| <b>Version</b>                | Revision level of the chassis component.                                                                                                                                                                                                |
| <b>Part Number</b>            | Part number for the chassis component.                                                                                                                                                                                                  |
| <b>Serial Number</b>          | Serial number of the chassis component. The serial number of the backplane is also the serial number of the device chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the device chassis. |
| <b>Assb ID or Assembly ID</b> | Identification number that describes the FRU hardware.                                                                                                                                                                                  |

|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <p>Brief description of the hardware item:</p> <ul style="list-style-type: none"> <li>Type of power supply.</li> <li>Switch Control Board (SCB)</li> </ul> <p>Starting with Junos OS Release 12.1X47-D15, the SRX5K-SCBE (SCB2) is introduced.</p> <ul style="list-style-type: none"> <li>There are three SCB slots in SRX5800 devices. The third slot can be used for an SCB or an FPC. When an SRX5K-SCB was used, the third SCB slot was used as an FPC. SCB redundancy is provided in chassis cluster mode.</li> <li>With an SCB2, a third SCB is supported. If a third SCB is plugged in, it provides intra-chassis fabric redundancy.</li> <li>The Ethernet switch in the SCB2 provides the Ethernet connectivity among all the FPCs and the Routing Engine. The Routing Engine uses this connectivity to distribute forwarding and routing tables to the FPCs. The FPCs use this connectivity to send exception packets to the Routing Engine.</li> <li>Fabric connects all FPCs in the data plane. The Fabric Manager executes on the Routing Engine and controls the fabric system in the chassis. Packet Forwarding Engines on the FPC and fabric planes on the SCB are connected through HSL2 channels.</li> <li>SCB2 supports HSL2 with both 3.11 Gbps and 6.22 Gbps (SerDes) link speed and various HSL2 modes. When an FPC is brought online, the link speed and HSL2 mode are determined by the type of FPC.</li> </ul> <p>Starting with Junos OS Release 15.1X49-D10, the SRX5K-SCB3 (SCB3) with enhanced midplanes is introduced.</p> <ul style="list-style-type: none"> <li>All existing SCB software that is supported by SCB2 is supported on SCB3.</li> <li>SRX5K-RE-1800X4 (RE2). Mixed Routing Engine use is not supported.</li> <li>SCB3 works with the SRX5K-MPC (IOC2), SRX5K-MPC3-100G10G (IOC3), SRX5K-MPC3-40G10G (IOC3), and SRX5K-SPC-4-15-320 (SPC2) with current midplanes and the new enhanced midplanes.</li> <li>Mixed SCB use is not supported. If an SCB2 and an SCB3 are used, the system will only power on the master Routing Engine's SCB and will power off the other SCBs. Only the SCB in slot 0 will be powered on and a system log is generated.</li> <li>SCB3 supports up to 400 Gbps per slot with old midplanes and up to 500 Gbps per slot with new midplanes.</li> <li>SCB3 supports fabric intra-chassis redundancy.</li> <li>SCB3 supports the same chassis cluster function as the SRX5K-SCB (SCB1) and the SRX5K-SCBE (SCB2), except for in-service software upgrade (ISSU) and in-service hardware upgrade (ISHU).</li> <li>SCB3 has a second external Ethernet port.</li> <li>Fabric bandwidth increasing mode is not supported.</li> </ul> |

Table 188: show chassis hardware Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>PEM number</b> | <p>AC or DC PEM number on the chassis. The following output fields are displayed for the PEM:</p> <ul style="list-style-type: none"> <li>• State—State of the PEM: <ul style="list-style-type: none"> <li>• Online—PEM is present in the slot and online.</li> <li>• Empty—PEM is not present in the slot.</li> <li>• Present—PEM is present in the slot, but not online.</li> </ul> </li> <li>• AC Input —State of the AC input power feed with the number of active and expected feeds (1 or 2).</li> <li>• Capacity—Actual power input capacity with maximum capacity displayed (in parentheses) in watts.</li> <li>• DC Output—DC power output, in watts, for the specified zone, at the specified amps and voltage (A @ V), and load and percentage utilization of the maximum capacity for the zone.</li> </ul> |
| <b>System</b>     | <p>Overall power statistics for the system zone:</p> <ul style="list-style-type: none"> <li>• Zone number: <ul style="list-style-type: none"> <li>• Capacity—Maximum power capacity available for the zone, in watts.</li> <li>• Allocated power—Actual capacity allocated for the zone, in watts, with remaining power displayed in parentheses.</li> <li>• Actual usage—Actual power usage for the zone, in watts.</li> </ul> </li> <li>• Total system capacity—Cumulative power capacity of all the zones, in watts.</li> <li>• Total remaining capacity—Difference between the total system capacity and cumulative allocated power of all zones, in watts.</li> </ul>                                                                                                                                            |

## Sample Output

### show chassis power

```
user@host> show chassis power

PEM 0:
 State: Present
 DC input: Out of range (1 feed expected, 0 feed connected)
 DC input: 48.0 V input (0 mV)
 Capacity: 0 W (maximum 4100 W)

PEM 1:
 State: Present
 DC input: Out of range (1 feed expected, 0 feed connected)
 DC input: 48.0 V input (0 mV)
 Capacity: 0 W (maximum 4100 W)

PEM 2:
 State: Online
 DC input: OK (2 feed expected, 2 feed connected)
 DC input: 48.0 V input (57500 mV)
 Capacity: 4100 W (maximum 4100 W)
 DC output: 1881 W (zone 0, 33 A at 57 V, 45% of capacity)

PEM 3:
 State: Online
 DC input: OK (2 feed expected, 2 feed connected)
 DC input: 48.0 V input (56500 mV)
 Capacity: 4100 W (maximum 4100 W)
 DC output: 2464 W (zone 1, 44 A at 56 V, 60% of capacity)

System:
 Zone 0:
 Capacity: 4100 W (maximum 4100 W)
 Allocated power: 2920 W (1180 W remaining)
 Actual usage: 1881 W
 Zone 1:
 Capacity: 4100 W (maximum 4100 W)
 Allocated power: 3875 W (225 W remaining)
 Actual usage: 2464 W
 Total system capacity: 8200 W (maximum 8200 W)
 Total remaining power: 1405 W
```

| <b>Hardware address</b>        | Hardware MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up or up to down. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                             | <b>detail extensive</b> |
| <b>Input Rate</b>              | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                                                                                                                                                                                    | None specified          |
| <b>Output Rate</b>             | Output rate in bps and pps.                                                                                                                                                                                                                                                                                                                                                                                                                          | None specified          |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b> |

Table 193: Aggregated Ethernet show interfaces Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output  |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| IPv6 transit statistics | <p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | detail extensive |
| Input errors            | <p>Input errors on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of incoming frame aborts and frame check sequence (FCS) errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid FCS.</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>                                                                                                 | detail extensive |
| Output errors           | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b> —Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | detail extensive |
| Egress queues           | Total number of egress queues supported on the specified interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail extensive |

| <b>Route Table</b>                                    | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive</b>      |

Table 193: Aggregated Ethernet show interfaces Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                          | Level of Output              |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Flags</b>                 | Information about protocol family flags.                                                                                                                   | <b>detail extensive none</b> |
| <b>Mac-Validate Failures</b> | Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface. | <b>detail extensive none</b> |
| <b>Addresses, Flags</b>      | Information about address flags.                                                                                                                           | <b>detail extensive none</b> |
| <b>Destination</b>           | IP address of the remote side of the connection.                                                                                                           | <b>detail extensive none</b> |
| <b>Local</b>                 | IP address of the logical interface.                                                                                                                       | <b>detail extensive none</b> |
| <b>Broadcast</b>             | Broadcast address of the logical interface.                                                                                                                | <b>detail extensive none</b> |
| <b>Policer</b>               | Policer to be evaluated when packets are received or transmitted on the interface.                                                                         | <b>detail extensive none</b> |
| <b>Generation</b>            | Unique number for use by Juniper Networks technical support only.                                                                                          | <b>detail extensive</b>      |

## Sample Output

### show interfaces extensive (Aggregated Ethernet)

```
user@host> show interfaces ae0 extensive
```

```
Physical interface: ae0, Enabled, Physical link is Up
Interface index: 1973, SNMP ifIndex: 501, Generation: 2176
Link-level type: Ethernet, MTU: 1518, Speed: 3Gbps, BPDU Error: None, MAC-REWRITE
Error: None, Loopback: Disabled,
Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1,
Minimum bandwidth needed: 0
Device flags : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
Current address: 00:1f:12:8c:af:c0, Hardware address: 00:1f:12:8c:af:c0
Last flapped : 2010-04-16 14:25:36 PDT (00:02:50 ago)
Statistics last cleared: Never
Traffic statistics:
Input bytes : 64 0 bps
Output bytes : 9816525824 463779840 bps
Input packets: 1 0 pps
Output packets: 38345804 226455 pps
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Dropped traffic statistics due to STP State:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Input errors:
Errors: 0, Drops: 0, Framing errors: 0, Runts: 0, Giants: 0, Policed discards:
```

```

0, Resource errors: 0
Output errors:
 Carrier transitions: 0, Errors: 0, Drops: 0, MTU errors: 0, Resource errors:
0
Egress queues: 8 supported, 4 in use

## show interfaces (SRX Series)

**Syntax** show interfaces {  
 <brief | detail | extensive | terse>  
 controller *interface-name*  
 descriptions *interface-name*  
 destination-class (all | *destination-class-name logical-interface-name*)  
 diagnostics optics *interface-name*  
 far-end-interval *interface-fpc/pic/port*  
 filters *interface-name*  
 flow-statistics *interface-name*  
 interval *interface-name*  
 load-balancing (detail | *interface-name*)  
 mac-database mac-address *mac-address*  
 mc-ae id *identifier* unit *number* revertive-info  
 media *interface-name*  
 policers *interface-name*  
 queue both-ingress-egress egress forwarding-class *forwarding-class* ingress l2-statistics  
 redundancy (detail | *interface-name*)  
 routing brief detail summary *interface-name*  
 routing-instance (all | *instance-name*)  
 snmp-index *snmp-index*  
 source-class (all | *destination-class-name logical-interface-name*)  
 statistics *interface-name*  
 switch-port *switch-port number*  
 transport pm (all | optics | otn) (all | current | currentday | interval | previousday) (all |  
   *interface-name*)  
 zone *interface-name*  
 }

**Release Information** Command modified in Junos OS Release 9.5.

**Description** Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

On SRX Series appliance, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

- Options**
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
    - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
    - **ce1-*pim*/0/ *port***—Channelized E1 interface.
    - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
    - **ct1-*pim*/0/*port***—Channelized T1 interface.
    - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
    - **e1-*pim*/0/*port***—E1 interface.
    - **e3-*pim*/0/*port***—E3 interface.

- **fe-pim/0/port**—Fast Ethernet interface.
- **ge-pim/0/port**—Gigabit Ethernet interface.
- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
- **brief | detail | extensive | terse**—(Optional) Display the specified level of output.
- **controller**—(Optional) Show controller information.
- **descriptions**—(Optional) Display interface description strings.
- **destination-class**—(Optional) Show statistics for destination class.
- **diagnostics**—(Optional) Show interface diagnostics information.
- **far-end-interval**—(Optional) Show far end interval statistics.
- **filters**—(Optional) Show interface filters information.
- **flow-statistics**—(Optional) Show security flow counters and errors.
- **interval**—(Optional) Show interval statistics.
- **load-balancing**—(Optional) Show load-balancing status.
- **mac-database**—(Optional) Show media access control database information.
- **mc-ae**—(Optional) Show MC-AE configured interface information.
- **media**—(Optional) Display media information.
- **policers**—(Optional) Show interface policers information.
- **queue**—(Optional) Show queue statistics for this interface.
- **redundancy**—(Optional) Show redundancy status.
- **routing**—(Optional) Show routing status.
- **routing-instance**—(Optional) Name of routing instance.
- **snmp-index**—(Optional) SNMP index of interface.
- **source-class**—(Optional) Show statistics for source class.
- **statistics**—(Optional) Display statistics and detailed output.
- **switch-port**—(Optional) Front end port number (0..15).
- **transport**—(Optional) Show interface transport information.
- **zone**—(Optional) Interface's zone.

**Required Privilege Level**    view

| <b>Output Fields</b>         | <p><a href="#">Table 194</a> lists the output fields for the <b>show interfaces</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 194: show interfaces Output Fields

| Field Name                | Field Description                                                                                                                                                                                                                                   | Level of Output              |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                                                                                                                     |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                                                                                                                     | All levels                   |
| <b>Enabled</b>            | State of the interface.                                                                                                                                                                                                                             | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                                                                                                                                 | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                                                                                                                       | <b>detail extensive none</b> |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                                                                                                                                 | All levels                   |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                   | <b>detail extensive</b>      |
| <b>MTU</b>                | Maximum transmission unit size on the physical interface.                                                                                                                                                                                           | All levels                   |
| <b>Link mode</b>          | Link mode: Full-duplex or Half-duplex.                                                                                                                                                                                                              |                              |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                                                                                                                                            | All levels                   |
| <b>BPDU error</b>         | Bridge protocol data unit (BPDU) error: Detected or None                                                                                                                                                                                            |                              |
| <b>Loopback</b>           | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                                                                                                                      | All levels                   |
| <b>Source filtering</b>   | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                        | All levels                   |
| <b>Flow control</b>       | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                            | All levels                   |
| <b>Auto-negotiation</b>   | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                           | All levels                   |
| <b>Remote-fault</b>       | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul> | All levels                   |
| <b>Device flags</b>       | Information about the physical device.                                                                                                                                                                                                              | All levels                   |
| <b>Interface flags</b>    | Information about the interface.                                                                                                                                                                                                                    | All levels                   |

Table 194: show interfaces Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output              |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Last flapped</b>                     | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                          | <b>detail extensive none</b> |
| <b>Input Rate</b>                       | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                                                                                                                                                                                                                                                             | None                         |
| <b>Output Rate</b>                      | Output rate in bps and pps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | None                         |
| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul> | <b>detail extensive none</b> |
| <b>Statistics last cleared</b>          | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b>      |
| <b>Traffic statistics</b>               | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                  | <b>detail extensive</b>      |

Table 194: show interfaces Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output  |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b>  | <p>Input errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>                                                                                                                                                    | <b>extensive</b> |
| <b>Output errors</b> | <p>Output errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 194: show interfaces Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |

| <b>Ingress queues</b>                  | Total number of ingress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>extensive</b>        |
| <b>Queue counters and queue number</b> | CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>MAC statistics</b>                  | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> <li>• Packet length exceeds 1518 octets, or</li> <li>• Packet length exceeds MRU</li> </ul> </li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b>        |

Table 194: show interfaces Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Filter statistics                      | <p><b>Receive</b> and <b>Transmit</b> statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul> | extensive       |
| Autonegotiation information            | <p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | extensive       |

| <b>Transit statistics</b>                             | Number and rate of bytes and packets transiting the switch.<br><br><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler. | <b>extensive</b>             |

## Sample Output

### show interfaces Gigabit Ethernet

