpm probe customerB test http-test traps probe-failure
set services rpm probe customerB test http-test traps test-failure
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure basic RPM probes:

1. Configure the RPM.  

```
[edit]
user@host# edit services rpm
```
2. Configure the RPM owners.  

```
[edit services rpm]
user@host# set probe customerA
user@host# set probe customerB
```
3. Configure the RPM test for customerA.  

```
[edit services rpm]
user@host# edit probe customerA
user@host# set test icmp-test probe-interval 15
user@host# set test icmp-test probe-type icmp-ping-timestamp
```
4. Specify a probe timestamp and a target address.  

```
[edit services rpm probe customerA]
user@host# set test icmp-test hardware-timestamp
user@host# set test icmp-test target address 192.178.16.5
```
5. Configure RPM thresholds and corresponding SNMP traps.  

```
[edit services rpm probe customerA]
user@host# set test icmp-test thresholds ingress-time 3000
user@host# set test icmp-test traps ingress-time-exceeded
```
6. Configure the RPM test for customerB.  

```
[edit]
user@host# edit services rpm probe customerB
user@host# set test http-test probe-interval 30
```
7. Specify a probe type and a target URL.  

```
[edit services rpm probe customerB]
user@host# set test http-test probe-type http-get
user@host# set test http-test target url http://customerB.net
```

8. Configure RPM thresholds and corresponding SNMP traps.

```
[edit services rpm probe customerB]
user@host# set test http-test thresholds successive-loss 3
user@host# set test http-test thresholds total-loss 10
user@host# set test http-test traps probe-failure
user@host# set test http-test traps test-failure
```

**Results** From configuration mode, confirm your configuration by entering the **show services rpm** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show services rpm
probe customerA {
 test icmp-test {
 probe-type icmp-ping-timestamp;
 target address 192.178.16.5;
 probe-interval 15;
 thresholds {
 ingress-time 3000;
 }
 traps ingress-time-exceeded;
 hardware-timestamp;
 }
}
probe customerB {
 test http-test {
 probe-type http-get
 target url http://customerB.net;
 probe-interval 30;
 thresholds {
 successive-loss 3;
 total-loss 10;
 }
 traps [probe-failure test-failure];
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying RPM Services on page 1345](#)
- [Verifying RPM Statistics on page 1346](#)

### **Verifying RPM Services**

**Purpose** Verify that the RPM configuration is within the expected values.

**Action** From configuration mode, enter the **show services rpm** command. The output shows the values that are configured for RPM on the device.

### *Verifying RPM Statistics*

**Purpose** Verify that the RPM probes are functioning and that the RPM statistics are within expected values.

**Action** From configuration mode, enter the **show services rpm probe-results** command.

```
user@host> show services rpm probe-results
```

```

### **Example: Configuring RPM Using TCP and UDP Probes**

This example shows how to configure RPM using TCP and UDP probes.

- [Requirements on page 1347](#)
- [Overview on page 1347](#)

- [Configuration on page 1347](#)
- [Verification on page 1349](#)

### Requirements

Before you begin:

- Establish basic connectivity. See the *Getting Started Guide for Branch SRX Series* for your device.
- Configure network interfaces. See *Interfaces Feature Guide for Security Devices*.
- Configure the probe owner, the test, and the specific parameters of the RPM probe. See [“Example: Configuring Basic RPM Probes” on page 1343](#).

### Overview

In this example, you configure both the host (device A) and the remote device (device B) to act as TCP and UDP servers. You configure a probe for customerC, which uses TCP packets. Device B is configured as an RPM server for both TCP and UDP packets, using an lt services interface as the destination interface, and ports 50000 and 50037, respectively.

**CAUTION:** Use probe classification with caution, because improper configuration can cause packets to be dropped.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
{device A}
set services rpm probe customerC test tcp-test probe-interval 5
set services rpm probe customerC test tcp-test probe-type tcp-ping
set services rpm probe customerC test tcp-test target address 192.162.45.6
set services rpm probe customerC test tcp-test destination-interface lt-0/0/0
set services rpm probe customerC test tcp-test destination-port 50000

{device B}
set services rpm probe-server tcp port 50000
set services rpm probe-server udp port 50037
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure RPM using TCP and UDP probes:

1. Configure the RPM owner on device A.

```
{device A}
[edit]
```

- ```
user@host# edit services rpm
user@host# set probe customerC
```
2. Configure the RPM test.

```
{device A}
[edit services rpm]
user@host# edit services rpm probe customerC
user@host# set test tcp-test probe-interval 5
```
 3. Set the probe type.

```
{device A}
[edit services rpm probe customerC]
user@host# set test tcp-test probe-type tcp-ping
```
 4. Specify the target address.

```
{device A}
[edit services rpm probe customerC]
user@host# set test tcp-test target address 192.162.45.6
```
 5. Configure the destination interface.

```
{device A}
[edit services rpm probe customerC]
user@host# set test tcp-test destination-interface lt-0/0/0
```
 6. Configure port 50000 as the TCP port to which the RPM probes are sent.

```
{device A}
[edit services rpm probe customerC]
user@host# set test tcp-test destination-port 50000
```
 7. Configure device B to act as a TCP server using port 50000.

```
{device B}
[edit]
user@host# edit services rpm
user@host# set probe-server tcp port 50000
```
 8. Configure device B to act as a UDP server using port 50037.

```
{device B}
[edit services rpm]
user@host# set probe-server udp port 50037
```

Results From configuration mode, confirm your configuration by entering the **show services rpm** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show services rpm
probe customerC {
test tcp-test {
probe-type tcp-ping;
target address 192.162.45.6;
probe-interval 5;
destination-port 50000;
destination-interface lt-0/0/0.0;
```

```
    }  
  }  
  probe-server {  
    tcp {  
      port 50000;  
    }  
    udp {  
      port 50037;  
    }  
  }
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Verifying RPM Probe Servers

Purpose Confirm that the configuration is working properly.

Verify that the device is configured to receive and transmit TCP and UDP RPM probes on the correct ports.

Action From configuration mode, enter the **show services rpm active-servers** command. The output shows a list of the protocols and corresponding ports for which the device is configured as an RPM server.

```
user@host> show services rpm active-servers  
  
Protocol: TCP, Port: 50000  
  
Protocol: UDP, Port: 50037
```

 - [Example: Configuring RPM Probes for BGP Monitoring on page 1349](#)
 - [Tuning RPM Probes on page 1354](#)

Example: Configuring RPM Probes for BGP Monitoring

This example shows how to configure RPM probes to monitor BGP neighbors.

- [Requirements on page 1349](#)
- [Overview on page 1350](#)
- [Configuration on page 1350](#)
- [Verification on page 1351](#)

Requirements

Before you begin:

- Configure the BGP parameters under RPM configuration to send RPM probes to BGP neighbors. See [“Example: Configuring Basic RPM Probes” on page 1343.](#)
- Use TCP or UDP probes by configure both the probe server (Juniper Networks device) and the probe receiver (the remote device) to transmit and receive RPM probes on the same TCP or UDP port. See [“Example: Configuring RPM Using TCP and UDP Probes” on page 1346.](#)

Overview

In this example, you specify a hexadecimal value that you want to use for the data portion of the RPM probe as ABCD123. (It ranges from 1 through 2048 characters.) You specify the data size of the RPM probe as 1024 bytes. (The value ranges from 0 through 65,507.)

Then you configure destination port 50000 as the TCP port to which the RPM probes are sent. You specify the number of probe results to be saved in the probe history as 25. (It ranges from 0 through 255, and the default is 50.) You set the probe count to 5 and probe interval as 1. (The probe count ranges from 1 through 15, and the default is 1; and the probe interval ranges from 1 through 255, and the default is 3.) You then specify tcp-ping as the type of probe to be sent as part of the test.

Finally, you set the test interval as 60. The value ranges from 0 through 86,400 seconds for the interval between tests.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set services rpm bgp data-fill ABCD123 data-size 1024
set services rpm bgp destination-port 50000 history-size 25
set services rpm bgp probe-count 5 probe-interval 1
set services rpm bgp probe-type tcp-ping test-interval 60
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure RPM probes to monitor BGP neighbors:

1. Configure the RPM and BGP.

```
[edit]
user@host# edit services rpm bgp
```
2. Specify a hexadecimal value.

```
[edit services rpm bgp]
user@host# set data-fill ABCD123
```
3. Specify the data size of the RPM probe.

```
[edit services rpm bgp]
user@host# set data-size 1024
```

4. Configure the destination port.

```
[edit services rpm bgp]
user@host# set destination-port 50000
```
5. Specify the number of probes.

```
[edit services rpm bgp]
user@host# set history-size 25
```
6. Set the probe count and probe interval.

```
[edit services rpm bgp]
user@host# set probe-count 5 probe-interval 1
```
7. Specify the type of probe.

```
[edit services rpm bgp]
user@host# set probe-type tcp-ping
```

NOTE: If you do not specify the probe type the default ICMP probes are sent.

8. Set the test interval.

```
[edit services rpm bgp]
user@host# set test-interval 60
```

Results From configuration mode, confirm your configuration by entering the **show services rpm** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show services rpm
bgp {
  probe-type tcp-ping;
  probe-count 5;
  probe-interval 1;
  test-interval 60;
  destination-port 50000;
  history-size 25;
  data-size 1024;
  data-fill ABCD123;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Verifying RPM Probes for BGP Monitoring

Purpose Confirm that the configuration is working properly.

Verify that the RPM probes for BGP monitoring is configured.

Action From configuration mode, enter the **show services rpm** command.

- Related Documentation**
- [RPM Overview on page 1337](#)
 - [RPM Configuration Options on page 1355](#)
 - [Directing RPM Probes to Select BGP Devices on page 1352](#)
 - [Tuning RPM Probes on page 1354](#)

Directing RPM Probes to Select BGP Devices

If a device has a large number of BGP neighbors configured, you can direct (filter) the RPM probes to a selected group of BGP neighbors rather than to all the neighbors. To identify the BGP devices to receive RPM probes, you can configure routing instances.

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To direct RPM probes to select BGP neighbors:

1. Configure routing instance **R11** to send RPM probes to BGP neighbors within the routing instance.

```
[edit services rpm bgp]
user@host# set routing-instances R11
```

2. If you are done configuring the device, enter **commit** from configuration mode.

- Related Documentation**
- [RPM Overview on page 1337](#)
 - [RPM Configuration Options on page 1355](#)
 - [Example: Configuring Basic RPM Probes on page 1343](#)
 - [Example: Configuring RPM Probes for BGP Monitoring on page 1349](#)
 - [Tuning RPM Probes on page 1354](#)

Configuring RPM Timestamping

To account for latency in the communication of probe messages, you can enable timestamping of the probe packets. You can timestamp the following RPM probe types: **icmp-ping**, **icmp-ping-timestamp**, **udp-ping**, and **udp-ping-timestamp**.

This example shows how to enable timestamping for customerA. The test for customerA is identified as customerA-test.

To configure timestamping:

1. Specify the RPM probe owner for which you want to enable timestamping.

```
[edit services rpm]
user@host# edit probe customerA
```

2. Specify a name for the test.

```
[edit services rpm probe customerA]
user@host# edit test customerA-test
```

3. Enable timestamping.

```
[edit services rpm probe customerA test customerA-test]
user@host# edit hardware-timestamp
```

4. (Optional) If preferred, indicate that you want timestamping to be only one-way.

```
[edit services rpm probe customerA test customerA-test]
user@host# edit one-way-hardware-timestamp
```

NOTE: You cannot include both the `source-address` and `hardware-timestamp` or `one-way-hardware-timestamp` statements at the `[edit services rpm probe probe-name test test-name]` hierarchy level simultaneously.

Configuring IPv6 RPM Probes

You can configure IPv6 source and destination addresses for an IPv6-based RPM probe test.

To configure an IPv6 RPM test:

1. Specify the RPM probe owner for the probe you want to configure as an IPv6 test.

```
[edit services rpm]
user@host# edit probe customerA
```

2. Specify a name for the test.

```
[edit services rpm probe customerA]
user@host# edit test ipv6-test
```

3. Specify the probe type.

```
[edit services rpm probe customerA test ipv6-test]
user@host# set probe-type icmp6-ping
```

4. Specify the source address for the test.

```
[edit services rpm probe customerA test ipv6-test]
user@host# set source-address 2001:db8:1a:1112::20
```

5. Specify the target address for the test.

```
[edit services rpm probe customerA test ipv6-test]
```

```
user@host# set target inet6-address 2001:db8:1a:1112::1
```

6. Configure the remaining RPM test parameters.

**Related
Documentation**

- [Guidelines for Configuring RPM Probes for IPv6 on page 1341](#)

Tuning RPM Probes

After configuring an RPM probe, you can set parameters to control probe functions, such as the interval between probes, the total number of concurrent probes that a system can handle, and the source address used for each probe packet. See “[Example: Configuring Basic RPM Probes](#)” on page 1343.

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To tune RPM probes:

1. Set the maximum number of concurrent probes allowed on the system to 10.

```
[edit services rpm]
user@host# set probe-limit 10
```

2. Access the ICMP probe of customer A.

```
[edit]
user@host# edit services rpm probe customerA test icmp-test
```

3. Set the time between probe transmissions to 15 seconds.

```
[edit services rpm probe customerA test icmp-test]
user@host# set probe-interval 15
```

4. Set the number of probes within a test to 10.

```
[edit services rpm probe customerA test icmp-test]
user@host# set probe-count 10
```

5. Set the source address for each probe packet to 192.168.2.9. If you do not explicitly configure a source address, the address on the outgoing interface through which the probe is sent is used as the source address.

```
[edit services rpm probe customerA test icmp-test]
user@host# set source-address 192.168.2.9
```

6. If you are done configuring the device, enter **commit** from configuration mode.

RPM Configuration Options

You can configure real-time performance monitoring (RPM) parameters. See [Table 127 on page 1355](#) for a summary of the configuration options.

Table 127: RPM Configuration Summary

Field	Function	Your Action
Performance Probe Owners		
Owner Name (required)	Identifies an RPM owner for which one or more RPM tests are configured. In most implementations, the owner name identifies a network on which a set of tests is being run (a particular customer, for example).	Type the name of the RPM owner.
Identification		
Test name (required)	Uniquely identifies the RPM test	Type the name of the RPM test.
Target (Address or URL) (required)	IPv4 or IPv6 address or URL of probe target	Type the IPv4 address, in dotted decimal notation, IPv6 address, or the URL of the probe target. If the target is a URL, type a fully formed URL that includes http:// .
Source Address	Explicitly configured IPv4 or IPv6 address to be used as the probe source address	Type the source address to be used for the probe. If the source address is not one of the device's assigned addresses, the packet uses the outgoing interface's address as its source.
Routing Instance	Particular routing instance over which the probe is sent	Type the routing instance name. The routing instance applies only to probes of type icmp , icmp6-ping , and icmp-timestamp . The default routing instance is inet.0 .
History Size	Number of probe results saved in the probe history	Type a number between 0 and 255. The default history size is 50 probes.
Request Information		
Probe Type (required)	Specifies the type of probe to send as part of the test.	Select the desired probe type from the list: <ul style="list-style-type: none"> • http-get • http-get-metadata • icmp6-ping • icmp-ping • icmp-ping-timestamp • tcp-ping • udp-ping
Interval	Sets the wait time (in seconds) between each probe transmission	Type a number between 1 and 255 (seconds).
Test Interval (required)	Sets the wait time (in seconds) between tests.	Type a number between 0 and 86400 (seconds).

Table 127: RPM Configuration Summary (*continued*)

Field	Function	Your Action
Probe Count	Sets the total number of probes to be sent for each test.	Type a number between 1 and 15.
Destination Port	Specifies the TCP or UDP port to which probes are sent. To use TCP or UDP probes, you must configure the remote server as a probe receiver. Both the probe server and the remote server must be Juniper Networks devices configured to receive and transmit RPM probes on the same TCP or UDP port.	Type the number 7—a standard TCP or UDP port number—or a port number from 49152 through 65535.
DSCP Bits	Specifies the Differentiated Services code point (DSCP) bits. This value must be a valid 6-bit pattern. The default is 000000 .	Type a valid 6-bit pattern.
Data Size	Specifies the size of the data portion of the ICMP probes.	Type a size (in bytes) between 0 and 65507.
Data Fill	Specifies the contents of the data portion of the ICMP probes.	Type a hexadecimal value between 1 and 800h to use as the contents of the ICMP probe data.
Hardware Timestamp	Enables timestamping of RPM probe messages. You can timestamp the following RPM probes to improve the measurement of latency or jitter: <ul style="list-style-type: none"> ICMP ping ICMP ping timestamp UDP ping—destination port UDP-ECHO (port 7) only UDP ping timestamp—destination port UDP-ECHO (port 7) only 	To enable timestamping, select the check box.
Maximum Probe Thresholds		
Successive Lost Probes	Sets the total number of probes that must be lost successively to trigger a probe failure and generate a system log message.	Type a number between 0 and 15.
Lost Probes	Sets the total number of probes that must be lost to trigger a probe failure and generate a system log message.	Type a number between 0 and 15.
Round Trip Time	Sets the total round-trip time (in microseconds), from the device to the remote server, that triggers a probe failure and generates a system log message.	Type a number between 0 and 60,000,000 (microseconds).
Jitter	Sets the total jitter (in microseconds), for a test, that triggers a probe failure and generates a system log message.	Type a number between 0 and 60,000,000 (microseconds).

Table 127: RPM Configuration Summary (*continued*)

Field	Function	Your Action
Standard Deviation	Sets the maximum allowable standard deviation (in microseconds) for a test, which, if exceeded, triggers a probe failure and generates a system log message.	Type a number between 0 and 60,000,000 (microseconds).
Egress Time	Sets the total one-way time (in microseconds), from the device to the remote server, that triggers a probe failure and generates a system log message.	Type a number between 0 and 60,000,000 (microseconds).
Ingress Time	Sets the total one-way time (in microseconds), from the remote server to the device, that triggers a probe failure and generates a system log message.	Type a number between 0 and 60,000,000 (microseconds)
Jitter Egress Time	Sets the total outbound-time jitter (in microseconds), for a test, that triggers a probe failure and generates a system log message.	Type a number between 0 and 60,000,000 (microseconds)
Jitter Ingress Time	Sets the total inbound-time jitter (in microseconds), for a test, that triggers a probe failure and generates a system log message.	Type a number between 0 and 60,000,000 (microseconds).
Egress Standard Deviation	Sets the maximum allowable standard deviation of outbound times (in microseconds) for a test, which, if exceeded, triggers a probe failure and generates a system log message.	Type a number between 0 and 60,000,000 (microseconds).
Ingress Standard Deviation	Sets the maximum allowable standard deviation of inbound times (in microseconds) for a test, which, if exceeded, triggers a probe failure and generates a system log message.	Type a number between 0 and 60,000,000 (microseconds).
Traps		
Egress Jitter Exceeded	Generates SNMP traps when the threshold for jitter in outbound time is exceeded.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
Egress Standard Deviation Exceeded	Generates SNMP traps when the threshold for standard deviation in outbound times is exceeded.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
Egress Time Exceeded	Generates SNMP traps when the threshold for maximum outbound time is exceeded.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
Ingress Jitter Exceeded	Generates SNMP traps when the threshold for jitter in inbound time is exceeded.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
Ingress Standard Deviation Exceeded	Generates SNMP traps when the threshold for standard deviation in inbound times is exceeded.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.

Table 127: RPM Configuration Summary (*continued*)

Field	Function	Your Action
Ingress Time Exceeded	Generates traps when the threshold for maximum inbound time is exceeded.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
Jitter Exceeded	Generates traps when the threshold for jitter in round-trip time is exceeded.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
Probe Failure	Generates traps when the threshold for the number of successive lost probes is reached.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
RTT Exceeded	Generates traps when the threshold for maximum round-trip time is exceeded.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
Standard Deviation Exceeded	Generates traps when the threshold for standard deviation in round-trip times is exceeded.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
Test Completion	Generates traps when a test is completed.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
Test Failure	Generates traps when the threshold for the total number of lost probes is reached.	<ul style="list-style-type: none"> To enable SNMP traps for this condition, select the check box. To disable SNMP traps, clear the check box.
Performance Probe Server		
TCP Probe Server	Specifies the port on which the device is to receive and transmit TCP probes.	Type the number 7—a standard TCP or UDP port number—or a port number from 49160 through 65535.
UDP Probe Server	Specifies the port on which the device is to receive and transmit UDP probes.	Type the number 7—a standard TCP or UDP port number—or a port number from 49160 through 65535.

Monitoring RPM Probes

The RPM information includes the round-trip time, jitter, and standard deviation values for each configured RPM test on the device. To view these RPM properties, select

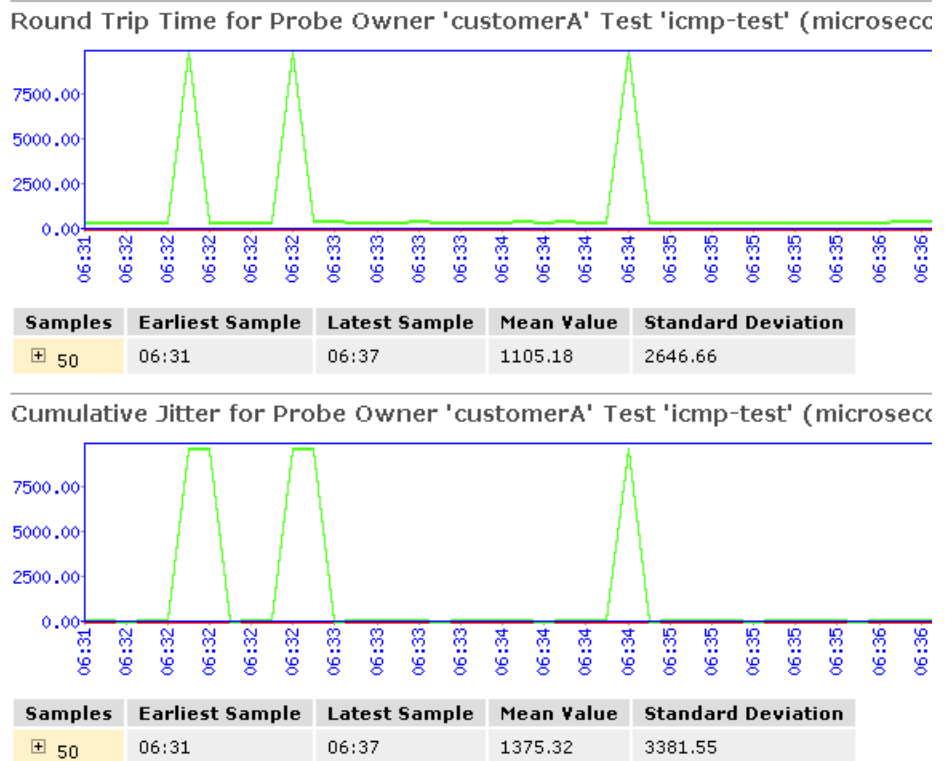

Troubleshoot>RPM>View RPM in the J-Web user interface, or in configuration mode enter the **show** command:

[edit]

```
user@host# run show services rpm probe-results
```

In addition to the RPM statistics for each RPM test, the J-Web user interface displays the round-trip times and cumulative jitter graphically. [Figure 45 on page 642](#) shows sample graphs for an RPM test.

Figure 57: Sample RPM Graphs

In [Figure 45 on page 642](#), the round-trip time and jitter values are plotted as a function of the system time. Large spikes in round-trip time or jitter indicate a slower outbound (egress) or inbound (ingress) time for the probe sent at that particular time.

[Table 128 on page 1359](#) summarizes key output fields in RPM displays.

Table 128: Summary of Key RPM Output Fields

Field	Values	Additional Information
Currently Running Tests		
Graph		Click the Graph link to display the graph (if it is not already displayed) or to update the graph for a particular test.
Owner	Configured owner name of the RPM test.	—

Table 128: Summary of Key RPM Output Fields (*continued*)

Field	Values	Additional Information
Test Name	Configured name of the RPM test.	—
Probe Type	Type of RPM probe configured for the specified test: <ul style="list-style-type: none"> • http-get • http-get-metadata • icmp-ping • icmp6-ping • icmp-ping-timestamp • tcp-ping • udp-ping 	—
Target Address	IPv4 address, IPv6 address, or URL of the remote server that is being probed by the RPM test.	—
Source Address	Explicitly configured IPv4 or IPv6 source address that is included in the probe packet headers.	If no source address is configured, the RPM probe packets use the outgoing interface as the source address, and the Source Address field is empty.
Minimum RTT	Shortest round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test.	—
Maximum RTT	Longest round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test.	—
Average RTT	Average round-trip time from the Juniper Networks device to the remote server, as measured over the course of the test.	—
Standard Deviation RTT	Standard deviation of round-trip times from the Juniper Networks device to the remote server, as measured over the course of the test.	—
Probes Sent	Total number of probes sent over the course of the test.	—
Loss Percentage	Percentage of probes sent for which a response was not received.	—
Round-Trip Time for a Probe		
Samples	Total number of probes used for the data set.	The Juniper Networks device maintains records of the most recent 50 probes for each configured test. These 50 probes are used to generate RPM statistics for a particular test.
Earliest Sample	System time when the first probe in the sample was received.	—

Table 128: Summary of Key RPM Output Fields (*continued*)

Field	Values	Additional Information
Latest Sample	System time when the last probe in the sample was received.	–
Mean Value	Average round-trip time for the 50-probe sample.	–
Standard Deviation	Standard deviation of the round-trip times for the 50-probe sample.	–
Lowest Value	Shortest round-trip time from the device to the remote server, as measured over the 50-probe sample.	–
Time of Lowest Sample	System time when the lowest value in the 50-probe sample was received.	–
Highest Value	Longest round-trip time from the Juniper Networks device to the remote server, as measured over the 50-probe sample.	–
Time of Highest Sample	System time when the highest value in the 50-probe sample was received.	–
Cumulative Jitter for a Probe		
Samples	Total number of probes used for the data set.	The Juniper Networks device maintains records of the most recent 50 probes for each configured test. These 50 probes are used to generate RPM statistics for a particular test.
Earliest Sample	System time when the first probe in the sample was received.	–
Latest Sample	System time when the last probe in the sample was received.	–
Mean Value	Average jitter for the 50-probe sample.	–
Standard Deviation	Standard deviation of the jitter values for the 50-probe sample.	–
Lowest Value	Smallest jitter value, as measured over the 50-probe sample.	–
Time of Lowest Sample	System time when the lowest value in the 50-probe sample was received.	–
Highest Value	Highest jitter value, as measured over the 50-probe sample.	–

IP Monitoring Overview

This feature monitors IP on standalone SRX Series devices or a chassis cluster redundant Ethernet (reth) interface. Existing RPM probes are sent to an IP address to check for reachability. The user takes action based on the reachability result. Supported action currently is preferred static route injection to system route table.

The actions supported are:

- Adding or deleting a new static route that has a higher priority (lower preference) value than a route configured through the CLI command **set routing-options static route**
- Defining multiple probe names under the same IP monitoring policy. If any probe fails, the action is taken. If all probes are reachable, the action is reverted
- Configuring multiple tests in one RPM probe. All tests must fail for the RPM probe to be considered unreachable. If at least one test reaches its target, the RPM probe is considered reachable
- Configuring multiple failure thresholds in one RPM test. If one threshold is reached, the test fails. If no thresholds are reached, the test succeeds.
- Specifying the no-preempt option. If the no-preempt option is specified, the policy does not perform preemptive failback when it is in a failover state or when the RPM probe test recovers from a failure.

- Setting preferred metric values. If the preferred metric value is set, during failover, the route is injected with the set preferred metric value.
- Enabling and disabling interfaces.
 - **Interface-Enable** – On a physical or logical interface, when the interface-enable action is configured, the initial state of the interface is disable after startup, and it continues to remain in the disable state as long as the associated RPM probe is in the pass state. When the associated RPM probe fails, the configured physical and logical interfaces are enabled.
 - **Interface-Disable** – On a physical or logical interface, when the interface-disable action is configured, the interface state remains unchanged. When the associated RPM probe fails, the physical and logical interfaces are disabled.

NOTE: Multiple probe names and actions can be defined for the same IP monitoring policy.

Related Documentation

- [Understanding IP Monitoring Test Parameters on page 1363](#)

Understanding IP Monitoring Test Parameters

Each probed target is monitored over the course of a test, which represents a collection of probes during which statistics such as standard deviation and jitter are collected are calculated. During a test, probes are generated and responses collected at a rate defined by the probe interval, the number of seconds between probes.

NOTE: To avoid flap, an action is reverted only at the end of a test cycle. During the test cycle, if no threshold is reached, the action is reverted. Although action-failover takes place based on a predefined condition of a monitored IP, when the condition is reversed, the IP becomes reachable on the original route, and the newly added route is deleted. Recovery is performed only when all RPM probes report the IP as reachable.

[Table 129 on page 1363](#) lists the test parameters and its default values:

Table 129: Test Parameters and Default Values

Parameter	Default Value
probe-count	1
probe-interval	3 seconds
test-interval	1 second

[Table 130 on page 1364](#) lists the supported threshold and its description:

Table 130: Threshold Supported and Description

Threshold	Description
Successive-Loss	Successive loss count of probes
Total-Loss	Total probe lost count

Related Documentation

- [IP Monitoring Overview on page 1362](#)

Example: Configuring IP Monitoring on Branch SRX Series Devices

This example shows how to monitor IP on branch SRX Series devices.

- [Requirements on page 1364](#)
- [Overview on page 1364](#)
- [Configuration on page 1364](#)
- [Verification on page 1366](#)

Requirements

Before you begin:

Configure the following RPM options for RPM test:

- target-address
- probe-count
- probe-interval
- test-interval
- thresholds
- next-hop

Overview

This example shows how to set up IP monitoring on an SRX Series for the branch device.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, past them into a text file, remove any line breaks, change any details to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set services rpm probe Probe-Payment-Server test paysvr target address 1.1.1.10
set services rpm probe Probe-Payment-Server test paysvr probe-count 10
set services rpm probe Probe-Payment-Server test paysvr probe-interval 5
set services rpm probe Probe-Payment-Server test paysvr test-interval 5
set services rpm probe Probe-Payment-Server test paysvr thresholds successive-loss 10
set services rpm probe Probe-Payment-Server test paysvr next-hop 2.2.2.1
```

```
set services ip-monitoring policy Payment-Server-Tracking match rpm-probe
Probe-Payment-Server
set services ip-monitoring policy Payment-Server-Tracking then preferred-route route
1.1.1.0/24 next-hop 1.1.1.99
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure IP monitoring on an SRX Series Services Gateway:

1. Configure the target address under the RPM probe.

```
[edit ]
user@host# set services rpm probe Probe-Payment-Server test paysvr target address
1.1.1.10
```
2. Configure the probe count under the RPM probe.

```
[edit ]
user@host# set services rpm probe Probe-Payment-Server test paysvr probe-count
10
```
3. Configure the probe interval (in seconds) under the RPM probe.

```
[edit ]
user@host# set services rpm probe Probe-Payment-Server test paysvr probe-interval
5
```
4. Configure the test interval (in seconds) under the RPM probe.

```
[edit ]
user@host# set services rpm probe Probe-Payment-Server test paysvr test-interval
5
```
5. Configure the threshold successive loss count under the RPM

```
[edit ]
user@host# set services rpm probe Probe-Payment-Server test paysvr thresholds
successive-loss 10
```
6. Configure the next-hop IP address under the RPM probe.

```
[edit ]
user@host# set services rpm probe Probe-Payment-Server test paysvr next-hop
2.2.2.1
```
7. Configure the IP monitoring policy under services.

```
[edit ]
user@host# set services ip-monitoring policy Payment-Server-Tracking match
rpm-probe Probe-Payment-Server
```

NOTE: The following steps are not mandatory. You can configure interface actions and route actions independently, or you can configure both the interface action and the route action together in one IP monitoring policy.

8. Configure the IP monitoring preferred route under services.

```
[edit ]
user@host# set services ip-monitoring policy Payment-Server-Tracking then
preferred-route route 1.1.1.0/24 preferred-metric 4
```

9. Configure the IP monitoring interface actions.

- Enable

```
[edit ]
user@host# set services ip-monitoring policy Payment-Server-Tracking then
interface ge-0/0/1 enable
```

- Disable

```
[edit ]
user@host# set services ip-monitoring policy Payment-Server-Tracking then
interface fe-0/0/[4-6] disable
```

10. Configure the no-preempt option.

```
[edit ]
user@host# set services ip-monitoring policy Payment-Server-Tracking no-preempt
```

Verification

Verifying IP Monitoring

Purpose Verify the IP monitoring status of a policy.

Action To verify the configuration is working properly, enter the following command:

```
show services ip-monitoring status <policy-name>
```

Understanding IP Monitoring Through Redundant Ethernet Interface Link Aggregation Groups

IP monitoring checks the reachability of an upstream device. It is designed to check the end-to-end connectivity of configured IP addresses and allows a redundancy group (RG) to automatically failover when the monitored IP address is not reachable through the redundant Ethernet. Both the primary and secondary devices in the chassis cluster monitor specific IP addresses to determine whether an upstream device in the network is reachable.

A redundant Ethernet interface contains physical interfaces from both the primary and secondary nodes in the SRX Series chassis cluster. In a redundant Ethernet interface, two physical interfaces are configured with each node contributing one physical interface. In a redundant Ethernet interface LAG, more than two physical interfaces are configured in the redundant Ethernet interface.

- Related Documentation**
- [IP Monitoring Overview on page 1362](#)

Example: Configuring IP Monitoring on High-End SRX Series Devices

This example shows how to monitor IP on a high-end SRX Series device with chassis cluster enabled.

- [Requirements on page 1367](#)
- [Overview on page 1367](#)
- [Configuration on page 1368](#)
- [Verification on page 1370](#)

Requirements

- You need two SRX5800 Services Gateways with identical hardware configurations, one SRX Series device (SRX650 in this example), and one EX8208 Ethernet Switch.
- Physically connect the two SRX5800 devices (back-to-back for the fabric and control ports) and ensure that they are the same models. Configure/add these two devices in a cluster.

Overview

IP address monitoring checks end-to-end reachability of configured IP address and allows a redundancy group to automatically fail over when not reachable through the child link of redundant Ethernet interface (known as a reth) interface. Redundancy groups on both devices in a cluster can be configured to monitor specific IP addresses to determine whether an upstream device in the network is reachable.

This example shows how to set up IP monitoring on a high-end SRX Series device.

NOTE: IP monitoring is not supported on an NP-IOC card.

Topology

[Figure 58 on page 1368](#) shows the topology used in this example.

Figure 58: IP Monitoring on a High-End SRX Series Device Topology Example

In this example, two SRX5800 devices in a chassis cluster are connected to an SRX650 device through an EX8208 Ethernet Switch. The example shows how the redundancy groups can be configured to monitor key upstream resources reachable through redundant Ethernet interfaces on either node in a cluster.

Configuration

- [Configuring IP Monitoring on a High-End SRX Series Device on page 1369](#)

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set chassis cluster reth-count 1
set chassis cluster redundancy-group 0 node 0 priority 254
set chassis cluster redundancy-group 0 node 1 priority 1
set chassis cluster redundancy-group 1 node 0 priority 200
set chassis cluster redundancy-group 1 node 1 priority 199
set chassis cluster redundancy-group 1 ip-monitoring global-weight 255
set chassis cluster redundancy-group 1 ip-monitoring global-threshold 80
set chassis cluster redundancy-group 1 ip-monitoring retry-interval 3
set chassis cluster redundancy-group 1 ip-monitoring retry-count 10
set chassis cluster redundancy-group 1 ip-monitoring family inet 111.111.111.111
weight 80
set chassis cluster redundancy-group 1 ip-monitoring family inet 111.111.111.111
interface reth0.0 secondary-ip-address 12.1.1.3
set interfaces ge-0/0/1 gigether-options redundant-parent reth0
```

```

set interfaces ge-4/0/1 gigether-options redundant-parent reth0
set interfaces reth0 redundant-ether-options redundancy-group 1
set interfaces reth0 unit 0 family inet address 12.1.1.1/24
set routing-options static route 111.111.111.111/32 next-hop 12.1.1.2

```

Configuring IP Monitoring on a High-End SRX Series Device

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure IP monitoring on a high-end SRX Series device:

1. Specify the number of redundant Ethernet interfaces.

```

{primary:node0}[edit]
user@host# set chassis cluster reth-count 1

```
2. Specify a redundancy group's priority for primacy on each node of the cluster. The higher number takes precedence.

```

{primary:node0}[edit]
user@host# set chassis cluster redundancy-group 0 node 0 priority 254
user@host# set chassis cluster redundancy-group 0 node 1 priority 1
user@host# set chassis cluster redundancy-group 1 node 0 priority 200
user@host# set chassis cluster redundancy-group 1 node 1 priority 199

```
3. Configure the redundant Ethernet interfaces to redundancy-group 1.

```

{primary:node0}[edit]
user@host# set interfaces reth0 redundant-ether-options redundancy-group 1
user@host# set interfaces reth0 unit 0 family inet address 12.1.1.1/24

```
4. Assign child interfaces for the redundant Ethernet interfaces from node 0 and node 1.

```

{primary:node0}[edit]
user@host# set interfaces ge-0/0/1 gigether-options redundant-parent reth0
user@host# set interfaces ge-4/0/1 gigether-options redundant-parent reth0

```
5. Configure the static route to the IP address that is to be monitored.

```

{primary:node0}[edit]
user@host# set routing-options static route 111.111.111.111/32 next-hop 12.1.1.2

```
6. Configure IP monitoring under redundancy-group 1 with global weight and global threshold.

```

{primary:node0}[edit]
user@host# set chassis cluster redundancy-group 1 ip-monitoring global-weight 255
user@host# set chassis cluster redundancy-group 1 ip-monitoring global-threshold 80

```
7. Specify the retry interval.

```

{primary:node0}[edit]
user@host# set chassis cluster redundancy-group 1 ip-monitoring retry-interval 3

```
8. Specify the retry count.

```

{primary:node0}[edit]

```

```
user@host# set chassis cluster redundancy-group 1 ip-monitoring retry-count 10
```

9. Assign a weight to the IP address to be monitored, and configure a secondary IP address that will be used to send ICMP packets from the secondary node to track the IP being monitored.

```
{primary:node0}[edit]
```

```
user@host# set chassis cluster redundancy-group 1 ip-monitoring family inet  
111.111.111.111 weight 80
```

```
user@host# set chassis cluster redundancy-group 1 ip-monitoring family inet  
111.111.111.111 interface reth0.0 secondary-ip-address 12.1.1.3
```

NOTE:

- The redundant Ethernet (reth0) IP address, 12.1.1.1/24, is used to send ICMP packets from node 0 to check the reachability of the monitored IP.
- The secondary IP address, 12.1.1.3, should belong to the same network as the reth0 IP address.
- The secondary IP address is used to send ICMP packets from node 1 to check the reachability of the monitored IP.

Verification

Confirm the configuration is working properly.

- [Verifying Chassis Cluster Status—Before Failover on page 1370](#)

Verifying Chassis Cluster Status—Before Failover

Purpose Verify the chassis cluster status, failover status, and redundancy group information before failover.

Action From operational mode, enter the **show chassis cluster status** command.

```
show chassis cluster status
```

```
Cluster ID: 11
Node          Priority      Status    Preempt  Manual failover

Redundancy group: 0 , Failover count: 0
  node0        254         primary   no       no
  node1         1         secondary no       no

Redundancy group: 1 , Failover count: 0
  node0        200         primary   no       no
  node1        199         secondary no       no
```

Verifying Chassis Cluster IP Monitoring Status—Before Failover

Purpose Verify the IP status being monitored from both nodes and the failover count for both nodes before failover.

Action From operational mode, enter the **show chassis cluster ip-monitoring status redundancy-group 1** command.

```
show chassis cluster ip-monitoring status redundancy-group 1
```

```
node0:
```

```
Redundancy group: 1
```

IP address	Status	Failure count	Reason
111.111.111.111	reachable	0	n/a

```
node1:
```

```
Redundancy group: 1
```

IP address	Status	Failure count	Reason
111.111.111.111	reachable	0	n/a

Verifying Chassis Cluster Status—After Failover

Purpose Verify the chassis cluster status, failover status, and redundancy group information after failover.

NOTE: If the IP address is not reachable, the following output will be displayed.

Action From operational mode, enter the **show chassis cluster status** command.

```
show chassis cluster status
```

```
Cluster ID: 11
Node          Priority      Status    Preempt  Manual failover

Redundancy group: 0 , Failover count: 0
  node0        254        primary    no        no
  node1         1        secondary  no        no

Redundancy group: 1 , Failover count: 1
  node0         0        secondary  no        no
  node1        199        primary    no        no
```

Verifying Chassis Cluster IP Monitoring Status—After Failover

Purpose Verify the IP status being monitored from both nodes and the failover count for both nodes after failover.

Action From operational mode, enter the **show chassis cluster ip-monitoring status redundancy-group 1** command.

```
show chassis cluster ip-monitoring status redundancy-group 1
```

```
node0:
```

```
Redundancy group: 1
```

IP address	Status	Failure count	Reason
111.111.111.111	unreachable	1	unknown

```
node1:
```

```
Redundancy group: 1
```

IP address	Status	Failure count	Reason
111.111.111.111	reachable	0	n/a

Example: Configuring Chassis Cluster Redundancy Group IP Address Monitoring

This example shows how to configure redundancy group IP address monitoring for an SRX Series device in chassis cluster.

- [Requirements on page 1373](#)
- [Overview on page 1373](#)
- [Configuration on page 1373](#)
- [Verification on page 1375](#)

Requirements

Before you begin:

- Set the chassis cluster node ID and cluster ID. See *Example: Setting the Chassis Cluster Node ID and Cluster ID for Branch SRX Series Devices* or *Example: Setting the Chassis Cluster Node ID and Cluster ID for High-End SRX Series Devices*.
- Configure the chassis cluster management interface. See *Example: Configuring the Chassis Cluster Management Interface*.
- Configure the chassis cluster fabric. See *Example: Configuring the Chassis Cluster Fabric Interfaces*.

Overview

You can configure redundancy groups to monitor upstream resources by pinging specific IP addresses that are reachable through redundant Ethernet interfaces on either node in a cluster. You can also configure global threshold, weight, retry interval, and retry count parameters for a redundancy group. When a monitored IP address becomes unreachable, the weight of that monitored IP address is deducted from the redundancy group IP address monitoring global threshold. When the global threshold reaches 0, the global weight is deducted from the redundancy group threshold. The retry interval determines the ping interval for each IP address monitored by the redundancy group. The pings are sent as soon as the configuration is committed. The retry count sets the number of allowed consecutive ping failures for each IP address monitored by the redundancy group.

In this example, you configure the following settings for redundancy group 1:

- IP address to monitor—10.1.1.10
- IP address monitoring global-weight—100
- IP address monitoring global-threshold—200

NOTE: The threshold applies cumulatively to all IP addresses monitored by the redundancy group.

- IP address retry-interval—3 seconds
- IP address retry-count—10
- Weight—150
- Redundant Ethernet interface—reth1.0
- Secondary IP address—10.1.1.101

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
{primary:node0}[edit]
user@host#
set chassis cluster redundancy-group 1 ip-monitoring global-weight 100
set chassis cluster redundancy-group 1 ip-monitoring global-threshold 200
set chassis cluster redundancy-group 1 ip-monitoring retry-interval 3
set chassis cluster redundancy-group 1 ip-monitoring retry-count 10
set chassis cluster redundancy-group 1 ip-monitoring family inet 10.1.1.10 weight 150
interface reth1.0 secondary-ip-address 10.1.1.101
```

Step-by-Step Procedure

To configure redundancy group IP address monitoring:

1. Specify a global monitoring weight.

```
{primary:node0}[edit]
user@host# set chassis cluster redundancy-group 1 ip-monitoring global-weight 100
```

2. Specify the global monitoring threshold.

```
{primary:node0}[edit]
user@host# set chassis cluster redundancy-group 1 ip-monitoring global-threshold 200
```

3. Specify the retry interval.

```
{primary:node0}[edit]
user@host# set chassis cluster redundancy-group 1 ip-monitoring retry-interval 3
```

4. Specify the retry count.

```
{primary:node0}[edit]
user@host# set chassis cluster redundancy-group 1 ip-monitoring retry-count 10
```

5. Specify the IP address to be monitored, weight, redundant Ethernet interface, and secondary IP address.

```
{primary:node0}[edit]
user@host# set chassis cluster redundancy-group 1 ip-monitoring family inet 10.1.1.10 weight 100 interface reth1.0 secondary-ip-address 10.1.1.101
```

Results

From configuration mode, confirm your configuration by entering the **show chassis cluster redundancy-group 1** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
{primary:node0}[edit]
user@host# show chassis cluster redundancy-group 1
ip-monitoring {
  global-weight 100;
  global-threshold 200;
  family {
    inet {
      10.1.1.10 {
        weight 100;
        interface reth1.0 secondary-ip-address 10.1.1.101;
      }
    }
  }
}
```

```

    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Verifying the Status of Monitored IP Addresses for a Redundancy Group

Purpose Verify the status of monitored IP addresses for a redundancy group.

Action From operational mode, enter the **show chassis cluster ip-monitoring status** command. For information about a specific group, enter the **show chassis cluster ip-monitoring status redundancy-group** command.

```

{primary:node0}
user@host> show chassis cluster ip-monitoring status
node0:

```

```

-----
Redundancy group: 1
Global threshold: 200
Current threshold: -120

```

IP address	Status	Failure count	Reason	Weight
10.1.1.10	reachable	0	n/a	220
10.1.1.101	reachable	0	n/a	100

```

node1:

```

```

-----
Redundancy group: 1
Global threshold: 200
Current threshold: -120

```

IP address	Status	Failure count	Reason	Weight
10.1.1.10	reachable	0	n/a	220
10.1.1.101	reachable	0	n/a	100

- [Displaying Real-Time Monitoring Information on page 1378](#)

Displaying Multicast Path Information

To display information about a multicast path from a source to the device, enter the **mtrace from-source** command with the following syntax:

```
user@host> mtrace from-source source host <extra-hops number> <group address>
<interval seconds> <max-hops number> <max-queries number> <response host>
<routing-instance routing-instance-name> <ttl number> <wait-time seconds> <loop>
<multicast-response | unicast-response> <no-resolve> <no-router-alert> <brief |
detail>
```

[Table 131 on page 1376](#) describes the **mtrace from-source** command options.

Table 131: CLI mtrace from-source Command Options

Option	Description
source host	Traces the path to the specified hostname or IP address.
extra-hops number	(Optional) Sets the number of extra hops to trace past nonresponsive devices. Specify a value from 0 through 255.
group address	(Optional) Traces the path for the specified group address. The default value is 0.0.0.0.
interval seconds	(Optional) Sets the interval between statistics gathering. The default value is 10.
max-hops number	(Optional) Sets the maximum number of hops to trace toward the source. Specify a value from 0 through 255. The default value is 32.
max-queries number	(Optional) Sets the maximum number of query attempts for any hop. Specify a value from 1 through 32. The default value is 3.
response host	(Optional) Sends the response packets to the specified hostname or IP address. By default, the response packets are sent to the device.
routing-instance routing-instance-name	(Optional) Traces the routing instance you specify.

Table 131: CLI mtrace from-source Command Options (*continued*)

Option	Description
ttl number	(Optional) Sets the time-to-live (TTL) value in the IP header of the query packets. Specify a hop count from 0 through 255 . The default value for local queries to the all routers multicast group is 1. Otherwise, the default value is 127 .
wait-time seconds	(Optional) Sets the time to wait for a response packet. The default value is 3 seconds.
loop	(Optional) Loops indefinitely, displaying rate and loss statistics. To quit the mtrace command, press Ctrl-C.
multicast-response	(Optional) Forces the responses to use multicast.
unicast-response	(Optional) Forces the response packets to use unicast.
no-resolve	(Optional) Does not display hostnames.
no-router-alert	(Optional) Does not use the device alert IP option in the IP header.
brief	(Optional) Does not display packet rates and losses.
detail	(Optional) Displays packet rates and losses if a group address is specified.

The following is sample output from the **mtrace from-source** command:

```

user@host> mtrace from-source source 192.1.4.1 group 224.1.1.1

Mtrace from 192.1.4.1 to 192.1.30.2 via group 224.1.1.1 Querying full reverse
path... * * 0 ? (192.1.30.2) -1 ? (192.1.30.1) PIM thresh^ 1 -2

(192.1.4.1) Round trip time 22 ms; total ttl of 2 required. Waiting to accumulate
statistics...Results after 10 seconds:
Source Response Dest Overall
Packet Statistics For Traffic From 192.1.4.1 192.1.30.2 Packet
192.1.4.1 To 224.1.1.1 v ___/ rtt 16 ms Rate Lost/Sent =
Pct Rate 192.168.195.37 192.1.40.2 routerC.mycompany.net v ^
ttl 2 0/0 = -- 0 pps 192.1.40.1 192.1.30.1
? v \_ ttl 3 ?/0
0 pps 192.1.30.2 192.1.30.2 Receiver Query Source

```

Each line of the trace display is usually in the following format (depending on the options selected and the responses from the devices along the path):

hop-number host (ip-address) protocolttl

Table 132 on page 1378 summarizes the output fields of the display.

NOTE: The packet statistics gathered from Juniper Networks devices and routing nodes always display as 0.

Table 132: CLI mtrace from-source Command Output Summary

Field	Description
<i>hop-number</i>	Number of the hop (device) along the path.
<i>host</i>	Hostname, if available, or IP address of the device. If the no-resolve option was entered in the command, the hostname is not displayed.
<i>ip-address</i>	IP address of the device.
<i>protocol</i>	Protocol used.
<i>ttl</i>	TTL threshold.
Round trip time <i>milliseconds ms</i>	Total time between the sending of the query packet and the receiving of the response packet.
total ttl of <i>number</i> required	Total number of hops required to reach the source.
Source	Source IP address of the response packet.
Response Dest	Response destination IP address.
Overall	Average packet rate for all traffic at each hop.
Packet Statistics For Traffic From	Number of packets lost, number of packets sent, percentage of packets lost, and average packet rate at each hop.
Receiver	IP address receiving the multicast packets.
Query Source	IP address of the host sending the query packets.

[Displaying Real-Time Monitoring Information](#)

To display real-time monitoring information about each device between the device and a specified destination host, enter the **traceroute monitor** command with the following syntax:

```
user@host> traceroute monitor host <count number> <inet | inet6> <interval seconds>
<no-resolve> <size bytes> <source source-address> <summary>
```

[Table 133 on page 1378](#) describes the **traceroute monitor** command options.

Table 133: CLI traceroute monitor Command Options

Option	Description
<i>host</i>	Sends traceroute packets to the hostname or IP address you specify.

Table 133: CLI traceroute monitor Command Options (*continued*)

Option	Description
count <i>number</i>	(Optional) Limits the number of ping requests, in packets, to send in summary mode. If you do not specify a count, ping requests are continuously sent until you press Q.
inet	(Optional) Forces the traceroute packets to an IPv4 destination.
inet6	(Optional) Forces the traceroute packets to an IPv6 destination.
interval <i>seconds</i>	(Optional) Sets the interval between ping requests, in seconds. The default value is 1 second.
no-resolve	(Optional) Suppresses the display of the hostnames of the hops along the path.
size <i>bytes</i>	(Optional) Sets the size of the ping request packet. The size can be from 0 through 65,468 bytes. The default packet size is 64 bytes.
source <i>address</i>	(Optional) Uses the source address that you specify, in the traceroute packet.
summary	(Optional) Displays the summary traceroute information.

To quit the **traceroute monitor** command, press Q.

The following is sample output from a **traceroute monitor** command:

```

user@host> traceroute monitor host2

                                     My traceroute  [v0.69]

PDUs processed	Number of SCCP ALG protocol data units (PDUs) processed.	—
Current call rate	Number of calls per second.	—
Error counters		
Packets dropped	Number of packets dropped by the SCCP ALG.	—
Decode errors	SCCP ALG decoding errors.	—
Protocol errors	Number of protocol errors.	—

Table 140: Summary of Key SCCP Counters Output Fields (*continued*)

Field	Values	Additional Information
Address translation errors	Number of Network Address Translation (NAT) errors encountered by SCCP ALG.	—
Policy lookup errors	Number of packets dropped because of a failed policy lookup.	—
Unknown PDUs	Number of unknown protocol data units (PDUs).	—
Maximum calls exceed	Number of times the maximum SCCP calls limit was exceeded.	—
Maximum call rate exceed	Number of times the maximum SCCP call rate exceeded.	—
Initialization errors	Number of initialization errors.	—
Internal errors	Number of internal errors.	—
Unsupported feature	Number of unsupported feature errors.	—
Non specific error	Number of nonspecific errors.	—

Monitoring SIP ALGs

This section contains the following topics:

- [Monitoring SIP ALG Calls on page 1387](#)
- [Monitoring SIP ALG Counters on page 1388](#)
- [Monitoring SIP ALG Rate Information on page 1390](#)
- [Monitoring SIP ALG Transactions on page 1391](#)

Monitoring SIP ALG Calls

Purpose View information about SIP ALG calls.

Action Select **Monitor>ALGs>SIP>Calls** in the J-Web user interface. To view detailed information, select the Call Leg on the SIP calls page.

Alternatively, enter the **show security alg sip calls detail** command.

[Table 141 on page 1388](#) summarizes key output fields in the SIP calls display.

Table 141: Summary of Key SIP Calls Output Fields

Field	Values	Additional Information
SIP Calls Information		
Call Leg	Call length identifier.	—
Zone	Client zone identifier.	—
RM Group	Resource manager group identifier.	—
Local Tag	Local tag for the SIP ALG User Agent server.	—
Remote Tag	Remote tag for the SIP ALG User Agent server.	—

Monitoring SIP ALG Counters

Purpose View SIP ALG counters information.

Action Select **Monitor>ALGs>SIP>Count** in the J-Web user interface, or enter the **show security alg sip counters** command.

[Table 142 on page 1388](#) summarizes key output fields in the SIP counters display.

Table 142: Summary of Key SIP Counters Output Fields

Field	Values	Additional Information
SIP Counters Information		
INVITE	Number of INVITE requests sent.	An INVITE request is sent to invite another user to participate in a session.
CANCEL	Number of CANCEL requests sent.	A user can send a CANCEL request to cancel a pending INVITE request. A CANCEL request has no effect if the SIP server processing the INVITE had sent a final response for the INVITE before it received the CANCEL.
ACK	Number of ACK requests sent.	The user from whom the INVITE originated sends an ACK request to confirm reception of the final response to the INVITE request.
BYE	Number of BYE requests sent.	A user sends a BYE request to abandon a session. A BYE request from either user automatically terminates the session.

Table 142: Summary of Key SIP Counters Output Fields (*continued*)

Field	Values	Additional Information
REGISTER	Number of REGISTER requests sent.	A user sends a REGISTER request to a SIP registrar server to inform it of the current location of the user. A SIP registrar server records all the information it receives in REGISTER requests and makes this information available to any SIP server attempting to locate a user.
OPTIONS	Number of OPTIONS requests sent.	An OPTION message is used by the User Agent (UA) to obtain information about the capabilities of the SIP proxy. A server responds with information about what methods, session description protocols, and message encoding it supports.
INFO	Number of INFO requests sent.	An INFO message is used to communicate mid-session signaling information along the signaling path for the call.
MESSAGE	Number of MESSAGE requests sent.	SIP messages consist of requests from a client to a server and responses to the requests from a server to a client with the purpose of establishing a session (or a call).
NOTIFY	Number of NOTIFY requests sent.	A NOTIFY message is sent to inform subscribers of changes in state to which the subscriber has a subscription.
REFER	Number of REFER requests sent.	A REFER request is used to refer the recipient (identified by the Request-URI) to a third party by the contact information provided in the request.
SUBSCRIBE	Number of SUBSCRIBE requests sent.	A SUBSCRIBE request is used to request current state and state updates from a remote node.
UPDATE	Number of UPDATE requests sent.	An UPDATE request is used to create a temporary opening in the firewall (pinhole) for new or updated Session Description Protocol (SDP) information. The following header fields are modified: Via, From, To, Call-ID, Contact, Route, and Record-Route.
SIP Error Counters		
Total Pkt-in	SIP ALG total packets received.	—
Total Pkt dropped on error	Number of packets dropped by the SIP ALG.	—
Transaction error	SIP ALG transaction errors.	—
Call error	SIP ALG call errors.	—

Table 142: Summary of Key SIP Counters Output Fields (*continued*)

Field	Values	Additional Information
IP resolve error	SIP ALG IP address resolution errors.	—
NAT error	SIP ALG NAT errors.	—
Resource manager error	SIP ALG resource manager errors.	—
RR header exceeded max	Number of times the SIP ALG RR (Record-Route) headers exceeded the maximum limit.	—
Contact header exceeded max	Number of times the SIP ALG contact header exceeded the maximum limit.	—
Call dropped due to limit	SIP ALG calls dropped because of call limits.	—
SIP stack error	SIP ALG stack errors.	—

Monitoring SIP ALG Rate Information

Purpose View SIP ALG rate information.

Action Select **Monitor>ALGs>SIP>Rate** in the J-Web user interface, or enter the **show security alg sip rate** command.

[Table 143 on page 1390](#) summarizes key output fields in the SIP rate display.

Table 143: Summary of Key SIP Rate Output Fields

Field	Values	Additional Information
SIP Rate Information		
CPU ticks per microseconds is	SIP ALG CPU ticks per microsecond.	—
Time taken for the last message in microseconds is	Time, in microseconds, that the last SIP ALG message needed to transit the network.	—
Number of messages in 10 minutes	Total number of SIP ALG messages transiting the network in 10 minutes.	—

Table 143: Summary of Key SIP Rate Output Fields (*continued*)

Field	Values	Additional Information
Time taken by the messages in 10 minutes	Total time, in microseconds, during an interval of less than 10 minutes for the specified number of SIP ALG messages to transit the network.	–
Rate	Number of SIP ALG messages per second transiting the network.	–

Monitoring SIP ALG Transactions

Purpose View information about SIP ALG transactions.

Action Select **Monitor>ALGs>SIP>Transactions** in the J-Web user interface, or enter the **show security alg sip transactions** command.

[Table 144 on page 1391](#) summarizes key output fields in the SIP transactions display.

Table 144: Summary of Key SIP Transactions Output Fields

Field	Values	Additional Information
SIP Transactions Information		
Transaction Name	<ul style="list-style-type: none"> • UAS—SIP ALG User Agent server transaction name. • UAC—SIP ALG User Agent client transaction name. 	–
Method	<p>The method to be performed on the resource. Possible methods:</p> <ul style="list-style-type: none"> • INVITE—Initiate call • ACK—Confirm final response • BYE—Terminate and transfer call • CANCEL—Cancel searches and “ringing” • OPTIONS—Features support by the other side • REGISTER—Register with location service 	–

Monitoring Voice ALG H.323

Purpose Use the monitoring functionality to view the ALG H.323 page.

Action To monitor ALG H.323 select **Monitor>Security>Voice ALGs>H.323** in the J-Web user interface.

Meaning [Table 145 on page 1392](#) summarizes key output fields in the ALG H.323 page.

Table 145: ALG H.323 Monitoring Page

Field	Value	Additional Information
Virtual Chassis Member	Display the list of virtual chassis member.	Select one of the virtual chassis members listed.
Refresh Interval (30 sec)	Displays the time interval set for page refresh.	Select the time interval from the drop-down list.
Refresh	Displays the option to refresh the page.	—
Clear	Provides an option to clear the monitor summary.	Click clear to clear the monitor summary.

H.323 Counter Summary

Category	Displays the following categories: <ul style="list-style-type: none"> • Packets received—Number of ALG H.323 packets received. • Packets dropped—Number of ALG H.323 packets dropped. • RAS message received—Number of incoming RAS (Registration, Admission, and Status) messages per second per gatekeeper received and processed. • Q.931 message received—Counter for Q.931 message received. • H.245 message received—Counter for H.245 message received. • Number of calls—Total number of ALG H.323 calls. • Number of active calls—Number of active ALG H.323 calls. • Number of DSCP Marked—Number of DSCP Marked on ALG H.323 calls. 	—
Count	Provides count of response codes for each H.323 counter summary category.	—

H.323 Error Counter

Category	Displays the following categories: <ul style="list-style-type: none"> • Decoding errors—Number of decoding errors. • Message flood dropped—Error counter for message flood dropped. • NAT errors—H.323 ALG NAT errors. • Resource manager errors—H.323 ALG resource manager errors. • DSCP Marked errors—H.323 ALG DSCP marked errors. 	—
Count	Provides count of response codes for each H.323 error counter category.	—

Counter Summary Chart

Table 145: ALG H.323 Monitoring Page (*continued*)

Field	Value	Additional Information
Packets Received	Provides the graphical representation of the packets received.	—
H.323 Message Counter		
Category	Displays the following categories: <ul style="list-style-type: none"> • RRQ—Registration Request message counter. • RCF—Registration Confirmation Message. • ARQ—Admission Request message counter. • ACF—Admission Confirmation • URQ—Unregistration Request. • UCF—Unregistration Confirmation. • DRQ—Disengage Request. • DCF—Disengage Confirmation. • Oth RAS—Other incoming Registration, Admission, and Status messages message counter. • Setup—Timeout value, in seconds, for the response of the outgoing setup message. • Alert—Alert message type. • Connect—Connect setup process. • CallProd—Number of call production messages sent. • Info—Number of info requests sent. • RelCmpl—Number of Rel Cmpl message ssent. • Facility—Number of facility messages sent. • Empty—Empty capabilities to the support message counter. • OLC—Open Local Channel message counter. • OLC ACK—Open Local Channel Acknowledge message counter. • Oth H245—Other H.245 message counter 	—
Count	Provides count of response codes for each H.323 message counter category.	—

Monitoring Voice ALG MGCP

Purpose Use the monitoring functionality to view the voice ALG MGCP page.

Action To monitor ALG MGCP, select **Monitor>Security>Voice ALGs>MGCP** in the J-Web user interface.

Meaning Table 146 on page 1394 summarizes key output fields in the voice ALG MGCP page.

Table 146: Voice ALG MGCP Monitoring Page

Field	Value	Additional Information
Virtual Chassis Member	Displays the list of virtual chassis member.	Select one of the virtual chassis members listed.
Refresh Interval (30 sec)	Displays the time interval set for page refresh.	Select the time interval from the drop-down list.
Refresh	Displays the option to refresh the page.	—
Clear	Provides an option to clear the monitor summary.	Click Clear to clear the monitor summary.

Counters

MGCP Counters Summary

Category	Displays the following categories: <ul style="list-style-type: none"> • Packets Received—Number of ALG MGCP packets received. • Packets Dropped— Number of ALG MGCP packets dropped. • Message received— Number of ALG MGCP messages received. • Number of connections— Number of ALG MGCP connections. • Number of active connections— Number of active ALG MGCP connections. • Number of calls— Number of ALG MGCP calls. • Number of active calls— Number of active ALG MGCP calls. • Number of active transactions— Number of active transactions. • Number of transactions— Number of transactions. • Number of re-transmission—Number of ALG MGCP retransmissions. • Number of active endpoints— Number of MGCP active endpoints. • Number of DSCP marked— Number of MGCP DSCPs marked. 	—
Count	Provides the count of response codes for each MGCP counter summary category.	—

Table 146: Voice ALG MGCP Monitoring Page (*continued*)

Field	Value	Additional Information
MGCP Error Counter		
Category	Displays the following categories: <ul style="list-style-type: none"> • Unknown-method— MGCP ALG unknown method errors. • Decoding error— MGCP ALG decoding errors. • Transaction error— MGCP ALG transaction errors. • Call error— MGCP ALG call ounter errors. • Connection error— MGCP ALG connection errors. • Connection flood drop— MGCP ALG connection flood drop errors. • Message flood drop— MGCP ALG message flood drop error. • IP resolve error— MGCP ALG IP address resolution errors. • NAT error— MGCP ALG NAT errors. • Resource manager error— MGCP ALG resource manager errors. • DSCP Marked error— MGCP ALG DSCP marked errors. 	—
Count	Provides the count of response codes for each summary error counter category.	—
Counter Summary Chart	Displays the Counter Summary Chart.	—
MGCP Packet Counters		
Category	Displays the following categories: <ul style="list-style-type: none"> • CRCX— Create Connection • MDCX— Modify Connection • DLCX— Delete Connection • AUEP— Audit Endpoint • AUCX— Audit Connection • NTFY— Notify MGCP • RSIP— Restart in Progress • EPCF— Endpoint Configuration • RQNT— Request for Notification • 000-199—Respond code is 0-199 • 200-299—Respond code is 200-299 • 300-399—Respond code is 300-399 	—
Count	Provides count of response codes for each MGCP packet counter category.	—

Table 146: Voice ALG MGCP Monitoring Page (*continued*)

Field	Value	Additional Information
Calls		
Endpoint@GW	Displays the endpoint name.	—
Zone	Displays the following options: <ul style="list-style-type: none"> • trust—Trust zone. • untrust—Untrust zone. 	—
Endpoint IP	Displays the endpoint IP address.	—
Call ID	Displays the call identifier for ALG MGCP.	—
RM Group	Displays the resource manager group ID.	—
Call Duration	Displays the duration for which connection is active.	—

Counters

SIP Counters Information

Table 148: Voice ALG SIP Monitoring Page (*continued*)

Field	Value	Additional Information
Method	<p>Displays the SIP counter information. The available options are:</p> <ul style="list-style-type: none"> • BYE— Number of BYE requests sent. A user sends a BYE request to abandon a session. A BYE request from either user automatically terminates the session. • REGISTER— Number of REGISTER requests sent. A user sends a REGISTER request to a SIP registrar server to inform it of the current location of the user. The SIP registrar server records all the information it receives in REGISTER requests and makes this information available to any SIP server attempting to locate a user. • OPTIONS— Number of OPTIONS requests sent. An OPTION message is used by the User Agent (UA) to obtain information about the capabilities of the SIP proxy. A server responds with information about what methods, session description protocols, and message encoding it supports. • INFO— Number of INFO requests sent. An INFO message is used to communicate mid-session signaling information along the signaling path for the call. • MESSAGE— Number of MESSAGE requests sent. SIP messages consist of requests from a client to the server and responses to the requests from the server to a client for the purpose of establishing a session (or a call). 	—

SIP Counters Information (*continued*)

Table 148: Voice ALG SIP Monitoring Page (*continued*)

Field	Value	Additional Information
Method	<ul style="list-style-type: none"> • NOTIFY— Number of NOTIFY requests sent. A NOTIFY message is sent to inform subscribers about the change in state of the subscription. • PRACK— Number of PRACK requests sent. The PRACK request plays the same role as the ACK request, but for provisional responses. • PUBLISH— Number of PUBLISH requests sent. The PUBLISH request is used for publishing the event state. PUBLISH is similar to REGISTER that allows a user to create, modify, and remove state in another entity which manages this state on behalf of the user. • REFER— Number of REFER requests sent. A REFER request is used to refer the recipient (identified by the Request-URI) to a third party identified by the contact information provided in the request. • SUBSCRIBE— Number of SUBSCRIBE requests sent. A SUBSCRIBE request is used to request current state and state information updates from a remote node. • UPDATE— Number of UPDATE requests sent. An UPDATE request is used to create a temporary opening in the firewall (pinhole) for new or updated Session Description Protocol (SDP) information. The following header fields are modified: Via, From, To, Call-ID, Contact, Route, and Record-Route. • BENOTIFY— Number of BENOTIFY requests sent. A BENOTIFY request is used to reduce the unnecessary SIP signaling traffic on application servers. Applications that do not need a response for a NOTIFY request can enhance performance by enabling BENOTIFY. • SERVICE— Number of SERVICE requests sent. The SERVICE method is used by a SIP client to request a service from a SIP server. It is a standard SIP message and will be forwarded until it reaches the server or end user that is performing the service. • OTHER— Number of OTHER requests sent. 	—
T, RT	Displays the transmit and retransmit method.	—
1xx, RT	Displays one transmit and retransmit method.	—
2xx, RT	Displays two transmit and retransmit methods.	—
3xx, RT	Displays three transmit and retransmit methods.	—
4xx, RT	Displays four transmit and retransmit methods.	—
5xx, RT	Displays five transmit and retransmit methods.	—
6xx, RT	Displays six transmit and retransmit methods.	—
Calls		
Call ID	Displays the call ID.	—

Table 148: Voice ALG SIP Monitoring Page (*continued*)

Field	Value	Additional Information
Method	Displays the call method used.	—
State	Displays the state of the ALG SIP.	—
Group ID	Displays the group identifier.	—
Invite Method Chart	Displays the invite method chart. The available options are: <ul style="list-style-type: none">• T/RT• 1xx/ RT• 2xx/ RT• 3xx/ RT• 4xx/ RT• 5xx/ RT• 6xx/ RT	—

SIP Error Counters

Table 148: Voice ALG SIP Monitoring Page (*continued*)

Field	Value	Additional Information
Category	<p>Displays the SIP error counters. The available options are:</p> <ul style="list-style-type: none"> • Total Pkt-in— Number of SIP ALG total packets received. • Total Pkt dropped on error— Number of packets dropped by the SIP ALG. • Call error— SIP Number of ALG call errors. • IP resolve error— Number of SIP ALG IP address resolution errors. • NAT error— SIP Number of ALG NAT errors. • Resource manager error— Number of SIP ALG resource manager errors. • RR header exceeded max— Number of times the SIP ALG RR (Record-Route) headers exceeded the maximum limit. • Contact header exceeded max— Number of times the SIP ALG contact header exceeded the maximum limit. • Call dropped due to limit— Number of SIP ALG calls dropped because of call limits. • SIP stack error— Number of SIP ALG stack errors. • SIP Decode error— Number of SIP ALG decode errors. • SIP unknown method error— Number of SIP ALG unknow method errors. • SIP DSCP marked—SIP ALG DSCP marked. • SIP DSCP marked error— Number of SIP ALG DSCPs marked. • RTO message sent— Number of SIP ALG marked RTO messages sent. • RTO message received— Number of SIP ALG RTO messages received. • RTO buffer allocation failure— Number of SIP ALG RTO buffer allocation failures. • RTO buffer transmit failure— Number of SIP ALG RTO buffer transmit failures. • RTO send processing error— Number of SIP ALG RTO send processing errors. • RTO receiving processing error— Number of SIP ALG RTO receiving processing errors. • RTO receive invalid length— Number of SIP ALG RTOs receiving invalid length. • RTO receive call process error— Number of SIP ALG RTO receiving call process errors. • RTO receive call allocation error— Number of SIP ALG RTO receiving call allocation error. • RTO receive call register error— Number of SIP ALG RTO receiving call register errors. • RTO receive invalid status error— Number of SIP ALG RTO receiving register errors. 	—
Count	Provides count of response codes for each SIP ALG counter category.	—

Monitoring Class-of-Service

- [Monitoring Class-of-Service Performance on page 1405](#)
- [Monitoring CoS Classifiers on page 1411](#)

Monitoring Class-of-Service Performance

The J-Web user interface provides information about the class-of-service (CoS) performance on a device. You can view information about the current status of CoS components—classifiers, CoS value aliases, red drop profiles, forwarding classes, rewrite rules and scheduler maps. You can also see the interfaces to which these components are assigned.

In addition, you can display the entire CoS configuration, including system-chosen defaults, by entering the **show class-of-service** command.

This section contains the following topics:

- [Monitoring CoS Interfaces on page 1405](#)
- [Monitoring CoS Classifiers on page 1406](#)
- [Monitoring CoS Value Aliases on page 1407](#)
- [Monitoring CoS RED Drop Profiles on page 1408](#)
- [Monitoring CoS Forwarding Classes on page 1408](#)
- [Monitoring CoS Rewrite Rules on page 1409](#)
- [Monitoring CoS Scheduler Maps on page 1410](#)

Monitoring CoS Interfaces

Purpose Display details about the physical and logical interfaces and the CoS components assigned to them.

Action Select **Monitor>Class of Service>Interfaces** in the J-Web user interface, or enter the **show class-of-service interface *interface*** command.

[Table 150 on page 1405](#) summarizes key output fields for CoS interfaces.

Table 150: Summary of Key CoS Interfaces Output Fields

Field	Values	Additional Information
Interface	Name of a physical interface to which CoS components are assigned.	To display names of logical interfaces configured on this physical interface, click the plus sign (+).

Table 150: Summary of Key CoS Interfaces Output Fields (*continued*)

Field	Values	Additional Information
Scheduler Map	Name of the scheduler map associated with this interface.	–
Queues Supported	Number of queues you can configure on the interface.	–
Queues in Use	Number of queues currently configured.	–
Logical Interface	Name of a logical interface on the physical interface, to which CoS components are assigned.	–
Object	Category of an object—for example, classifier , scheduler-map , or rewrite .	–
Name	Name that you have given to an object—for example, ba-classifier .	–
Type	Type of an object—for example, dscp , or exp for a classifier.	–
Index	Index of this interface or the internal index of a specific object.	–

Monitoring CoS Classifiers

Purpose Display the mapping of incoming CoS value to forwarding class and loss priority.

Action For each classifier, select **Monitor>Class of Service>Classifiers** in the J-Web user interface, or enter the **show class-of-service classifier** command.

Table 151 on page 1406 summarizes key output fields for CoS classifiers.

Table 151: Summary of Key CoS Classifier Output Fields

Classifier Name	Name of a classifier.	To display classifier assignments, click the plus sign (+).
CoS Value Type	<p>The classifiers are displayed by type:</p> <ul style="list-style-type: none"> • dscp—All classifiers of the DSCP type. • dscp ipv6—All classifiers of the DSCP IPv6 type. • exp—All classifiers of the MPLS EXP type. • ieee-802.1—All classifiers of the IEEE 802.1 type. • inet-precedence—All classifiers of the IP precedence type. 	

Table 151: Summary of Key CoS Classifier Output Fields (*continued*)

Index	Internal index of the classifier.
Incoming CoS Value	CoS value of the incoming packets, in bits. These values are used for classification.
Assign to Forwarding Class	Forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the device.
Assign to Loss Priority	Loss priority value that the classifier assigns to the incoming packet based on its CoS value.

Monitoring CoS Value Aliases

Purpose Display information about the CoS value aliases that the system is currently using to represent DSCP, DSCP IPv6, MPLS EXP, and IPv4 precedence bits.

Action Select **Monitor>Class of Service>CoS Value Aliases** in the J-Web user interface, or enter the **show class-of-service code-point-aliases** command.

Table 152 on page 1407 summarizes key output fields for CoS value aliases.

Table 152: Summary of Key CoS Value Alias Output Fields

Field	Values	Additional Information
CoS Value Type	Type of the CoS value: <ul style="list-style-type: none"> dscp—Examines Layer 3 packet headers for IP packet classification. dscp ipv6—Examines Layer 3 packet headers for IPv6 packet classification. exp—Examines Layer 2 packet headers for MPLS packet classification. ieee-802.1—Examines Layer 2 packet header for packet classification. inet-precedence—Examines Layer 3 packet headers for IP packet classification. 	To display aliases and bit patterns, click the plus sign (+).
CoS Value Alias	Name given to a set of bits—for example, af11 is a name for 001010 bits.	—
Bit Pattern	Set of bits associated with an alias.	—

Monitoring CoS RED Drop Profiles

Purpose Display data point information for each CoS random early detection (RED) drop profile currently on a system.

Action Select **Monitor>Class of Service>RED Drop Profiles** in the J-Web user interface, or enter the **show class-of-service drop-profile** command.

Table 153 on page 1408 summarizes key output fields for CoS RED drop profiles.

Table 153: Summary of Key CoS RED Drop Profile Output Fields

Field	Values	Additional Information
RED Drop Profile Name	Name of the RED drop profile. A drop profile consists of pairs of values between 0 and 100, one for queue buffer fill level and one for drop probability, that determine the relationship between a buffer's fullness and the likelihood it will drop packets.	To display profile values, click the plus sign (+).
Graph RED Profile	Link to a graph of a RED curve that the system uses to determine the drop probability based on queue buffer fullness.	The x axis represents the queue buffer fill level, and the y axis represents the drop probability.
Type	Type of a specific drop profile: <ul style="list-style-type: none"> interpolated—The two coordinates (x and y) of the graph are interpolated to produce a smooth profile. segmented—The two coordinates (x and y) of the graph are represented by line fragments to produce a segmented profile. 	—
Index	Internal index of this drop profile.	—
Fill Level	Percentage fullness of a buffer queue. This value is the x coordinate of the RED drop profile graph.	—
Drop Probability	Drop probability of a packet corresponding to a specific queue buffer fill level. This value is the y coordinate of the RED drop profile graph.	—

Monitoring CoS Forwarding Classes

Purpose View the current assignment of CoS forwarding classes to queue numbers on the system.

Action Select **Monitor>Class of Service>Forwarding Classes** in the J-Web user interface, or enter the **show class-of-service forwarding-class** command.

Table 154 on page 1409 summarizes key output fields for CoS forwarding classes.

Table 154: Summary of Key CoS Forwarding Class Output Fields

Field	Values	Additional Information
Forwarding Class	Names of forwarding classes assigned to queue numbers. By default, the following forwarding classes are assigned to queues 0 through 3: <ul style="list-style-type: none"> • best-effort—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value, and RED drop profiles are more aggressive. • expedited-forwarding—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service. • assured-forwarding—Provides high assurance for packets within specified service profile. Excess packets are dropped. • network-control—Packets can be delayed but not dropped. 	—
Queue	Queue number corresponding to the forwarding class name.	By default, four queues, 0 through 3, are assigned to forwarding classes.

Monitoring CoS Rewrite Rules

Purpose Display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

Action Select **Monitor>Class of Service>Rewrite Rules** in the J-Web user interface, or enter the **show class-of-service rewrite-rules** command.

Table 155 on page 1409 summarizes key output fields for CoS rewrite rules.

Table 155: Summary of Key CoS Rewrite Rules Output Fields

Field	Values	Additional Information
Rewrite Rule Name	Names of rewrite rules.	—
CoS Value Type	Rewrite rule type: <ul style="list-style-type: none"> • dscp—For IPv4 DiffServ traffic. • dscp-ipv6—For IPv6 DiffServ traffic. • exp—For MPLS traffic. • ieee-802.1—For Layer 2 traffic. • inet-precedence—For IPv4 traffic. 	To display forwarding classes, loss priorities, and rewritten CoS values, click the plus sign (+).
Index	Internal index for this particular rewrite rule.	—

Table 155: Summary of Key CoS Rewrite Rules Output Fields (*continued*)

Field	Values	Additional Information
Forwarding Class	Forwarding class that in combination with loss priority is used to determine CoS values for rewriting.	Rewrite rules are applied to CoS values in outgoing packets based on forwarding class and loss priority setting.
Loss Priority	Loss priority that in combination with forwarding class is used to determine CoS values for rewriting.	—
Rewrite CoS Value To	Value that the CoS value is rewritten to.	—

Monitoring CoS Scheduler Maps

Purpose Display assignments of CoS forwarding classes to schedulers.

Action Select **Monitor>Class of Service>Scheduler Maps** in the J-Web user interface, or enter the **show class-of-service scheduler-map** command.

Table 156 on page 1410 summarizes key output fields for CoS scheduler maps.

Table 156: Summary of Key CoS Scheduler Maps Output Fields

Field	Values	Additional Information
Scheduler Map	Name of a scheduler map.	For details, click the plus sign (+).
Index	Index of a specific object—scheduler maps, schedulers, or drop profiles.	—
Scheduler Name	Name of a scheduler.	—
Forwarding Class	Forwarding classes this scheduler is assigned to.	—
Transmit Rate	Configured transmit rate of the scheduler in bits per second (bps). The rate value can be either of the following: <ul style="list-style-type: none"> A percentage—The scheduler receives the specified percentage of the total interface bandwidth. remainder—The scheduler receives the remaining bandwidth of the interface after allocation to other schedulers. 	—
Rate Limit	Rate limiting configuration of the queue: <ul style="list-style-type: none"> none—No rate limiting. exact—The queue transmits at only the configured rate. 	—

Table 156: Summary of Key CoS Scheduler Maps Output Fields (*continued*)

Field	Values	Additional Information
Buffer Size	Delay buffer size in the queue or the amount of transmit delay (in milliseconds). The buffer size can be either of the following: <ul style="list-style-type: none"> • A percentage—The buffer is a percentage of the total buffer allocation. • remainder—The buffer is sized according to what remains after other scheduler buffer allocations. 	—
Priority	Scheduling priority of a queue: <ul style="list-style-type: none"> • high—Packets in this queue are transmitted first. • low—Packets in this queue are transmitted last. • medium-high—Packets in this queue are transmitted after high-priority packets. • medium-low—Packets in this queue are transmitted before low-priority packets. 	—
Drop Profiles	Name and index of a drop profile that is assigned to a specific loss priority and protocol pair.	—
Loss Priority	Packet loss priority corresponding to a drop profile: <ul style="list-style-type: none"> • low—Packet has a low loss priority. • high—Packet has a high loss priority. • medium-low—Packet has a medium-low loss priority. • medium-high—Packet has a medium-high loss priority. 	—
Protocol	Transport protocol corresponding to a drop profile.	—
Drop Profile Name	Name of the drop profile.	—

Monitoring CoS Classifiers

Purpose Display the mapping of incoming CoS value to forwarding class and loss priority.

Action For each classifier, select **Monitor>Class of Service>Classifiers** in the J-Web user interface, or enter the **show class-of-service classifier** command.

Table 151 on page 1406 summarizes key output fields for CoS classifiers.

Table 157: Summary of Key CoS Classifier Output Fields

Classifier Name	Name of a classifier.	To display classifier assignments, click the plus sign (+).
CoS Value Type	The classifiers are displayed by type: <ul style="list-style-type: none"> • dscp—All classifiers of the DSCP type. • dscp ipv6—All classifiers of the DSCP IPv6 type. • exp—All classifiers of the MPLS EXP type. • ieee-802.1—All classifiers of the IEEE 802.1 type. • inet-precedence—All classifiers of the IP precedence type. 	
Index	Internal index of the classifier.	
Incoming CoS Value	CoS value of the incoming packets, in bits. These values are used for classification.	
Assign to Forwarding Class	Forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the device.	
Assign to Loss Priority	Loss priority value that the classifier assigns to the incoming packet based on its CoS value.

Displaying Real-Time Interface Information

Enter the **monitor interface** command to display real-time traffic, error, alarm, and filter statistics about a physical or logical interface:

```
user@host> monitor interface (interface-name | traffic)
```

Replace **interface-name** with the name of a physical or logical interface. If you specify the **traffic** option, statistics for all active interfaces display.

The real-time statistics update every second. The **Current delta** and **Delta** columns display the amount the statistics counters have changed since the **monitor interface** command was entered or since you cleared the delta counters. [Table 158 on page 1413](#) and [Table 159 on page 1413](#) list the keys you use to control the display using the **interface-name** and **traffic** options. (The keys are not case sensitive.)

Table 158: CLI monitor interface Output Control Keys

Key	Action
c	Clears (returns to 0) the delta counters in the Current delta column. The statistics counters are not cleared.
f	Freezes the display, halting the update of the statistics and delta counters.
i	Displays information about a different interface. You are prompted for the name of a specific interface.
n	Displays information about the next interface. The device scrolls through the physical and logical interfaces in the same order in which they are displayed by the show interfaces terse command.
q or ESC	Quits the command and returns to the command prompt.
t	Thaws the display, resuming the update of the statistics and delta counters.

Table 159: CLI monitor interface traffic Output Control Keys

Key	Action
b	Displays the statistics in units of bytes and bytes per second (bps).

Table 159: CLI monitor interface traffic Output Control Keys (*continued*)

Key	Action
c	Clears (returns to 0) the delta counters in the Delta column. The statistics counters are not cleared.
d	Displays the Delta column instead of the rate column—in bps or packets per second (pps).
p	Displays the statistics in units of packets and packets per second (pps).
q or ESC	Quits the command and returns to the command prompt.
r	Displays the rate column—in bps and pps—instead of the Delta column.

The following are sample displays from the **monitor interface** command:

```

user@host> monitor interface fe-0/0/0

host1                               Seconds: 5                               Time: 04:38:40
                                      Delay: 3/0/10

Interface: fe-0/0/0, Enabled, Link is Up
Encapsulation: Ethernet, Speed: 1000mbps
Traffic statistics:
  Input bytes:          885405423 (3248 bps)          [2631]
  Output bytes:         137411893 (3344 bps)          [10243]
  Input packets:        7155064 (2 pps)               [28]
  Output packets:       636071 (1 pps)                [23]
Error statistics:
  Input errors:         0                             [0]
  Input drops:          0                             [0]
  Input framing errors: 0                             [0]
  Policed discards:     0                             [0]
  L3 incompletes:       0                             [0]
  L2 channel errors:    0                             [0]
  L2 mismatch timeouts: 0                             [0]
  Carrier transitions:   1                             [0]
  Output errors:        0                             [0]
  Output drops:         0                             [0]
  Aged packets:         0                             [0]
Active alarms : None
Active defects: None
Input MAC/Filter statistics:
  Unicast packets       73083                         [16]
  Broadcast packets     3629058                       [5]
  Multicast packets     3511364                       [3]
  Oversized frames      0                             [0]
  Packet reject count   0                             [0]
  DA rejects            0                             [0]
  SA rejects            0                             [0]
Output MAC/Filter Statistics:
  Unicast packets       629555                         [28]
  Broadcast packets     6494 Multicast packet          [0]

```

NOTE: The output fields that display when you enter the `monitor interface interface-name` command are determined by the interface you specify.

```
user@host> monitor interface traffic
```

Interface	Link	Input packets	(pps)	Output packets	(pps)
fe-0/0/0	Up	42334	(5)	23306	(3)
fe-0/0/1	Up	587525876	(12252)	589621478	(12891)

Monitoring Address Pools

Purpose Use the monitoring functionality to view the Address Pools page.

Action To monitor Address Pools, select **Monitor>Access>Address Pools** in the J-Web user interface.

Meaning [Table 160 on page 1415](#) summarizes key output fields in the Address Pools page.

Table 160: Address Pools Monitoring Page

Field	Values	Additional Information
Address Pool Properties		
Address Pool Name	Displays the name of the address pool.	-
Network Address	Displays the IP network address of the address pool.	-
Address Ranges	Displays the name, the lower limit, and the upper limit of the address range.	-
Primary DNS	Displays the primary-dns IP address.	-
Secondary DNS	Displays the secondary-dns IP address.	-
Primary WINS	Displays the primary-wins IP address.	-
Secondary WINS	Displays the secondary-wins IP address.	-
Address Pool Address Assignment		
IP Address	Displays the IP address of the address pool.	-
Hardware Address	Displays the hardware MAC address of the address pool.	-

Table 160: Address Pools Monitoring Page (*continued*)

Field	Values	Additional Information
Host/User	Displays the user name using the address pool.	-
Type	Displays the authentication type used by the address pool	The authentication types can be extended authentication (XAuth) or IKE Authentication.

Monitoring Ethernet Switching

Purpose View information about the Ethernet Switching interface details.

Action Select **Monitor>Switching>Ethernet Switching** in the J-Web user interface, or enter the following CLI commands:

- **show ethernet-switching table**
- **show ethernet-switching mac-learning-log**

[Table 161 on page 1416](#) summarizes the Ethernet Switching output fields.

Table 161: Summary of Ethernet Switching Output Fields

Field	Values	Additional Information
VLAN	The VLAN for which Ethernet Switching is enabled.	
MAC Address	The MAC address associated with the VLAN. If a VLAN range has been configured for a VLAN, the output displays the MAC addresses for the entire series of VLANs that were created with that name.	
Type	The type of MAC address. Values are: <ul style="list-style-type: none"> • static—The MAC address is manually created. • learn—The MAC address is learned dynamically from a packet's source MAC address. • flood—The MAC address is unknown and flooded to all members. 	
Age	The time remaining before the entry ages out and is removed from the Ethernet switching table.	
Interfaces	Interface associated with learned MAC addresses or All-members (flood entry).	

Table 161: Summary of Ethernet Switching Output Fields (*continued*)

Field	Values	Additional Information
VLAN-ID	The VLAN ID.	
MAC Address	The learned MAC address.	
Time	Timestamp when the MAC address was added or deleted from the log.	
State	Indicates the MAC address learned on the interface.

[Monitoring GVRP](#)

Purpose Use the monitoring functionality to view the GVRP page.

Action To monitor GVRP select **Monitor>Switching>GVRP** in the J-Web user interface.

Meaning [Table 162 on page 1417](#) summarizes key output fields in the GVRP page.

Table 162: GVRP Monitoring Page

Field	Value	Additional Information
Global GVRP Configuration		
GVRP Status	Displays whether GVRP is enabled or disabled.	—
GVRP Timer	Displays the GVRP timer in millisecond.	—
Join	The number of milliseconds the interfaces must wait before sending VLAN advertisements.	—
Leave	The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message.	—
Leave All	The interval in milliseconds at which Leave All messages are sent on interfaces. Leave All messages maintain current GVRP VLAN membership information in the network.	—
GVRP Interface Details		
Interface Name	The interface on which GVRP is configured.	—

Table 162: GVRP Monitoring Page (*continued*)

Field	Value	Additional Information
Protocol Status	Displays whether GVRP is enabled or disabled.	—

- Related Documentation**

Monitoring Interfaces

Purpose View general information about all physical and logical interfaces for a device.

Action Select **Monitor>Interfaces** in the J-Web user interface. The J-Web Interfaces page displays the following details about each device interface:

- Port—Indicates the interface name.
- Admin Status—Indicates whether the interface is enabled (Up) or disabled (Down).
- Link Status—Indicates whether the interface is linked (Up) or not linked (Down).
- Address—Indicates the IP address of the interface.
- Zone—Indicates whether the zone is an untrust zone or a trust zone.
- Services—Indicates services that are enabled on the device, such as HTTP and SSH.
- Protocols—Indicates protocols that are enabled on the device, such as BGP and IGMP.
- Input Rate graph—Displays interface bandwidth utilization. Input rates are shown in bytes per second.
- Output Rate graph—Displays interface bandwidth utilization. Output rates are shown in bytes per second.
- Error Counters chart—Displays input and output error counters in the form of a bar chart.
- Packet Counters chart—Displays the number of broadcast, unicast, and multicast packet counters in the form of a pie chart. (Packet counter charts are supported only for interfaces that support MAC statistics.)

To change the interface display, use the following options:

- Port for FPC—Controls the member for which information is displayed.
- Start/Stop button—Starts or stops monitoring the selected interfaces.
- Show Graph—Displays input and output packet counters and error counters in the form of charts.
- Pop-up button—Displays the interface graphs in a separate pop-up window.

- **Details**—Displays extensive statistics about the selected interface, including its general status, traffic information, IP address, I/O errors, class-of-service data, and statistics.
- **Refresh Interval**—Indicates the duration of time after which you want the data on the page to be refreshed.
- **Clear Statistics**—Clears the statistics for the selected interface.