```
user@host> show interfaces ge-0/0/1
```

```

Physical interface: ge-0/0/1, Enabled, Physical link is Down
 Interface index: 135, SNMP ifIndex: 510
 Link-level type: Ethernet, MTU: 1514, Link-mode: Full-duplex, Speed: 1000mbps,

 BPDU Error: None, MAC-REWRITE Error: None, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
 Remote fault: Online
 Device flags : Present Running Down
 Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
 Link flags : None
 CoS queues : 8 supported, 8 maximum usable queues
 Current address: 00:1f:12:e4:b1:01, Hardware address: 00:1f:12:e4:b1:01
 Last flapped : 2015-05-12 08:36:59 UTC (1w1d 22:42 ago)
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)
 Active alarms : LINK
 Active defects: LINK
 Interface transmit statistics: Disabled

Logical interface ge-0/0/1.0 (Index 71) (SNMP ifIndex 514)
 Flags: Device-Down SNMP-Traps 0x0 Encapsulation: ENET2
 Input packets : 0
 Output packets: 0
 Security: Zone: public
 Protocol inet, MTU: 1500
 Flags: Sendbroadcast-pkt-to-re
 Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
 Destination: 1.1.1/24, Local: 1.1.1.1, Broadcast: 1.1.1.255

```

## Sample Output

### show interfaces brief (Gigabit Ethernet)

```

user@host> show interfaces ge-3/0/2 brief
Physical interface: ge-3/0/2, Enabled, Physical link is Up
 Link-level type: 52, MTU: 1522, Speed: 1000mbps, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
 Remote fault: Online
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Link flags : None

Logical interface ge-3/0/2.0
 Flags: SNMP-Traps 0x4000
 VLAN-Tag [0x8100.512 0x8100.513] In(pop-swap 0x8100.530) Out(swap-push
 0x8100.512 0x8100.513)
 Encapsulation: VLAN-CCC
 ccc

Logical interface ge-3/0/2.32767
 Flags: SNMP-Traps 0x4000 VLAN-Tag [0x0000.0] Encapsulation: ENET2

```

## Sample Output

### show interfaces detail (Gigabit Ethernet)

```

user@host> show interfaces ge-0/0/1 detail
Physical interface: ge-0/0/1, Enabled, Physical link is Down
 Interface index: 135, SNMP ifIndex: 510, Generation: 138
 Link-level type: Ethernet, MTU: 1514, Link-mode: Full-duplex, Speed: 1000mbps,
 BPDU Error: None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering:

```

```

Disabled,

### show interfaces mac-database mac-address

```

user@host> show interfaces mac-database xe-0/3/3 mac-address 00:00:c8:01:01:09
Physical interface: xe-0/3/3, Enabled, Physical link is Up
 Interface index: 372, SNMP ifIndex: 788
 Link-level type: Ethernet, MTU: 1514, LAN-PHY mode, Speed: 10Gbps, Loopback:
None, Source filtering: Disabled, Flow control: Enabled
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Link flags : None

 Logical interface xe-0/3/3.0 (Index 364) (SNMP ifIndex 829)
 Flags: SNMP-Traps 0x4004000 Encapsulation: ENET2
 MAC address: 00:00:c8:01:01:09, Type: Configured,
 Input bytes : 202324652
 Output bytes : 202324560
 Input frames : 4398362
 Output frames : 4398360
 Policer statistics:
 Policer type Discarded frames Discarded bytes
 Output aggregate 3992386 183649756

```

## Sample Output

### show interfaces mc-ae

```

user@host> show interfaces mc-ae ae0 unit 512
Member Links : ae0
Local Status : active
Peer Status : active
Logical Interface : ae0.512
Core Facing Interface : Label Ethernet Interface
ICL-PL : Label Ethernet Interface

```

### show interfaces media (SONET/SDH)

The following example displays the output fields unique to the **show interfaces media** command for a SONET interface (with no level of output specified):

```

user@host> show interfaces media so-4/1/2
Physical interface: so-4/1/2, Enabled, Physical link is Up
 Interface index: 168, SNMP ifIndex: 495
 Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC48,
Loopback: None, FCS: 16, Payload scrambler: Enabled
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps 16384
 Link flags : Keepalives
 Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
 Keepalive: Input: 1783 (00:00:00 ago), Output: 1786 (00:00:08 ago)
 LCP state: Opened

```

```

NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
mpls: Not-configured
CHAP state: Not-configured
CoS queues : 8 supported
Last flapped : 2005-06-15 12:14:59 PDT (04:31:29 ago)
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)
SONET alarms : None
SONET defects : None
SONET errors:
 BIP-B1: 121, BIP-B2: 916, REI-L: 0, BIP-B3: 137, REI-P: 16747, BIP-BIP2: 0
Received path trace: routerb so-1/1/2
Transmitted path trace: routera so-4/1/2

```

## Sample Output

## Sample Output

### show interfaces queue

The following truncated example shows the CoS queue sizes for queues 0, 1, and 3. Queue 1 has a queue buffer size (guaranteed allocated memory) of 9192 bytes.

```

user@host> show interfaces queue
Physical interface: ge-0/0/0, Enabled, Physical link is Up
 Interface index: 134, SNMP ifIndex: 509
Forwarding classes: 8 supported, 8 in use
Egress queues: 8 supported, 8 in use
Queue: 0, Forwarding classes: class0
 Queued:
 Packets : 0 0 pps
 Bytes : 0 0 bps

```

```

Transmitted:
 Packets : 0 0 pps
 Bytes : 0 0 bps
 Tail-dropped packets : 0 0 pps
 RL-dropped packets : 0 0 pps
 RL-dropped bytes : 0 0 bps
 RED-dropped packets : 0 0 pps
 Low : 0 0 pps
 Medium-low : 0 0 pps
 Medium-high : 0 0 pps
 High : 0 0 pps
 RED-dropped bytes : 0 0 bps
 Low : 0 0 bps
 Medium-low : 0 0 bps
 Medium-high : 0 0 bps
 High : 0 0 bps
Queue Buffer Usage:
 Reserved buffer : 118750000 bytes
 Queue-depth bytes :
 Current : 0
..
..

| <b>Release Information</b>      | Command introduced in Junos OS Release 10.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Display diagnostics data and alarms for Gigabit Ethernet optical transceivers (SFP) installed in SRX Series Services Gateways. The information provided by this command is known as digital optical monitoring (DOM) information.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.</p> |
| <b>Options</b>                  | <i>interface-name</i> —Name of the interface associated with the port in which the transceiver is installed: <code>ge-fpc/pic/port</code> .                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Output Fields</b>            | <a href="#">Table 195</a> lists the output fields for the show interfaces diagnostics optics command. Output fields are listed in the general order in which they appear.                                                                                                                                                                                                                                                                                                                                                                     |

**Table 195: show interfaces diagnostics optics Output Fields**

| Field Name                            | Field Description                                                                                                                                                  |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface                    | Displays the name of the physical interface.                                                                                                                       |
| Laser bias current                    | Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents. |
| Laser output power                    | Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                                         |
| Module temperature                    | Displays the temperature, in Celsius and Fahrenheit.                                                                                                               |
| Module voltage                        | Displays the voltage, in Volts.                                                                                                                                    |
| Receiver signal average optical power | Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                      |
| Laser bias current high alarm         | Displays whether the laser bias power setting high alarm is <b>On</b> or <b>Off</b> .                                                                              |

Table 195: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                      | Field Description                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------|
| Laser bias current low alarm    | Displays whether the laser bias power setting low alarm is <b>On</b> or <b>Off</b> .    |
| Laser bias current high warning | Displays whether the laser bias power setting high warning is <b>On</b> or <b>Off</b> . |
| Laser bias current low warning  | Displays whether the laser bias power setting low warning is <b>On</b> or <b>Off</b> .  |
| Laser output power high alarm   | Displays whether the laser output power high alarm is <b>On</b> or <b>Off</b> .         |
| Laser output power low alarm    | Displays whether the laser output power low alarm is <b>On</b> or <b>Off</b> .          |
| Laser output power high warning | Displays whether the laser output power high warning is <b>On</b> or <b>Off</b> .       |
| Laser output power low warning  | Displays whether the laser output power low warning is <b>On</b> or <b>Off</b> .        |
| Module temperature high alarm   | Displays whether the module temperature high alarm is <b>On</b> or <b>Off</b> .         |
| Module temperature low alarm    | Displays whether the module temperature low alarm is <b>On</b> or <b>Off</b> .          |
| Module temperature high warning | Displays whether the module temperature high warning is <b>On</b> or <b>Off</b> .       |
| Module temperature low warning  | Displays whether the module temperature low warning is <b>On</b> or <b>Off</b> .        |
| Module voltage high alarm       | Displays whether the module voltage high alarm is <b>On</b> or <b>Off</b> .             |
| Module voltage low alarm        | Displays whether the module voltage low alarm is <b>On</b> or <b>Off</b> .              |
| Module voltage high warning     | Displays whether the module voltage high warning is <b>On</b> or <b>Off</b> .           |
| Module voltage low warning      | Displays whether the module voltage low warning is <b>On</b> or <b>Off</b> .            |
| Laser rx power high alarm       | Displays whether the receive laser power high alarm is <b>On</b> or <b>Off</b> .        |
| Laser rx power low alarm        | Displays whether the receive laser power low alarm is <b>On</b> or <b>Off</b> .         |

Table 195: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                | Field Description                                                                  |
|-------------------------------------------|------------------------------------------------------------------------------------|
| Laser rx power high warning               | Displays whether the receive laser power high warning is <b>On</b> or <b>Off</b> . |
| Laser rx power low warning                | Displays whether the receive laser power low warning is <b>On</b> or <b>Off</b> .  |
| Laser bias current high alarm threshold   | Displays the vendor-specified threshold for the laser bias current high alarm.     |
| Laser bias current low alarm threshold    | Displays the vendor-specified threshold for the laser bias current low alarm.      |
| Laser bias current high warning threshold | Displays the vendor-specified threshold for the laser bias current high warning.   |
| Laser bias current low warning threshold  | Displays the vendor-specified threshold for the laser bias current low warning.    |
| Laser output power high alarm threshold   | Displays the vendor-specified threshold for the laser output power high alarm.     |
| Laser output power low alarm threshold    | Displays the vendor-specified threshold for the laser output power low alarm.      |
| Laser output power high warning threshold | Displays the vendor-specified threshold for the laser output power high warning.   |
| Laser output power low warning threshold  | Displays the vendor-specified threshold for the laser output power low warning.    |
| Module temperature high alarm threshold   | Displays the vendor-specified threshold for the module temperature high alarm.     |
| Module temperature low alarm threshold    | Displays the vendor-specified threshold for the module temperature low alarm.      |
| Module temperature high warning threshold | Displays the vendor-specified threshold for the module temperature high warning.   |
| Module temperature low warning threshold  | Displays the vendor-specified threshold for the module temperature low warning.    |
| Module voltage high alarm threshold       | Displays the vendor-specified threshold for the module voltage high alarm.         |
| Module voltage low alarm threshold        | Displays the vendor-specified threshold for the module voltage low alarm.          |
| Module voltage high warning threshold     | Displays the vendor-specified threshold for the module voltage high warning.       |

| <b>Laser rx power low warning threshold</b>  | Displays the vendor-specified threshold for the laser rx power low warning.  |

## Sample Output

### show interfaces diagnostics optics

```

user@host> show interfaces diagnostics optics ge-2/0/0
Physical interface: ge-2/0/0
 Laser bias current : 7.408 mA
 Laser output power : 0.3500 mW / -4.56 dBm
 Module temperature : 23 degrees C / 73 degrees F
 Module voltage : 3.3450 V
 Receiver signal average optical power : 0.0002 mW / -36.99 dBm
 Laser bias current high alarm : Off
 Laser bias current low alarm : Off
 Laser bias current high warning : Off
 Laser bias current low warning : Off
 Laser output power high alarm : Off
 Laser output power low alarm : Off
 Laser output power high warning : Off
 Laser output power low warning : Off
 Module temperature high alarm : Off
 Module temperature low alarm : Off
 Module temperature high warning : Off
 Module temperature low warning : Off
 Module voltage high alarm : Off
 Module voltage low alarm : Off
 Module voltage high warning : Off
 Module voltage low warning : Off
 Laser rx power high alarm : Off
 Laser rx power low alarm : On
 Laser rx power high warning : Off
 Laser rx power low warning : On
 Laser bias current high alarm threshold : 17.000 mA
 Laser bias current low alarm threshold : 1.000 mA
 Laser bias current high warning threshold : 14.000 mA
 Laser bias current low warning threshold : 2.000 mA
 Laser output power high alarm threshold : 0.6310 mW / -2.00 dBm
 Laser output power low alarm threshold : 0.0670 mW / -11.74 dBm
 Laser output power high warning threshold : 0.6310 mW / -2.00 dBm
 Laser output power low warning threshold : 0.0790 mW / -11.02 dBm

```

Module temperature high alarm threshold : 95 degrees C / 203 degrees F  
Module temperature low alarm threshold : -25 degrees C / -13 degrees F  
Module temperature high warning threshold : 90 degrees C / 194 degrees F  
Module temperature low warning threshold : -20 degrees C / -4 degrees F  
Module voltage high alarm threshold : 3.900 V  
Module voltage low alarm threshold : 2.700 V  
Module voltage high warning threshold : 3.700 V  
Module voltage low warning threshold : 2.900 V  
Laser rx power high alarm threshold : 1.2590 mW / 1.00 dBm  
Laser rx power low alarm threshold : 0.0100 mW / -20.00 dBm  
Laser rx power high warning threshold : 0.7940 mW / -1.00 dBm  
Laser rx power low warning threshold : 0.0158 mW / -18.01 dBm

| <b>List of Sample Output</b>    | <a href="#">show interfaces flow-statistics (Gigabit Ethernet) on page 1997</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Output Fields</b>            | <a href="#">Table 196</a> lists the output fields for the <b>show interfaces flow-statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 196: show interfaces flow-statistics Output Fields**

| Field Name         | Field Description                                                               |
|--------------------|---------------------------------------------------------------------------------|
| Traffic statistics | Number of packets and bytes transmitted and received on the physical interface. |

Table 196: show interfaces flow-statistics Output Fields (*continued*)

| Field Name                    | Field Description                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Local statistics</b>       | Number of packets and bytes transmitted and received on the physical interface.                         |
| <b>Transit statistics</b>     | Number of packets and bytes transiting the physical interface.                                          |
| <b>Flow input statistics</b>  | Statistics on packets received by flow module.                                                          |
| <b>Flow output statistics</b> | Statistics on packets sent by flow module.                                                              |
| <b>Flow error statistics</b>  | Packet drop statistics for the flow module.<br><br>For further details, see <a href="#">Table 197</a> . |

Table 197: Flow Error Statistics (Packet Drop Statistics for the Flow Module)

| Error                           | Error Description                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Screen:</b>                  |                                                                                                                                                                                                                                                                                                                                                                 |
| Address spoofing                | The packet was dropped when the screen module detected address spoofing.                                                                                                                                                                                                                                                                                        |
| Syn-attack protection           | The packet was dropped because of SYN attack protection or SYN cookie protection.                                                                                                                                                                                                                                                                               |
| <b>VPN:</b>                     |                                                                                                                                                                                                                                                                                                                                                                 |
| Authentication failed           | The packet was dropped because the IPsec Encapsulating Security Payload (ESP) or Authentication Header (AH) authentication failed.                                                                                                                                                                                                                              |
| No SA for incoming SPI          | The packet was dropped because the incoming IPsec packet's security parameter index (SPI) does not match any known SPI.                                                                                                                                                                                                                                         |
| Security association not active | The packet was dropped because an IPsec packet was received for an inactive SA.                                                                                                                                                                                                                                                                                 |
| <b>NAT:</b>                     |                                                                                                                                                                                                                                                                                                                                                                 |
| Incoming NAT errors             | The source NAT rule search failed, an invalid source NAT binding was found, or the NAT allocation failed.                                                                                                                                                                                                                                                       |
| Multiple incoming NAT           | Sometimes packets are looped through the system more than once; if source NAT is specified more than once, the packet will be dropped.                                                                                                                                                                                                                          |
| <b>Auth:</b>                    |                                                                                                                                                                                                                                                                                                                                                                 |
| Multiple user authentications   | Sometimes packets are looped through the system more than once. Each time a packet passes through the system, that packet must be permitted by a policy. If the packet matches more than one policy that specifies user authentication, then it will be dropped.                                                                                                |
| User authentication errors      | Packet was dropped because policy requires authentication; however: <ul style="list-style-type: none"> <li>• Only Telnet, FTP, and HTTP traffic can be authenticated.</li> <li>• The corresponding authentication entry could not be found, if web-auth is specified.</li> <li>• The maximum number of authenticated sessions per user was exceeded.</li> </ul> |

**Table 197: Flow Error Statistics (Packet Drop Statistics for the Flow Module) (*continued*)**

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## show security flow ip-action

---

**Syntax** `show security flow ip-action [ <filter> ] [ summary family (inet | inet6) ]`

**Release Information** Command introduced in Junos OS Release 10.1. Logical systems option added in Junos OS Release 11.2. Summary option introduced in Junos OS Release 12.1.

**Description** Display the current IP-action settings, based on filtered options, for IP sessions running on the device.

**Options** • *filter*—Filter the display based on the specified criteria.

The following filters display those sessions that match the criteria specified by the filter. Refer to the sample output for filtered output examples.

**all** | [*filter*]  
—All active sessions on the device.

**destination-port** *destination-port*  
—Destination port number of the traffic. Range is 1 through 65,535.

**destination-prefix** *destination-prefix*  
—Destination IP prefix or address.

**family** (inet | inet6) [*filter*]  
—IPv4 traffic or IPv6-NATPT traffic and filtered options.

**logical-system** *logical-system-name* | **all** [*filter*]  
—Specified logical system or all logical systems.

**protocol** *protocol-name* | *protocol-number* [*filter*]  
—Protocol name or number and filtered options.

- **ah** or 51
- **egp** or 8
- **esp** or 50
- **gre** or 47
- **icmp** or 1
- **icmp6** or 58
- **igmp** or 2
- **ipip** or 4
- **ospf** or 89
- **pim** or 103
- **rsvp** or 46
- **sctp** or 132
- **tcp** or 6
- **udp** or 17

**root-logical-system** [*filter*]  
—Default logical system information and filtered options.

**source-port** *source-port*—Source port number of the traffic. Range is 1 through 65,535.

**source-prefix** *source-prefix*—Source IP prefix or address of the traffic.

- **summary** —Summary information about IP-action entries.

**family**—Display summary of IP-action entries by family. This option is used to filter the output.

- **inet**—Display summary of IPv4 entries.
- **inet6**—Display summary of IPv6 entries.

**Required Privilege Level** view

**Output Fields** [Table 208](#) lists the output fields for the **show security flow ip-action** command. Output fields are listed in the approximate order in which they appear.

**Table 208: show security flow ip-action Output Fields**

| Field Name     | Field Description                                                |
|----------------|------------------------------------------------------------------|
| Src-Addr       | Source address of outbound IP traffic.                           |
| Src-Port       | Source port number of outbound IP traffic.                       |
| Dst-Addr       | Destination address of inbound IP traffic.                       |
| Dst-Port/Proto | Destination port number and protocol type of inbound IP traffic. |
| Timeout (sec)  | Configured timeouts and time remaining for an IP session.        |
| Zone           | Security zone associated with an IP session.                     |
| Action         | Configured action type, for example, block, close, and notify.   |

Table 208: show security flow ip-action Output Fields (*continued*)

| Field Name        | Field Description                                                                   |
|-------------------|-------------------------------------------------------------------------------------|
| State             | The active mode and passive mode describe the states of the <b>ip-action</b> entry. |
| IPv4 action count | The total number of IPv4 entries.                                                   |
| IPv6 action count | The total number of IPv6 entries.                                                   |

## show security flow gate destination-port

**Syntax** `show security flow gate destination-port destination-port-number [brief | summary]`

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Display information about temporary openings known as pinholes or gates in the security firewall that for the specified destination port.

**NOTE:** Destination port filter matches the gate only if the given port falls within the range of ports specified in the gate.

**Options**

- destination-port-number*—Number of the destination port for which to display gate information.

**Range:** 1 through 65,535

- brief | summary—Display the specified level of output.

**Required Privilege Level** view

**Related Documentation**

## show security flow gate destination-prefix

**Syntax** `show security flow gate destination-prefix destination-IP-prefix [brief | summary]`

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Display information about temporary openings known as pinholes or gates in the security firewall for the specified destination prefix.

**NOTE:** Destination prefix must match both the starting and ending address in the gate.

- Options**
- *destination-IP-prefix*—Destination IP prefix or address for which to display gate information.
  - `brief | summary`—Display the specified level of output.

**Required Privilege Level** view

- Related Documentation**

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 212: show security flow gate protocol Output Fields

| Field Name            | Field Description                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hole                  | Range of flows permitted by the pinhole.                                                                                                                                         |
| Translated            | Tuples used to create the session if it matches the pinhole. <ul style="list-style-type: none"> <li>• Source address and port</li> <li>• Destination address and port</li> </ul> |
| Protocol              | Application protocol, such as UDP or TCP.                                                                                                                                        |
| Application           | Name of the application.                                                                                                                                                         |
| Age                   | Idle timeout for the pinhole.                                                                                                                                                    |
| Flags                 | Internal debug flags for the pinhole.                                                                                                                                            |
| Zone                  | Incoming zone.                                                                                                                                                                   |
| Reference count       | Number of resource manager references to the pinhole.                                                                                                                            |
| Resource              | Resource manager information about the pinhole.                                                                                                                                  |
| Valid gates           | Number of valid gates.                                                                                                                                                           |
| Pending gates         | Number of pending gates.                                                                                                                                                         |
| Invalidated gates     | Number of invalid gates.                                                                                                                                                         |
| Gates in other states | Number of gates in other states.                                                                                                                                                 |
| Total gates           | Number of gates in total.                                                                                                                                                        |

## Sample Output

### show security flow gate protocol brief

```

root> root> show security flow gate protocol tcp brief
Hole: 40.0.0.111-40.0.0.111/0-0->30.0.0.100-30.0.0.100/37308-37308
Translated: 40.0.0.111/0->30.0.0.100/37308
Protocol: tcp
Application: FTP ALG/79
Age: 65414 seconds
Flags: 0x0080
Zone: trust
Reference count: 1
Resource: 1-24575-86015

Valid gates: 1
Pending gates: 0
Invalidated gates: 0
Gates in other states: 0

```

```
Total gates: 1

Flow Gates on FPC5 PIC0:

Valid gates: 0
Pending gates: 0
Invalidated gates: 0
Gates in other states: 0
Total gates: 0

Flow Gates on FPC5 PIC1:

Valid gates: 0
Pending gates: 0
Invalidated gates: 0
Gates in other states: 0
Total gates: 0
```

#### show security flow gate protocol summary

```
root> show security flow gate protocol tcp summary
Flow Gates on FPC4 PIC1:

Valid gates: 1
Pending gates: 0
Invalidated gates: 0
Gates in other states: 0
Total gates: 1

Flow Gates on FPC5 PIC0:

Valid gates: 0
Pending gates: 0
Invalidated gates: 0
Gates in other states: 0
Total gates: 0

Flow Gates on FPC5 PIC1:

Valid gates: 0
Pending gates: 0
Invalidated gates: 0
Gates in other states: 0

Maximum gates: 131072

## show security flow session

---

**Syntax**    **show security flow session**  
              [*filter* ] [ **brief** | **extensive** | **summary** ]

**Release Information**    Command introduced in Junos OS Release 8.5. Support for filter and view options added in Junos OS Release 10.2. Application firewall, dynamic application, and logical system filters added in Junos OS Release 11.2. Policy ID filter added in Junos OS Release 12.3X48-D10.

**Description**    Display information about all currently active security sessions on the device.

**Options**    • *filter*—Filter the display by the specified criteria.

The following filters reduce the display to those sessions that match the criteria specified by the filter. Refer to the specific **show** command for examples of the filtered output.

**application**—Predefined application name

**application-firewall**—Application firewall enabled

**application-firewall-rule-set**—Application firewall enabled with the specified rule set

**application-traffic-control**—Application traffic control session

**application-traffic-control-rule-set**—Application traffic control rule set name and rule name

**destination-port**—Destination port

**destination-prefix**—Destination IP prefix or address

**dynamic-application**—Dynamic application

**dynamic-application-group**—Dynamic application

**encrypted**—Encrypted traffic

**extensive**—Display detailed output

**family**—Display session by family

**idp**—IDP enabled sessions

**interface**—Name of incoming or outgoing interface

**logical-system** (**all** | *logical-system-name*)—Name of a specific logical system or **all** to display all logical systems

**nat**—Display sessions with network address translation

**policy-id**—Display session information based on policy ID; the range is 1 through 4,294,967,295

**protocol**—IP protocol number

**resource-manager**—Resource manager

**root-logical-system**—Display root logical system as default

**security-intelligence**—Display security intelligence sessions

**services-offload**—Display services offload sessions

**session-identifier**—Display session with specified session identifier

**source-port**—Source port

**source-prefix**—Source IP prefix

**summary**—Display output summary

**tunnel**—Tunnel sessions

- **brief | extensive | summary**—Display the specified level of output.
- **none**—Display information about all active sessions.

**Required Privilege Level** view

**Output Fields** Table 26 lists the output fields for the **show security flow session** command. Output fields are listed in the approximate order in which they appear.