Alternatively, you can enter the following **show** commands in the CLI to view interface status and traffic statistics:

- **show interfaces terse**

NOTE: On SRX Series devices, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

- **show interfaces detail**
- **show interfaces extensive**
- **show interfaces *interface-name***

Monitoring MPLS Traffic Engineering Information

This section contains the following topics:

- [Monitoring MPLS Interfaces on page 1419](#)
- [Monitoring MPLS LSP Information on page 1420](#)
- [Monitoring MPLS LSP Statistics on page 1421](#)
- [Monitoring RSVP Session Information on page 1422](#)
- [Monitoring MPLS RSVP Interfaces Information on page 1423](#)

Monitoring MPLS Interfaces

Purpose View the interfaces on which MPLS is configured, including operational state and any administrative groups applied to an interface.

Action Select **Monitor>MPLS>Interfaces** in the J-Web user interface, or enter the **show mpls interface** command.

[Table 163 on page 1420](#) summarizes key output fields in the MPLS interface information display.

Table 163: Summary of Key MPLS Interface Information Output Fields

Field	Values	Additional Information
Interface	Name of the interface on which MPLS is configured.	–
State	State of the specified interface: Up or Dn (down).	–
Administrative groups	Administratively assigned colors of the MPLS link configured on the interface.	–

Monitoring MPLS LSP Information

Purpose View all label-switched paths (LSPs) configured on the services router, including all inbound (ingress), outbound (egress), and transit LSP information.

Action Select **Monitor>MPLS>LSP Information** in the J-Web user interface, or enter the **show mpls lsp** command.

[Table 164 on page 1420](#) summarizes key output fields in the MPLS LSP information display.

Table 164: Summary of Key MPLS LSP Information Output Fields

Field	Values	Additional Information
Ingress LSP	Information about LSPs on the inbound device. Each session has one line of output.	–
Egress LSP	Information about the LSPs on the outbound device. Each session has one line of output.	MPLS learns this information by querying RSVP, which holds all the transit and outbound session information.
Transit LSP	Number of LSPs on the transit routers and the state of these paths.	MPLS learns this information by querying RSVP, which holds all the transit and outbound session information.
To	Destination (outbound device) of the session.	–
From	Source (inbound device) of the session.	–
State	State of the path. It can be Up , Down , or AdminDn .	AdminDn indicates that the LSP is being taken down gracefully.
Rt	Number of active routes (prefixes) installed in the routing table.	For inbound RSVP sessions, the routing table is the primary IPv4 table (inet.0). For transit and outbound RSVP sessions, the routing table is the primary MPLS table (mpls.0).
Active Path	Name of the active path: Primary or Secondary .	This field is used for inbound LSPs only.
P	An asterisk (*) in this column indicates that the LSP is a primary path.	This field is used for inbound LSPs only.

Table 164: Summary of Key MPLS LSP Information Output Fields (*continued*)

Field	Values	Additional Information
LSPname	Configured name of the LSP.	–
Style	RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be FF (fixed filter), SE (shared explicit), or WF (wildcard filter).	This field is used for outbound and transit LSPs only.
Labelin	Incoming label for this LSP.	–
Labelout	Outgoing label for this LSP.	–
Total	Total number of LSPs displayed for the particular type— ingress (inbound), egress (outbound), or transit .	–

Monitoring MPLS LSP Statistics

Purpose Display statistics for LSP sessions currently active on the device, including the total number of packets and bytes forwarded through an LSP.

Action Select **Monitor>MPLS>LSP Statistics** in the J-Web user interface, or enter the **show mpls lsp statistics** command.

NOTE: Statistics are not available for LSPs on the outbound device, because the penultimate device in the LSP sets the label to 0. Also, as the packet arrives at the outbound device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

Table 165 on page 1421 summarizes key output fields in the MPLS LSP statistics display.

Table 165: Summary of Key MPLS LSP Statistics Output Fields

Field	Values	Additional Information
Ingress LSP	Information about LSPs on the inbound device. Each session has one line of output.	–
Egress LSP	Information about the LSPs on the outbound device. Each session has one line of output.	MPLS learns this information by querying RSVP, which holds all the transit and outbound session information.
Transit LSP	Number of LSPs on the transit routers and the state of these paths.	MPLS learns this information by querying RSVP, which holds all the transit and outbound session information.

Table 165: Summary of Key MPLS LSP Statistics Output Fields (*continued*)

Field	Values	Additional Information
To	Destination (outbound device) of the session.	–
From	Source (inbound device) of the session.	–
State	State of the path: Up , Down , or AdminDn .	AdminDn indicates that the LSP is being taken down gracefully.
Packets	Total number of packets received on the LSP from the upstream neighbor.	–
Bytes	Total number of bytes received on the LSP from the upstream neighbor.	–
LSPname	Configured name of the LSP.	–
Total	Total number of LSPs displayed for the particular type— ingress (inbound), egress (outbound), or transit .	–

Monitoring RSVP Session Information

Purpose View information about RSVP-signaled LSP sessions currently active on the device, including inbound (ingress) and outbound (egress) addresses, LSP state, and LSP name.

Action Select **Monitor>MPLS>RSVP Sessions** in the J-Web user interface, or enter the **show rsvp session** command.

[Table 166 on page 1422](#) summarizes key output fields in the RSVP session information display.

Table 166: Summary of Key RSVP Session Information Output Fields

Field	Values	Additional Information
Ingress LSP	Information about inbound RSVP sessions. Each session has one line of output.	–
Egress LSP	Information about outbound RSVP sessions. Each session has one line of output.	MPLS learns this information by querying RSVP, which holds all the transit and outbound session information.
Transit LSP	Information about transit RSVP sessions.	MPLS learns this information by querying RSVP, which holds all the transit and outbound session information.
To	Destination (outbound device) of the session.	–
From	Source (inbound device) of the session.	–

Table 166: Summary of Key RSVP Session Information Output Fields (*continued*)

Field	Values	Additional Information
State	State of the path: Up , Down , or AdminDn .	AdminDn indicates that the LSP is being taken down gracefully.
Rt	Number of active routes (prefixes) installed in the routing table.	For inbound RSVP sessions, the routing table is the primary IPv4 table (inet.0). For transit and outbound RSVP sessions, the routing table is the primary MPLS table (mpls.0).
Style	RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be FF (fixed filter), SE (shared explicit), or WF (wildcard filter).	This field is used for outbound and transit LSPs only.
Labelin	Incoming label for this RSVP session.	—
Labelout	Outgoing label for this RSVP session.	—
LSPname	Configured name of the LSP.	—
Total	Total number of RSVP sessions displayed for the particular type— ingress (inbound), egress (outbound), or transit .	—

Monitoring MPLS RSVP Interfaces Information

Purpose View information about the interfaces on which RSVP is enabled, including the interface name, total bandwidth through the interface, and total current reserved and reservable (available) bandwidth on the interface.

Action Select **Monitor>MPLS>RSVP Interfaces** in the J-Web user interface, or enter the **show rsvp interface** command.

[Table 167 on page 1423](#) summarizes key output fields in the RSVP interfaces information display.

Table 167: Summary of Key RSVP Interfaces Information Output Fields

Field	Values	Additional Information
RSVP Interface	Number of interfaces on which RSVP is active. Each interface has one line of output.	—
Interface	Name of the interface.	—

Table 167: Summary of Key RSVP Interfaces Information Output Fields (*continued*)

Field	Values	Additional Information
State	State of the interface: <ul style="list-style-type: none"> • Disabled—No traffic engineering information is displayed. • Down—The interface is not operational. • Enabled—Displays traffic engineering information. • Up—The interface is operational. 	—
Active resv	Number of reservations that are actively reserving bandwidth on the interface.	—
Subscription	User-configured subscription factor.	—
Static BW	Total interface bandwidth, in bits per second (bps).	—
Available BW	Amount of bandwidth that RSVP is allowed to reserve, in bits per second (bps). It is equal to (static bandwidth X subscription factor).	—
Reserved BW	Currently reserved bandwidth, in bits per second (bps).	—
Highwater mark	Highest bandwidth that has ever been reserved on this interface, in bits per second (bps).	—

Monitoring PPP

- Purpose** Display PPP monitoring information, including PPP address pool information, session status for PPP interfaces, cumulative statistics for all PPP interfaces, and a summary of PPP sessions.

NOTE: PPP monitoring information is available only in the CLI. The J-Web user interface does not include pages for displaying PPP monitoring information.

- Action** Enter the following CLI commands:

- `show ppp address-pool pool-name`
- `show ppp interface interface-name`
- `show ppp statistics`
- `show ppp summary`

Related Documentation

Monitoring PPPoE

Purpose Display the session status for PPPoE interfaces, cumulative statistics for all PPPoE interfaces on the device, and the PPPoE version configured on the device.

Action Select **Monitor>PPPoE** in the J-Web user interface. To view interface-specific properties in the J-Web interface, select the interface name on the PPPoE page.

[Table 168 on page 1425](#) summarizes key output fields in PPPoE displays.

Table 168: Summary of Key PPPoE Output Fields

Field	Values	Additional Information
PPPoE Interfaces		
Interface	Name of the PPPoE interface.	Click the interface name to display PPPoE information for the interface.
State	State of the PPPoE session on the interface.	—
Session ID	Unique session identifier for the PPPoE session.	To establish a PPPoE session, first the device acting as a PPPoE client obtains the Ethernet address of the PPPoE server or access concentrator, and then the client and the server negotiate a unique session ID. This process is referred to as PPPoE active discovery and is made up of four steps: initiation, offer, request, and session confirmation. The access concentrator generates the session ID for session confirmation and sends it to the PPPoE client in a PPPoE Active Discovery Session-Confirmation (PADS) packet.
Service Name	Type of service required from the access concentrator.	Service Name identifies the type of service provided by the access concentrator, such as the name of the Internet service provider (ISP), class, or quality of service.
Configured AC Name	Configured access concentrator name.	—
Session AC Names	Name of the access concentrator.	—

Table 168: Summary of Key PPPoE Output Fields (*continued*)

Field	Values	Additional Information
AC MAC Address	Media access control (MAC) address of the access concentrator.	—
Session Uptime	Number of seconds the current PPPoE session has been running.	—
Auto-Reconnect Timeout	Number of seconds to wait before reconnecting after a PPPoE session is terminated.	—
Idle Timeout	Number of seconds a PPPoE session can be idle without disconnecting.	—
Underlying Interface	Name of the underlying logical Ethernet or ATM interface on which PPPoE is running—for example, ge-0/0/0.1 .	—
PPPoE Statistics		
Active PPPoE Sessions	Total number of active PPPoE sessions.	—
Packet Type	Packets sent and received during the PPPoE session, categorized by packet type and packet error: <ul style="list-style-type: none"> • PADI—PPPoE Active Discovery Initiation packets. • PADO—PPPoE Active Discovery Offer packets. • PADR—PPPoE Active Discovery Request packets. • PADS—PPPoE Active Discovery Session-Confirmation packets. • PADT—PPPoE Active Discovery Terminate packets. • Service Name Error—Packets for which the Service-Name request could not be honored. • AC System Error—Packets for which the access concentrator experienced an error in processing the host request. For example, the host had insufficient resources to create a virtual circuit. • Generic Error—Packets that indicate an unrecoverable error occurred. • Malformed Packet—Malformed or short packets that caused the packet handler to disregard the frame as unreadable. • Unknown Packet—Unrecognized packets. 	—
Sent	Number of the specific type of packet sent from the PPPoE client.	—

Table 168: Summary of Key PPPoE Output Fields (*continued*)

Field	Values	Additional Information
Received	Number of the specific type of packet received by the PPPoE client.	—
Timeout	<p>Information about the timeouts that occurred during the PPPoE session.</p> <ul style="list-style-type: none"> • PADI—Number of timeouts that occurred for the PADI packet. • PADO—Number of timeouts that occurred for the PADO packet. (This value is always 0 and is not supported.) • PADR—Number of timeouts that occurred for the PADR packet. 	—
Sent	Number of the timeouts that occurred for PADI, PADO, and PADR packets.	—
PPPoE Version		
Maximum Sessions	Maximum number of active PPPoE sessions the device can support. The default is 256 sessions.	—
PADI Resend Timeout	Initial time, (in seconds) the device waits to receive a PADO packet for the PADI packet sent—for example, 2 seconds. This timeout doubles for each successive PADI packet sent.	The PPPoE Active Discovery Initiation (PADI) packet is sent to the access concentrator to initiate a PPPoE session. Typically, the access concentrator responds to a PADI packet with a PPPoE Active Discovery Offer (PADO) packet. If the access concentrator does not send a PADO packet, the device sends the PADI packet again after timeout period is elapsed. The PADI Resend Timeout doubles for each successive PADI packet sent. For example, if the PADI Resend Timeout is 2 seconds, the second PADI packet is sent after 2 seconds, the third after 4 seconds, the fourth after 8 seconds, and so on.
PADR Resend Timeout	Initial time (in seconds) the device waits to receive a PADS packet for the PADR packet sent. This timeout doubles for each successive PADR packet sent.	The PPPoE Active Discovery Request (PADR) packet is sent to the access concentrator in response to a PADO packet, and to obtain the PPPoE session ID. Typically, the access concentrator responds to a PADR packet with a PPPoE Active Discovery Session-Confirmation (PADS) packet, which contains the session ID. If the access concentrator does not send a PADS packet, the device sends the PADR packet again after the PADR Resend Timeout period is elapsed. The PADR Resend Timeout doubles for each successive PADR packet sent.
Maximum Resend Timeout	Maximum value (in seconds) that the PADI or PADR resend timer can accept—for example, 64 seconds. The maximum value is 64.	—
Maximum Configured AC Timeout	Time (in seconds), within which the configured access concentrator must respond.	—

Alternatively, enter the following CLI commands:

- **show pppoe interfaces**
- **show pppoe statistics**
- **show pppoe version**

You can also view status information about the PPPoE interface by entering the **show interfaces pp0** command in the CLI editor.

Monitoring Spanning Tree

Purpose Use the monitoring functionality to view the Spanning Tree page.

Action To monitor spanning tree, select **Monitor>Switching>Spanning Tree** in the J-Web user interface.

Meaning [Table 169 on page 1428](#) summarizes key output fields in the spanning tree page.

Table 169: Spanning Tree Monitoring Page

Field	Value	Additional Information
Bridge parameters		
Context ID	An internally generated identifier.	—
Enabled Protocol	Spanning tree protocol type enabled.	—
Root ID	Bridge ID of the elected spanning tree root bridge.	The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.
Bridge ID	Locally configured bridge ID.	—
Inter instance ID	An internally generated instance identifier.	—
Extended system ID	Extended system generated instance identifier.	—
Maximum age	Maximum age of received bridge protocol data units (BPDUs).	—
Number of topology changes	Total number of STP topology changes detected since the switch last booted.	—

Table 169: Spanning Tree Monitoring Page (*continued*)

Field	Value	Additional Information
Forward delay	Spanning tree forward delay.	–
Interface List		
Interface Name	Interface configured to participate in the STP instance.	–
Port ID	Logical interface identifier configured to participate in the STP instance.	–
Designated Port ID	Port ID of the designated port for the LAN segment to which the interface is attached.	–
Port Cost	Configured cost for the interface.	–
State	STP port state. Forwarding (FWD), blocking (BLK), listening, learning, or disabled.	–
Role	MSTP or RSTP port role. Designated (DESG), backup (BKUP), alternate (ALT), or root.	–

Monitoring Source NAT Information

Purpose Display configured information about source Network Address Translation (NAT) rules, pools, persistent NAT, and paired addresses.

Action Select **Monitor>NAT>Source NAT** in the J-Web user interface, or enter the following CLI commands:

- **show security nat source summary**
- **show security nat source pool *pool-name***
- **show security nat source persistent-nat-table**
- **show security nat source paired-address**

[Table 170 on page 1430](#) describes the available options for monitoring source NAT.

Table 170: Source NAT Monitoring Page

Field	Description	Action
Rules		
Rule-set Name	Name of the rule set.	Select all rule sets or a specific rule set to display from the list.
Total rules	Number of rules configured.	—
ID	Rule ID number.	—
Name	Name of the rule .	—
From	Name of the routing instance/zone/interface from which the packet flows.	—
To	Name of the routing instance/zone/interface to which the packet flows.	—
Source address range	Source IP address range in the source pool.	—

Table 170: Source NAT Monitoring Page (*continued*)

Field	Description	Action
Destination address range	Destination IP address range in the source pool.	—
Source ports	Source port numbers.	—
Ip protocol	IP protocol.	—
Action	Action taken for a packet that matches a rule.	—
Persistent NAT type	Persistent NAT type.	—
Inactivity timeout	Inactivity timeout interval for the persistent NAT binding.	—
Alarm threshold	Utilization alarm threshold.	—
Max session number	The maximum number of sessions.	—
Sessions (Succ/ Failed/ Current)	Successful, failed, and current sessions. <ul style="list-style-type: none"> • Succ—Number of successful session installations after the NAT rule is matched. • Failed—Number of unsuccessful session installations after the NAT rule is matched. • Current—Number of sessions that reference the specified rule. 	—
Translation Hits	Number of times a translation in the translation table is used for a source NAT rule.	—
Pools		
Pool Name	The names of the pools.	Select all pools or a specific pool to display from the list.
Total Pools	Total pools added.	—
ID	ID of the pool.	—
Name	Name of the source pool.	—
Address range	IP address range in the source pool.	—

Table 170: Source NAT Monitoring Page (*continued*)

Field	Description	Action
Single/Twin ports	Number of allocated single and twin ports.	—
Port	Source port number in the pool.	—
Address assignment	Displays the type of address assignment.	—
Alarm threshold	Utilization alarm threshold.	—
Port overloading factor	Port overloading capacity.	—
Routing instance	Name of the routing instance.	—
Total addresses	Total IP address, IP address set, or address book entry.	—
Host address base	Host base address of the original source IP address range.	—
Translation hits	Number of times a translation in the translation table is used for source NAT.	—
Top 10 Translation Hits		
Graph	Displays the graph of top 10 translation hits.	—
Persistent NAT		
Persistent NAT table statistics		
binding total	Displays the total number of persistent NAT bindings for the FPC.	—
binding in use	Number of persistent NAT bindings that are in use for the FPC.	—
enode total	Total number of persistent NAT enodes for the FPC.	—
enode in use	Number of persistent NAT enodes that are in use for the FPC.	—
Persistent NAT table		
Source NAT pool	Name of the pool.	Select all pools or a specific pool to display from the list.

Table 170: Source NAT Monitoring Page (*continued*)

Field	Description	Action
Internal IP	Internal IP address.	Select all IP addresses or a specific IP address to display from the list.
Internal port	Displays the internal ports configured in the system.	Select the port to display from the list.
Internal protocol	Internal protocols .	Select all protocols or a specific protocol to display from the list.
Internal IP	Internal transport IP address of the outgoing session from internal to external.	—
Internal port	Internal transport port number of the outgoing session from internal to external.	—
Internal protocol	Internal protocol of the outgoing session from internal to external.	—
Reflective IP	Translated IP address of the source IP address.	—
Reflective port	Displays the translated number of the port.	—
Reflective protocol	Translated protocol.	—
Source NAT pool	Name of the source NAT pool where persistent NAT is used.	—
Type	Persistent NAT type.	—
Left time/Conf time	Inactivity timeout period that remains and the configured timeout value.	—
Current session num/Max session num	Number of current sessions associated with the persistent NAT binding and the maximum number of sessions.	—
Source NAT rule	Name of the source NAT rule to which this persistent NAT binding applies.	—
External node table		
Internal IP	Internal transport IP address of the outgoing session from internal to external.	—

Table 170: Source NAT Monitoring Page (*continued*)

Field	Description	Action
Internal port	Internal port number of the outgoing session from internal to external.	—
External IP	External IP address of the outgoing session from internal to external.	—
External port	External port of the outgoing session from internal to external.	—
Zone	External zone of the outgoing session from internal to external.	—
Paired Address		
Pool name	Name of the pool.	Select all pools or a specific pool to display from the list.
Specified Address	IP address.	Select all addresses, or select the internal or external IP address to display, and enter the IP address.
Pool name	Displays the selected pool or pools.	—
Internal address	Displays the internal IP address.	—
External address	Displays the external IP address.	—
Resource Usage		
Utilization for all source pools		
Pool name	Name of the pool.	To view additional usage information for Port Address Translation (PAT) pools, select a pool name. The information displays under Detail Port Utilization for Specified Pool.
Pool type	Pool type: PAT or Non-PAT.	—
Port overloading factor	Port overloading capacity for PAT pools.	—
Address	Addresses in the pool.	—
Used	Number of used resources in the pool. For Non-PAT pools, the number of used IP addresses is displayed. For PAT pools, the number of used ports is displayed.	—

Table 170: Source NAT Monitoring Page (*continued*)

Field	Description	Action
Available	Number of available resources in the pool. For Non-PAT pools, the number of available IP addresses is displayed. For PAT pools, the number of available ports is displayed.	—
Total	Number of used and available resources in the pool. For Non-PAT pools, the total number of used and available IP addresses is displayed. For PAT pools, the total number of used and available ports is displayed.	—
Usage	Percent of resources used. For Non-PAT pools, the percent of IP addresses used is displayed. For PAT pools, the percent of ports, including single and twin ports, is displayed.	—
Peak usage	Percent of resources used during the peak date and time.	—
Detail Port Utilization for Specified Pool		
Address Name	IP addresses in the PAT pool.	Select the IP address for which you want to display detailed usage information.
Factor-Index	Index number.	—
Port-range	Displays the number of ports allocated at a time.	—
Used	Displays the number of used ports.	—
Available	Displays the number of available ports.	—
Total	Displays the number of used and available ports.	—
Usage	Displays the percentage of ports used during the peak date and time.	—

Monitoring Destination NAT Information

Purpose View the destination Network Address Translation (NAT) summary table and the details of the specified NAT destination address pool information.

Action Select **Monitor>NAT> Destination NAT** in the J-Web user interface, or enter the following CLI commands:

- **show security nat destination summary**
- **show security nat destination pool *pool-name***

[Table 171 on page 1436](#) summarizes key output fields in the destination NAT display.

Table 171: Summary of Key Destination NAT Output Fields

Field	Values	Action
Rules		
Rule-set Name	Name of the rule set.	Select all rule sets or a specific rule set to display from the list.
Total rules	Number of rules configured.	—
ID	Rule ID number.	—
Name	Name of the rule .	—
Ruleset Name	Name of the rule set.	—
From	Name of the routing instance/zone/interface from which the packet flows.	—
Source address range	Source IP address range in the source pool.	—
Destination address range	Destination IP address range in the source pool.	—
Destination port	Destination port in the destination pool.	—
IP protocol	IP protocol.	—
Action	Action taken for a packet that matches a rule.	—
Alarm threshold	Utilization alarm threshold.	—

Table 171: Summary of Key Destination NAT Output Fields (*continued*)

Field	Values	Action
Sessions (Succ/ Failed/ Current)	Successful, failed, and current sessions. <ul style="list-style-type: none"> Succ—Number of successful session installations after the NAT rule is matched. Failed—Number of unsuccessful session installations after the NAT rule is matched. Current—Number of sessions that reference the specified rule. 	—
Translation hits	Number of times a translation in the translation table is used for a destination NAT rule.	—
Pools		
Pool Name	The names of the pools.	Select all pools or a specific pool to display from the list.
Total Pools	Total pools added.	—
ID	ID of the pool.	—
Name	Name of the destination pool.	—
Address range	IP address range in the destination pool.	—
Port	Destination port number in the pool.	—
Routing instance	Name of the routing instance.	—
Total addresses	Total IP address, IP address set, or address book entry.	—
Translation hits	Number of times a translation in the translation table is used for destination NAT.	—
Top 10 Translation Hits		
Graph	Displays the graph of top 10 translation hits.	—

Monitoring Static NAT Information

Purpose View static NAT rule information.

Action Select **Monitor>NAT>Static NAT** in the J-Web user interface, or enter the following CLI command:

show security nat static rule

Table 172 on page 1438 summarizes key output fields in the static NAT display.

Table 172: Summary of Key Static NAT Output Fields

Field	Values	Action
Rule-set Name	Name of the rule set.	Select all rule sets or a specific rule set to display from the list.
Total rules	Number of rules configured.	—
ID	Rule ID number.	—
Position	Position of the rule that indicates the order in which it applies to traffic.	—
Name	Name of the rule.	—
Ruleset Name	Name of the rule set.	—
From	Name of the routing instance/interface/zone from which the packet comes	—
Source addresses	Source IP addresses.	—
Source ports	Source port numbers.	—
Destination addresses	Destination IP address and subnet mask.	—
Destination ports	Destination port numbers .	—
Host addresses	Name of the host addresses.	—
Host ports	Host port numbers.	—
Netmask	Subnet IP address.	—
Host routing instance	Name of the routing instance from which the packet comes.	—
Alarm threshold	Utilization alarm threshold.	—
Sessions (Succ/ Failed/ Current)	Successful, failed, and current sessions. <ul style="list-style-type: none"> • Succ—Number of successful session installations after the NAT rule is matched. • Failed—Number of unsuccessful session installations after the NAT rule is matched. • Current—Number of sessions that reference the specified rule. 	—

Table 172: Summary of Key Static NAT Output Fields (*continued*)

Field	Values	Action
Translation hits	Number of times a translation in the translation table is used for a static NAT rule.	—
Top 10 Translation Hits		
Graph	Displays the graph of top 10 translation hits.	—

Monitoring Incoming Table Information

Purpose View NAT table information.

Action Select **Monitor>NAT>Incoming Table** in the J-Web user interface, or enter the following CLI command:

show security nat incoming-table

[Table 173 on page 1439](#) summarizes key output fields in the incoming table display.

Table 173: Summary of Key Incoming Table Output Fields

Field	Values	Additional Information
Statistics		
In use	Number of entries in the NAT table.	—
Maximum	Maximum number of entries possible in the NAT table.	—
Entry allocation failed	Number of entries failed for allocation.	—
Incoming Table		
Clear		—
Destination	Destination IP address and port number.	—
Host	Host IP address and port number that the destination IP address is mapped to.	—
References	Number of sessions referencing the entry.	—
Timeout	Timeout, in seconds, of the entry in the NAT table.	—
Source-pool	Name of source pool where translation is allocated.	—

Monitoring Interface NAT Port Information

Purpose View port usage for an interface source pool information.

Action Select **Monitor>Firewall/NAT>Interface NAT** in the J-Web user interface, or enter the following CLI command:

- **show security nat interface-nat-ports**

Table 174 on page 1440 summarizes key output fields in the interface NAT display.

Table 174: Summary of Key Interface NAT Output Fields

Field	Values	Additional Information
Interface NAT Summary Table		
Pool Index	Port pool index.	—
Total Ports	Total number of ports in a port pool.	—
Single Ports Allocated	Number of ports allocated one at a time that are in use.	—
Single Ports Available	Number of ports allocated one at a time that are free for use.	—
Twin Ports Allocated	Number of ports allocated two at a time that are in use.	—
Twin Ports Available	Number of ports allocated two at a time that are free for use.	—

- [Monitoring Routing Information on page 1441](#)
- [Monitoring Security Events by Policy on page 1448](#)
- [Monitoring Security Features on page 1450](#)

Monitoring Policy Statistics

Purpose Monitor and record traffic that Junos OS permits or denies based on previously configured policies.

Action To monitor traffic, enable the count and log options.

Count—Configurable in an individual policy. If count is enabled, statistics are collected for sessions that enter the device for a given policy, and for the number of packets and bytes that pass through the device in both directions for a given policy. For counts (only for packets and bytes), you can specify that alarms be generated whenever the traffic exceeds specified thresholds. See *count (Security Policies)*.

Log—Logging capability can be enabled with security policies during session initialization (**session-init**) or session close (**session-close**) stage. See *log (Security Policies)*.

- To view logs from denied connections, enable log on **session-init**.
- To log sessions after their conclusion/tear-down, enable log on **session-close**.

NOTE: Session log is enabled at real time in the flow code which impacts the user performance. If both **session-close** and **session-init** are enabled, performance is further degraded as compared to enabling **session-init** only.

For details about information collected for session logs, see *Information Provided in Session Log Entries for SRX Series Services Gateways*.

Monitoring Routing Information

This section contains the following topics:

- [Monitoring Route Information on page 1441](#)
- [Monitoring RIP Routing Information on page 1443](#)
- [Monitoring OSPF Routing Information on page 1444](#)
- [Monitoring BGP Routing Information on page 1446](#)

Monitoring Route Information

Purpose View information about the routes in a routing table, including destination, protocol, state, and parameter information.

Action Select **Monitor>Routing>Route Information** in the J-Web user interface, or enter the following CLI commands:

- **show route terse**

- **show route detail**

NOTE: When you use an HTTPS connection in the Microsoft Internet Explorer browser to save a report from this page in the J-Web interface, the error message "Internet Explorer was not able to open the Internet site" is displayed. This problem occurs because the Cache-Control: no cache HTTP header is added on the server side and Internet Explorer does not allow you to download the encrypted file with the Cache-Control: no cache HTTP header set in the response from the server.

As a workaround, refer to Microsoft Knowledge Base article 323308, which is available at this URL: <http://support.microsoft.com/kb/323308>. Also, you can alternatively use HTTP in the Internet Explorer browser or use HTTPS in the Mozilla Firefox browser to save a file from this page.

Table 175 on page 1442 describes the different filters, their functions, and the associated actions.

Table 176 on page 1443 summarizes key output fields in the routing information display.

Table 175: Filtering Route Messages

Field	Function	Your Action
Destination Address	Specifies the destination address of the route.	Enter the destination address.
Protocol	Specifies the protocol from which the route was learned.	Enter the protocol name.
Next hop address	Specifies the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.	Enter the next hop address.
Receive protocol	Specifies the dynamic routing protocol using which the routing information was received through a particular neighbor.	Enter the routing protocol.
Best route	Specifies only the best route available.	Select the view details of the best route.
Inactive routes	Specifies the inactive routes.	Select the view details of inactive routes.
Exact route	Specifies the exact route.	Select the view details of the exact route.
Hidden routes	Specifies the hidden routes.	Select the view details of hidden routes.
Search	Applies the specified filter and displays the matching messages.	To apply the filter and display messages, click Search .
Reset	Resets selected options to default	To reset the filter, click Reset .

Table 176: Summary of Key Routing Information Output Fields

Field	Values	Additional Information
Static Route Addresses	The list of static route addresses.	—
Protocol	Protocol from which the route was learned: Static , Direct , Local , or the name of a particular protocol.	—
Preference	The preference is the individual preference value for the route.	The route preference is used as one of the route selection criteria.
Next-Hop	Network Layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.	<p>If a next hop is listed as Discard, all traffic with that destination address is discarded rather than routed. This value generally means that the route is a static route for which the discard attribute has been set.</p> <p>If a next hop is listed as Reject, all traffic with that destination address is rejected. This value generally means that the address is unreachable. For example, if the address is a configured interface address and the interface is unavailable, traffic bound for that address is rejected.</p> <p>If a next hop is listed as Local, the destination is an address on the host (either the loopback address or Ethernet management port 0 address, for example).</p>
Age	How long the route has been active.	—
State	Flags for this route.	There are many possible flags.
AS Path	<p>AS path through which the route was learned. The letters of the AS path indicate the path origin:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • ?—Incomplete. Typically, the AS path was aggregated. 	—

Monitoring RIP Routing Information

Purpose View RIP routing information, including a summary of RIP neighbors and statistics.

Action Select **Monitor>Routing>RIP Information** in the J-Web user interface, or enter the following CLI commands:

- **show rip statistics**
- **show rip neighbors**

[Table 177 on page 1444](#) summarizes key output fields in the RIP routing display in the J-Web user interface.

Table 177: Summary of Key RIP Routing Output Fields

Field	Values	Additional Information
RIP Statistics		
Protocol Name	The RIP protocol name.	—
Port number	The port on which RIP is enabled.	—
Hold down time	The interval during which routes are neither advertised nor updated.	—
Global routes learned	Number of RIP routes learned on the logical interface.	—
Global routes held down	Number of RIP routes that are not advertised or updated during the hold-down interval.	—
Global request dropped	Number of requests dropped.	—
Global responses dropped	Number of responses dropped.	—
RIP Neighbors		
Details	Tab used to view the details of the interface on which RIP is enabled.	—
Neighbor	Name of the RIP neighbor.	This value is the name of the interface on which RIP is enabled. Click the name to see the details for this neighbor.
State	State of the RIP connection: Up or Dn (Down).	—
Source Address	Local source address.	This value is the configured address of the interface on which RIP is enabled.
Destination Address	Destination address.	This value is the configured address of the immediate RIP adjacency.
Send Mode	The mode of sending RIP messages.	—
Receive Mode	The mode in which messages are received.	—
In Metric	Value of the incoming metric configured for the RIP neighbor.	—

Monitoring OSPF Routing Information

Purpose View OSPF routing information, including a summary of OSPF neighbors, interfaces, and statistics.

Action Select **Monitor>Routing>OSPF Information** in the J-Web user interface, or enter the following CLI commands:

- **show ospf neighbors**
- **show ospf interfaces**
- **show ospf statistics**

Table 178 on page 1445 summarizes key output fields in the OSPF routing display in the J-Web user interface.

Table 178: Summary of Key OSPF Routing Output Fields

Field	Values	Additional Information
OSPF Interfaces		
Details	Tab used to view the details of the selected OSPF.	—
Interface	Name of the interface running OSPF.	—
State	State of the interface: BDR , Down , DR , DROther , Loop , PtToPt , or Waiting .	The Down state, indicating that the interface is not functioning, and PtToPt state, indicating that a point-to-point connection has been established, are the most common states.
Area	Number of the area that the interface is in.	—
DR ID	ID of the area's designated device.	—
BDR ID	ID of the area's backup designated device.	—
Neighbors	Number of neighbors on this interface.	—
OSPF Statistics		
Packets tab		
Sent	Displays the total number of packets sent.	—
Received	Displays the total number of packets received.	—
Details tab		
Flood Queue Depth	Number of entries in the extended queue.	—
Total Retransmits	Number of retransmission entries enqueued.	—
Total Database Summaries	Total number of database description packets.	—
OSPF Neighbors		
Address	Address of the neighbor.	—

Table 178: Summary of Key OSPF Routing Output Fields (*continued*)

Field	Values	Additional Information
Interface	Interface through which the neighbor is reachable.	–
State	State of the neighbor: Attempt , Down , Exchange , ExStart , Full , Init , Loading , or 2way .	Generally, only the Down state, indicating a failed OSPF adjacency, and the Full state, indicating a functional adjacency, are maintained for more than a few seconds. The other states are transitional states that a neighbor is in only briefly while an OSPF adjacency is being established.
ID	ID of the neighbor.	–
Priority	Priority of the neighbor to become the designated router.	–
Activity Time	The activity time.	–
Area	Area that the neighbor is in.	–
Options	Option bits received in the hello packets from the neighbor.	–
DR Address	Address of the designated router.	–
BDR Address	Address of the backup designated router.	–
Uptime	Length of time since the neighbor came up.	–
Adjacency	Length of time since the adjacency with the neighbor was established.	–

Monitoring BGP Routing Information

Purpose Monitor BGP routing information on the routing device, including a summary of BGP routing and neighbor information.

Action Select **Monitor>Routing>BGP Information** in the J-Web user interface, or enter the following CLI commands:

- **show bgp summary**
- **show bgp neighbor**

[Table 179 on page 1447](#) summarizes key output fields in the BGP routing display in the J-Web user interface.

Table 179: Summary of Key BGP Routing Output Fields

Field	Values	Additional Information
BGP Peer Summary		
Total Groups	Number of BGP groups.	—
Total Peers	Number of BGP peers.	—
Down Peers	Number of unavailable BGP peers.	—
Unconfigured Peers	Address of each BGP peer.	—
RIB Summary tab		
RIB Name	Name of the RIB group.	—
Total Prefixes	Total number of prefixes from the peer, both active and inactive, that are in the routing table.	—
Active Prefixes	Number of prefixes received from the EBGp peers that are active in the routing table.	—
Suppressed Prefixes	Number of routes received from EBGp peers currently inactive because of damping or other reasons.	—
History Prefixes	History of the routes received or suppressed.	—
Dumped Prefixes	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.	—
Pending Prefixes	Number of pending routes.	—
State	Status of the graceful restart process for this routing table: BGP restart is complete, BGP restart in progress, VPN restart in progress, or VPN restart is complete.	—
BGP Neighbors		
Details	Click this button to view the selected BGP neighbor details.	—
Peer Address	Address of the BGP neighbor.	—
Autonomous System	AS number of the peer.	—

Table 179: Summary of Key BGP Routing Output Fields (*continued*)

Field	Values	Additional Information
Peer State	<p>Current state of the BGP session:</p> <ul style="list-style-type: none"> Active—BGP is initiating a TCP connection in an attempt to connect to a peer. If the connection is successful, BGP sends an open message. Connect—BGP is waiting for the TCP connection to become complete. Established—The BGP session has been established, and the peers are exchanging BGP update messages. Idle—This is the first stage of a connection. BGP is waiting for a Start event. OpenConfirm—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. OpenSent—BGP has sent an open message and is waiting to receive an open message from the peer. 	Generally, the most common states are Active , which indicates a problem establishing the BGP connection, and Established , which indicates a successful session setup. The other states are transition states, and BGP sessions normally do not stay in those states for extended periods of time.
Elapsed Time	Elapsed time since the peering session was last reset.	—
Description	Description of the BGP session.	—

Monitoring Security Events by Policy

Purpose Monitor security events by policy and display logged event details with the J-Web user interface.

- Action**
1. Select **Monitor>Events and Alarms>Security Events** in the J-Web user interface. The View Policy Log pane appears. [Table 180 on page 1448](#) describes the content of this pane.

Table 180: View Policy Log Fields

Field	Value
Log file name	Name of the event log files to search.
Policy name	Name of the policy of the events to be retrieved.
Source address	Source address of the traffic that triggered the event.

Table 180: View Policy Log Fields (*continued*)

Field	Value
Destination address	Destination address of the traffic that triggered the event.
Event type	Type of event that was triggered by the traffic.
Application	Application of the traffic that triggered the event.
Source port	Source port of the traffic that triggered the event.
Destination port	Destination port of the traffic that triggered the event.
Source zone	Source zone of the traffic that triggered the event.
Destination zone	Destination zone of the traffic that triggered the event.
Source NAT rule	Source NAT rule of the traffic that triggered the event.
Destination NAT rule	Destination NAT rule of the traffic that triggered the event.
Is global policy	Specifies that the policy is a global policy.

If your device is not configured to store session log files locally, the Create log configuration button is displayed in the lower-right portion of the View Policy Log pane.

- To store session log files locally, click **Create log configuration**.

If session logs are being sent to an external log collector (stream mode has been configured for log files), a message appears indicating that event mode must be configured to view policy logs.

NOTE: Reverting to event mode will discontinue event logging to the external log collector.

- To reset the **mode** option to **event**, enter the **set security log** command.
2. Enter one or more search fields in the View Policy Log pane and click **Search** to display events matching your criteria.

For example, enter the event type **Session Close** and the policy **pol1** to display event details from all Session Close logs that contain the specified policy. To reduce search results further, add more criteria about the particular event or group of events that you want displayed.

The Policy Events Detail pane displays information from each matching session log. [Table 181 on page 1450](#) describes the contents of this pane.

Table 181: Policy Events Detail Fields

Field	Value
Timestamp	Time when the event occurred.
Policy name	Policy that triggered the event.
Record type	Type of event log providing the data.
Source IP/Port	Source address (and port, if applicable) of the event traffic.
Destination IP/Port	Destination address (and port, if applicable) of the event traffic.
Service name	Service name of the event traffic.
NAT source IP/Port	NAT source address (and port, if applicable) of the event traffic.
NAT destination IP/Port	NAT destination address (and port, if applicable) of the event traffic.

Monitoring Policies

Purpose Display, sort, and review policy activity for every activated policy configured on the device. Policies are grouped by Zone Context (the from and to zones of the traffic) to control the volume of data displayed at one time. From the policy list, select a policy to display statistics and current network activity.

Action To review policy activity:

1. Select **Monitor>Security>Policy>Activities** in the J-Web user interface. The Security Policies Monitoring page appears and lists the policies from the first Zone Context. See [Table 182 on page 1451](#) for field descriptions.
2. Select the **Zone Context** of the policy you want to monitor, and click **Filter**. All policies within the zone context appear in match sequence.
3. Select a policy, and click **Clear Statistics** to set all counters to zero for the selected policy.

Table 182: Security Policies Monitoring Output Fields

Field	Value	Additional Information
Zone Context (Total #)	Displays a list of all from and to zone combinations for the configured policies. The total number of active policies for each context is specified in the Total # field. By default, the policies from the first Zone Context are displayed.	To display policies for a different context, select a zone context and click Filter . Both inactive and active policies appear for each context. However, the Total # field for a context specifies the number of active policies only.
Default Policy action	Specifies the action to take for traffic that does not match any of the policies in the context: <ul style="list-style-type: none"> • permit-all—Permit all traffic that does not match a policy. • deny-all—Deny all traffic that does not match a policy. 	—
From Zone	Displays the source zone to be used as match criteria for the policy.	—
To Zone	Displays the destination zone to be used as match criteria for the policy.	—
Name	Displays the name of the policy.	—
Source Address	Displays the source addresses to be used as match criteria for the policy. Address sets are resolved to their individual names. (In this case, only the names are given, not the IP addresses).	—
Destination Address	Displays the destination addresses (or address sets) to be used as match criteria for the policy. Addresses are entered as specified in the destination zone's address book.	—
Source Identity	Displays the name of the source identities set for the policy.	To display the value of the source identities, hover the mouse on this field. Unknown source identities are also displayed.
Application	Displays the name of a predefined or custom application signature to be used as match criteria for the policy.	—

Table 182: Security Policies Monitoring Output Fields (*continued*)

Field	Value	Additional Information
Dynamic App	<p>Displays the dynamic application signatures to be used as match criteria if an application firewall rule set is configured for the policy.</p> <p>For a network firewall, a dynamic application is not defined.</p>	<p>The rule set appears in two lines. The first line displays the configured dynamic application signatures in the rule set. The second line displays the default dynamic application signature.</p> <p>If more than two dynamic application signatures are specified for the rule set, hover over the output field to display the full list in a tooltip.</p>
Action	<p>Displays the action portion of the rule set if an application firewall rule set is configured for the policy.</p> <ul style="list-style-type: none"> • permit—Permits access to the network services controlled by the policy. A green background signifies permission. • deny—Denies access to the network services controlled by the policy. A red background signifies denial. 	<p>The action portion of the rule set appears in two lines. The first line identifies the action to be taken when the traffic matches a dynamic application signature. The second line displays the default action when traffic does not match a dynamic application signature.</p>
NW Services	<p>Displays the network services permitted or denied by the policy if an application firewall rule set is configured. Network services include:</p> <ul style="list-style-type: none"> • gprs-gtp-profile—Specify a GPRS Tunneling Protocol profile name. • idp—Perform intrusion detection and prevention. • redirect-wx—Set WX redirection. • reverse-redirect-wx—Set WX reverse redirection. • uac-policy—Enable unified access control enforcement of the policy. 	—
Policy Hit Counters Graph	<p>Provides a representation of the value over time for a specified counter. The graph is blank if Policy Counters indicates no data. As a selected counter accumulates data, the graph is updated at each refresh interval.</p>	<p>To toggle a graph on and off, click the counter name below the graph.</p>

Table 182: Security Policies Monitoring Output Fields (*continued*)

Field	Value	Additional Information
Policy Counters	<p>Lists statistical counters for the selected policy if Count is enabled. The following counters are available for each policy:</p> <ul style="list-style-type: none"> • input-bytes • input-byte-rate • output-bytes • output-byte-rate • input-packets • input-packet-rate • output-packets • output-packet-rate • session-creations • session-creation-rate • active-sessions 	To graph or to remove a counter from the Policy Hit Counters Graph, toggle the counter name. The names of enabled counters appear below the graph.

Checking Policies

Purpose Enter match criteria and conduct a policy search. The search results include all policies that match the traffic criteria in the sequence in which they will be encountered.

Because policy matches are listed in the sequence in which they would be encountered, you can determine whether a specific policy is being applied correctly or not. The first policy in the list is applied to all matching traffic. Policies listed after this one remain in the “shadow” of the first policy and are never encountered by this traffic.

By manipulating the traffic criteria and policy sequence, you can tune policy application to suit your needs. During policy development, you can use this feature to establish the appropriate sequence of policies for optimum traffic matches. When troubleshooting, use this feature to determine if specific traffic is encountering the appropriate policy.

Action

1. Select **Monitor>Security>Policy>Shadow Policies** in the J-Web user interface. The Check Policies page appears. [Table 183 on page 1454](#) explains the content of this page.
2. In the top pane, enter the From Zone and To Zone to supply the context for the search.
3. Enter match criteria for the traffic, including the source address and port, the destination address and port, and the protocol of the traffic.
4. Enter the number of matching policies to display.
5. Click **Search** to find policies matching your criteria. The lower pane displays all policies matching the criteria up to the number of policies you specified.
 - The first policy will be applied to all traffic with this match criteria.
 - Remaining policies will not be encountered by any traffic with this match criteria.
6. To manipulate the position and activation of a policy, select the policy and click the appropriate button:

- **Move**—Moves the selected policy up or down to position it at a more appropriate point in the search sequence.
- **Move to**—Moves the selected policy by allowing you to drag and drop it to a different location on the same page.

Table 183: Check Policies Output

Field	Function
Check Policies Search Input Pane	
From Zone	Name or ID of the source zone. If a From Zone is specified by name, the name is translated to its ID internally.
To Zone	Name or ID of the destination zone. If a To Zone is specified by name, the name is translated to its ID internally.
Source Address	Address of the source in IP notation.
Source Port	Port number of the source.
Destination Address	Address of the destination in IP notation.
Destination Port	Port number of the destination.
Source Identity	Name of the source identity.

Table 183: Check Policies Output (*continued*)

Field	Function
Protocol	Name or equivalent value of the protocol to be matched. ah—51 egp—8 esp—50 gre—47 icmp—1 igmp—2 igp—9 ipip—94 ipv6—41 ospf—89 pgm—113 pim—103 rdp—27 rsvp—46 sctp—132 tcp—6 udp—17 vrrp—112
Result Count	(Optional) Number of policies to display. Default value is 1. Maximum value is 16.
Check Policies List	
From Zone	Name of the source zone.
To Zone	Name of the destination zone.
Total Policies	Number of policies retrieved.
Default Policy action	The action to be taken if no match occurs.
Name	Policy name
Source Address	Name of the source address (not the IP address) of a policy. Address sets are resolved to their individual names.

Table 183: Check Policies Output (*continued*)

Field	Function
Destination Address	Name of the destination address or address set. A packet's destination address must match this value for the policy to apply to it.
Source Identity	Name of the source identity for the policy.
Application	Name of a preconfigured or custom application of the policy match.
Action	Action taken when a match occurs as specified in the policy.
Hit Counts	Number of matches for this policy. This value is the same as the Policy Lookups in a policy statistics report.
Active Sessions	Number of active sessions matching this policy.

Alternatively, to list matching policies using the CLI, enter the **show security match-policies** command and include your match criteria and the number of matching policies to display.

Monitoring Screen Counters

Purpose View screen statistics for a specified security zone.

Action Select **Monitor>Security>Screen Counters** in the J-Web user interface, or enter the following CLI command:

show security screen statistics zone zone-name

[Table 184 on page 1456](#) summarizes key output fields in the screen counters display.

Table 184: Summary of Key Screen Counters Output Fields

Field	Values	Additional Information
Zones		
ICMP Flood	Internet Control Message Protocol (ICMP) flood counter.	An ICMP flood typically occurs when ICMP echo requests use all resources in responding, such that valid network traffic can no longer be processed.
UDP Flood	User Datagram Protocol (UDP) flood counter.	UDP flooding occurs when an attacker sends IP packets containing UDP datagrams with the purpose of slowing down the resources, such that valid connections can no longer be handled.
TCP Winnuke	Number of Transport Control Protocol (TCP) WinNuke attacks.	WinNuke is a denial-of-service (DoS) attack targeting any computer on the Internet running Windows.

Table 184: Summary of Key Screen Counters Output Fields (*continued*)

Field	Values	Additional Information
TCP Port Scan	Number of TCP port scans.	The purpose of this attack is to scan the available services in the hopes that at least one port will respond, thus identifying a service to target.
ICMP Address Sweep	Number of ICMP address sweeps.	An IP address sweep can occur with the intent of triggering responses from active hosts.
IP Tear Drop	Number of teardrop attacks.	Teardrop attacks exploit the reassembly of fragmented IP packets.
TCP SYN Attack	Number of TCP SYN attacks.	—
IP Spoofing	Number of IP spoofs.	IP spoofing occurs when an invalid source address is inserted in the packet header to make the packet appear to come from a trusted source.
ICMP Ping of Death	ICMP ping of death counter.	Ping of death occurs when IP packets are sent that exceed the maximum legal length (65,535 bytes).
IP Source Route	Number of IP source route attacks.	—
TCP Land Attack	Number of land attacks.	Land attacks occur when attacker sends spoofed SYN packets containing the IP address of the victim as both the destination and source IP address.
TCP SYN Fragment	Number of TCP SYN fragments.	—
TCP No Flag	Number of TCP headers without flags set.	A normal TCP segment header has at least one control flag set.
IP Unknown Protocol	Number of unknown Internet protocols.	—
IP Bad Options	Number of invalid options.	—
IP Record Route Option	Number of packets with the IP record route option enabled.	This option records the IP addresses of the network devices along the path that the IP packet travels.
IP Timestamp Option	Number of IP timestamp option attacks.	This option records the time (in Universal Time) when each network device receives the packet during its trip from the point of origin to its destination.
IP Security Option	Number of IP security option attacks.	—

Table 184: Summary of Key Screen Counters Output Fields (*continued*)

Field	Values	Additional Information
IP Loose route Option	Number of IP loose route option attacks.	This option specifies a partial route list for a packet to take on its journey from source to destination.
IP Strict Source Route Option	Number of IP strict source route option attacks.	This option specifies the complete route list for a packet to take on its journey from source to destination.
IP Stream Option	Number of stream option attacks.	This option provides a way for the 16-bit SATNET stream identifier to be carried through networks that do not support streams.
ICMP Fragment	Number of ICMP fragments.	Because ICMP packets contain very short messages, there is no legitimate reason for ICMP packets to be fragmented. If an ICMP packet is so large that it must be fragmented, something is amiss.
ICMP Large Packet	Number of large ICMP packets.	—
TCP SYN FIN Packet	Number of TCP SYN FIN packets.	—
TCP FIN without ACK	Number of TCP FIN flags without the acknowledge (ACK) flag.	—
TCP SYN-ACK-ACK Proxy	Number of TCP flags enabled with SYN-ACK-ACK.	To prevent flooding with SYN-ACK-ACK sessions, you can enable the SYN-ACK-ACK proxy protection screen option. After the number of connections from the same IP address reaches the SYN-ACK-ACK proxy threshold, Junos OS rejects further connection requests from that IP address.
IP Block Fragment	Number of IP block fragments.	—

Monitoring IDP Status

Purpose View detailed information about the IDP Status, Memory, Counters, Policy Rulebase Statistics, and Attack table statistics.

Action To view Intrusion Detection and Prevention (IDP) table information, select **Monitor>Security>IDP>Status** in the J-Web user interface, or enter the following CLI commands:

- **show security idp status**
- **show security idp memory**

[Table 185 on page 1459](#) summarizes key output fields in the IDP display.

Table 185: Summary of IDP Status Output Fields

Field	Values	Additional Information
IDP Status		
Status of IDP	Displays the status of the current IDP policy.	—
Up Since	Displays the time from when the IDP policy first began running on the system.	—
Packets/Second	Displays the number of packets received and returned per second.	—
Peak	Displays the maximum number of packets received per second and the time when the maximum was reached.	—
Kbits/Second	Displays the aggregated throughput (kilobits per second) for the system.	—
Peak Kbits	Displays the maximum kilobits per second and the time when the maximum was reached.	—
Latency (Microseconds)	Displays the delay, in microseconds, for a packet to receive and return by a node .	—
Current Policy	Displays the name of the current installed IDP policy.	—
IDP Memory Status		
IDP Memory Statistics	Displays the status of all IDP data plane memory.	—
PIC Name	Displays the name of the PIC.	—
Total IDP Data Plane Memory (MB)	Displays the total memory space, in megabytes, allocated for the IDP data plane.	—
Used (MB)	Displays the used memory space, in megabytes, for the data plane.	—
Available (MB)	Displays the available memory space, in megabytes, for the data plane.	—

Monitoring Flow Gate Information

Purpose View information about temporary openings known as pinholes or gates in the security firewall.

Action Select **Monitor>Security>Flow Gate** in the J-Web user interface, or enter the **show security flow gate** command.

[Table 186 on page 1460](#) summarizes key output fields in the flow gate display.

Table 186: Summary of Key Flow Gate Output Fields

Field	Values	Additional Information
Flow Gate Information		
Hole	Range of flows permitted by the pinhole.	—
Translated	Tuples used to create the session if it matches the pinhole: <ul style="list-style-type: none"> • Source address and port • Destination address and port 	—
Protocol	Application protocol, such as UDP or TCP.	—
Application	Name of the application.	—
Age	Idle timeout for the pinhole.	—
Flags	Internal debug flags for pinhole.	—
Zone	Incoming zone.	—
Reference count	Number of resource manager references to the pinhole.	—
Resource	Resource manager information about the pinhole.	—

Monitoring Firewall Authentication Table

Purpose View information about the authentication table, which divides firewall authentication user information into multiple parts.

Action Select **Monitor>Security>Firewall Authentication>Authentication Table** in the J-Web user interface. To view detailed information about the user with a particular identifier, select the ID on the Authentication Table page. To view detailed information about the user at a particular source IP address, select the Source IP on the Authentication Table page.

Alternatively, enter the following CLI **show** commands:

- **show security firewall-authentication users**
- **show security firewall-authentication users address *ip-address***
- **show security firewall-authentication users identifier *identifier***

[Table 187 on page 1461](#) summarizes key output fields in firewall authentication table display.

Table 187: Summary of Key Firewall Authentication Table Output Fields

Field	Values	Additional Information
Firewall authentication users		
Total users in table	Number of users in the authentication table.	—
Authentication table		
ID	Authentication identification number.	—
Source Ip	IP address of the authentication source.	—
Age	Idle timeout for the user.	—
Status	Status of authentication (success or failure).	—
user	Name of the user.	—
Detailed report per ID selected: <i>ID</i>		
Source Zone	Name of the source zone.	—
Destination Zone	Name of the destination zone.	—
profile	Name of the profile.	Users information.
Authentication method	Path chosen for authentication.	—
Policy Id	Policy Identifier.	—
Interface name	Name of the interface.	—
Bytes sent by this user	Number of packets in bytes sent by this user.	—
Bytes received by this user	Number of packets in bytes received by this user.	—
Client-groups	Name of the client group.	—
Detailed report per Source Ip selected		
Entries from Source IP	IP address of the authentication source.	—
Source Zone	Name of the source zone.	—
Destination Zone	Name of the destination zone.	—
profile	Name of the profile.	—
Age	Idle timeout for the user.	—
Status	Status of authentication (success or failure).	—

Table 187: Summary of Key Firewall Authentication Table Output Fields (*continued*)

Field	Values	Additional Information
user	Name of the user.	—
Authentication method	Path chosen for authentication.	—
Policy Id	Policy Identifier.	—
Interface name	Name of the interface.	—
Bytes sent by this user	Number of packets in bytes sent by this user.	—
Bytes received by this user	Number of packets in bytes received by this user.	—
Client-groups	Name of the client group.	—

Monitoring Firewall Authentication History

Purpose View information about the authentication history, which is divided into multiple parts.

Action Select **Monitor>Security>Firewall Authentication>Authentication History** in the J-Web user interface. To view the detailed history of the authentication with this identifier, select the ID on the Firewall Authentication History page. To view a detailed authentication history of this source IP address, select the Source IP on the Firewall Authentication History page.

Alternatively, enter the following CLI **show** commands:

- **show security firewall-authentication history**
- **show security firewall-authentication history address *ip-address***
- **show security firewall-authentication history identifier *identifier***

[Table 188 on page 1462](#) summarizes key output fields in firewall authentication history display.

Table 188: Summary of Key Firewall Authentication History Output Fields

Field	Values	Additional Information
History of Firewall Authentication Data		
Total authentications	Number of authentication.	—
History Table		
ID	Identification number.	—
Source Ip	IP address of the authentication source.	—

Table 188: Summary of Key Firewall Authentication History Output Fields (*continued*)

Field	Values	Additional Information
Start Date	Authentication date.	—
Start Time	Authentication time.	—
Duration	Authentication duration.	—
Status	Status of authentication (success or failure).	—
User	Name of the user.	—
Detail history of selected Id: ID		
Authentication method	Path chosen for authentication.	—
Policy Id	Security policy identifier.	—
Source zone	Name of the source zone.	—
Destination Zone	Name of the destination zone.	—
Interface name	Name of the interface.	—
Bytes sent by this user	Number of packets in bytes sent by this user.	—
Bytes received by this user	Number of packets in bytes received by this user.	—
Client-groups	Name of the client group.	—
Detail history of selected Source Ip:Source Ip		
User	Name of the user.	—
Start Date	Authentication date.	—
Start Time	Authentication time.	—
Duration	Authentication duration.	—
Status	Status of authentication (success or failure).	—
Profile	Name of the profile.	—
Authentication method	Path chosen for authentication.	—
Policy Id	Security policy identifier.	—
Source zone	Name of the source zone.	—

Table 188: Summary of Key Firewall Authentication History Output Fields (*continued*)

Field	Values	Additional Information
Destination Zone	Name of the destination zone.	–
Interface name	Name of the interface.	–
Bytes sent by this user	Number of packets in bytes sent by this user.	–
Bytes received by this user	Number of packets in bytes received by this user.	–
Client-groups	Name of the client group.	–

Monitoring 802.1x

Purpose View information about 802.1X properties.

Action Select **Monitor>Security>802.1x** in the J-Web user interface, or enter the following CLI commands:

- **show dot1x interfaces *interface-name***
- **show dot1x authentication-failed-users**

[Table 189 on page 1464](#) summarizes the Dot1X output fields.

Table 189: Summary of Dot1X Output Fields

Field	Values	Additional Information
Select Port	List of ports for selection.	–
Number of connected hosts	Total number of hosts connected to the port.	–
Number of authentication bypassed hosts	Total number of authentication-bypassed hosts with respect to the port.	–
Authenticated Users Summary		
MAC Address	MAC address of the connected host.	–
User Name	Name of the user.	–
Status	Information about the host connection status.	–
Authentication Due	Information about host authentication.	–
Authentication Failed Users Summary		
MAC Address	MAC address of the authentication-failed host.	–

Table 189: Summary of Dot1X Output Fields (*continued*)

Field	Values	Additional Information
User Name	Name of the authentication-failed user.	—

Monitoring DHCP Client Bindings

Purpose View information about DHCP client bindings.

Action Select **Monitor>Services>DHCP>Binding** in the J-Web user interface, or enter the **show system services dhcp binding** command.

[Table 190 on page 1465](#) summarizes the key output fields in the DHCP client binding displays.

Table 190: Summary of Key DHCP Client Binding Output Fields

Field	Values	Additional Information
IP Address	List of IP addresses the DHCP server has assigned to clients.	—
Hardware Address	Corresponding media access control (MAC) address of the client.	—
Type	Type of binding assigned to the client: dynamic or static.	—
Lease Expires at	Date and time the lease expires, or never for leases that do not expire.	—

Monitoring Events

Purpose Use the monitoring functionality to view the events page.

Action To monitor events select **Monitor>Events and Alarms>View Events** in the J-Web user interface.

NOTE: When you use an HTTPS connection in the Microsoft Internet Explorer browser to save a report from this page in the J-Web interface, the error message "Internet Explorer was not able to open the Internet site" is displayed. This problem occurs because the Cache-Control: no cache HTTP header is added on the server side and Internet Explorer does not allow you to download the encrypted file with the Cache-Control: no cache HTTP header set in the response from the server.

As a workaround, refer to Microsoft Knowledge Base article 323308, which is available at this URL: <http://support.microsoft.com/kb/323308>. Also, you can alternatively use HTTP in the Internet Explorer browser or use HTTPS in the Mozilla Firefox browser to save a file from this page.

Meaning Table 191 on page 1466 summarizes key output fields in the events page.

Table 191: Events Monitoring Page

Field	Value	Additional Information
Events Filter		
System Log File	Specifies the name of the system log file that records errors and events.	—
Process	Specifies the system processes that generate the events to display.	—
Include archived files	Specifies to enable the option to include archived files.	Select to enable.
Date From	Specifies the beginning date range to monitor. Set the date using the calendar pick tool.	—
To	Specifies the end of the date range to monitor. Set the date using the calendar pick tool.	—
Event ID	Specifies the specific ID of the error or event to monitor.	—
Description	Enter a description for the errors or events.	—
Search	Fetches the errors and events specified in the search criteria.	—
Reset	Clears the cache of errors and events that were previously selected.	—

Table 191: Events Monitoring Page (*continued*)

Field	Value	Additional Information
Generate Report	Creates an HTML report based on the specified parameters.	—
Events Detail		
Process	Displays the system process that generated the error or event.	—
Severity	<p>Displays the severity level that indicates how seriously the triggering event affects routing platform functions. Only messages from the facility that are rated at that level or higher are logged. Possible severities and their corresponding color code are:</p> <ul style="list-style-type: none"> • Debug/Info/Notice (Green)—Indicates conditions that are not errors but are of interest or might warrant special handling. • Warning (Yellow) — Indicates conditions that warrant monitoring. • Error (Blue) — Indicates standard error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels. • Critical (Pink) — Indicates critical conditions, such as hard drive errors. • Alert (Orange) — Indicates conditions that require immediate correction, such as a corrupted system database. • Emergency (Red) — Indicates system panic or other conditions that cause the routing platform to stop functioning. 	—
Event ID	Displays the unique ID of the error or event. The prefix on each code identifies the generating software process. The rest of the code indicates the specific event or error.	—
Event Description	Displays a more detailed explanation of the message.	—
Time	Time that the error or event occurred.	—

Monitoring the System

The J-Web user interface lets you monitor a device's physical characteristics, current processing status and alarms, and ongoing resource utilization to quickly assess the condition of a device at any time.

On SRX Series devices, the **Dashboard** lets you customize your view by selecting which informational panes to include on the Dashboard.

This section contains the following topics:

- [Monitoring System Properties for SRX Series Devices on page 1468](#)
- [Monitoring Chassis Information on page 1470](#)
- [System Health Management for Branch SRX Series Devices on page 1472](#)

Monitoring System Properties for SRX Series Devices

Purpose View system properties and customize the Dashboard.

When you start the J-Web user interface on an SRX Series device, the interface opens to the Dashboard. At the top and bottom of the page, the Dashboard displays an interactive representation of your device and a current log messages pane. By default, the center panes of the Dashboard display System Information, Resource Utilization, Security Resources, and System Alarms. However, you can customize the Dashboard panes to provide the best overview of your system.

Action To control the content and appearance of the Dashboard:

1. Click the **Preferences** icon at the top-right corner of the page. The Dashboard Preference dialog box appears.
2. Select the types of information you want to display.
3. (Optional) Specify the Automatically Refresh Data option to specify how often you want the data on the Dashboard to be refreshed.
4. Click **OK** to save the configuration or **Cancel** to clear it.
5. On the Dashboard, minimize, maximize, or drag the individual information panes to customize the display as needed.

Chassis View—Displays an image of the device chassis, including line cards, link states, errors, individual PICs, FPCs, fans, and power supplies.

You can use the Chassis View to link to corresponding configuration and monitoring pages for the device. To link to interface configuration pages for a selected port from the Chassis View, right-click the port in the device image and choose one of the following options:

- Chassis Information—Links to the Chassis page.
- Configure Port: *Port-name*—Links to the interfaces configuration page for the selected port.

- Monitor Port: *Port-name*—Links to the monitor interfaces page for the selected port.

System Identification—Displays the device's serial number, hostname, current software version, the BIOS version, the amount of time since the device was last booted, and the system's time.

NOTE:

- To view the BIOS version under system identification, delete your browser cookies.
- The hostname that appears in this pane is defined using the `set system hostname` command.

On SRX Series devices, security logs were always timestamped using the UTC time zone by running `set system time-zone utc` and `set security log utc-timestamp` CLI commands. Now, time zone can be defined using the local time zone by running the `set system time-zone time-zone` command to specify the local time zone that the system should use when timestamping the security logs.

Resource Utilization—Provides a graphic representation of resource use. Each bar represents the percentage of CPU, memory, or storage utilization for the data plane or the control plane.

Security Resources—Provides the maximum, configured, and active sessions; firewall and VPN policies; and IPsec VPNs. Click **Sessions**, **FW/VPN Policies**, or **IPsec VPNs** for detailed statistics about each category.

System Alarms—Indicates a missing rescue configuration or software license, where valid. System alarms are preset and cannot be modified.

File Usage—Displays the usage statistics for log files, temporary files, crash (core) files, and database files.

Login Sessions—Provides a list of all currently logged in sessions. The display includes user credentials, login time, and idle time for each session.

Chassis Status—Provides a snapshot of the current physical condition of the device, including temperature and fan status.

Storage Usage—Displays the storage usage report in detail.

Threat Activity—Provides information about the most current threats received on the device.

Message Logs—Displays log messages and errors. You can clear old logs from the Message Logs pane by clicking the Clear button.

To control the information that is displayed in the Chassis View, use the following options:

- To view an image of the front of the device, right-click the image and choose **View Front**.
- To view an image of the back of the device, right-click the image and choose **View Rear**.
- To enlarge or shrink the device view, use the **Zoom** bar.
- To return the device image to its original position and size, click **Reset**.

NOTE: To use the Chassis View, a recent version of Adobe Flash that supports ActionScript and AJAX (Version 9) must be installed. Also note that the Chassis View appears by default on the Dashboard page. You can enable or disable it using options in the Dashboard Preference dialog box. Clearing cookies in Internet Explorer also causes the Chassis View appear on the Dashboard page.

To return to the Dashboard at any time, select **Dashboard** in the J-Web user interface.

Alternatively, you can view system properties by entering the following **show** commands in the CLI:

- **show system uptime**
- **show system users**
- **show system storage**
- **show version**
- **show chassis hardware**

Monitoring Chassis Information

Purpose View chassis properties, which include the status of hardware components on the device.

Action To view these chassis properties, select **Monitor>System View>Chassis Information** in the J-Web user interface.

CAUTION: Do not install a combination of Physical Interface Modules (PIMs) in a single chassis that exceeds the maximum power and heat capacity of the chassis. If power management is enabled, PIMs that exceed the maximum power and heat limits remain offline when the chassis is powered on. To check PIM power and heat status, use the **show chassis fpc** and **show chassis power-ratings** commands.

The Chassis Information page displays the following types of information:

- **Routing Engine Details**—This section of the page includes the following tabs:
 - **Master**—Master tab displays information about the routing engine, including the routing engine module, model number, version, part number, serial number, memory utilization, temperature, and start time. Additionally, this tab displays the CPU load averages for the last 1, 5, and 15 minutes.
 - **Backup**—If a backup routing engine is available, the Backup tab displays the routing engine module, model number, version, part number, serial number, memory utilization, temperature, and start time. Additionally, this tab displays the CPU load averages for the last 1, 5, and 15 minutes.

NOTE: If you need to contact customer support about the device chassis, supply them with the version and serial number displayed in the Routing Engine Details section of the page.

- **Power and Fan Tray Details**—This Details section of the page includes the following tabs:
 - **Power**—Power tab displays the names of the device's power supply units and their statuses.
 - **Fan**—Fan tab displays the names of the device's fans and their speeds (normal or high). (The fan speeds are adjusted automatically according to the current temperature.)
- **Chassis Component Details**—This section of the page includes the following tabs:
 - **General**—General tab displays the version number, part number, serial number, and description of the selected device component.
 - **Temperature**—Temperature tab displays the temperature of the selected device component (if applicable).
 - **Resource**—Resource tab displays the state, total CPU DRAM, and start time of the selected device component (if applicable).

NOTE: On some devices, you can have an FPC state as “offline.” You might want to put an FPC offline because of an error or if the FPC is not responding. You can put the FPC offline by using the CLI command `request chassis fpc slot number offline`.

- **Sub-Component**—Sub-Component tab displays information about the device's sub-components (if applicable). Details include the sub-component's version, part number, serial number, and description.

To control which component details appear, select a hardware component from the **Select component** list.

Alternatively, you can view chassis details by entering the following **show** commands in the CLI configuration editor:

- **show chassis hardware**
- **show chassis routing-engine**
- **show chassis environment**
- **show chassis redundant-power-supply**
- **show redundant-power-supply status**

System Health Management for Branch SRX Series Devices

Purpose Tracking the utilization of critical resources in the system ensures that all parameters are within normal limits and the system remains functional.

In the event of a malfunction caused by abnormal resource usage, the system health management feature provides the right diagnostic information to identify the source of the problem.

When the system health management action is configured by the user, the system takes appropriate monitoring, preventive, and recovery actions to ensure that the system is accessible. The system configuration might be updated based on the information collected by system health management feature to ensure that the system stays in the normal operating environment. For example, when a system runs out of memory, then the configuration associated with applications identified to be consuming memory resources can be updated to bring down the memory resource consumption.

Action The system health management feature periodically monitors critical system resources against configurable thresholds. The resources that can be monitored include CPU usage, memory, storage, open-file-descriptor, process-count, and temperature. The system health management feature collects usage information for each resource at the configured interval and compares it against the three levels of thresholds: moderate, high, and critical. Based on the configurations, appropriate action is taken.

The intervals, thresholds, and action are associated with system health management and can be configured at both the resource level and the global level. Configurable and default levels are as follows:

- **Default configuration level**— Default configuration is applied when system health monitoring is enabled, and neither a global nor a resource-specific configuration is present.
- **Global configuration level**—Configuration that is applied to resources when no resource-specific configuration is available.
- **Resource-specific configuration level**—Configuration that, if available, overrides both the global and the default configurations.

Per-resource configurations take precedence over the global configuration, and a global configuration takes precedence over the defaults.

When resource usage exceeds the configured thresholds, the system collects information that can be used to find the source of the increased usage and saves it in history for analysis and action.

When resource utilization exceeds the high threshold, a minor system alarm is generated, and the alarm LED lights yellow. When resource utilization exceeds the critical threshold, a major alarm is generated, and the alarm LED lights red.

An SNMP trap is also sent to the remote monitoring server (NMS) for all events that exceed the threshold.

To enable the system health monitor, use the **set snmp health-monitor routing engine** command. You can view system properties by using CLI show commands.

Monitoring Antivirus Scan Engine Status

Purpose Using the CLI, you can view the following scan engine status items:

Antivirus license key status

- View license expiration dates.

Scan engine status and settings

- View last action result.
- View default file extension list.

Antivirus pattern update server settings

- View update URL (HTTP or HTTPS-based).
- View update interval.

Antivirus pattern database status

- View auto update status.
- View last result of database loading.

- If the download completes, view database version timestamp virus record number.
- If the download fails, view failure reason.

Action In the CLI, enter the `user@host> show security utm anti-virus status` command.

Example status result:

```
AV Key Expire Date: 03/01/2010 00:00:00
Update Server: http://update.juniper-updates.net/AV/SRX210
interval: 60 minutes
auto update status: next update in 12 minutes
last result: new database loaded
AV signature version: 12/21/2008 00:35 GMT, virus records: 154018
Scan Engine Info: last action result: No error(0x00000000)
```

- [Monitoring Antivirus Scan Results on page 1474](#)

Monitoring Antivirus Scan Results

Purpose View statistics for antivirus requests, scan results, and fallback counters.

Scan requests provide

- The total number of scan request forwarded to the engine.
- The number of scan request being pre-windowed.
- The number of scan requests using scan-all mode.
- The number of scan requests using scan-by-extension mode.

Scan code counters provide

- Number of clean files.
- Number of infected files.
- Number of password protected files.
- Number of decompress layers.
- Number of corrupt files.
- When the engine is out of resources.
- When there is an internal error.

Fallback applied status provides either a log-and-permit or block result when the following has occurred

- Scan engine not ready.
- Maximum content size reached.

- Too many requests.
- Password protected file found.
- Decompress layer too large.
- Corrupt file found.
- Timeout occurred.
- Out of resources.
- Other.

Action To view antivirus scan results using the CLI editor, enter the **user@host> show security utm anti-virus statistics status** command.

To view antivirus scan results using J-Web:

1. Select **Monitor>Security>UTM>Anti-Virus**.

The following information becomes viewable in the right pane.

Antivirus license key status

- View license expiration dates.

Antivirus pattern update server settings

- View update URL (HTTP or HTTPS-based).
- View update interval.

Antivirus pattern database status

- View auto update status.
- View last result of database loading.
- If the download completes, view database version timestamp virus record number.
- If the download fails, view failure reason.

Antivirus statistics provide

- The number of scan request being pre-windowed.
- The total number of scan request forwarded to the engine.
- The number of scan requests using scan-all mode.
- The number of scan requests using scan-by-extension mode.

Scan code counters provide

- Number of clean files.
- Number of infected files.
- Number of password protected files.

- Number of decompress layers.
- Number of corrupt files.
- When the engine is out of resources.
- When there is an internal error.

Fallback applied status provides either a log-and-permit or block result when the following has occurred

- Scan engine not ready.
- Password protected file found.
- Decompress layer too large.
- Corrupt file found.
- Out of resources.
- Timeout occurred.
- Maximum content size reached.
- Too many requests.
- Other.

2. You can click the **Clear Anti-Virus Statistics** button to clear all current viewable statistics and begin collecting new statistics.

Related Documentation • [Monitoring Antivirus Session Status on page 1476](#)

Monitoring Antivirus Session Status

Purpose Using the CLI, you can view the following session status items:

Antivirus session status displays a snapshot of current antivirus sessions. It includes

- Maximum supported antivirus session numbers.
- Total allocated antivirus session numbers.
- Total freed antivirus session numbers.
- Current active antivirus session numbers.

Action In the CLI, enter the `user@host> show security utm session status` command.

Related Documentation • [Full Antivirus Configuration Overview](#)

• [Monitoring Antivirus Scan Results on page 1474](#)

Monitoring Content Filtering Configurations

Purpose View content filtering statistics.

Action To view content filtering statistics in the CLI, enter the `user@host > show security utm content-filtering statistics` command.

The content filtering **show statistics** command displays the following information:

```
Base on command list: # Blocked
Base on mime list: # Blocked
Base on extension list: # Blocked
ActiveX plugin: # Blocked
Java applet: # Blocked
EXE files: # Blocked
ZIP files: # Blocked
HTTP cookie: # Blocked
```

To view content filtering statistics using J-Web:

1. Select **Clear Content filtering statistics**Monitor>Security>UTM>Content FilteringMonitor>Security>UTM>Content Filtering.

The following statistics become viewable in the right pane.

```
Base on command list: # Passed # Blocked
Base on mime list: # Passed # Blocked
Base on extension list: # Passed # Blocked
ActiveX plugin: # Passed # Blocked
Java applet: # Passed # Blocked
EXE files: # Passed # Blocked
ZIP files: # Passed # Blocked
HTTP cookie: # Passed # Blocked
```

2. You can click **Clear Content filtering statistics** to clear all current viewable statistics and begin collecting new statistics.

Monitoring Reports

On-box reporting offers a comprehensive reporting facility where your security management team can spot a security event when it occurs, immediately access and review pertinent details about the event, and quickly decide appropriate remedial action. The J-Web reporting feature provides one- or two-page reports that are equivalent to a compilation of numerous log entries.

This section contains the following topics:

- [Threats Monitoring Report on page 1478](#)
- [Traffic Monitoring Report on page 1482](#)

Threats Monitoring Report

Purpose Use the Threats Report to monitor general statistics and activity reports of current threats to the network. You can analyze logging data for threat type, source and destination details, and threat frequency information. The report calculates, displays, and refreshes the statistics, providing graphic presentations of the current state of the network.

Action To view the Threats Report:

1. Click **Threats Report** in the bottom right of the Dashboard, or select **Monitor>Reports>Threats** in the J-Web user interface. The Threats Report appears.
2. Select one of the following tabs:
 - **Statistics** tab. See [Table 192 on page 1478](#) for a description of the page content.
 - **Activities** tab. See [Table 193 on page 1480](#) for a description of the page content.

Table 192: Statistics Tab Output in the Threats Report

Field	Description
General Statistics Pane	
Threat Category	<p>One of the following categories of threats:</p> <ul style="list-style-type: none"> • Traffic • IDP • Content Security <ul style="list-style-type: none"> • Antivirus • Antispam • Web Filter—Click the Web filter category to display counters for 39 subcategories. • Content Filter • Firewall Event
Severity	<p>Severity level of the threat:</p> <ul style="list-style-type: none"> • emerg • alert • crit • err • warning • notice • info • debug
Hits in past 24 hours	Number of threats encountered per category in the past 24 hours.

Table 192: Statistics Tab Output in the Threats Report (*continued*)

Field	Description
Hits in current hour	Number of threats encountered per category in the last hour.
Threat Counts in the Past 24 Hours	
By Severity	Graph representing the number of threats received each hour for the past 24 hours sorted by severity level.
By Category	Graph representing the number of threats received each hour for the past 24 hours sorted by category.
X Axis	Twenty-four hour span with the current hour occupying the right-most column of the display. The graph shifts to the left every hour.
Y Axis	Number of threats encountered. The axis automatically scales based on the number of threats encountered.
Most Recent Threats	
Threat Name	Names of the most recent threats. Depending on the threat category, you can click the threat name to go to a scan engine site for a threat description.
Category	Category of each threat: <ul style="list-style-type: none"> Traffic IDP Content Security <ul style="list-style-type: none"> Antivirus Antispam Web Filter Content Filter Firewall Event
Source IP/Port	Source IP address (and port number, if applicable) of the threat.
Destination IP/Port	Destination IP address (and port number, if applicable) of the threat.
Protocol	Protocol name of the threat.
Description	Threat identification based on the category type: <ul style="list-style-type: none"> Antivirus—URL Web filter—category Content filter—reason Antispam—sender e-mail
Action	Action taken in response to the threat.
Hit Time	Time the threat occurred.

Table 192: Statistics Tab Output in the Threats Report (*continued*)

Field	Description
Threat Trend in past 24 hours	
Category	Pie chart graphic representing comparative threat counts by category: <ul style="list-style-type: none"> • Traffic • IDP • Content Security <ul style="list-style-type: none"> • Antivirus • Antispam • Web Filter • Content Filter • Firewall Event
Web Filter Counters Summary	
Category	Web filter count broken down by up to 39 subcategories. Clicking on the Web filter listing in the General Statistics pane opens the Web Filter Counters Summary pane.
Hits in past 24 hours	Number of threats per subcategory in the last 24 hours.
Hits in current hour	Number of threats per subcategory in the last hour.

Table 193: Activities Tab Output in the Threats Report

Field	Function
Most Recent Virus Hits	
Threat Name	Name of the virus threat. Viruses can be based on services, like Web, FTP, or e-mail, or based on severity level.
Severity	Severity level of each threat: <ul style="list-style-type: none"> • emerg • alert • crit • err • warning • notice • info • debug
Source IP/Port	IP address (and port number, if applicable) of the source of the threat.
Destination IP/Port	IP address (and port number, if applicable) of the destination of the threat.
Protocol	Protocol name of the threat.

Table 193: Activities Tab Output in the Threats Report (*continued*)

Field	Function
Description	Threat identification based on the category type: <ul style="list-style-type: none"> • Antivirus—URL • Web filter—category • Content filter—reason • Antispam—sender e-mail
Action	Action taken in response to the threat.
Last Hit Time	Last time the threat occurred.
Most Recent Spam E-Mail Senders	
From e-mail	E-mail address that was the source of the spam.
Severity	Severity level of the threat: <ul style="list-style-type: none"> • emerg • alert • crit • err • warning • notice • info • debug
Source IP	IP address of the source of the threat.
Action	Action taken in response to the threat.
Last Send Time	Last time that the spam e-mail was sent.
Recently Blocked URL Requests	
URL	URL request that was blocked.
Source IP/Port	IP address (and port number, if applicable) of the source.
Destination IP/Port	IP address (and port number, if applicable) of the destination.
Hits in current hour	Number of threats encountered in the last hour.
Most Recent IDP Attacks	
Attack	

Table 193: Activities Tab Output in the Threats Report (*continued*)

Field	Function
Severity	Severity of each threat: <ul style="list-style-type: none"> • emerg • alert • crit • err • warning • notice • info • debug
Source IP/Port	IP address (and port number, if applicable) of the source.
Destination IP/Port	IP address (and port number, if applicable) of the destination.
Protocol	Protocol name of the threat.
Action	Action taken in response to the threat.
Last Send Time	Last time the IDP threat was sent.

Traffic Monitoring Report

Purpose Monitor network traffic by reviewing reports of flow sessions over the past 24 hours. You can analyze logging data for connection statistics and session usage by a transport protocol.

Action To view network traffic in the past 24 hours, select **Monitor>Reports>Traffic** in the J-Web user interface. See [Table 194 on page 1482](#) for a description of the report.

Table 194: Traffic Report Output

Field	Description
Sessions in Past 24 Hours per Protocol	
Protocol Name	Name of the protocol. To see hourly activity by protocol, click the protocol name and review the "Protocol activities chart" in the lower pane. <ul style="list-style-type: none"> • TCP • UDP • ICMP
Total Session	Total number of sessions for the protocol in the past 24 hours.
Bytes In (KB)	Total number of incoming bytes in KB.
Bytes Out (KB)	Total number of outgoing bytes in KB.

Table 194: Traffic Report Output (*continued*)

Field	Description
Packets In	Total number of incoming packets.
Packets Out	Total number of outgoing packets.
Most Recently Closed Sessions	
Source IP/Port	Source IP address (and port number, if applicable) of the closed session.
Destination IP/Port	Destination IP address (and port number, if applicable) of the closed session.
Protocol	Protocol of the closed session. <ul style="list-style-type: none"> • TCP • UDP • ICMP
Bytes In (KB)	Total number of incoming bytes in KB.
Bytes Out (KB)	Total number of outgoing bytes in KB.
Packets In	Total number of incoming packets.
Packets Out	Total number of outgoing packets.
Timestamp	The time the session was closed.
Protocol Activities Chart	
Bytes In/Out	Graphic representation of traffic as incoming and outgoing bytes per hour. The byte count is for the protocol selected in the Sessions in Past 24 Hours per Protocol pane. Changing the selection causes this chart to refresh immediately.
Packets In/Out	Graphic representation of traffic as incoming and outgoing packets per hour. The packet count is for the protocol selected in the Sessions in Past 24 Hours per Protocol pane. Changing the selection causes this chart to refresh immediately.
Sessions	Graphic representation of traffic as the number of sessions per hour. The session count is for the protocol selected in the Sessions in Past 24 Hours per Protocol pane. Changing the selection causes this chart to refresh immediately.
X Axis	One hour per column for 24 hours.
Y Axis	Byte, packet, or session count.
Protocol Session Chart	
Sessions by Protocol	Graphic representation of the traffic as the current session count per protocol. The protocols displayed are TCP, UDP, and ICMP.

Monitoring Web Filtering Configurations

Purpose View Web-filtering statistics.

Action To view Web-filtering statistics using the CLI, enter the following commands:

```
user@host> show security utm web-filtering status
user@host> show security utm web-filtering statistics
```

To view Web-filtering statistics using J-Web:

1. Select **Clear Web Filtering Statistics**.

The following information is displayed in the right pane.

```
Total Requests: #
White List Hit: #
Black List Hit: #
Queries to Server: #
Server Reply Permit: #
Server Reply Block: #
Custom Category Permit: #
Custom Category Block: #
Cache Hit Permit: #
Cache Hit Block: #
Web Filtering Session Total: #
Web Filtering Session Inuse: #
Fall Back: Log-and-Permit Block
Default # #
Timeout # #
Server-Connectivity # #
Too-Many-Requests # #
```

2. You can click the **Clear Web Filtering Statistics** button to clear all current viewable statistics and begin collecting new statistics.

Monitoring IKE Gateway Information

Purpose View information about IKE security associations (SAs).

Action Select **Monitor>IPSec VPN>IKE Gateway** in the J-Web user interface. To view detailed information for a particular SA, select the IKE SA index on the IKE gateway page.

Alternatively, enter the following CLI commands:

- **show security ike security-associations**
- **show security ike security-associations index *index-id* detail**

[Table 195 on page 1485](#) summarizes key output fields in the IKE gateway display.

Table 195: Summary of Key IKE SA Information Output Fields

Field	Values	Additional Information
IKE Security Associations		
IKE SA Index	Index number of an SA.	This number is an internally generated number you can use to display information about a single SA.
Remote Address	IP address of the destination peer with which the local peer communicates.	—
State	State of the IKE security associations: <ul style="list-style-type: none"> • DOWN—SA has not been negotiated with the peer. • UP—SA has been negotiated with the peer. 	—
Initiator cookie	Random number, called a cookie, which is sent to the remote node when the IKE negotiation is triggered.	—
Responder cookie	Random number generated by the remote node and sent back to the initiator as a verification that the packets were received.	A cookie is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity.

Table 195: Summary of Key IKE SA Information Output Fields (*continued*)

Field	Values	Additional Information
Mode	<p>Negotiation method agreed on by the two IPsec endpoints, or peers, used to exchange information between themselves. Each exchange type determines the number of messages and the payload types that are contained in each message. The modes, or exchange types, are:</p> <ul style="list-style-type: none"> • Main—The exchange is done with six messages. This mode, or exchange type, encrypts the payload, protecting the identity of the neighbor. The authentication method used is displayed: preshared keys or certificate. • Aggressive—The exchange is done with three messages. This mode, or exchange type, does not encrypt the payload, leaving the identity of the neighbor unprotected. 	—
IKE Security Association (SA) Index		
IKE Peer	IP address of the destination peer with which the local peer communicates.	—
IKE SA Index	Index number of an SA.	This number is an internally generated number you can use to display information about a single SA.
Role	Part played in the IKE session. The device triggering the IKE negotiation is the initiator, and the device accepting the first IKE exchange packets is the responder.	—
State	<p>State of the IKE security associations:</p> <ul style="list-style-type: none"> • DOWN—SA has not been negotiated with the peer. • UP—SA has been negotiated with the peer. 	—
Initiator cookie	Random number, called a cookie, which is sent to the remote node when the IKE negotiation is triggered.	—
Responder cookie	Random number generated by the remote node and sent back to the initiator as a verification that the packets were received.	A cookie is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity.

Understanding Data Path Debugging for SRX Series Devices

Data path debugging, or end-to-end debugging, support provides tracing and debugging at multiple processing units along the packet-processing path. The packet filter can be executed with minimal impact to the production system.

On a high-end SRX Series device, a packet goes through series of events involving different components from ingress to egress processing.

With the data path debugging feature, you can trace and debug (capture packets) at different data points along the processing path. The events available in the packet-processing path are: NP ingress, load-balancing thread (LBT), jexec, packet-ordering thread (POT), and NP egress. You can also enable flow module trace if the security flow trace flag for a certain module is set.

At each event, you can specify any of the four actions (count, packet dump, packet summary, and trace). Data path debugging provides filters to define what packets to capture, and only the matched packets are traced. The packet filter can filter out packets based on logical interface, protocol, source IP address prefix, source port, destination IP address prefix, and destination port.

To enable end-to-end debugging, you must perform the following steps:

1. Define the capture file and specify the maximum capture size.
2. Define the packet filter to trace only a certain type of traffic based on the requirement.
3. Define the action profile specifying the location on the processing path from where to capture the packets (for example, LBT or NP ingress).
4. Enable the data path debugging.
5. Capture traffic.
6. Disable data path debugging.
7. View or analyze the report.

NOTE:

The packet-filtering behavior for the port and interface options is as follows:

- The packet filter traces both IPv4 and IPv6 traffic if only port is specified.
 - The packet filter traces IPv4, IPV6, and non-IP traffic if only interface is specified.
-

Debugging the Data Path (CLI Procedure)

To configure the device for data path debugging:

1. Specify the following request command to set the data path debugging for the multiple processing units along the packet-processing path:

```
[edit]
user@host# set security datapath-debug
```

2. Specify the trace options for data path-debug using the following command:

```
[edit]
user@host# set security datapath-debug traceoptions
```

3. Using the request security packet-filter command, you can set the packet filter to specify the related packets to perform data path-debug action. A maximum of four filters are supported at the same time. For example, the following command sets the first packet-filter:

```
[edit]
user@host# set security datapath-debug packet-filter name
```

4. Using the request security action-profile command, you can set the action for the packet match for a specified filter. Only the default action profile is supported, which is the trace option for network processor ezchip ingress, ezchip egress, spu.lbt, and spu.pot:

```
[edit]
user@host# set security datapath-debug packet-filter name action-profile
```

Example: Configuring End-to-End Debugging on a High-End SRX Series Device

This example shows how to configure end-to-end debugging on an SRX Series device with an SRX5K-MPC.

- [Requirements on page 1497](#)
- [Overview on page 1498](#)
- [Configuration on page 1498](#)
- [Enabling Data Path Debugging on page 1500](#)
- [Verification on page 1500](#)

Requirements

This example uses the following hardware and software components:

- SRX5600 device with an SRX5K-MPC installed with 100-Gigabit Ethernet CFP installed

- Junos OS Release 12.1X47-D15 or later for SRX Series devices

Before you begin:

- See *Understanding Data Path Debugging for SRX Series Devices*.

No special configuration beyond device initialization is required before configuring this feature.

Overview

Data path debugging enhances troubleshooting capabilities by providing tracing and debugging at multiple processing units along the packet-processing path. With the data path debugging feature, you can trace and debug (capture packets) at different data points along the processing path. At each event, you can specify an action (count, packet dump, packet summary, and trace) and you can set filters to define what packets to capture.

In this example, you define a traffic filter, then you apply an action profile. The action profile specifies a variety of actions on the processing unit. The NP ingress and NP egress are specified as location on the processing path to capture the data for incoming and outgoing traffic.