**Table 214: show security flow session Output Fields**

| Field Name    | Field Description                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------|
| Session ID    | Number that identifies the session. Use this ID to get more information about the session.                             |
| CP Session ID | Number that identifies the central point session. Use this ID to get more information about the central point session. |
| Policy name   | Policy that permitted the traffic.                                                                                     |
| Timeout       | Idle timeout after which the session expires.                                                                          |

Table 214: show security flow session Output Fields (*continued*)

| Field Name                           | Field Description                                                                                                                                                                                                               |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In                                   | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).                                         |
| Out                                  | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).                                          |
| Total sessions                       | Total number of sessions.                                                                                                                                                                                                       |
| Status                               | Session status.                                                                                                                                                                                                                 |
| Flag                                 | Internal flag depicting the state of the session, used for debugging purposes. The three available flags are: <ul style="list-style-type: none"> <li>flag</li> <li>natflag</li> <li>natflag2</li> </ul>                         |
| Policy name                          | Name and ID of the policy that the first packet of the session matched.                                                                                                                                                         |
| Source NAT pool                      | The name of the source pool where NAT is used.                                                                                                                                                                                  |
| Dynamic application                  | Name of the application.                                                                                                                                                                                                        |
| Application traffic control rule-set | AppQoS rule set for this session.                                                                                                                                                                                               |
| Rule                                 | AppQoS rule for this session.                                                                                                                                                                                                   |
| Forwarding class                     | The AppQoS forwarding class name for this session that distinguishes the transmission priority                                                                                                                                  |
| DSCP code point                      | Differentiated Services (DiffServ) code point (DSCP) value remarked by the matching rule for this session.                                                                                                                      |
| Loss priority                        | One of four priority levels set by the matching rule to control discarding a packet during periods of congestion. A high loss priority means a high probability that the packet could be dropped during a period of congestion. |
| Rate limiter client to server        | The rate-limiter profile assigned to the client-to-server traffic defining a unique combination of <b>bandwidth-limit</b> and <b>burst-size-limit</b> specifications.                                                           |
| Rate limiter server to client        | The rate-limiter profile assigned to the server-to-client traffic defining a unique combination of <b>bandwidth-limit</b> and <b>burst-size-limit</b> specifications.                                                           |
| Maximum timeout                      | Maximum session timeout.                                                                                                                                                                                                        |
| Current timeout                      | Remaining time for the session unless traffic exists in the session.                                                                                                                                                            |

Table 214: show security flow session Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Session State</b>      | Session state.                                                                                                                                                                                |
| <b>Start time</b>         | Time when the session was created, offset from the system start time.                                                                                                                         |
| <b>Unicast-sessions</b>   | Number of unicast sessions.                                                                                                                                                                   |
| <b>Multicast-sessions</b> | Number of multicast sessions.                                                                                                                                                                 |
| <b>Failed-sessions</b>    | Number of failed sessions.                                                                                                                                                                    |
| <b>Sessions-in-use</b>    | Number of sessions in use. <ul style="list-style-type: none"> <li>• Valid sessions</li> <li>• Pending sessions</li> <li>• Invalidated sessions</li> <li>• Sessions in other states</li> </ul> |
| <b>Maximum-sessions</b>   | Maximum number of sessions permitted.                                                                                                                                                         |

## Sample Output

### show security flow session

```

root> show security flow session
Flow Sessions on FPC10 PIC1:

Session ID: 410000086, Policy name: default-policy-00/2, Timeout: 1790, Valid
 In: 200.0.0.10/41041 --> 60.0.0.2/21;tcp, If: ge-7/1/0.0, Pkts: 6, Bytes: 288,
 CP Session ID: 410000206
 Out: 60.0.0.2/21 --> 200.0.0.10/41041;tcp, If: ge-7/1/1.0, Pkts: 5, Bytes: 291,
 CP Session ID: 410000206
Total sessions: 1

**Table 215: show security flow session brief node Output Fields**

| Field Name  | Field Description                                                                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Session ID  | Number that identifies the session. Use this ID to get more information about the session.                                                                                |
| Policy name | Policy that permitted the traffic.                                                                                                                                        |
| State       | Session state.                                                                                                                                                            |
| Timeout     | Idle timeout after which the session expires.                                                                                                                             |
| In          | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN state, packets and bytes). |

Table 215: show security flow session brief node Output Fields (*continued*)

| Field Name            | Field Description                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Out</b>            | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| <b>CP Session ID</b>  | Number that identifies the central point session. Use this ID to get more information about the central point session.                                                                 |
| <b>Total sessions</b> | Total number of sessions.                                                                                                                                                              |

## Sample Output

### show security flow session brief node 0

```

root@host> show security flow session brief node 0
node0:

Flow Sessions on FPC0 PIC1:

Session ID: 10000001, Policy name: default-policy-00/2, State: Active, Timeout:
1696, Valid
Resource information : FTP ALG, 1, 0
 In: 100.0.0.2/60059 --> 120.0.0.2/21;tcp, If: reth0.0, Pkts: 14, Bytes: 626,
CP Session ID: 10000001
 Out: 120.0.0.2/21 --> 100.0.0.2/60059;tcp, If: reth1.0, Pkts: 13, Bytes: 744,
CP Session ID: 10000001

Total sessions: 1

Flow Sessions on FPC0 PIC2:
Total sessions: 0

Flow Sessions on FPC0 PIC3:
Total sessions: 0

```

### show security flow session brief node 1

```

root@host> show security flow session brief node 1
node1:

Flow Sessions on FPC0 PIC1:

Session ID: 10000001, Policy name: default-policy-00/2, State: Backup, Timeout:
12, Valid
Resource information : FTP ALG, 1, 0
 In: 100.0.0.2/60059 --> 120.0.0.2/21;tcp, If: reth0.0, Pkts: 0, Bytes: 0, CP
Session ID: 10000001
 Out: 120.0.0.2/21 --> 100.0.0.2/60059;tcp, If: reth1.0, Pkts: 0, Bytes: 0, CP
Session ID: 10000001
Total sessions: 1

Flow Sessions on FPC0 PIC2:
Total sessions: 0

```

```
Flow Sessions on FPC0 PIC3:
Total sessions: 0
```

### show security flow session brief node all

```
root@host> show security flow session brief node all
node0:

Flow Sessions on FPC0 PIC1:

Session ID: 10000001, Policy name: default-policy-00/2, State: Active, Timeout:
1672, Valid
Resource information : FTP ALG, 1, 0
 In: 100.0.0.2/60059 --> 120.0.0.2/21;tcp, If: reth0.0, Pkts: 14, Bytes: 626,

| Field Name            | Field Description                                                                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Session ID</b>     | Number that identifies the session. You can use this ID to get additional information about the session.                                                                                |
| <b>Policy name</b>    | Policy that permitted the traffic.                                                                                                                                                      |
| <b>Timeout</b>        | Idle timeout after which the session expires.                                                                                                                                           |
| <b>In</b>             | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| <b>Out</b>            | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |
| <b>Total sessions</b> | Total number of sessions.                                                                                                                                                               |

Table 216: show security flow session destination-port Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status             | Session status.                                                                                                                                                                       |
| Flag               | Internal flag depicting the state of the session, used for debugging purposes.                                                                                                        |
| Policy name        | Name and ID of the policy that the first packet of the session matched.                                                                                                               |
| Source NAT pool    | The name of the source pool where NAT is used.                                                                                                                                        |
| Application        | Name of the application.                                                                                                                                                              |
| Maximum timeout    | Maximum session timeout.                                                                                                                                                              |
| Current timeout    | Remaining time for the session unless traffic exists in the session.                                                                                                                  |
| Session State      | Session state.                                                                                                                                                                        |
| Start time         | Time when the session was created, offset from the system start time.                                                                                                                 |
| Unicast-sessions   | Number of unicast sessions.                                                                                                                                                           |
| Multicast-sessions | Number of multicast sessions.                                                                                                                                                         |
| Failed-sessions    | Number of failed sessions.                                                                                                                                                            |
| Sessions-in-use    | Number of sessions in use. <ul style="list-style-type: none"> <li>Valid sessions</li> <li>Pending sessions</li> <li>Invalidated sessions</li> <li>Sessions in other states</li> </ul> |
| Maximum-sessions   | Number of maximum sessions.                                                                                                                                                           |

## Sample Output

### show security flow session destination-port 23

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                       |

**Table 217: show security flow session destination-prefix Output Fields**

| Field Name  | Field Description                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Session ID  | Number that identifies the session. You can use this ID to get additional information about the session.                                                                                |
| Policy name | Policy that permitted the traffic.                                                                                                                                                      |
| Timeout     | Idle timeout after which the session expires.                                                                                                                                           |
| In          | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| Out         | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |

Table 217: show security flow session destination-prefix Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Total sessions     | Total number of sessions.                                                                                                                                                             |
| Status             | Session status.                                                                                                                                                                       |
| Flag               | Internal flag depicting the state of the session, used for debugging purposes.                                                                                                        |
| Policy name        | Name and ID of the policy that the first packet of the session matched.                                                                                                               |
| Source NAT pool    | The name of the source pool where NAT is used.                                                                                                                                        |
| Application        | Name of the application.                                                                                                                                                              |
| Maximum timeout    | Maximum session timeout.                                                                                                                                                              |
| Current timeout    | Remaining time for the session unless traffic exists in the session.                                                                                                                  |
| Session State      | Session state.                                                                                                                                                                        |
| Start time         | Time when the session was created, offset from the system start time.                                                                                                                 |
| Unicast-sessions   | Number of unicast sessions.                                                                                                                                                           |
| Multicast-sessions | Number of multicast sessions.                                                                                                                                                         |
| Failed-sessions    | Number of failed sessions.                                                                                                                                                            |
| Sessions-in-use    | Number of sessions in use. <ul style="list-style-type: none"> <li>Valid sessions</li> <li>Pending sessions</li> <li>Invalidated sessions</li> <li>Sessions in other states</li> </ul> |
| Maximum-sessions   | Number of maximum sessions.                                                                                                                                                           |

## Sample Output

### show security flow session destination-prefix 60/8

```
root> show security flow session destination-prefix 60/8
```

```

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                  |

**Table 218: show security flow session extensive node Output Fields**

| Field Name  | Field Description                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------|
| Session ID  | Number that identifies the session. You can use this ID to get additional information about the session. |
| Status      | Session status.                                                                                          |
| State       | Session state.                                                                                           |
| Flag        | Internal flag depicting the state of the session, used for debugging purposes.                           |
| Policy name | Policy that permitted the traffic.                                                                       |

Table 218: show security flow session extensive node Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source NAT pool | The name of the source pool where NAT is used.                                                                                                                                                |
| Maximum timeout | Maximum session timeout.                                                                                                                                                                      |
| Current timeout | Remaining time for the session unless traffic exists in the session.                                                                                                                          |
| Start time      | Time when the session was created, offset from the system start time.                                                                                                                         |
| Duration        | Length of time for which the session is active.                                                                                                                                               |
| In              | Incoming flow (source and destination IP addresses, application protocol, interface, session token, flag, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| Out             | Reverse flow (source and destination IP addresses, application protocol, interface, session token, flag, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |
| Total sessions  | Total number of sessions.                                                                                                                                                                     |
| CP Session ID   | Number that identifies the central point session. Use this ID to get more information about the central point session.                                                                        |

## Sample Output

### show security flow session extensive node 0

```

root@host> show security flow session extensive node 0
node0:

Flow Sessions on FPC0 PIC1:

Session ID: 10000003, Status: Normal, State: Active

**Table 219: show security flow session family Output Fields**

| Field Name     | Field Description                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Session ID     | Number that identifies the session. Use this ID to get more information about the session.                                                                                              |
| Policy name    | Policy that permitted the traffic.                                                                                                                                                      |
| Timeout        | Idle timeout after which the session expires.                                                                                                                                           |
| In             | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| Out            | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |
| Total sessions | Total number of sessions.                                                                                                                                                               |
| Status         | Session status.                                                                                                                                                                         |

Table 219: show security flow session family Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flag               | Internal flag depicting the state of the session, used for debugging purposes.                                                                                                                |
| Policy name        | Name and ID of the policy that the first packet of the session matched.                                                                                                                       |
| Source NAT pool    | The name of the source pool where NAT is used.                                                                                                                                                |
| Application        | Name of the application.                                                                                                                                                                      |
| Maximum timeout    | Maximum session timeout.                                                                                                                                                                      |
| Current timeout    | Remaining time for the session unless traffic exists in the session.                                                                                                                          |
| Session State      | Session state.                                                                                                                                                                                |
| Start time         | Time when the session was created, offset from the system start time.                                                                                                                         |
| Unicast-sessions   | Number of unicast sessions.                                                                                                                                                                   |
| Multicast-sessions | Number of multicast sessions.                                                                                                                                                                 |
| Failed-sessions    | Number of failed sessions.                                                                                                                                                                    |
| Sessions-in-use    | Number of sessions in use. <ul style="list-style-type: none"> <li>• Valid sessions</li> <li>• Pending sessions</li> <li>• Invalidated sessions</li> <li>• Sessions in other states</li> </ul> |
| Maximum-sessions   | Number of maximum sessions.                                                                                                                                                                   |

## Sample Output

### show security flow session family inet

```

root> show security flow session family inet
Flow Sessions on FPC10 PIC1:
Total sessions: 0

Flow Sessions on FPC10 PIC2:

Session ID: 420000107, Policy name: default-policy-00/2, Timeout: 4, Valid
 In: 200.0.0.10/3 --> 60.0.0.1/19001;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
CP Session ID: 420000202
 Out: 60.0.0.1/19001 --> 200.0.0.10/3;icmp, If: .local..0, Pkts: 1, Bytes: 84,
CP Session ID: 420000202
Total sessions: 1

Flow Sessions on FPC10 PIC3:
```

```

Session ID: 430000115, Policy name: default-policy-00/2, Timeout: 2, Valid
 In: 200.0.0.10/2 --> 60.0.0.1/19001;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
CP Session ID: 430000110
 Out: 60.0.0.1/19001 --> 200.0.0.10/2;icmp, If: .local..0, Pkts: 1, Bytes: 84,
CP Session ID: 430000110

```

```

Session ID: 430000117, Policy name: default-policy-00/2, Timeout: 4, Valid
 In: 200.0.0.10/4 --> 60.0.0.1/19001;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
CP Session ID: 430000111
 Out: 60.0.0.1/19001 --> 200.0.0.10/4;icmp, If: .local..0, Pkts: 1, Bytes: 84,
CP Session ID: 430000111
Total sessions: 2

```

| <b>Output Fields</b>            | Table 220 lists the output fields for the <b>show security flow session interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                               |

**Table 220: show security flow session interface Output Fields**

| Field Name            | Field Description                                                                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Session ID</b>     | Number that identifies the session. You can use this ID to get additional information about the session.                                                                                |
| <b>Policy name</b>    | Policy that permitted the traffic.                                                                                                                                                      |
| <b>Timeout</b>        | Idle timeout after which the session expires.                                                                                                                                           |
| <b>In</b>             | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| <b>Out</b>            | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |
| <b>Total sessions</b> | Total number of sessions.                                                                                                                                                               |