Next, you enable data path debugging in operational mode, and finally you view the data capture report.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security datapath-debug traceoptions file e2e.trace size 10m
set security datapath-debug capture-file datapcap format pcap
set security datapath-debug maximum-capture-size 1500
set security datapath-debug action-profile profile-1 preserve-trace-order
set security datapath-debug action-profile profile-1 record-pic-history
set security datapath-debug action-profile profile-1 event np-ingress trace
set security datapath-debug action-profile profile-1 event np-ingress count
set security datapath-debug action-profile profile-1 event np-ingress packet-summary
set security datapath-debug action-profile profile-1 event np-ingress packet-count
set security datapath-debug action-profile profile-1 event np-egress trace
set security datapath-debug action-profile profile-1 event np-egress count
set security datapath-debug action-profile profile-1 event np-egress packet-summary
set security datapath-debug action-profile profile-1 event np-egress packet-count
set security datapath-debug packet-filter filter-1
set security datapath-debug packet-filter filter-1 action-profile profile-1
set security datapath-debug packet-filter filter-1 protocol tcp
set security datapath-debug packet-filter filter-1 source-prefix 200.7.6.0/24
set security datapath-debug packet-filter filter-1 destination-prefix 200.8.6.0/24
set security datapath-debug packet-filter filter-1 source-port 1000
set security datapath-debug packet-filter filter-1 destination-port 80
set security datapath-debug packet-filter filter-1 interface xe-2/2/0.0
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure data path debugging:

1. Edit the security datapath-debug option for the multiple processing units along the packet-processing path:

```
[edit]
user@host# edit security datapath-debug
```

2. Enable the capture file, file format, file size, and the number of files.

```
[edit security datapath-debug]
user@host# set traceoptions file e2e.trace size 10m
user@host# set capture-file datapcap format pcap;
user@host# set maximum-capture-size 1500
```

3. Configure action profile, event type, and actions for the action profile.

```
[edit security datapath-debug]
user@host# set action-profile profile-1 preserve-trace-order
user@host# set action-profile profile-1 record-pic-history
user@host# set action-profile profile-1 event np-ingress trace
user@host# set action-profile profile-1 event np-ingress count
user@host# set action-profile profile-1 event np-ingress packet-summary
user@host# set action-profile profile-1 event np-ingress packet-count
user@host# set action-profile profile-1 event np-egress trace
user@host# set action-profile profile-1 event np-egress count
user@host# set action-profile profile-1 event np-egress packet-summary
user@host# set action-profile profile-1 event np-egress packet-count
```

4. Configure packet filter, action, and filter options.

```
[edit security datapath-debug]
user@host# set packet-filter filter-1
user@host# set packet-filter filter-1 action-profile profile-1
user@host# set packet-filter filter-1 protocol tcp
user@host# set packet-filter filter-1 source-prefix 200.7.6.0/24
user@host# set packet-filter filter-1 destination-prefix 200.8.6.0/24
user@host# set packet-filter filter-1 source-port 1000
user@host# set packet-filter filter-1 destination-port 80
user@host# set packet-filter filter-1 interface xe-2/2/0.0
```

Results From configuration mode, confirm your configuration by entering the **show security datapath-debug** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
traceoptions {
  file e2e.trace size 10m;
}
capture-file datapcap format pcap;
maximum-capture-size 1500;
action-profile {
  profile-1 {
    preserve-trace-order;
```

```

record-pic-history;
event np-ingress {
    trace;
    count;
    packet-summary;
    packet-dump;
}
event np-egress {
    trace;
    count;
    packet-summary;
    packet-dump;
}
}
}
packet-filter filter-1 {
    action-profile profile-1;
    protocol tcp;
    source-prefix 200.7.6.0/24;
    destination-prefix 200.8.6.0/24;
    source-port 1000;
    destination-port 80;
    interface xe-2/2/0.0;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Enabling Data Path Debugging

Step-by-Step Procedure After configuring data path debugging, you must start the process on the device from operational mode.

1. Enable data path debugging.

```

user@host> request security datapath-debug capture start
datapath-debug capture started on file datapcap

```
2. Once you are done, you must disable data path debugging before you verify the configuration and view the reports.

```

user@host> request security datapath-debug capture stop
datapath-debug capture succesfully stopped, use show security datapath-debug capture to view

```

Verification

Confirm that the configuration is working properly.

Verifying Data Path Debug Packet Capture Details

Purpose Verify the data captured by enabling the data path debugging configuration.

Action From operational mode, enter the **show security datapath-debug capture** command.

```

36 37....

```

For brevity, the **show** command output is truncated to display only a few samples. Additional samples have been replaced with ellipses (...).

To view the results, from CLI operational mode, access the local UNIX shell and navigate to the directory `/var/log/<file-name>`. The result can be read by using the **tcpdump** utility.

Understanding Security Debugging Using Trace Options

The Junos OS trace function allows applications to write security debugging information to a file. The information that appears in this file is based on criteria you set. You can use this information to analyze security application issues.

The trace function operates in a distributed manner, with each thread writing to its own trace buffer. These trace buffers are then collected at one point, sorted, and written to trace files. Trace messages are delivered using the InterProcess Communications (IPC) protocol. A trace message has a lower priority than that of control protocol packets such as BGP, OSPF, and IKE, and therefore delivery is not considered to be as reliable.

Setting Security Trace Options (CLI Procedure)

Use the following configuration statements to configure security trace options in the CLI configuration editor.

- To disable remote tracing, enter the following statement:

```

[edit]
user@host# set security traceoptions no-remote-trace

```

- To write trace messages to a local file, enter the following statement. The system saves the trace file in the `/var/log/` directory.

```
[edit]
user@host# set security traceoptions use-local-files
```

- To specify a name for the trace file, enter the following statement. Valid values range from 1 and 1024 characters. The name cannot include spaces, `/`, or `%` characters. The default filename is `security`.

```
[edit]
user@host# set security traceoptions file filename
```

- To specify the maximum number of trace files that can accumulate, enter the following statement. Valid values range from 2 to 1000. The default value is 3.

```
[edit]
user@host# set security traceoptions file files 3
```

- To specify the match criteria that you want the system to use when logging information to the file, enter the following statement. Enter a regular expression. Wildcard (`*`) characters are accepted.

```
[edit]
user@host# set security traceoptions file match *thread
```

- To allow any user to read the trace file, enter the **world-readable** statement. Otherwise, enter the **no-world-readable** statement.

```
[edit]
user@host# set security traceoptions file world-readable
user@host# set security traceoptions file no-world-readable
```

- To specify the maximum size to which the trace file can grow, enter the following statement. Once the file reaches the specified size, it is compressed and renamed *filename0.gz*, the next file is named *filename1.gz*, and so on. Valid values range from 10240 to 1,073,741,824.

```
[edit]
user@host# set security traceoptions file size 10240
```

- To turn on trace options and to perform more than one tracing operation, set the following flags.

```
[edit]
user@host# set security traceoptions flag all
user@host# set security traceoptions flag compilation
user@host# set security traceoptions flag configuration
user@host# set security traceoptions flag routing-socket
```

- To specify the groups that these trace option settings do or do not apply to, enter the following statements:

```
[edit]
user@host# set security traceoptions apply-groups value
user@host# set security traceoptions apply-groups-except value
```

- [Displaying Output for Security Trace Options on page 1503](#)

Displaying Log and Trace Files

Enter the **monitor start** command to display real-time additions to system logs and trace files:

```
user@host> monitor start filename
```

When the device adds a record to the file specified by **filename**, the record displays on the screen. For example, if you have configured a system log file named **system-log** (by including the **syslog** statement at the [**edit system**] hierarchy level), you can enter the **monitor start system-log** command to display the records added to the system log.

To display a list of files that are being monitored, enter the **monitor list** command. To stop the display of records for a specified file, enter the **monitor stop filename** command.

Displaying Output for Security Trace Options

Purpose Display output for security trace options.

Action Use the **show security traceoptions** command to display the output of your trace files. For example:

```
[edit]
user@host # show security traceoptions file usp_trace
user@host # show security traceoptions flag all
user@host # show security traceoptions rate-limit 888
```

The output for this example is as follows:

```
Apr 11 16:06:42 21:13:15.750395:CID-906489336:FPC-01:PIC-01:THREAD_ID-01:PFE:now

Displaying Multicast Trace Operations

To monitor and display multicast trace operations, enter the **mtrace monitor** command:

```
user@host> mtrace monitor
```

```
Mtrace query at Apr 21 16:00:54 by 192.1.30.2, resp to 224.0.1.32, qid 2a83aa
packet from 192.1.30.2 to 224.0.0.2 from 192.1.30.2 to 192.1.4.1 via group
224.1.1.1 (mxhop=60) Mtrace query at Apr 21 16:00:57 by 192.1.30.2, resp to
224.0.1.32, qid 25dc17 packet from 192.1.30.2 to 224.0.0.2 from 192.1.30.2 to
192.1.4.1 via group 224.1.1.1 (mxhop=60) Mtrace query at Apr 21 16:01:00 by
192.1.30.2, resp to same, qid 20e046 packet from 192.1.30.2 to 224.0.0.2 from
192.1.30.2 to 192.1.4.1 via group 224.1.1.1 (mxhop=60) Mtrace query at Apr 21
16:01:10 by 192.1.30.2, resp to same, qid 1d25ad packet from 192.1.30.2 to
224.0.0.2 from 192.1.30.2 to 192.1.4.1 via group 224.1.1.1 (mxhop=60)
```

This example displays only **mtrace** queries. However, when the device captures an **mtrace** response, the display is similar, but the complete **mtrace** response also appears (exactly as it is appears in the **mtrace from-source** command output).

Table 199 on page 1504 summarizes the output fields of the display.

Table 199: CLI mtrace monitor Command Output Summary

Field	Description
<i>Mtrace operation-type at time-of-day</i>	<ul style="list-style-type: none"> operation-type—Type of multicast trace operation: query or response. time-of-day—Date and time the multicast trace query or response was captured.
<i>by</i>	IP address of the host issuing the query.
<i>resp to address</i>	address —Response destination address.
<i>qid qid</i>	qid —Query ID number.
<i>packet from source to destination</i>	<ul style="list-style-type: none"> source—IP address of the source of the query or response. destination—IP address of the destination of the query or response.
<i>from source to destination</i>	<ul style="list-style-type: none"> source—IP address of the multicast source. destination—IP address of the multicast destination.
<i>via group address</i>	address —Group address being traced.
<i>mxhop=number</i>	number —Maximum hop setting.

 - [J-Web Traceroute Results and Output Summary on page 1506](#)

Using the J-Web Traceroute Tool

You can use the traceroute diagnostic tool to display a list of devices between the device and a specified destination host. The output is useful for diagnosing a point of failure in

the path from the device to the destination host, and addressing network traffic latency and throughput problems.

The device generates the list of devices by sending a series of ICMP traceroute packets in which the time-to-live (TTL) value in the messages sent to each successive device is incremented by 1. (The TTL value of the first traceroute packet is set to 1.) In this manner, each device along the path to the destination host replies with a Time Exceeded packet from which the source IP address can be obtained.

To use the traceroute tool:

1. Select **Troubleshoot>Traceroute**.
2. Next to Advanced options, click the expand icon.
3. Enter information into the Traceroute page (see [Table 200 on page 1505](#)).

Table 200: Traceroute Field Summary

Field	Function	Your Action
Remote Host	Identifies the destination host of the traceroute. The Remote Host field is the only required field.	Type the hostname or IP address of the destination host.
Advanced Options		
Don't Resolve Addresses	Determines whether hostnames of the hops along the path are displayed, in addition to IP addresses.	<ul style="list-style-type: none"> • Suppress the display of the hop hostnames by selecting the check box. • Display the hop hostnames by clearing the check box.
Gateway	Specifies the IP address of the gateway to route through.	Type the gateway IP address.
Source Address	Specifies the source address of the outgoing traceroute packets.	Type the source IP address.
Bypass Routing	<p>Determines whether traceroute packets are routed by means of the routing table.</p> <p>If the routing table is not used, traceroute packets are sent only to hosts on the interface specified in the Interface box. If the host is not on that interface, traceroute responses are not sent.</p>	<ul style="list-style-type: none"> • Bypass the routing table and send the traceroute packets to hosts on the specified interface only by selecting the check box. • Route the traceroute packets by means of the routing table by clearing the check box.
Interface	Specifies the interface on which the traceroute packets are sent.	Select the interface on which traceroute packets are sent from the list. If you select any , the traceroute requests are sent on all interfaces.
Time-to-Live	Specifies the maximum time-to-live (TTL) hop count for the traceroute request packet.	Select the TTL from the list.
Type-of-Service	Specifies the type-of-service (TOS) value to include in the IP header of the traceroute request packet.	Select the decimal value of the TOS field from the list.

Table 200: Traceroute Field Summary (*continued*)

Field	Function	Your Action
Resolve AS Numbers	Determines whether the autonomous system (AS) number of each intermediate hop between the device and the destination host is displayed.	<ul style="list-style-type: none"> Display the AS numbers by selecting the check box. Suppress the display of the AS numbers by clearing the check box.

4. Click **Start**.

The results of the traceroute operation are displayed in the main pane. If no options are specified, each line of the traceroute display is in the following format:

hop-number host (ip-address) [as-number]time1 time2 time3

The device sends a total of three traceroute packets to each router along the path and the round-trip time for each traceroute operation appears. If the device times out before receiving a **Time Exceeded** message, an asterisk (*) appears for that round-trip time.

5. You can stop the traceroute operation before it is complete by clicking **OK** while the results of the traceroute operation appear.**Related Documentation**

[J-Web Traceroute Results and Output Summary](#)

[Table 201 on page 1506](#) summarizes the output in the traceroute display.

Table 201: J-Web Traceroute Results and Output Summary

Field	Description
<i>hop-number</i>	Number of the hop (device) along the path.
<i>host</i>	Hostname, if available, or IP address of the device. If the Don't Resolve Addresses check box is selected, the hostname does not appear.
<i>ip-address</i>	IP address of the device.
<i>as-number</i>	AS number of the device.
<i>time1</i>	Round-trip time between the sending of the first traceroute packet and the receiving of the corresponding Time Exceeded packet from that particular device.

Table 201: J-Web Traceroute Results and Output Summary (*continued*)

Field	Description
<i>time2</i>	Round-trip time between the sending of the second traceroute packet and the receiving of the corresponding Time Exceeded packet from that particular device.
<i>time3</i>	Round-trip time between the sending of the third traceroute packet and the receiving of the corresponding Time Exceeded packet from that particular device.

If the device does not display the complete path to the destination host, one of the following explanations might apply:

- The host is not operational.
- There are network connectivity problems between the device and the host.
- The host, or a router along the path, might be configured to ignore ICMP traceroute messages.
- The host, or a device along the path, might be configured with a firewall filter that blocks ICMP traceroute requests or ICMP time exceeded responses.
- The value you selected in the Time Exceeded box was less than the number of hops in the path to the host. In this case, the host might reply with an ICMP error message.

Understanding Flow Debugging Using Trace Options

For flow trace options, you can define a packet filter using combinations of **destination-port**, **destination-prefix**, **interface**, **protocol**, **source-port**, and **source-prefix**. If the security flow trace flag for a certain module is set, the packet matching the specific packet filter triggers flow tracing and writes debugging information to the trace file.

- [Debugging the Data Path \(CLI Procedure\) on page 1497](#)

Setting Flow Debugging Trace Options (CLI Procedure)

The following examples display the options you can set by using **security flow traceoptions**.

- To match the imap destination port for the filter1 packet filter, use the following statement:

[edit]

```
user@host# set security flow traceoptions packet-filter filter1 destination-port imap
```

- To set the 1.2.3.4 destination IPv4 prefix address for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 destination-prefix 1.2.3.4
```

- To set the fxp0 logical interface for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 interface fxp0
```

- To match the TCP IP protocol for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 protocol tcp
```

- To match the HTTP source port for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 source-port http
```

- To set the 5.6.7.8 IPv4 prefix address for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 source-prefix 5.6.7.8
```

Related Documentation

- [Understanding Flow Debugging Using Trace Options on page 1507](#)

Displaying a List of Devices

To display a list of devices between the device and a specified destination host, enter the **traceroute** command with the following syntax:

```
user@host> traceroute host <interface interface-name> <as-number-lookup>
<bypass-routing> <gateway address> <inet | inet6> <no-resolve>
<routing-instance routing-instance-name> <source source-address> <tos number>
<tll number> <wait seconds>
```

[Table 202 on page 1508](#) describes the **traceroute** command options.

Table 202: CLI traceroute Command Options

Option	Description
<i>host</i>	Sends traceroute packets to the hostname or IP address you specify.
<i>interface interface-name</i>	(Optional) Sends the traceroute packets on the interface you specify. If you do not include this option, traceroute packets are sent on all interfaces.
<i>as-number-lookup</i>	(Optional) Displays the autonomous system (AS) number of each intermediate hop between the device and the destination host.

Table 202: CLI traceroute Command Options (*continued*)

Option	Description
bypass-routing	(Optional) Bypasses the routing tables and sends the traceroute packets only to hosts on directly attached interfaces. If the host is not on a directly attached interface, an error message is returned. Use this option to display a route to a local system through an interface that has no route through it.
gateway address	(Optional) Uses the gateway you specify to route through.
inet	(Optional) Forces the traceroute packets to an IPv4 destination.
inet6	(Optional) Forces the traceroute packets to an IPv6 destination.
no-resolve	(Optional) Suppresses the display of the hostnames of the hops along the path.
routing-instance <i>routing-instance-name</i>	(Optional) Uses the routing instance you specify for the traceroute.
source address	(Optional) Uses the source address that you specify, in the traceroute packet.
tos number	(Optional) Sets the type-of-service (TOS) value in the IP header of the traceroute packet. Specify a value from 0 through 255.
ttl number	(Optional) Sets the time-to-live (TTL) value for the traceroute packet. Specify a hop count from 0 through 128.
wait seconds	(Optional) Sets the maximum time to wait for a response.

To quit the **traceroute** command, press Ctrl-C.

The following is sample output from a **traceroute** command:

```

user@host> traceroute host2

traceroute to 173.24.232.66 (172.24.230.41), 30 hops max, 40 byte packets 1
173.18.42.253 (173.18.42.253) 0.482 ms 0.346 ms 0.318 ms 2 host4.site1.net
(173.18.253.5) 0.401 ms 0.435 ms 0.359 ms 3 host5.site1.net (173.18.253.5)
0.401 ms 0.360 ms 0.357 ms 4 173.24.232.65 (173.24.232.65) 0.420 ms 0.456
ms 0.378 ms 5 173.24.232.66 (173.24.232.66) 0.830 ms 0.779 ms 0.834 ms

```

The fields in the display are the same as those displayed by the J-Web traceroute diagnostic tool.

- [Pinging Layer 3 VPNs on page 1524](#)
- [Pinging RSVP-Signaled LSPs and LDP-Signaled LSPs on page 1525](#)

MPLS Connection Checking Overview

Use either the J-Web ping MPLS diagnostic tool or the CLI commands **ping mpls**, **ping mpls l2circuit**, **ping mpls l2vpn**, and **ping mpls l3vpn** to diagnose the state of label-switched paths (LSPs), Layer 2 and Layer 3 virtual private networks (VPNs), and Layer 2 circuits.

Based on how the LSP or VPN outbound (egress) node at the remote endpoint of the connection replies to the probes, you can determine the connectivity of the LSP or VPN.

Each probe is an echo request sent to the LSP or VPN exit point as an MPLS packet with a UDP payload. If the outbound node receives the echo request, it checks the contents of the probe and returns a value in the UDP payload of the response packet. If the device receives the response packet, it reports a successful ping response.

Responses that take longer than 2 seconds are identified as failed probes.

[Table 85 on page 657](#) summarizes the options for using either the J-Web ping MPLS diagnostic tool or the CLI **ping mpls** command to display information about MPLS connections in VPNs and LSPs.

Table 203: Options for Checking MPLS Connections

J-Web Ping MPLS Tool	ping mpls Command	Purpose	Additional Information
Ping RSVP-signaled LSP	ping mpls rsvp	Checks the operability of an LSP that has been set up by the Resource Reservation Protocol (RSVP). The device pings a particular LSP using the configured LSP name.	When an RSVP-signaled LSP has several paths, the device sends the ping requests on the path that is currently active.
Ping LDP-signaled LSP	ping mpls ldp	Checks the operability of an LSP that has been set up by the Label Distribution Protocol (LDP). The device pings a particular LSP using the forwarding equivalence class (FEC) prefix and length.	When an LDP-signaled LSP has several gateways, the device sends the ping requests through the first gateway. Ping requests sent to LDP-signaled LSPs use only the master routing instance.

Table 203: Options for Checking MPLS Connections (*continued*)

J-Web Ping MPLS Tool	ping mpls Command	Purpose	Additional Information
Ping LSP to Layer 3 VPN prefix	ping mpls l3vpn	Checks the operability of the connections related to a Layer 3 VPN. The device tests whether a prefix is present in a provider edge (PE) device's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix.	The device does not test the connection between a PE device and a customer edge (CE) router.
Locate LSP using interface name	ping mpls l2vpn interface	Checks the operability of the connections related to a Layer 2 VPN. The device directs outgoing request probes out the specified interface.	—
Instance to which this connection belongs	ping mpls l2vpn instance	Checks the operability of the connections related to a Layer 2 VPN. The device pings on a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, to test the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the inbound and outbound PE routers.	—
Locate LSP from interface name	ping mpls l2circuit interface	Checks the operability of the Layer 2 circuit connections. The device directs outgoing request probes out the specified interface.	—
Locate LSP from virtual circuit information	ping mpls l2circuit virtual-circuit	Checks the operability of the Layer 2 circuit connections. The device pings on a combination of the IPv4 prefix and the virtual circuit identifier on the outbound PE router, testing the integrity of the Layer 2 circuit between the inbound and outbound PE routers.	—
Ping end point of LSP	ping mpls lsp-end-point	Checks the operability of an LSP endpoint. The device pings an LSP endpoint using either an LDP FEC prefix or an RSVP LSP endpoint address.	—

- Related Documentation**
- [Diagnostic Tools Overview on page 1300](#)
 - [Configuring Ping MPLS on page 1512](#)
 - [Using the J-Web Ping Host Tool on page 1514](#)
 - [Using the ping Command on page 1512](#)

Configuring Ping MPLS

Before using the ping MPLS feature, make sure that the receiving interface on the VPN or LSP remote endpoint has MPLS enabled, and that the loopback interface on the outbound node is configured as **127.0.0.1**. The source address for MPLS probes must be a valid address on the device.

- **MPLS Enabled**—To process ping MPLS requests, the remote endpoint of the VPN or LSP must be configured appropriately. You must enable MPLS on the receiving interface of the outbound node for the VPN or LSP. If MPLS is not enabled, the remote endpoint drops the incoming request packets and returns an “ICMP host unreachable” message to the device.
- **Loopback Address**—The loopback address (**lo0**) on the outbound node must be configured as **127.0.0.1**. If this interface address is not configured correctly, the outbound node does not have this forwarding entry. It drops the incoming request packets and returns a “host unreachable” message to the device.
- **Source Address for Probes**—The source IP address you specify for a set of probes must be an address configured on one of the device interfaces. If it is not a valid device address, the ping request fails with the error message “Can’t assign requested address.”

Related Documentation

- [Using the J-Web Ping Host Tool on page 1514](#)
- [Using the J-Web Ping MPLS Tool on page 1517](#)
- [Using the ping Command on page 1512](#)

Using the ping Command

You can perform certain tasks only through the CLI. Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The device sends a series of ICMP echo (ping) requests to a specified host and receives ICMP echo responses.

Enter the **ping** command with the following syntax:

```
user@host> ping host <interface source-interface> <bypass-routing> <count number>
<do-not-fragment> <inet | inet6> <interval seconds> <loose-source [hosts]>
<no-resolve> <pattern string> <rapid> <record-route>
<routing-instance routing-instance-name> <size bytes> <source source-address> <strict>
<strict-source [hosts]> <tos number> <ttl number> <wait seconds> <detail> <verbose>
```

[Table 204 on page 1513](#) describes the **ping** command options.

To quit the **ping** command, press Ctrl-C.

Table 204: CLI ping Command Options

Option	Description
<i>host</i>	Pings the hostname or IP address you specify.
<i>interface source-interface</i>	(Optional) Sends the ping requests on the interface you specify. If you do not include this option, ping requests are sent on all interfaces.
<i>bypass-routing</i>	(Optional) Bypasses the routing tables and sends the ping requests only to hosts on directly attached interfaces. If the host is not on a directly attached interface, an error message is returned. Use this option to ping a local system through an interface that has no route through it.
<i>countnumber</i>	(Optional) Limits the number of ping requests to send. Specify a count from 1 through 2,000,000,000. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
<i>do-not-fragment</i>	(Optional) Sets the Don't Fragment (DF) bit in the IP header of the ping request packet.
<i>inet</i>	(Optional) Forces the ping requests to an IPv4 destination.
<i>inet6</i>	(Optional) Forces the ping requests to an IPv6 destination.
<i>interval seconds</i>	(Optional) Sets the interval between ping requests, in seconds. Specify an interval from 0.1 through 10,000. The default value is 1 second.
<i>loose-source [hosts]</i>	(Optional) For IPv4, sets the loose source routing option in the IP header of the ping request packet.
<i>no-resolve</i>	(Optional) Suppresses the display of the hostnames of the hops along the path.
<i>pattern string</i>	(Optional) Includes the hexadecimal string you specify, in the ping request packet.
<i>rapid</i>	(Optional) Sends ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the count option.
<i>record-route</i>	(Optional) For IPv4, sets the record route option in the IP header of the ping request packet. The path of the ping request packet is recorded within the packet and displayed on the screen.
<i>routing-instance routing-instance-name</i>	(Optional) Uses the routing instance you specify for the ping request.
<i>size bytes</i>	(Optional) Sets the size of the ping request packet. Specify a size from 0 through 65,468. The default value is 56 bytes, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.
<i>source source-address</i>	(Optional) Uses the source address that you specify, in the ping request packet.
<i>strict</i>	(Optional) For IPv4, sets the strict source routing option in the IP header of the ping request packet.

Table 204: CLI ping Command Options (*continued*)

Option	Description
strict-source <i>[hosts]</i>	(Optional) For IPv4, sets the strict source routing option in the IP header of the ping request packet, and uses the list of hosts you specify for routing the packet.
tos <i>number</i>	(Optional) Sets the type-of-service (TOS) value in the IP header of the ping request packet. Specify a value from 0 through 255 .
ttl <i>number</i>	(Optional) Sets the time-to-live (TTL) value for the ping request packet. Specify a value from 0 through 255 .
wait <i>seconds</i>	(Optional) Sets the maximum time to wait after sending the last ping request packet. If you do not specify this option, the default delay is 10 seconds. If you use this option without the count option, the device uses a default count of 5 packets.
detail	(Optional) Displays the interface on which the ping response was received.
verbose	(Optional) Displays detailed output.

The following is sample output from a **ping** command:

```

user@host> ping host3 count 4

PING host3.site.net (176.26.232.111): 56 data bytes 64 bytes from 176.26.232.111:
icmp_seq=0 ttl=122 time=0.661 ms 64 bytes from 176.26.232.111: icmp_seq=1 ttl=122
time=0.619 ms 64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms 64
bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms --- host3.site.net
ping statistics --- 4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms

```

The fields in the display are the same as those displayed by the J-Web ping host diagnostic tool.

Using the J-Web Ping Host Tool

You can ping a host to verify that the host can be reached over the network. The output is useful for diagnosing host and network connectivity problems. The device sends a series of ICMP echo (ping) requests to a specified host and receives ICMP echo responses.

Alternatively, you can use the CLI **ping** command. (See [“Using the ping Command” on page 1512.](#))

To use the ping host tool:

1. Select **Troubleshoot>Ping Host** from the task bar.
2. Next to Advanced options, click the expand icon.
3. Enter information into the Ping Host page (see [Table 205 on page 1515](#)).

Table 205: J-Web Ping Host Field Summary

Field	Function	Your Action
Remote Host	Identifies the host to ping. This is the only required field.	Type the hostname or IP address of the host to ping.
Advanced Options		
Don't Resolve Addresses	Determines whether to display hostnames of the hops along the path.	<ul style="list-style-type: none"> • Suppress the display of the hop hostnames by selecting the check box. • Display the hop hostnames by clearing the check box.
Interface	Specifies the interface on which the ping requests are sent.	Select the interface on which ping requests are sent from the list. If you select any , the ping requests are sent on all interfaces.
Count	Specifies the number of ping requests to send.	Select the number of ping requests to send from the list.
Don't Fragment	Specifies the Don't Fragment (DF) bit in the IP header of the ping request packet.	<ul style="list-style-type: none"> • Set the DF bit by selecting the check box. • Clear the DF bit by clearing the check box.
Record Route	Sets the record route option in the IP header of the ping request packet. The path of the ping request packet is recorded within the packet and displayed in the main pane.	<ul style="list-style-type: none"> • Record and display the path of the packet by selecting the check box. • Suppress the recording and display of the path of the packet by clearing the check box.
Type-of-Service	Specifies the type-of-service (TOS) value in the IP header of the ping request packet.	Select the decimal value of the TOS field from the list.
Routing Instance	Names the routing instance for the ping attempt.	Select the routing instance name from the list.
Interval	Specifies the interval, in seconds, between the transmission of each ping request.	Select the interval from the list.
Packet Size	Specifies the size of the ping request packet.	Type the size, in bytes, of the packet. The size can be from 0 through 65,468. The device adds 8 bytes of ICMP header to the size.
Source Address	Specifies the source address of the ping request packet.	Type the source IP address.

Table 205: J-Web Ping Host Field Summary (*continued*)

Field	Function	Your Action
Time-to-Live	Specifies the time-to-live (TTL) hop count for the ping request packet.	Select the TTL from the list.
Bypass Routing	<p>Determines whether ping requests are routed by means of the routing table.</p> <p>If the routing table is not used, ping requests are sent only to hosts on the interface specified in the Interface box. If the host is not on that interface, ping responses are not sent.</p>	<ul style="list-style-type: none"> Bypass the routing table and send the ping requests to hosts on the specified interface only by selecting the check box. Route the ping requests using the routing table by clearing the check box.

4. Click **Start**.

The results of the ping operation appear in the main pane. If no options are specified, each ping response is in the following format:

bytes bytes from ip-address: icmp_seq=number ttl=number time=time

5. You can stop the ping operation before it is complete by clicking **OK**.**Related Documentation**

J-Web Ping Host Results and Output Summary

Table 206 on page 1516 summarizes the output in the ping host display.

Table 206: Ping Host Results and Output

Ping Host Result	Description
<i>bytes bytes from ip-address</i>	<ul style="list-style-type: none"> bytes—Size of ping response packet, which is equal to the value you entered in the Packet Size box, plus 8. ip-address—IP address of destination host that sent the ping response packet.
<i>icmp_seq=0</i> <i>icmp_seq=number</i>	number —Sequence Number field of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
<i>ttl=number</i>	number —Time-to-live hop-count value of the ping response packet.
<i>number packets transmitted</i>	number —Number of ping requests (probes) sent to host.

Table 206: Ping Host Results and Output (*continued*)

Ping Host Result	Description
<i>percentage</i> packet loss	<i>percentage</i> —Number of ping responses divided by the number of ping requests, specified as a percentage.
round-trip min/avg/max/stddev = <i>min-time/avg-time/max-time/std-dev</i> ms	<ul style="list-style-type: none"> • <i>min-time</i>—Minimum round-trip time (see <i>time=time</i> field in this table). • <i>avg-time</i>—Average round-trip time. • <i>max-time</i>—Maximum round-trip time. • <i>std-dev</i>—Standard deviation of the round-trip times.

If the device does not receive ping responses from the destination host (the output shows a packet loss of 100 percent), one of the following explanations might apply:

- The host is not operational.
- There are network connectivity problems between the device and the host.
- The host might be configured to ignore ICMP echo requests.
- The host might be configured with a firewall filter that blocks ICMP echo requests or ICMP echo responses.
- The size of the ICMP echo request packet exceeds the MTU of a host along the path.
- The value you selected in the Time-to-Live box was less than the number of hops in the path to the host, in which case the host might reply with an ICMP error message.

- *Interfaces Feature Guide for Security Devices*

Using the J-Web Ping MPLS Tool

Before using the ping MPLS feature, make sure that the receiving interface on the VPN or LSP remote endpoint has MPLS enabled, and that the loopback interface on the outbound node is configured as **127.0.0.1**. The source address for MPLS probes must be a valid address on the device.

To use the ping MPLS tool:

1. Select **Troubleshoot>Ping MPLS** from the task bar.
2. Next to the ping MPLS option you want to use, click the expand icon.
3. Enter information into the Ping MPLS page (see [Table 207 on page 1518](#)).

Table 207: J-Web Ping MPLS Field Summary

Field	Function	Your Action
Ping RSVP-signaled LSP		
LSP Name	Identifies the LSP to ping.	Type the name of the LSP to ping.
Source Address	Specifies the source address of the ping request packet.	Type the source IP address—a valid address configured on a device interface.
Count	Specifies the number of ping requests to send.	Select the number of ping requests to send from the list. The default is 5 requests.
Detailed Output	Requests the display of extensive rather than brief ping output.	Select the check box to display detailed output.
Ping LDP-signaled LSP		
FEC Prefix	Identifies the LSP to ping.	Type the forwarding equivalence class (FEC) prefix and length of the LSP to ping.
Source Address	Specifies the source address of the ping request packet.	Type the source IP address—a valid address configured on a device interface.
Count	Specifies the number of ping requests to send.	Select the number of ping requests to send from the list. The default is 5 requests.
Detailed Output	Requests the display of extensive rather than brief ping output.	Select the check box to display detailed output.
Ping LSP to Layer 3 VPN prefix		
Layer 3 VPN Name	Identifies the Layer 3 VPN to ping.	Type the name of the VPN to ping.
Count	Specifies the number of ping requests to send.	Select the number of ping requests to send from the list. The default is 5 requests.
Detailed Output	Requests the display of extensive rather than brief ping output.	Select the check box to display detailed output.
VPN Prefix	Identifies the IP address prefix and length of the Layer 3 VPN to ping.	Type the IP address prefix and length of the VPN to ping.
Source Address	Specifies the source address of the ping request packet.	Type the source IP address—a valid address configured on a device interface.
Locate LSP using interface name		
Interface	Specifies the interface on which the ping requests are sent.	Select the device interface on which ping requests are sent from the list. If you select any , the ping requests are sent on all interfaces.
Source Address	Specifies the source address of the ping request packet.	Type the source IP address—a valid address configured on a device interface.

Table 207: J-Web Ping MPLS Field Summary (*continued*)

Field	Function	Your Action
Count	Specifies the number of ping requests to send.	Select the number of ping requests to send from the list. The default is 5 requests.
Detailed Output	Requests the display of extensive rather than brief ping output.	Select the check box to display detailed output.
Instance to which this connection belongs		
Layer 2VPN Name	Identifies the Layer 2 VPN to ping.	Type the name of the VPN to ping.
Remote Site Identifier	Specifies the remote site identifier of the Layer 2 VPN to ping.	Type the remote site identifier for the VPN.
Source Address	Specifies the source address of the ping request packet.	Type the source IP address—a valid address configured on a device interface.
Local Site Identifier	Specifies the local site identifier of the Layer 2 VPN to ping.	Type the local site identifier for the VPN.
Count	Specifies the number of ping requests to send.	Select the number of ping requests to send from the list. The default is 5 requests.
Detailed Output	Requests the display of extensive rather than brief ping output.	Select the check box to display detailed output.
Locate LSP from interface name		
Interface	Specifies the interface on which the ping requests are sent.	Select the device interface on which ping requests are sent from the list. If you select any , the ping requests are sent on all interfaces.
Source Address	Specifies the source address of the ping request packet.	Type the source IP address—a valid address configured on a device interface.
Count	Specifies the number of ping requests to send.	Select the number of ping requests to send from the list. The default is 5 requests.
Detailed Output	Requests the display of extensive rather than brief ping output.	Select the check box to display detailed output.
Locate LSP from virtual circuit information		
Remote Neighbor	Identifies the remote neighbor (PE device) within the virtual circuit to ping.	Type the IP address of the remote neighbor within the virtual circuit.
Circuit Identifier	Specifies the virtual circuit identifier for the Layer 2 circuit to ping.	Type the virtual circuit identifier for the Layer 2 circuit.
Source Address	Specifies the source address of the ping request packet.	Type the source IP address—a valid address configured on a device interface.

Table 207: J-Web Ping MPLS Field Summary (*continued*)

Field	Function	Your Action
Count	Specifies the number of ping requests to send.	Select the number of ping requests to send from the list.
Detailed Output	Requests the display of extensive rather than brief ping output.	Select the check box to display detailed output.
Ping end point of LSP		
VPN Prefix	Identifies the LSP endpoint to ping.	Type either the LDP FEC prefix and length or the RSVP LSP endpoint address for the LSP to ping.
Source Address	Specifies the source address of the ping request packet.	Type the source IP address—a valid address configured on a device interface.
Count	Specifies the number of ping requests to send.	Select the number of ping requests to send from the list.
Detailed Output	Requests the display of extensive rather than brief ping output.	Select the check box to display detailed output.

4. Click **Start**.

5. You can stop the ping operation before it is complete by clicking **OK**.

J-Web Ping MPLS Results and Output Summary

Table 208 on page 1520 summarizes the output in the ping MPLS display.

Table 208: J-Web Ping MPLS Results and Output Summary

Field	Description
Exclamation point (!)	Echo reply was received.
Period (.)	Echo reply was not received within the timeout period.
x	Echo reply was received with an error code. Errored packets are not counted in the received packets count and are accounted for separately.

Table 208: J-Web Ping MPLS Results and Output Summary (*continued*)

Field	Description
<i>number</i> packets transmitted	<i>number</i> —Number of ping requests (probes) sent to a host.
<i>number</i> packets received	<i>number</i> —Number of ping responses received from a host.
<i>percentage</i> packet loss	<i>percentage</i> —Number of ping responses divided by the number of ping requests, specified as a percentage.
time	For Layer 2 circuits only, the number of milliseconds required for the ping packet to reach the destination. This value is approximate, because the packet has to reach the Routing Engine.

If the device does not receive ping responses from the destination host (the output shows a packet loss of 100 percent), one of the following explanations might apply:

- The host is not operational.
- There are network connectivity problems between the device and the host.
- The host might be configured to ignore echo requests.
- The host might be configured with a firewall filter that blocks echo requests or echo responses.
- The size of the echo request packet exceeds the MTU of a host along the path.
- The outbound node at the remote endpoint is not configured to handle MPLS packets.
- The remote endpoint's loopback address is not configured to 127.0.0.1.

Pinging Layer 2 Circuits

Enter the **ping mpls l2circuit** command with the following syntax:

```
user@host> ping mpls l2circuit (interface interface-name | virtual-circuit neighbor
    prefix-name virtual-circuit-id) <exp forwarding-class> <count number>
    <source source-address> <detail>
```

[Table 209 on page 1522](#) describes the **ping mpls l2circuit** command options.

Table 209: CLI ping mpls l2circuit Command Options

Option	Description
l2circuit interface <i>interface-name</i>	Sends ping requests out the specified interface configured for the Layer 2 circuit on the outbound PE device.
l2circuit virtual-circuit neighbor <i>prefix-name</i> <i>virtual-circuit-id</i>	Pings on a combination of the IPv4 prefix and the virtual circuit identifier on the outbound PE device, testing the integrity of the Layer 2 circuit between the inbound and outbound PE devices.
exp forwarding-class	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
countnumber	(Optional) Limits the number of ping requests to send. Specify a count from 0 through 1,000,000. The default value is 5. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
source source-address	(Optional) Uses the source address that you specify, in the ping request packet.
detail	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the **ping mpls l2circuit** command, press Ctrl-C.

The following is sample output from a **ping mpls l2circuit** command:

```
user@host> ping mpls l2circuit interface fe-1/0/0.0
Request for seq 1, to interface 69, labels <100000, 100208>
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

Pinging Layer 2 VPNs

Enter the **ping mpls l2vpn** command with the following syntax:

```
user@host> ping mpls l2vpn interface interface-name | instance l2vpn-instance-name
local-site-id local-site-id-number remote-site-id remote-site-id-number
<bottom-label-ttl> <exp forwarding-class> <count number> <source source-address>
<detail>
```

[Table 210 on page 1523](#) describes the **ping mpls l2vpn** command options.

Table 210: CLI ping mpls l2vpn Command Options

Option	Description
l2vpn interface <i>interface-name</i>	Sends ping requests out the specified interface configured for the Layer 2 VPN on the outbound (egress) PE device.
l2vpn instance <i>l2vpn-instance-name</i> <i>local-site-id</i> <i>local-site-id-number</i> <i>remote-site-id</i> <i>remote-site-id-number</i>	Pings on a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the inbound (ingress) and outbound PE devices.
bottom-label-ttl	(Optional) Displays the time-to-live (TTL) value for the bottom label in the MPLS label stack.
exp forwarding-class	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
countnumber	(Optional) Limits the number of ping requests to send. Specify a count from 0 through 1,000,000. The default value is 5. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
source source-address	(Optional) Uses the source address that you specify, in the ping request packet.
detail	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the **ping mpls l2vpn** command, press Ctrl-C.

The following is sample output from a **ping mpls l2vpn** command:

```

user@host> ping mpls l2vpn instance vpn1 remote-site-id 1 local-site-id 2 detail
Request for seq 1, to interface 68, labels <800001, 100176>
Reply for seq 1, return code: Egress-ok
Request for seq 2, to interface 68, labels <800001, 100176>
Reply for seq 2, return code: Egress-ok
Request for seq 3, to interface 68, labels <800001, 100176>
Reply for seq 3, return code: Egress-ok
Request for seq 4, to interface 68, labels <800001, 100176>
Reply for seq 4, return code: Egress-ok
Request for seq 5, to interface 68, labels <800001, 100176>
Reply for seq 5, return code: Egress-ok

--- 1ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss

```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

Pinging Layer 3 VPNs

Enter the **ping mpls l3vpn** command with the following syntax:

```
user@host> ping mpls l3vpn prefix prefix-name <l3vpn-name> <bottom-label-ttl>
<exp forwarding-class> <count number> <source source-address> <detail>
```

[Table 211 on page 1524](#) describes the **ping mpls l3vpn** command options.

Table 211: CLI ping mpls l3vpn Command Options

Option	Description
l3vpn prefix <i>prefix-name</i>	Pings the remote host specified by the prefix to verify that the prefix is present in the PE device's VPN routing and forwarding (VRF) table. This option does not test the connectivity between a PE device and a CE device.
<i>l3vpn-name</i>	(Optional) Layer 3 VPN name.
bottom-label-ttl	(Optional) Displays the time-to-live (TTL) value for the bottom label in the MPLS label stack.
exp <i>forwarding-class</i>	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
count<i>number</i>	(Optional) Limits the number of ping requests to send. Specify a count from 0 through 1,000,000. The default value is 5. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
source <i>source-address</i>	(Optional) Uses the source address that you specify, in the ping request packet.
detail	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the **ping mpls l3vpn** command, press Ctrl-C.

The following is sample output from a **ping mpls l3vpn** command:

```
user@host> ping mpls l3vpn vpn1 prefix 10.255.245.122/32
!!!!
--- 1sping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

Pinging RSVP-Signaled LSPs and LDP-Signaled LSPs

Enter the **ping mpls** command with the following syntax:

```
user@host> ping mpls (ldp fec | lsp-end-point prefix-name | rsvp lsp-name)
<exp forwarding-class> <count number> <source source-address> <detail>
```

[Table 212 on page 1525](#) describes the **ping mpls** command options.

Table 212: CLI ping mpls ldp and ping mpls lsp-end-point Command Options

Option	Description
ldp fec	Pings an LDP-signaled LSP identified by the forwarding equivalence class (FEC) prefix and length.
lsp-end-point prefix-name	Pings an LSP endpoint using either an LDP FEC or a RSVP LSP endpoint address.
rsvp lsp-name	Pings an RSVP-signaled LSP identified by the specified LSP name.
exp forwarding-class	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
countnumber	(Optional) Limits the number of ping requests to send. Specify a count from 0 through 1,000,000. The default value is 5. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
source source-address	(Optional) Uses the source address that you specify, in the ping request packet.
detail	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the **ping mpls** command, press Ctrl-C.

The following is sample output from a **ping mpls** command:

```
user@host> ping mpls rsvp count 5
!!xxx
--- lsping statistics ---
5 packets transmitted, 2 packets received, 60% packet loss
3 packets received with error status, not counted as received.
```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

Packet Capture Overview

Packet capture is a tool that helps you to analyze network traffic and troubleshoot network problems. The packet capture tool captures real-time data packets traveling over the network for monitoring and logging.

NOTE: Packet capture is supported on physical interfaces, reth interfaces, and tunnel interfaces, such as gr, ip, st0, and lsq-/ls.

Packets are captured as binary data, without modification. You can read the packet information offline with a packet analyzer such as Ethereal or tcpdump. If you need to quickly capture packets destined for, or originating from, the Routing Engine and analyze them online, you can use the J-Web packet capture diagnostic tool.

NOTE: The packet capture tool does not support IPv6 packet capture.

You can use either the J-Web configuration editor or CLI configuration editor to configure packet capture.

Network administrators and security engineers use packet capture to perform the following tasks:

- Monitor network traffic and analyze traffic patterns.
- Identify and troubleshoot network problems.

- Detect security breaches in the network, such as unauthorized intrusions, spyware activity, or ping scans.

Packet capture operates like traffic sampling on the device, except that it captures entire packets including the Layer 2 header and saves the contents to a file in libpcap format. Packet capture also captures IP fragments. You cannot enable packet capture and traffic sampling on the device at the same time. Unlike traffic sampling, there are no tracing operations for packet capture.

NOTE: You can enable packet capture and port mirroring simultaneously on a device.

This section contains the following topics:

- [Packet Capture on Device Interfaces on page 1527](#)
- [Firewall Filters for Packet Capture on page 1528](#)
- [Packet Capture Files on page 1528](#)
- [Analysis of Packet Capture Files on page 1528](#)

Packet Capture on Device Interfaces

Packet capture is supported on the T1, T3, E1, E3, serial, Fast Ethernet, ADSL, G.SHDSL, PPPoE, and ISDN interfaces.

To capture packets on an ISDN interface, configure packet capture on the dialer interface. To capture packets on a PPPoE interface, configure packet capture on the PPPoE logical interface.

Packet capture supports PPP, Cisco HDLC, Frame Relay, and other ATM encapsulations. Packet capture also supports Multilink PPP (MLPPP), Multilink Frame Relay end-to-end (MLFR), and Multilink Frame Relay UNI/NNI (MFR) encapsulations.

You can capture all IPv4 packets flowing on an interface in the inbound or outbound direction. However, on traffic that bypasses the flow software module (protocol packets such as ARP, OSPF, and PIM), packets generated by the Routing Engine are not captured unless you have configured and applied a firewall filter on the interface in the outbound direction.

Tunnel interfaces can support packet capture in the outbound direction only.

Use the J-Web configuration editor or CLI configuration editor to specify the maximum packet size, the filename to be used for storing the captured packets, the maximum file size, the maximum number of packet capture files, and the file permissions.

NOTE: For packets captured on T1, T3, E1, E3, serial, and ISDN interfaces in the outbound (egress) direction, the size of the packet captured might be 1 byte less than the maximum packet size configured because of the packet loss priority (PLP) bit.

To modify encapsulation on an interface that has packet capture configured, you must first disable packet capture.

Firewall Filters for Packet Capture

When you enable packet capture on a device, all packets flowing in the direction specified in packet capture configuration (inbound, outbound, or both) are captured and stored. Configuring an interface to capture all packets might degrade the performance of the device. You can control the number of packets captured on an interface with firewall filters and specify various criteria to capture packets for specific traffic flows.

You must also configure and apply appropriate firewall filters on the interface if you need to capture packets generated by the host device, because interface sampling does not capture packets originating from the host device.

Packet Capture Files

When packet capture is enabled on an interface, the entire packet including the Layer 2 header is captured and stored in a file. You can specify the maximum size of the packet to be captured, up to 1500 bytes. Packet capture creates one file for each physical interface. You can specify the target filename, the maximum size of the file, and the maximum number of files.

File creation and storage take place in the following way. Suppose you name the packet capture file **pcap-file**. Packet capture creates multiple files (one per physical interface), suffixing each file with the name of the physical interface; for example, **pcap-file.fe-0.0.1** for the Fast Ethernet interface **fe-0.0.1**. When the file named **pcap-file.fe-0.0.1** reaches the maximum size, the file is renamed **pcap-file.fe-0.0.1.0**. When the file named **pcap-file.fe-0.0.1** reaches the maximum size again, the file named **pcap-file.fe-0.0.1.0** is renamed **pcap-file.fe-0.0.1.1** and **pcap-file.fe-0.0.1** is renamed **pcap-file.fe-0.0.1.0**. This process continues until the maximum number of files is exceeded and the oldest file is overwritten. The **pcap-file.fe-0.0.1** file is always the latest file.

Packet capture files are not removed even after you disable packet capture on an interface.

Analysis of Packet Capture Files

Packet capture files are stored in libpcap format in the **/var/tmp** directory. You can specify user or administrator privileges for the files.

Packet capture files can be opened and analyzed offline with tcpdump or any packet analyzer that recognizes the libpcap format. You can also use FTP or the Session Control Protocol (SCP) to transfer the packet capture files to an external device.

NOTE: Disable packet capture before opening the file for analysis or transferring the file to an external device with FTP or SCP. Disabling packet capture ensures that the internal file buffer is flushed and all the captured packets are written to the file.

Example: Enabling Packet Capture on a Device

This example shows how to enable packet capture on a device, allowing you to analyze network traffic and troubleshoot network problems

- [Requirements on page 1529](#)
- [Overview on page 1529](#)
- [Configuration on page 1529](#)
- [Verification on page 1530](#)

Requirements

Before you begin:

- Establish basic connectivity. See the *Getting Started Guide for Branch SRX Series* for your device.
- Configure network interfaces. See *Interfaces Feature Guide for Security Devices*.

Overview

In this example, you set the maximum packet capture size in each file as 500 bytes. The range is from 68 through 1500, and the default is 68 bytes. You specify the target filename for the packet capture file as pcap-file. You then specify the maximum number of files to capture as 100. The range is from 2 through 10,000, and the default is 10 files. You set the maximum size of each file to 1024 bytes. The range is from 1,024 through 104,857,600, and the default is 512,000 bytes. Finally, you specify that all users have permission to read the packet capture files.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set forwarding-options packet-capture maximum-capture-size 500
set forwarding-options packet-capture file filename pcap-file files 100 size 1024
world-readable
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To enable packet capture on a device:

1. Set the maximum packet capture size.
[edit]

```
user@host# edit forwarding-options
user@host# set packet-capture maximum-capture-size 500
```

2. Specify the target filename.

```
[edit forwarding-options]
user@host# set packet-capture file filename pcap-file
```

3. Specify the maximum number of files to capture.

```
[edit forwarding-options]
user@host# set packet-capture file files 100
```

4. Specify the maximum size of each file.

```
[edit forwarding-options]
user@host# set packet-capture file size 1024
```

5. Specify that all users have permission to read the file.

```
[edit forwarding-options]
user@host# set packet-capture file world-readable
```

Results From configuration mode, confirm your configuration by entering the **show forwarding-options** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show forwarding-options
packet-capture {
  file filename pcap-file files 100 size 1k world-readable;
  maximum-capture-size 500;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying the Packet Capture Configuration on page 1530](#)
- [Verifying Captured Packets on page 1530](#)

Verifying the Packet Capture Configuration

Purpose Verify that the packet capture is configured on the device.

Action From configuration mode, enter the **show forwarding-options** command. Verify that the output shows the intended file configuration for capturing packets.

Verifying Captured Packets

Purpose Verify that the packet capture file is stored under the **/var/tmp** directory and the packets can be analyzed offline.

Action 1. Disable packet capture.

Using FTP, transfer a packet capture file (for example, **126b.fe-0.0.1**), to a server where you have installed packet analyzer tools (for example, **tools-server**).

- a. From configuration mode, connect to **tools-server** using FTP.

```
[edit]
user@host# run ftp tools-server
Connected to tools-server.mydomain.net
220 tools-server.mydomain.net FTP server (Version 6.00LS) ready
Name (tools-server:user):remoteuser
331 Password required for remoteuser.
Password:
230 User remoteuser logged in.
Remote system type is UNIX.
Using binary mode to transfer files.
ftp>
```

- b. Navigate to the directory where packet capture files are stored on the device.

```
ftp> lcd /var/tmp
Local directory now /cf/var/tmp
```

- c. Copy the packet capture file that you want to analyze to the server, for example **126b.fe-0.0.1**.

```
ftp> put 126b.fe-0.0.1
local: 126b.fe-0.0.1 remote: 126b.fe-0.0.1
200 PORT command successful.
150 Opening BINARY mode data connection for '126b.fe-0.0.1'.
100% 1476 00:00 ETA
226 Transfer complete.
1476 bytes sent in 0.01 seconds (142.42 KB/s)
```

- d. Return to configuration mode.

```
ftp> bye
221 Goodbye.
[edit]
user@host#
```

2. Open the packet capture file on the server with tcpdump or any packet analyzer that supports libpcap format and review the output.

```
root@server% tcpdump -r 126b.fe-0.0.1 -xvvvvv
01:12:36.279769 Out 0:5:85:c4:e3:d1 > 0:5:85:c8:f6:d1, ethertype IPv4 (0x0800),

Example: Configuring Packet Capture on an Interface

This example shows how to configure packet capture on an interface to analyze traffic.

- [Requirements on page 1532](#)
- [Overview on page 1532](#)
- [Configuration on page 1533](#)
- [Verification on page 1533](#)

Requirements

Before you begin:

- Establish basic connectivity. See the *Getting Started Guide for Branch SRX Series* for your device.
- Configure network interfaces. See *Interfaces Feature Guide for Security Devices*.

Overview

In this example, you create an interface called fe-0/0/1. You then configure the direction of the traffic for which you are enabling packet capture on the logical interface as inbound and outbound.

NOTE: On traffic that bypasses the flow software module (protocol packets such as ARP, OSPF, and PIM), packets generated by the Routing Engine are not captured unless you have configured and applied a firewall filter on the interface in the output direction.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
edit interfaces fe-0/0/1
set unit 0 family inet sampling input output
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure packet capture on an interface:

1. Create an interface.

```
[edit]
user@host# edit interfaces fe-0/0/1
```

2. Configure the direction of the traffic.

```
[edit interfaces fe-0/0/1]
user@host# set unit 0 family inet sampling input output
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Verification

Verifying the Packet Capture Configuration

Purpose Confirm that the configuration is working properly.

Verify that packet capture is configured on the interface.

Action From configuration mode, enter the **show interfaces fe-0/0/1** command.

Related Documentation

- [Packet Capture Overview on page 1526](#)
- [Changing Encapsulation on Interfaces with Packet Capture Configured on page 1540](#)
- [Example: Configuring a Firewall Filter for Packet Capture on page 1534](#)
- [Example: Enabling Packet Capture on a Device on page 1529](#)
- [Deleting Packet Capture Files on page 1539](#)
- [Disabling Packet Capture on page 1539](#)

Example: Configuring a Firewall Filter for Packet Capture

This example shows how to configure a firewall filter for packet capture and apply it to a logical interface.

- [Requirements on page 1534](#)
- [Overview on page 1534](#)
- [Configuration on page 1534](#)
- [Verification on page 1535](#)

Requirements

Before you begin:

- Establish basic connectivity. See the *Getting Started Guide for Branch SRX Series* for your device.
- Configure network interfaces. See *Interfaces Feature Guide for Security Devices*.

Overview

In this example, you set a firewall filter called `dest-all` and a term name called `dest-term` to capture packets from a specific destination address, which is `192.168.1.1/32`. You define the match condition to accept the sampled packets. Finally, you apply the `dest-all` filter to all of the outgoing packets on interface `fe-0/0/1`.

NOTE: If you apply a firewall filter on the loopback interface, it affects all traffic to and from the Routing Engine. If the firewall filter has a `sample` action, packets to and from the Routing Engine are sampled. If packet capture is enabled, then packets to and from the Routing Engine are captured in the files created for the input and output interfaces.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter `commit` from configuration mode.

```
set firewall filter dest-all term dest-term from destination-address 192.168.1.1/32
set firewall filter dest-all term dest-term then sample accept
edit interfaces
set interfaces fe-0/0/1 unit 0 family inet filter output dest-all
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a firewall filter for packet capture and apply it to a logical interface:

1. Specify the firewall filter and its destination address.

```
[edit]
user@host# edit firewall
user@host# set filter dest-all term dest-term from destination-address 192.168.1.1/32
```

2. Define the match condition and its action.

```
[edit firewall]
user@host# set filter dest-all term dest-term then sample accept
```

3. Apply the filter to all the outgoing packets.

```
[edit interfaces]
user@host# set interfaces fe-0/0/1 unit 0 family inet filter output dest-all
```

Results From configuration mode, confirm your configuration by entering the **show firewall filter dest-all** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show firewall filter dest-all
term dest-term {
  from {
    destination-address 192.168.1.1/32;
  }
  then {
    sample;
    accept;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Verifying the Firewall Filter for Packet Capture Configuration

Purpose Confirm that the configuration is working properly.

Verify that the firewall filter for packet capture is configured.

Action From configuration mode, enter the **show firewall filter dest-all** command. Verify that the output shows the intended configuration of the firewall filter for capturing packets sent to the destination address.

Related Documentation

- [Packet Capture Overview on page 1526](#)
- [Example: Configuring Packet Capture on an Interface on page 1532](#)
- [Example: Enabling Packet Capture on a Device on page 1529](#)
- [Deleting Packet Capture Files on page 1539](#)
- [Disabling Packet Capture on page 1539](#)

Example: Configuring Packet Capture for Datapath Debugging

This example shows how to configure packet capture to monitor traffic that passes through the device. Packet capture then dumps the packets into a PCAP file format that can be later examined by the tcpdump utility.

- [Requirements on page 1536](#)
- [Overview on page 1536](#)
- [Configuration on page 1536](#)
- [Verification on page 1538](#)

Requirements

Before you begin, see “[Debugging the Data Path \(CLI Procedure\)](#)” on page 1497.

Overview

A filter is defined to filter traffic; then an action profile is applied to the filtered traffic. The action profile specifies a variety of actions on the processing unit. One of the supported actions is packet dump, which sends the packet to the Routing Engine and stores it in proprietary form to be read using the **show security datapath-debug capture** command.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security datapath-debug capture-file my-capture
set security datapath-debug capture-file format pcap
set security datapath-debug capture-file size 1m
set security datapath-debug capture-file files 5
set security datapath-debug maximum-capture-size 400
set security datapath-debug action-profile do-capture event np-ingress packet-dump
set security datapath-debug packet-filter my-filter action-profile do-capture
set security datapath-debug packet-filter my-filter source-prefix 1.2.3.4/32
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure packet capture:

1. Edit the security datapath-debug option for the multiple processing units along the packet-processing path:

```
[edit]
user@host# edit security datapath-debug
```
2. Enable the capture file, the file format, the file size, and the number of files. Size number limits the size of the capture file. After the limit size is reached, if the file number is specified, then the capture file will be rotated to filename x, where x is

auto-incremented until it reaches the specified index and then returns to zero. If no files index is specified, the packets will be discarded after the size limit is reached. The default size is 512 kilobytes.

```
[edit security datapath-debug]
user@host# set capture-file my-capture format pcap size 1m files 5
[edit security datapath-debug]
user@host# set maximum-capture-size 400
```

3. Enable action profile and set the event. Set the action profile as do-capture and the event type as np-ingress:

```
[edit security datapath-debug]
user@host# edit action-profile do-capture
[edit security datapath-debug action-profile do-capture]
user@host# edit event np-ingress
```

4. Enable packet dump for the action profile:

```
[edit security datapath-debug action-profile do-capture event np-ingress]
user@host# set packet-dump
```

5. Enable packet filter, action, and filter options. The packet filter is set to my-filter, the action profile is set to do-capture, and filter option is set to source-prefix 1.2.3.4/32.

```
[edit security datapath-debug]
user@host# set security datapath-debug packet-filter my-filter action-profile
do-capture

[edit security datapath-debug]
user@host# set security datapath-debug packet-filter my-filter source-prefix
1.2.3.4/32
```

Results From configuration mode, confirm your configuration by entering the **show security datapath-debug** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it. The following is **show security datapath-debug** output from the **show security datapath-debug** command:

```
security {
  datapath-debug {
    capture-file {
      my-capture
      format pcap
      size 1m
      files 5;
    }
  }
  maximum-capture-size 100;
  action-profile do-capture {
    event np-ingress {
      packet-dump
    }
  }
  packet-filter my-filter {
    source-prefix 1.2.3.4/32
    action-profile do-capture
  }
}
```

```
}  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying Packet Capture on page 1538](#)
- [Verifying Data Path Debugging Capture on page 1538](#)
- [Verifying Data Path Debugging Counter on page 1538](#)

Verifying Packet Capture

Purpose Verify if the packet capture is working.

Action From operational mode, enter the **request security datapath-debug capture start** command to start packet capture and enter the **request security datapath-debug capture stop** command to stop packet capture.

To view the results, from CLI operational mode, access the local UNIX shell and navigate to the directory `/var/log/my-capture`. The result can be read by using the `tcpdump` utility.

Verifying Data Path Debugging Capture

Purpose Verify the details of data path debugging capture file.

Action From operational mode, enter the [show security datapath-debug capture](#) command.
`user@host>show security datapath-debug capture`

WARNING: When you are done troubleshooting, make sure to remove or deactivate all the traceoptions configurations (not limited to flow traceoptions) and the complete security datapath-debug configuration stanza. If any debugging configurations remain active, they will continue to use the device's CPU and memory resources.

Verifying Data Path Debugging Counter

Purpose Verify the details of the data path debugging counter.

Action From operational mode, enter the [show security datapath-debug counter](#) command.

Related Documentation

- [Packet Capture Overview on page 1526](#)
- [Understanding Data Path Debugging for SRX Series Devices on page 1495](#)
- [Debugging the Data Path \(CLI Procedure\) on page 1497](#)

Disabling Packet Capture

You must disable packet capture before opening the packet capture file for analysis or transferring the file to an external device. Disabling packet capture ensures that the internal file buffer is flushed and all the captured packets are written to the file.

To disable packet capture, enter from configuration mode:

```
[edit forwarding-options]
user@host# set packet-capture disable
```

If you are done configuring the device, enter **commit** from configuration mode.

Related Documentation

- [Packet Capture Overview on page 1526](#)
- [Example: Configuring Packet Capture on an Interface on page 1532](#)
- [Example: Configuring a Firewall Filter for Packet Capture on page 1534](#)
- [Example: Enabling Packet Capture on a Device on page 1529](#)
- [Deleting Packet Capture Files on page 1539](#)

Deleting Packet Capture Files

Deleting packet capture files from the `/var/tmp` directory only temporarily removes the packet capture files. Packet capture files for the interface are automatically created again the next time a packet capture configuration change is committed or as part of a packet capture file rotation.

To delete a packet capture file:

1. Disable packet capture (see [“Disabling Packet Capture” on page 1539](#)).
2. Delete the packet capture file for the interface.
 - a. From operational mode, access the local UNIX shell.

```
user@host> start shell
%
```
 - b. Navigate to the directory where packet capture files are stored.

```
% cd /var/tmp
%
```
 - c. Delete the packet capture file for the interface; for example `pcap-file.fe.0.0.0`.

```
% rm pcap-file.fe.0.0.0
%
```
 - d. Return to operational mode.

```
% exit
```

user@host>

3. Reenable packet capture (see [“Example: Enabling Packet Capture on a Device” on page 1529](#)).
4. If you are done configuring the device, enter **commit** from configuration mode.

**Related
Documentation**

- [Changing Encapsulation on Interfaces with Packet Capture Configured on page 1540](#)
- [Disabling Packet Capture on page 1539](#)

Changing Encapsulation on Interfaces with Packet Capture Configured

Before modifying the encapsulation on a device interface that is configured for packet capture, you must disable packet capture and rename the latest packet capture file. Otherwise, packet capture saves the packets with different encapsulations in the same packet capture file. Packet files containing packets with different encapsulations are not useful, because packet analyzer tools like tcpdump cannot analyze such files.

After modifying the encapsulation, you can safely reenable packet capture on the device.

To change the encapsulation on interfaces with packet capture configured:

1. Disable packet capture (see [“Disabling Packet Capture” on page 1539](#)).
2. Enter **commit** from configuration mode.
3. Rename the latest packet capture file on which you are changing the encapsulation with the **.chdsl** extension.
 - a. From operational mode, access the local UNIX shell.

```
user@host> start shell
%
```

- b. Navigate to the directory where packet capture files are stored.

```
% cd /var/tmp
%
```

- c. Rename the latest packet capture file for the interface on which you are changing the encapsulation; for example **fe.0.0.0**.

```
% mv pcap-file.fe.0.0.0 pcap-file.fe.0.0.0.chdsl
%
```

- d. Return to operational mode.

```
% exit
```

user@host>

4. Change the encapsulation on the interface using the J-Web user interface or CLI configuration editor.
5. If you are done configuring the device, enter **commit** from configuration mode.
6. Reenable packet capture (see “[Example: Enabling Packet Capture on a Device](#)” on [page 1529](#)).
7. If you are done configuring the device, enter **commit** from configuration mode.

Displaying Packet Headers

Enter the **monitor traffic** command to display packet headers transmitted through network interfaces with the following syntax:

NOTE: Using the **monitor traffic** command can degrade system performance. We recommend that you use filtering options—such as **count** and **matching**—to minimize the impact to packet throughput on the system.

```
user@host> monitor traffic <absolute-sequence> <count number>
<interface interface-name> <layer2-headers> <matching "expression">
<no-domain-names> <no-promiscuous> <no-resolve> <no-timestamp> <print-ascii>
<print-hex> <size bytes> <brief | detail | extensive>
```

[Table 213 on page 1541](#) describes the **monitor traffic** command options.

Table 213: CLI monitor traffic Command Options

Option	Description
absolute-sequence	(Optional) Displays the absolute TCP sequence numbers.
count number	(Optional) Displays the specified number of packet headers. Specify a value from 0 through 100,000 . The command quits and exits to the command prompt after this number is reached.
interface interface-name	(Optional) Displays packet headers for traffic on the specified interface. If an interface is not specified, the lowest numbered interface is monitored.
layer2-headers	(Optional) Displays the link-layer packet header on each line.

Table 213: CLI monitor traffic Command Options (*continued*)

Option	Description
matching "expression"	(Optional) Displays packet headers that match an expression enclosed in quotation marks (" "). Table 214 on page 1543 through Table 216 on page 1545 list match conditions, logical operators, and arithmetic, binary, and relational operators you can use in the expression.
no-domain-names	(Optional) Suppresses the display of the domain name portion of the hostname.
no-promiscuous	(Optional) Specifies <i>not</i> to place the monitored interface in promiscuous mode. In promiscuous mode, the interface reads every packet that reaches it. In nonpromiscuous mode, the interface reads only the packets addressed to it.
no-resolve	(Optional) Suppresses the display of hostnames.
no-timestamp	(Optional) Suppresses the display of packet header timestamps.
print-ascii	(Optional) Displays each packet header in ASCII format.
print-hex	(Optional) Displays each packet header, except link-layer headers, in hexadecimal format.
size bytes	(Optional) Displays the number of bytes for each packet that you specify. If a packet header exceeds this size, the displayed packet header is truncated. The default value is 96 .
brief	(Optional) Displays minimum packet header information. This is the default.
detail	(Optional) Displays packet header information in moderate detail. For some protocols, you must also use the size option to see detailed information.
extensive	(Optional) Displays the most extensive level of packet header information. For some protocols, you must also use the size option to see extensive information.

To quit the **monitor traffic** command and return to the command prompt, press Ctrl-C.

To limit the packet header information displayed by the **monitor traffic** command, include the **matching "expression"** option. An expression consists of one or more match conditions listed in [Table 214 on page 1543](#), enclosed in quotation marks (" "). You can combine match conditions by using the logical operators listed in [Table 215 on page 1544](#) (shown in order of highest to lowest precedence).

For example, to display TCP or UDP packet headers, enter:

```
user@host> monitor traffic matching "tcp || udp"
```

To compare the following types of expressions, use the relational operators listed in [Table 216 on page 1545](#) (listed from highest to lowest precedence):

- Arithmetic—Expressions that use the arithmetic operators listed in [Table 216 on page 1545](#).
- Binary—Expressions that use the binary operators listed in [Table 216 on page 1545](#).
- Packet data accessor—Expressions that use the following syntax:

```
protocol [byte-offset <size>]
```

Replace *protocol* with any protocol in [Table 214 on page 1543](#). Replace *byte-offset* with the byte offset, from the beginning of the packet header, to use for the comparison. The optional *size* parameter represents the number of bytes examined in the packet header—1, 2, or 4 bytes.

For example, the following command displays all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

Table 214: CLI monitor traffic Match Conditions

Match Condition	Description
Entity Type	
host [<i>address</i> <i>hostname</i>]	Matches packet headers that contain the specified address or hostname. You can prepend any of the following protocol match conditions, followed by a space, to host : arp , ip , rarp , or any of the Directional match conditions.
network address	Matches packet headers with source or destination addresses containing the specified network address.
network address mask <i>mask</i>	Matches packet headers containing the specified network address and subnet mask.
port [<i>port-number</i> <i>port-name</i>]	Matches packet headers containing the specified source or destination TCP or UDP port number or port name.
Directional	
destination	Matches packet headers containing the specified destination. Directional match conditions can be prepended to any Entity Type match conditions, followed by a space.
source	Matches packet headers containing the specified source.
source and destination	Matches packet headers containing the specified source <i>and</i> destination.
source or destination	Matches packet headers containing the specified source <i>or</i> destination.
Packet Length	
less bytes	Matches packets with lengths less than or equal to the specified value, in bytes.
greater bytes	Matches packets with lengths greater than or equal to the specified value, in bytes.

Table 214: CLI monitor traffic Match Conditions (*continued*)

Match Condition	Description
Protocol	
arp	Matches all ARP packets.
ether	Matches all Ethernet frames.
ether [broadcast multicast]	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with source or destination .
ether protocol [address (\arp \ip \rarp)]	Matches Ethernet frames with the specified address or protocol type. The arguments arp , ip , and rarp are also independent match conditions, so they must be preceded with a backslash (\) when used in the ether protocol match condition.
icmp	Matches all ICMP packets.
ip	Matches all IP packets.
ip [broadcast multicast]	Matches broadcast or multicast IP packets.
ip protocol [address (\icmp igmp \tcp \udp)]	Matches IP packets with the specified address or protocol type. The arguments icmp , tcp , and udp are also independent match conditions, so they must be preceded with a backslash (\) when used in the ip protocol match condition.
isis	Matches all IS-IS routing messages.
rarp	Matches all RARP packets.
tcp	Matches all TCP packets.
udp	Matches all UDP packets.

Table 215: CLI monitor traffic Logical Operators

Logical Operator	Description
!	Logical NOT. If the first condition does not match, the next condition is evaluated.
&&	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
 	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
()	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

Table 216: CLI monitor traffic Arithmetic, Binary, and Relational Operators

Operator	Description
Arithmetic Operator	
+	Addition operator.
–	Subtraction operator.
/	Division operator.
Binary Operator	
&	Bitwise AND.
*	Bitwise exclusive OR.
	Bitwise inclusive OR.
Relational Operator	
<=	A match occurs if the first expression is less than or equal to the second.
>=	A match occurs if the first expression is greater than or equal to the second.
<	A match occurs if the first expression is less than the second.
>	A match occurs if the first expression is greater than the second.
=	A match occurs if the first expression is equal to the second.
!=	A match occurs if the first expression is not equal to the second.

The following is sample output from the **monitor traffic** command:

```
user@host> monitor traffic count 4 matching "arp" detail
```

```
Listening on fe-0/0/0, capture size 96 bytes 15:04:16.276780 In arp who-has
193.1.1.1 tell host1.site2.net 15:04:16.376848 In arp who-has host2.site2.net
tell host1.site2.net 15:04:16.376887 In arp who-has 193.1.1.2 tell host1.site2.net
15:04:16.601923 In arp who-has 193.1.1.3 tell host1.site2.net
```

- [Example: Configuring Packet Capture on an Interface on page 1532](#)

Using the J-Web Packet Capture Tool

You can use the J-Web packet capture diagnostic tool when you need to quickly capture and analyze router control traffic on a device. Packet capture on the J-Web user interface

allows you to capture traffic destined for, or originating from, the Routing Engine. You can use the J-Web packet capture tool to compose expressions with various matching criteria to specify the packets that you want to capture. You can either choose to decode and view the captured packets in the J-Web user interface as they are captured, or save the captured packets to a file and analyze them offline using packet analyzers such as Ethereal. The J-Web packet capture tool does not capture transient traffic.

To capture transient traffic and entire IPv4 data packets for offline analysis, you must configure packet capture with the J-Web user interface or CLI configuration editor.

To use J-Web packet capture:

1. Select **Troubleshoot>Packet Capture**.
2. Enter information into the Packet Capture page (see [Table 217 on page 1546](#)). The sample configuration captures the next 10 TCP packets originating from the IP address **10.1.40.48** on port 23 and passing through the Gigabit Ethernet interface **ge-0/0/0**.
3. Save the captured packets to a file, or specify other advanced options by clicking the expand icon next to Advanced options.
4. Click **Start**.

The captured packet headers are decoded and appear in the Packet Capture display.

5. Do one of the following:
 - To stop capturing the packets and stay on the same page while the decoded packet headers are being displayed, click **Stop Capturing**.
 - To stop capturing packets and return to the Packet Capture page, click **OK**.

Table 217: Packet Capture Field Summary

Field	Function	Your Action
Interface	Specifies the interface on which the packets are captured. If you select default , packets on the Ethernet management port 0 are captured.	Select an interface from the list—for example, ge-0/0/0 .
Detail level	Specifies the extent of details to be displayed for the packet headers. <ul style="list-style-type: none"> • Brief—Displays the minimum packet header information. This is the default. • Detail—Displays packet header information in moderate detail. • Extensive—Displays the maximum packet header information. 	Select Detail from the list.
Packets	Specifies the number of packets to be captured. Values range from 1 to 1000. Default is 10. Packet capture stops capturing packets after this number is reached.	Select the number of packets to be captured from the list—for example, 10.

Table 217: Packet Capture Field Summary (*continued*)

Field	Function	Your Action
Addresses	<p>Specifies the addresses to be matched for capturing the packets using a combination of the following parameters:</p> <ul style="list-style-type: none"> Direction—Matches the packet headers for IP address, hostname, or network address of the source, destination or both. Type—Specifies if packet headers are matched for host address or network address. <p>You can add multiple entries to refine the match criteria for addresses.</p>	<p>Select address-matching criteria. For example:</p> <ol style="list-style-type: none"> From the Direction list, select source. From the Type list, select host. In the Address box, type 10.1.40.48. Click Add.
Protocols	Matches the protocol for which packets are captured. You can choose to capture TCP, UDP, or ICMP packets or a combination of TCP, UDP, and ICMP packets.	Select a protocol from the list—for example, tcp .
Ports	Matches packet headers containing the specified source or destination TCP or UDP port number or port name.	<p>Select a direction and a port. For example:</p> <ol style="list-style-type: none"> From the Type list, select src. In the Port box, type 23.
Advanced Options		
Absolute TCP Sequence	Specifies that absolute TCP sequence numbers are to be displayed for the packet headers.	<ul style="list-style-type: none"> Display absolute TCP sequence numbers in the packet headers by selecting this check box. Stop displaying absolute TCP sequence numbers in the packet headers by clearing this check box.
Layer 2 Headers	Specifies that link-layer packet headers to display.	<ul style="list-style-type: none"> Include link-layer packet headers while capturing packets, by selecting this check box. Exclude link-layer packet headers while capturing packets by clearing this check box.
Non-Promiscuous	<p>Specifies not to place the interface in promiscuous mode, so that the interface reads only packets addressed to it.</p> <p>In promiscuous mode, the interface reads every packet that reaches it.</p>	<ul style="list-style-type: none"> Read all packets that reach the interface by selecting this check box. Read only packets addressed to the interface by clearing this check box.
Display Hex	Specifies that packet headers, except link-layer headers, are to be displayed in hexadecimal format.	<ul style="list-style-type: none"> Display the packet headers in hexadecimal format by selecting this check box. Stop displaying the packet headers in hexadecimal format by clearing this check box.
Display ASCII and Hex	Specifies that packet headers are to be displayed in hexadecimal and ASCII format.	<ul style="list-style-type: none"> Display the packet headers in ASCII and hexadecimal formats by selecting this check box. Stop displaying the packet headers in ASCII and hexadecimal formats by clearing this check box.

Table 217: Packet Capture Field Summary (*continued*)

Field	Function	Your Action
Header Expression	Specifies the match condition for the packets to capture. The match conditions you specify for Addresses, Protocols, and Ports appear in expression format in this field.	Enter match conditions in expression format or modify the expression composed from the match conditions you specified for Addresses, Protocols, and Ports. If you change the match conditions specified for Addresses, Protocols, and Ports again, packet capture overwrites your changes with the new match conditions.
Packet Size	Specifies the number of bytes to be displayed for each packet. If a packet header exceeds this size, the display is truncated for the packet header. The default value is 96 bytes.	Type the number of bytes you want to capture for each packet header—for example, 256 .
Don't Resolve Addresses	Specifies that IP addresses are not to be resolved into hostnames in the packet headers displayed.	<ul style="list-style-type: none"> Prevent packet capture from resolving IP addresses to hostnames by selecting this check box. Resolve IP addresses into hostnames by clearing this check box.
No Timestamp	Suppresses the display of packet header timestamps.	<ul style="list-style-type: none"> Stop displaying timestamps in the captured packet headers by selecting this check box. Display the timestamp in the captured packet headers by clearing this check box.
Write Packet Capture File	Writes the captured packets to a file in PCAP format in <code>/var/tmp</code> . The files are named with the prefix <code>jweb-pcap</code> and the extension <code>.pcap</code> . If you select this option, the decoded packet headers do not appear on the packet capture page.	<ul style="list-style-type: none"> Save the captured packet headers to a file by selecting this check box. Decode and display the packet headers on the J-Web page by clearing this check box.

J-Web Packet Capture Results and Output Summary

Table 218 on page 1549 summarizes the output in the packet capture display.

Table 218: J-Web Packet Capture Results and Output Summary

Field	Description
<i>timestamp</i>	Time when the packet was captured. The timestamp 00:45:40.823971 means 00 hours (12.00 a.m.), 45 minutes, and 40.823971 seconds. NOTE: The time displayed is local time.
<i>direction</i>	Direction of the packet. Specifies whether the packet originated from the Routing Engine (Out), or was destined for the Routing Engine (In).
<i>protocol</i>	Protocol for the packet. In the sample output, IP indicates the Layer 3 protocol.
<i>source address</i>	Hostname, if available, or IP address and the port number of the packet's origin. If the Don't Resolve Addresses check box is selected, only the IP address of the source displays. NOTE: When a string is defined for the port, the packet capture output displays the string instead of the port number.
<i>destination address</i>	Hostname, if available, or IP address of the packet's destination with the port number. If the Don't Resolve Addresses check box is selected, only the IP address of the destination and the port appear. NOTE: When a string is defined for the port, the packet capture output displays the string instead of the port number.
<i>protocol</i>	Protocol for the packet. In the sample output, TCP indicates the Layer 4 protocol.
<i>data size</i>	Size of the packet (in bytes).

Recovering the Root Password for SRX Series Devices

If you forget the root password for an SRX Series device, you can use the password recovery procedure to reset the root password. This procedure also involves disabling the watchdog functionality to allow the system to properly boot into single-user mode (KB article 17565).

NOTE: You need console access to recover the root password

To recover the root password for an SRX Series device:

1. Power on the device by pressing the power button on the front panel. Verify that the **POWER** LED on the front panel turns green.

The device's boot sequence on your management device appears on the terminal emulation screen.

2. When the autoboot completes, press the Spacebar a few times to access the bootstrap loader prompt.
3. In operational mode, disable the watchdog functionality and enter **boot -s** to start up the system in single-user mode.

```
loader>boot -s
```

The SRX Series device will start up in single-user mode.

4. Enter **recovery** to start the root password recovery procedure.

```
System watchdog timer disabled.
```

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery
```

5. Enter configuration mode in the CLI.
6. Set the root password.

```
[edit]
```

```
user@host# set system root-authentication plain-text-password
```

7. Enter the new root password.

```
New password: juniper1
```

```
Retype new password:
```

8. At the second prompt, reenter the new root password.
9. If you are finished configuring the network, commit the configuration.

```
root@host# commit
```

```
commit complete
```

10. Exit from configuration mode.
11. Exit from operational mode.
12. Enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

The start up messages display on the screen.

13. Once again, press the Spacebar a few times to access the bootstrap loader prompt.

14. In operational mode, enable the watchdog functionality and enter **boot** to start up the system.

```
loader>watchdog enable
loader>boot
```

15. The SRX Series device starts up again and prompts you to enter a user name and password. Enter the newly configured password:

```
Wed Jul 12 14:20:21 UTC 2011
Deviceabc (ttyu0)
login: root
Password: juniper1
```

Troubleshooting DNS Name Resolution in Logical System Security Policies (Master Administrators Only)

Problem **Description:** The address of a hostname in an address book entry that is used in a security policy might fail to resolve correctly.

Cause Normally, address book entries that contain dynamic hostnames refresh automatically for SRX Series devices. The TTL field associated with a DNS entry indicates the time after which the entry should be refreshed in the policy cache. Once the TTL value expires, the SRX Series device automatically refreshes the DNS entry for an address book entry.

However, if the SRX Series device is unable to obtain a response from the DNS server (for example, the DNS request or response packet is lost in the network or the DNS server cannot send a response), the address of a hostname in an address book entry might fail to resolve correctly. This can cause traffic to drop as no security policy or session match is found.

Solution The master administrator can use the **show security dns-cache** command to display DNS cache information on the SRX Series device. If the DNS cache information needs to be refreshed, the master administrator can use the **clear security dns-cache** command.

NOTE: These commands are only available to the master administrator on devices that are configured for logical systems. This command is not available in user logical systems or on devices that are not configured for logical systems.

Troubleshooting the Link Services Interface

To solve configuration problems on a link services interface:

- [Determine Which CoS Components Are Applied to the Constituent Links on page 1552](#)
- [Determine What Causes Jitter and Latency on the Multilink Bundle on page 1553](#)
- [Determine If LFI and Load Balancing Are Working Correctly on page 1554](#)
- [Determine Why Packets Are Dropped on a PVC Between a Juniper Networks Device and a Third-Party Device on page 1560](#)

Determine Which CoS Components Are Applied to the Constituent Links

Problem **Description:** You are configuring a multilink bundle, but you also have traffic without MLPPP encapsulation passing through constituent links of the multilink bundle. Do you apply all CoS components to the constituent links, or is applying them to the multilink bundle enough?

Solution You can apply a scheduler map to the multilink bundle and its constituent links. Although you can apply several CoS components with the scheduler map, configure only the ones that are required. We recommend that you keep the configuration on the constituent links simple to avoid unnecessary delay in transmission.

[Table 219 on page 1552](#) shows the CoS components to be applied on a multilink bundle and its constituent links.

Table 219: CoS Components Applied on Multilink Bundles and Constituent Links

Cos Component	Multilink Bundle	Constituent Links	Explanation
Classifier	Yes	No	CoS classification takes place on the incoming side of the interface, not on the transmitting side, so no classifiers are needed on constituent links.
Forwarding class	Yes	No	Forwarding class is associated with a queue, and the queue is applied to the interface by a scheduler map. The queue assignment is predetermined on the constituent links. All packets from Q2 of the multilink bundle are assigned to Q2 of the constituent link, and packets from all the other queues are queued to Q0 of the constituent link.

Table 219: CoS Components Applied on Multilink Bundles and Constituent Links (*continued*)

Cos Component	Multilink Bundle	Constituent Links	Explanation
Scheduler map	Yes	Yes	<p>Apply scheduler maps on the multilink bundle and the constituent link as follows:</p> <ul style="list-style-type: none"> • Transmit rate—Make sure that the relative order of the transmit rate configured on Q0 and Q2 is the same on the constituent links as on the multilink bundle. • Scheduler priority—Make sure that the relative order of the scheduler priority configured on Q0 and Q2 is the same on the constituent links as on the multilink bundle. • Buffer size—Because all non-LFI packets from the multilink bundle transit on Q0 of the constituent links, make sure that the buffer size on Q0 of the constituent links is large enough. • RED drop profile—Configure a RED drop profile on the multilink bundle only. Configuring the RED drop profile on the constituent links applies a back pressure mechanism that changes the buffer size and introduces variation. Because this behavior might cause fragment drops on the constituent links, make sure to leave the RED drop profile at the default settings on the constituent links.
Shaping rate for a per-unit scheduler or an interface-level scheduler	No	Yes	Because per-unit scheduling is applied only at the end point, apply this shaping rate to the constituent links only. Any configuration applied earlier is overwritten by the constituent link configuration.
Transmit-rate exact or queue-level shaping	Yes	No	The interface-level shaping applied on the constituent links overrides any shaping on the queue. Thus apply transmit-rate exact shaping on the multilink bundle only.
Rewrite rules	Yes	No	Rewrite bits are copied from the packet into the fragments automatically during fragmentation. Thus what you configure on the multilink bundle is carried on the fragments to the constituent links.
Virtual channel group	Yes	No	Virtual channel groups are identified through firewall filter rules that are applied on packets only before the multilink bundle. Thus you do not need to apply the virtual channel group configuration to the constituent links.

Determine What Causes Jitter and Latency on the Multilink Bundle

Problem **Description:** To test jitter and latency, you send three streams of IP packets. All packets have the same IP precedence settings. After configuring LFI and CRTP, the latency increased even over a noncongested link. How can you reduce jitter and latency?

Solution To reduce jitter and latency, do the following:

1. Make sure that you have configured a shaping rate on each constituent link.
2. Make sure that you have not configured a shaping rate on the link services interface.
3. Make sure that the configured shaping rate value is equal to the physical interface bandwidth. See *Example: Configuring Interface Shaping Rates*.
4. If shaping rates are configured correctly, and jitter still persists, contact the Juniper Networks Technical Assistance Center (JTAC).

Determine If LFI and Load Balancing Are Working Correctly

Problem **Description:** In this case, you have a single network that supports multiple services. The network transmits data and delay-sensitive voice traffic. After configuring MLPPP and LFI, make sure that voice packets are transmitted across the network with very little delay and jitter. How can you find out if voice packets are being treated as LFI packets and load balancing is performed correctly?

Solution When LFI is enabled, data (non-LFI) packets are encapsulated with an MLPPP header and fragmented to packets of a specified size. The delay-sensitive, voice (LFI) packets are PPP-encapsulated and interleaved between data packet fragments. Queuing and load balancing are performed differently for LFI and non-LFI packets.

To verify that LFI is performed correctly, determine that packets are fragmented and encapsulated as configured. After you know whether a packet is treated as an LFI packet or a non-LFI packet, you can confirm whether the load balancing is performed correctly.

Solution Scenario—Suppose two Juniper Networks devices, R0 and R1, are connected by a multilink bundle `lsq-0/0/0.0` that aggregates two serial links, `se-1/0/0` and `se-1/0/1`. On R0 and R1, MLPPP and LFI are enabled on the link services interface and the fragmentation threshold is set to 128 bytes.

In this example, we used a packet generator to generate voice and data streams. You can use the packet capture feature to capture and analyze the packets on the incoming interface.

The following two data streams were sent on the multilink bundle:

- 100 data packets of 200 bytes (larger than the fragmentation threshold)
- 500 data packets of 60 bytes (smaller than the fragmentation threshold)

The following two voice streams were sent on the multilink bundle:

- 100 voice packets of 200 bytes from source port 100
- 300 voice packets of 200 bytes from source port 200

To confirm that LFI and load balancing are performed correctly:

NOTE: Only the significant portions of command output are displayed and described in this example. For more information, see *Verifying the Link Services Interface*.

1. Verify packet fragmentation. From operational mode, enter the **show interfaces lsq-0/0/0** command to check that large packets are fragmented correctly.

```
user@R0#> show interfaces lsq-0/0/0

```

Meaning—The output shows a summary of packets transiting the device on the multilink bundle. Verify the following information on the multilink bundle:

- The total number of transiting packets = 1000
- The total number of transiting fragments=1100
- The number of data packets that were fragmented =100

The total number of packets sent (600 + 400) on the multilink bundle match the number of transiting packets (1000), indicating that no packets were dropped.

The number of transiting fragments exceeds the number of transiting packets by 100, indicating that 100 large data packets were correctly fragmented.

Corrective Action—If the packets are not fragmented correctly, check your fragmentation threshold configuration. Packets smaller than the specified fragmentation threshold are not fragmented. See *Example: Configuring Link Fragmentation and Interleaving*.

2. Verify packet encapsulation. To find out whether a packet is treated as an LFI or non-LFI packet, determine its encapsulation type. LFI packets are PPP encapsulated, and non-LFI packets are encapsulated with both PPP and MLPPP. PPP and MLPPP encapsulations have different overheads resulting in different-sized packets. You can compare packet sizes to determine the encapsulation type.

A small unfragmented data packet contains a PPP header and a single MLPPP header. In a large fragmented data packet, the first fragment contains a PPP header and an MLPPP header, but the consecutive fragments contain only an MLPPP header.

PPP and MLPPP encapsulations add the following number of bytes to a packet:

- PPP encapsulation adds 7 bytes:
4 bytes of header+2 bytes of frame check sequence (FCS)+1 byte that is idle or contains a flag
- MLPPP encapsulation adds between 6 and 8 bytes:
4 bytes of PPP header+2 to 4 bytes of multilink header

Figure 59 on page 1556 shows the overhead added to PPP and MLPPP headers.

Figure 59: PPP and MLPPP Headers

For CRTP packets, the encapsulation overhead and packet size are even smaller than for an LFI packet. For more information, see *Example: Configuring the Compressed Real-Time Transport Protocol*.

Table 220 on page 1556 shows the encapsulation overhead for a data packet and a voice packet of 70 bytes each. After encapsulation, the size of the data packet is larger than the size of the voice packet.

Table 220: PPP and MLPPP Encapsulation Overhead

Packet Type	Encapsulation	Initial Packet Size	Encapsulation Overhead	Packet Size after Encapsulation
Voice packet (LFI)	PPP	70 bytes	4 + 2 + 1 = 7 bytes	77 bytes
Data fragment (non-LFI) with short sequence	MLPPP	70 bytes	4 + 2 + 1 + 4 + 2 = 13 bytes	83 bytes

Table 220: PPP and MLPPP Encapsulation Overhead (*continued*)

Packet Type	Encapsulation	Initial Packet Size	Encapsulation Overhead	Packet Size after Encapsulation
Data fragment (non-LFI) with long sequence	MLPPP	70 bytes	4 + 2 + 1 + 4 + 4 = 15 bytes	85 bytes

From operational mode, enter the **show interfaces queue** command to display the size of transmitted packet on each queue. Divide the number of bytes transmitted by the number of packets to obtain the size of the packets and determine the encapsulation type.

- Verify load balancing. From operational mode, enter the **show interfaces queue** command on the multilink bundle and its constituent links to confirm whether load balancing is performed accordingly on the packets.