Table 220: show security flow session interface Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status             | Session status.                                                                                                                                                                       |
| Flag               | Internal flag depicting the state of the session, used for debugging purposes.                                                                                                        |
| Policy name        | Name and ID of the policy that the first packet of the session matched.                                                                                                               |
| Source NAT pool    | The name of the source pool where NAT is used.                                                                                                                                        |
| Application        | Name of the application.                                                                                                                                                              |
| Maximum timeout    | Maximum session timeout.                                                                                                                                                              |
| Current timeout    | Remaining time for the session unless traffic exists in the session.                                                                                                                  |
| Session State      | Session state.                                                                                                                                                                        |
| Start time         | Time when the session was created, offset from the system start time.                                                                                                                 |
| Unicast-sessions   | Number of unicast sessions.                                                                                                                                                           |
| Multicast-sessions | Number of multicast sessions.                                                                                                                                                         |
| Failed-sessions    | Number of failed sessions.                                                                                                                                                            |
| Sessions-in-use    | Number of sessions in use. <ul style="list-style-type: none"> <li>Valid sessions</li> <li>Pending sessions</li> <li>Invalidated sessions</li> <li>Sessions in other states</li> </ul> |
| Maximum-sessions   | Number of maximum sessions.                                                                                                                                                           |

## Sample Output

### show security flow session interface ge-0/0/2.0

```

root> show security flow session interface ge-7/1/1.0
Flow Sessions on FPC10 PIC1:
Total sessions: 0

Flow Sessions on FPC10 PIC2:

Session ID: 420000146, Policy name: default-policy-00/2, Timeout: 58, Valid
 In: 200.0.0.10/9 --> 60.0.0.2/21562;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
 CP Session ID: 420000247
 Out: 60.0.0.2/21562 --> 200.0.0.10/9;icmp, If: ge-7/1/1.0, Pkts: 0, Bytes: 0,
 CP Session ID: 420000247
Total sessions: 1

```

Flow Sessions on FPC10 PIC3:

```
Session ID: 430000146, Policy name: default-policy-00/2, Timeout: 56, Valid
 In: 200.0.0.10/8 --> 60.0.0.2/21562;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
CP Session ID: 430000131
 Out: 60.0.0.2/21562 --> 200.0.0.10/8;icmp, If: ge-7/1/1.0, Pkts: 0, Bytes: 0,
CP Session ID: 430000131
Total sessions: 1
```

#### show security flow session interface ge-0/0/2.0 brief

```
root> show security flow session interface ge-7/1/1.0 brief
```

Flow Sessions on FPC10 PIC1:

```
Session ID: 410000137, Policy name: default-policy-00/2, Timeout: 2, Valid
 In: 200.0.0.10/5 --> 60.0.0.2/23354;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
CP Session ID: 410000269
 Out: 60.0.0.2/23354 --> 200.0.0.10/5;icmp, If: ge-7/1/1.0, Pkts: 1, Bytes: 84,
CP Session ID: 410000269
Total sessions: 1
```

Flow Sessions on FPC10 PIC2:

```
Session ID: 420000151, Policy name: default-policy-00/2, Timeout: 54, Valid
 In: 200.0.0.10/1 --> 60.0.0.2/23354;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
CP Session ID: 420000252
 Out: 60.0.0.2/23354 --> 200.0.0.10/1;icmp, If: ge-7/1/1.0, Pkts: 0, Bytes: 0,
CP Session ID: 420000252
Total sessions: 1
```

Flow Sessions on FPC10 PIC3:

Total sessions: 0

| <b>Output Fields</b>            | <a href="#">Table 221</a> lists the output fields for the <b>show security flow session nat</b> command. Output fields are listed in the approximate order in which they appear.                                  |

**Table 221: show security flow session nat Output Fields**

| Field Name                  | Field Description                                                                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Session ID</b>           | Number that identifies the session. You can use this ID to get additional information about the session.                                                                                |
| <b>Policy name</b>          | Policy that permitted the traffic.                                                                                                                                                      |
| <b>Timeout</b>              | Idle timeout after which the session expires.                                                                                                                                           |
| <b>Resource information</b> | Information about the session particular to the resource manager, including the name of the ALG, the group ID, and the resource ID.                                                     |
| <b>In</b>                   | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| <b>Out</b>                  | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |
| <b>Total sessions</b>       | Total number of sessions.                                                                                                                                                               |
| <b>Status</b>               | Session status.                                                                                                                                                                         |
| <b>Flag</b>                 | Internal flag depicting the state of the session, used for debugging purposes.                                                                                                          |

Table 221: show security flow session nat Output Fields (*continued*)

| Field Name           | Field Description                                                       |
|----------------------|-------------------------------------------------------------------------|
| Policy name          | Name and ID of the policy that the first packet of the session matched. |
| Source NAT pool      | The name of the source pool where NAT is used.                          |
| Application          | Name of the application.                                                |
| Maximum timeout      | Maximum session timeout.                                                |
| Current timeout      | Remaining time for the session unless traffic exists in the session.    |
| Session State        | Session state.                                                          |
| Start time           | Time when the session was created, offset from the system start time.   |
| Valid sessions       | Number of valid sessions.                                               |
| Pending sessions     | Number of pending sessions.                                             |
| Invalidated sessions | Number of invalidated sessions.                                         |

## Sample Output

### show security flow session nat brief

```

[show security flow session protocol icmp summary on page 2094](#)

**Output Fields** Table 223 lists the output fields for the **show security flow session protocol** command. Output fields are listed in the approximate order in which they appear.

**Table 223: show security flow session protocol Output Fields**

| Field Name                | Field Description                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Session ID</b>         | Number that identifies the session. You can use this ID to get additional information about the session.                                                                                |
| <b>Policy name</b>        | Policy that permitted the traffic.                                                                                                                                                      |
| <b>Timeout</b>            | Idle timeout after which the session expires.                                                                                                                                           |
| <b>In</b>                 | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| <b>Out</b>                | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |
| <b>Total sessions</b>     | Total number of sessions.                                                                                                                                                               |
| <b>Status</b>             | Session status.                                                                                                                                                                         |
| <b>Flag</b>               | Internal flag depicting the state of the session, used for debugging purposes.                                                                                                          |
| <b>Policy name</b>        | Name and ID of the policy that the first packet of the session matched.                                                                                                                 |
| <b>Source NAT pool</b>    | The name of the source pool where NAT is used.                                                                                                                                          |
| <b>Application</b>        | Name of the application.                                                                                                                                                                |
| <b>Maximum timeout</b>    | Maximum session timeout.                                                                                                                                                                |
| <b>Current timeout</b>    | Remaining time for the session unless traffic exists in the session.                                                                                                                    |
| <b>Session State</b>      | Session state.                                                                                                                                                                          |
| <b>Start time</b>         | Time when the session was created, offset from the system start time.                                                                                                                   |
| <b>Unicast-sessions</b>   | Number of unicast sessions.                                                                                                                                                             |
| <b>Multicast-sessions</b> | Number of multicast sessions.                                                                                                                                                           |
| <b>Failed-sessions</b>    | Number of failed sessions.                                                                                                                                                              |

Table 223: show security flow session protocol Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sessions-in-use  | <p>Number of sessions in use.</p> <ul style="list-style-type: none"> <li>Valid sessions</li> <li>Pending sessions</li> <li>Invalidated sessions</li> <li>Sessions in other states</li> </ul> |
| Maximum-sessions | Number of maximum sessions.                                                                                                                                                                  |

## Sample Output

### show security flow session protocol icmp

```

root> show security flow session protocol icmp
Flow Sessions on FPC10 PIC1:

Session ID: 410000654, Policy name: p1/4, Timeout: 2, Valid
 In: 200.0.0.10/2 --> 60.0.0.2/15685;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
CP Session ID: 410001264
 Out: 60.0.0.2/15685 --> 200.0.0.10/2;icmp, If: ge-7/1/1.0, Pkts: 1, Bytes: 84,
CP Session ID: 410001264
Total sessions: 1

Flow Sessions on FPC10 PIC2:
Total sessions: 0

Flow Sessions on FPC10 PIC3:

Session ID: 430000399, Policy name: p1/4, Timeout: 2, Valid
 In: 200.0.0.10/3 --> 60.0.0.2/15685;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
CP Session ID: 430001053
 Out: 60.0.0.2/15685 --> 200.0.0.10/3;icmp, If: ge-7/1/1.0, Pkts: 1, Bytes: 84,
CP Session ID: 430001053
Total sessions: 1

```

### show security flow session protocol icmp brief

```

root> show security flow session protocol icmp brief
Flow Sessions on FPC10 PIC1:

Session ID: 410000658, Policy name: p1/4, Timeout: 4, Valid
 In: 200.0.0.10/4 --> 60.0.0.2/16453;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
CP Session ID: 410001268
 Out: 60.0.0.2/16453 --> 200.0.0.10/4;icmp, If: ge-7/1/1.0, Pkts: 1, Bytes: 84,
CP Session ID: 410001268
Total sessions: 1

Flow Sessions on FPC10 PIC2:

Session ID: 420000612, Policy name: p1/4, Timeout: 2, Valid
 In: 200.0.0.10/5 --> 60.0.0.2/16453;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
CP Session ID: 420001316
 Out: 60.0.0.2/16453 --> 200.0.0.10/5;icmp, If: ge-7/1/1.0, Pkts: 1, Bytes: 84,
CP Session ID: 420001316
Total sessions: 1

```

## Flow Sessions on FPC10 PIC3:

```

Session ID: 430000405, Policy name: p1/4, Timeout: 2, Valid
 In: 200.0.0.10/6 --> 60.0.0.2/16453;icmp, If: ge-7/1/0.0, Pkts: 1, Bytes: 84,
 CP Session ID: 430001059
 Out: 60.0.0.2/16453 --> 200.0.0.10/6;icmp, If: ge-7/1/1.0, Pkts: 1, Bytes: 84,
 CP Session ID: 430001059
Total sessions: 1

```

## show security flow session protocol icmp extensive

```

root> show security flow session protocol icmp extensive

```

## Flow Sessions on FPC10 PIC1:

```

Session ID: 410000660, Status: Normal
Flags: 0x80000040/0x0/0x2800003
Policy name: p1/4
Source NAT pool: Null
Dynamic application: junos:UNKNOWN,
Encryption: Unknown
Application traffic control rule-set: INVALID, Rule: INVALID
Maximum timeout: 4, Current timeout: 2
Session State: Valid
Start time: 153201, Duration: 3
 In: 200.0.0.10/8 --> 60.0.0.2/16453;icmp,
 Interface: ge-7/1/0.0,
 Session token: 0x6, Flag: 0xc0000021
 Route: 0x70010, Gateway: 200.0.0.10, Tunnel: 0

**Table 224: show security flow session resource-manager Output Fields**

| Field Name           | Field Description                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Session ID           | Number that identifies the session. You can use this ID to get additional information about the session.                                                                                |
| Policy name          | Policy that permitted the traffic.                                                                                                                                                      |
| Timeout              | Idle timeout after which the session expires.                                                                                                                                           |
| Resource information | Information about the session particular to the resource manager, including the name of the ALG, the group ID, and the resource ID.                                                     |
| In                   | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| Out                  | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |
| Total sessions       | Total number of sessions.                                                                                                                                                               |

Table 224: show security flow session resource-manager Output Fields (*continued*)

| Field Name               | Field Description                                                                                                      |
|--------------------------|------------------------------------------------------------------------------------------------------------------------|
| Status                   | Session status.                                                                                                        |
| Flag                     | Internal flag depicting the state of the session, used for debugging purposes.                                         |
| Policy name              | Name and ID of the policy that the first packet of the session matched.                                                |
| Source NAT pool          | The name of the source pool where NAT is used.                                                                         |
| Application              | Name of the application.                                                                                               |
| Maximum timeout          | Maximum session timeout.                                                                                               |
| Current timeout          | Remaining time for the session unless traffic exists in the session.                                                   |
| Session State            | Session state.                                                                                                         |
| Start time               | Time when the session was created, offset from the system start time.                                                  |
| Valid sessions           | Number of valid sessions.                                                                                              |
| Pending sessions         | Number of pending sessions.                                                                                            |
| Invalidated sessions     | Number of invalidated sessions.                                                                                        |
| Sessions in other states | Number of sessions in other states.                                                                                    |
| CP Session ID            | Number that identifies the central point session. Use this ID to get more information about the central point session. |