```

```

Meaning—The output from these commands shows the packets transmitted and queued on each queue of the link services interface and its constituent links.

[Table 221 on page 1559](#) shows a summary of these values. (Because the number of transmitted packets equaled the number of queued packets on all the links, this table shows only the queued packets.)

Table 221: Number of Packets Transmitted on a Queue

Packets Queued	Bundle lsq-0/0/0.0	Constituent Link se-1/0/0	Constituent Link se-1/0/1	Explanation
Packets on Q0	600	350	350	The total number of packets transiting the constituent links (350+350 = 700) exceeded the number of packets queued (600) on the multilink bundle.
Packets on Q2	400	100	300	The total number of packets transiting the constituent links equaled the number of packets on the bundle.
Packets on Q3	0	19	18	The packets transiting Q3 of the constituent links are for keepalive messages exchanged between constituent links. Thus no packets were counted on Q3 of the bundle.

On the multilink bundle, verify the following:

- The number of packets queued matches the number transmitted. If the numbers match, no packets were dropped. If more packets were queued than were transmitted, packets were dropped because the buffer was too small. The buffer size on the constituent links controls congestion at the output stage. To correct this problem, increase the buffer size on the constituent links. For more information, see *Example: Configuring Scheduler Maps*.
- The number of packets transiting Q0 (600) matches the number of large and small data packets received (100+500) on the multilink bundle. If the numbers match, all data packets correctly transited Q0.
- The number of packets transiting Q2 on the multilink bundle (400) matches the number of voice packets received on the multilink bundle. If the numbers match, all voice LFI packets correctly transited Q2.

On the constituent links, verify the following:

- The total number of packets transiting Q0 (350+350) matches the number of data packets and data fragments (500+200). If the numbers match, all the data packets after fragmentation correctly transited Q0 of the constituent links.

Packets transited both constituent links, indicating that load balancing was correctly performed on non-LFI packets.

- The total number of packets transiting Q2 (300+100) on constituent links matches the number of voice packets received (400) on the multilink bundle. If the numbers match, all voice LFI packets correctly transited Q2.

LFI packets from source port **100** transited **se-1/0/0**, and LFI packets from source port **200** transited **se-1/0/1**. Thus all LFI (Q2) packets were hashed based on the source port and correctly transited both constituent links.

Corrective Action—If the packets transited only one link, take the following steps to resolve the problem:

- a. Determine whether the physical link is **up** (operational) or **down** (unavailable). An unavailable link indicates a problem with the PIM, interface port, or physical connection (link-layer errors). If the link is operational, move to the next step.
 - b. Verify that the classifiers are correctly defined for non-LFI packets. Make sure that non-LFI packets are not configured to be queued to Q2. All packets queued to Q2 are treated as LFI packets.
 - c. Verify that at least one of the following values is different in the LFI packets: source address, destination address, IP protocol, source port, or destination port. If the same values are configured for all LFI packets, the packets are all hashed to the same flow and transit the same link.
4. Use the results to verify load balancing.

Determine Why Packets Are Dropped on a PVC Between a Juniper Networks Device and a Third-Party Device

Problem Description: You are configuring a permanent virtual circuit (PVC) between T1, E1, T3, or E3 interfaces on a Juniper Networks device and a third-party device, and packets are being dropped and ping fails.

Solution If the third-party device does not have the same FRF.12 support as the Juniper Networks device or supports FRF.12 in a different way, the Juniper Networks device interface on the PVC might discard a fragmented packet containing FRF.12 headers and count it as a "Policed Discard."

As a workaround, configure multilink bundles on both peers, and configure fragmentation thresholds on the multilink bundles.

Troubleshooting Security Policies

- [Checking a Security Policy Commit Failure on page 1560](#)
- [Verifying a Security Policy Commit on page 1561](#)
- [Debugging Policy Lookup on page 1561](#)

Checking a Security Policy Commit Failure

Problem Description: Most policy configuration failures occur during a commit or runtime. Commit failures are reported directly on the CLI when you execute the CLI command **commit-check** in configuration mode. These errors are configuration errors, and you cannot commit the configuration without fixing these errors.

Solution To fix these errors, do the following:

1. Review your configuration data.
2. Open the file `/var/log/nsd_chk_only`. This file is overwritten each time you perform a commit check and contains detailed failure information.

Verifying a Security Policy Commit

Problem Description: Upon performing a policy configuration commit, if you notice that the system behavior is incorrect, use the following steps to troubleshoot this problem:

- Solution**
1. **Operational `show` Commands**—Execute the operational commands for security policies and verify that the information shown in the output is consistent with what you expected. If not, the configuration needs to be changed appropriately.
 2. **Traceoptions**—Set the **traceoptions** command in your policy configuration. The flags under this hierarchy can be selected as per user analysis of the **show** command output. If you cannot determine what flag to use, the flag option **all** can be used to capture all trace logs.

```
user@host# set security policies traceoptions <flag all>
```

You can also configure an optional filename to capture the logs.

```
user@host# set security policies traceoptions <filename>
```

If you specified a filename in the trace options, you can look in the `/var/log/<filename>` for the log file to ascertain if any errors were reported in the file. (If you did not specify a filename, the default filename is `eventd`.) The error messages indicate the place of failure and the appropriate reason.

After configuring the trace options, you must recommit the configuration change that caused the incorrect system behavior.

Debugging Policy Lookup

Problem Description: When you have the correct configuration, but some traffic was incorrectly dropped or permitted, you can enable the **lookup** flag in the security policies traceoptions. The **lookup** flag logs the lookup related traces in the trace file.

Solution `user@host# set security policies traceoptions <flag lookup>`

Understanding Log Error Messages for Troubleshooting ISSU-Related Problems

The following problems might occur during an ISSU upgrade. You can identify the errors by using the details in the logs. You can also see the details of the error messages in the *Junos OS System Log Reference*.

- [Chassisd Process Errors on page 1562](#)
- [Kernel State Synchronization on page 1562](#)
- [Installation Related Errors on page 1562](#)
- [ISSU Support Related Errors on page 1563](#)
- [Redundancy Group Failover Errors on page 1563](#)
- [Initial Validation Checks Fail on page 1563](#)

Chassisd Process Errors

Problem **Description:** Errors related to chassisd.

Solution Use the error messages to understand the issues related to chassisd.

When ISSU starts, a request is sent to chassisd to check whether there are any problems related to ISSU from a chassis perspective. If there is a problem, a log message is created.

Kernel State Synchronization

Problem **Description:** Errors related to ksyncd.

Solution Use the following error messages to understand the issues related to ksyncd:

Failed to get kernel-replication error information from Standby Routing Engine.
mgd_slave_peer_has_errors() returns error at line 4414 in mgd_package_issu.

ISSU checks whether there are any ksyncd errors on the secondary node (node 1) and displays the error message if there are any problems and aborts the ISSU.

Installation Related Errors

Problem **Description:** The install image file does not exist or the remote site is inaccessible.

Solution Use the following error messages to understand the installation related problems:

error: File does not exist: /var/tmp/junos-srx5000-11.4X3.2-domest
error: Couldn't retrieve package /var/tmp/junos-srx5000-11.4X3.2-domest

ISSU downloads the install image as specified in the ISSU command as an argument. The image file can be a local file or located at a remote site. If the file does not exist or the remote site is inaccessible, an error is reported.

ISSU Support Related Errors

Problem Description: Installation failure because of unsupported software and unsupported feature configuration.

Solution Use the following error messages to understand the compatibility-related problems:

```
WARNING: Current configuration not compatible with
/var/tmp/junos-srx5000-11.4X3.2-domestic.tgz
Exiting in-service-upgrade window
Exiting in-service-upgrade window
```

Redundancy Group Failover Errors

Problem Description: Problem with automatic redundancy group (RG) failure.

Solution Use the following error messages to understand the problem:

```
failover all RG 1+ groups to node 0
error: Command failed. None of the redundancy-groupss has been failed over.
Some redundancy-groups on node1 are already in manual failover mode.
Please execute 'failover reset all' first..
```

Initial Validation Checks Fail

Problem Description: The initial validation checks fail.

Solution The following error messages are displayed when initial validation checks fail when the image is not present and ISSU is aborted:

When Image is Not Present

```
user@host> ...0120914_srx_12q1_major2.2-539764-domestic.tgz reboot
Chassis ISSU Started
Chassis ISSU Started
ISSU: Validating Image
Initiating in-service-upgrade
Initiating in-service-upgrade
Fetching package...
error: File does not exist:

Accounting-Options Configuration Statement Hierarchy

Use the statements in the **accounting-options** configuration hierarchy to collect and log data about basic system operations and services on the device.

```

accounting-options {
    class-usage-profile profile-name {
        destination-classes {
            destination-class-name;
        }
        file filename;
        interval minutes;
        source-classes {
            source-class-name;
        }
    }
}

```

```
    }  
  }  
  file filename {  
    archive-sites url {  
      password password ;  
    }  
    files number;  
    nonpersistent;  
    size bytes;  
    start-time yyyy-mm-dd.hh:mm;

accounting-options

Syntax	accounting-options {...} }
Hierarchy Level	[edit]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Configure options for accounting statistics collection.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuration Statements at the [edit accounting-options] Hierarchy Level• Accounting Options Configuration on page 1305

action-profile

Syntax `action-profile profile-name {`
 `event (jexec | lbt | lt-enter | lt-leave | mac-egress | mac-ingress | np-egress | np-ingress |`
 `pot) {`
 `count;`
 `packet-dump;`
 `packet-summary;`
 `trace;`
 `}`
 `module {`
 `flow {`
 `flag {`
 `all;`
 `}`
 `}`
 `}`
 `preserve-trace-order;`
 `record-pic-history;`
`}`

Hierarchy Level [edit security datapath-debug]

Release Information Command introduced in Junos OS Release 10.0.

Description Configure the action profile options for data path debugging.

- Options**
- ***action-profile name*** — Name of the action profile.
 - **event**—Enable the events to trace the packet when the packet hit the events (jexec, lbt, lt-enter, lt-leave, mac-egress, mac-ingress, np-egress, np-ingress, pot)
 - **count**—Number of times a packet hits the specified event.
 - **packet-dump**—Capture the packet that hits the specified event.
 - **packet-summary**—Print the source/destination IP address details with protocol number and IP length details along with trace message for the specified event.
 - **trace**—Print the standard trace message when the packet hits the specified event.
 - **module**—Turn on the flow session related trace messages.
 - **flow**—Trace flow session related messages.
 - **flag**—Specify which flow message needs to be traced.
 - **all**—Trace all possible flow trace messages.
 - **trace**—Print the standard trace message when the packet hits the specified event.
 - **preserve-trace-order**—Preserve trace order.
 - **record-pic-history**—Record the PICs in which the packet has been processed.

Required Privilege Level security—To view this statement in the configuration.
security-control—To add this statement to the configuration.

Related Documentation

- [Example: Configuring Packet Capture for Datapath Debugging on page 1536](#)

archive-sites

Syntax archive-sites {
 site-name;
}

Hierarchy Level [edit accounting-options [file](#) *filename*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure an archive site. If more than one site name is configured, an ordered list of archive sites for the accounting-data log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with a filename of the format ***router-name_log-filename_timestamp***.

Options *site-name*—Any valid FTP URL to a destination.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

capture-file (Security)

Syntax	<pre>capture-file { filename; files <i>number</i>; format <i>pcap-format</i>; size <i>maximum-file-size</i>; (world-readable no-world-readable); }</pre>
Hierarchy Level	[edit security datapath-debug]
Release Information	Statement introduced in Release 10.4 of Junos OS.
Description	Sets packet capture for performing the datapath-debug action.
Options	<ul style="list-style-type: none"> • filename—Name of the file to receive the output of the packet capturing operation. • files—Maximum number of capture files. If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename. Range: 1 through 10 files • format—Describes the format of the capture file. The default format file is pcap. You can also set it as private (binary) format. • size—Describes the size limit of the capture file. If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename. Range: 10 KB through 100 MB • world-readable no-world-readable—By default, log files can be accessed only by the user who configures the tracing operation. The world-readable option enables any user to read the file. To explicitly set the default behavior, use the no-world-readable option.
Required Privilege Level	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • System Log Messages

class-usage-profile

Syntax	<pre>class-usage-profile <i>profile-name</i> { file <i>filename</i>; interval <i>minutes</i>; source-classes { <i>source-class-name</i>; } destination-classes { <i>destination-class-name</i>; } }</pre>
Hierarchy Level	[edit accounting-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	<p>Create a class usage profile, which is used to log class usage statistics to a file in the <code>/var/log</code> directory. The class usage profile logs class usage statistics for the configured source classes on every interface that has destination-class-usage configured.</p> <p>For information about configuring source classes, see the Junos Routing Protocols Configuration Guide. For information about configuring source class usage, see the Junos Network Management Configuration Guide.</p>
Options	<p>profile-name—Name of the destination class profile.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

destination-port

Syntax	<code>destination-port port;</code>
Hierarchy Level	[edit services rpm bgp], [edit services rpm probe owner test <i>test-name</i>], [edit services rpm twamp client control-connection <i>control-client-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers. Support at the [edit services rpm twamp client control-connection <i>control-client-name</i>] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.
Description	Specify the User Datagram Protocol (UDP) or Transmission Control Protocol (TCP) port to which a probe is sent. This statement is used only for TCP or UDP probe types. The value for the destination-port can be only 7 when you configure the destination port along with hardware timestamping. A constraint check prevents you for configuring any other value for the destination port in this case. This constraint does not apply when you are using one-way hardware timestamping along with destination-port and either probe-type udp-ping or probe-type udp-ping-timestamp .
Options	Default: The default value for the port is 862 to which the TWAMP client establishes control connection. port —The port number can be 7 or from 49,160 through 65,535.
<div>  NOTE: The specified port numbers are recommended for RPM only. </div>	
Required Privilege Level	system—To view this statement in the configuration. interface-control—To add this statement to the configuration.

```

Hierarchy Level [edit security]

Release Information Statement modified in Junos OS Release 9.5.

Description Determine how the device manages packet flow. The device can regulate packet flow in the following ways:

- Enable or disable DNS replies when there is no matching DNS request.
- Set the initial session-timeout values.

Options The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level security—To view this statement in the configuration.
security-control—To add this statement to the configuration.

global-threshold

Syntax	<code>global-threshold <i>number</i>;</code>
Hierarchy Level	[edit chassis cluster redundancy-group <i>group-number</i> ip-monitoring]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	Specify the failover value for all IP addresses monitored by the redundancy group. When IP addresses with a configured total weight in excess of the threshold have become unreachable, the weight of IP monitoring is deducted from the redundancy group threshold.
Options	<i>number</i> —Value at which the IP monitoring weight will be applied against the redundancy group failover threshold. Range: 0 through 255 Default: 0
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• ip-monitoring on page 1600

global-weight

Syntax	<code>global-weight <i>number</i>;</code>
Hierarchy Level	<code>[edit chassis cluster redundancy-group <i>group-number</i> ip-monitoring]</code>
Release Information	Statement introduced in Junos OS Release 10.1.
Description	Specify the relative importance of all IP address monitored objects to the operation of the redundancy group. Every monitored IP address is assigned a weight. If the monitored address becomes unreachable, the weight of the object is deducted from the global-threshold of IP monitoring objects in its redundancy group. When the global-threshold reaches 0, the global-weight is deducted from the redundancy group. Every redundancy group has a default threshold of 255. If the threshold reaches 0, a failover is triggered. Failover is triggered even if the redundancy group is in manual failover mode and preemption is not enabled.
Options	<p><i>number</i> —Combined weight assigned to all monitored IP addresses. A higher weight value indicates a greater importance.</p> <p>Range: 0 through 255</p> <p>Default: 255</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

ip-monitoring

```
Syntax  ip-monitoring {
        family {
            inet {
                ipv4-address {
                    interface {
                        logical-interface-name;
                        secondary-ip-address ip-address;
                    }
                    weight number;
                }
            }
        }
        global-threshold number;
        global-weight number;
        retry-count number;
        retry-interval seconds;
    }
```

Hierarchy Level [edit chassis cluster redundancy-group *group-number*]

Release Information Statement updated in Junos OS Release 10.1.

Description Specify a global IP address monitoring threshold and weight, and the interval between pings (**retry-interval**) and the number of consecutive ping failures (**retry-count**) permitted before an IP address is considered unreachable for all IP addresses monitored by the redundancy group. Also specify IP addresses, a monitoring weight, a redundant Ethernet interface number, and a secondary IP monitoring ping source for each IP address, for the redundancy group to monitor.

Options *family family-name IP address*—The address to be continually monitored for reachability.

NOTE: All monitored object failures, including IP monitoring, are deducted from the redundancy group threshold priority. Other monitored objects include interface monitor, SPU monitor, cold-sync monitor, and NPC monitor (on supported platforms).

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information	Statement introduced in Junos OS Release 7.5.
Description	Configure packet capture on a device.
Options	<p>disable—Disable packet capture on the router.</p> <p>file <i>filename</i>—Name of the file to enable packet capture.</p> <ul style="list-style-type: none">• <i>number</i>—Maximum size of file.• <i>no-world-readable</i>—Restrict file access to the owner.• <i>world-readable</i>—Enable unrestricted file access. <p>maximum-capture-size—Configure the maximum size of capture for packets.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Packet Capture Overview on page 1526

packet-filter

Syntax	<pre>packet-filter <i>packet-filter-name</i> { action-profile (<i>profile-name</i> default); destination-port (<i>port-range</i> <i>protocol-name</i>); destination-prefix <i>destination-prefix</i>; interface <i>logical-interface-name</i>; protocol (<i>protocol-number</i> <i>protocol-name</i>); source-port (<i>port-range</i> <i>protocol-name</i>); source-prefix <i>source-prefix</i>; }</pre>
Hierarchy Level	[edit security datapath-debug]
Release Information	<p>Command introduced in Junos OS Release 9.6 ; Support for IPv6 addresses for the destination-prefix and source-prefix options added in Junos OS Release 10.4.</p> <p>Support for IPv6 filter for the interface option added in Junos OS Release 10.4.</p>
Description	Set packet filter for taking the datapath-debug action. A maximum of four filters are supported at the same time.
Options	<ul style="list-style-type: none"> • action-profile (<i>profile-name</i> default)—Identify the action profile to use. You can specify the name of the action profile to use or select default action profile. • destination-port (<i>port-range</i> <i>protocol name</i>)—Specify a destination port to match TCP/UDP destination port. • destination-prefix <i>destination-prefix</i>—Specify a destination IPv4/IPv6 address prefix. • interface <i>logical-interface-name</i>—Specify a logical interface name. • protocol (<i>protocol-number</i> <i>protocol-name</i>)—Match IP protocol type. • source-port (<i>port-range</i> <i>protocol-name</i>)—Match TCP/UDP source port. • source-prefix <i>source-prefix</i>—Specify a source IP address prefix.
Required Privilege Level	<p>security—To view this statement in the configuration</p> <p>security-control—To add this statement to the configuration.</p>

                    std-dev-egress microseconds;
                    std-dev-ingress microseconds;
                    std-dev-rtt microseconds;
                    successive-loss count;
                    total-loss count;
                }
                traps [trap-names];
            }
        }

```

Hierarchy Level [edit services rpm]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.

Description Specify an owner name. The owner name combined with the test name represent a single RPM configuration instance.

Options *owner*—Specify an owner name up to 32 characters in length.

The remaining statements are explained separately.

Required Privilege	system—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

probe-interval

Syntax	<code>probe-interval interval;</code>
Hierarchy Level	[edit services rpm bgp], [edit services rpm probe owner test test-name]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers. Statement at the [edit services rpm twamp client control-connection control-client-name] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.
Description	Specify the time to wait between sending packets, in seconds.
Options	<i>interval</i> —Number of seconds, from 1 through 255.
Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring BGP Neighbor Discovery Through RPM</i>• <i>Configuring RPM Probes</i>

probe-limit

Syntax	<code>probe-limit limit;</code>
Hierarchy Level	[edit services rpm]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.3 for EX Series switches.
Description	Specify the maximum number of concurrent probes allowed.
Options	<i>limit</i> —A value from 1 through 500. Default: 100.
Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

probe-server

Syntax `probe-server {
 tcp {
 destination-interface interface-name;
 port number;
 }
 udp {
 destination-interface interface-name;
 port number;
 }
 }`

Hierarchy Level [edit services rpm]

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 9.3 for EX Series switches.

Description Specify the server to act as a receiver for the probes.

 The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

probe-type

Syntax	<code>probe-type type;</code>
Hierarchy Level	<code>[edit services rpm bgp],</code> <code>[edit services rpm probe owner test test-name]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers. icmp6-ping option added in Junos OS Release 15.1X49-D10 for vSRX.
Description	Specify the packet and protocol contents of a probe.
Options	type —Specify one of the following probe type values: <ul style="list-style-type: none">• http-get—(Not available at the <code>[edit services rpm bgp]</code> hierarchy level.) Sends a Hypertext Transfer Protocol (HTTP) get request to a target URL.• http-metadata-get—(Not available at the <code>[edit services rpm bgp]</code> hierarchy level.) Sends an HTTP get request for metadata to a target URL.• icmp-ping—Sends ICMP echo requests to an IPv4 target address.• icmp6-ping—Sends ICMPv6 echo requests to an IPv6 target address.• icmp-ping-timestamp—Sends ICMP timestamp requests to an IPv4 target address.• tcp-ping—Sends TCP packets to a target.• udp-ping—Sends UDP packets to a target.• udp-ping-timestamp—Sends UDP timestamp requests to a target address.
Required Privilege Level	interface —To view this statement in the configuration. interface-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring BGP Neighbor Discovery Through RPM</i>

redundancy-group (Chassis Cluster)

```
Syntax  redundancy-group group-number {
        gratuitous-arp-count number;
        hold-down-interval number;
        interface-monitor interface-name {
            weight number;
        }
        ip-monitoring {
            family {
                inet {
                    ipv4-address {
                        interface {
                            logical-interface-name;
                            secondary-ip-address ip-address;
                        }
                        weight number;
                    }
                }
            }
            global-threshold number;
            global-weight number;
            retry-count number;
            retry-interval seconds;
        }
        node (0 | 1) {
            priority number;
        }
        preempt;
    }
```

Hierarchy Level [edit chassis cluster]

Release Information Statement introduced in Junos OS Release 9.0.

Description Define a redundancy group. Except for redundancy group 0, a redundancy group is a logical interface consisting of two physical Ethernet interfaces, one on each chassis. One interface is active, and the other is on standby. When the active interface fails, the standby interface becomes active. The logical interface is called a redundant Ethernet interface (**reth**).

Redundancy group 0 consists of the two Routing Engines in the chassis cluster and controls which Routing Engine is primary. You must define redundancy group 0 in the chassis cluster configuration.

Options *group-number* —Redundancy group identification number.

Range: 0 through 128

NOTE: The maximum number of redundancy groups is equal to the number of redundant Ethernet interfaces that you configure.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation • [ip-monitoring on page 1600](#)

retry-interval (Chassis Cluster)

Syntax `retry-interval interval;`

Hierarchy Level [edit chassis cluster redundancy-group *group-number* ip-monitoring]

Release Information Statement introduced in Junos OS Release 10.1.

Description Specify the ping packet send frequency (in seconds) for each IP address monitored by the redundancy group. (See **retry-count** for a related IP address monitoring configuration variable.)

Options *interval*—Pause time between each ping sent to each IP address monitored by the redundancy group.

Range: 1 to 30 seconds

Default: 1 second

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation • [ip-monitoring on page 1600](#)

routing-engine-profile

Syntax	<pre> routing-engine-profile <i>profile-name</i> { fields { <i>field-name</i>; } file <i>filename</i>; interval <i>minutes</i>; } </pre>
Hierarchy Level	[edit accounting-options]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	Create a Routing Engine profile to collect selected Routing Engine statistics and write them to a file in the <code>/var/log</code> directory.
Options	<p><i>profile-name</i>—Name of the Routing Engine statistics profile.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring the Routing Engine Profile on page 1325

rpm (Services)

```
Syntax  rpm {
        bgp {
            data-fill data;
            data-size size;
            destination-port port;
            history-size size;
            logical-system logical-system-name <routing-instances routing-instance-name>;
            moving-average-size number-of-samples;
            probe-count count;
            probe-interval seconds;
            probe-type type;
            routing-instances {
                routing-instance-name;
            }
            test-interval seconds;
        }
        probe owner {
            test test-name {
                data-fill data;
                data-size size;
                destination-interface interface-name;

size

Syntax	<code>size bytes;</code>
Hierarchy Level	[edit accounting-options file <i>filename</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify attributes of an accounting-data log file.
Options	bytes —Maximum size of each log file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a log file (for example, profilelog) reaches its maximum size, it is renamed profilelog.0 , then profilelog.1 , and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. If you do not specify a size, the file is closed, archived, and renamed when the time specified for the transfer interval is exceeded. Syntax: <i>x</i> to specify bytes, <i>xk</i> to specify KB, <i>xm</i> to specify MB, <i>xg</i> to specify GB Range: 256 KB through 1 GB
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Maximum Size of the File on page 1309

source-classes

Syntax	<pre>source-classes { <i>source-class-name</i>; }</pre>
Hierarchy Level	[edit accounting-options class-usage-profile <i>profile-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify the source classes for which statistics are collected.
Options	source-class-name —Name of the source class to include in the class usage profile.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring a Class Usage Profile on page 1321

start-time

Syntax	<code>start-time <i>time</i>;</code>
Hierarchy Level	[edit accounting-options file <i>filename</i>]
Release Information	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify the start time for transfer of an accounting-data log file.
Options	<i>time</i> —Start time for file transfer. Syntax: <i>YYYY-MM-DD.hh:mm</i>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Start Time for File Transfer on page 1310

target (Services RPM)

Syntax	<code>target (url url address ipv4-address inet6-url url inet6-address ipv6-address);</code>
Hierarchy Level	<code>[edit services rpm probe owner test test-name]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2 for PTX Packet Transport Routers.</p> <p>inet6-url and inet6-address options added in Junos OS Release 15.1X49-D10 for vSRX.</p>
Description	Specify the destination address or URL used for the probes.
Options	<p>url url—For HTTP probe types, specify a fully formed URL that includes http:// in the URL address.</p> <p>inet6-url url—For HTTP probe types, specify a fully formed URL that includes http:// in the URL address. You can also specify an IPv6 address of a host in the URL to denote the destination or server to which the RPM probes must be sent.</p> <p>address ipv4-address—For all IPv4 probe types other than the HTTP probes, specify an IPv4 address for the target host.</p> <p>inet6-address ipv6-address—For all IPv6 probe types other than the HTTP probes, specify an IPv6 address for the target host.</p>
<div>  <p>NOTE: Starting with Junos OS Release 15.1X49-D10, the RPM client router (the router or switch that originates the RPM probes) can send probe packets to the RPM probe server (the device that receives the RPM probes) that contains an IPv6 address.</p> </div>	
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring IPv6 RPM Probes on page 1353

thresholds

Syntax	<code>thresholds thresholds;</code>
Hierarchy Level	<code>[edit services rpm probe owner test test-name]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2 for PTX Packet Series Transport Routers.</p> <p>Support at the <code>[edit services rpm twamp client control-connection control-client-name]</code> hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.</p>
Description	Specify thresholds used for the probes. A system log message is generated when the configured threshold is exceeded. Likewise, an SNMP trap (if configured) is generated when a threshold is exceeded.
Options	<p>thresholds—Specify one or more threshold measurements. The following options are supported:</p> <ul style="list-style-type: none"> • egress-time—Measures maximum source-to-destination time per probe. • ingress-time—Measures maximum destination-to-source time per probe. • jitter-egress—Measures maximum source-to-destination jitter per test. • jitter-ingress—Measures maximum destination-to- source jitter per test. • jitter-rtt—Measures maximum jitter per test, from 0 through 60,000,000 microseconds. • rtt—Measures maximum round-trip time per probe, in microseconds. • std-dev-egress—Measures maximum source-to-destination standard deviation per test. • std-dev-ingress—Measures maximum destination-to-source standard deviation per test. • std-dev-rtt—Measures maximum standard deviation per test, in microseconds. • successive-loss—Measures successive probe loss count, indicating probe failure. Default: 1 • total-loss—Measures total probe loss count indicating test failure, from 0 through 15. Default: 1
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring RPM Probes</i>

traceoptions (Security Datapath Debug)

Syntax	<pre> traceoptions { file { filename; files number; match regular-expression; size maximum-file-size; (world-readable no-world-readable); } no-remote-trace; } </pre>
Hierarchy Level	[edit security datapath-debug]
Release Information	Command introduced in Junos OS Release 9.6.
Description	Sets the trace options for datapath-debug.
Options	<ul style="list-style-type: none"> • file—Configure the trace file options. <ul style="list-style-type: none"> • filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. By default, the name of the file is the name of the process being traced. • files number—Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed to trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten. <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.</p> <p>Range: 2 through 1000 files</p> <p>Default: 10 files</p> • match regular-expression—Refine the output to include lines that contain the regular expression. • size maximum-file-size—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. <p>If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.</p> <p>Syntax: x K to specify KB, x m to specify MB, or x g to specify GB</p> <p>Range: 10 KB through 1 GB</p> <p>Default: 128 KB</p>

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option
- **no-remote-trace**—Set remote tracing as disabled.

Required Privilege Level trace—To view this statement in the configuration.
trace-control—To add this statement to the configuration.

Related Documentation • [Security Configuration Statement Hierarchy on page 59](#)

transfer-interval

Syntax transfer-interval *minutes*;

Hierarchy Level [edit accounting-options [file](#) *filename*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Specify the length of time the file remains open and receives new statistics before it is closed and transferred to an archive site.

Options *minutes*—Time the file remains open and receives new statistics before it is closed and transferred to an archive site.
Range: 5 through 2880 minutes
Default: 30 minutes

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

traps

Syntax	<code>traps traps;</code>
Hierarchy Level	<p>[edit services rpm probe owner test <i>test-name</i>]</p> <p>[edit services rpm twamp client control-connection <i>control-client-name</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.</p> <p>Support at the [edit services rpm twamp client control-connection <i>control-client-name</i>] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.</p>
Description	Set the trap bit to generate traps for probes. Traps are sent if the configured threshold is met or exceeded.
Options	<p>traps—Specify one or more traps. The following options are supported:</p> <ul style="list-style-type: none"> • control-connection-closed—Generate traps when the control connection is closed. • egress-jitter-exceeded—Generate traps when the jitter in egress time threshold is met or exceeded. • egress-std-dev-exceeded—Generate traps when the egress time standard deviation threshold is met or exceeded. • egress-time-exceeded—Generate traps when the maximum egress time threshold is met or exceeded. • ingress-jitter-exceeded—Generate traps when the jitter in ingress time threshold is met or exceeded. • ingress-std-dev-exceeded—Generate traps when the ingress time standard deviation threshold is met or exceeded. • ingress-time-exceeded—Generate traps when the maximum ingress time threshold is met or exceeded. • jitter-exceeded—Generate traps when the jitter in round-trip time threshold is met or exceeded. • probe-failure—Generate traps when successive probe loss thresholds are crossed. • rtt-exceeded—Generate traps when the maximum round-trip time threshold is met or exceeded. • std-dev-exceeded—Generate traps when the round-trip time standard deviation threshold is met or exceeded. • test-completion—Generate traps when a test is completed. • test-failure—Generate traps when the total probe loss threshold is met or exceeded. • test-iteration-done—Generate traps when all test sessions under control connections complete one test iteration.

NOTE: For RPM traps to be generated, you must configure the `remote-operations` SNMP trap category by including the `categories` statement at the `[edit snmp trap-group trap-group-name]` hierarchy level.

Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

clear chassis cluster ip-monitoring failure-count

Syntax	clear chassis cluster ip-monitoring failure-count
Release Information	Command introduced in Junos OS Release 10.1.
Description	Clear the failure count for all IP addresses.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• <i>clear chassis cluster failover-count</i>• clear chassis cluster ip-monitoring failure-count ip-address on page 1628
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
user@host> clear chassis cluster ip-monitoring failure-count
node0:
-----
Cleared failure count for all IPs

node1:
-----
Cleared failure count for all IPs
```

clear chassis cluster ip-monitoring failure-count ip-address

Syntax	clear chassis cluster ip-monitoring failure-count ip-address 1.1.1.1
Release Information	Command introduced in Junos OS Release 10.1.
Description	Clear the failure count for a specified IP address.

NOTE: Entering an IP address at the end of this command is optional. If you do not specify an IP address, the failure count for all monitored IP addresses is cleared.

Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• <i>clear chassis cluster failover-count</i>• clear chassis cluster ip-monitoring failure-count on page 1627
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
user@host> clear chassis cluster ip-monitoring failure-count ip-address 1.1.1.1
node0:
-----
Cleared failure count for IP: 1.1.1.1

node1:
-----
Cleared failure count for IP: 1.1.1.1
```

monitor list

Syntax	monitor list
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display the status of monitored log and trace files.
Options	This command has no options.
Additional Information	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the syslog statement at the [edit system] hierarchy level and the options statement at the [edit routing-options] hierarchy level. The trace files generated by the routing protocol process are those configured with traceoptions statements at the [edit routing-options] , [edit interfaces] , and [edit protocols protocol] hierarchy levels.
Required Privilege Level	trace
Related Documentation	<ul style="list-style-type: none"> monitor start on page 1630 monitor stop on page 1632
List of Sample Output	monitor list on page 1629
Output Fields	Table 222 on page 1629 describes the output fields for the monitor list command. Output fields are listed in the approximate order in which they appear.

Table 222: monitor list Output Fields

Field Name	Field Description
monitor start	Indicates the file is being monitored.
"filename"	Name of the file that is being monitored.
Last changed	Date and time at which the file was last modified.

Sample Output

monitor list

```
user@host> monitor list
monitor start "vrrpd" (Last changed Dec 03:11:06 20)
monitor start "cli-commands" (Last changed Nov 07:3)
```

monitor start

Syntax	<code>monitor start <i>filename</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Start displaying the system log or trace file and additional entries being added to those files.
Options	<i>filename</i> —Specific log or trace file.
Additional Information	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the syslog statement at the [edit system] hierarchy level and the options statement at the [edit routing-options] hierarchy level. The trace files generated by the routing protocol process are configured with traceoptions statements at the [edit routing-options] , [edit interfaces] , and [edit protocols protocol] hierarchy levels.

NOTE: To monitor a log file within a logical system, issue the `monitor start logical-system-name/filename` command.

Required Privilege Level	trace
Related Documentation	<ul style="list-style-type: none"> monitor list on page 1629 monitor stop on page 1632
List of Sample Output	monitor start on page 1631
Output Fields	Table 223 on page 1630 describes the output fields for the monitor start command. Output fields are listed in the approximate order in which they appear.

Table 223: monitor start Output Fields

Field Name	Field Description
<i>filename</i>	Name of the file from which entries are being displayed. This line is displayed initially and when the command switches between log files.
<i>Date and time</i>	Timestamp for the log entry.

Sample Output

monitor start

```
user@host> monitor start system-log
*** system-log***
Jul 20 15:07:34 hang sshd[5845]: log: Generating 768 bit RSA key.
Jul 20 15:07:35 hang sshd[5845]: log: RSA key generation complete.
Jul 20 15:07:35 hang sshd[5845]: log: Connection from 204.69.248.180 port 912
Jul 20 15:07:37 hang sshd[5845]: log: RSA authentication for root accepted.
Jul 20 15:07:37 hang sshd[5845]: log: ROOT LOGIN as 'root' from host.example.com
Jul 20 15:07:37 hang sshd[5845]: log: Closing connection to 204.69.248.180
```

monitor stop

Syntax	<code>monitor stop <i>filename</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Stop displaying the system log or trace file.
Options	<i>filename</i> —Specific log or trace file.
Additional Information	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are those configured with the syslog statement at the [edit system] hierarchy level and the options statement at the [edit routing-options] hierarchy level. The trace files generated by the routing protocol process are those configured with traceoptions statements at the [edit routing-options] , [edit interfaces] , and [edit protocols <i>protocol</i>] hierarchy levels.
Required Privilege Level	trace

List of Sample Output	monitor stop on page 1632
Output Fields	This command produces no output.

Sample Output

monitor stop

```
user@host> monitor stop
```

mtrace monitor

Syntax	mtrace monitor
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Listen passively for IP multicast responses. To exit the mtrace monitor command, type Ctrl+c.
Options	none —Trace the master instance.
Required Privilege Level	view
List of Sample Output	mtrace monitor on page 1634
Output Fields	Table 224 on page 1633 describes the output fields for the mtrace monitor command. Output fields are listed in the approximate order in which they appear.

Table 224: mtrace monitor Output Fields

Field Name	Field Description
Mtrace query at	Date and time of the query.
by	Address of the host issuing the query.
resp to	Response destination.
qid	Query ID number.
packet from...to	IP address of the query source and default group destination.
from...to	IP address of the multicast source and the response address.
via group	IP address of the group to trace.
mxhop	Maximum hop setting.

Sample Output

mtrace monitor

```
user@host> mtrace monitor
Mtrace query at Oct 22 13:36:14 by 192.1.3.2, resp to 224.0.1.32, qid 74a5b8
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:17 by 192.1.3.2, resp to 224.0.1.32, qid 1d07ba
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:20 by 192.1.3.2, resp to same, qid 2fea1d
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:30 by 192.1.3.2, resp to same, qid 7c88ad
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)
```

ping mpls l2circuit

Syntax	<p>ping mpls l2circuit (interface <i>interface-name</i> virtual-circuit <i>virtual-circuit-id</i> neighbor <i>address</i>)</p> <p><count <i>count</i>></p> <p><destination <i>address</i>></p> <p><detail></p> <p><exp <i>forwarding-class</i>></p> <p><logical-system (all <i>logical-system-name</i>)></p> <p>reply-mode (application-level-control-channel ip-udp no-reply)</p> <p><size <i>bytes</i>></p> <p><source <i>source-address</i>></p> <p><sweep></p> <p><v1></p>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p> <p>The size and sweep options were introduced in Junos OS Release 9.6.</p> <p>The reply-mode option and its suboptions are introduced in Junos OS Release 10.4R1.</p>
Description	<p>Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a ping mpls l2circuit command.</p>
Options	<p>count <i>count</i>—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.</p> <p>destination <i>address</i>—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.</p> <p>detail—(Optional) Display detailed information about the echo requests sent and received.</p> <p>exp <i>forwarding-class</i>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p>interface <i>interface-name</i>—Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p>reply-mode—(Optional) Reply mode for the ping request. This option has the following suboptions:</p> <p>application-level-control-channel—Reply using an application level control channel.</p> <p>ip-udp—Reply using an IPv4 or IPv6 UDP packet.</p> <p>no-reply—Do not reply to the ping request.</p>

NOTE: The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

size bytes—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

vl—(Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV).

virtual-circuit virtual-circuit-id neighbor address—Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

Additional Information You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

Required Privilege Level network

List of Sample Output [ping mpls l2circuit interface on page 1637](#)
[ping mpls l2circuit virtual-circuit detail on page 1637](#)
[ping mpls l2circuit interface <interface-name> reply-mode on page 1637](#)

Output Fields When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls l2circuit interface

```
user@host> ping mpls l2circuit interface so-1/0/0.1
Request for seq 1, to interface 69, labels <100000, 100208>, packet size 100
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

ping mpls l2circuit virtual-circuit detail

```
user@host> ping mpls l2circuit virtual-circuit 200 neighbor 10.255.245.122/32 detail
Request for seq 1, to interface 68, labels <100048, 100128>, packet size 100

Reply for seq 1, return code: Egress-ok time: 0.539 ms
```

ping mpls l2circuit interface <interface-name> reply-mode

```
user@host> ping mpls l2circuit interface lt-1/2/0.21 reply-mode application-level-control-channel
!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

ping mpls l2vpn

Syntax	<p>ping mpls l2vpn (instance <i>instance-name</i> local-site-id <i>local-site-id-number</i> remote-site-id <i>remote-site-id-number</i> interface <i>interface-name</i>)</p> <p><bottom-label-ttl></p> <p><count <i>count</i>></p> <p><destination <i>address</i>></p> <p><detail></p> <p><exp <i>forwarding-class</i>></p> <p><logical-system (all <i>logical-system-name</i>)></p> <p>reply-mode (application-level-control-channel ip-udp no-reply)</p> <p><size <i>bytes</i>></p> <p><source <i>source-address</i>></p> <p><sweep></p>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>The size and sweep options were introduced in Junos OS Release 9.6.</p> <p>The reply-mode option and its suboptions are introduced in Junos OS Release 10.4R1.</p>
Description	<p>Check the operability of MPLS Layer 2 virtual private network (VPN) connections. Type Ctrl+c to interrupt a ping mpls l2vpn command.</p>
Options	<p>bottom-label-ttl—(Optional) Display the time-to-live value for the bottom label in the label stack.</p> <p>count <i>count</i>—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.</p> <p>destination <i>address</i>—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.</p> <p>detail—(Optional) Display detailed information about the echo requests sent and received.</p> <p>exp <i>forwarding-class</i>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p>instance <i>instance-name</i> local-site-id <i>local-site-id-number</i> remote-site-id <i>remote-site-id-number</i>—Ping a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the ingress and egress provider edge (PE) routers or switches.</p> <p>interface <i>interface-name</i>—Ping an interface configured for the Layer 2 VPN on the egress PE router or switch.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p>reply-mode—(Optional) Reply mode for the ping request. This option has the following suboptions:</p> <p>application-level-control-channel—Reply using an application level control channel.</p>

ip-udp—Reply using an IPv4 or IPv6 UDP packet.

no-reply—Do not reply to the ping request.

The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

size bytes—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

ping mpls ldp

Syntax ping mpls ldp *fec*
 <count *count*>
 <destination *address*>
 <detail>
 <exp *forwarding-class*>
 <instance *routing-instance-name*>
 <logical-system (all | *logical-system-name*)>
 <p2mp root-addr *ip-address* lsp-id *identifier*>
 <size *bytes*>
 <source *source-address*>
 <sweep>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
size and **sweep** options introduced in Junos OS Release 9.6.
instance option introduced in Junos OS Release 10.0.
p2mp, **root-address**, and **lsp-id** options introduced in Junos OS Release 11.2.
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Check the operability of MPLS LDP-signaled label-switched path (LSP) connections.
 Type Ctrl+c to interrupt a **ping mpls** command.

Options **count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through **1,000,000**. The default value is **5**.

destination *address*—(Optional) Specify an address other than the default (**127.0.0.1/32**) for the ping echo requests. The address can be anything within the **127/8** subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

fec—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

instance *routing-instance-name*—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

p2mp root-addr *ip-address* **lsp-id** *identifier*—(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.

size *bytes*—(Optional) Size of the LSP ping request packet (**88** through **65468** bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller

than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the **ping mpls ldp** command by specifying a new time in seconds using the **lsp-ping-interval** statement at the **[edit protocols ldp oam]** hierarchy level. For more information, see the *MPLS Feature Guide for Security Devices*.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

Required Privilege Level network

List of Sample Output [ping mpls ldp fec count on page 1645](#)
[ping mpls ldp p2mp root-addr lsp-id on page 1645](#)

Output Fields When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls ldp fec count

```
user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received,
70% packet loss 4 packets received with error status, not counted as received.
```

ping mpls ldp p2mp root-addr lsp-id

```

ping mpls rsvp

Syntax ping mpls rsvp
 <lsp-name>
 <count count>
 <destination address>
 <detail>
 <dynamic-bypass>
 <egress egress-address>
 <exp forwarding-class>
 <interface interface-name>
 <logical-system (all | logical-system-name)>
 <manual-bypass>
 <multipoint>
 <size bytes>
 <source source-address>
 <standby standby-path-name>
 <sweep>

Release Information Command introduced before Junos OS Release 7.4.
 The **egress** and **multipoint** options were introduced in Junos OS Release 9.2.
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.
 The **dynamic-bypass** and **manual-bypass** options were introduced in Junos OS Release 10.2.
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a **ping mpls** command.

Options **count count**—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination address—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

NOTE: When using the **detail** option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.

In practice, it is difficult to synchronize the system times of independent Juniper Networks routers with sufficient accuracy to provide a meaningful time value for the **detail** option (even when synchronized using NTP).

dynamic-bypass—(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

egress *egress-address*—(Optional) Only the specified egress router or switch responds to the ping request.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

interface—(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the **manual-bypass** option.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

lsp-name—Ping an RSVP-signaled LSP using an LSP name.

manual-bypass—(Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the **interface** option.

multipoint—(Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the **egress** option to ping a specific egress router or switch participating in a point-to-multipoint LSP.

size *bytes*—(Optional) Size of the LSP ping request packet (100 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.

standby *standby-path-name*—(Optional) Name of the standby path.

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

request pppoe connect

Syntax	request pppoe connect
Release Information	Statement supported on SRX100, SRX110, SRX210, SRX220, SRX240, and SRX650 is introduced in Release 11.2 and 11.4 of Junos OS.
Description	Connect all sessions that are down.
Options	pppoe interface name — (Optional) Connect to a specified session.
Required Privilege Level	maintenance
List of Sample Output	request pppoe connect on page 1654
Output Fields	When you enter this command, this command returns no output.

Sample Output

request pppoe connect

```
user@host> request pppoe connect
```

request pppoe disconnect

Syntax	request pppoe disconnect
Release Information	Statement supported on SRX100, SRX110, SRX210, SRX220, SRX240, and SRX650 is introduced in Release 11.2 and 11.4 of Junos OS.
Description	Disconnect all active sessions.
Options	session id — (Optional) Disconnect the session for which the session ID is specified. pppoe interface name — (Optional) Disconnect the session for a specific pppoe interface name.
Required Privilege Level	maintenance
List of Sample Output	request pppoe disconnect on page 1655
Output Fields	When you enter this command, this command returns no output.

Sample Output

request pppoe disconnect

```
user@host> request pppoe disconnect
```

request services ip-monitoring preempt-restore policy

Syntax	<code>request services ip-monitoring preempt-restore policy <policy-name></code>
Release Information	Command introduced in Release 11.4 of Junos OS.
Description	If the no-preempt option is specified, the policy will not perform preemptive failback when it is in a failover state, and when the RPM probe test recovers from failure. To manually revert to the failback state, run the request services ip-monitoring preempt-restore policy command.
	<div>  <p>NOTE: The <code>request services ip-monitoring preempt-restore policy</code> command takes effect only when the RPM probe is in the pass state, and when the policy is in a failover state.</p> </div>
Options	<code>policy name</code> —Name of the policy.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • show services rpm probe-results (View) on page 1723 • show services ip-monitoring status on page 1719
List of Sample Output	run request services ip-monitoring preempt-restore policy <policy name> on page 1656
Output Fields	When you run this command, the policy is restored to the failback state.

Sample Output

`run request services ip-monitoring preempt-restore policy <policy name>`

```
user@host> run request services ip-monitoring preempt-restore policy policy1
Restore request succeeded: Policy policy1
```

show chassis alarms

Syntax	show chassis alarms
Release Information	Command introduced in Junos OS Release 11.1 for SRX Series devices.
Description	Display information about the conditions that have been configured to trigger alarms.
Options	This command has no options.
Additional Information	<p>You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm is lit, it indicates that you are running the device in a manner that we do not recommend.</p> <p>On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.</p> <p>In Junos OS Release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.</p>
Required Privilege Level	view

List of Sample Output	show chassis alarms on page 1657
Output Fields	Table 225 on page 1657 lists the output fields for the show chassis alarms command. Output fields are listed in the approximate order in which they appear.

Table 225: show chassis alarms Output Fields

Field Name	Field Description
Alarm time	Date and time the alarm was first recorded.
Class	Severity class for this alarm: Minor or Major.
Description	Information about the alarm.

Sample Output

show chassis alarms

```
user@host> show chassis alarms
```

4 alarms currently active

Alarm time	Class	Description
2012-05-29 16:47:18 UTC	Major	/var partition usage crossed critical threshold
2012-05-29 16:47:18 UTC	Minor	/var partition usage crossed high threshold
2012-05-29 16:47:18 UTC	Major	/root partition usage crossed critical threshold
2012-05-29 16:47:18 UTC	Minor	/root partition usage crossed high threshold

show configuration

Syntax	<code>show configuration</code> <code><statement-path></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display the configuration that currently is running on the router or switch, which is the last committed configuration.
Options	<p>none—Display the entire configuration.</p> <p>statement-path—(Optional) Display one of the following hierarchies in a configuration. (Each statement-path option has additional suboptions not described here. See the appropriate feature guide or EX Series switch documentation for more information.)</p> <ul style="list-style-type: none"> • access—Network access configuration. • access-profile—Access profile configuration. • accounting-options—Accounting data configuration. • applications—Applications defined by protocol characteristics. • apply-groups—Groups from which configuration data is inherited. • chassis—Chassis configuration. • chassis network-services—Current running mode. • class-of-service—Class-of-service configuration. • diameter—Diameter base protocol layer configuration. • ethernet-switching-options—(EX Series switch only) Ethernet switching configuration. • event-options—Event processing configuration. • firewall—Firewall configuration. • forwarding-options—Options that control packet sampling. • groups—Configuration groups. • interfaces—Interface configuration. • jsrc—JSRC partition configuration. • jsrc-partition—JSRC partition configuration. • logical-systems—Logical system configuration. • poe—(EX Series switch only) Power over Ethernet configuration. • policy-options—Routing policy option configuration. • protocols—Routing protocol configuration.

- **routing-instances**—Routing instance configuration.
- **routing-options**—Protocol-independent routing option configuration.
- **security**—Security configuration.
- **services**—Service PIC applications configuration.
- **snmp**—Simple Network Management Protocol configuration.
- **system**—System parameters configuration.
- **virtual-chassis**—(EX Series switch only) Virtual Chassis configuration.
- **vlan**—(EX Series switch only) VLAN configuration.

Additional Information The portions of the configuration that you can view depend on the user class that you belong to and the corresponding permissions. If you do not have permission to view a portion of the configuration, the text **ACCESS-DENIED** is substituted for that portion of the configuration. If you do not have permission to view authentication keys and passwords in the configuration, because the **secret** permission bit is not set for your user account, the text **SECRET-DATA** is substituted for that portion of the configuration. If an identifier in the configuration contains a space, the identifier is displayed in quotation marks.

Likewise, when you issue the **show configuration** command with the **| display set** pipe option to view the configuration as **set** commands, those portions of the configuration that you do not have permissions to view are substituted with the text **ACCESS-DENIED**.

show chassis cluster ip-monitoring status redundancy-group

Syntax	show chassis cluster ip-monitoring status <redundancy-group group-number>
Release Information	Command introduced in Junos OS Release 9.6. Support for global threshold, current threshold, and weight of each monitored IP address added in Junos OS Release 12.1X47-D10.
Description	Display the status of all monitored IP addresses for a redundancy group.
Options	<ul style="list-style-type: none"> • none— Display the status of monitored IP addresses for all redundancy groups on the node. • redundancy-group group-number — Display the status of monitored IP addresses under the specified redundancy group.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>redundancy-group (Interfaces)</i> • <i>clear chassis cluster failover-count</i> • <i>request chassis cluster failover node</i> • <i>request chassis cluster failover reset</i>
List of Sample Output	show chassis cluster ip-monitoring status on page 1663 show chassis cluster ip-monitoring status redundancy-group on page 1664
Output Fields	Table 226 on page 1662 lists the output fields for the show chassis cluster ip-monitoring status command.

Table 226: show chassis cluster ip-monitoring status Output Fields

Field Name	Field Description
Redundancy-group	ID number (0 - 255) of a redundancy group in the cluster.
Global threshold	Failover value for all IP addresses monitored by the redundancy group.
Current threshold	Value equal to the global threshold minus the total weight of the unreachable IP address.
IP Address	Monitored IP address in the redundancy group.
Status	<p>Current reachability state of the monitored IP address.</p> <p>Values for this field are: reachable, unreachable, and unknown. The status is “unknown” if Packet Forwarding Engines (PFEs) are not yet up and running.</p>
Failure count	Number of attempts to reach an IP address.

Table 226: show chassis cluster ip-monitoring status Output Fields (*continued*)

Field Name	Field Description
Reason	Explanation for the reported status. See Table 227 on page 1663 .
Weight	Combined weight (0 - 255) assigned to all monitored IP addresses. A higher weight value indicates greater importance.

Expanded reason output fields for unreachable IP addresses added in Junos OS Release 10.1. You might see any of the following reasons displayed.

Table 227: show chassis cluster ip-monitoring status redundancy group Reason Fields

Reason	Reason Description
No route to host	The router could not resolve the ARP, which is needed to send the ICMP packet to the host with the monitored IP address.
No auxiliary IP found	The redundant Ethernet interface does not have an auxiliary IP address configured.
Reth child not up	A child interface of a redundant Ethernet interface is down.
redundancy-group state unknown	Unable to obtain the state (primary, secondary, secondary-hold, disable) of a redundancy-group.
No reth child MAC address	Could not extract the MAC address of the redundant Ethernet child interface.
Secondary link not monitored	The secondary link might be down (the secondary child interface of a redundant Ethernet interface is either down or non-functional).
Unknown	The IP address has just been configured and the router still does not know the status of this IP. or Do not know the exact reason for the failure.

Sample Output

show chassis cluster ip-monitoring status

```
user@host> show chassis cluster ip-monitoring status
node0:
```

```
-----
Redundancy group: 1
Global threshold: 200
Current threshold: -120
```

Release Information Command modified in Junos OS Release 9.5.

Description Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

On SRX Series appliance, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

- Options**
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
 - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
 - **ce1-*pim*/0/ *port***—Channelized E1 interface.
 - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
 - **ct1-*pim*/0/*port***—Channelized T1 interface.
 - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
 - **e1-*pim*/0/*port***—E1 interface.
 - **e3-*pim*/0/*port***—E3 interface.

- **fe-pim/0/port**—Fast Ethernet interface.
- **ge-pim/0/port**—Gigabit Ethernet interface.
- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

- **brief | detail | extensive | terse**—(Optional) Display the specified level of output.
- **controller**—(Optional) Show controller information.
- **descriptions**—(Optional) Display interface description strings.
- **destination-class**—(Optional) Show statistics for destination class.
- **diagnostics**—(Optional) Show interface diagnostics information.
- **far-end-interval**—(Optional) Show far end interval statistics.
- **filters**—(Optional) Show interface filters information.
- **flow-statistics**—(Optional) Show security flow counters and errors.
- **interval**—(Optional) Show interval statistics.
- **load-balancing**—(Optional) Show load-balancing status.
- **mac-database**—(Optional) Show media access control database information.
- **mc-ae**—(Optional) Show MC-AE configured interface information.
- **media**—(Optional) Display media information.
- **policers**—(Optional) Show interface policers information.
- **queue**—(Optional) Show queue statistics for this interface.
- **redundancy**—(Optional) Show redundancy status.
- **routing**—(Optional) Show routing status.
- **routing-instance**—(Optional) Name of routing instance.
- **snmp-index**—(Optional) SNMP index of interface.
- **source-class**—(Optional) Show statistics for source class.
- **statistics**—(Optional) Display statistics and detailed output.
- **switch-port**—(Optional) Front end port number (0..15).
- **transport**—(Optional) Show interface transport information.
- **zone**—(Optional) Interface's zone.

Output Fields	<p>Table 228 on page 1668 lists the output fields for the show interfaces command. Output fields are listed in the approximate order in which they appear.</p>

Table 228: show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Link-level type	Encapsulation being used on the physical interface.	All levels
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
MTU	Maximum transmission unit size on the physical interface.	All levels
Link mode	Link mode: Full-duplex or Half-duplex.	
Speed	Speed at which the interface is running.	All levels
BPDU error	Bridge protocol data unit (BPDU) error: Detected or None	
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device.	All levels
Interface flags	Information about the interface.	All levels
Link flags	Information about the physical link.	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Current address	Configured MAC address.	detail extensive none

Table 228: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None
Output Rate	Output rate in bps and pps.	None
Active alarms and Active defects	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Table 228: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Input errors	<p>Input errors on the interface.</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<p>Output errors on the interface.</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive

Table 228: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface.	extensive
Queue counters and queue number	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
MAC statistics	Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following: <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> • Packet length exceeds 1518 octets, or • Packet length exceeds MRU • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive

Table 228: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0. 	extensive
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. 	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 228: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Interface transmit statistics	Status of the interface-transmit-statistics configuration: Enabled or Disabled.	detail extensive
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive

Table 228: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Local statistics	Number and rate of bytes and packets destined to the device.	extensive
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	extensive
Security	Security zones that interface belongs to.	extensive
Flow Input statistics	Statistics on packets received by flow module.	extensive
Flow Output statistics	Statistics on packets sent by flow module.	extensive
Flow error statistics (Packets dropped due to)	Statistics on errors in the flow module.	extensive
Protocol	Protocol family.	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. .	detail extensive
Addresses, Flags	Information about the address flags..	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

show poe interface (View)

Syntax	show poe interface <ge-fpc/pic/port>
Release Information	Command introduced in Release 9.5 of Junos OS.
Description	Display the status of Power over Ethernet (PoE) ports.
Options	<ul style="list-style-type: none"> none—Display the status of all PoE ports on the SRX Series device. ge-fpc/pic/port— (Optional) Display the status of a specific PoE port on the SRX Series device.
Required Privilege Level	View
Related Documentation	<ul style="list-style-type: none"> <i>Example: Configuring PoE on All Interfaces</i>
Output Fields	Table 229 on page 1696 lists the output fields for the show poe interface command. Output fields are listed in the approximate order in which they appear.

Table 229: show poe interface Output Fields

Field name	Field Description
PoE Interface	Specifies the interface name.
Admin Status	Specifies whether PoE capabilities are enabled or disabled.
Oper status	Specifies the operational status of the port.
Max-power	Specifies the maximum power configured on the port.
Priority	Specifies whether the port is high priority or low priority.
Power-consumption	Specifies how much power is being used by the port.
Class	Indicates the class of the powered device as defined by the IEEE 802 AF standard.

Sample Output

show poe interface

```
user@host>show poe interface
```

```

Interface Admin status Oper status Max power Priority Power consumption Class
ge-0/0/0 Enabled Searching 15.4W Low 0.0W 0

Class of power device : 0
```

show poe telemetries

Syntax	show poe telemetries <interface <i>interface-name</i> count <i>number</i> > <count <i>number</i> interface <i>interface-name</i> >
Release Information	Command modified in Junos OS Release 12.3X48-D10.
Description	Display a history of power consumption on the specified interface. Telemetries must be enabled on the interface before you can display a history of power consumption.
Options	<ul style="list-style-type: none"> • Interface <i>interface-name</i>—Display telemetries for the specified PoE interface. • count <i>number</i>—Display the specified number of telemetries records for the specified PoE interface.
Required Privilege Level	View
Related Documentation	<ul style="list-style-type: none"> • <i>Example: Configuring PoE on All Interfaces</i>
Output Fields	Table 230 on page 1698 lists the output fields for the show poe telemetries interface command. Output fields are listed in the approximate order in which they appear.

Table 230: show poe telemetries interface Output Fields

Field name	Field Description
S1 No	Number of the record for the specified port. The last record is the most recent.
Timestamp	Time that the power-consumption data was gathered.
Power	Amount of power provided by the specified port at the time the data was gathered.
Voltage	Voltage on the specified port at the time the data was gathered.

Sample Output

Output Fields	Table 231 on page 1700 lists the output fields for the show pppoe interfaces command. Output fields are listed in the approximate order in which they appear.

Table 231: show pppoe interfaces Output Fields

Field Name	Field Description
Index	Index number of the logical interface, which reflects its initialization sequence.
State	State of the logical interface: up or down .
Session ID	Session ID.
Service name	Type of service required (can be used to indicate an ISP name, a class, or quality of service).
Configured AC name	Configured access concentrator name.

Table 231: show pppoe interfaces Output Fields (*continued*)

Field Name	Field Description
Session AC name	Name of the access concentrator.
Remote MAC address or Remote MAC	MAC address of the remote side of the connection, either the access concentrator or the PPPoE client.
Auto-reconnect timeout	Timeout value for reconnecting after a PPPoE session is terminated (in seconds).
Idle timeout	Length of time (in seconds) that a connection can be idle before disconnecting.
Session uptime	Length of time the session has been up, in <i>hh:mm:ss</i> .
Ignore End-Of-List tag	Disables the End-of-List tag to continue processing of other tags after the End-of-List tag in a PPPoE Active Discovery Offer (PADO) packet.
Underlying interface	Interface on which PPPoE is running.
Packet Type	<p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> • PADI—PPPoE Active Discovery Initiation packets. • PADO—PPPoE Active Discovery Offer packets. • PADR—PPPoE Active Discovery Request packets. • PADS—PPPoE Active Discovery Session-Confirmation packets. • PADT—PPPoE Active Discovery Termination packets. • Service name error—Packets for which the Service-Name request could not be honored. • AC system error—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit. • Generic error—Packets that indicate an unrecoverable error occurred. • Malformed packets—Malformed or short packets that caused the packet handler to discard the frame as unreadable. • Unknown packets—Unrecognized packets.
Timeout	<p>Timeouts that occur during the PPPoE session:</p> <ul style="list-style-type: none"> • PADI—No PADI packets received within the timeout period. • PADO—No PADO packets received within the timeout period. (This value is always zero and is not supported.) • PADR—No PADR packets received within the timeout period.
Receive Error Counters	<p>Error counters received during the PPPoE session:</p> <ul style="list-style-type: none"> • PADI—No PADI error counters received during the session. • PADO—No PADO error counters received during the session. • PADR—No PADR error counters received during the session. • PADS—No PADS error counters received during the session.

show security alarms

Syntax show security alarms
 <detail>
 <alarm-id *id-number*>
 <alarm-type [*types*]>
 <newer-than YYYY-MM-DD.HH:MM:SS>
 <older-than YYYY-MM-DD.HH:MM:SS>
 <process *process*>
 <severity *severity*>

Release Information Command introduced in Junos OS Release 11.2.

Description Display the alarms that are active on the device. Run this command when the CLI prompt indicates that a security alarm has been raised, as shown here:

```
[1 SECURITY ALARM] user@host#
```

Options **none**—Display all active alarms.

detail—(Optional) Display detailed output.

alarm-id *id-number*—(Optional) Display the specified alarm.

alarm-type [*types*]—(Optional) Display the specified alarm type or a set of types.

You can specify one or more of the following alarm types:

- authentication
- cryptographic-self-test
- decryption-failures
- encryption-failures
- ike-phase1-failures
- ike-phase2-failures
- key-generation-self-test
- non-cryptographic-self-test
- policy
- replay-attacks

newer-than YYYY-MM-DD.HH:MM:SS—(Optional) Display active alarms that were raised after the specified date and time.

older-than YYYY-MM-DD.HH:MM:SS—(Optional) Display active alarms that were raised before the specified date and time.

process *process*—(Optional) Display active alarms that were raised by the specified system process.

severity severity—(Optional) Display active alarms of the specified severity.

You can specify the following severity levels:

- **alert**
- **crit**
- **debug**
- **emerg**
- **err**
- **info**
- **notice**
- **warning**

Required Privilege Level security—To view this statement in the configuration.

show security monitoring fpc fpc-number

Syntax	show security monitoring fpc <i>fpc-number</i> <node (<i>node-id</i> all local primary)>
Release Information	Command introduced in Release 9.2 of Junos OS.
Description	Display security monitoring information about the FPC slot.
Options	<ul style="list-style-type: none"> • <i>fpc-number</i>—Display security monitoring information for the specified FPC slot. It can be in the range from 0 to 11. • node—(Optional) For chassis cluster configurations, display security monitoring information for the specified FPC on a specific node (device) in the cluster. <ul style="list-style-type: none"> • <i>node-id</i>—Identification number of the node. It can be 0 or 1. • all—Display information about all nodes. • local—Display information about the local node. • primary—Display information about the primary node.
Additional Information	For complete list of slot numbering, physical port, and logical interface numbering for SRX Series devices in chassis cluster, see <i>Chassis Cluster Feature Guide for Branch SRX Series Devices</i> .
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show services ip-monitoring status on page 1719
List of Sample Output	show security monitoring fpc 0 on page 1715 show security monitoring fpc 1 on page 1715 show security monitoring fpc 8 on page 1716
Output Fields	Table 234 on page 1714 lists the output fields for the show security monitoring fpc <i>fpc-number</i> command. Output fields are listed in the approximate order in which they appear.

Table 234: show security monitoring fpc fpc-number Output Fields

Field Name	Field Description
FPC	Slot number in which the FPC is installed.
PIC	Slot number in which the PIC is installed.
CPU Utilization (%)	Total percentage of CPU being used by the PIC's processors.
Memory Utilization (%)	Percentage of heap space (dynamic memory) being used by the PIC's processor. If this number exceeds 80 percent, there might be a software problem (memory leak).

Table 234: show security monitoring fpc fpc-number Output Fields (*continued*)

Field Name	Field Description
Current flow session	The current number of flow sessions. When SRX Series devices operate in packet mode, flow sessions will not be created and this field will remain zero.
Max flow session	The maximum number of flow sessions allowed. This number will differ from one device to another.
SPU current cp session	The current number of cp sessions for the SPU (on SRX3400, SRX3600, SRX5600, and SRX5800 devices only).
SPU max cp session	The maximum number of cp sessions allowed for the SPU (on SRX3400, SRX3600, SRX5600, and SRX5800 devices only).

Sample Output

show security monitoring performance session

Syntax show security monitoring performance session

<fpc slot-number>

<pic slot-number>

Release Information Command introduced in Release of 10.2 of Junos OS.

Description Display the current session (total number of sessions at that time) for the last 60 seconds.

- Options**
- **fpc slot-number** — Display information about the FPC slot. Use this option to filter the output based on the slot number.
 - **pic slot-number** — Display information about existing PIMs or Mini-PIMs in a particular PIC slot. Use this option to filter the output based on PIC slot.

NOTE: The `fpc slot-number` and `pic slot-number` options are not available on SRX100, SRX210, SRX240, and SRX650 devices.

Required Privilege Level View

show services ip-monitoring status

Syntax	show services ip-monitoring status
Release Information	Command modified in Release 11.4 R2 of Junos OS. Next-hop functionality added in Junos OS Release 23.1X46-D15.
Description	Display a brief summary of IP monitoring status along with the current state for a given policy.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show services rpm probe-results (View) on page 1723
List of Sample Output	show services ip-monitoring status on page 1720 show services ip-monitoring status on page 1720 show services ip-monitoring status on page 1721 show services ip-monitoring status on page 1721 show services ip-monitoring status on page 1721
Output Fields	Table 235 on page 1719 lists the output fields for the show services ip-monitoring status command. Output fields are listed in the approximate order in which they appear.

Table 235: show services ip-monitoring status Output Fields

Field Name	Field Description
Policy	Name of the policy configured.
Probe Name	Name of the probe configured.
Address	Displays the configured target address.
Status	Displays the status of the probe on the target address. If the status is PASS, then the target address is reached.
Route-Action	Displays route injection information configured for the policy and its failover status.
Route-Instance	Displays the routing instance of the route to be injected during failover.
Route	Routing address of the route to be injected during failover.
Next-Hop	Specifies the next-hop address of the route to be injected during failover. P2P interfaces only.
State	Display the state of the route injection action. If the state is APPLIED, then the ip-monitoring policy is in failover state.
Interface Action	Displays the interface action type as enable or disable.

Table 235: show services ip-monitoring status Output Fields (*continued*)

Field Name	Field Description
Policy Action	Displays the policy action type as enable or disable.
Admin State	Displays the current admin state of the interface.
Action Status	Displays the current action status of the interface.

Sample Output

show services ip-monitoring status

```

user@host> show services ip-monitoring status

Policy - policy1 (Non-preemptive. Status: FAIL)
RPM Probes:
  Probe name      Test Name      Address      Status
  -----
  probe_a         a1             15.1.1.10    FAIL
  probe_a         a2             200.1.1.1    FAIL
Route-Action:
  route-instance  route          next-hop      State
  -----
  inet.0          200.1.1.0     150.1.1.1    APPLIED
Interface-Action:
  interface       policy action  admin state  action status
  -----
  fe-0/0/5.2      Enable        UP           FAILOVER
  fe-0/0/5.4      Disable       DOWN         FAILOVER
  t1-1/0/0         Enable        UP           FAILOVER
  d10              Enable        UP           FAILOVER
  ge-0/0/1         Enable        UP           FAILOVER

```

Sample Output

show services ip-monitoring status

In this example, the policy is in the failback state, and the no-preempt option is not configured.

```

user@host> show services ip-monitoring status

Policy - policy1 (Status: PASS)
RPM Probes:
  Probe name      Test Name      Address      Status
  -----
  probe1          a1             99.1.1.2     PASS
Route-Action:
  route-instance  route          next-hop      state
  -----
  inet.0          99.1.1.0       12.12.12.2    NOT-APPLIED
Interface-Action:
  interface       policy action  admin state  action status
  -----

```

at-2/0/0	Enable	DOWN	MARKED-DOWN
ge-0/0/2.2	Enable	DOWN	MARKED-DOWN
ge-0/0/2.3	Enable	DOWN	MARKED-DOWN

Sample Output

show services ip-monitoring status

In this example, the policy is in the failover state, and the primary is restored. The no-preempt option is configured.

```
user@host> show services ip-monitoring status
```

Policy - policy1 (Non-preemptive. Status: FAILOVER-NO-PREEMPT)

RPM Probes:

Probe name	Test Name	Address	Status
probe1	a1	99.1.1.2	PASS

Route-Action:

route-instance	route	next-hop	state
inet.0	99.1.1.0	12.12.12.2	APPLIED

Interface-Action:

interface	policy action	admin state	action status
at-2/0/0	Enable	UP	FAILOVER
ge-0/0/2.2	Enable	UP	FAILOVER
ge-0/0/2.3	Enable	UP	FAILOVER

Sample Output

show services ip-monitoring status

When the probe succeeds and the policy is not applied, the output is as follows:

```
user@host> show services ip-monitoring status
```

Policy payment (Status: PASS)

RPM Probes:

Probe name	Test Name	Address	Status
Probe-Payment-Server	paysvr	9.9.9.2	PASS

Route-Action:

route-instance	route	next-hop	state
inet.0	9.9.9.0/24	e1-6/0/0.0	NOT-APPLIED

Sample Output

show services ip-monitoring status

When the probe fails and the policy is applied, the output is as follows:

```
user@host> show services ip-monitoring status
```

Policy payment (Status: FAIL)

RPM Probes:

Probe name	Test Name	Address	Status
Probe-Payment-Server	paysvr	9.9.9.2	FAIL

Route-Action:

route-instance	route	next-hop	state
----------------	-------	----------	-------

-----	-----	-----	-----
inet.0	9.9.9.0/24	e1-6/0/0.0	APPLIED

show services rpm probe-results (View)

Syntax	show services rpm probe-results <owner <i>owner</i> > <test <i>name</i> >
Release Information	Command introduced in Release 11.2 of Junos OS.
Description	Display the results of the most recent real-time performance monitoring (RPM) probes.
Options	<p>none—Display all results of the most recent RPM probes.</p> <p>owner <i>owner</i>—(Optional) Display information for the specified probe owner.</p> <p>test <i>name</i>—(Optional) Display information for the specified test.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> show services ip-monitoring status on page 1719
List of Sample Output	show services rpm probe-results (IPv4 Targets) on page 1726 show services rpm probe-results (IPv6 Targets) on page 1726
Output Fields	Table 236 on page 1723 lists the output fields for the show services rpm probe-results command. Output fields are listed in the approximate order in which they appear.

Table 236: show services rpm probe-results Output Fields

Field Name	Field Description
Owner	Owner name. When you configure the probe owner statement at the [edit services rpm] hierarchy level, this field displays the configured owner name. When you configure BGP neighbor discovery through RPM, the output for this field is Rpm-Bgp-Owner .
Test	Name of a test representing a collection of probes. When you configure the test test-name statement at the [edit services rpm probe owner] hierarchy level, the field displays the configured test name. When you configure BGP neighbor discovery through RPM, the output for this field is Rpm-BGP-Test-<i>n</i> , where <i>n</i> is a cumulative number.
Target address	Destination IPv4 address used for the probes.
Target inet6-address	Destination IPv6 address used for the probes. This field is displayed when the probes are sent to the configured IPv6 targets or RPM servers.
Source address	Source address used for the probes.
Probe type	Protocol configured on the receiving probe server: http-get , http-metadata-get , icmp-ping , icmp6-ping , icmp-ping-timestamp , tcp-ping , udp-ping , or udp-ping-timestamp .
Test size	Number of probes within a test.

Table 236: show services rpm probe-results Output Fields (*continued*)

Field Name	Field Description
Routing Instance Name	<p>(BGP neighbor discovery) Name of the configured (if any) routing instance, logical system name, or both, in which the probe is configured:</p> <ul style="list-style-type: none"> When a routing instance is defined within a logical system, the logical system name is followed by the routing instance name. A slash (/) is used to separate the two entities. For example, if the routing instance called R1 is configured within the logical system called LS, the name in the output field is LS/R1. When a routing instance is configured but the default logical system is used, the name in the output field is the name of the routing instance. When a logical system is configured but the default routing instance is used, the name in the output field is the name of the logical system followed by default. A slash (/) is used to separate the two entities. For example, LS/default.
Probe results	<p>Raw measurement of a particular probe sample done by a remote host. This data is provided separately from the calculated results. The following information is contained in the raw measurement:</p> <ul style="list-style-type: none"> Response received—Timestamp when the probe result was determined. Client and server hardware timestamps—If timestamps are configured, an entry appears at this point. Rtt—Average ping round-trip time (RTT), in microseconds. Egress jitter—Egress jitter, in microseconds. Ingress jitter—Ingress jitter, in microseconds. Round trip jitter—Round-trip jitter, in microseconds. Egress interarrival jitter—Egress interarrival jitter, in microseconds. Ingress interarrival jitter—Ingress interarrival jitter, in microseconds. Round trip interarrival jitter—Round-trip interarrival jitter, in microseconds.
Results over current test	<p>Probes are grouped into tests, and the statistics are calculated for each test. If a test contains 10 probes, the average, minimum, and maximum results are calculated from the results of those 10 probes. If the command is issued while the test is in progress, the statistics use information from the completed probes.</p> <ul style="list-style-type: none"> Probes sent—Number of probes sent within the current test. Probes received—Number of probe responses received within the current test. Loss percentage—Percentage of lost probes for the current test. Measurement—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type icmp-ping-timestamp, the egress delay and ingress delay. <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> Samples—Number of probes. Minimum—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. Maximum—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. Average—Average RTT, ingress delay, or egress delay measured over the course of the current test. Peak to peak—Peak-to-peak difference, in microseconds. Stddev—Standard deviation, in microseconds. Sum—Statistical sum.

Table 236: show services rpm probe-results Output Fields (*continued*)

Field Name	Field Description
Results over last test	<p>Results for the most recently completed test. If the command is issued while the first test is in progress, this information is not displayed</p> <ul style="list-style-type: none"> • Probes sent—Number of probes sent for the most recently completed test. • Probes received—Number of probe responses received for the most recently completed test. • Loss percentage—Percentage of lost probes for the most recently completed test. • Test completed—Time the most recent test was completed. • Measurement—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type icmp-ping-timestamp, the egress delay and ingress delay. <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> • Samples—Number of probes. • Minimum—Minimum RTT, ingress delay, or egress delay measured for the most recently completed test. • Maximum—Maximum RTT, ingress delay, or egress delay measured for the most recently completed test. • Average—Average RTT, ingress delay, or egress delay measured for the most recently completed test. • Peak to peak—Peak-to-peak difference, in microseconds. • Stddev—Standard deviation, in microseconds. • Sum—Statistical sum.
Results over all tests	<p>Displays statistics made for all the probes, independently of the grouping into tests, as well as statistics for the current test.</p> <ul style="list-style-type: none"> • Probes sent—Number of probes sent in all tests. • Probes received—Number of probe responses received in all tests. • Loss percentage—Percentage of lost probes in all tests. • Measurement—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe types icmp-ping-timestamp and udp-ping-timestamp, the egress delay and ingress delay. <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> • Samples—Number of probes. • Minimum—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • Maximum—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • Average—Average RTT, ingress delay, or egress delay measured over the course of the current test. • Peak to peak—Peak-to-peak difference, in microseconds. • Stddev—Standard deviation, in microseconds. • Sum—Statistical sum.

show system alarms

Syntax	show system alarms
Release Information	Command introduced in Junos OS Release 11.1 for SRX Series devices.
Description	Display active system alarms.
Options	This command has no options.
Additional Information	System alarms are preset. They include a configuration alarm that appears when no rescue configuration alarm is set and a license alarm that appears when a software feature is configured but no valid license is configured for the feature.
Required Privilege Level	admin
List of Sample Output	show system alarms on page 1728

Sample Output

show system alarms

```
user@host> show system alarms
5 alarms currently active
Alarm time      Class  Description
2012-05-29 16:47:18 UTC  Major  /var partition usage crossed critical threshold
2012-05-29 16:47:18 UTC  Minor  /var partition usage crossed high threshold
2012-05-29 16:47:18 UTC  Major  /root partition usage crossed critical threshold
2012-05-29 16:47:18 UTC  Minor  /root partition usage crossed high threshold
2012-05-29 16:47:18 UTC  Minor  Rescue configuration is not set
```

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 mpls option introduced in Junos OS Release 9.2.
 propagate-ttl option introduced in Junos OS Release 12.1.
 Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the route that packets take to a specified network host. Use **traceroute** as a debugging tool to locate points of failure in a network.

Options **host**—IP address or name of remote host.

as-number-lookup—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.

bypass-routing—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached

network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.

clns—(Optional) Trace the route belonging to Connectionless Network Service (CLNS).

gateway address—(Optional) Address of a router or switch through which the route transits.

inet | inet6—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

interface *interface-name*—(Optional) Name of the interface over which to send packets.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

monitor *host*—(Optional) Display real-time monitoring information for the specified host.

monitor *host*—(Optional) Perform this operation to display real-time monitoring information.

monitor *host*—(Optional) Perform this operation to display real-time monitoring information.

mpls (ldp *FEC address* | rsvp *label-switched-path name*)—(Optional).

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

propagate-ttl—(Optional) On the PE router, use this option to view locally-generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only. Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the **no-propagate-ttl** configuration statement.

NOTE: Using **propagate-ttl** with **traceroute** on the CE router does not show hop-by-hop information.

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the traceroute attempt.

source *source-address*—(Optional) Source address of the outgoing traceroute packets.

tos *value*—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is 0 through 255.

ttl *value*—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is 0 through 128.

wait *seconds*—(Optional) Maximum time to wait for a response to the traceroute request.

Required Privilege Level network

List of Sample Output [traceroute on page 1731](#)
[traceroute as-number-lookup host on page 1731](#)
[traceroute no-resolve on page 1731](#)
[traceroute propagate-ttl on page 1732](#)
[traceroute \(Between CE Routers, Layer 3 VPN\) on page 1732](#)
[traceroute \(Through an MPLS LSP\) on page 1732](#)

Output Fields [Table 237 on page 1731](#) describes the output fields for the **traceroute** command. Output fields are listed in the approximate order in which they appear.

Table 237: traceroute Output Fields

Field Name	Field Description
traceroute to	IP address of the receiver.
hops max	Maximum number of hops allowed.
byte packets	Size of packets being sent.
<i>number-of-hops</i>	Number of hops from the source to the named router or switch.
<i>router-name</i>	Name of the router or switch for this hop.
<i>address</i>	Address of the router or switch for this hop.
Round trip time	Average round-trip time, in milliseconds (ms).

Sample Output

traceroute

```
user@host> traceroute santacruz
traceroute to host1.example.com (10.156.169.254), 30 hops max, 40 byte packets
 1 blue23 (10.168.1.254) 2.370 ms 2.853 ms 0.367 ms
 2 red14 (10.168.255.250) 0.778 ms 2.937 ms 0.446 ms
 3 yellow (10.156.169.254) 7.737 ms 89.905 ms 0.834 ms
```

traceroute as-number-lookup host

```
user@host> traceroute as-number-lookup 10.100.1.1
traceroute to 10.100.1.1 (10.100.1.1), 30 hops max, 40 byte packets
 1 10.39.1.1 (10.39.1.1) 0.779 ms 0.728 ms 0.562 ms
 2 10.39.1.6 (10.39.1.6) [AS 32] 0.657 ms 0.611 ms 0.617 ms
 3 10.100.1.1 (10.100.1.1) [AS 10, 40, 50] 0.880 ms 0.808 ms 0.774 ms
```

traceroute no-resolve

```
user@host> traceroute santacruz no-resolve
```

```
traceroute to host1.example.com (10.156.169.254), 30 hops max, 40 byte packets
 1  10.168.1.254  0.458 ms  0.370 ms  0.365 ms
 2  10.168.255.250  0.474 ms  0.450 ms  0.444 ms
 3  10.156.169.254  0.931 ms  0.876 ms  0.862 ms
```

traceroute propagate-ttl

```
user@host> traceroute propagate-ttl 100.200.2.2 routing-instance VPN-A
traceroute to 100.200.2.2 (100.200.2.2) from 1.1.0.2, 30 hops max, 40 byte packets

Junos OS System Log Overview

The Junos OS generates system log messages (also called *syslog messages*) to record events that occur on the device, including the following:

- Routine operations, such as creation of an Open Shortest Path First (OSPF) protocol adjacency or a user login to the configuration database
- Failure and error conditions, such as failure to access a configuration file or unexpected closure of a connection to a peer process
- Emergency or critical conditions, such as router power-down due to excessive temperature

Each system log message identifies the Junos OS process that generated the message and briefly describes the operation or error that occurred. For detailed information about specific system log messages, see the *Junos OS System Log Reference*.

NOTE: This topic describes system log messages for Junos OS processes and libraries and not the system logging services on a Physical Interface Card (PIC) such as the Adaptive Services PIC.

Junos OS System Logging Facilities and Message Severity Levels

Table 238 on page 1734 lists the Junos system logging facilities that you can specify in configuration statements at the **[edit system syslog]** hierarchy level.

Table 238: Junos OS System Logging Facilities

Facility	Type of Event or Error
any	All (messages from all facilities)
authorization	Authentication and authorization attempts
change-log	Changes to the Junos OS configuration
conflict-log	Specified configuration is invalid on the router type
daemon	Actions performed or errors encountered by system processes
dfc	Events related to dynamic flow capture
firewall	Packet filtering actions performed by a firewall filter
ftp	Actions performed or errors encountered by the FTP process
interactive-commands	Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client
kernel	Actions performed or errors encountered by the Junos OS kernel
pfe	Actions performed or errors encountered by the Packet Forwarding Engine
user	Actions performed or errors encountered by user-space processes

Table 239 on page 1735 lists the severity levels that you can specify in configuration statements at the **[edit system syslog]** hierarchy level. The levels from **emergency** through **info** are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the **none** level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see [“Disabling the System Logging of a Facility” on page 1746](#).

Table 239: System Log Message Severity Levels

Severity Level	Description
any	Includes all severity levels
none	Disables logging of the associated facility to a destination
emergency	System panic or other condition that causes the router to stop functioning
alert	Conditions that require immediate correction, such as a corrupted system database
critical	Critical conditions, such as hard errors
error	Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels
warning	Conditions that warrant monitoring
notice	Conditions that are not errors but might warrant special handling
info	Events or nonerror conditions of interest

Junos OS Minimum System Logging Configuration

To record or view system log messages, you must include the **syslog** statement at the **[edit system]** hierarchy level. Specify at least one destination for the messages, as described in [Table 240 on page 1735](#). For more information about the configuration statements, see *Single-Chassis System Logging Configuration Overview*.

Table 240: Minimum Configuration Statements for System Logging

Destination	Minimum Configuration Statements
File	<pre>[edit system syslog] file filename { facility severity; }</pre>
Terminal session of one, several, or all users	<pre>[edit system syslog] user (username *) { facility severity; }</pre>

Table 240: Minimum Configuration Statements for System Logging (*continued*)

Destination	Minimum Configuration Statements
Router or switch console	<code>[edit system syslog] console { facility severity; }</code>
Remote machine or the other Routing Engine on the router or switch	<code>[edit system syslog] host (hostname other-routing-engine) { facility severity; }</code>

Junos OS Default System Log Settings

[Table 241 on page 1736](#) summarizes the default system log settings that apply to all routers that run the Junos OS, and specifies which statement to include in the configuration to override the default value.

Table 241: Default System Logging Settings

Setting	Default	Overriding Statement	Instructions
Alternative facility for message forwarded to a remote machine	For change-log : local6 For conflict-log : local5 For dfc : local1 For firewall : local3 For interactive-commands : local7 For pfe : local4	<code>[edit system syslog] host hostname { facility-override facility; }</code>	<i>Changing the Alternative Facility Name for Remote System Log Messages</i>
Format of messages logged to a file	Standard Junos format, based on UNIX format	<code>[edit system syslog] file filename { structured-data; }</code>	“Logging Messages in Structured-Data Format” on page 1740
Maximum number of files in the archived set	10	<code>[edit system syslog] archive { files number; } file filename { archive { files number; } }</code>	<i>Specifying Log File Size, Number, and Archiving Properties</i>

Table 241: Default System Logging Settings (*continued*)

Setting	Default	Overriding Statement	Instructions
Maximum size of the log file	M Series, MX Series, and T Series: 1 megabyte (MB) TX Matrix: 10 MB	<pre>[edit system syslog] archive { size size; } file filename { archive { size size; } }</pre>	<i>Specifying Log File Size, Number, and Archiving Properties</i>
Timestamp format	Month, date, hour, minute, second For example: Aug 21 12:36:30	<pre>[edit system syslog] time-format format;</pre>	<i>"Including the Year or Millisecond in Timestamps" on page 1743</i>
Users who can read log files	root user and users with the Junos maintenance permission	<pre>[edit system syslog] archive { world-readable; } file filename { archive { world-readable; } }</pre>	<i>Specifying Log File Size, Number, and Archiving Properties</i>

- [Junos OS System Log Overview on page 1733](#)
- [Junos OS Platform-Specific Default System Log Messages on page 1737](#)

Junos OS Platform-Specific Default System Log Messages

The following messages are generated by default on specific routers. To view any of these types of messages, you must configure at least one destination for messages as described in ["Junos OS Minimum System Logging Configuration" on page 1735](#).

- To log the kernel process message on an M Series, MX Series, or T Series router, include the **kernel info** statement at the appropriate hierarchy level:

```
[edit system syslog]
(console | file filename | host destination | user username) {
  kernel info;
}
```

- On a routing matrix composed of a TX Matrix router and T640 routers, the master Routing Engine on each T640 router forwards all messages with a severity of **info** and higher to the master Routing Engine on the TX Matrix router. This is equivalent to the following configuration statement included on the TX Matrix router:

```
[edit system syslog]
host scc-master {
  any info;
}
```

- Likewise, on a routing matrix composed of a TX Matrix Plus router with connected T1600 or T4000 routers, the master Routing Engine on each T1600 or T4000 LCC forwards to the master Routing Engine on the TX Matrix Plus router all messages with a severity of **info** and higher. This is equivalent to the following configuration statement included on the TX Matrix Plus router:

NOTE: From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix Plus router controls all the T1600 or T4000 routers connected to it in the routing matrix.

```
[edit system syslog]
host sfc0-master {
  any info;
}
```

Specifying the Facility and Severity of Messages to Include in the Log

Each system log message belongs to a *facility*, which is a group of messages that are either generated by the same software process or concern a similar condition or activity (such as authentication attempts). Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions.

When you configure logging for a facility and destination, you specify a severity level for each facility. Messages from the facility that are rated at that level or higher are logged to the destination:

```
[edit system syslog]
(console | file filename | host destination | user username) {
    facility severity;
}
```

Related Documentation

- [Junos OS System Logging Facilities and Message Severity Levels on page 1734](#)
- [Single-Chassis System Logging Configuration Overview](#)
- [Examples: Configuring System Logging on page 1746](#)

Directing System Log Messages to a Log File

To direct system log messages to a file in the `/var/log` directory of the local Routing Engine, include the **file** statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
file filename {
    facility severity;
    archive <archive-sites (ftp-url <password password>)> <files number> <size size>
        <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
        no-world-readable>;
    explicit-priority;
    match "regular-expression";
    structured-data {
        brief;
    }
}
```

For the list of facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*.

To prevent log files from growing too large, the Junos OS system logging utility by default writes messages to a sequence of files of a defined size. By including the **archive** statement, you can configure the number of files, their maximum size, and who can read them, either for all log files or for a certain log file. For more information, see *Specifying Log File Size, Number, and Archiving Properties*.

For information about the following statements, see the indicated sections:

- **explicit-priority**—See [“Including Priority Information in System Log Messages” on page 1741](#)

- **match**—See “Using Regular Expressions to Refine the Set of Logged Messages” on page 1744
- **structured-data**—See “Logging Messages in Structured-Data Format” on page 1740

Related Documentation

- *Single-Chassis System Logging Configuration Overview*
- *Overview of Junos OS System Log Messages*
- [Logging Messages in Structured-Data Format on page 1740](#)
- [Examples: Configuring System Logging on page 1746](#)

Logging Messages in Structured-Data Format

You can log messages to a file in structured-data format instead of the standard Junos format. Structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from a message.

The structured-data format complies with Internet draft draft-ietf-syslog-protocol-23, *The syslog Protocol*, which is at <http://tools.ietf.org/html/draft-ietf-syslog-protocol-23>. The draft establishes a standard message format regardless of the source or transport protocol for logged messages.

To output messages to a file in structured-data format, include the **structured-data** statement at the **[edit system syslog file filename]** hierarchy level:

```
[edit system syslog file filename]
facility severity;
structured-data {
  brief;
}
```

The optional **brief** statement suppresses the English-language text that appears by default at the end of a message to describe the error or event. For information about the fields in a structured-data format message, see the [System Log Explorer](#).

The structured format is used for all messages logged to the file that are generated by a Junos process or software library.

NOTE: If you include either or both of the **explicit-priority** and **time-format** statements along with the **structured-data** statement, they are ignored. These statements apply to the standard Junos system log format, not to structured-data format.

Related Documentation

- *Single-Chassis System Logging Configuration Overview*
- [Examples: Configuring System Logging on page 1746](#)

Directing System Log Messages to a User Terminal

To direct system log messages to the terminal session of one or more specific users (or all users) when they are logged in to the local Routing Engine, include the **user** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
user (username | *) {
    facility severity;
    match "regular-expression";
}
```

Specify one or more Junos OS usernames, separating multiple values with spaces, or use the asterisk (*) to indicate all users who are logged in to the local Routing Engine.

For the list of logging facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*. For information about the **match** statement, see “Using Regular Expressions to Refine the Set of Logged Messages” on page 1744.

Related Documentation

- [Single-Chassis System Logging Configuration Overview](#)
- [Examples: Configuring System Logging on page 1746](#)

Directing System Log Messages to the Console

To direct system log messages to the console of the local Routing Engine, include the **console** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
console {
    facility severity;
}
```

For the list of logging facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*.

Related Documentation

- [Single-Chassis System Logging Configuration Overview](#)
- [Examples: Configuring System Logging on page 1746](#)

Including Priority Information in System Log Messages

The facility and severity level of a message are together referred to as its *priority*. By default, messages logged in the standard Junos OS format do not include information about priority. To include priority information in standard-format messages directed to a file, include the **explicit-priority** statement at the **[edit system syslog file filename]** hierarchy level:

```
[edit system syslog file filename]
facility severity;
explicit-priority;
```

NOTE: Messages logged in structured-data format include priority information by default. If you include the `structured-data` statement at the `[edit system syslog file filename]` hierarchy level along with the `explicit-priority` statement, the `explicit-priority` statement is ignored and messages are logged in structured-data format.

For information about the `structured-data` statement, see “[Logging Messages in Structured-Data Format](#)” on page 1740. For information about the contents of a structured-data message, see the [System Log Explorer](#).

To include priority information in messages directed to a remote machine or the other Routing Engine, include the `explicit-priority` statement at the `[edit system syslog host (hostname | other-routing-engine)]` hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
  facility severity;
  explicit-priority;
```

NOTE: The `other-routing-engine` option does not apply to the QFX Series.