## Sample Output

### show security flow session resource-manager

```

root> show security flow session resource-manager
Flow Sessions on FPC10 PIC1:

Session ID: 410000664, Policy name: p1/4, Timeout: 1734, Valid
Resource information : FTP ALG, 1, 0
 In: 200.0.0.10/41047 --> 60.0.0.2/21;tcp, If: ge-7/1/0.0, Pkts: 13, Bytes: 586,
 CP Session ID: 410001274
 Out: 60.0.0.2/21 --> 200.0.0.10/41047;tcp, If: ge-7/1/1.0, Pkts: 13, Bytes:
803, CP Session ID: 410001274

## show security flow session services-offload

---

**Syntax** `show security flow session services-offload`  
`[filter] [brief | extensive | summary]`

**Release Information** Command introduced in Junos OS Release 11.4. Low-latency option introduced in Junos OS Release 12.1X44-D10.  
Starting with Junos OS Release 15.1X49-D10, the SRX5K-MPC3-100G10G (IOC3) and the SRX5K-MPC3-40G10G (IOC3) with Express Path (formerly known as *services offloading*) support are introduced for SRX5400, SRX5600, and SRX5800 devices.

**Description** Display information about all currently active services-offload security sessions on the device.

**Options** • *filter*—Filter the display by the specified criteria.

The following filters reduce the display to those sessions that match the criteria specified by the filter:

**application** —Application name.

**application-firewall-rule-set**—Application firewall enabled with the specified rule set.

**application-traffic-control-rule-set**—Application traffic control enabled with the specified rule set.

**destination-port**—Destination port.

**destination-prefix**—Destination IP prefix or address.

**dynamic-application**—Dynamic application name.

**dynamic-application-group**—Dynamic application group name.

**encrypted**—Show encrypted traffic.

**family**—Protocol family.

**interface**—Name of incoming or outgoing interface.

**logical-system**—Logical system name.

**protocol**—IP protocol number.

**root-logical-system**—Root logical system name.

**source-port**—Source port.

**source-prefix**—Source IP prefix or address.

• *brief | extensive | summary*—Display the specified level of output.

**Required Privilege Level** view

**Output Fields** Table 225 lists the output fields for the **show security flow session services-offload** command. Output fields are listed in the approximate order in which they appear.

**Table 225: show security flow session services-offload Output Fields**

| Field Name                 | Field Description                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Session ID</b>          | Number that identifies the services-offload session. Use this ID to get more information about the session.                                                                              |
| <b>Policy name</b>         | Policy that permits the services-offload traffic.                                                                                                                                        |
| <b>Timeout</b>             | Idle timeout period after which the services-offload session expires.                                                                                                                    |
| <b>In</b>                  | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets, and bytes). |
| <b>Out</b>                 | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets, and bytes).  |
| <b>Total sessions</b>      | Total number of services-offload sessions.                                                                                                                                               |
| <b>Status</b>              | Services-offload session status.                                                                                                                                                         |
| <b>Flag</b>                | Internal flag depicting the state of the services-offload session, used for debugging purposes.                                                                                          |
| <b>Policy name</b>         | Name and ID of the policy that the first packet of the services-offload session matched.                                                                                                 |
| <b>Source NAT pool</b>     | The name of the source pool where NAT is used.                                                                                                                                           |
| <b>Application</b>         | Name of the application.                                                                                                                                                                 |
| <b>Dynamic application</b> | Name of the dynamic application.                                                                                                                                                         |
| <b>Maximum timeout</b>     | Maximum amount of idle time allowed for the services-offload session.                                                                                                                    |
| <b>Current timeout</b>     | Number of seconds that the current services-offload session has been idle.                                                                                                               |

Table 225: show security flow session services-offload Output Fields (*continued*)

| Field Name               | Field Description                                                                      |
|--------------------------|----------------------------------------------------------------------------------------|
| Session State            | Services-offload session state.                                                        |
| Start time               | Time when the services-offload session was created, offset from the system start time. |
| Duration                 | Duration of the services-offload session.                                              |
| Valid sessions           | Number of valid services-offload sessions.                                             |
| Pending sessions         | Number of pending services-offload sessions.                                           |
| Invalidated sessions     | Number of invalidated services-offload sessions.                                       |
| Sessions in other states | Number of services-offload sessions in other states.                                   |
| Total sessions           | Total number of services-offload sessions.                                             |

## Sample Output

### show security flow session services-offload

```

user@host>show security flow session services-offload
Flow Sessions on FPC10 PIC1:
Total sessions: 0

Flow Sessions on FPC10 PIC2:

Session ID: 420000002, Policy name: p1/4, Timeout: 1788, Valid
 In: 200.0.0.10/15198 --> 60.0.0.2/23;tcp, If: ge-7/1/0.0, Pkts: 9, Bytes: 507,
 CP Session ID: 420000002
 Out: 60.0.0.2/23 --> 200.0.0.10/15198;tcp, If: ge-7/1/1.0, Pkts: 8, Bytes: 462,
 CP Session ID: 420000002
Total sessions: 1

Flow Sessions on FPC10 PIC3:
Total sessions: 0

```

### show security flow session services-offload brief

```

user@host>show security flow session services-offload brief
Flow Sessions on FPC10 PIC1:
Total sessions: 0

Flow Sessions on FPC10 PIC2:

Session ID: 420000002, Policy name: p1/4, Timeout: 1748, Valid
 In: 200.0.0.10/15198 --> 60.0.0.2/23;tcp, If: ge-7/1/0.0, Pkts: 9, Bytes: 507,
 CP Session ID: 420000002
 Out: 60.0.0.2/23 --> 200.0.0.10/15198;tcp, If: ge-7/1/1.0, Pkts: 8, Bytes: 462,
 CP Session ID: 420000002
Total sessions: 1

Flow Sessions on FPC10 PIC3:
Total sessions: 0

```

**show security flow session services-offload extensive**

```

user@host>show security flow session services-offload extensive
Flow Sessions on FPC10 PIC1:
Total sessions: 0

Flow Sessions on FPC10 PIC2:

Session ID: 420000002, Status: Normal
Flags: 0x40/0x0/0x2408003, services-offload
Policy name: p1/4
Source NAT pool: Null, Application: junos-telnet/10
Dynamic application: junos:UNKNOWN,
Encryption: Unknown
Application traffic control rule-set: INVALID, Rule: INVALID
Maximum timeout: 1800, Current timeout: 1718
Session State: Valid
Start time: 165, Duration: 89
 In: 200.0.0.10/15198 --> 60.0.0.2/23;tcp,
 Interface: ge-7/1/0.0,
 Session token: 0x6, Flag: 0x42001021
 Route: 0x80010, Gateway: 200.0.0.10, Tunnel: 0
 Port sequence: 0, FIN sequence: 0,
 FIN state: 0,
 Pkts: 9, Bytes: 507
 CP Session ID: 420000002
 Out: 60.0.0.2/23 --> 200.0.0.10/15198;tcp,
 Interface: ge-7/1/1.0,
 Session token: 0x7, Flag: 0x42001020
 Route: 0x70010, Gateway: 60.0.0.2, Tunnel: 0
 Port sequence: 0, FIN sequence: 0,
 FIN state: 0,
 Pkts: 8, Bytes: 462

| <b>Output Fields</b>            | <a href="#">Table 226</a> lists the output fields for the <b>show security flow session session-identifier</b> command. Output fields are listed in the approximate order in which they appear.                                                          |

**Table 226: show security flow session session-identifier Output Fields**

| Field Name             | Field Description                                                                                                                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Session ID</b>      | Number that identifies the session. You can use this ID to get additional information about the session.                                                                                                      |
| <b>Status</b>          | Session status.                                                                                                                                                                                               |
| <b>Flag</b>            | Internal flag depicting the state of the session, used for debugging purposes. The three available flags are: <ul style="list-style-type: none"> <li>• flag</li> <li>• natflag</li> <li>• natflag2</li> </ul> |
| <b>Virtual system</b>  | Virtual system to which the session belongs.                                                                                                                                                                  |
| <b>Policy name</b>     | Name and ID of the policy that the first packet of the session matched.                                                                                                                                       |
| <b>Maximum timeout</b> | Maximum session timeout.                                                                                                                                                                                      |
| <b>Current timeout</b> | Remaining time for the session unless traffic exists in the session.                                                                                                                                          |
| <b>Start time</b>      | Time when the session was created, offset from the system start time.                                                                                                                                         |

Table 226: show security flow session session-identifier Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Output Fields</b>            | <a href="#">Table 227</a> lists the output fields for the <b>show security flow session source-port</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                 |

Table 227: show security flow session source-port Output Fields

| Field Name           | Field Description                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Session ID           | Number that identifies the session. You can use this ID to get additional information about the session.                                                                                |
| Policy name          | Policy that permitted the traffic.                                                                                                                                                      |
| Timeout              | Idle timeout after which the session expires.                                                                                                                                           |
| Resource information | Information about the session particular to the resource manager, including the name of the ALG, the group ID, and the resource ID.                                                     |
| In                   | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| Out                  | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |

Table 227: show security flow session source-port Output Fields (*continued*)

| Field Name               | Field Description                                                              |
|--------------------------|--------------------------------------------------------------------------------|
| Total sessions           | Total number of sessions.                                                      |
| Status                   | Session status.                                                                |
| Flag                     | Internal flag depicting the state of the session, used for debugging purposes. |
| Policy name              | Name and ID of the policy that the first packet of the session matched.        |
| Source NAT pool          | The name of the source pool where NAT is used.                                 |
| Application              | Name of the application.                                                       |
| Maximum timeout          | Maximum session timeout.                                                       |
| Current timeout          | Remaining time for the session unless traffic exists in the session.           |
| Session State            | Session state.                                                                 |
| Start time               | Time when the session was created, offset from the system start time.          |
| Valid sessions           | Number of valid sessions.                                                      |
| Pending sessions         | Number of pending sessions.                                                    |
| Invalidated sessions     | Number of invalidated sessions.                                                |
| Sessions in other states | Number of sessions in other states.                                            |

| <b>Output Fields</b>            | <a href="#">Table 228</a> lists the output fields for the <b>show security flow session source-prefix</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                  |

**Table 228: show security flow session source-prefix Output Fields**

| Field Name         | Field Description                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Session ID</b>  | Number that identifies the session. You can use this ID to get additional information about the session.                                                                                |
| <b>Policy name</b> | Policy that permitted the traffic.                                                                                                                                                      |
| <b>Timeout</b>     | Idle timeout after which the session expires.                                                                                                                                           |
| <b>In</b>          | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| <b>Out</b>         | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |

Table 228: show security flow session source-prefix Output Fields (*continued*)

| Field Name               | Field Description                                                              |
|--------------------------|--------------------------------------------------------------------------------|
| Total sessions           | Total number of sessions.                                                      |
| Status                   | Session status.                                                                |
| Flag                     | Internal flag depicting the state of the session, used for debugging purposes. |
| Policy name              | Name and ID of the policy that the first packet of the session matched.        |
| Source NAT pool          | The name of the source pool where NAT is used.                                 |
| Application              | Name of the application.                                                       |
| Maximum timeout          | Maximum session timeout.                                                       |
| Current timeout          | Remaining time for the session unless traffic exists in the session.           |
| Session State            | Session state.                                                                 |
| Start time               | Time when the session was created, offset from the system start time.          |
| Valid sessions           | Number of valid sessions.                                                      |
| Pending sessions         | Number of pending sessions.                                                    |
| Invalidated sessions     | Number of invalidated sessions.                                                |
| Sessions in other states | Number of sessions in other states.                                            |

**Output Fields** Table 231 lists the output fields for the **show security flow session summary services-offload** command. Output fields are listed in the approximate order in which they appear.

**Table 231: show security flow session summary services-offload Output Fields**

| Field Name                | Field Description                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unicast-sessions          | Number of unicast sessions.                                                                                                                                |
| Multicast-sessions        | Number of multicast sessions.                                                                                                                              |
| Services-offload-sessions | Number of services-offload sessions.                                                                                                                       |
| Failed-sessions           | Number of failed sessions.                                                                                                                                 |
| Sessions-in-use           | Number of sessions in use: <ul style="list-style-type: none"> <li>Valid</li> <li>Pending</li> <li>Invalidated</li> <li>Sessions in other states</li> </ul> |
| Maximum-sessions          | Maximum number of sessions.                                                                                                                                |

## Sample Output

### show security flow session summary services-offload

```

user@host> show security flow session summary services-offload
Flow Sessions on FPC1 PIC0:
Unicast-sessions: 0
Multicast-sessions: 0
Services-offload-sessions: 0
Failed-sessions: 0
Sessions-in-use: 0
 Valid sessions: 0
 Pending sessions: 0
 Invalidated sessions: 0
 Sessions in other states: 0
Maximum-sessions: 409600

Flow Sessions on FPC2 PIC0:
Unicast-sessions: 1
Multicast-sessions: 0
Services-offload-sessions: 1
Failed-sessions: 0
Sessions-in-use: 1
 Valid sessions: 1
 Pending sessions: 0
 Invalidated sessions: 0
 Sessions in other states: 0
Maximum-sessions: 819200

```

```

Flow Sessions on FPC3 PIC0:
Unicast-sessions: 0
Multicast-sessions: 0
Services-offload-sessions: 0
Failed-sessions: 0
Sessions-in-use: 0
 Valid sessions: 0
 Pending sessions: 0
 Invalidated sessions: 0
 Sessions in other states: 0
Maximum-sessions: 819200

```

```

Flow Sessions on FPC5 PIC0:
Unicast-sessions: 0
Multicast-sessions: 0
Services-offload-sessions: 0
Failed-sessions: 0
Sessions-in-use: 0
 Valid sessions: 0
 Pending sessions: 0
 Invalidated sessions: 0
 Sessions in other states: 0

| <b>Output Fields</b>            | Table 232 lists the output fields for the <b>show security flow session tunnel</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                         |

**Table 232: show security flow session tunnel Output Fields**

| Field Name             | Field Description                                                                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Session ID</b>      | Number that identifies the session. You can use this ID to get additional information about the session.                                                                                |
| <b>Policy name</b>     | Policy that permitted the traffic. NA (Not Applicable) for a tunnel session.                                                                                                            |
| <b>Timeout</b>         | Idle timeout after which the session expires. NA (Not Applicable) for a tunnel session.                                                                                                 |
| <b>In</b>              | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| <b>Total sessions</b>  | Total number of sessions.                                                                                                                                                               |
| <b>Status</b>          | Session status.                                                                                                                                                                         |
| <b>Flag</b>            | Internal flag depicting the state of the session, used for debugging purposes.                                                                                                          |
| <b>Policy name</b>     | Name and ID of the policy that the first packet of the session matched.                                                                                                                 |
| <b>Source NAT pool</b> | The name of the source pool where NAT is used.                                                                                                                                          |

Table 232: show security flow session tunnel Output Fields (*continued*)

| Field Name               | Field Description                                                     |
|--------------------------|-----------------------------------------------------------------------|
| Application              | Name of the application.                                              |
| Maximum timeout          | Maximum session timeout.                                              |
| Current timeout          | Remaining time for the session unless traffic exists in the session.  |
| Session State            | Session state.                                                        |
| Start time               | Time when the session was created, offset from the system start time. |
| Valid sessions           | Number of valid sessions.                                             |
| Pending sessions         | Number of pending sessions.                                           |
| Invalidated sessions     | Number of invalidated sessions.                                       |
| Sessions in other states | Number of sessions in other states.                                   |

## Sample Output

### show security flow session tunnel

```

root> show security flow session tunnel
Flow Sessions on FPC10 PIC1:

Session ID: 410000001, Policy name: N/A, Timeout: N/A, Valid
 In: 60.0.0.2/43405 --> 60.0.0.3/494;esp, If: ge-7/1/1.0, Pkts: 0, Bytes: 0, CP Session
 ID: 420000000

Session ID: 410000002, Policy name: N/A, Timeout: N/A, Valid
 In: 60.0.0.2/0 --> 60.0.0.3/0;esp, If: ge-7/1/1.0, Pkts: 0, Bytes: 0, CP Session

## show security flow statistics

**Syntax** `show security flow statistics`

**Release Information** Command introduced in Junos OS Release 10.2.  
Starting with Junos OS Release 15.1X49-D10, SRX5K-MPC3-100G10G (IOC3) and SRX5K-MPC3-40G10G (IOC3) are introduced for SRX5400, SRX5600, and SRX5800 devices that perform hash-based datapath packet forwarding to interconnect with all existing IOC and SPC cards using the XL chip (packet-processing chip). The IOC3 XL chip uses a hash-based method to distribute ingress traffic to a pool of SPUs by default. Selection of hash keys depends on application protocols.

**Description** Display flow-related system statistics.

**Required Privilege Level** view

**Related Documentation**

- [Juniper Networks Devices Processing Overview on page 1641](#)

**List of Sample Output** [show security flow statistics on page 2135](#)  
[show security flow statistics \(for hash-based datapath forwarding using SRX5K-MPC3-40G10G \(IOC3\) and SRX5K-MPC3-100G10G \(IOC3\) on page 2136](#)

**Output Fields** Table 233 lists the output fields for the `show security flow statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 233: show security flow statistics Output Fields**

| Field Name        | Field Description            |
|-------------------|------------------------------|
| Current sessions  | Number of current sessions.  |
| Packets forwarded | Number of packets forwarded. |
| Packets dropped   | Number of Packets dropped.   |
| Fragment packets  | Number of fragment packets.  |

## Sample Output

### show security flow statistics

```

root> show security flow statistics
Flow Statistics of FPC4 PIC1:
 Current sessions: 63
 Packets forwarded: 3001
 Packets dropped: 1281
 Fragment packets: 0

Flow Statistics of FPC5 PIC0:
 Current sessions: 22
 Packets forwarded: 859

```

```
Packets dropped: 0
Fragment packets: 0
```

Flow Statistics of FPC5 PIC1:

```
Current sessions: 22
Packets forwarded: 858
Packets dropped: 0
Fragment packets: 0
```

Flow Statistics Summary:

```
System total valid sessions: 107
Packets forwarded: 4718
Packets dropped: 1281
Fragment packets: 0
```

**show security flow statistics (for hash-based datapath forwarding using SRX5K-MPC3-40G10G (IOC3) and SRX5K-MPC3-100G10G (IOC3))**

```
root> show security flow statistics
```

Flow Statistics of FPC0 PIC1:

```
Current sessions: 0
Packets forwarded: 0
Packets dropped: 0
Fragment packets: 0
```

Flow Statistics of FPC0 PIC2:

```
Current sessions: 0
Packets forwarded: 0
Packets dropped: 0
Fragment packets: 0
```

Flow Statistics of FPC0 PIC3:

```
Current sessions: 0
Packets forwarded: 0
Packets dropped: 0
Fragment packets: 0
```

Flow Statistics Summary:

```
System total valid sessions: 0
Packets forwarded: 0
Packets dropped: 0
Fragment packets: 0
```

## show security flow status

## Sample Output

### show security flow status

```

root> show security flow status
 Flow forwarding mode:
Inet forwarding mode: flow based
Inet6 forwarding mode: flow based
MPLS forwarding mode: drop
ISO forwarding mode: drop
+Enhanced route scaling mode: Enabled (reboot needed to disable)
Flow trace status
Flow tracing status: on
Flow tracing options: all
Flow session distribution
Distribution mode: Hash-based
Flow packet ordering
Ordering mode: Software (reboot needed to change to software)

```

### show security flow status (IPsec Performance Acceleration)

```

root> show security flow status
Flow forwarding mode:
 Inet forwarding mode: flow based
 Inet6 forwarding mode: drop
 MPLS forwarding mode: drop
 ISO forwarding mode: drop
Flow trace status
 Flow tracing status: off
Flow session distribution
 Distribution mode: RR-based
Flow packet ordering
Ordering mode: Software (reboot needed to change to software)
Flow ipsec performance acceleration: on

```

### show security flow status (for hash-based datapath forwarding using SRX5K-MPC3-40G10G (IOC3) and SRX5K-MPC3-100G10G (IOC3))

```

root> show security flow status
node0:

Flow forwarding mode:
 Inet forwarding mode: flow based
 Inet6 forwarding mode: drop
 MPLS forwarding mode: drop
 ISO forwarding mode: drop
Flow trace status
 Flow tracing status: off

```

```
Flow session distribution
 Distribution mode: Hash-based
Flow ipsec performance acceleration: off
Flow packet ordering
 Ordering mode: Hardware
```

node1:

```

Flow forwarding mode:
 Inet forwarding mode: flow based
 Inet6 forwarding mode: drop
 MPLS forwarding mode: drop
 ISO forwarding mode: drop
Flow trace status
 Flow tracing status: off
Flow session distribution
 Distribution mode: Hash-based
Flow ipsec performance acceleration: off
Flow packet ordering
 Ordering mode: Hardware
```

## show security forward-options mirror-filter

|                                 |                                                                                                                                                                                                                   |

| <b>List of Sample Output</b>    | <a href="#">show security forward-options mirror-filter on page 2140</a>                                                                                                                                          |
| <b>Output Fields</b>            | Lists the output fields for the <b>show security forward-options mirror-filter</b> command. Output fields are listed in the approximate order in which they appear in the output.                                 |

Table 235: show security forward-options mirror-filter

| Field Name                | Field Description                                                               |
|---------------------------|---------------------------------------------------------------------------------|
| <b>mirror-filter-name</b> | Name of the mirror filter configured on the device.                             |
| <b>interface-in</b>       | Display the name of the incoming logical interface to be matched for mirroring. |
| <b>interface-out</b>      | Display the outgoing logical interface to be matched for mirroring.             |
| <b>protocol</b>           | Display the networking protocol name or number to be matched for mirroring.     |
| <b>source-prefix</b>      | Display the source IP prefix or address to be matched for mirroring.            |
| <b>destination-prefix</b> | Display the destination IP prefix or address to be matched for mirroring.       |
| <b>filter-counters</b>    | Display the number of packets matched for mirroring.                            |
| <b>output-counter</b>     | Display the number of packets sent to the sniffing device.                      |

## Sample Output

### show security forward-options mirror-filter

```
user@host> show security forward-options mirror-filter m10
node0:
```

-----  
Security mirror status

mirror-filter-name: m10  
interface-in: reth0.0  
interface-out: reth1.0  
protocol: 132  
source-prefix: 11.1.1.0  
destination-prefix: 41.1.1.0  
filter-counters: 143  
output-counters: 143

node1:

-----  
Security mirror status

mirror-filter-name: m10  
interface-in: reth0.0  
interface-out: reth1.0  
protocol: 132  
source-prefix: 11.1.1.0  
destination-prefix: 41.1.1.0  
filter-counters: 0  
output-counters: 0

## show security monitoring

| <b>Release Information</b>      | <p>Command modified in Junos OS Release 9.2. Support for IPv6 addresses added in Junos OS Release 10.2. Support for IPv6 addresses in active/active chassis cluster configurations in addition to the existing support of active/passive chassis cluster configurations added in Junos OS Release 10.4. Support for wildcard addresses added in Junos OS Release 11.1. Support for global policy added in Junos OS Release 11.4. Support for services offloading added in Junos OS Release 11.4. Support for source-identities added in Junos OS Release 12.1. The <b>Description</b> output field added in Junos OS Release 12.1. Support for negated address added in Junos OS Release 12.1X45-D10. The output fields for Policy Statistics expanded, and the output fields for the <b>global</b> and <b>policy-name</b> options expanded to include from-zone and to-zone global match criteria in Junos OS Release 12.1X47-D10. Support for the <b>initial-tcp-mss</b> and <b>reverse-tcp-mss</b> options added in Junos OS Release 12.3X48-D20.</p> |
| <b>Description</b>              | <p>Display a summary of all security policies configured on the device. If a particular policy is specified, display information particular to that policy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Output Fields** Table 51 lists the output fields for the **show security policies** command. Output fields are listed in the approximate order in which they appear.

**Table 236: show security policies Output Fields**

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>From zone</b>                        | Name of the source zone.                                                                                                                                                                                                                                                                                                                                                   |
| <b>To zone</b>                          | Name of the destination zone.                                                                                                                                                                                                                                                                                                                                              |
| <b>Policy</b>                           | Name of the applicable policy.                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>                      | Description of the applicable policy.                                                                                                                                                                                                                                                                                                                                      |
| <b>State</b>                            | Status of the policy: <ul style="list-style-type: none"> <li>• <b>enabled:</b> The policy can be used in the policy lookup process, which determines access rights for a packet and the action taken in regard to it.</li> <li>• <b>disabled:</b> The policy cannot be used in the policy lookup process, and therefore it is not available for access control.</li> </ul> |
| <b>Index</b>                            | Internal number associated with the policy.                                                                                                                                                                                                                                                                                                                                |
| <b>Sequence number</b>                  | Number of the policy within a given context. For example, three policies that are applicable in a from-zoneA-to-zoneB context might be ordered with sequence numbers 1, 2, 3. Also, in a from-zoneC-to-zoneD context, four policies might have sequence numbers 1, 2, 3, 4.                                                                                                |
| <b>Source addresses</b>                 | For standard display mode, the names of the source addresses for a policy. Address sets are resolved to their individual names.<br><br>For detail display mode, the names and corresponding IP addresses of the source addresses for a policy. Address sets are resolved to their individual address name-IP address pairs.                                                |
| <b>Destination addresses</b>            | Name of the destination address (or address set) as it was entered in the destination zone's address book. A packet's destination address must match this value for the policy to apply to it.                                                                                                                                                                             |
| <b>Source addresses (excluded)</b>      | Name of the source address excluded from the policy.                                                                                                                                                                                                                                                                                                                       |
| <b>Destination addresses (excluded)</b> | Name of the destination address excluded from the policy.                                                                                                                                                                                                                                                                                                                  |
| <b>Source identities</b>                | One or more user roles specified for a policy.                                                                                                                                                                                                                                                                                                                             |

Table 236: show security policies Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Applications                    | <p>Name of a preconfigured or custom application whose type the packet matches, as specified at configuration time.</p> <ul style="list-style-type: none"> <li>• <b>IP protocol</b>: The Internet protocol used by the application—for example, TCP, UDP, ICMP.</li> <li>• <b>ALG</b>: If an ALG is explicitly associated with the policy, the name of the ALG is displayed. If <b>application-protocol ignore</b> is configured, ignore is displayed. Otherwise, 0 is displayed. However, even if this command shows ALG: 0, ALGs might be triggered for packets destined to well-known ports on which ALGs are listening, unless ALGs are explicitly disabled or when <b>application-protocol ignore</b> is not configured for custom applications.</li> <li>• <b>Inactivity timeout</b>: Elapsed time without activity after which the application is terminated.</li> <li>• <b>Source port range</b>: The low-high source port range for the session application.</li> </ul> |
| Destination Address Translation | <p>Status of the destination address translation traffic:</p> <ul style="list-style-type: none"> <li>• <b>drop translated</b>—Drop the packets with translated destination addresses.</li> <li>• <b>drop untranslated</b>—Drop the packets without translated destination addresses.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Application Firewall            | <p>An application firewall includes the following:</p> <ul style="list-style-type: none"> <li>• <b>Rule-set</b>—Name of the rule set.</li> <li>• <b>Rule</b>—Name of the rule. <ul style="list-style-type: none"> <li>• <b>Dynamic applications</b>—Name of the applications.</li> <li>• <b>Dynamic application groups</b>—Name of the application groups.</li> <li>• <b>Action</b>—The action taken with respect to a packet that matches the application firewall rule set. Actions include the following: <ul style="list-style-type: none"> <li>• <b>permit</b></li> <li>• <b>deny</b></li> </ul> </li> </ul> </li> <li>• <b>Default rule</b>—The default rule applied when the identified application is not specified in any rules of the rule set.</li> </ul>                                                                                                                                                                                                             |
| Action or Action-type           | <ul style="list-style-type: none"> <li>• The action taken in regard to a packet that matches the policy's tuples. Actions include the following: <ul style="list-style-type: none"> <li>• <b>permit</b></li> <li>• <b>firewall-authentication</b></li> <li>• <b>tunnel ipsec-vpn <i>vpn-name</i></b></li> <li>• <b>pair-policy <i>pair-policy-name</i></b></li> <li>• <b>source-nat pool <i>pool-name</i></b></li> <li>• <b>pool-set <i>pool-set-name</i></b></li> <li>• <b>interface</b></li> <li>• <b>destination-nat <i>name</i></b></li> <li>• <b>deny</b></li> <li>• <b>reject</b></li> <li>• <b>services-offload</b></li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                |
| Session log                     | <p>Session log entry that indicates whether the <b>at-create</b> and <b>at-close</b> flags were set at configuration time to log session information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Destination addresses:
da-1-ipv4: 2.2.2.0/24
da-2-ipv6: 2400:0af8::/32
da-3-ipv6: 2400:0d78:0/24
Source identities: role1, role4
Applications: any
Action: deny, scheduled

```

#### show security policies policy-name p1 detail