The priority recorded in a message always indicates the original, local facility name. If the `facility-override` statement is included for messages directed to a remote destination, the Junos OS system logging utility still uses the alternative facility name for the messages themselves when directing them to the remote destination. For more information, see *Changing the Alternative Facility Name for Remote System Log Messages*.

When the `explicit-priority` statement is included, the Junos OS logging utility prepends codes for the facility name and severity level to the message tag name, if the message has one:

```
FACILITY-severity[-TAG]
```

(The tag is a unique identifier assigned to some Junos OS system log messages.)

In the following example, the `CHASSISD_PARSE_COMPLETE` message belongs to the `daemon` facility and is assigned severity `info` (6):

```
Aug 21 12:36:30 router1 chassisd[522]: %DAEMON-6-CHASSISD_PARSE_COMPLETE:
  Using new configuration
```

When the `explicit-priority` statement is not included, the priority does not appear in the message:

```
Aug 21 12:36:30 router1 chassisd[522]: CHASSISD_PARSE_COMPLETE: Using new
  configuration
```

For more information about message formatting, see the [System Log Explorer](#).

System Log Default Facilities for Messages Directed to a Remote Destination

Table 242 on page 1743 lists the default alternative facility name next to the Junos OS-specific facility name for which it is used. For facilities that are not listed, the default alternative name is the same as the local facility name.

Table 242: Default Facilities for Messages Directed to a Remote Destination

Junos OS-specific Local Facility	Default Facility When Directed to Remote Destination
change-log	local6
conflict-log	local5
dfc	local1
firewall	local3
interactive-commands	local7
pfe	local4

Related Documentation

- *Single-Chassis System Logging Configuration Overview*

Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 12:36:30
```

To include the year, the millisecond, or both in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the **[edit system syslog time-format]** statement.

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2006):

```
Aug 21 12:36:30.401 2006
```

NOTE: Messages logged in structured-data format include the year and millisecond by default. If you include the structured-data statement at the [edit system syslog file *filename*] hierarchy level along with the time-format statement, the time-format statement is ignored and messages are logged in structured-data format.

For information about the structured-data statement, see “[Logging Messages in Structured-Data Format](#)” on page 1740. For information about the contents of a structured-data message, see the [System Log Explorer](#).

Related Documentation

- [Single-Chassis System Logging Configuration Overview](#)
- [Examples: Configuring System Logging on page 1746](#)

Using Regular Expressions to Refine the Set of Logged Messages

The predefined facilities group together related messages, but you can also use regular expression matching to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination.

To specify the text string that must (or must not) appear in a message for the message to be logged to a destination, include the **match** statement and specify the regular expression which the text string must match:

```
match "regular-expression";
```

You can include this statement at the following hierarchy levels:

- [edit system syslog file *filename*] (for a file)
- [edit system syslog user (*username* | *)] (for a specific user session or for all user sessions on a terminal)
- [edit system syslog host (*hostname* | other-routing-engine)] (for a remote destination)

In specifying the regular expression, use the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. Explaining regular expression syntax is beyond the scope of this document, but POSIX standards are available from the Institute of Electrical and Electronics Engineers (IEEE, <http://www.ieee.org>).

[Table 243 on page 1745](#) specifies which character or characters are matched by some of the regular expression operators that you can use in the match statement. In the descriptions, the term *term* refers to either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

NOTE: The match statement is not case-sensitive.

Table 243: Regular Expression Operators for the match Statement

Operator	Matches
. (period)	One instance of any character except the space.
* (asterisk)	Zero or more instances of the immediately preceding term.
+ (plus sign)	One or more instances of the immediately preceding term.
? (question mark)	Zero or one instance of the immediately preceding term.
(pipe)	One of the terms that appears on either side of the pipe operator.
! (exclamation point)	Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of the exclamation point is Junos OS-specific.
^ (caret)	Start of a line, when the caret appears outside square brackets. One instance of any character that does not follow it within square brackets, when the caret is the first character inside square brackets.
\$ (dollar sign)	End of a line.
[] (paired square brackets)	One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen (-) to separate the beginning and ending characters of the range. For example, [a-z0-9] matches any letter or number.
() (paired parentheses)	One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.

Using Regular Expressions

Filter messages that belong to the **interactive-commands** facility, directing those that include the string **configure** to the terminal of the root user:

```
[edit system syslog]
user root {
  interactive-commands any;
  match ".*configure.*";
}
```

Messages like the following appear on the **root** user's terminal when a user issues a **configure** command to enter configuration mode:

```
timestamp router-name mgd[PID]: UI_CMDLINE_READ_LINE: User 'user', command
'configure private'
```

Filter messages that belong to the **daemon** facility and have a severity of **error** or higher, directing them to the file **/var/log/process-errors**. Omit messages generated by the SNMP process (snmpd), instead directing them to the file **/var/log/snmpd-errors**:

```
[edit system syslog]
file process-errors {
  daemon error;
```

```
match "!(.*snmpd.*)";
}
file snmpd-errors {
  daemon error;
  match ".*snmpd.*";
}
```

 - [Examples: Configuring System Logging on page 1746](#)

Disabling the System Logging of a Facility

To disable the logging of messages that belong to a particular facility, include the **facility none** statement in the configuration. This statement is useful when, for example, you want to log messages that have the same severity level and belong to all but a few facilities. Instead of including a statement for each facility you want to log, you can include the **any severity** statement and then a **facility none** statement for each facility that you do not want to log. For example, the following logs all messages at the **error** level or higher to the console, except for messages from the **daemon** and **kernel** facilities. Messages from those facilities are logged to the file `>/var/log/internals` instead:

```
[edit system syslog]
console {
  any error;
  daemon none;
  kernel none;
}
file internals {
  daemon info;
  kernel info;
}
```

- Related Documentation**
- [Single-Chassis System Logging Configuration Overview](#)

Examples: Configuring System Logging

The following example shows how to configure the logging of messages about all commands entered by users at the CLI prompt or invoked by client applications such as Junos OS XML protocol or NETCONF client applications, and all authentication or authorization attempts, both to the file **cli-commands** and to the terminal of any user who is logged in:

```
[edit system]
syslog {
  file cli-commands {
    interactive-commands info;
    authorization info;
  }
  user * {
    interactive-commands info;
    authorization info;
  }
}
```

```
}
```

The following example shows how to configure the logging of all changes in the state of alarms to the file `/var/log/alarms`:

```
[edit system]
syslog {
  file alarms {
    kernel warning;
  }
}
```

The following example shows how to configure the handling of messages of various types, as described in the comments. Information is logged to two files, to the terminal of user `alex`, to a remote machine, and to the console:

```
[edit system]
syslog {
  /* write all security-related messages to file /var/log/security */
  file security {
    authorization info;
    interactive-commands info;
  }
  /* write messages about potential problems to file /var/log/messages: */
  /* messages from "authorization" facility at level "notice" and above, */
  /* messages from all other facilities at level "warning" and above */
  file messages {
    authorization notice;
    any warning;
  }
  /* write all messages at level "critical" and above to terminal of user "alex" if */
  /* that user is logged in */
  user alex {
    any critical;
  }
  /* write all messages from the "daemon" facility at level "info" and above, and */
  /* messages from all other facilities at level "warning" and above, to the */
  /* machine monitor.mycompany.com */
  host monitor.mycompany.com {
    daemon info;
    any warning;
  }
  /* write all messages at level "error" and above to the system console */
  console {
    any error;
  }
}
```

The following example shows how to configure the handling of messages generated when users issue Junos OS CLI commands, by specifying the **interactive-commands** facility at the following severity levels:

- **info**—Logs a message when users issue any command at the CLI operational or configuration mode prompt. The example writes the messages to the file `/var/log/user-actions`.

- **notice**—Logs a message when users issue the configuration mode commands **rollback** and **commit**. The example writes the messages to the terminal of user **philip**.
- **warning**—Logs a message when users issue a command that restarts a software process. The example writes the messages to the console.

```
[edit system]
syslog {
  file user-actions {
    interactive-commands info;
  }
  user philip {
    interactive-commands notice;
  }
  console {
    interactive-commands warning;
  }
}
```

Directing System Log Messages to a Remote Destination

- [Adding a Text String to System Log Messages on page 1748](#)
- [Adding a String on page 1749](#)
- [Examples: Assigning an Alternative Facility on page 1749](#)

Adding a Text String to System Log Messages

To add a text string to every system log message directed to a remote machine or to the other Routing Engine, include the **log-prefix** statement at the **[edit system syslog host]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
log-prefix string;
```

The string can contain any alphanumeric or special character except the equal sign (=) and the colon (:). It also cannot include the space character; do not enclose the string in quotation marks (" ") in an attempt to include spaces in it.

The Junos OS system logging utility automatically appends a colon and a space to the specified string when the system log messages are written to the log. The string is inserted after the identifier for the Routing Engine that generated the message.

The following example shows how to add the string M120 to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine hardware-logger.mycompany.com:

```
[edit system syslog]
host hardware-logger.mycompany.com {
  any info;
  log-prefix M120;
```

```
}
```

When these configuration statements are included on an M120 router called `origin1`, a message in the system log on `hardware-logger.mycompany.com` looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user 'root', command 'run
show version'
```

**Related
Documentation**

- *Single-Chassis System Logging Configuration Overview*
- *Specifying Log File Size, Number, and Archiving Properties*

Adding a String

Add the string `M120` to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine `hardware-logger.mycompany.com`:

```
[edit system syslog]
host hardware-logger.mycompany.com {
  any info;
  log-prefix M120;
}
```

When these configuration statements are included on an M120 router called `origin1`, a message in the system log on **`hardware-logger.mycompany.com`** looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user 'root', command 'run
show version'
```

Examples: Assigning an Alternative Facility

Log all messages generated on the local routing platform at the error level or higher to the **`local0`** facility on the remote machine called **`monitor.mycompany.com`**:

```
[edit system syslog]
host monitor.mycompany.com {
  any error;
  facility-override local0;
}
```

Configure routing platforms located in California and routing platforms located in New York to send messages to a single remote machine called **`central-logger.mycompany.com`**. The messages from California are assigned alternative facility **`local0`** and the messages from New York are assigned to alternative facility **`local2`**.

- Configure California routing platforms to aggregate messages in the **`local0`** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local0;
}
```

- Configure New York routing platforms to aggregate messages in the **`local2`** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
```

```
change-log info;  
facility-override local2;  
}
```

On **central-logger**, you can then configure the system logging utility to write messages from the **local0** facility to the file **california-config** and the messages from the **local2** facility to the file **new-york-config**.

Displaying System Log Files

- [Displaying a Log File from a Single-Chassis System on page 1750](#)
- [Examples: Displaying a Log File on page 1750](#)

Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system, enter Junos OS CLI operational mode and issue either of the following commands:

```
user@host> show loglog-filename  
user@host> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine. To display the file stored on a particular Routing Engine, prefix the file or pathname with the string **re0** or **re1** and a colon. The following examples both display the **/var/log/messages** file stored on the Routing Engine in slot 1:

```
user@host> show log re1:messages  
user@host> file show re1:/var/log/messages
```

For information about the fields in a log message, see *Interpreting Messages Generated in Standard Format by a Junos Process or Library*, “[Interpreting Messages Generated in Standard Format by Services on a PIC](#)” on page 1758, and “[Interpreting Messages Generated in Structured-Data Format](#)” on page 1753. For examples, see “[Examples: Displaying a Log File](#)” on page 1750.

Examples: Displaying a Log File

Display the contents of the **/var/log/messages** file stored on the local Routing Engine. (The **/var/log** directory is the default location for log files, so you do not need to include it in the filename. The **messages** file is a commonly configured destination for system log messages.)

```
user@host> show log messages Apr 11 10:27:25 router1 mgd[3606]:  
  UI_DBASE_LOGIN_EVENT: User 'barbara' entering configuration mode  
Apr 11 10:32:22 router1 mgd[3606]: UI_DBASE_LOGOUT_EVENT: User 'barbara' exiting  
  configuration mode  
Apr 11 11:36:15 router1 mgd[3606]: UI_COMMIT: User 'root' performed commit: no comment  
Apr 11 11:46:37 router1 mib2d[2905]: SNMP_TRAP_LINK_DOWN: ifIndex 82, ifAdminStatus  
  up(1), ifOperStatus down(2), ifName at-1/0/0
```

Display the contents of the file `/var/log/processes`, which has been previously configured to include messages from the `daemon` facility. When issuing the `file show` command, you must specify the full pathname of the file:

```
user@host> file show /var/log/processes Feb 22 08:58:24 router1 snmpd[359]:
  SNMPD_TRAP_WARM_START: trap_generate_warm: SNMP trap: warm start
Feb 22 20:35:07 router1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
  trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 router1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
  SNMP trap: warm start
Feb 23 07:38:19 router1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
  SNMP trap: cold start
```

Display the contents of the file `/var/log/processes` when the `explicit-priority` statement is included at the `[edit system syslog file processes]` hierarchy level:

```
user@host> file show /var/log/processes Feb 22 08:58:24 router1 snmpd[359]:
%DAEMON-3-SNMPD_TRAP_WARM_START: trap_generate_warm: SNMP trap: warm
start
Feb 22 20:35:07 router1 snmpd[359]:
%DAEMON-6-SNMPD_THROTTLE_QUEUE_DRAINED: trap_throttle_timer_handler: cleared
all throttled traps
Feb 23 07:34:56 router1 snmpd[359]:
%DAEMON-3-SNMPD_TRAP_WARM_START: trap_generate_warm: SNMP trap: warm
start
Feb 23 07:38:19 router1 snmpd[359]:
%DAEMON-2-SNMPD_TRAP_COLD_START: trap_generate_cold: SNMP trap: cold start
```

Displaying and Interpreting System Log Message Descriptions

Displaying and Interpreting System Log Message Descriptions

This reference lists the messages available at the time of its publication. To display the list of messages that applies to the version of the Junos OS that is running on a routing platform, enter Junos OS CLI operational mode and issue the following command:

```
user@host> help syslog ?
```

To display the list of available descriptions for tags whose names begin with a specific character string, substitute the string (in all capital letters) for the variable `TAG-PREFIX` (there is no space between the prefix and the question mark):

```
user@host> help syslog TAG-PREFIX?
```

To display the complete descriptions for tags whose name includes a regular expression, substitute a Perl-based expression for the variable `regex`. The match is not case-sensitive. For information about Perl-based regular expressions, consult a Perl reference manual or website such as <http://perldoc.perl.org>.

```
user@host> help syslog regex
```

To display the complete description of a particular message, substitute its name for the variable **TAG** (in all capital letters):

```
user@host> help syslog TAG
```

[Table 244 on page 1752](#) describes the fields in a system log message description in this reference or in the CLI.

Table 244: Fields in System Log Message Descriptions

Field Name in Reference	Field Name in CLI	Description
—	Name	The message tag in all capital letters.
System Log Message	Message	<p>Text of the message written to the system log. In the log, a specific value is substituted for each variable that appears in italics in this reference or in angle brackets (<>) in the CLI.</p> <p>In this reference, the message text appears on the second line of the System Log Message field. The first line is the message tag (the same text as in the CLI Name field). The prefix on each tag identifies the message source and the rest of the tag indicates the specific event or error.</p>
—	Help	Short description of the message, which also appears in the right-hand column of CLI output for the help syslog command when the output lists multiple messages.
Description	Description	More detailed explanation of the message.
Type	Type	<p>Category to which the message belongs:</p> <ul style="list-style-type: none"> • Error: The message reports an error or failure condition that might require corrective action. • Event: The message reports a condition or occurrence that does not generally require corrective action.

Table 244: Fields in System Log Message Descriptions (*continued*)

Field Name in Reference	Field Name in CLI	Description
Severity	Severity	Message severity level as described in Table: System Log Message Severity Levels in <i>Specifying the Facility and Severity of Messages to Include in the Log</i> .
Cause	Cause	(Optional) Possible cause for message generation. There can be more than one cause.
Action	Action	(Optional) Action you can perform to resolve the error or failure condition described in the message. If this field does not appear in an entry, either no action is required or the action is self-explanatory.

Interpreting Messages Generated in Structured-Data Format

Beginning in Junos OS Release 8.3, when the **structured-data** statement is included in the configuration for a log file, Junos processes and software libraries write messages to the file in structured-data format instead of the standard Junos format. For information about the **structured-data** statement, see [“Logging Messages in Structured-Data Format” on page 1740](#).

Structured-format makes it easier for automated applications to extract information from the message. In particular, the standardized format for reporting the value of variables (elements in the English-language message that vary depending on the circumstances that triggered the message) makes it easy for an application to extract those values. In standard format, the variables are interspersed in the message text and not identified as variables.

The structured-data format for a message includes the following fields (which appear here on two lines only for legibility):

```
<priority code>version timestamp hostname process processID TAG [junos@2636.platform
variable-value-pairs] message-text
```

[Table 245 on page 1754](#) describes the fields. If the system logging utility cannot determine the value in a particular field, a hyphen (-) appears instead.

Table 245: Fields in Structured-Data Messages

Field	Description	Examples
<priority code>	Number that indicates the message's facility and severity. It is calculated by multiplying the facility number by 8 and then adding the numerical value of the severity. For a mapping of the numerical codes to facility and severity, see Table: Facility and Severity Codes in the priority-code Field in <i>Specifying the Facility and Severity of Messages to Include in the Log</i> .	<165> for a message from the pfe facility (facility=20) with severity notice (severity=5).
version	Version of the Internet Engineering Task Force (IETF) system logging protocol specification.	1 for the initial version
timestamp	Time when the message was generated, in one of two representations: <ul style="list-style-type: none"> YYYY-MM-DDTHH:MM:SS.MSZ is the year, month, day, hour, minute, second and millisecond in Universal Coordinated Time (UTC) YYYY-MM-DDTHH:MM:SS.MS+/-HH:MM is the year, month, day, hour, minute, second and millisecond in local time; the hour and minute that follows the plus sign (+) or minus sign (-) is the offset of the local time zone from UTC 	2007-02-15T09:17:15.719Z is 9:17 AM UTC on 15 February 2007. 2007-02-15T01:17:15.719-08:00 is the same timestamp expressed as Pacific Standard Time in the United States.
hostname	Name of the host that originally generated the message.	router1
process	Name of the Junos OS process that generated the message.	mgd
processID	UNIX process ID (PID) of the Junos OS process that generated the message.	3046
TAG	Junos OS system log message tag, which uniquely identifies the message.	UI_DBASE_LOGOUT_EVENT
junos@2636.platform	An identifier for the type of hardware platform that generated the message. The junos@2636 prefix indicates that the platform runs Junos OS. It is followed by a dot-separated numerical identifier for the platform type. For a list of the identifiers, see Table 247 on page 1757 .	junos@2636.1.1.1.2.18 for the M120 router

Table 245: Fields in Structured-Data Messages (*continued*)

Field	Description	Examples
<i>variable-value-pairs</i>	A variable-value pair for each element in the <i>message-text</i> string that varies depending on the circumstances that triggered the message. Each pair appears in the format <i>variable = "value"</i> .	username="user"
<i>message-text</i>	English-language description of the event or error (omitted if the brief statement is included at the [edit system syslog file <i>filename</i> structured-data] hierarchy level). For the text for each message, see the chapters following System Log Messages.	User 'user' exiting configuration mode

By default, the structured-data version of a message includes English text at the end, as in the following example (which appears on multiple lines only for legibility):

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="user"] User 'user' exiting configuration mode
```

When the brief statement is included at the [edit system syslog file *filename* structured-data] hierarchy level, the English text is omitted, as in this example:

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="user"]
```

Table 246 on page 1755 maps the codes that appear in the *priority-code* field to facility and severity level.

NOTE: Not all of the facilities and severities listed in Table 246 on page 1755 can be included in statements at the [edit system syslog] hierarchy level (some are used by internal processes). For a list of the facilities and severity levels that can be included in the configuration, see *Specifying the Facility and Severity of Messages to Include in the Log*.

Table 246: Facility and Severity Codes in the priority-code Field

Facility (number)	Severity emergency	alert	critical	error	warning	notice	info	debug
kernel (0)	1	1	2	3	4	5	6	7
user (1)	8	9	10	11	12	13	14	15
mail (2)	16	17	18	19	20	21	22	23
daemon (3)	24	25	26	27	28	29	30	31
authorization (4)	32	33	34	35	36	37	38	39

Table 246: Facility and Severity Codes in the priority-code Field (*continued*)

conflict-log (21)	168	169	170	171	172	173	174	175
change-log (22)	176	177	178	179	180	181	182	183
interactive-commands (23)	184	185	186	187	188	189	190	191

[Table 247 on page 1757](#) lists the numerical identifiers for routing platforms that appear in the **platform** field. The identifier is derived from the platform's SNMP object identifier (OID) as defined in the Juniper Networks routing platform MIB. For more information about OIDs, see the *SNMP MIBs and Traps Monitoring and Troubleshooting Guide for Security Devices*.

Table 247: Platform Identifiers in the platform Field

Identifier	Platform Name
1.1.1.2.1	M40 router
1.1.1.2.2	M20 router
1.1.1.2.3	M160 router
1.1.1.2.4	M10 router
1.1.1.2.5	M5 router
1.1.1.2.6	T640 routing node
1.1.1.2.7	T320 router
1.1.1.2.8	M40e router
1.1.1.2.9	M320 router
1.1.1.2.10	M7i router
1.1.1.2.11	M10i router
1.1.1.2.13	J2300 Services Router
1.1.1.2.14	J4300 Services Router
1.1.1.2.15	J6300 Services Router
1.1.1.2.17	TX Matrix platform
1.1.1.2.18	M120 router
1.1.1.2.19	J4350 Services Router
1.1.1.2.20	J6350 Services Router
1.1.1.2.23	J2320 Services Router
1.1.1.2.27	T1600 router
1.1.1.2.37	TX Matrix Plus platform
1.1.1.2.83	T4000 router

The message-source Field on a Single-Chassis System

The format of the **message-source** field in a message on a single-chassis system depends on whether the message was generated on the local Routing Engine or the other Routing Engine (on a system with two Routing Engines installed and operational). Messages from the other Routing Engine appear only if its configuration includes the **other-routing-engine** statement at the **[edit system syslog host]** hierarchy level.

- When the local Routing Engine generated the message, there are two subfields:

hostname process[process-ID]

- When the other Routing Engine generated the message, there are three subfields:

hostname reX process[process-ID]

hostname is the hostname of the local Routing Engine.

process[process-ID] is the name and PID of the process that generated the message. If the **reX** field also appears, the process is running on the other Routing Engine. If a process does not report its PID, the **[process-ID]** part does not appear.

reX indicates that the other Routing Engine generated the message (X is 0 or 1).

Interpreting Messages Generated in Standard Format by Services on a PIC

Standard-format system log messages generated by services on a PIC, such as the Adaptive Services (AS) PIC, have the following syntax:

*timestamp (FPC Slot fpc-slot, PIC Slot pic-slot) {service-set} [SERVICE]:
optional-string TAG: message-text*

NOTE: System logging for services on PICs is not configured at the **[edit system syslog]** hierarchy level as discussed in this chapter. For configuration information, see the *Junos Services Interfaces Configuration Guide*.

The (FPC Slot **fpc-slot**, PIC Slot **pic-slot**) field appears only when the standard system logging utility that runs on the Routing Engine writes the messages to the system log. When the PIC writes the message directly, the field does not appear.

Table 248 on page 1758 describes the message fields.

Table 248: Fields in Messages Generated by a PIC

Field	Description
<i>timestamp</i>	Time at which the message was logged.
<i>fpc-slot</i>	Slot number of the Flexible PIC Concentrator (FPC) that houses the PIC that generated the message.
<i>pic-slot</i>	Number of the PIC slot on the FPC in which the PIC that generated the message resides.

Table 248: Fields in Messages Generated by a PIC (*continued*)

Field	Description
<i>service-set</i>	Name of the service set that generated the message.
<i>SERVICE</i>	Code representing the service that generated the message. The codes include the following: <ul style="list-style-type: none"> FWNAT—Network Address Translation (NAT) service IDS—Intrusion detection service
<i>optional-string</i>	A text string that appears if the configuration for the PIC includes the log-prefix statement at the [edit interfaces interface-name services-options syslog] hierarchy level. For more information, see the <i>Junos Services Interfaces Configuration Guide</i> .
<i>TAG</i>	Text string that uniquely identifies the message, in all uppercase letters and using the underscore (_) to separate words. The tag name begins with a prefix that indicates the generating PIC. The entries in this reference are ordered alphabetically by this prefix.
<i>message-text</i>	Text of the message. For the text of each message, see System Log Messages.

Examples: Displaying System Log Message Descriptions

Display the list of all currently available system log message descriptions:

```
user@host> help syslog ?

Possible completions:
<syslog-tag>   Syslog tag
. . . . .
BOOTPD_ARG_ERR  Command-line option was invalid
BOOTPD_BAD_ID   Request failed because assembly ID was unknown
BOOTPD_BOOTSTRING tnp.bootpd provided boot string
BOOTPD_CONFIG_ERR tnp.bootpd could not parse configuration file;
                  used default settings
BOOTPD_CONF_OPEN tnp.bootpd could not open configuration file
BOOTPD_DUP_REV   Extra boot string definitions for revision were
                  ignored
---(more 4%)---
```

Display the list of all currently available system log message descriptions for tags that begin with the letters **ACCT** (there is no space between **ACCT** and the question mark, and some descriptions are shortened for legibility):

```
user@host> help syslog ACCT?

Possible completions:
<syslog-tag>   System log tag or regular expression
ACCT_ACCOUNTING_FERROR Error occurred during file processing
ACCT_ACCOUNTING_FOPEN_ERROR Open operation failed on file
ACCT_ACCOUNTING_SMALL_FILE_SIZE Maximum file size is smaller than ...
ACCT_BAD_RECORD_FORMAT Record format does not match accounting profile
ACCT_CU_RTSLIB_ERROR Error occurred obtaining current class usage ...
ACCT_FORK_ERR Could not create child process
ACCT_FORK_LIMIT_EXCEEDED Could not create child process because of limit
```

```
ACCT_GETHOSTNAME_ERROR    gethostname function failed
ACCT_MALLOC_FAILURE       Memory allocation failed
ACCT_UNDEFINED_COUNTER_NAME  Filter profile used undefined counter name
ACCT_XFER_FAILED          Attempt to transfer file failed
ACCT_XFER_POPEN_FAIL       File transfer failed
```

Display the description of the `UI_CMDLINE_READ_LINE` message:

```
user@host> help syslog UI_CMDLINE_READ_LINE
```

```
Name:      UI_CMDLINE_READ_LINE
Message:    User '<users>', command '<input>'
Help:       User entered command at CLI prompt
Description: The indicated user typed the indicated command at the CLI
              prompt and pressed the Enter key, sending the command string
              to the management process (mgd).
Type:       Event: This message reports an event, not an error
Severity:   info
```

Configuring System Logging for a Security Device

Understanding System Logging for Security Devices

Junos OS supports configuring and monitoring of system log messages (also called *syslog messages*). You can configure files to log system messages and also assign attributes, such as severity levels, to messages. Reboot requests are recorded to the system log files, which you can view with the **show log** command.

This section contains the following topics:

- [Redundant System Log Server on page 1760](#)
- [Control Plane and Data Plane Logs on page 1761](#)

Redundant System Log Server

Security system logging traffic intended for remote servers is sent through the network interface ports, which support two simultaneous system log destinations. Each system logging destination must be configured separately. When two system log destination addresses are configured, identical logs are sent to both destinations. While two destinations can be configured on any device that supports the feature, adding a second destination is primarily useful as a redundant backup for standalone and active/backup configured chassis cluster deployments.

The following redundant server information is available:

- Facility: **cron**
- Description: cron scheduling process
- Severity Level (from highest to lowest severity): **debug**
- Description: Software debugging messages

Control Plane and Data Plane Logs

Junos OS generates separate log messages to record events that occur on the system's control and data planes.

- The control plane logs include events that occur on the routing platform. The system sends control plane events to the **eventd** process on the Routing Engine, which then handles the events by using Junos OS policies, by generating system log messages, or both. You can choose to send control plane logs to a file, user terminal, routing platform console, or remote machine. To generate control plane logs, use the **syslog** statement at the **[system]** hierarchy level.
- The data plane logs primarily include security events that the system has handled directly inside the data plane. These system logs are also referred to as *security logs*. How the system handles data plane events depends on the device:
 - For SRX1400, SRX3400, SRX3600, SRX5600, and SRX5800 devices, the default logging mode is stream mode. The system streams already-processed data plane events directly to external log servers, bypassing the Routing Engine.

We recommend stream mode logging for the data plane. Data plane logs can be forwarded to the Routing Engine only when data plane logging is configured as an event mode.

NOTE: We recommend that only stream mode be used for security logs on high-end SRX Series devices. We do not recommend using event mode logging for high-end SRX Series devices. Supported logging rates apply to stream mode only. Logs might be dropped if you configure event mode logging on high-end SRX Series devices.

- For SRX100, SRX210, SRX220, SRX240, and SRX650 devices, by default, the system sends data plane events to the **eventd** process on the Routing Engine to be processed, formatted, and written to system log files in a similar manner to control plane events.

Understanding Binary Format for Security Logs

The Junos operating system (Junos OS) generates separate log messages to record events that occur on the system's control plane and data plane. The control plane monitors events that occur on the routing platform. Such events are recorded in system log messages. To generate system log messages, use the **syslog** statement at the **[system]** hierarchy level.

Data plane log messages, referred to as security log messages, record security events that the system handles directly inside the data plane. To generate security log messages, use the **log** statement at the **[security]** hierarchy level.

System log messages are maintained in log files in text-based formats, such as BSD Syslog, Structured Syslog, and WebTrends Enhanced Log Format (WELF).

Security log messages can also be maintained in text-based formats. Because security logging can produce large amounts of data, however, text-based log files can quickly consume storage and CPU resources. Depending on your implementation of security logging, a log file in a binary-based format can provide more efficient use of on-box or off-box storage and improved CPU utilization. Binary format for security log messages is available on all SRX Series devices.

When configured in event mode, security log messages generated in the data plane are directed to the control plane and stored locally on the device. Security log messages stored in binary format are maintained in a log file separate from that used to maintain system log messages. Events stored in a binary log file are not accessible with advanced log-scripting commands intended for text-based log files. A separate CLI operational command supports decoding, converting, and viewing binary log files that are stored locally on the device.

When configured in stream mode, security log messages generated in the data plane are streamed to a remote device. When these messages are stored in binary format, they are streamed directly to external log collection clients in a Juniper-specific binary format. The external client handles decoding, converting, and viewing binary log files that are stored on a remote device.

Related Documentation

- [Monitoring System Log Messages with the J-Web Event Viewer on page 1766](#)

Configuring Binary Security Log Files

You can configure security files in binary format using the **log** statement at the **[security]** hierarchy level.

The following procedure specifies binary format for event-mode or stream-mode logging, and defines the log filename, path, and log file characteristics.

1. Specify the format for the log file.
 - For on-box, event-mode logging:

```
set security log mode event
set security log format binary
```
 - For off-box, stream-mode logging:

```
set security log mode stream
set security log stream test-stream format binary host 1.3.54.22
```
2. For off-box security logging, specify the source address, which identifies the SRX Series device that generated the log messages. The source address is required.

```
set security log source-address 2.3.45.66
```
3. Optionally, define a log filename and a path. By default, the file `bin_messages` is created in the `/var/log` directory.

```
set security log file name security-binary-log
set security log file path security/log-folder
```
4. Optionally, change the maximum size of the log file and the maximum number of log files that can be archived. By default, the maximum size of the log file is 3 MB, and a total of three log files can be archived.

```
set security log file size 5
set security log file files 5
```
5. Optionally, select the `hpl` flag to enable diagnostic traces for binary logging. The prefix `smf_hpl` identifies all binary logging traces.

```
set security log traceoptions flag hpl
```
6. View the content of the event-mode log file stored on the device.

NOTE: The `show security log` command displays event-mode security log messages if they are in a text-based format. The `show security log file` command displays event-mode security log messages if they are in binary format.

```
show security log file
```

Use the following command to clear the content of the binary event-mode security log file.

```
clear security log file
```

NOTE: Third-party tools decode and convert log files to binary text when they are streamed to a remote device. Refer to your third-party documentation for details about displaying streamed security log messages.

Sending System Log Messages to a File

You can direct system log messages to a file on the CompactFlash (CF) card. The default directory for log files is `/var/log`. To specify a different directory on the CF card, include the complete pathname.

Create a file named **security**, and send log messages of the **authorization** class at the severity level **info** to the file.

To set the filename, the facility, and severity level:

```
{primary:node0}  
user@host# set system syslog file security authorization info
```

Setting the System to Send All Log Messages Through eventd

The **eventd** process of logging configuration is most commonly used for Junos OS. In this configuration, control plane logs and data plane, or security, logs are forwarded from the data plane to the Routing Engine control plane **rtlogd** process. The **rtlogd** process then either forwards syslog or sd-syslog-formatted logs to the **eventd** process or the WELF-formatted logs to the external or remote WELF log collector.

To send all log messages through **eventd**:

1. Set the **eventd** process to handle security logs and send them to a remote server.

```
{primary:node0}
user@host# set security log mode event
```

2. Configure the server that will receive the system log messages.

```
{primary:node0}
user@host# set system syslog host hostname any any
```

where *hostname* is the fully qualified hostname or IP address of the server that will receive the logs.

NOTE: To send duplicate logs to a second remote server, repeat the command with a new fully qualified *hostname* or IP address of a second server.

If your deployment is an active/active chassis cluster, you can also configure security logging on the active node to be sent to separate remote servers to achieve logging redundancy.

To rename or redirect one of the logging configurations, you need to delete and recreate it. To delete a configuration:

```
{primary:node0}
user@host# delete security log mode event
```

- [Monitoring System Log Messages with the J-Web Event Viewer on page 1766](#)

Setting the System to Stream Security Logs Through Revenue Ports

You can increase the number of data plane, or security, logs that are sent by modifying the manner in which they are sent. When the logging mode is set to **stream**, security logs generated in the data plane are streamed out a revenue traffic port directly to a remote server.

To use the **stream** mode, enter the following commands:

```
{primary:node0}
user@host# set security log mode stream source-address source-address
user@host# set security log stream streamname format (syslog|sd-syslog|welf) category
(all|content-security) host ipaddr
```

where *source-address* is the IP address of the source machine; **syslog**, **sd-syslog** (structured system logging messages) and **welf** are logging formats; **all** and **content-security** are the categories of logging; and *ipaddr* is the IP address of the server to which the logs will be streamed.

NOTE: WELF logs must be streamed through a revenue port because the `eventd` process does not recognize the WELF format. The category must be set to `content-security`. For example:

```
{primary:node0}
user@host# set security log stream securitylog1 format welf category
content-security host 10.121.23.5
```

To send duplicate logs to a second remote server, repeat the command with a new *ipaddr*. If your deployment is an active/active chassis cluster, you can also configure security logging on the active node to be sent to separate remote servers to achieve logging redundancy.

Monitoring System Log Messages with the J-Web Event Viewer

Purpose Monitor errors and events that occur on the device.

Action Select **Monitor>Events and Alarms>View Events** in the J-Web user interface.

The J-Web View Events page displays the following information about each event:

- **Process**—System process that generated the error or event.
- **Severity**—A severity level indicates how seriously the triggering event affects routing platform functions. Only messages from the facility that are rated at that level or higher are logged. Possible severities and their corresponding color code are:
 - **Debug/Info/Notice (Green)**—Indicates conditions that are not errors but are of interest or might warrant special handling.
 - **Warning (Yellow)**—Indicates conditions that warrant monitoring.
 - **Error (Blue)**—Indicates standard error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.
 - **Critical (Pink)**—Indicates critical conditions, such as hard drive errors.
 - **Alert (Orange)**—Indicates conditions that require immediate correction, such as a corrupted system database.
 - **Emergency (Red)**—Indicates system panic or other conditions that cause the routing platform to stop functioning.
- **Event ID**—Unique ID of the error or event. The prefix on each code identifies the generating software process. The rest of the code indicates the specific event or error.

- Event Description—Displays a more detailed explanation of the message.
- Time—Time that the error or event occurred.

To control which errors and events are displayed in the list, use the following options:

- System Log File—Specify the name of the system log file that records the errors and events.
- Process—Specify the system processes that generate the events you want to display. To view all the processes running on your system, enter the **show system processes** CLI command.
- Date From—Specify the beginning of the date range that you want to monitor. Set the date using the calendar pick tool.
- To—Specify the end of the date range that you want to monitor. Set the date using the calendar pick tool.
- Event ID—Specify the specific ID of the error or event that you want to monitor.
- Description—Enter a description for the errors or events.
- Search—Fetches the errors and events specified in the search criteria.
- Reset—Clears the cache of errors and events that were previously selected.
- Generate Report—Creates an HTML report based on the specified parameters.

explicit-priority

Syntax	explicit-priority;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> system syslog file <i>filename</i>], [edit logical-systems <i>logical-system-name</i> system syslog host], [edit system syslog file <i>filename</i>], [edit system syslog host]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Record the priority (facility and severity level) in each standard-format system log message directed to a file or remote destination. When the structured-data statement is also included at the [edit system syslog file <i>filename</i>] hierarchy level, this statement is ignored for the file.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Including Priority Information in System Log Messages on page 1741 • <i>Junos OS System Log Reference</i> • structured-data on page 1788

facility-override

Syntax	facility-override <i>facility</i> ;
Hierarchy Level	[edit system syslog host]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Substitute an alternate facility for the default facilities used when messages are directed to a remote destination.
Options	<i>facility</i> —Alternate facility to substitute for the default facilities. For a list of the possible facilities, see <i>Junos OS System Log Alternate Facilities for Remote Logging</i> .
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Changing the Alternative Facility Name for Remote System Log Messages</i> • <i>Junos OS System Log Reference</i>

file (Security Log)

Syntax	<pre>file { files <i>max-file-number</i>; name <i>file-name</i>; path <i>binary-log-file-path</i>; size <i>maximum-file-size</i>; }</pre>
Hierarchy Level	[edit security log]
Release Information	Statement modified in Release 9.2 of Junos OS.
Description	Configure security log file options for logs in binary format.
Options	<ul style="list-style-type: none">• files <i>number</i>—Specify the maximum number of binary log files. Range: 2 through 10 files.• name <i>name</i> —Name of the file to log messages.• path <i>filepath</i>—Specify the path of the binary log file.• size <i>maximum-file-size</i>—Maximum size of each trace file, in megabytes (MB). Range: 1 KB through 10 MB
Required Privilege Level	security—To view this statement in the configuration. security-control—To add this statement to the configuration.

files

Syntax	<code>files <i>number</i>;</code>
Hierarchy Level	[edit system syslog archive], [edit system syslog file <i>filename</i> archive]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for EX Series switches.
Description	Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i> , it closes the file, compresses it, and renames it to <i>logfile.0.gz</i> (for information about the maximum file size, see size). The utility then opens and writes to a new file called <i>logfile</i> . When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i> , and the new file is closed, compressed, and renamed <i>logfile.0.gz</i> . By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).
Options	<i>number</i> —Maximum number of archived files. Range: 1 through 1000 Default: 10 files
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Specifying Log File Size, Number, and Archiving Properties</i>• <i>Junos OS System Log Reference</i>• size on page 1787

host (Security Log)

Syntax	host { <i>ip-address</i> ; port <i>port-number</i> ; }
Hierarchy Level	[edit security log stream <i>stream-name</i>]
Release Information	Statement introduced in Release 9.2 of Junos OS.
Description	You can specify the IP address of the server to which the security logs will be streamed.
Options	<ul style="list-style-type: none"> • <i>ip-address</i>—Specify IP address of the host. • port <i>port-number</i>—Specify UDP port number.
Required Privilege Level	security—To view this statement in the configuration. security-control—To add this statement to the configuration.

Hierarchy Level [edit logical-systems *logical-system-name* system],
[edit system]

Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Support at the [edit logical-systems <i>logical-system-name</i> system] hierarchy level introduced in Junos OS Release 11.4.
Description	Configure the types of system log messages to log to files, a remote destination, user terminals, or the system console. The remaining statements are explained separately.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Junos OS System Log Overview on page 1733

system

Syntax	system { ... }
Hierarchy Level	[edit]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure system management properties.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>System Management Configuration Statements</i>

time-format

Syntax	<code>time-format (year millisecond year millisecond);</code>
Hierarchy Level	<code>[edit system syslog]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	<p>Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a file, console, or user statement at the <code>[edit system syslog]</code> hierarchy level. As of Junos OS Release 11.4, the additional time information is also sent to destinations configured by a host statement.</p> <p>By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, Aug 21 12:36:30. However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the <code>[edit system syslog time-format]</code> statement.</p>
	<p> NOTE: When the structured-data statement is included at the <code>[edit system syslog file <i>filename</i>]</code> hierarchy level, this statement is ignored for the file.</p>
Options	<p>millisecond—Include the millisecond in the timestamp.</p> <p>year—Include the year in the timestamp.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Including the Year or Millisecond in Timestamps on page 1743 • System Log Explorer • structured-data on page 1788

traceoptions (Security Log)

Syntax	<pre> traceoptions { file { filename; files number; match regular-expression; size maximum-file-size; (world-readable no-world-readable); } flag flag; no-remote-trace; } </pre>
Hierarchy Level	[edit security log]
Release Information	Statement modified in Release 9.2 of Junos OS.
Description	Configure security log tracing options.
Options	<ul style="list-style-type: none"> • file—Configure the trace file options. <ul style="list-style-type: none"> • filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. By default, the name of the file is the name of the process being traced. • files number—Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed to trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten. <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.</p> <p>Range: 2 through 1000 files</p> <p>Default: 10 files</p> • match regular-expression—Refine the output to include lines that contain the regular expression. • size maximum-file-size—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. <p>If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.</p> <p>Syntax: x K to specify KB, x m to specify MB, or x g to specify GB</p> <p>Range: 10 KB through 1 GB</p>

Default: 128 KB

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag**—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.
 - **all**—Trace with all flags enabled
 - **configuration**—Trace configuration events
 - **hpl**— Trace HPL logging
 - **report**— Trace HPL logging
 - **source**—Communicate with security log forwarder
- **no-remote-trace**—Set remote tracing as disabled.

Required Privilege	trace—To view this statement in the configuration.
Level	trace-control—To add this statement to the configuration.

Syntax	<pre> user (username *) { facility severity; match "regular-expression"; } </pre>
Hierarchy Level	[edit system syslog]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	Configure the logging of system messages to user terminals.
Options	<p>* (the asterisk)—Log messages to the terminal sessions of all users who are currently logged in.</p> <p>facility—Class of messages to log. To specify multiple classes, include multiple facility severity statements. For a list of the facilities, see Table 238 on page 1734.</p> <p>severity—Severity of the messages that belong to the facility specified by the paired facility name. Messages with severities the specified level and higher are logged. For a list of the severities, see Table 239 on page 1735.</p> <p>username—Junos OS login name of the user whose terminal session is to receive system log messages. To log messages to more than one user's terminal session, include more than one user statement.</p> <p>The remaining statement is explained separately.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

clear log

Syntax	<code>clear log <i>filename</i></code> <code><all></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Remove contents of a log file.
Options	<i>filename</i> —Name of the specific log file to delete. <code>all</code> —(Optional) Delete the specified log file and all archived versions of it.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • show log on page 1805

Output Fields	See <i>file list</i> for an explanation of output fields.

Sample Output

clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel          26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel           57 Sep 15 03:44 /var/log/sampled
total 1
```

clear security log

Syntax clear security log
<all>
<destination-address>
<destination-port>
<event-id>
<failure>
<interface-name>
<newer-than>
<older-than>
<process>
<protocol>
<severity>
<source-address>
<source-port>
<success>
<username>

Release Information Command introduced in Release 11.2 of Junos OS.

Description Deletes the event log.

Options **all**—Clears all audit event logs stored in the device memory.

destination-address—Clears audit event logs with the specified destination address.

destination-port—Clears audit event logs with the specified destination port.

event-id—Clears audit event logs with the specified event identification number.

failure—Clears failed audit event logs.

interface-name—Clears audit event logs with the specified interface.

newer-than—Clears audit event logs newer than the specified date and time.

older-than—Clears audit event logs older than the specified date and time.

process—Clears audit event logs with the specified process that generated the event.

protocol—Clears audit event logs generated through the specified protocol.

severity—Clears audit event logs generated with the specified severity.

source-address—Clears audit event logs with the specified source address.

source-port—Clears audit event logs with the specified source port.

success—Clears successful audit event logs.

username—Clears audit event logs generated for the specified user.

Sample Output

clear security log all

```
user@host> clear security log all
7905 security log events cleared
```

clear security log file

Syntax	clear security log file
Release Information	Command introduced in Release 12.1 of Junos OS.
Description	Deletes the content of an event mode security log file stored on the device in binary format.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show security log file on page 1812

Sample Output

clear security log file

```
user@host> clear security log file
7905 security log events cleared
```

monitor list

Syntax	monitor list
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display the status of monitored log and trace files.
Options	This command has no options.
Additional Information	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the syslog statement at the [edit system] hierarchy level and the options statement at the [edit routing-options] hierarchy level. The trace files generated by the routing protocol process are those configured with traceoptions statements at the [edit routing-options] , [edit interfaces] , and [edit protocols protocol] hierarchy levels.
Required Privilege Level	trace
Related Documentation	<ul style="list-style-type: none"> • monitor start on page 1630 • monitor stop on page 1632
List of Sample Output	monitor list on page 1801
Output Fields	Table 222 on page 1629 describes the output fields for the monitor list command. Output fields are listed in the approximate order in which they appear.

Table 249: monitor list Output Fields

Field Name	Field Description
monitor start	Indicates the file is being monitored.
"filename"	Name of the file that is being monitored.
Last changed	Date and time at which the file was last modified.

Sample Output

monitor list

```
user@host> monitor list
monitor start "vrrpd" (Last changed Dec 03:11:06 20)
monitor start "cli-commands" (Last changed Nov 07:3)
```

monitor start

Syntax	<code>monitor start <i>filename</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Start displaying the system log or trace file and additional entries being added to those files.
Options	<i>filename</i> —Specific log or trace file.
Additional Information	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the syslog statement at the [edit system] hierarchy level and the options statement at the [edit routing-options] hierarchy level. The trace files generated by the routing protocol process are configured with traceoptions statements at the [edit routing-options] , [edit interfaces] , and [edit protocols protocol] hierarchy levels.

NOTE: To monitor a log file within a logical system, issue the `monitor start logical-system-name/filename` command.

Required Privilege Level	trace
Related Documentation	<ul style="list-style-type: none"> monitor list on page 1629 monitor stop on page 1632
List of Sample Output	monitor start on page 1803
Output Fields	Table 223 on page 1630 describes the output fields for the monitor start command. Output fields are listed in the approximate order in which they appear.

Table 250: monitor start Output Fields

Field Name	Field Description
<i>filename</i>	Name of the file from which entries are being displayed. This line is displayed initially and when the command switches between log files.
<i>Date and time</i>	Timestamp for the log entry.

Sample Output

monitor start

```
user@host> monitor start system-log
*** system-log***
Jul 20 15:07:34 hang sshd[5845]: log: Generating 768 bit RSA key.
Jul 20 15:07:35 hang sshd[5845]: log: RSA key generation complete.
Jul 20 15:07:35 hang sshd[5845]: log: Connection from 204.69.248.180 port 912
Jul 20 15:07:37 hang sshd[5845]: log: RSA authentication for root accepted.
Jul 20 15:07:37 hang sshd[5845]: log: ROOT LOGIN as 'root' from host.example.com
Jul 20 15:07:37 hang sshd[5845]: log: Closing connection to 204.69.248.180
```

monitor stop

Syntax	<code>monitor stop <i>filename</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Stop displaying the system log or trace file.
Options	<i>filename</i> —Specific log or trace file.
Additional Information	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are those configured with the syslog statement at the [edit system] hierarchy level and the options statement at the [edit routing-options] hierarchy level. The trace files generated by the routing protocol process are those configured with traceoptions statements at the [edit routing-options] , [edit interfaces] , and [edit protocols <i>protocol</i>] hierarchy levels.
Required Privilege Level	trace

Output Fields	This command produces no output.

Sample Output

monitor stop

```
user@host> monitor stop
```

show log

List of Syntax	Syntax on page 1805 Syntax (QFX Series and OCX Series) on page 1805 Syntax (TX Matrix Router) on page 1805
Syntax	<pre>show log <filename user <username>></pre>
Syntax (QFX Series and OCX Series)	<pre>show log filename <device-type (device-id device-alias)></pre>
Syntax (TX Matrix Router)	<pre>show log <all-lcc lcc number scc> <filename user <username>></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option <i>device-type (device-id device-alias)</i> is introduced in Junos OS Release 13.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	List log files, display log file contents, or display information about users who have logged in to the router or switch.

NOTE: On MX Series routers, modifying a configuration to replace a service interface with another service interface is treated as a catastrophic event. When you modify a configuration, the entire configuration associated with the service interface—including NAT pools, rules, and service sets—is deleted and then re-created for the newly specified service interface. If there are active sessions associated with the service interface that is being replaced, these sessions are deleted and the NAT pools are then released, which leads to the generation of the NAT_POOL_RELEASE system log messages. However, because NAT pools are already deleted as a result of the catastrophic configuration change and no longer exist, the NAT_POOL_RELEASE system log messages are not generated for the changed configuration.

Options none—List all log files.

<all-lcc | lcc *number* | scc>—(Routing matrix only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace *number* with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type—(QFabric system only) (Optional) Display log messages for only one of the following device types:

- **director-device**—Display logs for Director devices.
- **infrastructure-device**—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).
- **interconnect-device**—Display logs for Interconnect devices.
- **node-device**—Display logs for Node devices.

NOTE: If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

(device-id | device-alias)—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

user <username>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include **username**, display logging information about the specified user.

List of Sample Output	show security log on page 1810

Output Fields Table 251 on page 1810 lists the output fields for the **show security log** command. Output fields are listed in the approximate order in which they appear.

Table 251: show security log Output Fields

Field Name	Field Description
Event time	The timestamp of the events received. On SRX Series devices, security logs were always timestamped using the UTC time zone by running set system time-zone utc and set security log utc-timestamp CLI commands. Now, time zone can be defined using the local time zone by running the set system time-zone time-zone command to specify the local time zone that the system should use when timestamping the security logs.
Message	Security events are listed.

Sample Output

Understanding Device Management Functions in Junos OS

After you have installed a device into your network, you need to manage the device within your network. Device management can be divided into five tasks:

- Fault management—Monitor the device; detect and fix faults.
- Configuration management—Configure device attributes.
- Accounting management—Collect statistics for accounting purposes.
- Performance management—Monitor and adjust device performance.
- Security management—Control device access and authenticate users.

The Junos OS network management features work in conjunction with an operations support system (OSS) to manage the devices within the network. Junos OS can assist you in performing these management tasks, as described in [Table 253 on page 1816](#).

Table 253: Device Management Features in Junos OS

Task	Junos OS Feature
Fault management	<p>Monitor and see faults using:</p> <ul style="list-style-type: none"> Operational mode commands—For more information about operational mode commands, see the <i>CLI User Guide</i>. SNMP MIBs—For more information about SNMP MIBs supported by Junos OS, see “Standard SNMP MIBs Supported by Junos OS” on page 1822 and “Juniper Networks Enterprise-Specific MIBs” on page 1841. Standard SNMP traps—For more information about standard SNMP traps, see the “Standard SNMP Traps Supported on Devices Running Junos OS” on page 1904. Enterprise-specific SNMP traps—For more information about enterprise-specific traps, see “Juniper Networks Enterprise-Specific SNMP Traps” on page 1889. System log messages—For more information about how to configure system log messages, see <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i>.
Configuration management	<ul style="list-style-type: none"> Configure device attributes using the command-line interface (CLI). For more information about configuring the device using the CLI, see the <i>CLI User Guide</i>. Configuration Management MIB—For more information about the Configuration Management MIB, see the <i>Configuration Management MIB</i>.
Accounting management	<p>Perform the following accounting-related tasks:</p> <ul style="list-style-type: none"> Collect statistics for interfaces, firewall filters, destination classes, source classes, and the Routing Engine. For more information about collecting statistics, see “Accounting Options Configuration” on page 1305. Use interface-specific traffic statistics and other counters, available in the Standard Interfaces MIB, Juniper Networks enterprise-specific extensions to the Interfaces MIB, and media-specific MIBs, such as the enterprise-specific ATM MIB. Count packets as part of a firewall filter. For more information about firewall filter policies, see “Juniper Networks Enterprise-Specific MIBs” on page 1841 and the <i>Junos OS Routing Protocols Library for Security Devices</i>.
Performance management	<p>Monitor performance in the following ways:</p> <ul style="list-style-type: none"> Use operational mode commands. For more information about monitoring performance using operational mode commands, see the <i>CLI User Guide</i>. Use firewall filters. For more information about performance monitoring using firewall filters, see the <i>Junos OS Routing Protocols Library for Security Devices</i>.

Table 253: Device Management Features in Junos OS (*continued*)

Task	Junos OS Feature
Security management	<p>Assure security in your network in the following ways:</p> <ul style="list-style-type: none"> Control access to the router and authenticate users. For more information about access control and user authentication, see the <i>Authentication and Integrated User Firewalls Feature Guide for Security Devices</i>. Control access to the router using SNMPv3 and SNMP over IPv6. For more information, see “Configuring the Local Engine ID” on page 1958 and “Tracing SNMP Activity on a Device Running Junos OS” on page 1996.

Understanding the Integrated Local Management Interface

The Integrated Local Management Interface (ILMI) provides a mechanism for Asynchronous Transfer Mode (ATM)-attached devices, such as hosts, routers, and ATM switches, to transfer management information. ILMI provides bidirectional exchange of management information between two ATM interfaces across a physical connection. ILMI information is exchanged over a direct encapsulation of SNMP version 1 (RFC 1157, *A Simple Network Management Protocol*) over ATM Adaptation Layer 5 (AAL5) using a virtual path identifier/virtual channel identifier (VPI/VCI) value (VPI=0, VCI=16).

Junos OS supports only two ILMI MIB variables: **atmfMYIPNmAddress** and **atmfPortMyIfname**. For ATM1 and ATM2 intelligent queuing (IQ) interfaces, you can configure ILMI to communicate directly with an attached ATM switch to enable querying of the switch's IP address and port number.

For more information about the ILMI MIB, see the ATM Forum at <http://www.atmforum.com/>.

SNMP MIBs Overview

- [Understanding the SNMP Implementation in Junos OS on page 1818](#)

Understanding the SNMP Implementation in Junos OS

SNMP enables the monitoring of network devices from a central location. This topic provides an overview of SNMP and describes how SNMP is implemented in the Junos OS.

This topic includes the following sections:

- [SNMP Architecture on page 1818](#)
- [Junos OS SNMP Agent Features on page 1820](#)

SNMP Architecture

The SNMP agent exchanges network management information with SNMP manager software running on a network management system (NMS), or host. The agent responds to requests for information and actions from the manager. The agent also controls access to the agent's MIB, the collection of objects that can be viewed or changed by the SNMP manager.

The SNMP manager collects information about network connectivity, activity, and events by polling managed devices.

Communication between the agent and the manager occurs in one of the following forms:

- **Get, GetBulk, and GetNext** requests—The manager requests information from the agent; the agent returns the information in a **Get** response message.
- **Set** requests—The manager changes the value of a MIB object controlled by the agent; the agent indicates status in a **Set** response message.
- **Traps** notification—The agent sends traps to notify the manager of significant events that occur on the network device.

This topic contains the following sections:

- [SNMP MIBs on page 1818](#)
- [SNMP Traps and Informs on page 1819](#)

SNMP MIBs

A MIB is a hierarchy of information used to define managed objects in a network device. The MIB structure is based on a tree structure, which defines a grouping of objects into related sets. Each object in the MIB is associated with an object identifier (OID), which names the object. The “leaf” in the tree structure is the actual managed object instance, which represents a resource, event, or activity that occurs in your network device.

MIBs are either standard or enterprise-specific. Standard MIBs are created by the Internet Engineering Task Force (IETF) and documented in various RFCs. Depending on the vendor, many standard MIBs are delivered with the NMS software. You can also download the standard MIBs from the IETF website, www.ietf.org, and compile them into your NMS, if necessary.

For a list of standard supported MIBs, see [“Standard SNMP MIBs Supported by Junos OS” on page 1822](#).

Enterprise-specific MIBs are developed and supported by a specific equipment manufacturer. If your network contains devices that have enterprise-specific MIBs, you must obtain them from the manufacturer and compile them into your network management software.

For a list of Juniper Networks enterprise-specific supported MIBs, see [“Juniper Networks Enterprise-Specific MIBs” on page 1841](#).

SNMP Traps and Informs

Routers can send notifications to SNMP managers when significant events occur on a network device, most often errors or failures. SNMP notifications can be sent as traps or inform requests. SNMP traps are unconfirmed notifications. SNMP informs are confirmed notifications.

SNMP traps are defined in either standard or enterprise-specific MIBs. Standard traps are created by the IETF and documented in various RFCs. The standard traps are compiled into the network management software. You can also download the standard traps from the IETF website, www.ietf.org.

For more information about standard traps supported by the Junos OS, see [“Standard SNMP Traps Supported on Devices Running Junos OS” on page 1904](#).

Enterprise-specific traps are developed and supported by a specific equipment manufacturer. If your network contains devices that have enterprise-specific traps, you must obtain them from the manufacturer and compile them into your network management software.

For more information about enterprise-specific traps supported by the Junos OS, see [“Juniper Networks Enterprise-Specific SNMP Traps” on page 1889](#). For information about system logging severity levels for SNMP traps, see [“System Logging Severity Levels for SNMP Traps” on page 1820](#).

With traps, the receiver does not send any acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. To increase reliability, SNMP informs are supported in SNMPv3. An SNMP manager that receives an inform acknowledges the message with a response. For information about SNMP informs, see [“Configuring SNMP Informs” on page 1959](#).

SNMP Trap Queuing

The Junos OS supports trap queuing to ensure that traps are not lost because of temporary unavailability of routes. Two types of queues, destination queues and a throttle queue, are formed to ensure delivery of traps and to control the trap traffic.

The Junos OS forms a destination queue when a trap to a particular destination is returned because the host is not reachable, and adds the subsequent traps to the same destination to the queue. The Junos OS checks for availability of routes every 30 seconds and sends the traps from the destination queue in a round-robin fashion. If the trap delivery fails, the trap is added back to the queue, and the delivery attempt counter and the next delivery attempt timer for the queue are reset. Subsequent attempts occur at progressive intervals of 1 minute, 2 minutes, 4 minutes, and 8 minutes. The maximum delay between the attempts is 8 minutes, and the maximum number of attempts is 10. After 10 unsuccessful attempts, the destination queue and all the traps in the queue are deleted.

The Junos OS also has a throttle mechanism to control the number of traps (**throttle threshold**; default value of 500 traps) sent during a particular time period (**throttle interval**; default of 5 seconds) and to ensure consistency in trap traffic, especially when a large number of traps are generated because of interface status changes. The throttle interval period begins when the first trap arrives at the throttle. All traps within the trap threshold are processed, and the traps beyond the threshold limit are queued. The maximum size of trap queues (that is, the throttle queue and the destination queue combined) is 40,000 traps. However, on EX Series switches, the maximum size of the trap queue is 1000 traps. The maximum size of any one queue is 20,000 traps for devices other than EX Series switches. On EX Series switches, the maximum size of one queue is 500 traps. If a trap is sent from a destination queue when the throttle queue has exceeded the maximum size, the trap is added back to the top of the destination queue, and all subsequent attempts from the destination queue are stopped for a 30-second period, after which the destination queue restarts sending the traps.

NOTE: Users cannot configure the Junos OS for trap queuing. Users cannot view any information about trap queues except what is available in the syslog.

System Logging Severity Levels for SNMP Traps

For some traps, when a trap condition occurs, regardless of whether the SNMP agent sends a trap to an NMS, the trap is logged if the system logging is configured to log an event with that system logging severity level. For more information about system logging severity levels, see the *System Log Monitoring and Troubleshooting Guide for Security Devices*.

For more information about system logging severity levels for standard traps, see [“Standard SNMP Version 1 Traps” on page 1905](#) and [“Standard SNMP Version 2 Traps” on page 1908](#). For more information about system logging severity levels for enterprise-specific traps, see [“Juniper Networks Enterprise-Specific SNMP Version 1 Traps” on page 1890](#) and [“Juniper Networks Enterprise-Specific SNMP Version 2 Traps” on page 1897](#).

Junos OS SNMP Agent Features

The Junos OS SNMP agent software consists of an SNMP master agent that delegates all SNMP requests to subagents. Each subagent is responsible for the support of a specific set of MIBs.

The Junos OS supports the following versions of SNMP:

- **SNMPv1**—The initial implementation of SNMP that defines the architecture and framework for SNMP.
- **SNMPv2c**—The revised protocol, with improvements to performance and manager-to-manager communications. Specifically, SNMPv2c implements community strings, which act as passwords when determining who, what, and how the SNMP clients can access the data in the SNMP agent. The community string is contained in SNMP **Get**, **GetBulk**, **GetNext**, and **Set** requests. The agent might require a different community string for **Get**, **GetBulk**, and **GetNext** requests (**read-only** access) than it does for **Set** requests (**read-write** access).
- **SNMPv3**—The most up-to-date protocol focuses on security. SNMPv3 defines a security model, user-based security model (USM), and a view-based access control model (VACM). SNMPv3 USM provides data integrity, data origin authentication, message replay protection, and protection against disclosure of the message payload. SNMPv3 VACM provides access control to determine whether a specific type of access (read or write) to the management information is allowed.

In addition, the Junos OS SNMP agent software accepts IPv4 and IPv6 addresses for transport over IPv4 and IPv6. For IPv6, the Junos OS supports the following features:

- SNMP data over IPv6 networks
- IPv6-specific MIB data
- SNMP agents for IPv6

Standard SNMP MIBs Supported by Junos OS

Table 254 on page 1822 contains the list of standard SNMP MIBs and RFCs that are supported on various devices running Junos OS. RFCs can be found at <http://www.ietf.org>.

NOTE: In this table, a value of 1 in any of the platform columns (M, T, MX, EX, and SRX) denotes that the corresponding MIB is supported on that particular platform, and a value of 0 denotes that the MIB is not supported on the platform.

Table 254: Standard MIBs Supported on Devices Running Junos OS

Juniper Networks Enterprise-Specific MIBs

The Junos OS supports the following enterprise-specific MIBs:

- **AAA Objects MIB**—Provides support for monitoring user authentication, authorization, and accounting through the RADIUS, LDAP, SecurID, and local authentication servers. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-user-aaa.txt

For more information, see *AAA Objects MIB*.
- **Access Authentication Objects MIB**—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported

by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-auth.txt.

For more information, see *Access Authentication Objects MIB*.

- Alarm MIB—Provides support for alarms from the router. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-chassis-alarm.txt.

For more information, see *Alarm MIB*.

- DHCP Objects MIB— Provides SNMP support (get and trap) for DHCP local server and relay configurations. It also provides support for bindings and leases tables, and for statistics. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-jdhcp.txt.

For more information, see *DHCP MIB*.

- Digital Optical Monitoring MIB—Provides support for the **SNMP Get** request for statistics and **SNMP Trap** notifications for alarms. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-dom.txt.

For more information, see *Digital Optical Monitoring MIB*.

- DNS Objects MIB—Provides support for monitoring DNS proxy queries, requests, responses, and failures. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-dns.txt.

For more information, see *DNS Objects MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-firewall.txt.

For more information, see *Firewall MIB*.

- Flow Collection Services MIB—Provides statistics on files, records, memory, FTP, and error states of a monitoring services interface. It also provides SNMP traps for unavailable destinations, unsuccessful file transfers, flow overloading, and memory overloading. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-coll.txt.

For more information, see *Flow Collection Services MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage format. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB,

see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-hostresources.txt.

For more information, see *Host Resources MIB*.

- IDP Objects MIB—Provides support for monitoring SNMP IDP queries, requests, responses, and failures. This MIB defines the key monitoring and threshold crossing trap support, IDP database update status and trap support, attack-related monitoring and trap support for all SRX Series devices. This MIB models IDP attributes specific to the appropriate Juniper Networks implementation. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-idp.txt.

For more information, see *IDP MIB*.

- Interface MIB—Extends the standard **ifTable** (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-if-extensions.txt.

For more information, see *Interface MIB*.

- Interface Accounting Forwarding Class MIB—Extends the Juniper Enterprise Interface MIB and provides support for monitoring statistics data for interface accounting and IETF standardization. This MIB is currently supported by Junos OS for M Series and MX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-if-accounting.txt

For more information, see *Interface Accounting Forwarding Class MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipforward.txt.

For more information, see *IP Forward MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt.

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt.

For more information, see *IPsec Monitoring MIB*.

- IPsec VPN Objects MIB—Provides support for monitoring IPsec and IPsec VPN management objects for Juniper security product lines. This MIB is an extension of **jnx-ipsec-flow-mon.mib**. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-ipsec-vpn.txt.

For more information, see *IPsec VPN Objects MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipv4.txt.

For more information, see *IPv4 MIB*.

- IPv6 and ICMPv6 MIB—Provides IPv6 and Internet Control Message Protocol version 6 (ICMPv6) statistics. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipv6.txt.

For more information, see *IPv6 MIB*.

- L2ALD MIB—Contains information about the Layer 2 Address Learning Daemon (L2ALD) and related traps, such as the routing instance MAC limit trap and the interface MAC limit trap. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-l2ald.txt.

For more information, see *L2ALD MIB*.

- L2CP MIB—Provides information about Layer 2 Control Protocols (L2CP) based features on MX Series 3D Universal Edge Routers. Currently, Junos OS supports only the **jnxDot1dStpPortRootProtectEnabled**, **jnxDot1dStpPortRootProtectState**, and **jnxPortRootProtectStateChangeTrap** objects. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-l2cp-features.txt.

For more information, see *L2CP MIB*.

- L2TP MIB—Provides information about Layer 2 Transport Protocol (L2TP) tunnels and sessions. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-l2tp.txt.

For more information, see *L2TP MIB*.

- LDP MIB—Provides LDP statistics and defines LDP label-switched path (LSP) notifications. LDP traps support only IPv4 standards. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ldp.txt.

For more information, see *LDP MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-license.txt.

For more information, see *License MIB*.

- Logical Systems MIBs—Extend SNMP support to logical systems security profile through various MIBs defined under **jnxLsysSecurityProfile**. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-lsys-securityprofile.txt.

For more information about logical systems MIBs and downloadable versions of the MIBs, see *Logical Systems MIB*.

- NAT Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-nat.txt.

For more information, see *NAT Objects MIB*.

- Power Supply Unit MIB—Enables monitoring and managing of the power supply on a device running the Junos OS. This MIB is currently supported only on EX Series Ethernet Switches. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-power-supply-unit.txt.

For more information, see *Power Supply Unit MIB*.

- PPP MIB—Provides SNMP support for PPP-related information such as the type of authentication used, interface characteristics, status, and statistics. This MIB is currently supported only on M Series and MX Series routers. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ppp.txt.

For more information, see *PPP MIB*.

- PPPoE MIB—Provides SNMP support for PPPoE-related information such as the type of authentication used, interface characteristics, status, and statistics. This MIB is currently supported only on M Series and MX Series routers. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-pppoe.txt.

For more information, see *PPPoE MIB*.

- Pseudowire TDM MIB—Extends the standard Pseudowire MIB, and contains information about configuration and statistics for specific pseudowire types. The enterprise-specific Pseudowire TDM MIB is the Juniper Networks implementation of the standard Managed Objects for TDM over Packet Switched Network MIB (draft-ietf-pwe3-tdm-mib-08.txt). For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-pwtdm.txt.
- SONET APS MIB—Monitors any SONET interface that participates in Automatic Protection Switching (APS). For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-sonetaps.txt.

For more information, see *SONET APS MIB*.

- SONET/SDH Interface Management MIB—Monitors the current alarm for each SONET/SDH interface. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-sonet.txt.

For more information, see *SONET/SDH Interface Management MIB*.

- Source Class Usage MIB—Counts packets sent to customers by performing a lookup on the IP source address and the IP destination address. The Source Class Usage (SCU) MIB makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-scu.txt.

For more information, see *Source Class Usage MIB*.

- SPU Monitoring MIB—Provides support for monitoring SPUs on all high-end SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt.

For more information, see *SPU Monitoring Objects MIB*.

- Structure of Management Information MIB—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for SRX Series devices, services, and traps. This MIB is currently supported by Junos OS for SRX Series devices only.

Explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-smi.txt.

For more information, see *Structure of Management Information MIB*.

List of SRX100, SRX210, SRX220, SRX240, SRX550, and SRX650 Services Gateways Supported Enterprise-Specific MIBs

Junos OS supports the following enterprise-specific MIBs:

- Structure of Management Information MIB—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for SRX Series devices product, services and traps. This MIB is currently supported only by Junos OS for SRX Series devices. It also explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-smi.txt. For more information, see *Structure of Management Information MIB*.
- Access Authentication Objects MIB—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported

only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-auth.txt.

For more information, see *Access Authentication Objects MIB*.

- Alarm MIB—Provides support for alarms from the router. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-chassis-alarm.txt.

For more information, see *Alarm MIB*.

- BGP4 V2 MIB—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-bgpmib2.txt.

For more information, see *BGP4 V2 MIB*.

- BFD MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-bfd.txt.

For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switching Board (SSB), Switching and Forwarding Model (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-chassis.txt.

For more information, see *Chassis MIBs*.

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in **jnxCmChgEventTable**. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-cfgmgmt.txt.

For more information, see *Configuration Management MIB*.

- Ethernet MAC MIB—Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, **inOctets**, **inFrames**, **outOctets**, and **outFrames** on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-mac.txt.

For more information, see *Ethernet MAC MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-event.txt.

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-firewall.txt.

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-hostresources.txt.

For more information, see *Host Resources MIB*.

- Interface MIB—Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-if-extensions.txt.

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipforward.txt.

For more information, see *IP Forward MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt.

For more information, see *IPsec Monitoring MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt.

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipv4.txt.

For more information, see *IPv4 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-license.txt.

For more information, see *License MIB*.

- Network Address Translation (NAT) Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-nat.txt.

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-pfe.txt.

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ping.txt.

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-policy.txt.

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-rpf.txt.

NOTE: The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- **RMON Events and Alarms MIB**—Supports the Junos extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments alarmTable with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-rmon.txt.

For more information, see *RMON Events and Alarms MIB*.

- **Security Interface Extension Objects MIB**—Provides support for the security management of interfaces. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-if-ext.txt.

For more information, see *Security Interface Extension Objects MIB*.

- **SNMP IDP Objects MIB**—Provides support for monitoring SNMP IDP queries, requests, responses, and failures. This MIB defines the key monitoring and threshold crossing trap support, IDP database update status and trap support, attack-related monitoring and trap support for SRX100, SRX210, SRX220, SRX240, SRX550, and SRX650 Services Gateways. This MIB models IDP attributes specific to the appropriate Juniper Networks implementation. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-idp.txt.

For more information, see *SNMP IDP MIB*.

- **System Log MIB**—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-syslog.txt.

For more information, see *System Log MIB*.

- **Traceroute MIB**—Supports the Junos extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the traceRouteCtlTable of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-traceroute.txt.

For more information, see *Traceroute MIB*.

- **Utility MIB**—Provides SNMP support for exposing Junos data and has tables that contain information on each type of data, such as integer and string. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-util.txt.

For more information, see *Utility MIB*.

- VPN Certificate Objects MIB—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-cert.txt.

For more information, see *VPN Certificate Objects MIB*.

List of SRX1400, SRX3400, and SRX3600 Services Gateways Supported Enterprise-Specific MIBs

Junos OS supports the following enterprise-specific MIBs:

- Structure of Management Information MIB—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for SRX Series devices product, services and traps. This MIB is currently supported only by Junos OS for SRX Series devices. It also explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-smi.txt. For more information, see *Structure of Management Information MIB*.
- AAA Objects MIB—Provides support for monitoring user authentication, authorization, and accounting through the RADIUS, LDAP, SecurID, and local authentication servers. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-user-aaa.txt.

For more information, see *AAA Objects MIB*.

- Access Authentication Objects MIB—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-auth.txt.

For more information, see *Access Authentication Objects MIB*.

- Alarm MIB—Provides support for alarms from the router. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-chassis-alarm.txt.

For more information, see *Alarm MIB*.

- ATM CoS MIB—Provides support for monitoring Asynchronous Transfer Mode, version 2 (ATM2) virtual circuit (VC) class-of-service (CoS) configurations. It also provides

CoS queue statistics for all VCs that have CoS configured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-atm-cos.txt.

For more information, see *ATM Class-of-Service MIB*.

- BGP4 V2 MIB—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-bgpmib2.txt.

For more information, see *BGP4 V2 MIB*.

- BFD MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-bfd.txt.

For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switching Board (SSB), Switching and Forwarding Model (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-chassis.txt.

For more information, see *Chassis MIBs*.

- Chassis Cluster MIB—Provides information about objects that are used whenever the state of the control link interfaces or fabric link interfaces changes (up to down or down to up) in a chassis cluster deployment. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-jsrpd.txt.

For more information, see *Chassis Cluster MIB*.

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in `jnxCmChgEventTable`. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-cfgmgmt.txt.

For more information, see *Configuration Management MIB*.

- Destination Class Usage MIB—Provides support for monitoring packet counts based on the ingress and egress points for traffic transiting your networks. Ingress points are identified by input interface. Egress points are identified by destination prefixes grouped into one or more sets, known as destination classes. One counter is managed per interface per destination class, up to a maximum of 16 counters per interface. For a

downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-dcu.txt.

For more information, see *Destination Class Usage MIB*.

- DNS Objects MIB—Provides support for monitoring DNS proxy queries, requests, responses, and failures. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-dns.txt.

For more information, see *DNS Objects MIB*.

- Ethernet MAC MIB—Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, **inOctets**, **inFrames**, **outOctets**, and **outFrames** on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-mac.txt.

For more information, see *Ethernet MAC MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-event.txt.

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-firewall.txt.

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-hostresources.txt.

For more information, see *Host Resources MIB*.

- Interface MIB—Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-if-extensions.txt.

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipforward.txt.

For more information, see *IP Forward MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt.

For more information, see *IPsec Monitoring MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt.

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipv4.txt.

For more information, see *IPv4 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-license.txt.

For more information, see *License MIB*.

- Logical Systems MIB—Provides support for logical systems security profile. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-lsys-securityprofile.txt.

For more information, see *Logical Systems MIB*.

- NAT Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-nat.txt.

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-pfe.txt.

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in **pingCtlTable** of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ping.txt.

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-policy.txt.

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-rpf.txt.

NOTE: The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- RMON Events and Alarms MIB—Supports the Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments **alarmTable** with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-rmon.txt.

For more information, see *RMON Events and Alarms MIB*.

- Security Interface Extension Objects MIB—Provides support for the security management of interfaces. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-if-ext.txt.

For more information, see *Security Interface Extension Objects MIB*.

- Security Screening Objects MIB—Defines the MIB for the Juniper Networks Enterprise Firewall screen functionality. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-screening.txt.

For more information, see *Security Screening Objects MIB*.

- Source Class Usage MIB—Counts packets sent to customers by performing a lookup on the IP source address and the IP destination address. The Source Class Usage (SCU) MIB makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-scu.txt.

For more information, see *Source Class Usage MIB*.

- SPU Monitoring MIB—Provides support for monitoring SPUs on SRX5600 and SRX5800 devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt.

For more information, see *SPU Monitoring Objects MIB*.

- System Log MIB—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-syslog.txt.

For more information, see *System Log MIB*.

- Traceroute MIB—Supports the Junos OS extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the **traceRouteCtlTable** of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-traceroute.txt.

For more information, see *Traceroute MIB*.

- Utility MIB—Provides SNMP support for exposing Junos OS data and has tables that contain information about each type of data, such as integer and string. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-util.txt.

For more information, see *Utility MIB*.

- VPN Certificate Objects MIB—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-cert.txt.

For more information, see *VPN Certificate Objects MIB*.

List of SRX5400, SRX5600 and SRX5800 Services Gateways Supported Enterprise-Specific MIBs

Junos OS supports the following enterprise-specific MIBs:

- Structure of Management Information MIB—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for SRX Series devices product, services and traps. This MIB is currently supported only by Junos OS for SRX Series devices. It also explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-smi.txt . For more information, see *Structure of Management Information MIB*.
- AAA Objects MIB—Provides support for monitoring user authentication, authorization, and accounting through the RADIUS, LDAP, SecurID, and local authentication servers. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-user-aaa.txt .
For more information, see *AAA Objects MIB*.
- Access Authentication Objects MIB—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-auth.txt .
For more information, see *Access Authentication Objects MIB*.
- Alarm MIB—Provides support for alarms from the router. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-chassis-alarm.txt .
For more information, see *Alarm MIB*.
- ATM CoS MIB—Provides support for monitoring Asynchronous Transfer Mode, version 2 (ATM2) virtual circuit (VC) class-of-service (CoS) configurations. It also provides CoS queue statistics for all VCs that have CoS configured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-atm-cos.txt .
For more information, see *ATM Class-of-Service MIB*.
- BGP4 V2 MIB—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-bgpmib2.txt .
For more information, see *BGP4 V2 MIB*.
- BFD MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-bfd.txt .
For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switching Board (SSB), Switching and Forwarding Model (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-chassis.txt.

For more information, see *Chassis MIBs*.

- Chassis Cluster MIB—Provides information about objects that are used whenever the state of the control link interfaces or fabric link interfaces changes (up to down or down to up) in a chassis cluster deployment. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-jsrpd.txt.

For more information, see *Chassis Cluster MIB*.

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in **jnxCmChgEventTable**. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-cfgmgmt.txt.

For more information, see *Configuration Management MIB*.

- Destination Class Usage MIB—Provides support for monitoring packet counts based on the ingress and egress points for traffic transiting your networks. Ingress points are identified by input interface. Egress points are identified by destination prefixes grouped into one or more sets, known as destination classes. One counter is managed per interface per destination class, up to a maximum of 16 counters per interface. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-dcu.txt.

For more information, see *Destination Class Usage MIB*.

- DNS Objects MIB—Provides support for monitoring DNS proxy queries, requests, responses, and failures. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-dns.txt.

For more information, see *DNS Objects MIB*.

- Ethernet MAC MIB—Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, **inoctets**, **inframes**, **outoctets**, and **outframes** on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/jnx-mac.txt.

For more information, see *Ethernet MAC MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-event.txt.

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-firewall.txt.

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-hostresources.txt.

For more information, see *Host Resources MIB*.

- Interface MIB—Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-if-extensions.txt.

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipforward.txt.

For more information, see *IP Forward MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt.

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt.

For more information, see *IPsec Monitoring MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a

downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ipv4.txt.

For more information, see *IPv4 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-license.txt.

For more information, see *License MIB*.

- Logical Systems MIB—Provides support for logical systems security profile. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-lsys-securityprofile.txt.

For more information, see *Logical Systems MIB*.

- Network Address Translation (NAT) Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-nat.txt.

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-pfe.txt.

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-ping.txt.

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-policy.txt.

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-rpf.txt.

NOTE: The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- **RMON Events and Alarms MIB**—Supports the Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments alarmTable with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-rmon.txt.

For more information, see *RMON Events and Alarms MIB*.

- **Security Interface Extension Objects MIB**—Provides support for the security management of interfaces. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-if-ext.txt.

For more information, see *Security Interface Extension Objects MIB*.

- **Security Screening Objects MIB**—Defines the MIB for the Juniper Networks Enterprise Firewall screen functionality. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-screening.txt.

For more information, see *Security Screening Objects MIB*.

- **Source Class Usage MIB**—Counts packets sent to customers by performing a lookup on the IP source address and the IP destination address. The Source Class Usage (SCU) MIB makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-scu.txt.

For more information, see *Source Class Usage MIB*.

- **SPU Monitoring MIB**—Provides support for monitoring SPUs on SRX5600 and SRX5800 devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt.

For more information, see *SPU Monitoring Objects MIB*.

- **System Log MIB**—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-syslog.txt.

For more information, see *System Log MIB*.

- **Traceroute MIB**—Supports the Junos OS extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the `traceRouteCtlTable` of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-traceroute.txt.

For more information, see *Traceroute MIB*.

- **Utility MIB**—Provides SNMP support for exposing Junos OS data and has tables that contain information on each type of data, such as integer and string. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-util.txt.

For more information, see *Utility MIB*.

- **VPN Certificate Objects MIB**—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-js-cert.txt.

For more information, see *VPN Certificate Objects MIB*.

Enterprise-Specific MIBs and Supported Devices

Table 255 on page 1863 lists the enterprise-specific MIBs that are supported on various devices running the Junos OS.

NOTE: In this table, a value of 1 in any of the platform columns (M, MX, T, EX, J, and SRX) denotes that the corresponding MIB is supported on that particular platform. A value of 0 denotes that the MIB is not supported on the platform.

NOTE: This topic uses the following classification for SRX Series devices: Low-End (SRX100, SRX110, SRX210, SRX220, and SRX240), Mid-Range (SRX550 and SRX650), and High-End (SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800).

Table 255: Enterprise-Specific MIBs and Supported Devices

Enterprise-Specific MIB	Platforms							SRX

MIB Support Details

Table 256 on page 1872 shows enterprise-specific MIB objects supported by Junos OS and provides notes detailing how they are handled when a routing instance is specified in an SNMP request. An en dash (–) indicates that the item is not applicable.

Table 256: MIB Support for Routing Instances (Juniper Networks MIBs)

Object	Support Class	Description/Notes
jnxProducts(1)	–	Product Object IDs
jnxServices(2)	–	Services
jnxMibs(3) jnxBoxAnatomy(1)	Class 3	Objects are exposed only for the default logical system.
mpls(2)	Class 2	All instances within a logical system are exposed. Data will not be segregated down to the routing instance level.
ifJnx(3)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxAlarms(4)	Class 3	Objects are exposed only for the default logical system.
jnxFirewalls(5)	Class 4	Data is not segregated by routing instance. All instances are exposed.

Table 256: MIB Support for Routing Instances (Juniper Networks MIBs) (*continued*)

Object	Support Class	Description/Notes
jnxDCUs(6)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxPingMIB(7)	Class 3	Objects are exposed only for the default logical system.
jnxTraceRouteMIB(8)	Class 3	Objects are exposed only for the default logical system.
jnxATM(10)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxIpv6(11)	Class 4	Data is not segregated by routing instance. All instances are exposed.
jnxIpv4(12)	Class 1	jnxIpv4AddrTable(1) . Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxRmon(13)	Class 3	jnxRmonAlarmTable(1) . Objects are exposed only for the default logical system.
jnxLdp(14)	Class 2	jnxLdpTrapVars(1) . All instances within a logical system are exposed. Data will not be segregated down to the routing instance level.
jnxCos(15) jnxCosIfqStatsTable(1) jnxCosFcTable(2) jnxCosFcIdTable(3) jnxCosQstatTable(4)	Class 3	Objects are exposed only for the default logical system.
jnxScu(16) jnxScuStatsTable(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxRpf(17) jnxRpfStatsTable(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxCfgMgmt(18)	Class 3	Objects are exposed only for the default logical system.

Table 256: MIB Support for Routing Instances (Juniper Networks MIBs) (continued)

Object	Support Class	Description/Notes
jnxPMon(19) jnxPMonFlowTable(1) jnxPMonErrorTable(2) jnxPMonMemoryTable(3)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxSonet(20) jnxSonetAlarmTable(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxAtmCos(21) jnxCosAtmVcTable(1) jnxCosAtmScTable(2) jnxCosAtmVcQstatsTable(3) jnxCosAtmTrunkTable(4)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
ipSecFlowMonitorMIB(22)	–	–
jnxMac(23) jnxMacStats(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
apsMIB(24)	Class 3	Objects are exposed only for the default logical system.
jnxChassisDefines(25)	Class 3	Objects are exposed only for the default logical system.
jnxVpnMIB(26)	Class 2	All instances within a logical system are exposed. Data will not be segregated down to the routing instance level.
jnxSericesInfoMib(27)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxCollectorMIB(28)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxHistory(29)	–	–
jnxSpMIB(32)	Class 3	Objects are exposed only for the default logical system.

[Table 257 on page 1876](#) shows Class 1 MIB objects (standard and enterprise-specific MIBs) supported by Junos OS. With Class 1 objects, only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.

Table 257: Class 1 MIB Objects (Standard and Juniper MIBs)

Class	MIB	Objects

Juniper Networks Enterprise-Specific SNMP Version 1 Traps

The Junos OS supports enterprise-specific SNMP version 1 traps shown in [Table 262 on page 1890](#). The traps are organized first by trap category and then by trap name. The system logging severity levels are listed for those traps that have them. Traps that do not have corresponding system logging severity levels are marked with an en dash (–).

For more information about system log messages, see the [System Log Explorer](#). To view the Juniper Networks enterprise-specific SNMP version 2 traps, see “[Juniper Networks Enterprise-Specific SNMP Version 2 Traps](#)” on page 1897. For more information about chassis traps, see *Chassis Traps*.

Table 262: Juniper Networks Enterprise-Specific Supported SNMP Version 1 Traps

Defined in	Trap Name	Enterprise ID	Generic Trap Number	Specific Trap Number	System Logging Severity Level	System Log Tag	Supported On
Chassis Notifications (Alarm Conditions)							
<i>Chassis MIB</i> (jnx-chassis.mib)	jnxPowerSupplyFailure	1.3.6.1.4.1.2636.4.1	6	1	Warning	CHASSISD_SNMP_TRAP	All devices running Junos OS.
	jnxFanFailure	1.3.6.1.4.1.2636.4.1	6	2	Critical	CHASSISD_SNMP_TRAP	All devices running Junos OS.
	jnxOverTemperature	1.3.6.1.4.1.2636.4.1	6	3	Alert	CHASSISD_SNMP_TRAP	All devices running Junos OS.
	jnxRedundancySwitchOver	1.3.6.1.4.1.2636.4.1	6	4	Critical	CHASSISD_SNMP_TRAP	All devices running Junos OS.

Juniper Networks Enterprise-Specific SNMP Version 2 Traps

The Junos OS supports the enterprise-specific SNMP version 2 traps shown in [Table 263 on page 1897](#). The traps are organized first by trap category and then by trap name. The system logging severity levels are listed for those traps that have them. Traps that do not have corresponding system logging severity levels are marked with an en dash (–).

For more information about system messages, see the [System Log Explorer](#). For more information about configuring system logging, see the [Junos OS Administration Library for Routing Devices](#). To view the Juniper Networks enterprise-specific SNMP version 1 traps, see “[Juniper Networks Enterprise-Specific SNMP Version 1 Traps](#)” on page 1890. For more information about chassis traps, see *Chassis Traps*.

Standard SNMP Traps Supported on Devices Running Junos OS

This topic provides pointers to the standard SNMP traps supported by the Junos OS.

NOTE: For scalability reasons, the MPLS traps are generated by the ingress router only.

Standard SNMP Version 1 Traps

Table 264 on page 1905 provides an overview of the standard traps for SNMPv1. The traps are organized first by trap category and then by trap name, and include their enterprise ID, generic trap number, and specific trap number. The system logging severity levels are listed for those traps that have them with their corresponding system log tag. Traps that do not have corresponding system logging severity levels are marked with an en dash (–) in the table.

For more information about system log messages, see the [System Log Explorer](#). For more information about configuring system logging, see the *Junos OS System Basics Configuration Guide*.

Table 264: Standard Supported SNMP Version 1 Traps

Defined in	Trap Name	Enterprise ID	Generic Trap Number	Specific Trap Number	System Logging Severity Level	Syslog Tag	Supported On
Startup Notifications							
RFC 1215, <i>Conventions for Defining Traps for Use with the SNMP</i>	authenticationFailure	1.3.6.1.4.1.2636	4	0	Notice	SNMPD_TRAP_GEN_FAILURE	All devices running Junos OS.
	coldStart	1.3.6.1.4.1.2636	0	0	Critical	SNMPD_TRAP_COLD_START	All devices running Junos OS.
	warmStart	1.3.6.1.4.1.2636	1	0	Error	SNMPD_TRAP_WARM_START	All devices running Junos OS.
Link Notifications

Standard SNMP Version 2 Traps

[Table 265 on page 1909](#) provides an overview of the standard SNMPv2 traps supported by the Junos OS. The traps are organized first by trap category and then by trap name and include their **snmpTrapOID**. The system logging severity levels are listed for those traps that have them with their corresponding system log tag. Traps that do not have corresponding system logging severity levels are marked with an en dash (–) in the table.

For more information about system log messages, see *System Log Monitoring and Troubleshooting Guide for Security Devices*.

Table 265: Standard Supported SNMP Version 2 Traps

Defined in	Trap Name	snmpTrapOID	System Logging Severity Level	Syslog Tag	Supported On
Startup Notifications					
RFC 1907, <i>Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)</i>	coldStart	1.3.6.1.6.3.1.1.5.1	Critical	SNMPD_TRAP_COLD_START	All devices running Junos OS.

Table 265: Standard Supported SNMP Version 2 Traps (*continued*)

Defined in	Trap Name	snmpTrapOID	System Logging Severity Level	Syslog Tag	Supported On
------------	-----------	-------------	-------------------------------	------------	--------------

The Junos OS also supports the following standard SNMP version 2 traps:

- [SNMP Version 2 MPLS Traps on page 1912](#)
- [SNMP Version 2 L3VPN Traps on page 1913](#)

SNMP Version 2 MPLS Traps

The Junos OS supports the MPLS SNMP version 2 traps defined in RFC 3812, *Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) Management Information Base*.

You can disable the MPLS traps by including the **no-trap** option at the **[edit protocol mpls log-updown]** hierarchy level. For information about disabling the generation of MPLS traps, see the *Junos OS MPLS Applications Configuration Guide*.

The Junos OS supports the following MPLS traps:

- **mplsTunnelUp**—Generated when an **mplsTunnelOperStatus** object for one of the configured tunnels leaves the **down** state and transitions into another state, other than the **notPresent** state.
- **mplsTunnelDown**—Generated when an **mplsTunnelOperStatus** object for one of the configured tunnels enters the **down** state from a state other than the **notPresent** state.

NOTE: When an LSP flaps, only the ingress and egress routers of that LSP generate the **mplsTunnelUp** and **mplsTunnelDown** traps. Previously, all the routers associated with an LSP—that is, the ingress, egress, and transit routers—used to generate the traps when the LSP flaps.

- **mplsTunnelRerouted**—Generated when a tunnel is rerouted.
- **mplsTunnelReoptimized**—Generated when a tunnel is reoptimized.

NOTE: In Junos OS Release 8.3 and earlier, **mplsTunnelReoptimized** was generated every time the optimization timer expired; that is, when the optimization timer exceeded the value set for the **optimize-timer** statement at the **[edit protocols mpls label-switched-path path-name]** hierarchy level. However, in Release 8.4 and later, this trap is generated only when the path is reoptimized, and not when the optimization timer expires.

SNMP Version 2 L3VPN Traps

The Junos OS also supports the following L3VPN SNMP version 2 traps defined in RFC 4382, *MPLS/BGP Layer 3 Virtual Private Network (VPN)*:

- **mplsL3VpnVrfUp**—Generated when:
 - No interface is associated with this VRF, and the first (and only first) interface associated with it has its **ifOperStatus** change to **up**.
 - Only one interface is associated with this VRF, and the **ifOperStatus** of this interface changes to **up**.
 - Multiple interfaces are associated with this VRF, and the **ifOperStatus** of all interfaces is **down**, and the first of those interfaces has its **ifOperStatus** change to **up**.
- **mplsL3VpnVrfDown**—Generated when:
 - One interface is associated with this VRF, and the **ifOperStatus** of this interface changes from **up** to **down**.
 - Multiple interfaces are associated with this VRF, and the **ifOperStatus** of all except one of these interfaces is equal to **up**, and the **ifOperStatus** of that interface changes from **up** to **down**.
 - The last interface with **ifOperStatus** equal to **up** is disassociated from a VRF.
- **mplsL3VpnVrfRouteMidThreshExceeded**—Generated when the number of routes contained by the specified VRF exceeds the value indicated by **mplsL3VpnVrfMidRouteThreshold**.

You can configure the **mplsL3VpnVrfMidRouteThreshold** value as follows:

```
[edit routing-instances <instance-name>]
user@R1# set routing-options maximum-paths <limit> threshold <threshold-value>
```

This configuration sets the **mplsL3VpnVrfMidRouteThreshold** value to **<threshold-value>** % of **<limit>**. This value can also be calculated as $(\text{<limit>} * \text{<threshold-value>}) / 100$.

- **mplsL3VpnVrfNumVrfRouteMaxThreshExceeded**—Generated when the number of routes contained by the specified VRF exceeds or attempts to exceed the maximum allowed value as indicated by **mplsL3VpnVrfMaxRouteThreshold**.
- **mplsL3VpnNumVrfSecIlglLblThrshExcd** —Generated when the number of illegal label violations on a VRF as indicated by **mplsL3VpnVrfSecIllegalLblVltns** has exceeded **mplsL3VpnIlglLblRcvThrsh**.
- **mplsL3VpnNumVrfRouteMaxThreshCleared**—Generated only after the number of routes contained by the specified VRF exceeds or attempts to exceed the maximum allowed value as indicated by **mplsVrfMaxRouteThreshold**, and then falls below this value.

Unsupported Standard SNMP Traps

Standard SNMP traps that are defined in MIBs supported by the Junos OS but are not generated by the Junos OS are shown in [Table 266 on page 1915](#).

Table 266: Unsupported Standard SNMP Traps

MIB	Trap Name	Description
isismib.mib	isisDatabaseOverload	Generated when the system enters or leaves the overload state.
	isisManualAddressDrops	Generated when one of the manual areaAddresses assigned to the system is ignored when computing routes.
	isisCorruptedLSPDetected	Generated when an LSP stored in memory becomes corrupted.
	isisAttemptToExceedMaxSequence	Generated when the sequence number on a generated LSP wraps the 32-bit sequence counter and the number is purged.
	isisIDLenMismatch	Generated when a protocol data unit (PDU) is received with a different value for the system ID length. This trap includes an index to identify the circuit where the PDU was received and the PDU header.
	isisMaxAreaAddressesMismatch	Generated when a PDU with a different value for the maximum area addresses is received.
	isisOwnLSPPurge	Generated when a PDU is received with a system ID and zero age. This notification includes the circuit index if available.
	isisSequenceNumberSkip	Generated when an LSP is received with a system ID and different contents, indicating the LSP might require a higher sequence number.
	isisAuthenticationTypeFailure	Generated when a PDU with the wrong authentication type field is received.
	isisAuthenticationFailure	Generated when a PDU with an incorrect authentication information field is received.
	isisVersionSkew	Generated when a hello PDU from an IS running a different version of the protocol is received.
	isisAreaMismatch	Generated when a hello PDU from an IS which does not share any area address is received.
	isisRejectedAdjacency	Generated when a hello PDU from an IS is received, but no adjacency is established because of a lack of resources.
	isisLSPTooLargeToPropagate	Generated when a link-state PDU that is larger than the dataLinkBlockSize for a circuit is attempted, but not propagated.
	isisOriginatingLSPBufferSizeMismatch	

Table 266: Unsupported Standard SNMP Traps (*continued*)

MIB	Trap Name	Description
		Generated when a Level 1 link-state PDU or Level 2 link-state PDU is received that is larger than the local value for originating L1LSPBufferSize or originating L2LSPBufferSize , respectively, or when a Level 1 link-state PDU or Level 2 link-state PDU is received containing the originating LSPBufferSize option and the value in the PDU option field does not match the local value for originating L1LSPBufferSize or originating L2LSPBufferSize , respectively.
	isisProtocolsSupportedMismatch	Generated when a nonpseudonode, segment 0 link-state PDU is received that has no matching protocols.
l3vpn-mib.mib	mplsVrflfUp	Generated when the ifOperStatus of an interface associated with a VRF table changes to the up(1) state, or when an interface with ifOperStatus = up(1) is associated with a VRF table.
	mplsVrflfDown	Generated when the ifOperStatus of an interface associated with a VRF table changes to the down(1) state, or when an interface with ifOperStatus = up(1) state is disassociated from a VRF table.
	mplsNumVrfRouteMidThreshExceeded	Generated when the number of routes contained by the specified VRF table exceeds the value indicated by mplsVrfMidRouteThreshold .
	mplsNumVrfRouteMaxThreshExceeded	Generated when the number of routes contained by the specified VRF table reaches or attempts to exceed the maximum allowed value as indicated by mplsVrfMaxRouteThreshold .
	mplsNumVrfSecIllegalLblThrshExcd	Generated when the number of illegal label violations on a VRF table as indicated by mplsVpnVrfSecIllegalLblVltns has exceeded mplsVpnVrfSecIllegalLblRcvThrsh .
msdp-mib.mib	msdpEstablished	Generated when the Multicast Source Discovery Protocol (MSDP) finite state machine (FSM) enters the Established state.
	msdpBackwardTransition	Generated when the MSDP FSM moves from a higher numbered state to a lower numbered state.
ospf2trap-mib	ospfOriginateLsa	Generated when a new LSA is originated by the router because of a topology change.
	ospfLsdbOverflow	Generated when the number of LSAs in the router's link-state database exceeds the value of ospfExtLsdbLimit .
	ospfLsdbApproachingOverflow	Generated when the number of LSAs in the router's link-state database exceeds 90% of the value of ospfExtLsdbLimit .

Table 266: Unsupported Standard SNMP Traps (*continued*)

MIB	Trap Name	Description
rfc1747.mib	sdlcPortStatusChange	Generated when the state of an SDLC port transitions to active or inactive.
	sdlcLSStatusChange	Generated when the state of an SDLC link station transitions to contacted or disconnected.
rfc2115a.mib	frDLCIStatusChange	Generated when a virtual circuit changes state (has been created or invalidated, or has toggled between the active and inactive states).
rfc2662.mib	adslAtucRateChangeTrap	Generated when the ATUCs transmit rate has changed (RADSL mode only).
	adslAtucPerfLofsThreshTrap	Generated when the loss of framing 15-minute interval threshold is reached.
	adslAtucInitFailureTrap	Generated when ATUC initialization fails.
	adslAturPerfLprsThreshTrap	Generated when the loss of power 15-minute interval threshold is reached.
	adslAturRateChangeTrap	Generated when the ATURs transmit rate changes (RADSL mode only).
rfc3020.mib	mfrMibTrapBundleLinkMismatch	Generated when a bundle link mismatch is detected.
rfc3813.mib	mplsXCUp	Generated when mplsXCOperStatus for one or more contiguous entries in mplsXCTable enters the up(1) state from some other state.
	mplsXCDown	Generated when mplsXCOperStatus for one or more contiguous entries in mplsXCTable enters the down(2) state from some other state.

Loading MIB Files to a Network Management System

For your network management system (NMS) to identify and understand the MIB objects used by the Junos OS, you must first load the MIB files to your NMS using a MIB compiler.

A MIB compiler is a utility that parses the MIB information such as the MIB object name, IDs, and data type for the NMS.

You can download the Junos MIB package from the **Enterprise-Specific MIBs and Traps** section of the Junos OS Technical Publications index page at <http://www.juniper.net/techpubs/software/junos/index.html>. The Junos MIB package is available in **.zip** and **.tar** packages. You can download the appropriate format based on your requirements.

The Junos MIB package contains two folders: **StandardMibs** and **JuniperMibs**. The **StandardMibs** folder contains the standard MIBs and RFCs that are supported on devices running the Junos OS, whereas the **JuniperMibs** folder contains the Juniper Networks enterprise-specific MIBs.

To load MIB files that are required for managing and monitoring devices running the Junos OS:

1. Go to the Junos OS Technical Publications index page (<http://www.juniper.net/techpubs/software/junos/index.html>).
2. Click the tab that corresponds to the Junos OS Release for which you want to download the MIB files.
3. On the selected tab, click the + (plus) sign that corresponds to the **Enterprise-Specific MIBs and Traps** section to expand the section.
4. Click the **TAR** or **ZIP** link that corresponds to the **Enterprise MIBs** link under the **Enterprise-Specific MIBs and Traps** section to download the Junos MIB package.
5. Decompress the file (**.tar** or **.zip**) using an appropriate utility.
6. Load the standard MIB files (from the **StandardMibs** folder) in the following order:

NOTE: Some of the MIB compilers that are commonly used have the standard MIBs preloaded on them. If the standard MIBs are already loaded on the MIB compiler that you are using, skip this step and proceed to Step 7.

- a. **mib-SNMPv2-SMI.txt**
- b. **mib-SNMPv2-TC.txt**
- c. **mib-IANAifType-MIB.txt**
- d. **mib-IANA-RTPROTO-MIB.txt**
- e. **mib-rfc1907.txt**
- f. **mib-rfc2011a.txt**
- g. **mib-rfc2012a.txt**
- h. **mib-rfc2013a.txt**
- i. **mib-rfc2863a.txt**

7. Load the remaining standard MIB files.

NOTE: You must follow the order specified in this procedure, and ensure that all standard MIBs are loaded before you load the enterprise-specific MIBs. There might be dependencies that require a particular MIB to be present on the compiler before loading some other MIB. You can find such dependencies listed in the **IMPORT** section of the MIB file.

8. Load the Juniper Networks enterprise-specific SMI MIB, **mib-jnx-smi.txt**, and the following optional SMI MIBs based on your requirements:
 - **mib-jnx-js-smi.txt**—(Optional) For Juniper Security MIB tree objects
 - **mib-jnx-ex-smi.txt**—(Optional) For EX Series Ethernet Switches
 - **mib-jnx-exp.txt**—(Recommended) For Juniper Networks experimental MIB objects
9. Load the remaining enterprise-specific MIBs from the **JuniperMibs** folder.

TIP: While loading a MIB file, if the compiler returns an error message saying that any of the objects is undefined, open the MIB file using a text editor and ensure that all the MIB files listed in the **IMPORT** section are loaded on the compiler. If any of the MIB files listed in the **IMPORT** section is not loaded on the compiler, load that MIB file, and then try to load the MIB file that failed to load.

For example, the enterprise-specific PING MIB, **mib-jnx-ping.txt**, has dependencies on RFC 2925, DiSMAN-PING-MIB, **mib-rfc2925a.txt**. If you try to load **mib-jnx-ping.txt** before loading **mib-rfc2925a.txt**, the compiler returns an error message saying that certain objects in **mib-jnx-ping.txt** are undefined. Load **mib-rfc2925a.txt**, and then try to load **mib-jnx-ping.txt**. The enterprise-specific PING MIB, **mib-jnx-ping.txt**, then loads without any issue.

Configuring SNMP on a Device Running Junos OS

By default, SNMP is disabled on devices running Junos OS. To enable SNMP on a router or switch, you must include the SNMP configuration statements at the **[edit snmp]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit snmp]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

The community defined here as **public** grants read access to all MIB data to any client.

To configure complete SNMP features, include the following statements at the **[edit snmp]** hierarchy level:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
      address restrict;
    }
    routing-instance routing-instance-name {
      clients {
        addresses;
      }
    }
  }
  logical-system logical-system-name {
    routing-instance routing-instance-name {
      clients {
        addresses;
      }
    }
  }
}
```

```

    }
  }
}
view view-name;
}
contact contact;
description description;
engine-id {
  (local engine-id | use-mac-address | use-default-ip-address);
}
filter-duplicates;
health-monitor {
  falling-threshold integer;
  interval seconds;
  rising-threshold integer;
}
interface [ interface-names ];
location location;
name name;
nonvolatile {
  commit-delay seconds;
}
rmon {
  alarm index {
    description text-description;
    falling-event-index index;
    falling-threshold integer;
    falling-threshold-interval seconds;
    interval seconds;
    request-type (get-next-request | get-request | walk-request);
    rising-event-index index;
    sample-type type;
    startup-alarm alarm;
    syslog-subtag syslog-subtag;
    variable oid-variable;
  }
  event index {
    community community-name;
    description text-description;
    type type;
  }
}

Configuring the System Contact on a Device Running Junos OS

You can specify an administrative contact for each system being managed by SNMP. This name is placed into the MIB II **sysContact** object. To configure a contact name, include the **contact** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
contact contact;
```

If the name contains spaces, enclose it in quotation marks (" ").

To define a system contact name that contains spaces:

```
[edit]
snmp {
  contact "Juniper Berry, (650) 555-1234";
}
```

Configuring the System Location for a Device Running Junos OS

You can specify the location of each system being managed by SNMP. This string is placed into the MIB II **sysLocation** object. To configure a system location, include the **location** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
location location;
```

If the location contains spaces, enclose it in quotation marks (" ").

To specify the system location:

```
[edit]
snmp {
  location "Row 11, Rack C";
}
```

Configuring the System Description on a Device Running Junos OS

You can specify a description for each system being managed by SNMP. This string is placed into the MIB II **sysDescription** object. To configure a description, include the **description** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
description description;
```

If the description contains spaces, enclose it in quotation marks (" ").

To specify the system description:

```
[edit]
snmp {
  description "M40 router with 8 FPCs";
}
```

Configuring the System Name

Junos OS enables you to override the system name by including the **name** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
name name;
```

If the name contains spaces, enclose it in quotation marks (" ").

To specify the system name override:

```
[edit]
snmp {
```

```
    name "snmp 1";  
}
```

Configuring the Commit Delay Timer

When a router or switch first receives an SNMP nonvolatile **Set** request, a Junos OS XML protocol session opens and prevents other users or applications from changing the candidate configuration (equivalent to the command-line interface [CLI] **configure exclusive** command). If the router does not receive new SNMP **Set** requests within 5 seconds (the default value), the candidate configuration is committed and the Junos OS XML protocol session closes (the configuration lock is released). If the router receives new SNMP **Set** requests while the candidate configuration is being committed, the SNMP **Set** request is rejected and an error is generated. If the router receives new SNMP **Set** requests before 5 seconds have elapsed, the commit-delay timer (the length of time between when the last SNMP request is received and the commit is requested) resets to 5 seconds.

By default, the timer is set to 5 seconds. To configure the timer for the SNMP **Set** reply and start of the commit, include the **commit-delay** statement at the **[edit snmp nonvolatile]** hierarchy level:

```
[edit snmp nonvolatile]  
  commit-delay seconds;
```

seconds is the length of the time between when the SNMP request is received and the commit is requested for the candidate configuration. For more information about the **configure exclusive** command and locking the configuration, see the *CLI User Guide*.

Configuring the SNMP Community String

Configuring the SNMP agent in Junos OS is a straightforward task that shares many familiar settings common to other managed devices in your network. For example, you need to configure Junos OS with an SNMP community string and a destination for traps. Community strings are administrative names that group collections of devices and the agents that are running on them together into common management domains. If a manager and an agent share the same community, they can communicate with each other. An SNMP community defines the level of authorization granted to its members, such as which MIB objects are available, which operations (read-only or read-write) are valid for those objects, and which SNMP clients are authorized, based on their source IP addresses.

The SNMP community string defines the relationship between an SNMP server system and the client systems. This string acts like a password to control the clients' access to the server. To configure a community string in a Junos OS configuration, include the **community** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
community name {
  authorization authorization;
  clients {
    default restrict;
    address restrict;
  }
  view view-name;
}
```

If the community name contains spaces, enclose it in quotation marks (" ").

Community names must be unique.

NOTE: You cannot configure the same community name at the **[edit snmp community]** and **[edit snmp v3 snmp-community community-index]** hierarchy levels.

```
[edit groups global]
user@host# set snmp community name
```

This example uses the standard name **public** to create a community that gives limited read-only access.

```
[edit groups global]
user@host# set snmp community public
```

1. Define the authorization level for the community.

The default authorization level for a community is **read-only**. To allow **Set** requests within a community, you need to define that community as **authorization read-write**. For **Set** requests, you also need to include the specific MIB objects that are accessible with read-write privileges using the **view** statement. The default view includes all supported MIB objects that are accessible with read-only privileges; no MIB objects

are accessible with read-write privileges. For more information about the **view** statement, see [“Configuring MIB Views” on page 1930](#).

```
[edit groups global snmp community name]
user@host# set authorization authorization
```

This example confines the public community to read-only access. Any SNMP client (for example, an SNMP management system) that belongs to the public community can read MIB variables but cannot set (change) them.

```
[edit groups global snmp community public]
user@host# set authorization read-only
```

2. Define a list of clients in the community who are authorized to communicate with the SNMP agent in Junos OS.

The **clients** statement lists the IP addresses of the clients (community members) that are allowed to use this community. If no **clients** statement is present, all clients are allowed. For **address**, you must specify an IPv4 or IPv6 address, not a hostname. Include the **default restrict** option to deny access to all SNMP clients for which access is not explicitly granted. We recommend that you always include the **default restrict** option to limit SNMP client access to the local router.

NOTE: Community names must be unique. You cannot configure the same community name at the `[edit snmp community]` and `[edit snmp v3 snmp-community community-index]` hierarchy levels.

Related Documentation

- [Adding a Group of Clients to an SNMP Community on page 1968](#)
- [Configuring SNMP on a Device Running Junos OS on page 1920](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 2031](#)
- [Examples: Configuring the SNMP Community String on page 1926](#)

Examples: Configuring the SNMP Community String

Grant read-only access to all clients. With the following configuration, the system responds to SNMP **Get**, **GetNext**, and **GetBulk** requests that contain the community string **public**:

```
[edit]
snmp {
  community public {
    authorization read-only;
  }
}
```

Grant all clients read-write access to the ping MIB and **jnxPingMIB**. With the following configuration, the system responds to SNMP **Get**, **GetNext**, **GetBulk**, and **Set** requests that contain the community string **private** and specify an OID contained in the ping MIB or **jnxPingMIB** hierarchy:

```
[edit]
snmp {
```

```

view ping-mib-view {
  oid pingMIB include;
  oid jnxPingMIB include;
  community private {
    authorization read-write;
    view ping-mib-view;
  }
}

```

The following configuration allows read-only access to clients with IP addresses in the range 1.2.3.4/24, and denies access to systems in the range fe80::1:2:3:4/64:

```

[edit]
snmp {
  community field-service {
    authorization read-only;
    clients {
      default restrict; # Restrict access to all SNMP clients not explicitly
                        # listed on the following lines.
      1.2.3.4/24; # Allow access by all clients in 1.2.3.4/24 except
      fe80::1:2:3:4/64 restrict; # fe80::1:2:3:4/64.
    }
  }
}

```

Related Documentation

- [Configuring the SNMP Community String on page 1925](#)

Filtering Duplicate SNMP Requests

By default, filtering duplicate **get**, **getNext**, and **getBulk** SNMP requests is disabled on devices running Junos OS. If a network management station retransmits a **Get**, **GetNext**, or **GetBulk** SNMP request too frequently to the router, that request might interfere with the processing of previous requests and slow down the response time of the agent. Filtering these duplicate requests improves the response time of the SNMP agent. Junos OS uses the following information to determine if an SNMP request is a duplicate:

- Source IP address of the SNMP request
- Source UDP port of the SNMP request
- Request ID of the SNMP request

To filter duplicate SNMP requests, include the **filter-duplicates** statement at the **[edit snmp]** hierarchy level:

```

[edit snmp]
filter-duplicates;

```

Related Documentation

- [Configuring the Interfaces on Which SNMP Requests Can Be Accepted on page 1928](#)
- [Filtering Interface Information Out of SNMP Get and GetNext Output on page 1928](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 2031](#)

Configuring the Interfaces on Which SNMP Requests Can Be Accepted

By default, all router or switch interfaces have SNMP access privileges. To limit the access through certain interfaces only, include the **interface** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
interface [ interface-names ];
```

Specify the names of any logical or physical interfaces that should have SNMP access privileges. Any SNMP requests entering the router or switch from interfaces not listed are discarded.

Related Documentation

- [Configuring SNMP on a Device Running Junos OS on page 1920](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 2031](#)
- [Example: Configuring Secured Access List Checking on page 1928](#)
- [Configuring SNMP](#)

Example: Configuring Secured Access List Checking

SNMP access privileges are granted to only devices on interfaces **so-0/0/0** and **at-1/0/1**. The following example does this by configuring a list of logical interfaces:

```
[edit]
snmp {
  interface [ so-0/0/0 so-0/0/0.1 at-1/0/1.0 at-1/0/1.1 ];
}
```

The following example grants the same access by configuring a list of physical interfaces:

```
[edit]
snmp {
  interface [ so-0/0/0 at-1/0/1 ];
}
```

Filtering Interface Information Out of SNMP Get and GetNext Output

Junos OS enables you to filter out information related to specific interfaces from the output of SNMP **Get** and **GetNext** requests performed on interface-related MIBs such as IF MIB, ATM MIB, RMON MIB, and the Juniper Networks enterprise-specific IF MIB.

You can use the following options of the **filter-interfaces** statement at the **[edit snmp]** hierarchy level to specify the interfaces that you want to exclude from SNMP **Get** and **GetNext** queries:

- **interfaces**—Interfaces that match the specified regular expressions.
- **all-internal-interfaces**—Internal interfaces.

```
[edit]
snmp {
  filter-interfaces {
    interfaces {
      interface1;
      interface2;
    }
    all-internal-interfaces;
  }
}
```

Starting with Release 12.1, Junos OS provides an except option (! operator) that enables you to filter out all interfaces except those interfaces that match all the regular expressions prefixed with the ! mark.

For example, to filter out all interfaces except the **ge** interfaces from the SNMP **get** and **get-next** results, enter the following command:

```
[edit snmp]
user@host# set filter-interfaces interfaces "!"~ge-.*"
user@host# commit
```

When this is configured, Junos OS filters out all interfaces except the **ge** interfaces from the SNMP **get** and **get-next** results.

NOTE: The ! mark is supported only as the first character of the regular expression. If it appears anywhere else in a regular expression, Junos OS considers the regular expression invalid, and returns an error.

However, note that these settings are limited to SNMP operations, and the users can continue to access information related to the interfaces (including those hidden using the **filter-interfaces** options) using the appropriate Junos OS command-line interface (CLI) commands.

Configuring MIB Views

SNMPv3 defines the concept of MIB views in RFC 3415, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)*. MIB views provide an agent better control over who can access specific branches and objects within its MIB tree. A view consists of a name and a collection of SNMP object identifiers, which are either explicitly included or excluded. Once defined, a view is then assigned to an SNMPv3 group or SNMPv1/v2c community (or multiple communities), automatically masking which parts of the agent's MIB tree members of the group or community can (or cannot) access.

By default, an SNMP community grants read access and denies write access to all supported MIB objects (even communities configured as **authorization read-write**). To restrict or grant read or write access to a set of MIB objects, you must configure a MIB view and associate the view with a community.

To configure MIB views, include the **view** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
```

The **view** statement defines a MIB view and identifies a group of MIB objects. Each MIB object of a view has a common object identifier (OID) prefix. Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as **interfaces**). A configuration statement uses a view to specify a group of MIB objects on which to define access. You can also use a wildcard character asterisk (*) to include OIDs that match a particular pattern in the SNMP view. To enable a view, you must associate the view with a community.

NOTE: To remove an OID completely, use the **delete view all oid oid-number** command but omit the include parameter.

To associate MIB views with a community, include the **view** statement at the **[edit snmp community community-name]** hierarchy level:

```
[edit snmp community community-name]
view view-name;
```

For more information about the Ping MIB, see RFC 2925 and the *PING MIB* topic.

Related Documentation

- [PING MIB](#)
- [Configuring SNMP on a Device Running Junos OS on page 1920](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 2031](#)
- [Example: Ping Proxy MIB on page 1931](#)
- [view \(Configuring a MIB View\) on page 2116](#)

- [view \(Associating MIB View with a Community\)](#)
- [oid on page 2073](#)

Example: Ping Proxy MIB

Restrict the **ping-mib** community to read and write access of the Ping MIB and **jnxpingMIB** only. Read or write access to any other MIB using this community is not allowed.

```
[edit snmp]
view ping-mib-view {
  oid 1.3.6.1.2.1.80 include; #pingMIB
  oid jnxPingMIB include; #jnxPingMIB
}
community ping-mib {
  authorization read-write;
  view ping-mib-view;
}
```

The following configuration prevents the **no-ping-mib** community from accessing Ping MIB and **jnxPingMIB** objects. However, this configuration does not prevent the **no-ping-mib** community from accessing any other MIB object that is supported on the device.

```
[edit snmp]

Configuring SNMP Trap Options and Groups on a Device Running Junos OS

Some carriers have more than one trap receiver that forwards traps to a central NMS. This allows for more than one path for SNMP traps from a router to the central NMS through different trap receivers. A device running Junos OS can be configured to send the same copy of each SNMP trap to every trap receiver configured in the trap group.

The source address in the IP header of each SNMP trap packet is set to the address of the outgoing interface by default. When a trap receiver forwards the packet to the central NMS, the source address is preserved. The central NMS, looking only at the source address of each SNMP trap packet, assumes that each SNMP trap came from a different source.

In reality, the SNMP traps came from the same router, but each left the router through a different outgoing interface.

The statements discussed in the following sections are provided to allow the NMS to recognize the duplicate traps and to distinguish SNMPv1 traps based on the outgoing interface.

To configure SNMP trap options and trap groups, include the **trap-options** and **trap-group** statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-options {
  agent-address outgoing-interface;
  source-address address;
}
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

- [Configuring SNMP Trap Groups on page 1936](#)
- [Configuring SNMP on a Device Running Junos OS on page 1920](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 2031](#)

Configuring SNMP Trap Options

Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router to a single address regardless of the outgoing interface. In addition, you can set the agent address of the SNMPv1 traps. For more information about the contents of SNMPv1 traps, see RFC 1157.

NOTE: SNMP cannot be associated with any routing instances other than the master routing instance.

To configure SNMP trap options, include the **trap-options** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-options {
  agent-address outgoing-interface;
  enterprise-oid
  logical-system
  routing-instance
```

```

    source-address address;
}

```

You must also configure a trap group for the trap options to take effect. For information about trap groups, see [“Configuring SNMP Trap Groups” on page 1936](#).

This topic contains the following sections:

- [Configuring the Source Address for SNMP Traps on page 1933](#)
- [Configuring the Agent Address for SNMP Traps on page 1935](#)
- [Adding snmpTrapEnterprise Object Identifier to Standard SNMP Traps on page 1935](#)

Configuring the Source Address for SNMP Traps

You can configure the source address of trap packets in many ways: **lo0**, a valid IPv4 address configured on one of the router interfaces, a logical-system address, or the address of a routing-instance. The value **lo0** indicates that the source address of the SNMP trap packets is set to the lowest loopback address configured on the interface **lo0**.

You can configure the source address of trap packets in one of the following formats:

- a valid IPv4 address configured on one of the router interfaces
- **lo0**; that is the lowest loopback address configured on the interface **lo0**.
- a logical-system name
- a routing-instance name

A valid IPv4 Address As the Source Address

To specify a valid interface address as the source address for SNMP traps on one of the router interfaces, include the **source-address** statement at the **[edit snmp trap-options]** hierarchy level:

```

[edit snmp trap-options]
source-address address;

```

address is a valid IPv4 address configured on one of the router interfaces.

The Lowest Loopback Address As the Source Address

To specify the source address of the SNMP traps so that they use the lowest loopback address configured on the interface **lo0** as the source address, include the **source-address** statement at the **[edit snmp trap-options]** hierarchy level:

```

[edit snmp trap-options]
source-address lo0;

```

To enable and configure the loopback address, include the **address** statement at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level:

```

[edit interfaces]
lo0 {
  unit 0 {
    family inet {
      address ip-address;
    }
  }
}

```

To configure the loopback address as the source address of trap packets:

```
[edit snmp]
trap-options {
  source-address lo0;
}
trap-group "urgent-dispatcher" {
  version v2;
  categories link startup;
  targets {
    192.168.10.22;
    172.17.1.2;
  }
}
[edit interfaces]
lo0 {
  unit 0 {
    family inet {
      address 10.0.0.1/32;
      address 127.0.0.1/32;
    }
  }
}
```

In this example, the IP address **10.0.0.1** is the source address of every trap sent from this router.

**Logical System Name
as the Source Address**

To specify a logical system name as the source address of SNMP traps, include the **logical-system** *logical-system-name* statement at the **[edit snmp trap-options]** hierarchy level.

For example, the following configuration sets logical system name **ls1** as the source address of SNMP traps:

```
[edit snmp]
trap-options {
  logical-system ls1;
}
```

**Routing Instance
Name as the Source
Address**

To specify a routing instance name as the source address of SNMP traps, include the **routing-instance** *routing-instance-name* statement at the **[edit snmp trap-options]** hierarchy level.

For example, the following configuration sets the routing instance name **ri1** as the source address for SNMP traps:

```
[edit snmp]
trap-options {
  routing-instance ri1;
}
```

Configuring the Agent Address for SNMP Traps

The agent address is only available in SNMPv1 trap packets (see RFC 1157). By default, the router's default local address is used in the agent address field of the SNMPv1 trap. To configure the agent address, include the **agent-address** statement at the **[edit snmp trap-options]** hierarchy level. Currently, the agent address can only be the address of the outgoing interface:

```
[edit snmp]
trap-options {
  agent-address outgoing-interface;
}
```

To configure the outgoing interface as the agent address:

```
[edit snmp]
trap-options {
  agent-address outgoing-interface;
}
trap-group "urgent-dispatcher" {
  version v1;
  categories link startup;
  targets {
    192.168.10.22;
    172.17.1.2;
  }
}
```

In this example, each SNMPv1 trap packet sent has its agent address value set to the IP address of the outgoing interface.

Adding *snmpTrapEnterprise* Object Identifier to Standard SNMP Traps

The **snmpTrapEnterprise** object helps you identify the enterprise that has defined the trap. Typically, the **snmpTrapEnterprise** object appears as the last varbind in enterprise-specific SNMP version 2 traps. However, starting Release 10.0, Junos OS enables you to add the **snmpTrapEnterprise** object identifier to standard SNMP traps as well.

To add **snmpTrapEnterprise** to standard traps, include the **enterprise-oid** statement at the **[edit snmp trap-options]** hierarchy level. If the **enterprise-oid** statement is not included in the configuration, **snmpTrapEnterprise** is added only for enterprise-specific traps.

```
[edit snmp]
trap-options {
  enterprise-oid;
}
```

- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 2031](#)

Configuring SNMP Trap Groups

You can create and name a group of one or more types of SNMP traps and then define which systems receive the group of SNMP traps. The trap group must be configured for SNMP traps to be sent. To create an SNMP trap group, include the **trap-group** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  routing-instance instance;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

The trap group name can be any string and is embedded in the community name field of the trap. To configure your own trap group port, include the **destination-port** statement. The default destination port is port 162.

For each trap group that you define, you must include the **target** statement to define at least one system as the recipient of the SNMP traps in the trap group. Specify the IPv4 or IPv6 address of each recipient, not its hostname.

Specify the types of traps the trap group can receive in the **categories** statement. For information about the category to which the traps belong, see the [“Standard SNMP Traps Supported on Devices Running Junos OS” on page 1904](#) and [“Juniper Networks Enterprise-Specific SNMP Traps” on page 1889](#) topics.

Specify the routing instance used by the trap group in the **routing-instance** statement. All targets configured in the trap group use this routing instance.

A trap group can receive the following categories:

- **authentication**—Authentication failures
- **chassis**—Chassis or environment notifications
- **configuration**—Configuration notifications
- **link**—Link-related notifications (up-down transitions, DS-3 and DS-1 line status change, IPv6 interface state change, and Passive Monitoring PIC overload)

NOTE: To send Passive Monitoring PIC overload interface traps, select the **link** trap category.

- **remote-operations**—Remote operation notifications
- **rmon-alarm**—Alarm for RMON events

- **routing**—Routing protocol notifications
- **sonet-alarms**—SONET/SDH alarms

NOTE: If you omit the SONET/SDH subcategories, all SONET/SDH trap alarm types are included in trap notifications.

- **loss-of-light**—Loss of light alarm notification
- **pll-lock**—PLL lock alarm notification
- **loss-of-frame**—Loss of frame alarm notification
- **loss-of-signal**—Loss of signal alarm notification
- **severely-errored-frame**—Severely errored frame alarm notification
- **line-ais**—Line alarm indication signal (AIS) alarm notification
- **path-ais**—Path AIS alarm notification
- **loss-of-pointer**—Loss of pointer alarm notification
- **ber-defect**—SONET/SDH bit error rate alarm defect notification
- **ber-fault**—SONET/SDH error rate alarm fault notification
- **line-remote-defect-indication**—Line remote defect indication alarm notification
- **path-remote-defect-indication**—Path remote defect indication alarm notification
- **remote-error-indication**—Remote error indication alarm notification
- **unequipped**—Unequipped alarm notification
- **path-mismatch**—Path mismatch alarm notification
- **loss-of-cell**—Loss of cell delineation alarm notification
- **vt-ais**—Virtual tributary (VT) AIS alarm notification
- **vt-loss-of-pointer**—VT loss of pointer alarm notification
- **vt-remote-defect-indication**—VT remote defect indication alarm notification
- **vt-unequipped**—VT unequipped alarm notification
- **vt-label-mismatch**—VT label mismatch error notification
- **vt-loss-of-cell**—VT loss of cell delineation notification
- **startup**—System warm and cold starts
- **timing-events**—Timing events and defects notification
- **vrrp-events**—Virtual Router Redundancy Protocol (VRRP) events such as new-master or authentication failures

- **startup**—System warm and cold starts
- **vrp-events**—Virtual Router Redundancy Protocol (VRRP) events such as new-master or authentication failures

If you include SONET/SDH subcategories, only those SONET/SDH trap alarm types are included in trap notifications.

The **version** statement allows you to specify the SNMP version of the traps sent to targets of the trap group. If you specify **v1** only, SNMPv1 traps are sent. If you specify **v2** only, SNMPv2 traps are sent. If you specify **all**, both an SNMPv1 and an SNMPv2 trap are sent for every trap condition. For more information about the **version** statement, see [version](#).

Example: Configuring SNMP Trap Groups

Set up a trap notification list named **urgent-dispatcher** for link and startup traps. This list is used to identify the network management hosts (**1.2.3.4** and **fe80::1:2:3:4**) to which traps generated by the local router should be sent. The name specified for a trap group is used as the SNMP community string when the agent sends traps to the listed targets.

```
[edit]
snmp {
  trap-group "urgent-dispatcher" {
    version v2;
    categories link startup;
    targets {
      1.2.3.4;
      fe80::1:2:3:4;
    }
  }
}
```

Configuring the Trap Notification Filter

SNMPv3 uses the notify filter to define which traps (or which objects from which traps) are sent to the network management system (NMS). The trap notification filter limits the type of traps that are sent to the NMS.

Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as **1.3.6.1.2.1.2**) or by its subtree name (such as **interfaces**). You can also use the wildcard character asterisk (*) in the object identifier (OID) to specify object identifiers that match a particular pattern.

To configure the trap notifications filter, include the **notify-filter** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
  notify-filter profile-name;
```

profile-name is the name assigned to the notify filter.

By default, the OID is set to **include**. To define access to traps (or objects from traps), include the **oid** statement at the **[edit snmp v3 notify-filter profile-name]** hierarchy level:

```
[edit snmp v3 notify-filter profile-name]
  oid oid (include | exclude);
```

oid is the object identifier. All MIB objects represented by this statement have the specified OID as a prefix. It can be specified either by a sequence of dotted integers or by a subtree name.

- **include**—Include the subtree of MIB objects represented by the specified OID.
- **exclude**—Exclude the subtree of MIB objects represented by the specified OID.

SNMPv3 Overview

In contrast to SNMP version 1 (SNMPv1) and SNMP version 2 (SNMPv2), SNMP version 3 (SNMPv3) supports authentication and encryption. SNMPv3 uses the user-based security model (USM) for message security and the view-based access control model (VACM) for access control. USM specifies authentication and encryption. VACM specifies access-control rules.

USM uses the concept of a user for which security parameters (levels of security, authentication, privacy protocols, and keys) are configured for both the agent and the manager. Messages sent using USM are better protected than messages sent with community strings, where passwords are sent in the clear. With USM, messages exchanged between the manager and the agent can have data integrity checking and data origin authentication. USM protects against message delays and message replays by using time indicators and request IDs. Encryption is also available.

To complement the USM, SNMPv3 uses the VACM, a highly granular access-control model for SNMPv3 applications. Based on the concept of applying security policies to the name of the groups querying the agent, the agent decides whether the group is allowed to view or change specific MIB objects. VACM defines collections of data (called views), groups of data users, and access statements that define which views a particular group of users can use for reading, writing, or receiving traps.

Trap entries in SNMPv3 are created by configuring the notify, notify filter, target address, and target parameters. The **notify** statement specifies the type of notification (trap) and

contains a single tag. The tag defines a set of target addresses to receive a trap. The notify filter defines access to a collection of trap object identifiers (OIDs). The target address defines a management application's address and other attributes to be used in sending notifications. Target parameters define the message processing and security parameters to be used in sending notifications to a particular management target.

To configure SNMPv3, perform the following tasks:

- [Creating SNMPv3 Users on page 1941](#)
- [Configuring MIB Views on page 1930](#)
- [Defining Access Privileges for an SNMP Group on page 1950](#)
- [Configuring SNMPv3 Traps on a Device Running Junos OS on page 1960](#)
- [Configuring SNMP Informs on page 1959](#)

Related Documentation

- [Complete SNMPv3 Configuration Statements on page 2034](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)

Creating SNMPv3 Users

For each SNMPv3 user, you can specify the username, authentication type, authentication password, privacy type, and privacy password. After a user enters a password, a key based on the engine ID and password is generated and is written to the configuration file. After the generation of the key, the password is deleted from this configuration file.

NOTE: You can configure only one encryption type for each SNMPv3 user.

To create users, include the **user** statement at the **[edit snmp v3 usm local-engine]** hierarchy level:

```
[edit snmp v3 usm local-engine]
user username;
```

username is the name that identifies the SNMPv3 user.

To configure user authentication and encryption, include the following statements at the **[edit snmp v3 usm local-engine user username]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
authentication-md5 {
  authentication-password authentication-password;
}
authentication-sha {
  authentication-password authentication-password;
}
authentication-none;
privacy-aes128 {
  privacy-password privacy-password;
}
privacy-des {
```

```

    privacy-password privacy-password;
}
privacy-3des {
    privacy-password privacy-password;
}
privacy-none;

```

Related Documentation

- [Complete SNMPv3 Configuration Statements on page 2034](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)
- [Example: Creating SNMPv3 Users Configuration on page 1945](#)

Example: SNMPv3 Configuration

Define an SNMPv3 configuration:

```

[edit snmp]
engine-id {
    use-mac-address;
}
view jnxAlarms {
    oid 1.3.6.1.4.1.2636.3.4 include;
}
view interfaces {
    oid 1.3.6.1.2.1.2 include;
}
view ping-mib {
    oid 1.3.6.1.2.1.80 include;
}
[edit snmp v3]
notify n1 {
    tag router1; # Identifies a set of target addresses
    type trap; # Defines type of notification
}
notify n2 {
    tag host1;
    type trap;
}
notify-filter nf1 {
    oid .1 include; # Defines which traps to send
} # In this case, includes all traps
notify-filter nf2 {
    oid 1.3.6.1.4.1 include; # Sends enterprise-specific traps only
}
notify-filter nf3 {
    oid 1.3.6.1.2.1.1.5 include; # Sends BGP traps only
}
snmp-community index1 {
    community-name "$ABC123"; # SECRET-DATA
    security-name john; # Matches the security name at the target parameters
    tag host1; # Finds the addresses that are allowed to be used with
}
target-address ta1 { # Associates the target address with the group

```

```

        # san-francisco.
address 10.1.1.1;
address-mask 255.255.255.0; # Defines the range of addresses
port 162;
tag-list router1;
target-parameters tp1; # Applies configured target parameters
}
target-address ta2 {
    address 10.1.1.2;
    address-mask 255.255.255.0;
    port 162;
    tag-list host1;
    target-parameters tp2;
}
target-address ta3 {
    address 10.1.1.3;
    address-mask 255.255.255.0;
    port 162;
    tag-list "router1 host1";
    target-parameters tp3;
}
target-parameters tp1 { # Defines the target parameters
    notify-filter nf1; # Specifies which notify filter to apply
    parameters {
        message-processing-model v1;
        security-model v1;
        security-level none;
        security-name john; # Matches the security name configured at the
    } # [edit snmp v3 snmp-community community-index hierarchy level.
}
target-parameters tp2 {
    notify-filter nf2;
    parameters {
        message-processing-model v1;
        security-model v1;
        security-level none;
        security-name john;
    }
}
target-parameters tp3 {
    notify-filter nf3;
    parameters {
        message-processing-model v1;
        security-model v1;
        security-level none;
        security-name john;
    }
}
usm {
    local-engine { #Defines authentication and encryption for SNMPv3 users
        user user1 {
            authentication-md5 {
                authentication-password authentication-password;
            }
            privacy-des {
                privacy-password privacy-password;
            }
        }
    }
}

```

```
    }
  }
  user user2 {
    authentication-sha {
      authentication-password authentication-password;
    }
    privacy-none;
  }
  user user3 {
    authentication-none;
    privacy-none;
  }
  user user4 {
    authentication-sha {
      authentication-password authentication-password;
    }
    privacy-aes128 {
      privacy-password privacy-password;
    }
  }
  user user5 {
    authentication-sha {
      authentication-password authentication-password;
    }
    privacy-none;
  }
}
}
vacm {
  access {
    group san-francisco { #Defines the access privileges for the group
      default-context-prefix { # called san-francisco
        security-model v1 {
          security-level none {
            notify-view ping-mib;
            read-view interfaces;
            write-view jnxAlarms;
          }
        }
      }
    }
  }
}
security-to-group {
  security-model v1 {
    security-name john { # Assigns john to the security group
      group san-francisco; # called san-francisco
    }
    security-name bob {
      group new-york;
    }
    security-name elizabeth {
      group chicago;
    }
  }
}
}
```

Example: Creating SNMPv3 Users Configuration

Define SNMPv3 users:

```
[edit]
snmp {
  v3 {
    usm {
      local-engine {
        user user1 {
          authentication-md5 {
            authentication-password authentication-password;
          }
          privacy-des {
            privacy-password password;
          }
        }
        user user2 {
          authentication-sha {
            authentication-password authentication-password;
          }
          privacy-none;
        }
        user user3 {
          authentication-none;
          privacy-none;
        }
        user user4 {
          authentication-md5 {
            authentication-password authentication-password;
          }
          privacy-des {
            privacy-password authentication-password;
          }
        }
        user user5 {
          authentication-sha {
            authentication-password authentication-password;
          }
          privacy-aes128 {
            privacy-password authentication-password;
          }
        }
      }
    }
  }
}

Minimum SNMPv3 Configuration on a Device Running Junos OS

To configure the minimum requirements for SNMPv3, include the following statements at the `[edit snmp v3]` and `[edit snmp]` hierarchy levels:

NOTE: You must configure at least one view (notify, read, or write) at the `[edit snmp view-name]` hierarchy level.

```
[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
  tag tag-name;
}
notify-filter profile-name {
  oid object-identifier (include | exclude);
}
snmp-community community-index {
  security-name security-name;
}
target-address target-address-name {
  address address;
  target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
usm {
  local-engine {
    user username {
    }
  }
}
vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix){
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
    }
  }
}
```

```

    }
  }
  security-to-group {
    security-model (usm | v1 | v2c) {
      security-name security-name {
        group group-name;
      }
    }
  }
}

```

Configuring the SNMPv3 Authentication Type

By default, in a Junos OS configuration the SNMPv3 authentication type is set to none.

This topic includes the following sections:

- [Configuring MD5 Authentication on page 1947](#)
- [Configuring SHA Authentication on page 1948](#)
- [Configuring No Authentication on page 1948](#)

Configuring MD5 Authentication

To configure the message digest algorithm (MD5) as the authentication type for an SNMPv3 user, include the **authentication-md5** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```

[edit snmp v3 usm local-engine user username]
authentication-md5 {
  authentication-password authentication-password;
}

```

authentication-password is the password used to generate the key used for authentication.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Configuring SHA Authentication

To configure the secure hash algorithm (SHA) as the authentication type for an SNMPv3 user, include the **authentication-sha** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
authentication-sha {  
    authentication-password authentication-password;  
}
```

authentication-password is the password used to generate the key used for authentication.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Configuring No Authentication

To configure no authentication for an SNMPv3 user, include the **authentication-none** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
authentication-none;
```

- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)

Configuring the Encryption Type

By default, encryption is set to none.

NOTE: Before you configure encryption, you must configure MD5 or SHA authentication.

Before you configure the **privacy-des**, **privacy-3des** and **privacy-aes128** statements, you must install the **jcrypto** package, and either restart the SNMP process or reboot the router.

This topic includes the following sections:

- [Configuring the Advanced Encryption Standard Algorithm on page 1949](#)
- [Configuring the Data Encryption Algorithm on page 1949](#)
- [Configuring Triple DES on page 1949](#)
- [Configuring No Encryption on page 1950](#)

Configuring the Advanced Encryption Standard Algorithm

To configure the Advanced Encryption Standard (AES) algorithm for an SNMPv3 user, include the **privacy-aes128** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
  privacy-aes128 {  
    privacy-password privacy-password;  
  }
```

privacy-password is the password used to generate the key used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Configuring the Data Encryption Algorithm

To configure the data encryption algorithm (DES) for an SNMPv3 user, include the **privacy-des** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
  privacy-des {  
    privacy-password privacy-password;  
  }
```

privacy-password is the password used to generate the key used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Configuring Triple DES

To configure triple DES for an SNMPv3 user, include the **privacy-3des** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
  privacy-3des {  
    privacy-password privacy-password;
```

```
}
```

privacy-password is the password used to generate the key used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Configuring No Encryption

To configure no encryption for an SNMPv3 user, include the **privacy-none** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
privacy-none;
```

- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)

Defining Access Privileges for an SNMP Group

The SNMP version 3 (SNMPv3) uses the view-based access control model (VACM), which allows you to configure the access privileges granted to a group. Access is controlled by filtering the MIB objects available for a specific operation through a predefined view. You assign views to determine the objects that are visible for read, write, and notify operations for a particular group, using a particular context, a particular security model (v1, v2c, or usm), and particular security level (authenticated, privacy, or none). For information about how to configure views, see “[Configuring MIB Views](#)” on page 1930.

You define user access to management information at the **[edit snmp v3 vacm]** hierarchy level. All access control within VACM operates on groups, which are collections of users as defined by USM, or community strings as defined in the SNMPv1 and SNMPv2c security models. The term **security-name** refers to these generic end users. The group to which a specific security name belongs is configured at the **[edit snmp v3 vacm security-to-group]** hierarchy level. That security name can be associated with a group defined at the **[edit snmp v3 vacm security-to-group]** hierarchy level. A group identifies a collection of SNMP users that share the same access policy. You then define the access privileges associated with a group at the **[edit snmp v3 vacm access]** hierarchy level. Access privileges are defined using views. For each group, you can apply different views depending on the SNMP operation; for example, read (**get**, **getNext**, or **getBulk**) write (**set**), notifications, the security level used (authentication, privacy, or none), and the security model (v1, v2c, or usm) used within an SNMP request.

You configure members of a group with the **security-name** statement. For v3 packets using USM, the security name is the same as the username. For SNMPv1 or SNMPv2c packets, the security name is determined based on the community string. Security names are specific to a security model. If you are also configuring VACM access policies for SNMPv1 or SNMPv2c packets, you must assign security names to groups for each security model (SNMPv1 or SNMPv2c) at the **[edit snmp v3 vacm security-to-group]** hierarchy level. You must also associate a security name with an SNMP community at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

To configure the access privileges for an SNMP group, include statements at the **[edit snmp v3 vacm]** hierarchy level:

```
[edit snmp v3 vacm]
access {
  group group-name {
    (default-context-prefix | context-prefix context-prefix){
      security-model (any | usm | v1 | v2c) {
        security-level (authentication | none | privacy) {
          notify-view view-name;
          read-view view-name;
          write-view view-name;
        }
      }
    }
  }
}
security-to-group {
  security-model (usm | v1 | v2c) {
    security-name security-name {
      group group-name;
    }
  }
}
```

Related Documentation

Configuring the Access Privileges Granted to a Group

This topic includes the following sections:

- [Configuring the Group on page 1952](#)
- [Configuring the Security Model on page 1952](#)
- [Configuring the Security Level on page 1952](#)
- [Associating MIB Views with an SNMP User Group on page 1953](#)

Configuring the Group

To configure the access privileges granted to a group, include the **group** statement at the **[edit snmp v3 vacm access]** hierarchy level:

```
[edit snmp v3 vacm access]
group group-name;
```

group-name is a collection of SNMP users that belong to a common SNMP list that defines an access policy. Users belonging to a particular SNMP group inherit all access privileges granted to that group.

Configuring the Security Model

To configure the security model, include the **security-model** statement at the **[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix)]
security-model (any | usm | v1 | v2c);
```

- **any**—Any security model
- **usm**—SNMPv3 security model
- **v1**—SNMPv1 security model
- **v2c**—SNMPv2c security model

Configuring the Security Level

To configure the access privileges granted to packets with a particular security level, include the **security-level** statement at the **[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name default-context-prefix security-model (any
| usm | v1 | v2c)]
security-level (authentication | none | privacy);
```

- **none**—Provides no authentication and no encryption.
- **authentication**—Provides authentication but no encryption.
- **privacy**—Provides authentication and encryption.

NOTE: Access privileges are granted to all packets with a security level equal to or greater than that configured. If you are configuring the SNMPv1 or SNMPv2c security model, use **none** as your security level. If you are configuring the SNMPv3 security model (USM), use the **authentication**, **none**, or **privacy** security level.

Associating MIB Views with an SNMP User Group

MIB views define access privileges for members of a group. Separate views can be applied for each SNMP operation (read, write, and notify) within each security model (usm, v1, and v2c) and each security level (authentication, none, and privacy) supported by SNMP.

To associate MIB views with an SNMP user group, include the following statements at the `[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]` hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
    context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
    | privacy)]
  notify-view view-name;
  read-view view-name;
  write-view view-name;
```

NOTE: You must associate at least one view (notify, read, or write) at the `[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]` hierarchy level.

You must configure the MIB view at the `[edit snmp view view-name]` hierarchy level. For information about how to configure MIB views, see [“Configuring MIB Views” on page 1930](#).

This section describes the following topics related to this configuration:

- [Configuring the Notify View on page 1953](#)
- [Configuring the Read View on page 1954](#)
- [Configuring the Write View on page 1954](#)

Configuring the Notify View

To associate notify access with an SNMP user group, include the `notify-view` statement at the `[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]` hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
    context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
    | privacy)]
  notify-view view-name;
```

view-name specifies the notify access, which is a list of notifications that can be sent to each user in an SNMP group. A view name cannot exceed 32 characters.

Configuring the Read View

To associate a read view with an SNMP group, include the **read-view** statement at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
  | privacy)]
  read-view view-name;
```

view-name specifies read access for an SNMP user group. A view name cannot exceed 32 characters.

Configuring the Write View

To associate a write view with an SNMP user group, include the **write-view** statement at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
  | privacy)]
  write-view view-name;
```

view-name specifies write access for an SNMP user group. A view name cannot exceed 32 characters.

Related Documentation

- [Complete SNMPv3 Configuration Statements on page 2034](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)
- [Example: Access Privilege Configuration on page 1954](#)

Example: Access Privilege Configuration

Define access privileges:

```
[edit snmp v3]
access {
  group group1 {
    default-context-prefix {
      security-model usm {      #Define an SNMPv3 security model
        security-level privacy {
          notify-view nv1;
          read-view rv1;
          write-view wv1;
        }
      }
    }
  }
}
```

```

context-prefix lrl/rl { # routing instance rl in logical system lrl
  security-model usm {
    security-level privacy {
      notify-view nv1;
      read-view rv1;
      write-view wv1;
    }
  }
}
group group2 {
  default-context-prefix {
    security-model usm {          #Define an SNMPv3 security model
      security-level authentication {
        read-view rv2;
        write-view wv2;
      }
    }
  }
}
group group3 {
  default-context-prefix {
    security-model v1 {          #Define an SNMPv3 security model
      security-level none {
        read-view rv3;
        write-view wv3;
      }
    }
  }
}

```

Related Documentation

- [Configuring the Access Privileges Granted to a Group on page 1951](#)

Assigning Security Model and Security Name to a Group

To assign security names to groups, include the following statements at the **[edit snmp v3 vacm security-to-group]** hierarchy level:

```

[edit snmp v3 vacm security-to-group]
security-model (usm | v1 | v2c) {
  security-name security-name {
    group group-name;
  }
}

```

This topic includes the following sections:

- [Configuring the Security Model on page 1956](#)
- [Assigning Security Names to Groups on page 1956](#)
- [Configuring the Group on page 1956](#)

Configuring the Security Model

To configure the security model, include the **security-model** statement at the **[edit snmp v3 vacm security-to-group]** hierarchy level:

```
[edit snmp v3 vacm security-to-group]
  security-model (usm | v1 | v2c);
```

- **usm**—SNMPv3 security model
- **v1**—SNMPv1 security model
- **v2c**—SNMPv2 security model

Assigning Security Names to Groups

To associate a security name with an SNMPv3 user, or a v1 or v2 community string, include the **security-name** statement at the **[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]** hierarchy level:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]
  security-name security-name;
```

For SNMPv3, the **security-name** is the username configured at the **[edit snmp v3 usm local-engine user username]** hierarchy level. For SNMPv1 and SNMPv2c, the security name is the community string configured at the **[edit snmp v3 snmp-community community-index]** hierarchy level. For information about configuring usernames, see [“Creating SNMPv3 Users” on page 1941](#). For information about configuring a community string, see [“Configuring the SNMPv3 Community” on page 1969](#).

NOTE: The USM security name is separate from the SNMPv1 and SNMPv2c security name. If you support SNMPv1 and SNMPv2c in addition to SNMPv3, you must configure separate security names within the security-to-group configuration at the **[edit snmp v3 vacm access]** hierarchy level.

Configuring the Group

After you have created SNMPv3 users, or v1 or v2 security names, you associate them with a group. A group is a set of security names belonging to a particular security model. A group defines the access rights for all users belonging to it. Access rights define what SNMP objects can be read, written to, or created. A group also defines what notifications a user is allowed to receive.

If you already have a group that is configured with all of the view and access permissions that you want to give a user, you can add the user to that group. If you want to give a user view and access permissions that no other groups have, or if you do not have any groups configured, create a group and add the user to it.

To configure the access privileges granted to a group, include the **group** statement at the **[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name security-name]** hierarchy level:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name
  security-name]
```

group *group-name*;

group-name identifies a collection of SNMP security names that share the same access policy. For more information about groups, see “[Defining Access Privileges for an SNMP Group](#)” on page 1950.

Example: Security Group Configuration

Assign security names to groups:

```
vacm {
  security-to-group {
    security-model usm {
      security-name user1 {
        group group1;
      }
      security-name user2 {
        group group2;
      }
      security-name user3 {
        group group3;
      }
    }
  }
}
```

Related Documentation

- [Assigning Security Model and Security Name to a Group on page 1955](#)
- [Complete SNMPv3 Configuration Statements on page 2034](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)

Example: Configuring the Tag List

In the following example, two tag entries (**router1** and **router2**) are defined at the **[edit snmp v3 notify *notify-name*]** hierarchy level. When an event triggers a notification, Junos OS sends a trap to all target addresses that have **router1** or **router2** configured in their target-address tag list. This results in the first two targets getting one trap each, and the third target getting two traps.

```
[edit snmp v3]
notify n1 {
  tag router1; # Identifies a set of target addresses
  type trap; # Defines the type of notification
}
notify n2 {
  tag router2;
  type trap;
}
target-address ta1 {
  address 10.1.1.1;
  address-mask 255.255.255.0;
  port 162;
  tag-list router1;
  target-parameters tp1;
}
```

```
target-address ta2 {
  address 10.1.1.2;
  address-mask 255.255.255.0;
  port 162;
  tag-list router2;
  target-parameters tp2;
}
target-address ta3 {
  address 10.1.1.3;
  address-mask 255.255.255.0;
  port 162;
  tag-list "router1 router2"; #Define multiple tags in the target address tag list
  target-parameters tp3;
}
```

Related Documentation

- [Configuring SNMPv3 Traps on a Device Running Junos OS on page 1960](#)
- [Configuring the Trap Target Address on page 1962](#)

Configuring the Local Engine ID

By default, the local engine ID uses the default IP address of the router. The local engine ID is the administratively unique identifier for the SNMPv3 engine. This statement is optional. To configure the local engine ID, include the **engine-id** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
engine-id {
  (local engine-id-suffix | use-default-ip-address | use-mac-address);
}
```

- **local engine-id-suffix**—The engine ID suffix is explicitly configured.
- **use-default-ip-address**—The engine ID suffix is generated from the default IP address.
- **use-mac-address**—The SNMP engine identifier is generated from the Media Access Control (MAC) address of the management interface on the router.

The local engine ID is defined as the administratively unique identifier of an SNMPv3 engine, and is used for identification, not for addressing. There are two parts of an engine ID: prefix and suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*. You can configure the suffix here.

NOTE: SNMPv3 authentication and encryption keys are generated based on the associated passwords and the engine ID. If you configure or change the engine ID, you must commit the new engine ID before you configure SNMPv3 users. Otherwise the keys generated from the configured passwords are based on the previous engine ID. For the engine ID, we recommend using the master IP address of the device if the device has multiple routing engines and has the master IP address configured. Alternatively, you can use the MAC address of the management port if the device has only one Routing Engine.

Related Documentation

- [Complete SNMPv3 Configuration Statements on page 2034](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)
- [Example: SNMPv3 Configuration on page 1942](#)

Configuring SNMP Informs

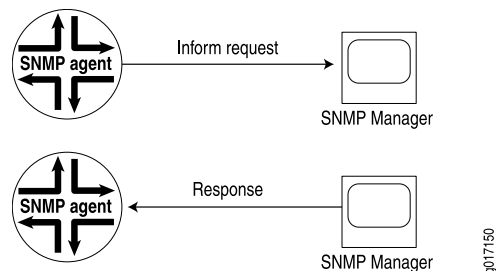

Junos OS supports two types of notifications: traps and informs. With traps, the receiver does not send any acknowledgment when it receives a trap. Therefore, the sender cannot determine if the trap was received. A trap may be lost because a problem occurred during transmission. To increase reliability, an inform is similar to a trap except that the inform is stored and retransmitted at regular intervals until one of these conditions occurs:

- The receiver (target) of the inform returns an acknowledgment to the SNMP agent.
- A specified number of unsuccessful retransmissions have been attempted and the agent discards the inform message.

If the sender never receives a response, the inform can be sent again. Thus, informs are more likely to reach their intended destination than traps are. Informs use the same communications channel as traps (same socket and port) but have different protocol data unit (PDU) types.

Informs are more reliable than traps, but they consume more network, router, and switch resources (see [Figure 60 on page 1959](#)). Unlike a trap, an inform is held in memory until a response is received or the timeout is reached. Also, traps are sent only once, whereas an inform may be retried several times. Use informs when it is important that the SNMP manager receive all notifications. However, if you are more concerned about network traffic, or router and switch memory, use traps.

Figure 60: Inform Request and Response

For information about configuring SNMP traps, see [“Configuring SNMPv3 Traps on a Device Running Junos OS” on page 1960](#).

Related Documentation

- [Configuring SNMPv3 Traps on a Device Running Junos OS on page 1960](#)

Configuring SNMPv3 Traps on a Device Running Junos OS

In SNMPv3, you create traps and informs by configuring the **notify**, **target-address**, and **target-parameters** parameters. Traps are unconfirmed notifications, whereas informs are confirmed notifications. This section describes how to configure SNMP traps. For information about configuring SNMP informs, see [“Configuring SNMP Informs” on page 1959](#).

The target address defines a management application’s address and parameters to be used in sending notifications. Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target. SNMPv3 also lets you define SNMPv1 and SNMPv2c traps.

NOTE: When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Access privileges are configured at the `[edit snmp v3 vacm access]` and `[edit snmp v3 vacm security-to-group]` hierarchy levels.

To configure SNMP traps, include the following statements at the `[edit snmp v3]` hierarchy level:

```
[edit snmp v3]
notify name {
  tag tag-name;
  type trap;
}
notify-filter name {
  oid object-identifier (include | exclude);
}
target-address target-address-name {
  address address;
  address-mask address-mask;
  logical-system logical-system;
  port port-number;
  routing-instance instance;
  tag-list tag-list;
  target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
```

```

message-processing-model (v1 | v2c | v3);
security-level (authentication | none | privacy);
security-model (usm | v1 | v2c);
security-name security-name;
}
}

```

- [Configuring the Inform Notification Type and Target Address on page 1971](#)

Configuring the SNMPv3 Trap Notification

The **notify** statement specifies the type of notification (trap) and contains a single tag. The tag defines a set of target addresses to receive a trap. The tag list contains one or more tags and is configured at the **[edit snmp v3 target-address target-address-name]** hierarchy level. If the tag list contains this tag, Junos OS sends a notification to all the target addresses associated with this tag.

To configure the trap notifications, include the **notify** statement at the **[edit snmp v3]** hierarchy level:

```

[edit snmp v3]
notify name {
  tag tag-name;
  type trap;
}

```

name is the name assigned to the notification.

tag-name defines the target addresses to which this notification is sent. This notification is sent to all the target-addresses that have this tag in their tag list. The **tag-name** is not included in the notification.

trap is the type of notification.

NOTE: Each notify entry name must be unique.

Junos OS supports two types of notification: **trap** and **inform**.

For information about how to configure the tag list, see [“Configuring the Trap Target Address” on page 1964](#).

Related Documentation

- [Configuring SNMPv3 Traps on a Device Running Junos OS on page 1960](#)
- [Configuring the Trap Notification Filter on page 1938](#)

- [Configuring SNMP Informs on page 1959](#)
- [Complete SNMPv3 Configuration Statements on page 2034](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)

Example: Configuring SNMPv3 Trap Notification

Specify three sets of destinations to send traps:

```
[edit snmp v3]
notify n1 {
  tag router1;
  type trap;
}
notify n2 {
  tag router2;
  type trap;
}
notify n3 {
  tag router3;
  type trap;
}
```

Related Documentation

- [Complete SNMPv3 Configuration Statements on page 2034](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)

Configuring the Trap Target Address

The target address defines a management application's address and parameters that are used in sending notifications. It can also identify management stations that are allowed to use specific community strings. When you receive a packet with a recognized community string and a tag is associated with it, Junos OS looks up all the target addresses with this tag and verifies that the source address of this packet matches one of the configured target addresses.

NOTE: You must configure the address mask when you configure the SNMP community.

To specify where you want the traps to be sent and define what SNMPv1 and SNMPv2cc packets are allowed, include the **target-address** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
target-address target-address-name;
```

target-address-name is the string that identifies the target address.

To configure the target address properties, include the following statements at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
address address;
address-mask address-mask;
logical-system logical-system;
port port-number;
routing-instance instance;
tag-list tag-list;
target-parameters target-parameters-name;
```

This section includes the following topics:

- [Configuring the Address on page 1963](#)
- [Configuring the Address Mask on page 1963](#)
- [Configuring the Port on page 1964](#)
- [Configuring the Routing Instance on page 1964](#)
- [Configuring the Trap Target Address on page 1964](#)
- [Applying Target Parameters on page 1965](#)

Configuring the Address

To configure the address, include the **address** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
address address;
```

address is the SNMP target address.

Configuring the Address Mask

The address mask specifies a set of addresses that are allowed to use a community string and verifies the source addresses for a group of target addresses.

To configure the address mask, include the **address-mask** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
address-mask address-mask;
```

address-mask combined with the address defines a range of addresses. For information about how to configure the community string, see [“Configuring the SNMPv3 Community” on page 1969](#).

Configuring the Port

By default, the UDP port is set to 162. To configure a different port number, include the **port** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
port port-number;
```

port-number is the SNMP target port number.

Configuring the Routing Instance

Traps are sent over the default routing instance. To configure the routing instance for sending traps, include the **routing-instance** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
routing-instance instance;
```

instance is the name of the routing instance. To configure a routing instance within a logical system, specify the logical system name followed by the routing instance name. Use a slash (/) to separate the two names (for example, **test-lr/test-ri**). To configure the default routing instance on a logical system, specify the logical system name followed by **default** (for example, **test-lr/default**).

Configuring the Trap Target Address

Each **target-address** statement can have one or more tags configured in its tag list. Each tag can appear in more than one tag list. When a significant event occurs on the network device, the tag list identifies the targets to which a notification is sent.

To configure the tag list, include the **tag-list** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
tag-list "tag-list";
```

tag-list specifies one or more tags as a space-separated list enclosed within double quotes.

For an example of tag list configuration, see [“Example: Configuring the Tag List” on page 1957](#).

For information about how to specify a tag at the **[edit snmp v3 notify notify-name]** hierarchy level, see [“Configuring the SNMPv3 Trap Notification” on page 1961](#).

NOTE: When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Configure access privileges at the **[edit snmp v3 vacm access]** hierarchy level.

Applying Target Parameters

The **target-parameters** statement at the **[edit snmp v3]** hierarchy level applies the target parameters configured at the **[edit snmp v3 target-parameters target-parameters-name]** hierarchy level.

To reference configured target parameters, include the **target-parameters** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
  target-parameters target-parameters-name;
```

target-parameters-name is the name associated with the message processing and security parameters that are used in sending notifications to a particular management target.

Related Documentation

- [Configuring SNMP Informs on page 1959](#)
- [Complete SNMPv3 Configuration Statements on page 2034](#)

Defining and Configuring the Trap Target Parameters

Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target.

To define a set of target parameters, include the **target-parameters** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
  target-parameters target-parameters-name;
```

target-parameters-name is the name assigned to the target parameters.

To configure target parameter properties, include the following statements at the **[edit snmp v3 target-parameters target-parameter-name]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name]
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | V3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
```

This topic includes the following sections:

- [Applying the Trap Notification Filter on page 1966](#)
- [Configuring the Target Parameters on page 1966](#)

Applying the Trap Notification Filter

To apply the trap notification filter, include the **notify-filter** statement at the **[edit snmp v3 target-parameters target-parameter-name]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name]
  notify-filter profile-name;
```

profile-name is the name of a configured notify filter. For information about configuring notify filters, see [“Configuring the Trap Notification Filter” on page 1938](#).

Configuring the Target Parameters

To configure target parameter properties, include the following statements at the **[edit snmp v3 target-parameters target-parameter-name parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
  message-processing-model (v1 | v2c | v3);
  security-level (authentication | none | privacy);
  security-model (usm | v1 | v2c);
  security-name security-name;
```

This section includes the following topics:

- [Configuring the Message Processing Model on page 1966](#)
- [Configuring the Security Model on page 1966](#)
- [Configuring the Security Level on page 1967](#)
- [Configuring the Security Name on page 1967](#)

Configuring the Message Processing Model

The message processing model defines which version of SNMP to use when generating SNMP notifications. To configure the message processing model, include the **message-processing-model** statement at the **[edit snmp v3 target-parameters target-parameter-name parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
  message-processing-model (v1 | v2c | v3);
```

- **v1**—SNMPv1 message processing model
- **v2c**—SNMPv2c message processing model
- **v3**—SNMPv3 message processing model

Configuring the Security Model

To define the security model to use when generating SNMP notifications, include the **security-model** statement at the **[edit snmp v3 target-parameters target-parameter-name parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
  security-model (usm | v1 | v2c);
```

- **usm**—SNMPv3 security model
- **v1**—SNMPv1 security model
- **v2c**—SNMPv2c security model

Configuring the Security Level

The **security-level** statement specifies whether the trap is authenticated and encrypted before it is sent.

To configure the security level to use when generating SNMP notifications, include the **security-level** statement at the **[edit snmp v3 target-parameters *target-parameter-name* parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
  security-level (authentication | none | privacy);
```

- **authentication**—Provides authentication but no encryption.
- **none**—No security. Provides no authentication and no encryption.
- **privacy**—Provides authentication and encryption.

NOTE: If you are configuring the SNMPv1 or SNMPV2c security model, use **none** as your security level. If you are configuring the SNMPv3 (USM) security model, use the **authentication** or **privacy** security level.

Configuring the Security Name

To configure the security name to use when generating SNMP notifications, include the **security-name** statement at the **[edit snmp v3 target-parameters *target-parameter-name* parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
  security-name security-name;
```

If the USM security model is used, the **security-name** identifies the user that is used when the notification is generated. If the v1 or v2c security models are used, **security-name** identifies the SNMP community used when the notification is generated.

NOTE: The access privileges for the group associated with a security name must allow this notification to be sent.

If you are using the v1 or v2 security models, the security name at the **[edit snmp v3 vacm security-to-group]** hierarchy level must match the security name at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Adding a Group of Clients to an SNMP Community

Junos OS enables you to add one or more groups of clients to an SNMP community. You can include the **client-list-name** *name* statement at the **[edit snmp community community-name]** hierarchy level to add all the members of the client list or prefix list to an SNMP community.

To define a list of clients, include the **client-list** statement followed by the IP addresses of the clients at the **[edit snmp]** hierarchy level:

```
[edit snmp]
  client-list client-list-name {
    ip-addresses;
  }
```

You can configure a prefix list at the **[edit policy options]** hierarchy level. Support for prefix lists in the SNMP community configuration enables you to use a single list to configure the SNMP and routing policies. For more information about the **prefix-list** statement, see the *Routing Policy Configuration Guide*.

To add a client list or prefix list to an SNMP community, include the **client-list-name** statement at the **[edit snmp community community-name]** hierarchy level:

```
[edit snmp community community-name]
  client-list-name client-list-name;
```

NOTE: The client list and prefix list must not have the same name.

The following example shows how to define a client list:

```
[edit]
snmp {
  client-list clentlist1 {
    10.1.1.1/32;
    10.2.2.2/32;
  }
}
```

The following example shows how to add a client list to an SNMP community:

```
[edit]
snmp {
  community community1 {
    authorization read-only;
    client-list-name clientlist1;
  }
}
```

The following example shows how to add a prefix list to an SNMP community:

```
[edit]
policy-options {
```

```

prefix-list prefixlist {
  10.3.3.3/32;
  10.5.5.5/32;
}
}
snmp {
  community community2 {
    client-list-name prefixlist;
  }
}

```

- Related Documentation**
- *client-list*
 - *client-list-name*

Configuring the SNMPv3 Community

The SNMP community defines the relationship between an SNMP server system and the client systems. This statement is optional.

To configure the SNMP community, include the **snmp-community** statement at the **[edit snmp v3]** hierarchy level:

```

[edit snmp v3]
snmp-community community-index;

```

community-index is the index for the SNMP community.

To configure the SNMP community properties, include the following statements at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level:

```

[edit snmp v3 snmp-community community-index]
community-name community-name;
context context-name;
security-name security-name;
tag tag-name;

```

This section includes the following topics:

- [Configuring the Community Name on page 1969](#)
- [Configuring the Context on page 1970](#)
- [Configuring the Security Names on page 1970](#)
- [Configuring the Tag on page 1970](#)

Configuring the Community Name

The community name defines the SNMP community. The SNMP community authorizes SNMPv1 or SNMPv2c clients. The access privileges associated with the configured security name define which MIB objects are available and the operations (read, write, or notify) allowed on those objects.

To configure the SNMP community name, include the **community-name** statement at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level:

```

[edit snmp v3 snmp-community community-index]
community-name community-name;

```

community-name is the community string for an SNMPv1 or SNMPv2c community.

If unconfigured, it is the same as the community index.

If the community name contains spaces, enclose it in quotation marks (" ").

NOTE: Community names must be unique. You cannot configure the same community name at the [edit snmp community] and [edit snmp v3 snmp-community *community-index*] hierarchy levels. The configured community name at the [edit snmp v3 snmp-community *community-index*] hierarchy level is encrypted. You cannot view the community name after you have configured it and committed your changes. In the command-line interface (CLI), the community name is concealed.

Configuring the Context

An SNMP context defines a collection of management information that is accessible to an SNMP entity. Typically, an SNMP entity has access to multiple contexts. A context can be a physical or logical system, a collection of multiple systems, or even a subset of a system. Each context in a management domain has a unique identifier.

To configure an SNMP context, include the **context context-name** statement at the [edit snmp v3 snmp-community *community-index*] hierarchy level:

```
[edit snmp v3 snmp-community community-index]  
context context-name;
```

NOTE: To query a routing instance or a logical system,

Configuring the Security Names

To assign a community string to a security name, include the **security-name** statement at the [edit snmp v3 snmp-community *community-index*] hierarchy level:

```
[edit snmp v3 snmp-community community-index]  
security-name security-name;
```

security-name is used when access control is set up. The **security-to-group** configuration at the [edit snmp v3 vacm] hierarchy level identifies the group.

NOTE: This security name must match the security name configured at the [edit snmp v3 target-parameters *target-parameters-name* parameters] hierarchy level when you configure traps.

Configuring the Tag

To configure the tag, include the **tag** statement at the [edit snmp v3 snmp-community *community-index*] hierarchy level:

```
[edit snmp v3 snmp-community community-index]
```

`tag tag-name;`

tag-name identifies the address of managers that are allowed to use a community string.

Related Documentation

- [Creating SNMPv3 Users on page 1941](#)
- [Complete SNMPv3 Configuration Statements on page 2034](#)
- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)
- [Example: SNMPv3 Community Configuration on page 1971](#)

Example: SNMPv3 Community Configuration

Define an SNMP community:

```
[edit snmp v3]
snmp-community index1 {
  community-name "$ABC123"; # SECRET-DATA
  security-name john;
  tag router1; # Identifies managers that are allowed to use
                # a community string
  target-address ta1 {
    address 10.1.1.1;
    address-mask 255.255.255.0; # Defines the range of addresses
    port 162;
    tag-list router1;
    target-parameters tp1; # Applies configured target parameters
  }
}
```

Related Documentation

- [Configuring the SNMPv3 Community on page 1969](#)

- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1946](#)

Configuring the Inform Notification Type and Target Address

To configure the inform notification type and target information, include the following statements at the `[edit snmp v3]` hierarchy level:

```
[edit snmp v3]
notify name {
  tag tag-name;
  type (trap | inform);
}
target-address target-address-name {
  address address;
  address-mask address-mask;
  logical-system logical-system;
  port port-number;
  retry-count number;
  routing-instance instance;
  tag-list tag-list;
  target-parameters target-parameters-name;
  timeout seconds;
```

```

}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}

```

notify *name* is the name assigned to the notification. Each notify entry name must be unique.

tag *tag-name* defines the target addresses that are sent this notification. The notification is sent to all target addresses that have this tag in their tag list. The **tag-name** is not included in the notification. For information about how to configure the tag list, see [“Configuring the Trap Target Address” on page 1964](#).

type inform is the type of notification.

target-address *target-address-name* identifies the target address. The target address defines a management application’s address and parameters that are used to respond to informs.

timeout *seconds* is the number of seconds to wait for an acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted. The default timeout is 15 seconds.

retry-count *number* is the maximum number of times an inform is transmitted if no acknowledgment is received. The default is 3. If no acknowledgment is received after the inform is transmitted the maximum number of times, the inform message is discarded.

message-processing-model defines which version of SNMP to use when SNMP notifications are generated. Informs require a **v3** message processing model.

security-model defines the security model to use when SNMP notifications are generated. Informs require a **usm** security model.

security-model defines the security model to use when SNMP notifications are generated. Informs require a **usm** security model.

security-level specifies whether the inform is authenticated and encrypted before it is sent. For the **usm** security model, the security level must be one of the following:

- **authentication**—Provides authentication but no encryption.
- **privacy**—Provides authentication and encryption.

security-name identifies the username that is used when generating the inform.

Related Documentation

- [Configuring SNMPv3 Traps on a Device Running Junos OS on page 1960](#)

Example: Configuring the Inform Notification Type and Target Address

In the following example, target **172.17.20.184** is configured to respond to informs. The inform timeout is **30** seconds and the maximum retransmit count is **3**. The inform is sent to all targets in the **tl1** list. The security model for the remote user is **usm** and the remote engine username is **u10**.

```
[edit snmp v3]
notify n1 {
  type inform;
  tag tl1;
}
notify-filter nf1 {
  oid .1.3 include;
}
target-address ta1 {
  address 172.17.20.184;
  retry-count 3;
  tag-list tl1;
  address-mask 255.255.255.0;
  target-parameters tp1;
  timeout 30;
}
target-parameters tp1 {
  parameters {
    message-processing-model v3;
    security-model usm;
    security-level privacy;
    security-name u10;
  }
  notify-filter nf1;
}
```

Related Documentation

Configuring the Remote Engine and Remote User

To send inform messages to an SNMPv3 user on a remote device, you must first specify the engine identifier for the SNMP agent on the remote device where the user resides. The remote engine ID is used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host. When sending an inform message, the agent uses the credentials of the user configured on the remote engine (inform target).

To configure a remote engine and remote user to receive and respond to SNMP informs, include the following statements at the `[edit snmp v3]` hierarchy level:

```
[edit snmp v3]
usm {
  remote-engine engine-id {
    user username {
      authentication-md5 {
        authentication-key key;
      }
      authentication-none;
      authentication-sha {
        authentication-key key;
      }
      privacy-3des {
        privacy-key key;
      }
      privacy-aes128 {
        privacy-key key;
      }
      privacy-des {
        privacy-key key;
      }
      privacy-none;
    }
  }
}
```

For informs, **remote-engine engine-id** is the identifier for the SNMP agent on the remote device where the user resides.

For informs, **user username** is the user on a remote SNMP engine who receives the informs.

Informs generated can be **unauthenticated**, **authenticated**, or **authenticated_and_encrypted**, depending on the security level of the SNMPv3 user configured on the remote engine (the inform receiver). The authentication key is used for generating message authentication code (MAC). The privacy key is used to encrypt the inform PDU part of the message.

Example: Configuring the Remote Engine ID and Remote Users

This example shows how to configure a remote engine and remote user so you can receive and respond to SNMP inform notifications. Inform notifications can be authenticated and encrypted. They are also more reliable than traps, another type of notification that

Junos OS supports. Unlike traps, inform notifications are stored and retransmitted at regular intervals until one of these conditions occurs:

- The target of the inform notification returns an acknowledgment to the SNMP agent.
- A specified number of unsuccessful retransmissions have been attempted.
- [Requirements on page 1975](#)
- [Overview on page 1975](#)
- [Configuration on page 1976](#)
- [Verification on page 1977](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

This feature requires the use of plain-text passwords valid for SNMPv3. SNMPv3 has the following special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Although quotation marks are not always required to enclose passwords, it is best to use them. You need quotation marks if the password contains any spaces or possibly in the case of certain special characters or punctuation.

Overview

Inform notifications are supported in SNMPv3 to increase reliability. For example, an SNMP agent receiving an inform notification acknowledges the receipt.

For inform notifications, the remote engine ID identifies the SNMP agent on the remote device where the user resides, and the username identifies the user on a remote SNMP engine who receives the inform notifications.

Consider a scenario in which you have the values in [Table 267 on page 1975](#) to use in configuring the remote engine ID and remote user in this example.

Table 267: Values to Use in Example

Name of Variable	Value
username	u10
remote engine ID	800007E5804089071BC6D10A41
authentication type	authentication-md5
authentication password	qol67R%?

Table 267: Values to Use in Example (*continued*)

Name of Variable	Value
encryption type	privacy-des
privacy password	m*72Jl9v

Configuration**CLI Quick Configuration**

To quickly configure this example, copy the following commands and paste them into a text file, remove any line breaks and change any details necessary to match your network configuration, copy and paste these commands into the CLI at the **[edit snmp v3]** hierarchy level, and then enter **commit** from configuration mode.

The following example configures user **u10** located on remote engine **0x800007E5804089071BC6D10A41** and the user's authentication and privacy keys. The keys are autogenerated from the passwords entered by the command-line interface (CLI) user.

[Warning: element unresolved in stylesheets: <step> (in <example>). This is probably a new element that is not yet supported in the stylesheets.]

Configure the remote engine ID, username, and authentication type and password.

```
[edit snmp v3]
user@host# set usm remote-engine 800007E5804089071BC6D10A41 user u10
authentication-md5 authentication-key "qol67R%?"
```

[Warning: element unresolved in stylesheets: <step> (in <example>). This is probably a new element that is not yet supported in the stylesheets.]

Configure the encryption type and privacy password.

You can configure only one encryption type per SNMPv3 user.

```
[edit snmp v3]
user@host# set usm remote-engine 800007E5804089071BC6D10A41 user u10
privacy-des privacy-key "m*72Jl9v"
```

[Warning: element unresolved in stylesheets: <results> (in <example>). This is probably a new element that is not yet supported in the stylesheets.]

In configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit snmp v3]
user@ host# show
usm {
  remote-engine 800007E5804089071BC6D10A41 {
    user u10 {
      authentication-md5 {
        authentication-key "$ABC123"
      }
      privacy-des {
        privacy-key "$ABC123"; ## SECRET-DATA
      }
      privacy-des {
        privacy-key "$ABC123"
      }
    }
  }
}
```

```

    }
  }
}

```

After you have confirmed that the configuration is correct, enter **commit** from configuration mode.

Verification

Verifying the Configuration of the Remote Engine ID and Username

Purpose Verify the status of the engine ID and user information.

Action Display information about the SNMPv3 engine ID and user.

```

user@host> show snmp v3
Local engine ID: 80 00 0a 4c 01 0a ff 03 e3
Engine boots:      3
Engine time:       769187 seconds
Max msg size:      65507 bytes

Engine ID: 80 00 07 e5 80 40 89 07 1b c6 d1 0a 41
  User      Auth/Priv  Storage  Status
  u10             md5/des   nonvolatile active

```

Meaning The output displays the following information:

- Local engine ID and detail about the engine
- Remote engine ID (labeled **Engine ID**)
- Username
- Authentication type and encryption (privacy) type that is configured for the user
- Type of storage for the username, either nonvolatile (configuration saved) or volatile (not saved)
- Status of the new user; only users with an active status can use SNMPv3

Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage

Even though Junos OS includes built-in performance metrics and monitoring options, you might need to have customized performance metrics. To make it easier for you to monitor such customized data through a standard monitoring system, Junos OS provides

you with an enterprise-specific Utility MIB that can store such data and thus extend SNMP support for managing and monitoring the data of your choice.

The enterprise-specific Utility MIB provides you with container objects of the following types: **32-bit counters**, **64-bit counters**, **signed integers**, **unsigned integers**, and **octet strings**. You can use these container MIB objects to store the data that are otherwise not supported for SNMP operations. You can populate data for these objects either by using CLI commands or with the help of Op scripts and an RPC API that can invoke the CLI commands.

The following CLI commands enable you to set and clear Utility MIB object values:

- **request snmp utility-mib set instance *name* object-type <counter | counter 64 | integer | string | unsigned integer> object-value *value***
- **request snmp utility-mib clear instance *name* object-type <counter | counter 64 | integer | string | unsigned integer>**

The **instance *name*** option of the **request snmp utility-mib <set | clear>** command specifies the name of the data instance and is the main identifier of the data. The **object-type <counter | counter 64 | integer | string | unsigned integer>** option enables you specify the object type, and the **object-value *value*** option enables you to set the value of the object.

To automate the process of populating Utility MIB data, you can use a combination of an event policy and event script. The following examples show the configuration for an event policy to run **show system buffers** every hour and to store the **show system buffers** data in Utility MIB objects by running an event script (**check-mbufs.slax**).

Event Policy Configuration

To configure an event policy that runs the **show system buffers** command every hour and invokes **check-mbufs.slax** to store the **show system buffers** data into Utility MIB objects, include the following statements at the **[edit]** hierarchy level:

```
event-options {
  generate-event {
    1-HOUR time-interval 3600;
  }
  policy Mbufs {
    events 1-HOUR;
    then {
      event-script check-mbufs.slax; # script stored at /var/db/scripts/event/
    }
  }
  event-script {
    file check-mbufs.slax;
  }
}
```

check-mbufs.slax Script

The following example shows the **check-mbufs.slax** script that is stored under **/var/db/scripts/event/**:

```
----- script START -----
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
```

```

ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
ns ext = "http://xmlsoft.org/XSLT/namespace";

match / {
  <op-script-results>{
    var $cmd = <command> "show system buffers";
    var $out = jcs:invoke($cmd);

    var $lines = jcs:break_lines($out);
    for-each ($lines) {
      if (contains(., "current/peak/max")) {
        var $pattern = "([0-9]+)/([0-9]+)/([0-9]+) mbufs";
        var $split = jcs:regex($pattern, .);
        var $result = $split[2];

        var $rpc = <request-snmp-utility-mib-set> {
          <object-type> "integer";
          <instance> "current-mbufs";
          <object-value> $result;
        }
        var $res = jcs:invoke($rpc);
      }
    }
  }
}
----- script END -----

```

You can run the following command to check the data stored in the Utility MIB as a result of the event policy and script shown in the preceding examples:

```

user@host> show snmp mib walk jnxUtilData ascii jnxUtilIntegerValue."current-mbufs"
= 0 jnxUtilIntegerTime."current-mbufs" = 07 da 05 0c 03 14 2c 00 2d 07 00
user@host>

```

Understanding SNMP Support for Routing Instances

Junos OS enables SNMP managers for all routing instances to request and manage SNMP data related to the corresponding routing instances and logical system networks.

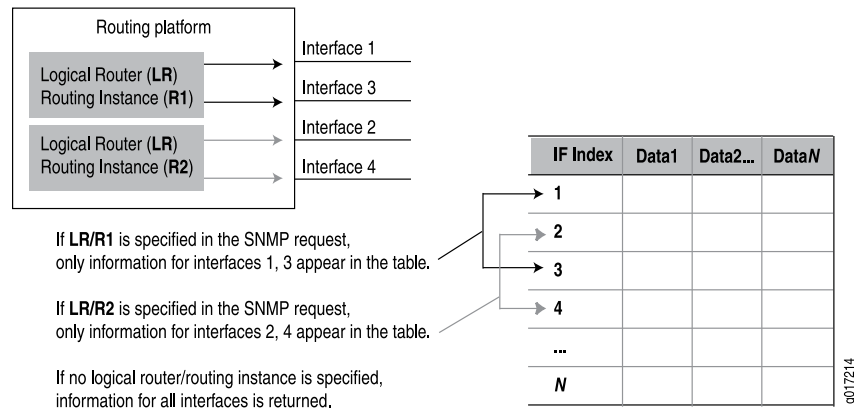

In Junos OS:

- Clients from routing instances other than the default can access MIB objects and perform SNMP operations only on the logical system networks to which they belong.
- Clients from the default routing instance can access information related to all routing instances and logical system networks.

Before Junos OS Release 8.4, only the SNMP manager in the default routing instance (**inet.0**) had access to the MIB objects

With the increase in virtual private network (VPN) service offerings, this feature is useful particularly for service providers who need to obtain SNMP data for specific routing instances (see [Figure 61 on page 1980](#)). Service providers can use this information for their own management needs or export the data for use by their customers.

Figure 61: SNMP Data for Routing Instances

If no routing instance is specified in the request, the SNMP agent operates as before:

- For nonrouting table objects, all instances are exposed.
- For routing table objects, only those associated with the default routing instance are exposed.

NOTE: The actual protocol data units (PDUs) are still exchanged over the default (**inet.0**) routing instance, but the data contents returned are dictated by the routing instance specified in the request PDUs.

Trap Support for Routing Instances

You can restrict the trap receivers from receiving traps that are not related to the logical system networks to which they belong. To do this, include the **logical-system-trap-filter** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
logical-system-trap-filter;
```

If the **logical-system-trap-filter** statement is not included in the SNMP configuration, all traps are forwarded to the configured routing instance destinations. However, even when this statement is configured, the trap receiver associated with the default routing instance will receive all SNMP traps.

When configured under the trap-group object, all v1 and v2c traps that apply to routing instances (or interfaces belonging to a routing instance) have the routing instance name encoded in the community string. The encoding is identical to that used in request PDUs.

For traps configured under the v3 framework, the routing instance name is carried in the context field when the v3 message processing model has been configured. For other message processing models (v1 or v2c), the routing instance name is not carried in the trap message header (and not encoded in the community string).

Related Documentation

- [Understanding SNMP Support for Routing Instances on page 1979](#)
- [MIB Support Details on page 1872](#)

Identifying a Routing Instance

With this feature, routing instances are identified by either the context field in v3 requests or encoded in the community string in v1 or v2c requests.

When encoded in a community string, the routing instance name appears first and is separated from the actual community string by the @ character.

To avoid conflicts with valid community strings that contain the @ character, the community is parsed only if typical community string processing fails. For example, if a routing instance named **RI** is configured, an SNMP request with **RI@public** is processed within the context of the **RI** routing instance. Access control (views, source address restrictions, access privileges, and so on) is applied according to the actual community string (the set of data after the @ character—in this case **public**). However, if the community string **RI@public** is configured, the protocol data unit (PDU) is processed according to that community and the embedded routing instance name is ignored.

Logical systems perform a subset of the actions of a physical router and have their own unique routing tables, interfaces, policies, and routing instances. When a routing instance is defined within a logical system, the logical system name must be encoded along with the routing instance using a slash (/) to separate the two. For example, if the routing instance **RI** is configured within the logical system **LS**, that routing instance must be encoded within a community string as **LS/RI@public**. When a routing instance is configured outside a logical system (within the default logical system), no logical system name (or / character) is needed.

Also, when a logical system is created, a default routing instance (named **default**) is always created within the logical system. This name should be used when querying data for that routing instance (for example, **LS/default@public**). For v3 requests, the name **logical system/routing instance** should be identified directly in the context field.

NOTE: To identify a virtual LAN (VLAN) spanning-tree instance (VSTP on MX Series 3D Universal Edge Routers), specify the routing instance name followed by a double colon (::) and the VLAN ID. For example, to identify VSTP instance for VLAN 10 in the global default routing instance, include **default::10@public** in the context (SNMPv3) or community (SNMPv1 or v2) string.

Related Documentation

- [Understanding SNMP Support for Routing Instances on page 1979](#)
- [Enabling SNMP Access over Routing Instances on page 1982](#)
- [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1982](#)

Enabling SNMP Access over Routing Instances

To enable SNMP managers in routing instances other than the default routing instance to access SNMP information, include the **routing-instance-access** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
  routing-instance-access;
```

If this statement is not included in the SNMP configuration, SNMP managers from routing instances other than the default routing instance cannot access SNMP information.

Related Documentation

- [Understanding SNMP Support for Routing Instances on page 1979](#)
- [Identifying a Routing Instance on page 1981](#)
- [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1982](#)
- [Configuring Access Lists for SNMP Access over Routing Instances on page 1985](#)

Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community

You can specify the routing instance along with the client information when you add a client to an SNMP community. To specify the routing instance to which a client belongs, include the **routing-instance** statement followed by the routing instance name and client information in the SNMP configuration.

The following example shows the configuration statement to add routing instance **test-ri** to SNMP community **community1**.

NOTE: Routing instances specified at the `[edit snmp community community-name]` hierarchy level are added to the default logical system in the community.

```
[edit snmp]
community community1 {
  clients {
    10.209.152.33/32;
  }
  routing-instance test-ri {
    clients {
      10.19.19.1/32;
    }
  }
}
```

If the routing instance is defined within a logical system, include the **routing-instance** statement at the `[edit snmp community community-name logical-system logical-system-name]` hierarchy level, as in the following example:

```
[edit snmp]
community community1 {
  clients {
    10.209.152.33/32;
  }
  logical-system test-LS {
    routing-instance test-ri {
      clients {
        10.19.19.1/32;
      }
    }
  }
}
```

- [Configuring Access Lists for SNMP Access over Routing Instances on page 1985](#)
- [Example: Configuring Interface Settings for a Routing Instance on page 1983](#)

Example: Configuring Interface Settings for a Routing Instance

This example shows an `802.3ad ae0` interface configuration allocated to a routing instance named `INFrtd`:

```
[edit chassis]
aggregated-devices {
  ethernet {
    device-count 5;
  }
}
```

```

[edit interfaces ae0]
vlan-tagging;
aggregated-ether-options {
  minimum-links 2;
  link-speed 100m;
}
unit 0 {
  vlan-id 100;
  family inet {
    address 10.1.0.1/24;
  }
}
[edit interfaces fe-1/1/0]
fastether-options {
  802.3ad ae0;
}
[edit interfaces fe-1/1/1]
fastether-options {
  802.3ad ae0;
}
[edit routing-instances]
INFrtd {
  instance-type virtual-router;
  interface fe-1/1/0.0;
  interface fe-1/1/1.0;
  interface fe-1/1/5.0;
  interface ae0.0;
  protocols {
    ospf {
      area 0.0.0.0 {
        interface all;
      }
    }
  }
}

```

The following **snmpwalk** command shows how to retrieve SNMP-related information from **router1** and the 802.3ae bundle interface belonging to routing instance **INFrtd** with the SNMP community **public**:

```

router# snmpwalk -Os router1 INFrtd@public dot3adAggTable
dot3adAggMACAddress.59 = 0:90:69:92:93:f0
dot3adAggMACAddress.65 = 0:90:69:92:93:f0
dot3adAggActorSystemPriority.59 = 0
dot3adAggActorSystemPriority.65 = 0
dot3adAggActorSystemID.59 = 0:0:0:0:0:0
dot3adAggActorSystemID.65 = 0:0:0:0:0:0
dot3adAggAggregateOrIndividual.59 = true(1)
dot3adAggAggregateOrIndividual.65 = true(1)
dot3adAggActorAdminKey.59 = 0
dot3adAggActorAdminKey.65 = 0
dot3adAggActorOperKey.59 = 0
dot3adAggActorOperKey.65 = 0
dot3adAggPartnerSystemID.59 = 0:0:0:0:0:0
dot3adAggPartnerSystemID.65 = 0:0:0:0:0:0
dot3adAggPartnerSystemPriority.59 = 0

```

```
dot3adAggPartnerSystemPriority.65 = 0
dot3adAggPartnerOperKey.59 = 0
dot3adAggPartnerOperKey.65 = 0
dot3adAggCollectorMaxDelay.59 = 0
dot3adAggCollectorMaxDelay.65 = 0
```

- [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1982](#)

Configuring Access Lists for SNMP Access over Routing Instances

You can create and maintain access lists to manage access to SNMP information. Access list configuration enables you to allow or deny SNMP access to clients of a specific routing instance.

The following example shows how to create an access list:

```
[edit snmp]
routing-instance-access {
  access-list {
    ri1 restrict;
    ls1/default;
    ls1/ri2;
    ls1*;
  }
}
```

The configuration given in the example:

- Restricts clients in **ri1** from accessing SNMP information.
- Allows clients in **ls1/default**, **ls1/ri2**, and all other routing instances with names starting with **ls1** to access SNMP information.

You can use the wildcard character (*) to represent a string in the routing instance name.

NOTE: You cannot restrict the SNMP manager of the default routing instance from accessing SNMP information.

- [Using the Traceroute MIB for Remote Monitoring Devices Running Junos OS on page 1995](#)

SNMP Remote Operations Overview

A SNMP remote operation is any process on the router that can be controlled remotely using SNMP. Junos OS currently provides support for two SNMP remote operations: the Ping MIB and Traceroute MIB, defined in RFC 2925. Using these MIBs, an SNMP client in the network management system (NMS) can:

- Start a series of operations on a router
- Receive notification when the operations are complete
- Gather the results of each operation

Junos OS also provides extended functionality to these MIBs in the Juniper Networks enterprise-specific extensions **jnxPingMIB** and **jnxTraceRouteMIB**. For more information about **jnxPingMIB** and **jnxTraceRouteMIB**, see *PING MIB* and *Traceroute MIB*.

This topic covers the following sections:

- [SNMP Remote Operation Requirements on page 1986](#)
- [Setting SNMP Views on page 1986](#)
- [Setting Trap Notification for Remote Operations on page 1987](#)
- [Using Variable-Length String Indexes on page 1988](#)
- [Enabling Logging on page 1988](#)

SNMP Remote Operation Requirements

To use SNMP remote operations, you should be experienced with SNMP conventions. You must also configure Junos OS to allow the use of the remote operation MIBs.

Setting SNMP Views

All remote operation MIBs supported by Junos OS require that the SNMP clients have read-write privileges. The default SNMP configuration of Junos OS does not provide clients with a community string with such privileges.

To set read-write privileges for an SNMP community string, include the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
community community-name {
  authorization authorization;
  view view-name;
}
view view-name {
  oid object-identifier (include | exclude);
}
```

Example: Setting SNMP Views

To create a community named **remote-community** that grants SNMP clients read-write access to the Ping MIB, **jnxPing** MIB, Traceroute MIB, and **jnxTraceRoute** MIB, include the following statements at the **[edit snmp]** hierarchy level:

```
snmp {
  view remote-view {
    oid 1.3.6.1.2.1.80 include; # pingMIB
    oid 1.3.6.1.4.1.2636.3.7 include; # jnxPingMIB
    oid 1.3.6.1.2.1.81 include; # traceRouteMIB
    oid 1.3.6.1.4.1.2636.3.8 include; # jnxTraceRouteMIB
  }
  community remote-community {
    view remote-view;
    authorization read-write;
  }
}
```

For more information about the **community** statement, see [“Configuring the SNMP Community String” on page 1925](#) and [community](#).

For more information about the **view** statement, see [“Configuring MIB Views” on page 1930](#), [view \(Associating a MIB View with a Community\)](#), and [view \(Configuring a MIB View\)](#).

Setting Trap Notification for Remote Operations

In addition to configuring the remote operations MIB for trap notification, you must also configure Junos OS. You must specify a target host for remote operations traps.

To configure trap notification for SNMP remote operations, include the **categories** and **targets** statements at the **[edit snmp trap-group group-name]** hierarchy level:

```
[edit snmp trap-group group-name]
  categories {
    category;
  }
  targets {
    address;
  }
}
```

Example: Setting Trap Notification for Remote Operations

Specify **172.17.12.213** as a target host for all remote operation traps:

```
snmp {
  trap-group remote-traps {
    categories remote-operations;
    targets {
      172.17.12.213;
    }
  }
}
```

For more information about trap groups, see [“Configuring SNMP Trap Groups” on page 1936](#).

Using Variable-Length String Indexes

All tabular objects in the remote operations MIBs supported by Junos OS are indexed by two variables of type **SnmpAdminString**. For more information about **SnmpAdminString**, see RFC 2571.

Junos OS does not handle **SnmpAdminString** any differently from the octet string variable type. However, the indexes are defined as variable length. When a variable length string is used as an index, the length of the string must be included as part of the object identifier (OID).

Example: Set Variable-Length String Indexes

To reference the **pingCtlTargetAddress** variable of a row in **pingCtlTable** where **pingCtlOwnerIndex** is **bob** and **pingCtlTestName** is **test**, use the following object identifier (OID):

```
pingMIB.pingObjects.pingCtlTable.pingCtlEntry.pingCtlTargetAddress."bob"."test"
1.3.6.1.2.1.80.1.2.1.4.3.98.111.98.4.116.101.115.116
```

For more information about the definition of the Ping MIB, see RFC 2925.

Enabling Logging

The SNMP error code returned in response to SNMP requests can only provide a generic description of the problem. The error descriptions logged by the remote operations process can often provide more detailed information about the problem and help you to solve the problem faster. This logging is not enabled by default. To enable logging, include the **flag general** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit]
snmp {
  traceoptions {
    flag general;
  }
}
```

For more information about traceoptions, see [“Tracing SNMP Activity on a Device Running Junos OS” on page 1996](#).

If the remote operations process receives an SNMP request that it cannot accommodate, the error is logged in the **/var/log/rmopd** file. To monitor this log file, issue the **monitor start rmopd** command in operational mode of the command-line interface (CLI).

Using the Ping MIB for Remote Monitoring Devices Running Junos OS

A ping test is used to determine whether packets sent from the local host reach the designated host and are returned. If the designated host can be reached, the ping test provides the approximate round-trip time for the packets. Ping test results are stored in **pingResultsTable** and **pingProbeHistoryTable**.

RFC 2925 is the authoritative description of the Ping MIB in detail and provides the ASN.1 MIB definition of the Ping MIB.

**Related
Documentation**

- [SNMP Remote Operations Overview on page 1986](#)
- [Starting a Ping Test on page 1989](#)
- [Monitoring a Running Ping Test on page 1990](#)
- [Gathering Ping Test Results on page 1993](#)
- [Stopping a Ping Test on page 1994](#)
- [Interpreting Ping Variables on page 1994](#)

Starting a Ping Test

Before you start a ping test, configure a Ping MIB view. This allows SNMP **Set** requests on **pingMIB**. To start a ping test, create a row in **pingCtlTable** and set **pingCtlAdminStatus** to **enabled**. The minimum information that must be specified before setting **pingCtlAdminStatus** to **enabled** is:

- **pingCtlOwnerIndexSnmpAdminString**
- **pingCtlTestNameSnmpAdminString**
- **pingCtlTargetAddressInetAddress**
- **pingCtlTargetAddressTypeInetAddressType**
- **pingCtlRowStatusRowStatus**

For all other values, defaults are chosen unless otherwise specified. **pingCtlOwnerIndex** and **pingCtlTestName** are used as the index, so their values are specified as part of the object identifier (OID). To create a row, set **pingCtlRowStatus** to **createAndWait** or **createAndGo** on a row that does not already exist. A value of **active** for **pingCtlRowStatus** indicates that all necessary information has been supplied and the test can begin; **pingCtlAdminStatus** can be set to **enabled**. An SNMP **Set** request that sets **pingCtlRowStatus** to **active** will fail if the necessary information in the row is not specified or is inconsistent. For information about how to configure a view, see [“Setting SNMP Views” on page 1986](#).

There are two ways to start a ping test:

- [Using Multiple Set Protocol Data Units \(PDUs\) on page 1989](#)
- [Using a Single Set PDU on page 1990](#)

Using Multiple Set Protocol Data Units (PDUs)

You can use multiple **Set** request PDUs (multiple PDUs, with one or more varbinds each) and set the following variables in this order to start the test:

- **pingCtlRowStatus** to **createAndWait**
- All appropriate test variables
- **pingCtlRowStatus** to **active**

Junos OS now verifies that all necessary information to run a test has been specified.

- **pingCtlAdminStatus** to **enabled**

Using a Single Set PDU

You can use a single **Set** request PDU (one PDU, with multiple varbinds) to set the following variables to start the test:

- **pingCtlRowStatus** to **createAndGo**
- All appropriate test variables
- **pingCtlAdminStatus** to **enabled**

Monitoring a Running Ping Test

When **pingCtlAdminStatus** is successfully set to **enabled**, the following is done before the acknowledgment of the SNMP **Set** request is sent back to the client:

- **pingResultsEntry** is created if it does not already exist.
- **pingResultsOperStatus** transitions to **enabled**.

For more information, see the following sections:

- [pingResultsTable](#) on page 1990
- [pingProbeHistoryTable](#) on page 1992
- [Generating Traps](#) on page 1992

pingResultsTable

While the test is running, **pingResultsEntry** keeps track of the status of the test. The value of **pingResultsOperStatus** is **enabled** while the test is running and **disabled** when it has stopped.

The value of **pingCtlAdminStatus** remains **enabled** until you set it to **disabled**. Thus, to get the status of the test, you must examine **pingResultsOperStatus**.

The **pingCtlFrequency** variable can be used to schedule many tests for one **pingCtlEntry**. After a test ends normally (you did not stop the test) and the **pingCtlFrequency** number of seconds has elapsed, the test is started again just as if you had set **pingCtlAdminStatus** to **enabled**. If you intervene at any time between repeated tests (you set **pingCtlAdminStatus** to **disabled** or **pingCtlRowStatus** to **notInService**), the repeat feature is disabled until another test is started and ends normally. A value of 0 for **pingCtlFrequency** indicates this repeat feature is not active.

pingResultsIpTgtAddr and **pingResultsIpTgtAddrType** are set to the value of the resolved destination address when the value of **pingCtlTargetAddressType** is **dns**. When a test starts successfully and **pingResultsOperStatus** transitions to **enabled**:

- **pingResultsIpTgtAddr** is set to **null-string**.
- **pingResultsIpTgtAddrType** is set to **unknown**.

pingResultsIpTgtAddr and **pingResultsIpTgtAddrType** are not set until **pingCtlTargetAddress** can be resolved to a numeric address. To retrieve these values, poll **pingResultsIpTgtAddrType** for any value other than **unknown** after successfully setting **pingCtlAdminStatus** to **enabled**.

At the start of a test, **pingResultsSentProbes** is initialized to 1 and the first probe is sent. **pingResultsSentProbes** increases by 1 each time a probe is sent.

As the test runs, every **pingCtlTimeOut** seconds, the following occur:

- **pingProbeHistoryStatus** for the corresponding **pingProbeHistoryEntry** in **pingProbeHistoryTable** is set to **requestTimedOut**.
- A **pingProbeFailed** trap is generated, if necessary.
- An attempt is made to send the next probe.

NOTE: No more than one outstanding probe exists for each test.

For every probe, you can receive one of the following results:

- The target host acknowledges the probe with a response.
- The probe times out; there is no response from the target host acknowledging the probe.
- The probe could not be sent.

Each probe result is recorded in **pingProbeHistoryTable**. For more information about **pingProbeHistoryTable**, see “[pingProbeHistoryTable](#)” on page 1992.

When a response is received from the target host acknowledging the current probe:

- **pingResultsProbeResponses** increases by 1.
- The following variables are updated:
 - **pingResultsMinRtt**—Minimum round-trip time
 - **pingResultsMaxRtt**—Maximum round-trip time
 - **pingResultsAverageRtt**—Average round-trip time
 - **pingResultsRttSumOfSquares**—Sum of squares of round-trip times
 - **pingResultsLastGoodProbe**—Timestamp of the last response

NOTE: Only probes that result in a response from the target host contribute to the calculation of the round-trip time (RTT) variables.

When a response to the last probe is received or the last probe has timed out, the test is complete.

pingProbeHistoryTable

An entry in **pingProbeHistoryTable** (**pingProbeHistoryEntry**) represents a probe result and is indexed by three variables:

- The first two variables, **pingCtlOwnerIndex** and **pingCtlTestName**, are the same ones used for **pingCtlTable**, which identifies the test.
- The third variable, **pingProbeHistoryIndex**, is a counter to uniquely identify each probe result.

The maximum number of **pingProbeHistoryTable** entries created for a given test is limited by **pingCtlMaxRows**. If **pingCtlMaxRows** is set to 0, no **pingProbeHistoryTable** entries are created for that test.

Each time a probe result is determined, a **pingProbeHistoryEntry** is created and added to **pingProbeHistoryTable**. **pingProbeHistoryIndex** of the new **pingProbeHistoryEntry** is 1 greater than the last **pingProbeHistoryEntry** added to **pingProbeHistoryTable** for that test. **pingProbeHistoryIndex** is set to 1 if this is the first entry in the table. The same test can be run multiple times, so this index keeps growing.

If **pingProbeHistoryIndex** of the last **pingProbeHistoryEntry** added is 0xFFFFFFFF, the next **pingProbeHistoryEntry** added has **pingProbeHistoryIndex** set to 1.

The following are recorded for each probe result:

- **pingProbeHistoryResponse**—Time to live (TTL)
- **pingProbeHistoryStatus**—What happened and why
- **pingProbeHistoryLastRC**—Return code (RC) value of ICMP packet
- **pingProbeHistoryTime**—Timestamp when probe result was determined

When a probe cannot be sent, **pingProbeHistoryResponse** is set to 0. When a probe times out, **pingProbeHistoryResponse** is set to the difference between the time when the probe was discovered to be timed out and the time when the probe was sent.

Generating Traps

For any trap to be generated, the appropriate bit of **pingCtlTrapGeneration** must be set. You must also configure a trap group to receive remote operations. A trap is generated under the following conditions:

- A **pingProbeFailed** trap is generated every time **pingCtlTrapProbeFailureFilter** number of consecutive probes fail during the test.
- A **pingTestFailed** trap is generated when the test completes and at least **pingCtlTrapTestFailureFilter** number of probes fail.
- A **pingTestCompleted** trap is generated when the test completes and fewer than **pingCtlTrapTestFailureFilter** probes fail.

NOTE: A probe is considered a failure when `pingProbeHistoryStatus` of the probe result is anything besides `responseReceived`.

For information about how to configure a trap group to receive remote operations, see “Configuring SNMP Trap Groups” on page 1936 and “Example: Setting Trap Notification for Remote Operations” on page 1987.

Gathering Ping Test Results

You can either poll `pingResultsOperStatus` to find out when the test is complete or request that a trap be sent when the test is complete. For more information about `pingResultsOperStatus`, see “`pingResultsTable`” on page 1990. For more information about Ping MIB traps, see “Generating Traps” on page 1992.

The statistics calculated and then stored in `pingResultsTable` include:

- `pingResultsMinRtt`—Minimum round-trip time
- `pingResultsMaxRtt`—Maximum round-trip time
- `pingResultsAverageRtt`—Average round-trip time
- `pingResultsProbeResponses`—Number of responses received
- `pingResultsSentProbes`—Number of attempts to send probes
- `pingResultsRttSumOfSquares`—Sum of squares of round-trip times
- `pingResultsLastGoodProbe`—Timestamp of the last response

You can also consult `pingProbeHistoryTable` for more detailed information about each probe. The index used for `pingProbeHistoryTable` starts at 1, goes to 0xFFFFFFFF, and wraps to 1 again.

For example, if `pingCtlProbeCount` is 15 and `pingCtlMaxRows` is 5, then upon completion of the first run of this test, `pingProbeHistoryTable` contains probes like those in Table 268 on page 1993.

Table 268: Results in `pingProbeHistoryTable`: After the First Ping Test

<code>pingProbeHistoryIndex</code>	Probe Result
11	Result of 11th probe from run 1
12	Result of 12th probe from run 1
13	Result of 13th probe from run 1
14	Result of 14th probe from run 1
15	Result of 15th probe from run 1

Upon completion of the first probe of the second run of this test, **pingProbeHistoryTable** will contain probes like those in [Table 269 on page 1994](#).

Table 269: Results in pingProbeHistoryTable: After the First Probe of the Second Test

pingProbeHistoryIndex	Probe Result
12	Result of 12th probe from run 1
13	Result of 13th probe from run 1
14	Result of 14th probe from run 1
15	Result of 15th probe from run 1
16	Result of 1st probe from run 2

Upon completion of the second run of this test, **pingProbeHistoryTable** will contain probes like those in [Table 270 on page 1994](#).

Table 270: Results in pingProbeHistoryTable: After the Second Ping Test

pingProbeHistoryIndex	Probe Result
26	Result of 11th probe from run 2
27	Result of 12th probe from run 2
28	Result of 13th probe from run 2
29	Result of 14th probe from run 2
30	Result of 15th probe from run 2

History entries can be deleted from the MIB in two ways:

- More history entries for a given test are added and the number of history entries exceeds **pingCtlMaxRows**. The oldest history entries are deleted to make room for the new ones.
- You delete the entire test by setting **pingCtlRowStatus** to **destroy**.

Stopping a Ping Test

To stop an active test, set **pingCtlAdminStatus** to **disabled**. To stop the test and remove its **pingCtlEntry**, **pingResultsEntry**, and any **pingHistoryEntry** objects from the MIB, set **pingCtlRowStatus** to **destroy**.

Interpreting Ping Variables

This section clarifies the ranges for the following variables that are not explicitly specified in the Ping MIB:

- **pingCtlDataSize**—The value of this variable represents the total size of the payload (in bytes) of an outgoing probe packet. This payload includes the timestamp (8 bytes) that is used to time the probe. This is consistent with the definition of **pingCtlDataSize** (maximum value of 65,507) and the standard ping application.

If the value of **pingCtlDataSize** is between 0 and 8 inclusive, it is ignored and the payload is 8 bytes (the timestamp). The Ping MIB assumes all probes are timed, so the payload must always include the timestamp.

For example, if you wish to add an additional 4 bytes of payload to the packet, you must set **pingCtlDataSize** to 12.

- **pingCtlDataFill**—The first 8 bytes of the data segment of the packet is for the timestamp. After that, the **pingCtlDataFill** pattern is used in repetition. The default pattern (when **pingCtlDataFill** is not specified) is (00, 01, 02, 03 ... FF, 00, 01, 02, 03 ... FF, ...).
- **pingCtlMaxRows**—The maximum value is 255.
- **pingMaxConcurrentRequests**—The maximum value is 500.
- **pingCtlTrapProbeFailureFilter** and **pingCtlTrapTestFailureFilter**—A value of 0 for **pingCtlTrapProbeFailureFilter** or **pingCtlTrapTestFailureFilter** is not well defined by the Ping MIB. If **pingCtlTrapProbeFailureFilter** is 0, **pingProbeFailed** traps will not be generated for the test under any circumstances. If **pingCtlTrapTestFailureFilter** is 0, **pingTestFailed** traps will not be generated for the test under any circumstances.

Using the Traceroute MIB for Remote Monitoring Devices Running Junos OS

A traceroute test approximates the path packets take from the local host to the remote host.

RFC 2925 is the authoritative description of the Traceroute MIB in detail and provides the ASN.1 MIB definition of the Traceroute MIB.

Tracing SNMP Activity

- [Tracing SNMP Activity on a Device Running Junos OS on page 1996](#)
- [Example: Tracing SNMP Activity on page 1999](#)

Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
 - chassisd
 - craftd
 - ilmid
 - mib2d
 - rmopd
 - serviced
 - snmpd
- When a trace file named **filename** reaches its maximum size, it is renamed **filename.0**, then **filename.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *System Log Monitoring and Troubleshooting Guide for Security Devices*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
traceoptions {
  file <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  memory-trace;
  no-remote-trace;
  no-default-memory-trace;
}
```

These statements are described in the following sections:

- [Configuring the Number and Size of SNMP Log Files on page 1997](#)
- [Configuring Access to the Log File on page 1997](#)
- [Configuring a Regular Expression for Lines to Be Logged on page 1997](#)
- [Configuring the Trace Operations on page 1997](#)

Configuring the Number and Size of SNMP Log Files

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed *filename.0*, then *filename.1*, and so on, until there are three trace files. Then the oldest trace file (*filename.2*) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (*filename*) reaches 2 MB, *filename* is renamed *filename.0*, and a new file called *filename* is created. When the new *filename* reaches 2 MB, *filename.0* is renamed *filename.1* and *filename* is renamed *filename.0*. This process repeats until there are 20 trace files. Then the oldest file (*filename.19*) is overwritten by the newest file (*filename.0*).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

Configuring Access to the Log File

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file filename]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
  configuration;
```

```

database;
events;
general;
interface-stats;
nonvolatile-sets;
pdu;
policy;
protocol-timeouts;
routing-socket;
server;
subagent;
timer;
varbind-error;
}

```

Table 271 on page 1998 describes the meaning of the SNMP tracing flags.

Table 271: SNMP Tracing Flags

Flag	Description	Default Setting
all	Log all operations.	Off
configuration	Log reading of the configuration at the [edit snmp] hierarchy level.	Off
database	Log events involving storage and retrieval in the events database.	Off
events	Log important events.	Off
general	Log general events.	Off
interface-stats	Log physical and logical interface statistics.	Off
nonvolatile-set	Log nonvolatile SNMP set request handling.	Off
pdu	Log SNMP request and response packets.	Off
policy	Log policy processing.	Off
protocol-timeouts	Log SNMP response timeouts.	Off
routing-socket	Log routing socket calls.	Off
server	Log communication with processes that are generating events.	Off
subagent	Log subagent restarts.	Off
timer	Log internal timer events.	Off
varbind-error	Log variable binding errors.	Off

To display the end of the log for an agent, issue the **show log *agentd* | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where ***agent*** is the name of an SNMP agent.

Configuring Vital MIB Data

- [Understanding Vital MIB OID Data Collection on page 1999](#)
- [Generating Readable Raw OID Data Collections on page 2000](#)
- [Generating Raw MIB OID from a Policy on page 2001](#)
- [Generating Vital Data from a Predefined Group on page 2003](#)
- [Generating Vital Data from an Interface on page 2003](#)
- [Generating Vital Data from an IPsec VPN on page 2004](#)
- [Generating Vital Data from a NAT Rule on page 2005](#)
- [Generating Vital Data from an Operating Component on page 2006](#)
- [Generating Vital Data from a Screen on page 2006](#)

Understanding Vital MIB OID Data Collection

MIB object identifier (OID) data is collected and configured for later use in reports. You can configure data collection duration (default is 3 days), dump file size limitation (default

is 5 megabytes for branch SRX Series and 10 megabytes for high-end SRX Series), and disk storage limitation (default is 80 percent). The expired dump file is removed automatically. When the dump file exceeds the limited size, a new dump file is created and the old dump file is compressed. When disk utilization exceeds the storage limitation, data collection is skipped but is attempted the next time. If an issue should arise, then the collected data is examined to help identify its cause.

Once you enable a predefined group, the vital data of all OIDs in the group are periodically collected and analyzed. Only critical data is collected when CPU utilization exceeds 60 percent but is within 80 percent.

A maximum of 64 groups per OIDs are supported for branch SRX Series devices and a maximum of 128 groups per OIDs are supported for high-end SRX Series devices.

You can also collect raw MIB OID data. For the format of raw OID output, the first volume is 40 characters and the second volume is 30 characters in length. Any extra characters are stripped.

TIP: To make the dump file easily understood, we recommend that you configure short comments for each raw OID.

Use the **set system processes system-log-vital disable** command to manually disable the syslvd process (daemon). Disabling syslvd will not impact the existing data in the dump file. Once all configuration commands are removed, syslvd is disabled automatically. If syslvd is disabled in the middle of a collection, data from the current collection will be lost but data available in the current dump file is retained.

Related Documentation

- [Generating Raw MIB OID from a Policy on page 2001](#)
- [Generating Readable Raw OID Data Collections on page 2000](#)

Generating Readable Raw OID Data Collections

You can use the **set system log-vital add oid comment “comment”** command to make raw object identifiers (OIDs) that are lengthy and unreadable easily understood.

```
[edit system]
log-vital {
  add oid {
    comment comment;
  }
}
```

The **OID** parameter can be formatted as `mib-table.index`. For example, `jnxOperating1MinLoadAvg.9.1.0.0` is an OID.

The “*comment*” parameter describes the OID. If “*comment*” is present, the comment instead of the OID is generated as the subject of the vital data.

For example, without the “comment” parameter, the output of the **set system log-vital add jnxJsPolicyNumber.0** command in the dump file is:

```
=====
jnxJsPolicyNumber.0          1
=====
```

With the “comment” parameter, the output of the **set system log-vital add jnxJsPolicyNumber.0 comment “Total Policy Number”** command in the dump file is:

```
=====
Total Policy Number          1
=====
```

NOTE: For OIDs that are temporarily unavailable, the string NA is generated for them and the system continues to get their values for every collection. In this case, the output displayed in the dump file is:

```
=====
Total Policy Number          NA
=====
```

Related Documentation

- [Generating Raw MIB OID from a Policy on page 2001](#)

Generating Raw MIB OID from a Policy

You can generate a raw MIB OID from a policy. You can also monitor the session number associated with the policy and other policy MIB tables.

For example, consider a policy called **test**. Monitor the session number associated with the policy.

```
[edit]
from-zone untrust to-zone trust {
  policy test {
    match {
      source-address any;
      destination-address any;
      application any;
    }
    then {
      permit;
      count;
    }
  }
}
```

To monitor a session number associated with a policy:

1. Identify the OID of the policy's session number.

```
user@host> show snmp mib walk jnxJsPolicyName | match test
```

```
jnxJsPolicyName.7.117.110.116.114.117.115.116.5.116.114.117.115.116.4.116.101.115.116
= test
```

In the above output, the index of the policy is 7.117.110.116.114.117.115.116.5.116.114.117.115.116.4.116.101.115.116; the policy name is test; and the MIB table name is jnxJsPolicyName.

2. With the index, verify that both the from-zone and the to-zone match the configuration. Enter the **show snmp mib get** command.

```
user@host> show snmp mib get
jnxJsPolicyFromZone.7.117.110.116.114.117.115.116.5.116.114.117.115.116.4.116.101.115.116
jnxJsPolicyFromZone.7.117.110.116.114.117.115.116.5.116.114.117.115.116.4.116.101.115.116
= untrust

user@host> show snmp mib get
jnxJsPolicyToZone.7.117.110.116.114.117.115.116.5.116.114.117.115.116.4.116.101.115.116
jnxJsPolicyToZone.7.117.110.116.114.117.115.116.5.116.114.117.115.116.4.116.101.115.116
= trust
```

3. Perform a mandatory from-zone and to-zone match check to avoid a scenario where there is a policy with the same name but the from-zone or the to-zone is different.
4. After performing both the from-zone and the to-zone match checks, ensure that 7.117.110.116.114.117.115.116.5.116.114.117.115.116.4.116.101.115.116 is the index of the policy called test in various policy MIB tables.
5. Monitor the session number using the following command:

```
[edit]
user@host# set system log-vital add
jnxJsPolicyStatsNumSessions.7.117.110.116.114.117.115.116.5.116.114.117.115.116.4.116.101.115.116
comment "sess num of policy test"
```

The output of the configuration is:

```
=====
sess num of policy test    100
=====
```

To monitor other policy MIB tables:

1. Combine a MIB table's name with the index.
2. Monitor the session setup rate for the test policy using the command:

```
[edit]
set system log-vital add
jnxJsPolicyStatsSessionRate.7.117.110.116.114.117.115.116.5.116.114.117.115.116.4.116.101.115.116
comment "sess setup rate of policy test"
```

The output of the configuration is:

```
=====
sess setup rate of policy test    233
=====
```

 - [Generating Readable Raw OID Data Collections on page 2000](#)

Generating Vital Data from a Predefined Group

You can use the `set system log-vital group [cluster-counter | idp | operating | storage | spu <spu-name> | screen <zone-name>` command to enable a predefined group.

```
[edit system]
group {
  operating;
  idp;
  storage;
  cluster-counter;
  screen;
  spu;
}
```

NOTE: The parameter for `spu-name` must be *fwdd*, *all*, *fpcy.picz* or *nodex.fpcy.picz*.

The predefined groups are operating, SPU, storage, IDP, screen, and cluster-counter. Once a group is enabled, all OIDs in the group are periodically collected and dumped.

The operating group includes state, temperature, current CPU utilization percentage, buffer utilization percentage, heap-utilization percentage, up time, average-load in the last 1 minute, 5 minutes, or 15 minutes, and buffer-pool utilization percentage in the control plane of each operating component in the system.

The IDP group includes IDP data plane memory usage, IDP session usage and policies loaded number.

The storage group includes storage utilization of directory `/var/log`.

The cluster-counter group includes current total session number, total CPS, IPv4 CPS, IPv6 CPS, current total IPv4 session number, and current total IPv6 session number of both node 0 and node 1.

The screen group includes screen statistics of a specified zone.

The SPU group includes CPU usage, memory usage, current flow session number, current CP session number, IPv4 session number, IPv6 session number, CP IPv4 session number, and CP IPv6 session number of the SPU.

Related Documentation

- [Generating Raw MIB OID from a Policy on page 2001](#)

Generating Vital Data from an Interface

You can monitor the statistics of interface `ge-0/0/0` by first obtaining the SNMP ifIndex from the interface.

```
user@host> show interfaces ge-0/0/0
```

```
Physical interface: ge-0/0/0, Enabled, Physical link is Up
  Interface index: 134, SNMP ifIndex: 509
```

In this output, the 509 value is the index of ge-0/0/0 in the interface MIB table. By combining this index value with the interface MIB tables, the vital data of the interface can be periodically collected.

For example, combine the 509 index with the ifInErrors interface MIB table to collect the In-Error data of interface ge-0/0/0 by using the following command:

```
[edit]
user@host# set system log-vital add ifInErrors.509 comment "In-Err of ge-0/0/0"
The output for the command is:
```

```
=====
In-Err of ge-0/0/0    100
=====
```

The following interface MIB tables can be used to collect vital data:

- ifInOctets
- ifInUcastPkts
- ifInNUcastPkts
- ifInDiscards
- ifInErrors
- ifInUnknownProtos
- ifOutOctets
- ifOutUcastPkts
- ifOutNUcastPkts
- ifOutDiscards
- ifOutErrors

- [Generating Readable Raw OID Data Collections on page 2000](#)

Generating Vital Data from an IPsec VPN

You can monitor the vital data of an IPsec VPN by first obtaining the index of the VPN in the IPsec VPN MIB table.

For example, consider the following below policy-based VPN configuration, where the name of the policy is test.

```
user@host> show configuration security policies
from-zone untrust to-zone trust {
  policy test {
    match {
      source-address any;
```

```

        destination-address any;
        application any;
    }
    then {
        permit {
            tunnel {
                ipsec-vpn ike-vpn;
            }
        }
    }
}

```

To monitor the error statistics for the VPN, you must first obtain the index of the VPN in the IPsec VPN MIB table. You can obtain this value by using the command:

```

user@host> show snmp mib walk jnxIpSecTunPolicyName | match test
jnxJsIpSecTunPolicyName.1.4.2.2.1.2 = test

```

In the output, 1.4.2.2.1.2 is the index of the IPsec SA associated with the policy called test. By combining the index with various IPsec VPN MIB tables, you can monitor the statistics by using the following commands:

```

[edit]
user@host# set system log-vital add jnxIpSecTunMonReplayDropPkts.1.4.2.2.1.2 comment
"Anti-Replay drop number of VPN policy test"
user@host# set system log-vital add jnxIpSecTunMonBadHeaders.1.4.2.2.1.2 comment "Bad
Header number of VPN policy test"

```

Related Documentation

- [Generating Vital Data from a Screen on page 2006](#)

Generating Vital Data from a NAT Rule

You can monitor the vital data from a NAT rule (in this example, r1) by first obtaining the MIB index of r1.

Consider the following source NAT configuration.

```

user@host> show configuration security nat

source {
    rule-set rs1 {
        from zone trust;
        to zone untrust;
        rule r1 {
            match {
                source-address 17.0.0.0/8;
                destination-address 0.0.0.0/0;
            }
            then {
                source-nat {
                    interface;
                }
            }
        }
    }
}

```

```
}
```

To find the MIB index of r1, enter the following command:

```
[edit]
user@host# show snmp mib walk jnxJsNatRuleName | grep r1
jnxJsNatRuleName.2.114.49.1 = r1
```

The output shows that 2.114.49.1 is the MIB index of r1.

Therefore, by combining the index with NAT MIB table jnxJsNatRuleHits, the session number associated with NAT rule r1 can be monitored by using the command:

```
[edit]
user@host# set system log-vital add jnxJsNatRuleHits.2.114.49.1 comment "Number of sessions on NAT rule r1"
```

Related Documentation

- [Generating Readable Raw OID Data Collections on page 2000](#)

Generating Vital Data from an Operating Component

You can monitor the vital data of an operating component. For example, to monitor the temperature of the SPC component located at slot 3 of node 0, enter the following command:

```
user@host> show snmp mib walk jnxOperatingDescr | match "SPC @ 3"
```

```
jnxOperatingDescr.7.4.0.0 = node0 FPC: SRX5k SPC @ 3/*/*
jnxOperatingDescr.7.10.0.0 = node1 FPC: SRX5k SPC @ 3/*/*
```

In the output, the SPC index at slot 3 of node 0 in the operating MIB table is 7.4.0.0. By combining the 7.4.0.0 index with operating MIB table jnxOperatingTemp, the temperature of SPC at slot 3 of node 0 can be monitored by using the following command:

```
[edit]
user@host# set system log-vital add jnxOperatingTemp.7.4.0.0 comment "Temperature of node0 SPC-3"
```

Related Documentation

- [Generating Vital Data from a Screen on page 2006](#)

Generating Vital Data from a Screen

The screen group collects all screen statistics of a specified zone. However, it can only collect some of the statistics rather than all statistics.

For example, consider the following screen configuration, where the number of UDP flood attacks in the untrust zone is to be monitored.

```
user@host> show configuration security screen
```

```
ids-option zone-syn-flood {
  tcp {
    syn-flood {
      timeout 20;
    }
  }
}
```

```
security-zone untrust {
    screen zone-syn-flood;
    ...
    ...
}
```

```
user@host> show snmp mib walk jnxJsScreenZoneName | match untrust  
jnxJsScreenZoneName.117.110.116.114.117.115.116.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.  
= untrust
```

By combining the index with screen MIB table `jnxJsScreenMonUdpFlood`, the number can be monitored using the following command:

Related Documentation

- [Generating Vital Data from a NAT Rule on page 2005](#)

- Managing Traps and Informs on page 2007

The following sections contain a few tips on managing SNMP notifications:

- [Generating Traps Based on SysLog Events on page 2007](#)
- [Filtering Traps Based on the Trap Category on page 2008](#)
- [Filtering Traps Based on the Object Identifier on page 2008](#)

Event policies can include an action that raises traps for events based on system log messages. This feature enables notification of an SNMP trap-based application when an important system log message occurs. You can convert any system log message, for which there is no corresponding trap, into a trap. If you are using network management system traps rather than system log messages to monitor your network, you can use this feature to ensure that you are notified of all the major events.

```
[edit event-options policy policy-name]  
events [ events ];
```

```
then {  
  raise-trap;  
}
```

The following example shows the sample configuration for raising a trap for the event `ui_mgd_terminate`:

**Generating Traps
Based on SysLog
Events**

```
[edit event-options policy p1]  
events ui_mgd_terminate;  
then {  
  raise-trap;  
}
```

Filtering Traps Based on the Trap Category

SNMP traps are categorized into many categories. The Junos OS provides a configuration option, **categories** at the `[edit snmp trap-group trap-group]` hierarchy level, that enables you to specify categories of traps that you want to receive on a particular host. You can use this option when you want to monitor only specific modules of the Junos OS.

The following example shows a sample configuration for receiving only **link**, **vrrp-events**, **services**, and **otn-alarms** traps:

```
[edit snmp]  
trap-group jnpr {  
  categories {  
    link;  
    vrrp-events;  
    services;  
    otn-alarms;  
  }  
  targets {  
    192.168.69.179;  
  }  
}
```

Filtering Traps Based on the Object Identifier

The Junos OS also provides a more advanced filter option that enables you to filter out specific traps based on their object identifiers. You can use the **notify-filter** option to filter out a specific trap or a group of traps.

The following example shows the sample configuration for excluding Juniper Networks enterprise-specific configuration management traps (note that the SNMPv3 configuration also supports filtering of SNMPv1 and SNMPv2 traps as is shown in the following example):

```
[edit snmp]  
v3 {  
  vacm {  
    security-to-group {  
      security-model v2c {  
        security-name sn_v2c_trap {  
          group gr_v2c_trap;  
        }  
      }  
    }  
  }  
}
```

```

access {
  group gr_v2c_trap {
    default-context-prefix {
      security-model v2c {
        security-level none {
          read-view all;
          notify-view all;
        }
      }
    }
  }
}
target-address TA_v2c_trap {
  address 10.209.196.166;
  port 9001;
  tag-list tg1;
  target-parameters TP_v2c_trap;
}
target-parameters TP_v2c_trap {
  parameters {
    message-processing-model v2c;
    security-model v2c;
    security-level none;
    security-name sn_v2c_trap;
  }
  notify-filter nfl;
}
notify v2c_notify {
  type trap;
  tag tg1;
}
notify-filter nfl {
  oid .1.3.6.1.4.1.2636.4.5 exclude;
  oid .1 include;
}
snmp-community index1 {
  community-name "$ABC123"; ## SECRET-DATA
  security-name sn_v2c_trap;
  tag tg1;
}
view all {
  oid .1 include;
}
}

```

Remote Monitoring (RMON) with SNMP

- [RMON Overview on page 2010](#)
- [Configuring RMON Alarms and Events on page 2012](#)
- [Monitoring RMON Alarms and Events on page 2019](#)

RMON Overview

- [Understanding RMON Alarms on page 2010](#)
- [Understanding RMON Events on page 2011](#)

Understanding RMON Alarms

An RMON alarm identifies:

- A specific MIB object that is monitored.
- The frequency of sampling.
- The method of sampling.
- The thresholds against which the monitored values are compared.

An RMON alarm can also identify a specific **eventTable** entry to be triggered when a threshold is crossed.

Configuration and operational values are defined in **alarmTable** in RFC 2819. Additional operational values are defined in Juniper Networks enterprise-specific extensions to **alarmTable** (**jnxRmonAlarmTable**).

This topic covers the following sections:

- [alarmTable on page 2010](#)
- [jnxRmonAlarmTable on page 2011](#)

alarmTable

alarmTable in the RMON MIB allows you to monitor and poll the following:

- **alarmIndex**—The index value for **alarmTable** that identifies a specific entry.
- **alarmInterval**—The interval, in seconds, over which data is sampled and compared with the rising and falling thresholds.
- **alarmVariable**—The MIB variable that is monitored by the alarm entry.
- **alarmSampleType**—The method of sampling the selected variable and calculating the value to be compared against the thresholds.
- **alarmValue**—The value of the variable during the last sampling period. This value is compared with the rising and falling thresholds.
- **alarmStartupAlarm**—The alarm sent when the entry is first activated.

- **alarmRisingThreshold**—The upper threshold for the sampled variable.
- **alarmFallingThreshold**—The lower threshold for the sampled variable.
- **alarmRisingEventIndex**—The **eventTable** entry used when a rising threshold is crossed.
- **alarmFallingEventIndex**—The **eventTable** entry used when a falling threshold is crossed.
- **alarmStatus**—Method for adding and removing entries from the table. It can also be used to change the state of an entry to allow modifications.

NOTE: If this object is not set to valid, the associated event alarm does not take any action.

jnxRmonAlarmTable

The **jnxRmonAlarmTable** is a Juniper Networks enterprise-specific extension to **alarmTable**. It provides additional operational information and includes the following objects:

- **jnxRmonAlarmGetFailCnt**—The number of times the internal **Get** request for the variable monitored by this entry has failed.
- **jnxRmonAlarmGetFailTime**—The value of **sysUpTime** when an internal **Get** request for the variable monitored by this entry last failed.
- **jnxRmonAlarmGetFailReason**—The reason an internal **Get** request for the variable monitored by this entry last failed.
- **jnxRmonAlarmGetOkTime**—The value of **sysUpTime** when an internal **Get** request for the variable monitored by this entry succeeded and the entry left the **getFailure** state.
- **jnxRmonAlarmState**—The current state of this RMON alarm entry.

To view the Juniper Networks enterprise-specific extensions to the RMON Events and Alarms and Event MIB, see http://www.juniper.net/techpubs/en_US/junos15.1/topics/reference/mibs/mib-jnx-vpls-generic.txt.

For more information about the Juniper Networks enterprise-specific extensions to the RMON Events and Alarms MIB, see “*RMON Events and Alarms MIB*” in the [SNMP MIB Explorer](#).

Related Documentation

- [Understanding RMON Events on page 2011](#)
- [Configuring an Alarm Entry and Its Attributes on page 2013](#)
- [Using alarmTable to Monitor MIB Objects](#)

Understanding RMON Events

An RMON event allows you to log the crossing of thresholds of other MIB objects. It is defined in **eventTable** for the RMON MIB.

This section covers the following topics:

- [eventTable on page 2012](#)

eventTable

eventTable contains the following objects:

- **eventIndex**—An index that uniquely identifies an entry in **eventTable**. Each entry defines one event that is generated when the appropriate conditions occur.
- **eventDescription**—A comment describing the event entry.
- **eventType**—Type of notification that the probe makes about this event.
- **eventCommunity**—Trap group used if an SNMP trap is to be sent. If **eventCommunity** is not configured, a trap is sent to each trap group configured with the **rmon-alarm** category.
- **eventLastTimeSent**—Value of **sysUpTime** when this event entry last generated an event.
- **eventOwner**—Any text string specified by the creating management application or the command-line interface (CLI). Typically, it is used to identify a network manager (or application) and can be used for fine access control between participating management applications.
- **eventStatus**—Status of this event entry.

NOTE: If this object is not set to valid, no action is taken by the associated event entry. When this object is set to valid, all previous log entries associated with this entry (if any) are deleted.

Understanding RMON Alarms and Events Configuration

Junos OS supports monitoring routers from remote devices. These values are measured against thresholds and trigger events when the thresholds are crossed. You configure remote monitoring (RMON) alarm and event entries to monitor the value of a MIB object.

To configure RMON alarm and event entries, you include statements at the `[edit snmp]` hierarchy level of the configuration:

```
[edit snmp]
rmon {
  alarm index {
    description text-description;
    falling-event-index index;
    falling-threshold integer;
    falling-threshold-interval seconds;
    interval seconds;
    rising-event-index index;
    rising-threshold integer;
    request-type (get-next-request | get-request | walk-request);
    sample-type (absolute-value | delta-value);
    startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);
    syslog-subtag syslog-subtag;
    variable oid-variable;
    event index {
      community community-name;
      description description;
      type type;
    }
  }
}
```

- [Configuring an Alarm Entry and Its Attributes on page 2013](#)
- [Configuring an Event Entry and Its Attributes on page 2017](#)

Configuring an Alarm Entry and Its Attributes

An alarm entry monitors the value of a MIB variable. You can configure how often the value is sampled, the type of sampling to perform, and what event to trigger if a threshold is crossed.

This section discusses the following topics:

- [Configuring the Alarm Entry on page 2014](#)
- [Configuring the Description on page 2014](#)
- [Configuring the Falling Event Index or Rising Event Index on page 2014](#)
- [Configuring the Falling Threshold or Rising Threshold on page 2015](#)
- [Configuring the Interval on page 2015](#)
- [Configuring the Falling Threshold Interval on page 2015](#)
- [Configuring the Request Type on page 2016](#)
- [Configuring the Sample Type on page 2016](#)
- [Configuring the Startup Alarm on page 2016](#)

- [Configuring the System Log Tag on page 2017](#)
- [Configuring the Variable on page 2017](#)

Configuring the Alarm Entry

An alarm entry monitors the value of a MIB variable. The **rising-event-index**, **rising-threshold**, **sample-type**, and **variable** statements are mandatory. All other statements are optional.

To configure the alarm entry, include the **alarm** statement and specify an index at the **[edit snmp rmon]** hierarchy level:

```
[edit snmp rmon]
alarm index {
  description description;
  falling-event-index index;
  falling-threshold integer;
  falling-threshold-interval seconds;
  interval seconds;
  rising-event-index index;
  rising-threshold integer;
  sample-type (absolute-value | delta-value);
  startup-alarm (falling-alarm | rising alarm | rising-or-falling-alarm);
  variable oid-variable;
}
```

index is an integer that identifies an alarm or event entry.

Configuring the Description

The description is a text string that identifies the alarm entry.

To configure the description, include the **description** statement and a description of the alarm entry at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
description description;
```

Configuring the Falling Event Index or Rising Event Index

The falling event index identifies the event entry that is triggered when a falling threshold is crossed. The rising event index identifies the event entry that is triggered when a rising threshold is crossed.

To configure the falling event index or rising event index, include the **falling-event-index** or **rising-event-index** statement and specify an index at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
falling-event-index index;
rising-event-index index;
```

index can be from 0 through 65,535. The default for both the falling and rising event index is 0.

Configuring the Falling Threshold or Rising Threshold

The falling threshold is the lower threshold for the monitored variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold, and the associated startup alarm is equal to **falling-alarm** or **rising-or-falling-alarm**. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the rising threshold. You must specify the falling threshold as an integer. Its default is 20 percent less than the rising threshold.

By default, the rising threshold is 0. The rising threshold is the upper threshold for the monitored variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold, and the associated **startup-alarm** is equal to **rising-alarm** or **rising-or-falling-alarm**. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the falling threshold. You must specify the rising threshold as an integer.

To configure the falling threshold or rising threshold, include the **falling-threshold** or **rising-threshold** statement at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
  falling-threshold integer;
  rising-threshold integer;
```

integer can be a value from -2,147,483,647 through 2,147,483,647.

Configuring the Interval

The interval represents the period of time, in seconds, over which the monitored variable is sampled and compared with the rising and falling thresholds.

To configure the interval, include the **interval** statement and specify the number of seconds at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
  interval seconds;
```

seconds can be a value from 1 through 2,147,483,647. The default is 60 seconds.

Configuring the Falling Threshold Interval

The falling threshold interval represents the interval between samples when the rising threshold is crossed. Once the alarm crosses the falling threshold, the regular sampling interval is used.

NOTE: You cannot configure the falling threshold interval for alarms that have the request type set to walk-request.

To configure the falling threshold interval, include the **falling-threshold-interval** statement at the **[edit snmp rmon alarm index]** hierarchy level and specify the number of seconds:

```
[edit snmp rmon alarm index]
  falling-threshold-interval seconds;
```

seconds can be a value from 1 through 2,147,483,647. The default is 60 seconds.

Configuring the Request Type

By default an RMON alarm can monitor only one object instance (as specified in the configuration). You can configure a **request-type** statement to extend the scope of the RMON alarm to include all object instances belonging to a MIB branch or to include the next object instance after the instance specified in the configuration.

To configure the request type, include the **request-type** statement at the **[edit snmp rmon alarm index]** hierarchy level and specify **get-next-request**, **get-request**, or **walk-request**:

```
[edit snmp rmon alarm index]
  request-type (get-next-request | get-request | walk-request);
```

walk extends the RMON alarm configuration to all object instances belonging to a MIB branch. **next** extends the RMON alarm configuration to include the next object instance after the instance specified in the configuration.

Configuring the Sample Type

The sample type identifies the method of sampling the selected variable and calculating the value to be compared against the thresholds. If the value of this object is **absolute-value**, the value of the selected variable is compared directly with the thresholds at the end of the sampling interval. If the value of this object is **delta-value**, the value of the selected variable at the last sample is subtracted from the current value, and the difference is compared with the thresholds.

To configure the sample type, include the **sample-type** statement and specify the type of sample at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
  sample-type (absolute-value | delta-value);
```

- **absolute-value**—Actual value of the selected variable is compared against the thresholds.
- **delta-value**—Difference between samples of the selected variable is compared against the thresholds.

Configuring the Startup Alarm

The startup alarm identifies the type of alarm that can be sent when this entry is first activated. You can specify it as **falling-alarm**, **rising-alarm**, or **rising-or-falling-alarm**.

To configure the startup alarm, include the **startup-alarm** statement and specify the type of alarm at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
  startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);
```

- **falling-alarm**—Generated if the first sample after the alarm entry becomes active is less than or equal to the falling threshold.
- **rising-alarm**—Generated if the first sample after the alarm entry becomes active is greater than or equal to the rising threshold.
- **rising-or-falling-alarm**—Generated if the first sample after the alarm entry becomes active satisfies either of the corresponding thresholds.

The default is **rising-or-falling-alarm**.

Configuring the System Log Tag

The **syslog-subtag** statement specifies the tag to be added to the system log message. You can specify a string of not more than 80 uppercase characters as the system log tag.

To configure the system log tag, include the **syslog-subtag** statement at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
syslog-subtag syslog-subtag;
```

Configuring the Variable

The variable identifies the MIB object that is being monitored.

To configure the variable, include the **variable** statement and specify the object identifier or object name at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
variable oid-variable;
```

oid-variable is a dotted decimal (for example, 1.3.6.1.2.1.2.1.2.2.1.10.1) or MIB object name (for example, ifInOctets.1).

Configuring an Event Entry and Its Attributes

An event entry generates a notification for an alarm entry when its rising or falling threshold is crossed. You can configure the type of notification that is generated. To configure the event entry, include the **event** statement at the **[edit snmp rmon]** hierarchy level. All statements except the **event** statement are optional.

```
[edit snmp rmon]
event index {
  community community-name;
  description description;
  type type;
}
```

index identifies an entry event.

community-name is the trap group that is used when generating a trap. If that trap group has the **rmon-alarm** trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group. If nothing is configured, all the trap groups are examined, and traps are sent using each group with the **rmon-alarm** category set.

description is a text string that identifies the entry.

The **type** variable of an event entry specifies where the event is to be logged. You can specify the type as one of the following:

- **log**—Adds the event entry to the **logTable**.
- **log-and-trap**—Sends an SNMP trap and creates a log entry.
- **none**—Sends no notification.
- **snmptrap**—Sends an SNMP trap.

The default for the event entry type is **log-and-trap**.

Example: Configuring an RMON Alarm and Event Entry

Configure an RMON alarm and event entry:

```
[edit snmp]
rmon {
  alarm 100 {
    description "input traffic on fxp0";
    falling-event-index 100;
    falling-threshold 10000;
    interval 60;
    rising-event-index 100;
    rising-threshold 100000;
    sample-type delta-value;
    startup-alarm rising-or-falling-alarm;
    variable ifInOctets.1;
  }
  event 100 {
    community bedrock;
    description "emergency events";
    type log-and-trap;
  }
}
```

Documentation**

- [Understanding RMON Alarms and Events Configuration on page 2012](#)
- [Configuring an Alarm Entry and Its Attributes on page 2013](#)
- [Configuring an Event Entry and Its Attributes on page 2017](#)

Example: Configuring Health Monitoring

Configure the health monitor:

```
[edit snmp]
health-monitor {
  falling-threshold 85;
  interval 600;
  rising-threshold 75;
}
```

In this example, the sampling interval is every **600** seconds (10 minutes), the falling threshold is **85** percent of the maximum possible value for each object instance monitored, and the rising threshold is **75** percent of the maximum possible value for each object instance monitored.

- [Understanding Measurement Points, Key Performance Indicators, and Baseline Values on page 2023](#)

Understanding RMON for Monitoring Service Quality

Health and performance monitoring can benefit from the remote monitoring of SNMP variables by the local SNMP agents running on each router. The SNMP agents compare MIB values against predefined thresholds and generate exception alarms without the need for polling by a central SNMP management platform. This is an effective mechanism for proactive management, as long as the thresholds have baselines determined and set correctly. For more information, see RFC 2819, *Remote Network Monitoring MIB*.

This topic includes the following sections:

- [Setting Thresholds on page 2019](#)
- [RMON Command-Line Interface on page 2020](#)
- [RMON Event Table on page 2021](#)
- [RMON Alarm Table on page 2021](#)
- [Troubleshooting RMON on page 2022](#)

Setting Thresholds

By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside of the allowable operational range. (See [Figure 62 on page 2020](#).)

Figure 62: Setting Thresholds

g041661

Events are only generated when the threshold is first crossed in any one direction rather than after each sample period. For example, if a rising threshold crossing event is raised, no more threshold crossing events will occur until a corresponding falling event. This considerably reduces the quantity of alarms that are produced by the system, making it easier for operations staff to react when alarms do occur.

To configure remote monitoring, specify the following pieces of information:

- The variable to be monitored (by its SNMP object identifier)
- The length of time between each inspection
- A rising threshold
- A falling threshold
- A rising event
- A falling event

Before you can successfully configure remote monitoring, you should identify what variables need to be monitored and their allowable operational range. This requires some period of baselining to determine the allowable operational ranges. An initial baseline period of at least three months is not unusual when first identifying the operational ranges and defining thresholds, but baseline monitoring should continue over the life span of each monitored variable.

RMON Command-Line Interface

Junos OS provides two mechanisms you use to control the Remote Monitoring agent on the router: command-line interface (CLI) and SNMP. To configure an RMON entry using the CLI, include the following statements at the **[edit snmp]** hierarchy level:

```
rmon {
  alarm index {
    description;
    falling-event-index;
    falling-threshold;
    intervals;
    rising-event-index;
```

```

    rising-threshold;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling | rising | rising-or-falling);
    variable;
  }
  event index {
    community;
    description;
    type (log | trap | log-and-trap | none);
  }
}

```

If you do not have CLI access, you can configure remote monitoring using the SNMP Manager or management application, assuming SNMP access has been granted. (See [Table 272 on page 2021](#).) To configure RMON using SNMP, perform SNMP **Set** requests to the RMON event and alarm tables.

RMON Event Table

Set up an event for each type that you want to generate. For example, you could have two generic events, *rising* and *falling*, or many different events for each variable that is being monitored (for example, *temperature rising* event, *temperature falling* event, *firewall hit* event, *interface utilization* event, and so on). Once the events have been configured, you do not need to update them.

Table 272: RMON Event Table

Field	Description
eventDescription	Text description of this event
eventType	Type of event (for example, log , trap , or log and trap)
eventCommunity	Trap group to which to send this event (as defined in the Junos OS configuration, which is not the same as the community)
eventOwner	Entity (for example, manager) that created this event
eventStatus	Status of this row (for example, valid , invalid , or createRequest)

RMON Alarm Table

The RMON alarm table stores the SNMP object identifiers (including their instances) of the variables that are being monitored, together with any rising and falling thresholds and their corresponding event indexes. To create an RMON request, specify the fields shown in [Table 273 on page 2021](#).

Table 273: RMON Alarm Table

Field	Description
alarmStatus	Status of this row (for example, valid , invalid , or createRequest)
alarmInterval	Sampling period (in seconds) of the monitored variable

Table 273: RMON Alarm Table (*continued*)

Field	Description
alarmVariable	OID (and instance) of the variable to be monitored
alarmValue	Actual value of the sampled variable
alarmSampleType	Sample type (absolute or delta changes)
alarmStartupAlarm	Initial alarm (rising , falling , or either)
alarmRisingThreshold	Rising threshold against which to compare the value
alarmFallingThreshold	Falling threshold against which to compare the value
alarmRisingEventIndex	Index (row) of the rising event in the event table
alarmFallingEventIndex	Index (row) of the falling event in the event table

Both the **alarmStatus** and **eventStatus** fields are **entryStatus** primitives, as defined in RFC 2579, *Textual Conventions for SMIV2*.

Troubleshooting RMON

You troubleshoot the RMON agent, **rmopd**, that runs on the router by inspecting the contents of the Juniper Networks enterprise RMON MIB, **jnxRmon**, which provides the extensions listed in [Table 274 on page 2022](#) to the RFC 2819 **alarmTable**.

Table 274: jnxRmon Alarm Extensions

Field	Description
jnxRmonAlarmGetFailCnt	Number of times the internal Get request for the variable failed
jnxRmonAlarmGetFailTime	Value of sysUpTime when the last failure occurred
jnxRmonAlarmGetFailReason	Reason why the Get request failed
jnxRmonAlarmGetOkTime	Value of sysUpTime when the variable moved out of failure state
jnxRmonAlarmState	Status of this alarm entry

Monitoring the extensions in this table provides clues as to why remote alarms may not behave as expected.

Understanding Measurement Points, Key Performance Indicators, and Baseline Values

This chapter topic provides guidelines for monitoring the service quality of an IP network. It describes how service providers and network administrators can use information provided by Juniper Networks routers to monitor network performance and capacity. You should have a thorough understanding of the SNMP and the associated MIB supported by Junos OS.

NOTE: For a good introduction to the process of monitoring an IP network, see RFC 2330, *Framework for IP Performance Metrics*.

This topic contains the following sections:

- [Measurement Points on page 2023](#)
- [Basic Key Performance Indicators on page 2024](#)
- [Setting Baselines on page 2024](#)

Measurement Points

Defining the measurement points where metrics are measured is equally as important as defining the metrics themselves. This section describes measurement points within the context of this chapter and helps identify where measurements can be taken from a service provider network. It is important to understand exactly where a measurement point is. Measurement points are vital to understanding the implication of what the actual measurement means.

An IP network consists of a collection of routers connected by physical links that are all running the Internet Protocol. You can view the network as a collection of routers with an ingress (entry) point and an egress (exit) point. See [Figure 63 on page 2023](#).

- Network-centric measurements are taken at measurement points that most closely map to the ingress and egress points for the network itself. For example, to measure delay across the provider network from Site A to Site B, the measurement points should be the ingress point to the provider network at Site A and the egress point at Site B.
- Router-centric measurements are taken directly from the routers themselves, but be careful to ensure that the correct router subcomponents have been identified in advance.

Figure 63: Network Entry Points

9017042

NOTE: [Figure 63 on page 2023](#) does not show the client networks at customer premises, but they would be located on either side of the ingress and egress points. Although this chapter does not discuss how to measure network services as perceived by these client networks, you can use measurements taken for the service provider network as input into such calculations.

Basic Key Performance Indicators

For example, you could monitor a service provider network for three basic key performance indicators (KPIs):

- *Availability* measures the “reachability” of one measurement point from another measurement point at the network layer (for example, using ICMP ping). The underlying routing and transport infrastructure of the provider network will support the availability measurements, with failures highlighted as unavailability.
- *Health* measures the number and type of errors that are occurring on the provider network, and can consist of both router-centric and network-centric measurements, such as hardware failures or packet loss.
- *Performance* of the provider network measures how well it can support IP services (for example, in terms of delay or utilization).

Setting Baselines

How well is the provider network performing? We recommend an initial three-month period of monitoring to identify a network’s normal operational parameters. With this information, you can recognize exceptions and identify abnormal behavior. You should continue baseline monitoring for the lifetime of each measured metric. Over time, you must be able to recognize performance trends and growth patterns.

Within the context of this chapter, many of the metrics identified do not have an allowable operational range associated with them. In most cases, you cannot identify the allowable operational range until you have determined a baseline for the actual variable on a specific network.

Configuring Health Monitoring

- [Configuring Health Monitoring on Devices Running Junos OS on page 2025](#)

Configuring Health Monitoring on Devices Running Junos OS

As the number of devices managed by a typical network management system (NMS) grows and the complexity of the devices themselves increases, it becomes increasingly impractical for the NMS to use polling to monitor the devices. A more scalable approach is to rely on network devices to notify the NMS when something requires attention.

On Juniper Networks routers, RMON alarms and events provide much of the infrastructure needed to reduce the polling overhead from the NMS. However, with this approach, you must set up the NMS to configure specific MIB objects into RMON alarms. This often requires device-specific expertise and customizing of the monitoring application. In addition, some MIB object instances that need monitoring are set only at initialization or change at runtime and cannot be configured in advance.

To address these issues, the health monitor extends the RMON alarm infrastructure to provide predefined monitoring for a selected set of object instances (for file system usage, CPU usage, and memory usage) and includes support for unknown or dynamic object instances (such as Junos OS processes).

Health monitoring is designed to minimize user configuration requirements. To configure health monitoring entries, include the **health-monitor** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
health-monitor {
  falling-threshold percentage;
  interval seconds;
  rising-threshold percentage;
}
```

You can use the **show snmp health-monitor** operational command to view information about health monitor alarms and logs.

This topic describes the minimum required configuration and discusses the following tasks for configuring the health monitor:

- [Monitored Objects on page 2025](#)
- [Minimum Health Monitoring Configuration on page 2026](#)
- [Configuring the Falling Threshold or Rising Threshold on page 2026](#)
- [Configuring the Interval on page 2027](#)
- [Log Entries and Traps on page 2027](#)

Monitored Objects

When you configure the health monitor, monitoring information for certain object instances is available, as shown in [Table 275 on page 2026](#).

Table 275: Monitored Object Instances

Object	Description
<code>jnxHrStoragePercentUsed.1</code>	Monitors the following file system on the router or switch: <code>/dev/ad0s1a:</code> This is the root file system mounted on <code>/</code> .
<code>jnxHrStoragePercentUsed.2</code>	Monitors the following file system on the router or switch: <code>/dev/ad0s1e:</code> This is the configuration file system mounted on <code>/config</code> .
<code>jnxOperatingCPU (RE0)</code>	Monitors CPU usage for Routing Engines (RE0 and RE1). The index values assigned to Routing Engines depend on whether the Chassis MIB uses a zero-based or ones-based indexing scheme. Because the indexing scheme is configurable, the proper index is determined when the router or switch is initialized and when there is a configuration change. If the router or switch has only one Routing Engine, the alarm entry monitoring RE1 is removed after five failed attempts to obtain the CPU value.
<code>jnxOperatingCPU (RE1)</code>	
<code>jnxOperatingBuffer (RE0)</code>	Monitors the amount of memory available on Routing Engines (RE0 and RE1). Because the indexing of this object is identical to that used for <code>jnxOperatingCPU</code> , index values are adjusted depending on the indexing scheme used in the Chassis MIB. As with <code>jnxOperatingCPU</code> , the alarm entry monitoring RE1 is removed if the router or switch has only one Routing Engine.
<code>jnxOperatingBuffer (RE1)</code>	
<code>sysApplElmtRunCPU</code>	Monitors the CPU usage for each Junos OS process (also called daemon). Multiple instances of the same process are monitored and indexed separately.
<code>sysApplElmtRunMemory</code>	Monitors the memory usage for each Junos OS process. Multiple instances of the same process are monitored and indexed separately.

Minimum Health Monitoring Configuration

To enable health monitoring on the router or switch, include the **health-monitor** statement at the `[edit snmp]` hierarchy level:

```
[edit snmp]
health-monitor;
```

Configuring the Falling Threshold or Rising Threshold

The falling threshold is the lower threshold (expressed as a percentage of the maximum possible value) for the monitored variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold. After a falling event is generated, another falling event cannot be generated until the sampled value rises

above this threshold and reaches the rising threshold. You must specify the falling threshold as a percentage of the maximum possible value. The default is **70** percent.

By default, the rising threshold is **80** percent of the maximum possible value for the monitored object instance. The rising threshold is the upper threshold for the monitored variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the falling threshold. You must specify the rising threshold as a percentage of the maximum possible value for the monitored variable.

To configure the falling threshold or rising threshold, include the **falling-threshold** or **rising-threshold** statement at the **[edit snmp health-monitor]** hierarchy level:

```
[edit snmp health-monitor]
  falling-threshold percentage;
  rising-threshold percentage;
```

percentage can be a value from 1 through 100.

The falling and rising thresholds apply to all object instances monitored by the health monitor.

Configuring the Interval

The interval represents the period of time, in seconds, over which the object instance is sampled and compared with the rising and falling thresholds.

To configure the interval, include the **interval** statement and specify the number of seconds at the **[edit snmp health-monitor]** hierarchy level:

```
[edit snmp health-monitor]
  interval seconds;
```

seconds can be a value from 1 through **2147483647**. The default is **300** seconds (5 minutes).

Log Entries and Traps

The system log entries generated for any health monitor events (thresholds crossed, errors, and so on) have a corresponding **HEALTHMONITOR** tag rather than a generic **SNMPD_RMON_EVENTLOG** tag. However, the health monitor sends generic **RMON risingThreshold** and **fallingThreshold** traps.

Complete SNMPv3 Configuration Statements

To configure SNMPv3, include the following statements at the `[edit snmp v3]` and `[edit snmp]` hierarchy levels:

```

[edit snmp]
engine-id {
  (local engine-id | use-mac-address | use-default-ip-address);
}
view view-name {
  oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
  tag tag-name;
  type (trap | inform);
}
notify-filter profile-name {
  oid object-identifier (include | exclude);
}
snmp-community community-index {
  community-name community-name;
  security-name security-name;
  tag tag-name;
}
target-address target-address-name {
  address address;
  address-mask address-mask;
  logical-system logical-system;
  port port-number;
  retry-count number;
  routing-instance instance;
  tag-list tag-list;
  target-parameters target-parameters-name;
  timeout seconds;
}

```

```

target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
usm {
  (local-engine | remote-engine engine-id) {
    user username {
      authentication-md5 {
        authentication-password authentication-password;
      }
      authentication-none;
      authentication-sha {
        authentication-password authentication-password;
      }
      privacy-3des {
        privacy-password privacy-password;
      }
      privacy-aes128 {
        privacy-password privacy-password;
      }
      privacy-des {
        privacy-password privacy-password;
      }
      privacy-none;
    }
  }
}
vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix){
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
    }
  }
  security-to-group {
    security-model (usm | v1 | v2c) {
      security-name security-name {
        group group-name;
      }
    }
  }
}

```

access-list

Syntax	<pre>[edit snmp] routing-instance-access { access-list { <i>routing-instance</i>; <i>routing-instance</i> restrict; } }</pre>
Hierarchy Level	[edit snmp routing-instance-access]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	Create access lists to control SNMP agents in routing instances from accessing SNMP information. To enable the SNMP agent on a routing instance to access SNMP information, specify the routing instance name. To disable the SNMP agent on a routing instance from accessing SNMP information, include the routing-instance name followed by the restrict keyword.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• routing-instance-access on page 2088

address

Syntax	<code>address <i>address</i>;</code>
Hierarchy Level	<code>[edit snmp v3 target-address <i>target-address-name</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify the SNMP target address.
Options	<i>address</i> —IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring the Address on page 1963

address-mask

Syntax	<code>address-mask <i>address-mask</i>;</code>
Hierarchy Level	<code>[edit snmp v3 target-address <i>target-address-name</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 on the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Verify the source addresses for a group of target addresses.
Options	<i>address-mask</i> combined with the address defines a range of addresses.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring the Address Mask on page 1963

agent-address

Syntax	agent-address outgoing-interface;
Hierarchy Level	[edit snmp trap-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is outgoing-interface , which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.
Options	outgoing-interface —Value of the agent address of all SNMPv1 traps generated by this router or switch. The outgoing-interface option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap. Default: disabled (the agent address is not specified in SNMPv1 traps).
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Agent Address for SNMP Traps on page 1935

alarm (SNMP RMON)

Syntax `alarm index {`
 `description description;`
 `falling-event-index index;`
 `falling-threshold integer;`
 `falling-threshold-interval seconds;`
 `interval seconds;`
 `request-type (get-next-request | get-request | walk-request);`
 `rising-event-index index;`
 `rising-threshold integer;`
 `sample-type (absolute-value | delta-value);`
 `startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);`
 `syslog-subtag syslog-subtag;`
 `variable oid-variable;`
 `}`

Hierarchy Level `[edit snmp rmon]`

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 9.0 for EX Series switches.
 Statement introduced in Junos OS Release 11.1 for the QFX Series.
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Configure RMON alarm entries.

Options *index*—Identifies this alarm entry as an integer.
 The remaining statements are explained separately.

Required Privilege Level `snmp`—To view this statement in the configuration.
 `snmp-control`—To add this statement to the configuration.

authentication-md5

Syntax	<code>authentication-md5 { authentication-password authentication-password; }</code>
Hierarchy Level	[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure MD5 as the authentication type for the SNMPv3 user.

NOTE: You can only configure one authentication type for each SNMPv3 user.

The remaining statement is explained separately.

Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring MD5 Authentication on page 1947

authentication-none

Syntax	authentication-none;
Hierarchy Level	[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure that there should be no authentication for the SNMPv3 user.

NOTE: You can configure only one authentication type for each SNMPv3 user.

Required Privilege	snmp—To view this statement in the configuration.
Level	snmp-control—To add this statement to the configuration.

client-list

Syntax	<code>client-list <i>client-list-name</i> { <i>ip-addresses</i>; }</code>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for QFX Series switches.
Description	Define a list of SNMP clients.
Options	<i>client-list-name</i> —Name of the client list. <i>ip-addresses</i> —IP addresses of the SNMP clients to be added to the client list,
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Adding a Group of Clients to an SNMP Community on page 1968

client-list-name

Syntax	<code>client-list-name <i>client-list-name</i>;</code>
Hierarchy Level	[edit snmp community <i>community-name</i>]
Release Information	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for FX Series switches.
Description	Add a client list or prefix list to an SNMP community.
Options	<i>client-list-name</i> —Name of the client list or prefix list.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Adding a Group of Clients to an SNMP Community on page 1968

clients

Syntax	<pre>clients { address <restrict>; }</pre>
Hierarchy Level	[edit snmp community <i>community-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for FX Series switches.
Description	Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.
Default	If you omit the clients statement, all SNMP clients using this community string are authorized to access the router.
Options	address —Address of an SNMP client that is authorized to access this router. You must specify an address, not a hostname. To specify more than one client, include multiple address options. restrict —(Optional) Do not allow the specified SNMP client to access the router.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the SNMP Community String on page 1925

commit-delay

Syntax	<pre>commit-delay <i>seconds</i>;</pre>
Hierarchy Level	[edit snmp nonvolatile]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure the timer for the SNMP Set reply and start of the commit.
Options	seconds —Delay between an affirmative SNMP Set reply and start of the commit. Default: 5 seconds
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Commit Delay Timer on page 1924

community

Syntax	<pre>community <i>community-name</i> { authorization <i>authorization</i>; client-list-name <i>client-list-name</i>; clients { address restrict; } view <i>view-name</i>; }</pre>
Hierarchy Level	[edit snmp]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	<p>Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.</p> <p>The SNMP client application specifies an SNMP community name in Get, GetBulk, GetNext, and Set SNMP requests.</p>
Default	If you omit the community statement, all SNMP requests are denied.
Options	<p>community-name—Community string. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring the SNMP Community String on page 1925

community

Syntax	<code>community <i>community-name</i>;</code>
Hierarchy Level	[edit snmp rmon event <i>index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The trap group that is used when generating a trap (if eventType is configured to send traps). If that trap group has the rmon-alarm trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of eventCommunity). If nothing is configured, traps are sent to each group with the rmon-alarm category set.
Options	<i>community-name</i> —Identifies the trap group that is used when generating a trap if the event is configured to send traps.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring an Event Entry and Its Attributes on page 2017

community-name

Syntax	<code>community-name <i>community-name</i>;</code>
Hierarchy Level	<code>[edit snmp v3 snmp-community <i>community-index</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The community name defines an SNMP community. The SNMP community authorizes SNMPv1 or SNMPv2 clients. The access privileges associated with the configured security name define which MIB objects are available and the operations (notify, read, or write) allowed on those objects.
Options	<i>community-name</i> —Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose it in quotation marks (" ").
<div>  <p>NOTE: Community names must be unique. You cannot configure the same community name at the <code>[edit snmp community]</code> and <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy levels.</p> <p>The community name at the <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy level is encrypted and not displayed in the command-line interface (CLI).</p> </div>	
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring the SNMPv3 Community on page 1969

contact

Syntax	<code>contact <i>contact</i>;</code>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Define the value of the MIB II sysContact object, which is the contact person for the managed system.
Options	contact —Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

destination-port

Syntax	<code>destination-port <i>port-number</i>;</code>
Hierarchy Level	[edit snmp trap-group]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Assign a trap port number other than the default.
Default	If you omit this statement, the default port is 162.
Options	<i>port-number</i> —SNMP trap port number.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring SNMP Trap Groups on page 1936

engine-id

Syntax	engine-id { (local <i>engine-id-suffix</i> use-default-ip-address use-mac-address); }
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.1 for EX Series switches.
Description	The local engine ID is defined as the administratively unique identifier of an SNMPv3 engine, and is used for identification, not for addressing. There are two parts of an engine ID: prefix and suffix. The prefix is formatted according to the specifications defined in RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i> . You can configure the suffix here.
<div>  <p>NOTE: SNMPv3 authentication and encryption keys are generated based on the associated passwords and the engine ID. If you configure or change the engine ID, you must commit the new engine ID before you configure SNMPv3 users. Otherwise the keys generated from the configured passwords are based on the previous engine ID.</p> <p>For the engine ID, we recommend using the MAC address of the management port.</p> </div>	
Options	<p>local <i>engine-id-suffix</i>—Explicit setting for the engine ID suffix.</p> <p>use-default-ip-address—The engine ID suffix is generated from the default IP address.</p> <p>use-mac-address—The SNMP engine identifier is generated from the MAC address of the management interface on the router.</p> <p>Default: use-default-ip-address</p>
Required Privilege Level	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Configuring the Local Engine ID on page 1958

enterprise-oid

Syntax	enterprise-oid;
Hierarchy Level	[edit snmp trap-options]
Release Information	Statement introduced in Junos OS Release 10.0
Description	Add the snmpTrapEnterprise object, which shows the association between an enterprise-specific trap and the organization that defined the trap, to standard SNMP traps. By default, the snmpTrapEnterprise object is added only to the enterprise-specific traps. When the enterprise-oid statement is included in the configuration, snmpTrapEnterprise is added to all the traps generated from the device.

falling-event-index

Syntax	<code>falling-event-index <i>index</i>;</code>
Hierarchy Level	[edit snmp rmon alarm <i>index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The index of the event entry that is used when a falling threshold is crossed. If this value is zero, no event is triggered.
Options	<i>index</i> —Index of the event entry that is used when a falling threshold is crossed. Range: 0 through 65,535 Default: 0
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Falling Event Index or Rising Event Index on page 2014• rising-event-index on page 2083

falling-threshold

Syntax	<code>falling-threshold <i>percentage</i>;</code>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The lower threshold is expressed as a percentage of the maximum possible value for the sampled variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the rising-threshold .
Options	<i>percentage</i> —The lower threshold for the alarm entry. Range: 1 through 100 Default: 70 percent of the maximum possible value
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Falling Threshold or Rising Threshold on page 2026• rising-threshold on page 2084

falling-threshold

Syntax	<code>falling-threshold <i>integer</i>;</code>
Hierarchy Level	[edit snmp rmon alarm <i>index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The lower threshold for the sampled variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold, and the associated startup-alarm value is equal to falling-alarm value or rising-or-falling-alarm value. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the rising-threshold .
Options	<i>integer</i> —The lower threshold for the alarm entry. Range: -2,147,483,648 through 2,147,483,647 Default: 20 percent less than rising-threshold
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Falling Threshold or Rising Threshold on page 2015• rising-threshold on page 2083

falling-threshold-interval

Syntax	<code>falling-threshold-interval seconds;</code>
Hierarchy Level	[edit snmp rmon alarm index]
Release Information	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Interval between samples when the rising threshold is crossed. Once the alarm crosses the falling threshold, the regular sampling interval is used.
Options	seconds —Time between samples, in seconds. Range: 1 through 2,147,483,647 seconds Default: 60 seconds
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Falling Threshold Interval on page 2015• interval on page 2061

filter-duplicates

Syntax	<code>filter-duplicates;</code>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Filter duplicate Get , GetNext , or GetBulk SNMP requests.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Filtering Duplicate SNMP Requests on page 1927

filter-interfaces

Syntax	<pre>filter-interfaces { interfaces { all-internal-interfaces; interface 1; interface 2; } }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 9.4 for EX Series Switches.
Description	Filter out information related to specific interfaces from the output of SNMP Get and GetNext requests performed on interface-related MIBs.
Options	<p>all-internal-interfaces—Filters out information from SNMP Get and GetNext requests for the specified interfaces.</p> <p>interfaces—Specifies the interfaces to filter out from the output of SNMP Get and GetNext requests.</p>
Required Privilege Level	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Filtering Interface Information Out of SNMP Get and GetNext Output on page 1928

group (Configuring Group Name)

```
Syntax  group group-name {
        (default-context-prefix | context-prefix context-prefix){
            security-model (any | usm | v1 | v2c) {
                security-level (authentication | none | privacy) {
                    notify-view view-name;
                    read-view view-name;
                    write-view view-name;
                }
            }
        }
    }
```

Hierarchy Level [edit snmp v3 vacm access]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The **default-context-prefix** statement, when included, adds all the contexts configured on the device to the group, whereas the **context-prefix context-prefix** statement enables you to specify a context and to add that particular context to the group.

(Not applicable to the QFX Series and OCX Series.) When the context prefix is specified as default (for example, **context-prefix default**), the context associated with the master routing instance is added to the group. To specify a routing instance that is part of a logical system, specify it as **logical system/routing instance**. For example, to specify routing instance ri1 in logical system ls1, include **context-prefix ls1/ri1**.

The remaining statements under this hierarchy are explained separately.

Options *group-name*—SNMPv3 group name created for the SNMPv3 group.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

logical-system-trap-filter

Syntax	logical-system-trap-filter;
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	Restrict the routing instances from receiving traps that are not related to the logical system networks to which they belong.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Trap Support for Routing Instances on page 1981

log-vital

Syntax	<pre> log-vital { add <oid> { comment <comment>; } file-size; files; group { operating; idp; storage; cluster-counter; screen; spu; } interval; storage-limit; } </pre>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 12.1X47-D15.
Description	Configure vital log data.
Options	<p>add<oid>—Specify the OID to be used to collect the raw data.</p> <ul style="list-style-type: none"> comment—Specify the comment for the raw OID. <p>file-size—Specify the size of the current dump file.</p> <p>Range: 1 MB to 100 MB.</p> <p>Default: 5 MB for branch SRX Series devices and 10 MB for high-end SRX Series devices.</p> <p>files—Specify the lifetime (number of days) for the dump file to be stored. The dump file is stored at <code>/var/log/vital/</code>.</p> <p>Range: 1 to 30 days.</p> <p>Default: 3 days.</p> <p>group—Specify the pre-defined OID group to be used. Each group contains multiple OIDs within the same area. Once a group enabled, all OIDs in the group will be periodically collected and dumped.</p> <ul style="list-style-type: none"> operating—This group includes state, temperature, current CPU utilization percentage, buffer utilization percentage, heap-utilization percentage, up time, average-load in the last 1 minute, 5 minutes, or 15 minutes, and buffer-pool utilization percentage in the control plane of each operating component in the system. idp—This group includes IDP data plane memory usage, IDP session usage and policies loaded number.

- **storage**—This group includes storage utilization of directory `/var/log`.
- **cluster-counter**—This group includes current total session number, total CPS, IPv4 CPS, IPv6 CPS, current total IPv4 session number, and current total IPv6 session number of both node 0 and node 1.
- **screen**—This group includes screen statistics of a specified zone.
- **spu**—This group includes CPU usage, memory usage, current flow session number, current CP session number, IPv4 session number, IPv6 session number, CP IPv4 session number, and CP IPv6 session number of the SPU.

interval—Specify the collection interval in minutes. The configuration takes effect immediately with new interval value.

Range: 1 to 1440 minutes.

Default: 10 minutes.

storage-limit—Specify the storage usage limit in percentage. If the current storage usage of the directory `/var/log/` is above the upper limit, collection is canceled but is tried next time.

Range: 1 to 100 percent.

Default: 80 percent.

Required Privilege Level	security—To view this statement in the configuration.
	security-control—To add this statement to the configuration.

Hierarchy Level	[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the Data Encryption Standard (DES) as the privacy type for the SNMPv3 user.
Options	privacy-password <i>privacy-password</i> —Password that a user enters. The password is then converted into a key that is used for encryption. SNMPv3 has special requirements when you create plain-text passwords on a router or switch: <ul style="list-style-type: none">• The password must be at least eight characters long.• The password can include alphabetic, numeric, and special characters, but it cannot include control characters.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Encryption Type on page 1948

privacy-none

Syntax	<code>privacy-none;</code>
Hierarchy Level	[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure that no encryption be used for the SNMPv3 user.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Encryption Type on page 1948

privacy-password

Syntax	<code>privacy-password <i>privacy-password</i>;</code>
Hierarchy Level	<p>[edit snmp v3 usm local-engine user <i>username</i> privacy-3des], [edit snmp v3 usm local-engine user <i>username</i> privacy-aes128], [edit snmp v3 usm local-engine user <i>username</i> privacy-des], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-3des], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-aes128], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-des]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	Configure a privacy password for the SNMPv3 user.
Options	<p><i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption.</p> <p>SNMPv3 has special requirements when you create plain-text passwords on a router or switch:</p> <ul style="list-style-type: none"> • The password must be at least eight characters long. • The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

            }
        }
    }
```

Hierarchy Level [edit snmp v3 usm]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the remote engine information for the user-based security model (USM). To send inform messages to an SNMPv3 user on a remote device, you must configure the engine identifier for the SNMP agent on the remote device where the user resides.

Options *engine-id*—Engine identifier. Used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

request-type

Syntax	<code>request-type (get-next-request get-request walk-request);</code>
Hierarchy Level	<code>[edit snmp rmon alarm index]</code>
Release Information	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Extend monitoring to a specific SNMP object instance (get-request), or extend monitoring to all object instances belonging to a MIB branch (walk-request), or extend monitoring to the next object instance after the instance specified in the configuration (get-next-request).
Options	get-next-request —Performs an SNMP get next request. get-request —Performs an SNMP get request. walk-request —Performs an SNMP walk request. Default: <code>walk-request</code>
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.

retry-count

Syntax	<code>retry-count <i>number</i>;</code>
Hierarchy Level	<code>[edit snmp v3 target-address target-address-name]</code>
Release Information	Statement introduced in Junos OS Release 7.4.
Description	Configure the retry count for SNMP informs.
Options	<i>number</i> —Maximum number of times the inform is transmitted if no acknowledgment is received. If no acknowledgment is received after the inform is transmitted the maximum number of times, the inform message is discarded. Default: 3 times
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring SNMP Informs on page 1959• timeout on page 2103

rising-event-index

Syntax	<code>rising-event-index <i>index</i>;</code>
Hierarchy Level	<code>[edit snmp rmon alarm index]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Index of the event entry that is used when a rising threshold is crossed. If this value is zero, no event is triggered.
Options	<i>index</i> —Index of the event entry that is used when a rising threshold is crossed. Range: 0 through 65,535 Default: 0
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring the Falling Event Index or Rising Event Index on page 2014 • falling-event-index on page 2054

rising-threshold

Syntax	<code>rising-threshold <i>integer</i>;</code>
Hierarchy Level	<code>[edit snmp rmon alarm index]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Upper threshold for the sampled variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold, and the associated startup alarm value is equal to the falling alarm or rising or falling alarm value. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the falling threshold.
Options	<i>integer</i> —The lower threshold for the alarm entry. Range: -2,147,483,648 through 2,147,483,647
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring the Falling Threshold or Rising Threshold on page 2015 • falling-threshold on page 2056

rising-threshold

Syntax	<code>rising-threshold <i>percentage</i>;</code>
Hierarchy Level	<code>[edit snmp]</code>
Release Information	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The upper threshold is expressed as a percentage of the maximum possible value for the sampled variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the falling-threshold .
Options	<i>percentage</i> —The lower threshold for the alarm entry. Range: 1 through 100 Default: 80 percent of the maximum possible value
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• falling-threshold on page 2055• Configuring the Falling Threshold or Rising Threshold on page 2026

rmon

Syntax	<code>rmon { ... }</code>
Hierarchy Level	<code>[edit snmp]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure Remote Monitoring.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

routing-engine (SNMP Resource Level)

Syntax routing-engine {
 resource <cpu | memory | open-files-count | process-count | storage | temperature> ;
 {
 interval <interval in secs>;
 moderate-threshold <percentage level>;
 high-threshold <percentage level>;
 critical-threshold <percentage level>;
 action <monitor | prevent | recover>;
 }
 }

Hierarchy Level [edit snmp health-monitor routing-engine]

Release Information Statement introduced in Junos OS Release 12.1X44-D10. Statement modified in Junos OS Release 15.1x49-D10.

Description Override the global configuration for a resource.

- Options**
- **interval**—Monitoring interval in seconds.
 Default: 300 seconds
 - **moderate-threshold**—Percentage of moderate threshold level resource utilization.
 Default: 70 percent.
 - **high-threshold** —Percentage of high-threshold level resource utilization.
 Default: 80 percent.
 - **critical-threshold** —Percentage of critical threshold level resource utilization.
 Default: 90 percent.
 - **action**—Enable action for all resources.
 Default: If action is not enabled, the default action is prevent.

WARNING: If the system health management action for an affected resource is configured to recover, then certain intrusive operations necessary for preventing system breakdown are taken. Intrusive operations can include restarting or terminating processes, deleting files, and so on. Such action information is logged in the system health management history and system log.

Required Privilege security—To view this statement in the configuration.
Level security-control—To add this statement to the configuration.

routing-engine (SNMP Global Level)

Syntax routing-engine

```
{
  interval <interval in secs>;
  moderate-threshold <percentage level>;
  high-threshold <percentage level>;
  critical-threshold <percentage level>;
  traceoptions;
  action <monitor | prevent | recover>;
}
```

Hierarchy Level [edit snmp health-monitor routing-engine]

Release Information Statement introduced in Junos OS Release 12.1X44-D10. Statement modified in Junos OS Release 12.1X45-D10.

Description Enable the system health management feature to use the specified parameters.

- Options**
- **interval**—Monitoring interval in seconds.
Default: 300 seconds
 - **moderate-threshold**—Percentage of moderate threshold level resource utilization.
Default: 70 percent.
 - **high-threshold** —Percentage of high-threshold level resource utilization.
Default: 80 percent.
 - **critical-threshold** —Percentage of critical threshold level resource utilization.
Default: 90 percent.
 - **traceoptions**—Enable tracing of system health monitoring daemon.
 - **action**—Enable action for all resources.
Default: If action is not enabled, the default is prevent.

WARNING: If the system health management action for an affected resource is configured to recover, then certain intrusive operations necessary for preventing system breakdown are taken. Intrusive operations can include restarting or terminating processes, deleting files, and so on. Such action information is logged in the system health management history and system log.

Required Privilege Level

security	—To view this statement in the configuration.
security-control	—To add this statement to the configuration.

routing-instance

Syntax	<code>routing-instance <i>routing-instance-name</i>;</code>
Hierarchy Level	<code>[edit snmp community <i>community-name</i>],</code> <code>[edit snmp community <i>community-name</i> logical-system <i>logical-system-name</i>],</code> <code>[edit snmp trap-group <i>group</i>]</code>
Release Information	Statement introduced in Junos OS Release 8.3. Added to the <code>[edit snmp community <i>community-name</i>]</code> hierarchy level in Junos OS Release 8.4. Added to the <code>[edit snmp community <i>community-name</i> logical-system <i>logical-system-name</i>]</code> hierarchy level in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
Description	Specify a routing instance for SNMPv1 and SNMPv2 trap targets. All targets configured in the trap group use this routing instance. If the routing instance is defined within a logical system, include the logical-system <i>logical-system-name</i> statement at the <code>[edit snmp community <i>community-name</i>]</code> hierarchy level and specify the routing-instance statement under the <code>[edit snmp community <i>community-name</i> logical-system <i>logical system-name</i>]</code> hierarchy level.
Options	<i>routing-instance-name</i> —Name of the routing instance.
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring SNMP Trap Groups on page 1936 • Configuring the Source Address for SNMP Traps on page 1933 • Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 1982

routing-instance

Syntax	<code>routing-instance <i>routing-instance-name</i>;</code>
Hierarchy Level	<code>[edit snmp v3 target-address <i>target-address-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify a routing instance for an SNMPv3 trap target.
Options	<p><i>routing-instance-name</i>—Name of the routing instance.</p> <p>To configure a routing instance within a logical system, specify the logical system name followed by the routing instance name. Use a slash (/) to separate the two names (for example, test-ls/test-ri). To configure the default routing instance on a logical system, specify the logical system name followed by default (for example, test-ls/default).</p>
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Trap Target Address on page 1962

routing-instance-access

Syntax	<pre>[edit snmp] routing-instance-access { access-list { <i>routing-instance</i>; <i>routing-instance</i> restrict; } }</pre>
Hierarchy Level	<code>[edit snmp]</code>
Release Information	Statement introduced in Junos OS Release 8.4.
Description	Enable SNMP managers in routing instances other than the default routing instance to access SNMP information. For information about the access-list option, see access-list .
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Enabling SNMP Access over Routing Instances on page 1982

sample-type

Syntax	sample-type (absolute-value delta-value);
Hierarchy Level	[edit snmp rmon alarm index]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Method of sampling the selected variable.
Options	<p>absolute-value—Actual value of the selected variable is used when comparing against the thresholds.</p> <p>delta-value—Difference between samples of the selected variable is used when comparing against the thresholds.</p>
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

security-level (Defining Access Privileges)

Syntax	<pre>security-level (authentication none privacy) { notify-view <i>view-name</i>; read-view <i>view-name</i>; write-view <i>view-name</i>; }</pre>
Hierarchy Level	[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix context-prefix <i>context-prefix</i>) security-model (any usm v1 v2c)]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Define the security level used for access privileges.
Default	none
Options	authentication —Provide authentication but no encryption. none —No authentication and no encryption. privacy —Provide authentication and encryption.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Security Level on page 1952

security-level (Generating SNMP Notifications)

Syntax	security-level (authentication none privacy);
Hierarchy Level	[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the security level to use when generating SNMP notifications.
Default	none
Options	authentication —Provide authentication but no encryption. none —No authentication and no encryption. privacy —Provide authentication and encryption.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Security Level on page 1967

security-model (Access Privileges)

Syntax	security-model (usm v1 v2c);
Hierarchy Level	[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix context-prefix <i>context-prefix</i>)]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the security model for an SNMPv3 group. The security model is used to determine access privileges for the group.
Options	usm —SNMPv3 security model. v1 —SNMPv1 security model. v2c —SNMPv2c security model.
Required Privilege Level	snmp —To view this statement in the configuration. snmp-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Security Model on page 1952

security-model (Group)

Syntax	<pre>security-model (usm v1 v2c) { security-name security-name { group group-name; } }</pre>
Hierarchy Level	[edit snmp v3 vacm security-to-group]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Define a security model for a group.
Options	usm —SNMPv3 security model. v1 —SNMPv1 security model. v2c —SNMPv2c security model.
Required Privilege Level	snmp —To view this statement in the configuration. snmp-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring the Security Model on page 1956

security-model (SNMP Notifications)

Syntax	security-model (usm v1 v2c);
Hierarchy Level	[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the security model for an SNMPv3 group. The security model is used for SNMP notifications.
Options	usm —SNMPv3 security model. v1 —SNMPv1 security model. v2c —SNMPv2c security model.
Required Privilege Level	snmp —To view this statement in the configuration. snmp-control —To add this statement to the configuration.

target-parameters

Syntax At the `[edit snmp v3]` hierarchy level:

```
target-parameters target-parameters-name {
  profile-name;
  parameters {
    message-processing-model (v1 | v2c | V3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
```

At the `[edit snmp v3 target-address target-address-name]` hierarchy level:

```
target-parameters target-parameters-name;
```

Hierarchy Level `[edit snmp v3]`
`[edit snmp v3 target-address target-address-name]`

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the `[edit snmp v3]` hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the `[edit snmp v3 target-parameters target-parameters-name]` hierarchy level to the target address configuration at the `[edit snmp v3]` hierarchy level.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

traceoptions (SNMP)

Syntax	<pre> traceoptions { file <i>filename</i> <files <i>number</i>> <match <i>regular-expression</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i>; no-remote-trace; } </pre>
Hierarchy Level	[edit snmp]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>file <i>filename</i> option added in Junos OS Release 8.1.</p> <p>world-readable no-world-readable option added in Junos OS Release 8.1.</p> <p>match <i>regular-expression</i> option added in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	<p>The output of the tracing operations is placed into log files in the /var/log directory. Each log file is named after the SNMP agent that generates it. Currently, the following logs are created in the /var/log directory when the traceoptions statement is used:</p> <ul style="list-style-type: none"> • chassisd • craftd • ilmids • mib2d • rmopd • serviced • snmpd
Options	<p>file <i>filename</i>—By default, the name of the log file that records trace output is the name of the process being traced (for example, mib2d or snmpd). Use this option to specify another name.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, snmpd) reaches its maximum size, it is archived by being renamed to snmpd.0. The previous snmpd.1 is renamed to snmpd.2, and so on. The oldest archived file is deleted.</p> <p>Range: 2 through 1000 files</p> <p>Default: 10 files</p> <p>flag <i>flag</i>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements:</p> <ul style="list-style-type: none"> • all—Log all SNMP events. • general—Log general events.

- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **subagent**—Log subagent restarts.
- **timer**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

match *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

size *size*—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

Range: 10 KB through 1 GB

Default: 1000 KB

world-readable | no-world-readable—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

show snmp health-monitor

Syntax	show snmp health-monitor <alarms <detail>> <logs>
Release Information	Statement introduced in Junos OS Release 12.1X44-D10 for SRX Series devices.
Description	Display information about SNMP health monitor alarms and logs.
Options	<p>none—Display information about all health monitor alarms and logs.</p> <p>alarms <detail>—(Optional) Display detailed information about health monitor alarms.</p> <p>logs—(Optional) Display information about health monitor logs.</p>
Required Privilege Level	view
List of Sample Output	show snmp health-monitor on page 2120 show snmp health-monitor alarms detail on page 2121 show snmp health-monitor alarms brief on page 2122
Output Fields	Table 276 on page 2118 describes the output fields for the show snmp health-monitor command. Output fields are listed in the approximate order in which they appear.

Table 276: show snmp health-monitor Output Fields

Field Name	Field Description
Alarm Index	Alarm identifier.
Variable description	Description of the health monitor object instance being monitored.
Variable name	Name of the health monitor object instance being monitored.
Value	Current value of the monitored variable in the most recent sample interval.

Table 276: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description
State	<p>State of the alarm or event entry:</p> <ul style="list-style-type: none"> Alarms: <ul style="list-style-type: none"> moderate-threshold—Percentage of moderate threshold level resource utilization. high-threshold—Percentage of high-threshold level resource utilization. critical-threshold—Percentage of critical threshold level resource utilization. active—Entry is fully configured and activated. falling threshold crossed—Value of the variable has crossed the lower threshold limit. rising threshold crossed—Value of the variable has crossed the upper threshold limit. under creation—Entry is being configured and is not yet activated. startup—Alarm is waiting for the first sample of the monitored variable. object not available—Monitored variable of that type is not available to the health monitor agent. instance not available—Monitored variable's instance is not available to the health monitor agent. object type invalid—Monitored variable is not a numeric value. object processing errored—An error occurred when the monitored variable was processed. unknown—State is not one of the above.
Variable OID	Object ID to which the variable name is resolved. The format is x.x.x.x.
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of absolute value or delta value .
Startup alarm	<p>Alarm that might be sent when this entry is first activated, depending on the following criteria:</p> <ul style="list-style-type: none"> Alarm is sent when one of the following situations exists: <ul style="list-style-type: none"> Value of the alarm is above or equal to the rising threshold and the startup type is either rising alarm or rising or falling alarm. Value of the alarm is below or equal to the falling threshold and the startup type is either falling alarm or rising or falling alarm. Alarm is <i>not</i> sent when one of the following situations exists: <ul style="list-style-type: none"> Value of the alarm is above or equal to the rising threshold and the startup type is falling alarm. Value of the alarm is below or equal to the falling threshold and the startup type is rising alarm. Value of the alarm is between the thresholds.
Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has monitor prepended to it.
Creator	Mechanism by which the entry was configured (Health Monitor).

Table 276: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description
Sample interval	Time period between samples (in seconds).
Rising threshold	Upper limit threshold value as a percentage of the maximum possible value.
Falling threshold	Lower limit threshold value as a percentage of the maximum possible value.
Rising event index	Event triggered when the rising threshold is crossed.
Falling event index	Event triggered when the falling threshold is crossed.

Sample Output

show snmp health-monitor

```
user@host> show snmp health-monitor
```

```

show snmp health-monitor routing-engine history

Syntax	<code>show snmp health-monitor routing-engine history resource <cpu memory open-files-count process-count storage temperature>;</code>
Release Information	Statement introduced in Junos OS Release 12.1X44-D10 for branch SRX Series devices. Statement modified in Junos OS Release 12.1X45-D10.
Description	Display the health-monitoring information collected for a Routing Engine.
Options	brief —Displays brief health monitor history. extensive —Displays extensive health monitor history. terse —Displays terse health monitor history.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show snmp health-monitor on page 2118
List of Sample Output	show snmp health-monitor routing-engine history on page 2125 show snmp health-monitor routing-engine history extensive on page 2126 show snmp health-monitor routing-engine history terse on page 2127
Output Fields	Table 277 on page 2124 describes the output fields for the show snmp health-monitor routing engine history command. Output fields are listed in the approximate order in which they appear.

Table 277: show snmp health-monitor routing engine history Output Fields

Field Name	Field Description
Resource	Name of the health monitor object instance being monitored.
Event	Displays the latest event and time associated with the resource. The available events are: <ul style="list-style-type: none"> • Moderate Rising • High Rising • Critical Rising • Moderate Falling • High Falling • Critical Falling

Table 277: show snmp health-monitor routing engine history Output Fields (*continued*)

Field Name	Field Description
Configuration	Effective configuration of a resource. <ul style="list-style-type: none"> interval — Configured interval in seconds. moderate-threshold—Percentage of moderate threshold level resource utilization. high-threshold — Percentage of high-threshold level resource utilization. critical-threshold — Percentage of critical threshold level resource utilization. action — Configured action for a resource.
Usage Trail	Displays the previous usage records.
Top daemon	List of processes with high resource utilization.
Growing daemons	List of processes with high incremental resource utilization from the previous sample.
Top files	List of large files in a partition.
Growing files	List of files in a partition that have gotten larger since the previous sample.
Resource name	Name of the resource.
Latest event	Displays the latest event associated with the resource. The available events are: <ul style="list-style-type: none"> Moderate Rising High Rising Critical Rising Moderate Falling High Falling Critical Falling
Time elapsed	Displays the time elapsed since the event occurred.
Action	Displays the action associated with the resource. The available actions are: <ul style="list-style-type: none"> Monitor Prevent Recover

Description	Display the SNMP health-monitoring information for a Routing Engine.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show snmp health-monitor routing-engine history on page 2124
List of Sample Output	show snmp health-monitor routing-engine status on page 2128
Output Fields	Table 278 on page 2128 describes the output fields for the show snmp health-monitor routing-engine status command. Output fields are listed in the approximate order in which they appear.

Table 278: show snmp health-monitor routing engine status Output Fields

Field Name	Field Description
Alarm Index	Alarm identifier.
Resource name	Name of the resource.
Current State	Current state of the monitored variable.
Config Action	Displays the configured action.
Threshold	Displays the threshold value for medium, high, and critical as a percentage.
Interval	Displays the time taken in seconds.

Sample Output

show snmp health-monitor routing-engine status

```
user@host> show snmp health-monitor routing-engine status
```

```
Health monitor status
```

Alarm Index	Resource Name	Current State	Config Action	Threshold (M/H/C)%	Interval (sec)
32770	MD3:/jail/mfs	Active(47)	Monitor	70/80/90	1
32773	MD2:/mfs/var/run/utm	Moderate(69)	Monitor	70/80/90	1
32776	MD1:/mfs	Active(13)	Monitor	70/80/90	1
32782	Root:/cf	Moderate(54)	Monitor	30/70/85	1
32785	Config:/config	Active(0)	Monitor	30/70/85	1
32779	Var:/cf/var	Critical(85)	Monitor	30/70/85	1
32788	CPU	Critical(100)	Monitor	30/70/85	1

32791	Memory	Critical(88)	Monitor	70/80/90	1
32800	RE process count	High(81)	Monitor	30/70/85	1
32803	RE open files count	Moderate(58)	Monitor	30/70/85	1
32797	RE Temperature	Moderate(44)	Monitor	30/70/85	1

show snmp mib (View)

Syntax	<code>show snmp mib (get get-next walk) (ascii decimal) <i>object-id</i></code>
Release Information	Command introduced in Junos OS Release 9.4. Support for IPv4 and IPv6 systemwide policy statistics added in Junos OS Release 12.1X46-D10.
Description	Display local SNMP MIB object values.
Options	<p>get—Retrieve and display one or more SNMP object values.</p> <p>get-next—Retrieve and display the next SNMP object values.</p> <p>walk—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.</p> <p>ascii—Display the SNMP object's string indices as an ASCII-key representation.</p> <p>decimal—Display the SNMP object values in the decimal (default) format. The decimal option is the default option for this command. Therefore, issuing the show snmp mib (get get-next walk) decimal object-id and the show snmp mib (get get-next walk) object-id commands display the same output.</p> <p>object-id—The object can be represented by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as interfaces). When entering multiple objects, enclose the objects in quotation marks.</p>
	<p> NOTE: On all high-end SRX Series devices, the show snmp mib command will not display the output for security related MIBs. We recommend that you use an SNMP client and prefix logical-system-name@ to the community name. For example, if the community is public, use default@public for default root logical system.</p>
Required Privilege Level	snmp—To view this statement in the configuration.
Related Documentation	<ul style="list-style-type: none"> <i>SNMP MIBs and Traps Monitoring and Troubleshooting Guide for Security Devices</i>
List of Sample Output	<p>show snmp mib walk (standalone) on page 2131</p> <p>show snmp mib walk (HA) on page 2131</p> <p>show snmp mib walk jnxJsPolicySystemStats on page 2132</p> <p>show snmp mib walk jnxJsPolicySystemStatsIPv4 on page 2132</p> <p>show snmp mib walk jnxJsPolicySystemStatsTotalAllowIPv4Packets on page 2132</p>
Output Fields	Table 279 on page 2131 describes the output fields for the show snmp mib command. Output fields are listed in the approximate order in which they appear.

Table 279: show snmp mib Output Fields

Field Name	Field Description
<i>name</i>	Object name and numeric instance value.
<i>object value</i>	Object value. The Junos OS translates OIDs into the corresponding object names.

Sample Output

show system log-vital

Syntax	show system log-vital <data oid status>
Release Information	Command introduced in Junos OS Release 12.1X47-D15.
Description	Display the vital data of MIB OIDs.
Options	data —Display detailed vital data of the current day. oid —Display configured OID or group. status —Display the settings of the vital log.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • log-vital on page 2067
List of Sample Output	show system log-vital data on page 2134 show system log-vital oid on page 2135 show system log-vital status on page 2135
Output Fields	Table 280 on page 2133 lists the output fields for the show system log-vital command. Output fields are listed in the approximate order in which they appear.

Table 280: show system log-vital Output fields

Field Name	Field Description
Node	Identification number of the node. It can be 0 or 1.
SPU	Identification of Services Processing Unit.
CPU	CPU usage of SPU in percentage.
Mem	Memory usage of SPU in percentage.
Flow-Sess	Number of flow sessions.
CP-Sess	Number of central point sessions.
IPv4-Sess	Number of IPv4 sessions.
IPv6-Sess	Number of IPv6 sessions.
CP-IPv4	Number of central point IPv4 sessions.
CP-IPv6	Number of central point IPv6 sessions.

Table 280: show system log-vital Output fields (*continued*)

Field Name	Field Description
OID list	OIDs that are being monitored.
OID number	Number of OIDs that are being monitored.
Group SPU list	SPUs that are being monitored.
Group SPU number	Number of SPU's that are being monitored.
Group screen list	Security zones whose screen stats are being monitored.
Group screen number	Number of security zones whose screen stats are being monitored.
Group	A set of OIDs. Once a group is enabled, all OIDs in the group are monitored.
interval	Number of minutes used for the data collection interval.
file-days	Number of days for the dump file to be stored.
storage-limit	Storage usage limit in percentage.
file-size	Size of the current dump file.
state	Number that indicates which state the current collection is in. It could indicate IDLE or ONGOING .
snmp mgmt-sock op number	Stat number of the querying MIB.
current timer counter	Number that indicates the collection timer.

Accessing Standards Documents on the Internet

The following information about the location of standards on the Internet is accurate as of February 2011. It is subject to change and is provided only as a courtesy to the reader.

Information about accessing MIBs is provided in the entry for each MIB.

- ANSI standards are published by the American National Standards Institute. You can search for specific standards at <http://webstore.ansi.org>.
- FRF (Frame Relay Forum) standards are published by the Broadband Forum. They can be accessed at <http://www.broadband-forum.org>.
- GR (Generic Requirements) standards are published by Telcordia. Information about them can be accessed by clicking the “Document Center” link at <http://telecom-info.telcordia.com/site-cgi/ido/>.
- IEEE standards are published by the Institute of Electrical and Electronics Engineers. They can be accessed at <http://standards.ieee.org/getieee802/index.html>.
- ISO/IEC standards are published by the International Organization for Standardization/International Electrotechnical Commission. They can be accessed at http://www.iso.org/iso/iso_catalogue/catalogue_tc/.
- INCITS standards are published by the InterNational Committee for Information Technology Standards. They can be accessed at <https://standards.incits.org/>.
- Internet drafts are published by the Internet Engineering Task Force (IETF). They can be accessed at <http://tools.ietf.org/id/>.
- ITU–T Recommendations are published by the International Telecommunication Union. They can be accessed at <http://www.itu.int/rec/T-REC>.
- RFCs are published by the IETF. They can be accessed at <http://www.ietf.org/rfc.html>.

CHAPTER 38

- [Interface Standards on page 2154](#)
- [Layer 2 Standards on page 2159](#)
- [MPLS Applications Standards on page 2161](#)
- [Packet Processing Standards on page 2166](#)
- [Routing Protocol Standards on page 2168](#)
- [Services PIC and DPC Standards on page 2181](#)
- [VPLS and VPN Standards on page 2185](#)

Chassis and System Standards

- [Supported BOOTP and DHCP Standards on page 2141](#)
- [Supported Mobile IP Standards on page 2142](#)
- [Supported Network Management Standards on page 2143](#)
- [Supported RADIUS and TACACS+ Standards for User Authentication on page 2152](#)
- [Supported System Access Standards on page 2153](#)
- [Supported Time Synchronization Standard on page 2153](#)

Supported BOOTP and DHCP Standards

The Junos OS substantially supports the following RFCs, which define standards for bootstrap protocol (BOOTP) and Dynamic Host Control Protocol (DHCP).

- RFC 951, *BOOTSTRAP PROTOCOL (BOOTP)*
- RFC 1001, *PROTOCOL STANDARD FOR A NetBIOS SERVICE ON A TCP/UDP TRANSPORT: CONCEPTS AND METHODS*
- RFC 1002, *PROTOCOL STANDARD FOR A NetBIOS SERVICE ON A TCP/UDP TRANSPORT: DETAILED SPECIFICATIONS*
- RFC 1035, *DOMAIN NAMES - IMPLEMENTATION AND SPECIFICATION*
- RFC 1534, *Interoperation Between DHCP and BOOTP*
- RFC 1700, *ASSIGNED NUMBERS*

- RFC 2131, *Dynamic Host Configuration Protocol*
DHCP over virtual LAN (VLAN)-tagged interfaces is not supported.
- RFC 2132, *DHCP Options and BOOTP Vendor Extensions*
- RFC 3046, *DHCP Relay Agent Information Option*
- RFC 3118, *Authentication for DHCP Messages*
Only Section 4, "Configuration token," is supported.
- RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*
Address assignment is supported with IP version 4 (IPv4) but not IP version 6 (IPv6).
- RFC 3397, *Dynamic Host Configuration Protocol (DHCP) Domain Search Option*
- RFC 3633, *IPv6 Prefix Options for Dynamic Host Configuration Protocol (DHCP) version 6*
- RFC 3925, *Vendor-Identifying Vendor Options for Dynamic Host Configuration Protocol version 4 (DHCPv4)*
- RFC 4649, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Relay Agent Remote-ID Option*

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Mobile IP Standards

The Junos OS supports only static configuration of home agent addresses and IP tunnels; dynamic configuration is not supported. The Junos OS does not support the Mobile IP foreign agent, accounting, QoS, policy, data path, or logical interfaces per mobile node (for a mobile subscriber).

The Junos OS substantially supports the following RFCs, which define standards for Mobile IP.

- RFC 2794, *Mobile IP Network Access Identifier Extension for IPv4*
- RFC 3024, *Reverse Tunneling for Mobile IP, revised*
- RFC 3344, *IP Mobility Support for IPv4*
Only the Mobile IP home agent is supported.
- RFC 3543, *Registration Revocation in Mobile IPv4*
- RFC 4433, *Mobile IPv4 Dynamic Home Agent (HA) Assignment*

The following RFC does not define a standard, but provides information about Mobile IP. The IETF classifies it as “Informational.”

- RFC 2977, *Mobile IP Authentication, Authorization, and Accounting Requirements*

Accounting is not supported.

Related Documentation

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Network Management Standards

The Junos OS supports the majority of network management features defined in the following standards documents.

- Extended Security Options (ESO) Consortium, *ESO Consortium MIB*.

As of February 2011, the text of this MIB is accessible at <http://www.snmp.com/eso/esoConsortiumMIB.txt>.

- Institute of Electrical and Electronics Engineers (IEEE) Standard 802.3ad, *Aggregation of Multiple Link Segments* (published as Clause 43 in Section 3 of the 802.3 specification)

Only the following MIB objects are supported:

- dot3adAggPortDebugActorChangeCount
- dot3adAggPortDebugActorSyncTransitionCount
- dot3adAggPortDebugMuxState
- dot3adAggPortDebugPartnerChangeCount
- dot3adAggPortDebugPartnerSyncTransitionCount
- dot3adAggPortDebugRxState
- dot3adAggPortListTable
- dot3adAggPortStatsTable
- dot3adAggPortTable
- dot3adAggTable
- dot3adTablesLastChanged
- Integrated Local Management Interface (ILMI) MIB in the *Integrated Local Management Interface (ILMI) Specification, Version 4.0*.
As of February 2011, this document is accessible at <http://www.broadband-forum.org/ftp/pub/approved-specs/af-ilmi-0065.000.pdf>.
Only the **atmfMYIPNmAddress** and **atmfPortMyIfname** objects are supported.
- Internet Assigned Numbers Authority (IANA), *IANAiftype Textual Convention MIB* (referenced by RFC 2863, *The Interfaces Group MIB*)

As of February 2011, the text of this MIB is accessible at

<http://www.iana.org/assignments/ianaiftype-mib>.

- RFC 1122, *Requirements for Internet Hosts -- Communication Layers*
- RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*
- RFC 1156, *Management Information Base for Network Management of TCP/IP-based internets*
- RFC 1157, *A Simple Network Management Protocol (SNMP)*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*

Only the following MIB objects are supported:

- isisAdjIPAddr
- isisAreaAddr
- isisCirc
- isisCircLevel
- isisIPRA
- isisISAdj
- isisISAdjAreaAddr
- isisISAdjProtSupp
- isisMANAreaAddr
- isisPacketCount
- isisRa
- isisSysProtSupp
- isisSummAddr
- isisSystem
- RFC 1212, *Concise MIB Definitions*

- RFC 1213, *Management Information Base for Network Management of TCP/IP-based internets: MIB-II*

Only the following features are supported:

- Junos-specific secured access list
- Master configuration keywords
- MIB II and its SNMP version 2 derivatives, including the following:
 - Interface management
 - IP (except for the **ipRouteTable** object which has been replaced by **ipCidrRouteTable** [RFC 2096, *IP Forwarding Table MIB*])
 - SNMP management
 - Statistics counters
- Reconfigurations upon receipt of the SIGHUP signal
- SNMP version 1 **Get** and **GetNext** requests and version 2 **GetBulk** requests

- RFC 1215, *A Convention for Defining Traps for use with the SNMP*

Only MIB II SNMP version 1 traps and version 2 notifications are supported.

- RFC 1406, *Definitions of Managed Objects for the DS1 and E1 Interface Types* (obsoleted by RFC 2495)

The T1 MIB is supported.

- RFC 1407, *Definitions of Managed Objects for the DS3/E3 Interface Type* (obsoleted by RFC 2496)

The T3 MIB is supported.

- RFC 1472, *The Definitions of Managed Objects for the Security Protocols of the Point-to-Point Protocol*
- RFC 1473, *The Definitions of Managed Objects for the IP Network Control Protocol of the Point-to-Point Protocol*
- RFC 1657, *Definitions of Managed Objects for the Fourth Version of the Border Gateway Protocol (BGP-4) using SMIv2*

The **bgpBackwardTransition** and **bgpEstablished** notifications are not supported.

- RFC 1695, *Definitions of Managed Objects for ATM Management Version 8.0 Using SMIv2* (obsoleted by RFC 2515)
- RFC 1724, *RIP Version 2 MIB Extension*

- RFC 1850, *OSPF Version 2 Management Information Base*

The following features are not supported:

- Host Table
- **ospfLsdbApproachingOverflow** trap
- **ospfLsdbOverflow** trap
- **ospfOriginateLSA** trap
- **ospfOriginateNewLsas** MIB object
- **ospfRxNewLsas** MIB object
- RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)* (obsoleted by RFC 3416)
- RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)* (obsoleted by RFC 3418)
- RFC 2011, *SNMPv2 Management Information Base for the Internet Protocol using SMIv2*
- RFC 2012, *SNMPv2 Management Information Base for the Transmission Control Protocol using SMIv2*
- RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol using SMIv2*
- RFC 2068, *Hypertext Transfer Protocol -- HTTP/1.1*
- RFC 2096, *IP Forwarding Table MIB*

The **ipCidrRouteTable** object is extended to include the tunnel name when the next hop is through an RSVP-signaled label-switched path (LSP).

- RFC 2115, *Management Information Base for Frame Relay DTEs Using SMIv2*

Only the **frDlcmiTable** object is supported.

- RFC 2233, *The Interfaces Group MIB using SMIv2* (obsoleted by RFC 2863)
- RFC 2287, *Definitions of System-Level Managed Objects for Applications*

Only the following MIB objects are supported:

- **sysApplElmtRunTable**
- **sysApplInstallElmtTable**
- **sysApplInstallPkgTable**
- **sysApplMapTable**
- RFC 2465, *Management Information Base for IP Version 6: Textual Conventions and General Group*

IP version 6 (IPv6) and Internet Control Message Protocol version 6 (ICMPv6) statistics are not supported.

- RFC 2466, *Management Information Base for IP Version 6: ICMPv6 Group*

- RFC 2495, *Definitions of Managed Objects for the DS1, E1, DS2 and E2 Interface Types*

The following MIB objects are not supported:

- **dsx1FarEndConfigTable**
- **dsx1FarEndCurrentTable**
- **dsx1FarEndIntervalTable**
- **dsx1FarEndTotalTable**
- **dsx1FracTable**

- RFC 2496, *Definitions of Managed Objects for the DS3/E3 Interface Type*

The following MIB objects are not supported:

- **dsx3FarEndConfigTable**
- **dsx3FarEndCurrentTable**
- **dsx3FarEndIntervalTable**
- **dsx3FarEndTotalTable**
- **dsx3FracTable**

- RFC 2515, *Definitions of Managed Objects for ATM Management*

The following MIB objects are not supported:

- **aal5VccTable**
- **atmVcCrossConnectTable**
- **atmVpCrossConnectTable**

- RFC 2558, *Definitions of Managed Objects for the SONET/SDH Interface Type* (obsoleted by RFC 3592)

- RFC 2571, *An Architecture for Describing SNMP Management Frameworks*

Only read-only access is supported.

- RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (obsoleted by RFC 3412)

Only read-only access is supported.

- RFC 2578, *Structure of Management Information Version 2 (SMIv2)*
- RFC 2579, *Textual Conventions for SMIv2*
- RFC 2580, *Conformance Statements for SMIv2*
- RFC 2665, *Definitions of Managed Objects for the Ethernet-like Interface Types*
- RFC 2667, *IP Tunnel MIB*
- RFC 2787, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol*

The following features are not supported:

- Row creation
- **Set** operation
- **vrpStatsPacketLengthErrors** MIB object
- RFC 2790, *Host Resources MIB*

Only the following MIB objects are supported:

- **hrStorageTable** object. The file systems **/**, **/config**, **/var**, and **/tmp** always return the same index number. When SNMP restarts, the index numbers for the remaining file systems might change.
- Objects in the **hrSystem** group.
- Objects in the **hrSWInstalled** group.
- RFC 2819, *Remote Network Monitoring Management Information Base*

Only the following MIB objects are supported:

- **alarmTable**
- **etherStatsTable** object for Ethernet interfaces
- **eventTable**
- **logTable**
- RFC 2863, *The Interfaces Group MIB*
- RFC 2864, *The Inverted Stack Table Extension to the Interfaces Group MIB*
- RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*

Only the following MIB objects are supported:

- **pingCtlTable**
- **pingMaxConcurrentRequests**
- **pingProbeHistoryTable**
- **pingResultsTable**
- **traceRouteCtlTable**
- **traceRouteHopsTable**
- **traceRouteProbeHistoryTable**
- **traceRouteResultsTable**
- RFC 2932, *IPv4 Multicast Routing MIB*
- RFC 2933, *Internet Group Management Protocol MIB*
- RFC 2981, *Event MIB*

- RFC 3014, *Notification Log MIB*
- RFC 3019, *IP Version 6 Management Information Base for The Multicast Listener Discovery Protocol*
- RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*
- RFC 3412, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)*
- RFC 3413, *Simple Network Management Protocol (SNMP) Applications*

The proxy MIB is not supported.

- RFC 3414, *User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)*
- RFC 3415, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)*
- RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*
- RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*
- RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*
- RFC 3498, *Definitions of Managed Objects for Synchronous Optical Network (SONET) Linear Automatic Protection Switching (APS) Architectures*

Support is implemented under the Juniper Networks enterprise branch.

- RFC 3592, *Definitions of Managed Objects for the Synchronous Optical Network/Synchronous Digital Hierarchy (SONET/SDH) Interface Type*
- RFC 3811, *Definitions of Textual Conventions (TCs) for Multiprotocol Label Switching (MPLS) Management*

- RFC 3812, *Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) Management Information Base (MIB)*

Only read-only access is supported, and the following features and MIB objects are not supported:

- MPLS tunnels as interfaces
- **mplsTunnelCRLDResTable** object
- **mplsTunnelPerfTable** object
- The following objects in the **TunnelResource** table:
 - **mplsTunnelResourceExBurstSize**
 - **mplsTunnelResourceMaxBurstSize**
 - **mplsTunnelResourceMeanBurstSize**
 - **mplsTunnelResourceMeanRate**
 - **mplsTunnelResourceWeight**

The **mplsTunnelCHopTable** object is supported on ingress routers only.

NOTE: The branch used by the proprietary LDP MIB (**ldpmib.mib**) conflicts with RFC 3812. **ldpmib.mib** has been deprecated and replaced by **jnx-mpls-ldp.mib**.

- RFC 3813, *Multiprotocol Label Switching (MPLS) Label Switching Router (LSR) Management Information Base (MIB)*

Only read-only access is supported, and the following MIB objects are not supported:

- **mplsInSegmentMapTable**
- **mplsInSegmentPerfTable**
- **mplsInterfacePerfTable**
- **mplsOutSegmentPerfTable**
- **mplsXCDown**
- **mplsXCUp**

- RFC 3815, *Definitions of Managed Objects for the Multiprotocol Label Switching (MPLS), Label Distribution Protocol (LDP)*

Only the following MIB objects are supported:

- **mplsLdpLsrID**
- **mplsLdpSesPeerAddrTable**
- RFC 3826, *The Advanced Encryption Standard (AES) Cipher Algorithm in the SNMP User-based Security Model*

- RFC 4188, *Definitions of Managed Objects for Bridges*
- Internet draft draft-ietf-bfd-mib-02.txt, *Bidirectional Forwarding Detection Management Information Base*

Only read-only access is supported, and the **bfdSessDown** and **bfdSessUp** traps are supported. Objects in the **bfdSessMapTable** and **bfdSessPerfTable** tables are not supported. The MIB that supports this draft is **mib-jnx-bfd-exp.txt** under the Juniper Networks Enterprise **jnxExperiment** branch.

- Internet draft draft-ietf-idr-bgp4-mibv2-04.txt, *Definitions of Managed Objects for the Fourth Version of Border Gateway Protocol (BGP-4), Second Version*

Only the following MIB objects are supported:

- **jnxBgpM2PrefixInPrefixes**
- **jnxBgpM2PrefixInPrefixesAccepted**
- **jnxBgpM2PrefixInPrefixesRejected**
- Internet draft draft-ietf-isis-wg-mib-07.txt, *Management Information Base for IS-IS*

Only the following tables are supported:

- **isisISAdjAreaAddrTable**
- **isisISAdjIPAddrTable**
- **isisISAdjProtSuppTable**
- **isisISAdjTable**
- Internet draft draft-ietf-msdp-mib-08.txt, *Multicast Source Discovery protocol MIB*

The following MIB objects are not supported:

- **msdpBackwardTransition**
- **msdpEstablished**
- **msdpRequestsTable**
- Internet draft draft-ietf-ospf-ospfv3-mib-11.txt, *Management Information Base for OSPFv3*

Only read-only access is supported, and only for the **ospfv3NbrTable** table. The MIB that supports this draft is **mib-jnx-ospfv3mib.txt** under the Juniper Networks Enterprise **jnxExperiment** branch; MIB object names are prefixed with **jnx** (for example, **jnxOspfv3NbrAddressType**).

- Internet draft draft-reeder-snmpv3-usm-3desede-00.txt, *Extension to the User-Based Security Model (USM) to Support Triple-DES EDE in "Outside" CBC Mode*

The following RFCs do not define standards, but provide information about network management. The IETF classifies them variously as “Best Current Practice,” “Experimental” or “Informational.”

- RFC 1901, *Introduction to Community-based SNMPv2*
- RFC 2330, *Framework for IP Performance Metrics*
- RFC 2934, *Protocol Independent Multicast MIB for IPv4*
- RFC 3410, *Introduction and Applicability Statements for Internet Standard Management Framework*
- RFC 3584, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*

**Related
Documentation**

Supported RADIUS and TACACS+ Standards for User Authentication

For validation of the identity of users who attempt to access a router, the Junos OS supports RADIUS authentication, TACACS+ authentication, and authentication by means of Junos user accounts configured on the router. The Junos OS supports the configuration of Juniper Networks-specific RADIUS and TACACS+ attributes, and the creation of template accounts.

All users who can log in to the router must already be assigned to a Junos login class. A *login class* defines its members' access privileges during a login session, the commands they can and cannot issue, the configuration statements they can and cannot view or change, and the idle time before a member's login session is terminated.

The Junos OS substantially supports the following RFCs, which define standards for RADIUS and TACACS+.

- RFC 1492, *An Access Control Protocol, Sometimes Called TACACS*
- RFC 2865, *Remote Authentication Dial In User Service (RADIUS)*
- RFC 3162, *RADIUS and IPv6*
- RFC 4818, *RADIUS Delegated-IPv6-Prefix Attribute*

The following Internet drafts do not define standards, but provide information about RADIUS. The IETF classifies them as “Informational.”

- RFC 2866, *RADIUS Accounting*
- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*
- RFC 2869, *RADIUS Extensions*
- RFC 4679, *DSL Forum Vendor-Specific RADIUS Attributes*
- RFC 5176, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*

Supported System Access Standards

The Junos OS substantially supports the following protocols and applications for remote access to routers: telnet, FTP, rlogin, and finger. In addition, the Canada and U.S. version of the Junos OS substantially supports SSH as an access protocol.

The Junos OS substantially supports RFC 1994, *PPP Challenge Handshake Authentication Protocol (CHAP)*.

The Canada and U.S. version of the Junos OS substantially supports the following RFCs, which define standards for technologies used with Secure Sockets Layer (SSL):

- RFC 1319, *The MD2 Message-Digest Algorithm*
- RFC 1321, *The MD5 Message-Digest Algorithm*
- RFC 2246, *The TLS Protocol Version 1.0*
- RFC 3280, *Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile*

The following RFCs provide information about TFTP, which Junos OS supports as a remote access protocol. The IETF does not include the RFCs in its Standards track, instead assigning them status “Unknown (Legacy Stream)”.

- RFC 783, *THE TFTP PROTOCOL (REVISION 2)*.
- RFC 906, *Bootstrap Loading using TFTP*.

- Related Documentation**
- [Supported RADIUS and TACACS+ Standards for User Authentication on page 2152](#)
 - [Accessing Standards Documents on the Internet on page 2139](#)

Supported Time Synchronization Standard

The Junos OS substantially supports RFC 1305, *Network Time Protocol (Version 3) Specification, Implementation and Analysis*.

RFC 2030, *Simple Network Time Protocol (SNTP) Version 4 for IPv4, IPv6 and OSI*, does not define a standard, but provides information about time synchronization technology. The IETF classifies it as “Informational.”

In CLI operational mode, you can set the current date and time on the router manually or from an NTP server.

- [Supported Serial Interface Standards on page 2158](#)
- [Supported T3 Interface Standard on page 2158](#)

Supported ATM Interface Standards

The Junos OS substantially supports the following standards for Asynchronous Transfer Mode (ATM) interfaces.

- International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation I.432.3, *B-ISDN user-network interface - Physical layer specification: 1544 kbit/s and 2048 kbit/s operation*
- RFC 1483, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*

Only routed protocol data units (PDUs) are supported.

- RFC 2225, *Classical IP and ARP over ATM*

Only responses are supported.

- RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*

Only routed PDUs and Ethernet bridged PDUs are supported.

- IEEE Standard 802.1s, *IEEE Standard for Multiple Instances of Spanning Tree Protocol (MSTP)---Virtual Bridged Local Area Networks*
- IEEE Standard 802.3, *IEEE Standard for Information technology—Telecommunications and information exchange between systems—Local and metropolitan area networks—Specific requirements, Part 3: Carrier sense multiple access with Collision Detection (CSMA/CD) Access Method and Physical Layer Specifications*
- IEEE Standard 802.3ab, *1000BASE-T* (published as Clause 40 in Section 3 of the 802.3 specification)
- IEEE Standard 802.3ad, *Aggregation of Multiple Link Segments* (published as Clause 43 in Section 3 of the 802.3 specification)
- IEEE Standard 802.3ae, *10-Gigabit Ethernet* (published as Clauses 44-53 in Section 4 of the 802.3 specification)
- IEEE Standard 802.3ah, *Operations, Administration, and Maintenance (OAM)* (published as Clause 57 in Section 5 of the 802.3 specification)
- IEEE Standard 802.3z, *1000BASE-X* (published as Clauses 34-39, 41-42 in Section 3 of the 802.3 specification)
- InterNational Committee for Information Technology Standards (INCITS) T11, *Fibre Channel Interfaces*
- International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation Y.1731, *OAM functions and mechanisms for Ethernet based networks*

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Frame Relay Interface Standards

The Junos OS substantially supports the following standards for Frame Relay interfaces.

- American National Standards Institute (ANSI), *Annex D, Additional Procedures for Permanent Virtual Connections (PVCs) Using Unnumbered Information Frames* to T1.617-1991, *Integrated Services Digital Network (ISDN)—Signaling Specification for Frame Relay Bearer Service for Digital Subscriber Signaling System Number 1 (DSS1)*
- Broadband Forum standard FRF.12, *Frame Relay Fragmentation Implementation Agreement*
- FRF.15, *End-to-End Multilink Frame Relay Implementation Agreement*
- FRF.16.1, *Multilink Frame Relay UNI/NNI Implementation Agreement*
- International Telecommunication Union–Telecommunication Standardization (ITU–T), *Annex A, Additional procedures for Permanent Virtual Connection (PVC) status management (using Unnumbered Information frames)* to Recommendation Q.933,

ISDN Digital Subscriber Signalling System No. 1 (DSS1) - Signalling specifications for frame mode switched and permanent virtual connection control and status monitoring

- RFC 1973, *PPP in Frame Relay*
- RFC 2390, *Inverse Address Resolution Protocol*
- RFC 2427, *Multiprotocol Interconnect over Frame Relay* (obsoletes RFC 1490)
- RFC 2590, *Transmission of IPv6 Packets over Frame Relay Networks Specification*
- Internet draft draft-martini-frame-encap-mpls-01.txt, *Frame Relay Encapsulation over Pseudo-Wires* (expires December 2002)

Translation of the command/response bit and sequence numbers and padding are not supported.

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported GRE and IP-IP Interface Standards

The Junos OS substantially supports the following RFCs, which define standards for generic routing encapsulation (GRE) and IP-IP interfaces.

- RFC 2003, *IP Encapsulation within IP*
- RFC 2784, *Generic Routing Encapsulation (GRE)*
- RFC 2890, *Key and Sequence Number Extensions to GRE*

The key field is supported, but the sequence number field is not.

The following RFCs do not define standards, but provide information about GRE, IP-IP, and related technologies. The IETF classifies them as “Informational.”

- RFC 1701, *Generic Routing Encapsulation (GRE)*
- RFC 1702, *Generic Routing Encapsulation over IPv4 networks*
- RFC 2547, *BGP/MPLS VPNs* (over GRE tunnels)

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported PPP Interface Standards

The Junos OS substantially supports the following RFCs, which define standards for Point-to-Point Protocol (PPP) interfaces.

- RFC 1332, *The PPP Internet Protocol Control Protocol (IPCP)*
- RFC 1334, *PPP Authentication Protocols*
- RFC 1661, *The Point-to-Point Protocol (PPP)*
- RFC 1662, *PPP in HDLC-like Framing*

- RFC 1989, *PPP Link Quality Monitoring*
- RFC 1990, *The PPP Multilink Protocol (MP)*
- RFC 2364, *PPP Over AAL5*
- RFC 2615, *PPP over SONET/SDH*
- RFC 2686, *The Multi-Class Extension to Multi-Link PPP*

The following features are not supported:

- Negotiation of address field compression and protocol field compression PPP NCP options; instead, a full 4-byte PPP header is always sent
- Prefix elision
- RFC 3021, *Using 31-Bit Prefixes on IPv4 Point-to-Point Links*

The following RFCs do not define standards, but provide information about PPP. The IETF classifies them as “Informational.”

- RFC 1877, *PPP Internet Protocol Control Protocol Extensions for Name Server Addresses*
- RFC 2153, *PPP Vendor Extensions*

Related Documentation

Supported SDH and SONET Interface Standards

The Junos OS substantially supports the following standards for SDH and SONET interfaces.

- American National Standards Institute (ANSI) standard T1.105-2001, *Synchronous Optical Network (SONET) – Basic Description including Multiplex Structure, Rates, and Formats*
- ANSI standard T1.105.02-2001, *Synchronous Optical Network (SONET) – Payload Mappings*
- ANSI standard T1.105.06-2002, *Synchronous Optical Network (SONET): Physical Layer Specifications*
- GR-253-CORE (Telcordia Generic Requirements standard), *Synchronous Optical Network (SONET) Transport Systems: Common Generic Criteria* (replaces GR-1377-CORE, *SONET OC-192 Transport System Generic Criteria*)
- GR-499-CORE, *Transport Systems Generic Requirements (TSGR): Common Requirements*
- International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation G.691, *Optical interfaces for single channel STM-64 and other SDH systems with optical amplifiers*
- ITU–T Recommendation G.707 (1996), *Network node interface for the synchronous digital hierarchy (SDH)*

- ITU–T Recommendation G.783 (1994), *Characteristics of synchronous digital hierarchy (SDH) equipment functional blocks*
- ITU–T Recommendation G.813 (1996), *Timing characteristics of SDH equipment slave clocks (SEC)*
- ITU–T Recommendation G.825 (1993), *The control of jitter and wander within digital networks which are based on the synchronous digital hierarchy (SDH)*
- ITU–T Recommendation G.826 (1999), *Error performance parameters and objectives for international, constant bit-rate digital paths at or above the primary rate*
- ITU–T Recommendation G.831 (1993), *Management capabilities of transport networks based on the synchronous digital hierarchy (SDH)*
- ITU–T Recommendation G.957 (1995), *Optical interfaces for equipments and systems relating to the synchronous digital hierarchy*
- ITU–T Recommendation G.958 (1994), *Digital line systems based on the synchronous digital hierarchy for use on optical fibre cables*
- ITU–T Recommendation I.432 (1993), *B-ISDN user-network interface – Physical layer specification*
- RFC 1619, *PPP over SONET/SDH*

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Serial Interface Standards

The Junos OS substantially supports the following standards for serial interfaces.

- International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation V.35, *Data transmission at 48 kilobits per second using 60-108 kHz group band circuits*
- ITU–T Recommendation X.21 (1992), *Interface between Data Terminal Equipment and Data Circuit-terminating Equipment for synchronous operation on public data networks*

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported T3 Interface Standard

The Junos OS substantially supports International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation G.703, *Physical/electrical characteristics of hierarchical digital interfaces*.

**Related
Documentation**

Layer 2 Standards

- [Supported Layer 2 Networking Standards on page 2159](#)
- [Supported L2TP Standards on page 2159](#)
- [Supported Layer 2 Circuit Standards on page 2160](#)
- [Supported Layer 2 VPN Standard on page 2160](#)

Supported Layer 2 Networking Standards

The Junos OS substantially supports the following standards for Layer 2 networking.

- Institute of Electrical and Electronics Engineers (IEEE) Standard 802.1ab, *IEEE Standard for Local and metropolitan area networks—Station and Media Access Control Connectivity Discovery*
- IEEE Standard 802.1D, *IEEE Standard for Local and Metropolitan Area Networks: Media Access Control (MAC) Bridges*

This document includes the standard for Rapid Spanning Tree Protocol (RSTP), which is often referred to as 802.1w. It also discusses Quality of Service (QoS) at the MAC level, often referred to as 802.1p.

Related Documentation

- [Supported L2TP Standards on page 2159](#)
- [Supported Layer 2 Circuit Standards on page 2160](#)
- [Supported Layer 2 VPN Standard on page 2160](#)
- [Accessing Standards Documents on the Internet on page 2139](#)

Supported L2TP Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following RFC, which defines the standard for Layer 2 Tunneling Protocol (L2TP).

- RFC 2661, *Layer Two Tunneling Protocol “L2TP”*

The following RFC does not define a standard, but provides information about technology related to L2TP. The IETF classifies it as “Informational.”

- RFC 2866, *RADIUS Accounting*

Related Documentation

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Layer 2 Circuit Standards

The Junos OS substantially supports the following RFCs, which define standards for Layer 2 circuits.

- RFC 4447, *Pseudowire Setup and Maintenance Using the Label Distribution Protocol (LDP)*

The Junos OS does not support Section 5.3, “The Generalized PWid FEC Element.”

- RFC 4448, *Encapsulation Methods for Transport of Ethernet over MPLS Networks*

The following Internet drafts do not define standards, but provide information about Layer 2 technologies. The IETF classifies them as “Historic.”

- Internet draft draft-martini-l2circuit-encap-mpls-11.txt, *Encapsulation Methods for Transport of Layer 2 Frames Over IP and MPLS Networks*

The Junos OS differs from the Internet draft in the following ways:

- A packet with a sequence number of 0 (zero) is treated as out of sequence.
- Any packet that does not have the next incremental sequence number is considered out of sequence.
- When out-of-sequence packets arrive, the expected sequence number for the neighbor is set to the sequence number in the Layer 2 circuit control word.
- Internet draft draft-martini-l2circuit-trans-mpls-19.txt, *Transport of Layer 2 Frames Over MPLS*

MPLS Applications Standards

- [Supported GMPLS Standards on page 2161](#)
- [Supported LDP Standards on page 2162](#)
- [Supported MPLS Standards on page 2163](#)
- [Supported RSVP Standards on page 2165](#)

Supported GMPLS Standards

The Junos OS substantially supports the following RFCs and Internet drafts, which define standards for Generalized MPLS (GMPLS).

- RFC 3471, *Generalized Multi-Protocol Label Switching (GMPLS) Signaling Functional Description*

Only the following features are supported:

- Bidirectional LSPs (upstream label only)
- Control channel separation
- Generalized label (suggested label only)
- Generalized label request (bandwidth encoding only)
- RFC 3473, *Generalized Multi-Protocol Label Switching (GMPLS) Signaling Resource Reservation Protocol-Traffic Engineering (RSVP-TE) Extensions*
Only Section 9, "Fault Handling," is supported.
- RFC 4206, *Label Switched Paths (LSP) Hierarchy with Generalized Multi-Protocol Label Switching (GMPLS) Traffic Engineering (TE)*
- Internet draft draft-ietf-ccamp-gmpls-routing-09.txt, *Routing Extensions in Support of Generalized Multi-Protocol Label Switching*
Only interface switching is supported.
- Internet draft draft-ietf-ccamp-gmpls-rsvp-te-ason-02.txt, *Generalized MPLS (GMPLS) RSVP-TE Signalling in support of Automatically Switched Optical Network (ASON)* (expires January 2005)
- Internet draft draft-ietf-ccamp-gmpls-sonet-sdh-08.txt, *Generalized Multi-Protocol Label Switching Extensions for SONET and SDH Control*
Only S,U,K,L,M-format labels and SONET traffic parameters are supported.
- Internet draft draft-ietf-ccamp-lmp-10.txt, *Link Management Protocol (LMP)*

- Internet draft draft-ietf-ccamp-ospf-gmpls-extensions-12.txt, *OSPF Extensions in Support of Generalized Multi-Protocol Label Switching*

The following sub-TLV types for the Link type, link, value (TLV) are not supported:

- Link Local/Remote Identifiers (type 11)
- Link Protection Type (type 14)
- Shared Risk Link Group (SRLG) (type 16)

The features described in Section 2 of the draft, “Implications on Graceful Restart,” are also not supported.

The Interface Switching Capability Descriptor (type 15) sub-TLV type is implemented, but only for packet switching.

- Internet draft draft-ietf-mpls-bundle-04.txt, *Link Bundling in MPLS Traffic Engineering*

Related Documentation

- [Supported LDP Standards on page 2162](#)
- [Supported MPLS Standards on page 2163](#)
- [Supported RSVP Standards on page 2165](#)
- [Accessing Standards Documents on the Internet on page 2139](#)

Supported LDP Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for LDP.

- RFC 3212, *Constraint-Based LSP Setup using LDP*
- RFC 3478, *Graceful Restart Mechanism for Label Distribution Protocol*
- Internet draft draft-napierala-mpls-targeted-mldp-01.txt, *Using LDP Multipoint Extensions on Targeted LDP Sessions*

The following RFCs do not define standards, but provide information about LDP. The IETF classifies them as “Informational.”

- RFC 3215, *LDP State Machine*
- RFC 5036, *LDP Specification*

For the following features described in the indicated sections of the RFC, Junos OS supports one of the possible modes but not the others:

- Label distribution control (section 2.6.1): Ordered mode is supported, but not Independent mode.
- Label retention (section 2.6.2): Liberal mode is supported, but not Conservative mode.
- Label advertisement (section 2.6.3): Downstream Unsolicited mode is supported, but not Downstream on Demand mode.

- RFC 5443, *LDP IGP Synchronization*

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported MPLS Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for MPLS and traffic engineering.

- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 3031, *Multiprotocol Label Switching Architecture*
- RFC 3032, *MPLS Label Stack Encoding*
- RFC 3140, *Per Hop Behavior Identification Codes*
- RFC 3270, *Multi-Protocol Label Switching (MPLS) Support of Differentiated Services*
Only E-LSPs are supported.

- RFC 3443, *Time To Live (TTL) Processing in Multi-Protocol Label Switching (MPLS) Networks*

- RFC 3478, *Graceful Restart Mechanism for Label Distribution Protocol*

- RFC 4090, *Fast Reroute Extensions to RSVP-TE for LSP Tunnels*

Node protection in facility backup is not supported.

- RFC 4124, *Protocol Extensions for Support of Diffserv-aware MPLS Traffic Engineering*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*
- RFC 4875, *Extensions to RSVP-TE for Point-to-Multipoint TE LSPs*

- RFC 4950, *ICMP Extensions for Multiprotocol Label Switching*

- RFC 6388, *Label Distribution Protocol Extensions for Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Paths*

Only Point-to-Multipoint LSPs are supported.

- Internet draft draft-ietf-bfd-mpls-02.txt, *BFD for MPLS LSPs*

- Internet draft draft-ietf-mpls-rsvp-te-no-php-oob-mapping-01.txt, *Non PHP behavior and Out-of-Band Mapping for RSVP-TE LSPs*

- Internet draft draft-ietf-mpls-soft-preemption-02.txt, *MPLS Traffic Engineering Soft preemption*

The following RFCs and Internet drafts do not define standards, but provide information about MPLS, traffic engineering, and related technologies. The IETF classifies them variously as “Experimental,” “Historic,” or “Informational.”

- RFC 2547, *BGP/MPLS VPNs*
- RFC 2702, *Requirements for Traffic Engineering Over MPLS*
- RFC 2917, *A Core MPLS IP VPN Architecture*
- RFC 3063, *MPLS Loop Prevention Mechanism*
- RFC 3208, *PGM Reliable Transport Protocol Specification*

Only the network element is supported.

- RFC 3469, *Framework for Multi-Protocol Label Switching (MPLS)-based Recovery*
- RFC 3564, *Requirements for Support of Differentiated Services-aware MPLS Traffic Engineering*
- RFC 4125, *Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*
- RFC 4127, *Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*
- Internet draft draft-martini-l2circuit-encap-mpls-11.txt, *Encapsulation Methods for Transport of Layer 2 Frames Over IP and MPLS Networks*

Junos OS differs from the Internet draft in the following ways:

- A packet with a sequence number of 0 is treated as out of sequence.
- Any packet that does not have the next incremental sequence number is considered out of sequence.
- When out-of-sequence packets arrive, the expected sequence number for the neighbor is set to the sequence number in the Layer 2 circuit control word.
- Internet draft draft-martini-l2circuit-trans-mpls-19.txt, *Transport of Layer 2 Frames Over MPLS*
- Internet draft draft-raggarwa-mpls-p2mp-te-02.txt, *Establishing Point to Multipoint MPLS TE LSPs*

The features discussed in the indicated sections of the draft are not supported:

- Nonadjacent signaling for branch LSPs (section 7.1)
- Make-before-break and fast reroute (section 9)
- LSP hierarchy using point-to-point LSPs (section 10)

Supported RSVP Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for RSVP.

- RFC 2205, *Resource ReSerVation Protocol (RSVP)—Version 1 Functional Specification*
- RFC 2210, *The Use of RSVP with IETF Integrated Services*
- RFC 2211, *Specification of the Controlled-Load Network Element Service*
- RFC 2212, *Specification of Guaranteed Quality of Service*
- RFC 2215, *General Characterization Parameters for Integrated Service Network Elements*
- RFC 2745, *RSVP Diagnostic Messages*
- RFC 2747, *RSVP Cryptographic Authentication* (updated by RFC 3097)
- RFC 2961, *RSVP Refresh Overhead Reduction Extensions*
- RFC 3097, *RSVP Cryptographic Authentication—Updated Message Type Value*
- RFC 3209, *RSVP-TE: Extensions to RSVP for LSP Tunnels*

The Null Service Object for maximum transmission unit (MTU) signaling in RSVP is not supported.

- RFC 3473, *Generalized Multi-Protocol Label Switching (GMPLS) Signaling Resource ReSerVation Protocol-Traffic Engineering (RSVP-TE) Extensions*

Only Section 9, “Fault Handling,” is supported.

- RFC 3477, *Signalling Unnumbered Links in Resource ReSerVation Protocol - Traffic Engineering (RSVP-TE)*
- RFC 4090, *Fast Reroute Extensions to RSVP-TE for LSP Tunnels*
- RFC 4203, *OSPF Extensions in Support of Generalized Multi-Protocol Label Switching (GMPLS)*

(OSPF extensions can carry traffic engineering information over unnumbered links.)

- RFC 4558, *Node-ID Based Resource Reservation Protocol (RSVP) Hello: A Clarification Statement*
- RFC 4561, *Definition of a Record Route Object (RRO) Node-Id Sub-Object*

The RRO node ID subobject is for use in inter-AS link and node protection configurations.

- RFC 4875, *Extensions to RSVP-TE for Point-to-Multipoint TE LSPs*

The following RFCs do not define standards, but provide information about RSVP and related technologies. The IETF classifies them variously as “Experimental” or “Informational.”

- RFC 2209, *Resource ReSerVation Protocol (RSVP)—Version 1 Message Processing Rules*
- RFC 2216, *Network Element Service Specification Template*
- RFC 4125, *Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*
- RFC 4127, *Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*

Supported CoS Standards

The Junos OS substantially supports the following standards for class of service (CoS).

- IEEE Standard 802.1D, *IEEE Standard for Local and Metropolitan Area Networks: Media Access Control (MAC) Bridges*

This document discusses Quality of Service (QoS) at the MAC level, often referred to as 802.1p.

- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*

The following RFCs do not define standards, but provide information about CoS and related technologies. The IETF classifies them as “Informational.”

- RFC 2475, *An Architecture for Differentiated Services*
- RFC 2697, *A Single Rate Three Color Marker*
- RFC 2698, *A Two Rate Three Color Marker*
- RFC 2983, *Differentiated Services and Tunnels*

- RFC 3140, *Per Hop Behavior Identification Codes*
- RFC 3246, *An Expedited Forwarding PHB (Per-Hop Behavior)*
- RFC 3260, *New Terminology and Clarifications for Diffserv*

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Packet Filtering Standards

The Junos OS provides a packet-filtering language that enables you to control the flow of packets being forwarded to a network destination, as well as packets destined for and sent by the router. It substantially supports the following RFCs, which define standards for packet filtering.

- RFC 792, *INTERNET CONTROL MESSAGE PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 2460, *Internet Protocol, Version 6 (IPv6) Specification*
- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*
- RFC 3246, *An Expedited Forwarding PHB (Per-Hop Behavior)*
- RFC 4291, *IP Version 6 Addressing Architecture*
- RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*

The following RFCs do not define standards, but provide information about packet filtering and related technologies. The IETF classifies them as “Informational.”

- RFC 2267, *Network Ingress Filtering: Defeating Denial of Service Attacks which employ IP Source Address Spoofing*
- RFC 2475, *An Architecture for Differentiated Services*
- RFC 2983, *Differentiated Services and Tunnels*
- RFC 3260, *New Terminology and Clarifications for Diffserv*

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Policing Standard

The Junos OS supports policing, or rate limiting, to limit the amount of traffic that passes through an interface. For information about rate limiting, see RFC 2698, *A Two Rate Three Color Marker*.

The Junos implementation of policing uses a token-bucket algorithm and supports the following features:

- Adaptive shaping for Frame Relay traffic
- Virtual channels

Supported BGP Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for IP version 4 (IPv4) BGP.

For a list of supported IP version 6 (IPv6) BGP standards, see “[Supported IPv6 Standards](#)” on page 2174.

Junos OS BGP supports authentication for protocol exchanges (MD5 authentication).

- RFC 1745, *BGP4/IDRP for IP—OSPF Interaction*
- RFC 1772, *Application of the Border Gateway Protocol in the Internet*
- RFC 1997, *BGP Communities Attribute*
- RFC 2283, *Multiprotocol Extensions for BGP-4*

- RFC 4486, *Subcodes for BGP Cease Notification Message*
- RFC 4659, *BGP-MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN*
- RFC 4632, *Classless Inter-domain Routing (CIDR): The Internet Address Assignment and Aggregation Plan*
- RFC 4684, *Constrained Route Distribution for Border Gateway Protocol/MultiProtocol Label Switching (BGP/MPLS) Internet Protocol (IP) Virtual Private Networks (VPNs)*
- RFC 4724, *Graceful Restart Mechanism for BGP*
- RFC 4760, *Multiprotocol Extensions for BGP-4*
- RFC 4781, *Graceful Restart Mechanism for BGP with MPLS*
- RFC 4798, *Connecting IPv6 Islands over IPv4 MPLS Using IPv6 Provider Edge Routers (6PE)*

Option 4b (eBGP redistribution of labeled IPv6 routes from AS to neighboring AS) is not supported.

- RFC 4893, *BGP Support for Four-octet AS Number Space*
- RFC 5004, *Avoid BGP Best Path Transitions from One External to Another*
- RFC 5065, *Autonomous System Confederations for BGP*
- RFC 5082, *The Generalized TTL Security Mechanism (GTSM)*
- RFC 5291, *Outbound Route Filtering Capability for BGP-4 (partial support)*
- RFC 5292, *Address-Prefix-Based Outbound Route Filter for BGP-4 (partial support)*

Devices running Junos OS can receive prefix-based ORF messages.

- RFC 5396, *Textual Representation of Autonomous System (AS) Numbers*
- RFC 5492, *Capabilities Advertisement with BGP-4*
- RFC 5575, *Dissemination of flow specification rules*
- RFC 5668, *4-Octet AS Specific BGP Extended Community*
- RFC 6368, *Internal BGP as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 6810, *The Resource Public Key Infrastructure (RPKI) to Router Protocol*

- RFC 6811, *BGP Prefix Origin Validation*
- RFC 7311, *The Accumulated IGP Metric Attribute for BGP*
- Internet draft draft-ietf-idr-add-paths-04.txt, *Advertisement of Multiple Paths in BGP* (expires February 2011)
- Internet draft draft-ietf-idr-flow-spec-00.txt, *Dissemination of flow specification rules*
- Internet draft draft-ietf-idr-as0-06, *Codification of AS 0 processing* (expires February 2013)

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported ES-IS Standards

The Junos OS substantially supports the following standards for End System-to-Intermediate System (ES-IS).

- International Organization for Standardization/International Electrotechnical Commission (ISO/IEC) standard 8473, *Information technology — Protocol for providing the connectionless-mode network service*
- ISO/IEC standard 9542, *Information processing systems — Telecommunications and information exchange between systems — End system to Intermediate system routing exchange protocol for use in conjunction with the Protocol for providing the connectionless-mode network service (ISO 8473)*

- Related Documentation**
- [Accessing Standards Documents on the Internet on page 2139](#)

Supported ICMP and Neighbor Discovery Standards

The Junos OS substantially supports the following RFCs, which define standards for Internet Control Message Protocol (ICMP, for IP version 4 [IPv4]) and neighbor discovery (for IP version 6 [IPv6]).

- RFC 1256, *ICMP Router Discovery Messages*
- RFC 4861, *Neighbor Discovery for IP Version 6 (IPv6)*
- RFC 2462, *IPv6 Stateless Address Autoconfiguration*
- RFC 4862, *IPv6 Stateless Address Autoconfiguration*
- RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*
- RFC 4861, *IPv6 Stateless Address Autoconfiguration*
- RFC 4862, *Neighbor Discovery for IP version 6 (IPv6)*
- RFC 6106, *IPv6 Router Advertisement Options for DNS Configuration*

Supported IP Multicast Protocol Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for IP multicast protocols, including the Distance Vector Multicast Routing Protocol (DVMRP), Internet Group Management Protocol (IGMP), Multicast Listener Discovery (MLD), Multicast Source Discovery Protocol (MSDP), Pragmatic General Multicast (PGM), Protocol Independent Multicast (PIM), Session Announcement Protocol (SAP), and Session Description Protocol (SDP).

- RFC 1112, *Host Extensions for IP Multicasting* (defines IGMP Version 1)
- RFC 2236, *Internet Group Management Protocol, Version 2*
- RFC 2327, *SDP: Session Description Protocol*
- RFC 2710, *Multicast Listener Discovery (MLD) for IPv6*
- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 3031, *Multiprotocol Label Switching Architecture*
- RFC 3376, *Internet Group Management Protocol, Version 3*
- RFC 3590, *Source Address Selection for the Multicast Listener Discovery (MLD) Protocol*

- RFC 4601, *Protocol Independent Multicast – Sparse Mode (PIM-SM): Protocol Specification (Revised)*
- RFC 4607, *Source-Specific Multicast for IP*
- RFC 5015, *Bidirectional Protocol Independent Multicast (BIDIR-PIM)*
- *Using IGMPv3 and MLDv2 for Source-Specific Multicast*
- RFC 6513, *Multicast in MPLS/BGP IP VPNs*
- Internet draft draft-ietf-l3vpn-2547bis-mcast-bgp-08.txt, *BGP Encodings and Procedures for Multicast in MPLS/BGP IP VPNs*
- Internet draft draft-ietf-pim-sm-bsr-05.txt, *Bootstrap Router (BSR) Mechanism for PIM*

The scoping mechanism is not supported.

- Internet draft draft-raggarwa-l3vpn-2547-mvpn-00.txt, *Base Specification for Multicast in BGP/MPLS VPNs* (expires December 2004)

The following RFCs and Internet drafts do not define standards, but provide information about multicast protocols and related technologies. The IETF classifies them variously as “Best Current Practice,” “Experimental,” or “Informational.”

- RFC 1075, *Distance Vector Multicast Routing Protocol*
- RFC 2362, *Protocol Independent Multicast-Sparse Mode (PIM-SM): Protocol Specification*
- RFC 2365, *Administratively Scoped IP Multicast*
- RFC 2547, *BGP/MPLS VPNs*
- RFC 2974, *Session Announcement Protocol*
- RFC 3208, *PGM Reliable Transport Protocol Specification*
- RFC 3446, *Anycast Rendezvous Point (RP) mechanism using Protocol Independent Multicast (PIM) and Multicast Source Discovery Protocol (MSDP)*
- RFC 3569, *An Overview of Source-Specific Multicast (SSM)*
- RFC 3618, *Multicast Source Discovery Protocol (MSDP)*
- RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*
- RFC 3973, *Protocol Independent Multicast – Dense Mode (PIM-DM): Protocol Specification (Revised)*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- Internet draft draft-ietf-idmr-dvmrp-v3-11.txt, *Distance Vector Multicast Routing Protocol*
- Internet draft draft-ietf-mboned-ssm232-08.txt, *Source-Specific Protocol Independent Multicast in 232/8*
- Internet draft draft-ietf-mmusic-sap-00.txt, *SAP: Session Announcement Protocol*
- Internet draft draft-rosen-vpn-mcast-07.txt, *Multicast in MPLS/BGP VPNs*

Only section 7, “Data MDT: Optimizing flooding,” is supported.

- Related Documentation**
- [Accessing Standards Documents on the Internet on page 2139](#)

Supported IPv4, TCP, and UDP Standards

The Junos OS substantially supports the following RFCs, which define standards for Internet Protocol version 4 (IPv4), Transmission Control Protocol (TCP), and User Datagram Protocol (UDP).

- RFC 768, *User Datagram Protocol*
- RFC 791, *INTERNET PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 792, *INTERNET CONTROL MESSAGE PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 793, *TRANSMISSION CONTROL PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 826, *Ethernet Address Resolution Protocol—or—Converting Network Protocol Addresses to 48.bit Ethernet Address for Transmission on Ethernet Hardware*
- RFC 854, *TELNET PROTOCOL SPECIFICATION*
- RFC 862, *Echo Protocol*
- RFC 863, *Discard Protocol*
- RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*
- RFC 896, *Congestion Control in IP/TCP Internetworks*
- RFC 903, *A Reverse Address Resolution Protocol*
- RFC 919, *BROADCASTING INTERNET DATAGRAMS*
- RFC 922, *BROADCASTING INTERNET DATAGRAMS IN THE PRESENCE OF SUBNETS*
- RFC 950, *Internet Standard Subnetting Procedure*
- RFC 959, *FILE TRANSFER PROTOCOL (FTP)*
- RFC 1027, *Using ARP to Implement Transparent Subnet Gateways*
- RFC 1042, *A Standard for the Transmission of IP Datagrams over IEEE 802 Networks*
- RFC 1157, *A Simple Network Management Protocol (SNMP)*
- RFC 1166, *INTERNET NUMBERS*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*
- RFC 1256, *ICMP Router Discovery Messages*
- RFC 1305, *Network Time Protocol (Version 3) Specification, Implementation and Analysis*
- RFC 1519, *Classless Inter-Domain Routing (CIDR): an Address Assignment and Aggregation Strategy*
- RFC 1812, *Requirements for IP Version 4 Routers*

- RFC 2338, *Virtual Router Redundancy Protocol* (obsoleted by RFC 3768 in April 2004)
- RFC 2873, *TCP Processing of the IPv4 Precedence Field*
- RFC 3021, *Using 31-Bit Prefixes on IPv4 Point-to-Point Links*
- RFC 3246, *An Expedited Forwarding PHB (Per-Hop Behavior)*
- RFC 3768, *Virtual Router Redundancy Protocol (VRRP)*
- RFC 5798, *Virtual Router Redundancy Protocol (VRRP) Version 3 for IPv4 and IPv6*
- RFC 6527, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol Version 3 (VRRPv3)*

The following features are not supported:

- Row creation
- **Set** operation
- **vrpv3StatisticsRowDiscontinuityTime** MIB object
- **vrpv3StatisticsPacketLengthErrors** MIB object

The following RFCs do not define standards but provide information about IP, TCP, UDP, and related technologies. The IETF classifies them as “Informational.”

- RFC 1878, *Variable Length Subnet Table For IPv4*
- RFC 1948, *Defending Against Sequence Number Attacks*

**Related
Documentation**

- [Supported IPv6 Standards on page 2174](#)
- [Accessing Standards Documents on the Internet on page 2139](#)

Supported IPv6 Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for Internet Protocol version 6 (IPv6).

- RFC 1157, *A Simple Network Management Protocol (SNMP)*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*
- RFC 1213, *Management Information Base for Network Management of TCP/IP-based internets: MIB-II*

Only the following features are supported:

- Junos OS-specific secured access list
- Master configuration keywords

- MIB II and its SNMP version 2 derivatives, including the following:
 - Interface management
 - IP (except for the **ipRouteTable** object, which has been replaced by **inetCidrRouteTable** [RFC 4292, *IP Forwarding Table MIB*])

NOTE: RFC 2096 has been replaced by RFC 4292. However, Junos OS currently supports both RFC 2096 and RFC 4292.

- SNMP management
- Statistics counters
- Reconfigurations upon receipt of the SIGHUP signal
- SNMP version 1 **Get** and **GetNext** requests and version 2 **GetBulk** requests
- RFC 1215, *A Convention for Defining Traps for use with the SNMP*
Only MIB II SNMP version 1 traps and version 2 notifications are supported.
- RFC 1771, *A Border Gateway Protocol 4 (BGP-4)*
- RFC 1772, *Application of the Border Gateway Protocol in the Internet*
- RFC 1902, *Structure of Management Information for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 1981, *Path MTU Discovery for IP version 6*
- RFC 2080, *RIPng for IPv6*
- RFC 2081, *RIPng Protocol Applicability Statement*
- RFC 2283, *Multiprotocol Extensions for BGP-4*
- RFC 2373, *IP Version 6 Addressing Architecture*
- RFC 2375, *Multicast Address Assignments*
- RFC 2460, *Internet Protocol, Version 6 (IPv6) Specification*
- RFC 2464, *Transmission of IPv6 Packets over Ethernet Networks*
- RFC 2465, *Management Information Base for IP Version 6: Textual Conventions and General Group*
Internet Protocol version 6 (IPv6) and Internet Control Message Protocol version 6 (ICMPv6) statistics are not supported.
- RFC 2472, *IP Version 6 over PPP*
- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2491, *IPv6 Over Non-Broadcast Multiple Access (NBMA) networks*

- RFC 2492, *IPv6 over ATM Networks*
- RFC 2526, *Reserved IPv6 Subnet Anycast Addresses*
- RFC 2545, *Use of BGP-4 Multiprotocol Extensions for IPv6 Inter-Domain Routing*
- RFC 2578, *Structure of Management Information Version 2 (SMIv2)*
- RFC 2675, *IPv6 Jumbograms*
- RFC 2711, *IPv6 Router Alert Option*
- RFC 2740, *OSPF for IPv6* (partial support for RFC 5340)

Junos OS does not support the following components of RFC 5340:

- Multiple interfaces on the same link
 - Deprecation of Multicast Extensions to OSPF (MOSPF) for IPv6
 - Not-so-stubby area (NSSA) specification
 - Link LSA suppression
 - LSA options and prefix options updates
 - IPv6 site-local addresses
- RFC 2784, *Generic Routing Encapsulation*
 - RFC 2878, *PPP Bridging Control Protocol (BCP)*
 - RFC 2893, *Transition Mechanisms for IPv6 Hosts and Routers*
 - RFC 3306, *Unicast-Prefix-based IPv6 Multicast Addresses*
 - RFC 3307, *Allocation Guidelines for IPv6 Multicast Addresses*
 - RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*

Address assignment is supported with Internet Protocol version 4 (IPv4) but not Internet Protocol version 6 (IPv6).

- RFC 3484, *Default Address Selection for Internet Protocol version 6 (IPv6)*
- RFC 3513, *Internet Protocol Version 6 (IPv6) Addressing Architecture*
- RFC 3515, *The Session Initiation Protocol (SIP) Refer Method*
- RFC 3590, *Source Address Selection for the Multicast Listener D* (Supported for SSM include mode only)
- RFC 3768, *Virtual Router Redundancy Protocol (VRRP)*
- RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*
- RFC 3971, *Secure Neighbor Discovery for IPv6* (No support for certification paths, anchored on trusted parties)
- RFC 3972, *Cryptographically Generated Addresses*
- RFC 4087, *IP Tunnel MIB*
- RFC 4291, *IP Version 6 Addressing Architecture*

- RFC 4292, *IP Forwarding Table MIB*
- RFC 4294, *IPv6 Node Requirements* (Partial support)
- RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*
- RFC 4552, *Authentication/Confidentiality for OSPFv3*
- RFC 4604, *Using Internet Group Management Protocol Version 3 (IGMPv3)*
- RFC 4659, *BGP-MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN*
- RFC 4798, *Connecting IPv6 Islands over IPv4 MPLS Using IPv6 Provider Edge Routers (6PE)*

Option 4b (eBGP redistribution of labeled IPv6 routes from AS to neighboring AS) is not supported.

- RFC 4861 *Neighbor Discovery for IP Version 6 (IPv6)*
- RFC 4862, *IPv6 Stateless Address Autoconfiguration*
- RFC 4890, *Recommendations for Filtering ICMPv6 Messages in Firewalls*
- RFC 4942, *IPv6 Transition/Coexistence Security Considerations*
- RFC 5072, *IP Version 6 over PPP*
- RFC 5095, *Deprecation of Type 0 Routing Headers in IPv6*
- RFC 5308, *Routing IPv6 with IS-IS*
- RFC 5798, *Virtual Router Redundancy Protocol (VRRP) Version 3 for IPv4 and IPv6*
- RFC 5905, *Network Time Protocol Version 4 (for IPv6)*
- RFC 6164, *Using 127-Bit IPv6 Prefixes on Inter-Router Links*
- RFC 6527, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol Version 3 (VRRPv3)*

The following features are not supported:

- Row creation
- **Set** operation
- **vrrpv3StatisticsPacketLengthErrors** MIB object
- **vrrpv3StatisticsRowDiscontinuityTime** MIB object
- Internet draft draft-ietf-l3vpn-bgp-ipv6-07.txt, *BGP-MPLS IP VPN extension for IPv6 VPN*
- Internet draft draft-ietf-idr-flow-spec-00.txt, *Dissemination of flow specification rules*
- Internet draft draft-ietf-softwire-dual-stack-lite-04.txt, *Dual-Stack Lite Broadband Deployments Following IPv4 Exhaustion*
- Internet draft draft-kato-bgp-ipv6-link-local-00.txt, *BGP4+ Peering Using IPv6 Link-local Address*

The following RFCs and Internet draft do not define standards, but provide information about IPv6 and related technologies. The IETF classifies them variously as “Experimental” or “Informational.”

- RFC 1901, *Introduction to Community-based SNMPv2*
- RFC 2767, *Dual Stack Hosts using the "Bump-In-the-Stack" Technique (BIS)*
- RFC 3587, *IPv6 Global Unicast Address Format*
- Internet draft draft-ietf-ngtrans-bgp-tunnel-04.txt, *Connecting IPv6 Islands across IPv4 Clouds with BGP*

Only the MP-BGP over Internet Protocol version 4 (IPv4) approach is supported.

Supported IS-IS Standards

The Junos OS substantially supports the following standards for IS-IS.

- International Organization for Standardization/International Electrotechnical Commission (ISO/IEC) 8473, *Information technology — Protocol for providing the connectionless-mode network service*
- ISO 9542, *End System to Intermediate System Routing Exchange Protocol for Use in Conjunction with the Protocol for the Provision of the Connectionless-mode Network Service*
- ISO/IEC 10589, *Information technology — Telecommunications and information exchange between systems — Intermediate System to Intermediate System intra-domain routing information exchange protocol for use in conjunction with the protocol for providing the connectionless-mode network service (ISO 8473)*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*
- RFC 3719, *Recommendations for Interoperable Networks using Intermediate System to Intermediate System (IS-IS)*
- RFC 3847, *Restart Signaling for Intermediate System to Intermediate System (IS-IS)*
- RFC 5120, *M-ISIS: Multi Topology (MT) Routing in Intermediate System to Intermediate Systems (IS-ISs)*
- RFC 5130, *A Policy Control Mechanism in IS-IS Using Administrative Tags*
- RFC 5286, *Basic Specification for IP Fast Reroute: Loop-Free Alternates*
- RFC 5301, *Dynamic Hostname Exchange Mechanism for IS-IS*
- RFC 5302, *Domain-wide Prefix Distribution with Two-Level IS-IS*
- RFC 5303, *Three-Way Handshake for IS-IS Point-to-Point Adjacencies*
- RFC 5304, *IS-IS Cryptographic Authentication*

- RFC 5305, *IS-IS Extensions for Traffic Engineering*
- RFC 5306, *Restart Signaling for IS-IS*
- RFC 5307, *IS-IS Extensions in Support of Generalized Multi-Protocol Label Switching (GMPLS)*
- RFC 5308, *Routing IPv6 with IS-IS*
- Internet draft draft-ietf-bfd-base-09.txt, *Bidirectional Forwarding Detection*
Transmission of echo packets is not supported.
- Internet draft draft-ietf-isis-restart-02.txt, *Restart signaling for IS-IS*

The following RFCs do not define standards, but provide information about IS-IS and related technologies. The IETF classifies them as “Informational.”

- RFC 2973, *IS-IS Mesh Groups*
- RFC 3358, *Optional Checksums in Intermediate System to Intermediate System (ISIS)*
- RFC 3359, *Reserved Type, Length and Value (TLV) Codepoints in Intermediate System to Intermediate System*
- RFC 3373, *Three-Way Handshake for Intermediate System to Intermediate System (IS-IS) Point-to-Point Adjacencies*
- RFC 3567, *Intermediate System to Intermediate System (IS-IS) Cryptographic Authentication*
- RFC 3787, *Recommendations for Interoperable IP Networks using Intermediate System to Intermediate System (IS-IS)*
- RFC 5309, *Point-to-Point Operation over LAN in Link State Routing Protocols*
- Internet draft draft-ietf-bfd-base-09.txt, *Bidirectional Forwarding Detection* (except for the transmission of echo packets)
- Internet draft draft-ietf-isis-wg-255adj-02.txt, *Maintaining more than 255 circuits in IS-IS*

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported OSPF and OSPFv3 Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for OSPF and OSPF version 3 (OSPFv3).

- RFC 1583, *OSPF Version 2*
- RFC 1765, *OSPF Database Overflow*
- RFC 1793, *Extending OSPF to Support Demand Circuits*
- RFC 2154, *OSPF with Digital Signatures*

- RFC 2328, *OSPF Version 2*
- RFC 2370, *The OSPF Opaque LSA Option*

Support is provided by the **update-threshold** configuration statement at the **[edit protocols rsvp interface *interface-name*]** hierarchy level.

- RFC 2740, *OSPF for IPv6* (partial support for RFC 5340)

Junos OS does not support the following components of RFC 5340:

- Multiple interfaces on the same link
 - Deprecation of Multicast Extensions to OSPF (MOSPF) for IPv6
 - Not-so-stubby area (NSSA) specification
 - Link LSA suppression
 - LSA options and prefix options updates
 - IPv6 site-local addresses
- RFC 3101, *The OSPF Not-So-Stubby Area (NSSA) Option*
 - RFC 3623, *Graceful OSPF Restart*
 - RFC 3630, *Traffic Engineering (TE) Extensions to OSPF Version 2*
 - RFC 4203, *OSPF Extensions in Support of Generalized Multi-Protocol Label Switching (GMPLS)*

Only interface switching is supported.

- RFC 4552, *Authentication/Confidentiality for OSPFv3*
- RFC 4576, *Using a Link State Advertisement (LSA) Options Bit to Prevent Looping in BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4577, *OSPF as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4811, *OSPF Out-of-Band Link State Database (LSDB) Resynchronization*
- RFC 4812, *OSPF Restart Signaling*
- RFC 4813, *OSPF Link-Local Signaling*
- RFC 4915, *Multi-Topology (MT) Routing in OSPF*
- RFC 5185, *OSPF Multi-Area Adjacency*
- RFC 5187, *OSPFv3 Graceful Restart*
- RFC 5286, *Basic Specification for IP Fast Reroute: Loop-Free Alternates*
- RFC 5838, *Support of Address Families in OSPFv3*
- Internet draft draft-ietf-ospf-af-alt-10.txt, *Support of address families in OSPFv3*
- Internet draft draft-katz-ward-bfd-02.txt, *Bidirectional Forwarding Detection*

Transmission of echo packets is not supported.

The following RFCs do not define standards, but provide information about OSPF and related technologies. The IETF classifies them as “Informational.”

- RFC 3137, *OSPF Stub Router Advertisement*
- RFC 3509, *Alternative Implementations of OSPF Area Border Routers*
- RFC 5309, *Point-to-Point Operation over LAN in Link State Routing Protocols*

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported RIP and RIPng Standards

Junos OS substantially supports the following RFCs, which define standards for RIP (for IP version 4 [IPv4]) and RIP next generation (RIPng, for IP version 6 [IPv6]).

Junos OS supports authentication for all RIP protocol exchanges (MD5 or simple authentication).

- RFC 1058, *Routing Information Protocol*
- RFC 2080, *RIPng for IPv6*
- RFC 2082, *RIP-2 MD5 Authentication*

Multiple keys using distinct key IDs are not supported.

- RFC 2453, *RIP Version 2*

The following RFC does not define a standard, but provides information about RIPng. The IETF classifies it as “Informational.”

- RFC 2081, *RIPng Protocol Applicability Statement*

- [Supported NAT and SIP Standards on page 2184](#)

- [Supported RPM Standard on page 2185](#)
- [Supported Voice Services Standards on page 2185](#)

Supported DTCP Standard

The Junos OS substantially supports Internet draft draft-cavuto-dtcp-03.txt, *DTCP: Dynamic Tasking Control Protocol*.

Related Documentation

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Flow Monitoring and Discard Accounting Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions), Monitoring Services PICs, or Multiservices PICs or DPCs, the Junos OS substantially supports the standards for cflowd version 5 and version 8 formats that are maintained by CAIDA and accessible at <http://www.caida.org>.

The following RFC does not define a standard, but provides information about flow monitoring. The IETF classifies it as “Informational.”

- RFC 3954, *Cisco Systems NetFlow Services Export Version 9*

Related Documentation

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported IPsec and IKE Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following RFCs, which define standards for IP Security (IPsec) and Internet Key Exchange (IKE).

- RFC 2085, *HMAC-MD5 IP Authentication with Replay Prevention*
- RFC 2401, *Security Architecture for the Internet Protocol*
- RFC 2402, *IP Authentication Header*

This RFC is not supported on the ES PIC.

- RFC 2403, *The Use of HMAC-MD5-96 within ESP and AH*
- RFC 2404, *The Use of HMAC-SHA-1-96 within ESP and AH*
- RFC 2405, *The ESP DES-CBC Cipher Algorithm With Explicit IV*
- RFC 2406, *IP Encapsulating Security Payload (ESP)*
- RFC 2407, *The Internet IP Security Domain of Interpretation for ISAKMP*
- RFC 2408, *Internet Security Association and Key Management Protocol (ISAKMP)*
- RFC 2409, *The Internet Key Exchange (IKE)*
- RFC 2410, *The NULL Encryption Algorithm and Its Use With IPsec*

- RFC 3602, *The AES-CBC Cipher Algorithm and Its Use with IPsec*
- RFC 3948, *UDP Encapsulation of IPsec ESP Packets*
- RFC 4301, *Security Architecture for the Internet Protocol*
- RFC 4302, *IP Authentication Header*

This RFC is not supported on the ES PIC.

- RFC 4303, *IP Encapsulating Security Payload (ESP)*

The following RFCs and Internet draft do not define standards, but provide information about IPsec, IKE, and related technologies. The IETF classifies them as “Informational.”

- RFC 2104, *HMAC: Keyed-Hashing for Message Authentication*
- RFC 2412, *The OAKLEY Key Determination Protocol*
- RFC 3706, *A Traffic-Based Method of Detecting Dead Internet Key Exchange (IKE) Peers*
- Internet draft draft-eastlake-sha2-02.txt, *US Secure Hash Algorithms (SHA and HMAC-SHA)* (expires July 2006)

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported L2TP Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following RFC, which defines the standard for Layer 2 Tunneling Protocol (L2TP).

- RFC 2661, *Layer Two Tunneling Protocol “L2TP”*

The following RFC does not define a standard, but provides information about technology related to L2TP. The IETF classifies it as “Informational.”

- RFC 2866, *RADIUS Accounting*

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Link Services Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following RFCs, which define standards for link services.

- RFC 1990, *The PPP Multilink Protocol (MP)*
- RFC 2364, *PPP Over AAL5*

- RFC 2686, *The Multi-Class Extension to Multi-Link PPP*

The following features are not supported:

- Negotiation of address field compression and protocol field compression PPP NCP options; instead, a full 4-byte PPP header is always sent
- Prefix elision

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported NAT and SIP Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following Network Address Translation (NAT) and Session Initiation Protocol (SIP) standards. NAT supports SIP dialogs and UDP/IP version 4 (IPv4) transport of SIP messages.

The Junos OS substantially supports the following RFC and Internet draft.

- RFC 3261, *SIP: Session Initiation Protocol*
- Internet draft draft-mrw-behave-nat66-01.txt, *IPv6-to-IPv6 Network Address Translation (NAT66)*

The following RFCs do not define standards, but provide information about NAT. The IETF classifies them variously as “Best Current Practice,” “Historic” or “Informational.”

- RFC 1631, *The IP Network Address Translator (NAT)*
- RFC 2663, *IP Network Address Translator (NAT) Terminology and Considerations*
- RFC 2766, *Network Address Translation - Protocol Translation (NAT-PT)*
- RFC 2993, *Architectural Implications of NAT*
- RFC 3022, *Traditional IP Network Address Translator (Traditional NAT)*
- RFC 4787, *Network Address Translation (NAT) Behavioral Requirements for Unicast UDP*
- RFC 5382, *NAT Behavioral Requirements for TCP*
- RFC 5508, *NAT Behavioral Requirements for ICMP*

**Related
Documentation**

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported RPM Standard

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports real-time performance monitoring (RPM), and provides MIB support with extensions in substantial support of RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*.

- Related Documentation**
- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Voice Services Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Junos OS substantially supports the following following RFCs, which define standards for technologies used with voice services.

- RFC 2508, *Compressing IP/UDP/RTP Headers for Low-Speed Serial Links*
- RFC 2509, *IP Header Compression over PPP*

- Related Documentation**
- [Accessing Standards Documents on the Internet on page 2139](#)

VPLS and VPN Standards

- [Accessing Standards Documents on the Internet on page 2139](#)

Supported Layer 3 VPN Standards

The Junos OS substantially supports the following RFCs, which define standards for Layer 3 virtual private networks (VPNs).

- RFC 2283, *Multiprotocol Extensions for BGP-4*
- RFC 2685, *Virtual Private Networks Identifier*
- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*

The traceroute functionality is supported only on transit routers.

- RFC 4576, *Using a Link State Advertisement (LSA) Options Bit to Prevent Looping in BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4577, *OSPF as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4659, *BGP-MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN*
- RFC 4684, *Constrained Route Distribution for Border Gateway Protocol/MultiProtocol Label Switching (BGP/MPLS) Internet Protocol (IP) Virtual Private Networks (VPNs)*

The following RFC does not define a standard, but provides information about technology related to Layer 3 VPNs. The IETF classifies it as a “Best Current Practice.”

- RFC 1918, *Address Allocation for Private Internets*

- [Supported MPLS Standards on page 2163](#)
- [Supported BGP Standards on page 2168](#)

Supported VPLS Standards

The Junos OS substantially supports the following following RFCs, which define standards for virtual private LAN service (VPLS).

- RFC 4761, *Virtual Private LAN Service (VPLS) Using BGP for Auto-Discovery and Signaling*
- RFC 4762, *Virtual Private LAN Service (VPLS) Using Label Distribution Protocol (LDP) Signaling*

FEC 128, FEC 129, control bit 0, the Ethernet pseudowire type 0x0005, and the Ethernet tagged mode pseudowire type 0x0004 are supported.