```

user@host> show security policies policy-name p1 detail
Policy: p1, action-type: permit, State: enabled, Index: 4
Description: The policy p1 is for the sales team
Sequence number: 1
From zone: trust, To zone: untrust
Source addresses:
sa-1-ipv4: 2.2.2.0/24
sa-2-ipv6: 2001:0db8::/32
sa-3-ipv6: 2001:0db6/24
sa-4-wc: 192.168.0.11/255.255.0.255
Destination addresses:
da-1-ipv4: 2.2.2.0/24
da-2-ipv6: 2400:0af8::/32
da-3-ipv6: 2400:0d78:0/24
da-4-wc: 192.168.22.11/255.255.0.255
Source identities:
role1
role2
role4
Application: any
IP protocol: 0, ALG: 0, Inactivity timeout: 0
Source port range: [0-0]
Destination port range: [0-0]
Destination Address Translation: drop translated
Application firewall :
Rule-set: my_ruleset1
Rule: rule1
Dynamic Applications: junos:FACEBOOK, junos:YMSG
Dynamic Application groups: junos:web, junos:chat
Action: deny
Default rule: permit
Session log: at-create, at-close
Scheduler name: sch20
Per policy TCP Options: SYN check: No, SEQ check: No
Policy statistics:
Input bytes : 18144 545 bps
Initial direction: 9072 272 bps
Reply direction : 9072 272 bps
Output bytes : 18144 545 bps
Initial direction: 9072 272 bps

```

|                     |      |         |
|---------------------|------|---------|
| Reply direction :   | 9072 | 272 bps |
| Input packets :     | 216  | 6 pps   |
| Initial direction:  | 108  | 3 bps   |
| Reply direction :   | 108  | 3 bps   |
| Output packets :    | 216  | 6 pps   |
| Initial direction:  | 108  | 3 bps   |
| Reply direction :   | 108  | 3 bps   |
| Session rate :      | 108  | 3 sps   |
| Active sessions :   | 93   |         |
| Session deletions : | 15   |         |
| Policy lookups :    | 108  |         |

#### show security policies (services-offload)

```

user@host> show security policies
Default policy: deny-all

| <b>Release Information</b>      | Command introduced in Junos OS Release 12.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Display the utility rate of security policies according to the number of hits they receive. The number of hits can be listed without an order or sorted in either ascending or descending order, and they can be restricted to the number of hits that fall above or below a specific count or within a range. Data is shown for all zones associated with the policies or named zones.</p> <p>Use this command without options to display the number of hits in random order for all security policies and for all zones.</p>                                                                                                                                                                                                                                                                                                            |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 237: show security policies hit-count Output Fields

| Field Name              | Field Description                                               |
|-------------------------|-----------------------------------------------------------------|
| <b>from-zone</b>        | Name of the source zone.                                        |
| <b>to-zone</b>          | Name of the destination zone.                                   |
| <b>policy</b>           | Name of the security policy.                                    |
| <b>hit-count</b>        | Number of hits for each security policy.                        |
| <b>Number of policy</b> | Number of security policies for which hit counts are displayed. |

## Sample Output

### show security policies hit-count

```

user@host> show security policies hit-count
from-zone to-zone policy hit-count
untrust vrtrust u2t1 40
untrust trust u2t2 20
untrust trust u2t3 80

```

Number of policy: 3

## Sample Output

### show security policies hit-count ascending

```

user@host> show security policies hit-count ascending
from-zone to-zone policy hit-count
untrust trust u2t2 20
untrust vrtrust u2t1 40
untrust trust u2t3 80

```

Number of policy: 3

## Sample Output

### show security policies hit-count descending greater-than 70 less-than 100

```

user@host> show security policies hit-count descending greater-than 70 less-than 100
from-zone to-zone policy hit-count
untrust trust u2t2 100
untrust vrtrust u2t1 90
untrust vrtrust u2t3 80

```

Number of policy: 3

## Sample Output

### show security policies hit-count from-zone untrust to-zone trust

```

user@host> show security policies hit-count from-zone untrust to-zone trust
from-zone to-zone policy hit-count
untrust trust u2t2 20

```

untrust      trust      u2t3      80

Number of policy: 2

## show security resource-manager group active

| <b>Output Fields</b>            | Table 29 lists the output fields for the <b>show security resource-manager group</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 238: show security resource-manager group Output Fields**

| Field Name           | Field Description                                           |
|----------------------|-------------------------------------------------------------|
| <b>Total groups</b>  | Total number of groups in the system.                       |
| <b>active groups</b> | Number of active groups.                                    |
| <b>Group ID</b>      | Identification number whose group information is displayed. |

## Sample Output

### show security resource-manager group active

```
user@host> show security resource-manager group active
Total groups 32, active groups 0
```

## Sample Output

### show security resource-manager group active 2048

```
user@host> show security resource-manager group active 2048
Total groups 2048, active groups 1
Group ID 2048: state - Active
 : Virtual System - root
 : Application - SIP ALG
 : Group Timeout - 65535
 : Number of resources - 3
 Resource ID - 8190
 Resource ID - 8188
 Resource ID - 8187
```

## Sample Output

### show security resource-manager group active node primary

```
user@host> show security resource-manager group active node primary
node0:

Group ID 1024: Application - SIP ALG
Total groups 1024, active groups 1
```

## Sample Output

### show security resource-manager group active node all

```
user@host> show security resource-manager group active node all
node0:

Group ID 1024: Application - SIP ALG
Total groups 1024, active groups 1
node1:

Group ID 1024: Application - SIP ALG
Total groups 1024, active groups 1
```

## Sample Output

### show security resource-manager group active 1024 node all

```
user@host> show security resource-manager group active 1024 node all
node0:

Group ID 1024: state - Active
 : Application - SIP ALG
 : Group Timeout - 65535
 : Number of resources - 3
 Resource ID - 8192
 Resource ID - 8188
 Resource ID - 8187
```

node1:

-----

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 239: show security resource-manager resource Output Fields**

| Field Name       | Field Description                                              |
|------------------|----------------------------------------------------------------|
| Total resources  | Total number of resources in the system.                       |
| active resources | Number of active resources.                                    |
| Resource ID      | Identification number whose resource information is displayed. |

## Sample Output

### show security resource-manager resource active

```
user@host> show security resource-manager resource active
Resource ID 7: Group ID - 2, Application - JSF_sip

Resource ID 6: Group ID - 2, Application - JSF_sip

Resource ID 5: Group ID - 2, Application - JSF_sip

Resource ID 4: Group ID - 2, Application - JSF_sip

Resource ID 3: Group ID - 2, Application - JSF_sip

Resource ID 1: Group ID - 2, Application - JSF_sip

Resource ID 2: Group ID - 2, Application - JSF_sip
Total Resources 4326, active resources 7
```

## Sample Output

### show security resource-manager resource active 5

```
user@host> show security resource-manager resource active 5
Resource ID 5: state - Active
 Application - asl_client
 Parent group - 2
 Policy - 5
 From zone - untrust
 To zone - trust
 Resource timeout - 0
 Number of sessions - 0
 Number of Holes - 1
 Source IP range - {0.0.0.0, 0.0.0.0}
 Source port range - {0, 0}
 Destination IP range - {33.1.0.200, 33.1.0.200}
 Destination port range - {5060, 5060}
 Translated - {0.0.0.0/0 -> 33.1.0.200/5060}
 Protocol - 17
 Reference count - 1
```

## Sample Output

### show security resource-manager resource active node local

```
user@host> show security resource-manager resource active node local
node0:

Resource ID 8192: Group ID - 1024, Application - SIP ALG
Resource ID 8188: Group ID - 1024, Application - SIP ALG
Resource ID 8187: Group ID - 1024, Application - SIP ALG
Total Resources 8192, active resources 3
```

## Sample Output

### show security resource-manager resource active node primary

```
user@host> show security resource-manager resource active node primary
node0:

```

Resource ID 8192: Group ID - 1024, Application - SIP ALG  
Resource ID 8188: Group ID - 1024, Application - SIP ALG  
Resource ID 8187: Group ID - 1024, Application - SIP ALG  
Total Resources 8192, active resources 3

## show security resource-manager settings

| <b>Output Fields</b>            | Table 240 lists the output fields for the <b>show security resource-manager settings</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                    |

Table 240: show security resource-manager settings Output Fields

| Field Name       | Field Description                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Client Heartbeat | Time after which idle an resource manager client is timed out.                                                                                                                                        |
| Count            | Number of active clients.                                                                                                                                                                             |
| Pinhole age      | Duration for which the temporary opening in the security firewall (pinhole) is open for specified traffic. If the specified traffic does not exist during this time period, the pinhole is timed out. |

## Sample Output

### show security resource-manager settings

```
user@host> show security resource-manager settings
Client Heartbeat: timeout 600 seconds, count 5
Pinhole age: 32 seconds
```

## Sample Output

### show security resource-manager settings node primary

```
user@host> show security resource-manager settings node primary
node0:

Client heartbeat: timeout 600 seconds, count 5
Pinhole age: 120 seconds
```

## Sample Output

### show security resource-manager settings node all

```
user@host> show security resource-manager settings node all
node0:

Client heartbeat: timeout 600 seconds, count 5
Pinhole age: 120 seconds
node1:

Client heartbeat: timeout 600 seconds, count 5
Pinhole age: 120 seconds
```

## show security resource-manager summary

Table 242: show security screen ids-option Output Fields

| Field Name                   | Field Description                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| TCP address sweep threshold  | Number of microseconds for which the device accepts 10 TCP packets from the same remote source to different destination addresses. |
| TCP port scan threshold      | Number of microseconds during which the device accepts packets from the same remote source with up to 10 different port numbers.   |
| ICMP address sweep threshold | Maximum number of microseconds during which up to 10 ICMP echo requests from the same host are allowed into the device.            |

Table 242: show security screen ids-option Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| UDP flood threshold                 | Number of UDP packets per second allowed to ping the same destination address before the device rejects further UDP packets.                    |
| UDP port scan threshold             | Number of microseconds during which the device accepts packets from the same remote source IP with up to 10 different destination port numbers. |
| TCP winnuke                         | Enable or disable the detection of TCP WinNuke attacks.                                                                                         |
| TCP SYN flood attack threshold      | Number of SYN packets per second required to trigger the SYN proxy response.                                                                    |
| TCP SYN flood alarm threshold       | Number of half-complete proxy connections per second at which the device makes entries in the event alarm log.                                  |
| TCP SYN flood source threshold      | Number of SYN segments to be received per second before the device begins dropping connection requests.                                         |
| TCP SYN flood destination threshold | Number of SYN segments received per second before the device begins dropping connection requests.                                               |
| TCP SYN flood timeout               | Maximum length of time before a half-completed connection is dropped from the queue.                                                            |
| TCP SYN flood queue size            | Number of proxy connection requests that can be held in the proxy connection queue before the device begins rejecting new connection requests.  |
| ICMP large packet                   | Enable or disable the detection of any ICMP frame with an IP length greater than 1024 bytes.                                                    |
| UDP address sweep threshold         | Number of microseconds for which the device accepts 10 UDP packets from the same remote source to different destination addresses.              |
| IPv6 extension routing              | Enable or disable the IPv6 extension routing screen option.                                                                                     |
| IPv6 extension shim6                | Enable or disable the IPv6 extension shim6 screen option.                                                                                       |
| IPv6 extension fragment             | Enable or disable the IPv6 extension fragment screen option.                                                                                    |
| IPv6 extension AH                   | Enable or disable the IPv6 extension Authentication Header Protocol screen option.                                                              |
| IPv6 extension ESP                  | Enable or disable the IPv6 extension Encapsulating Security Payload screen option.                                                              |
| IPv6 extension mobility             | Enable or disable the IPv6 extension mobility screen option.                                                                                    |
| IPv6 extension HIP                  | Enable or disable the IPv6 extension Host Identify Protocol screen option.                                                                      |
| IPv6 extension no next              | Enable or disable the IPv6 extension no-next screen option.                                                                                     |
| IPv6 extension user-defined         | Enable or disable the IPv6 extension user-defined screen option.                                                                                |

Table 242: show security screen ids-option Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                        |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| IPv6 extension HbyH jumbo             | Enable or disable the IPv6 extension HbyH jumbo screen option.                                                           |
| IPv6 extension HbyH RPL               | Enable or disable the IPv6 extension HbyH RPL screen option.                                                             |
| IPv6 extension HbyH router alert      | Enable or disable the IPv6 extension HbyH router screen option.                                                          |
| IPv6 extension HbyH quick start       | Enable or disable the IPv6 extension HbyH quick-start screen option.                                                     |
| IPv6 extension HbyH CALIPSO           | Enable or disable the IPv6 extension HbyH Common Architecture Label IPv6 Security Screen option.                         |
| IPv6 extension HbyH SMF DPD           | Enable or disable the IPv6 extension HbyH Simplified Multicast Forwarding IPv6 Duplicate Packet Detection screen option. |
| IPv6 extension HbyH user-defined      | Enable or disable the IPv6 extension HbyH user-defined screen option.                                                    |
| IPv6 extension Dst tunnel encap limit | Enable or disable the IPv6 extension distributed (network) storage tunnel encapsulation limit screen option.             |
| IPv6 extension Dst home address       | Enable or disable the IPv6 extension DST home address screen option.                                                     |
| IPv6 extension Dst ILNP nonce         | Enable or disable the IPv6 extension DST Identifier-Locator Network Protocol nonce screen option.                        |
| IPv6 extension Dst line-id            | Enable or disable the IPv6 extension DST line-ID screen option.                                                          |
| IPv6 extension Dst user-defined       | Enable or disable the IPv6 extension DST user-defined screen option.                                                     |
| IPv6 extension header limit           | Threshold for the number of IPv6 extension headers that can pass through the screen.                                     |
| IPv6 malformed header                 | Enable or disable the IPv6 malformed header screen option.                                                               |
| ICMPv6 malformed header               | Enable or disable the ICMPv6 malformed packet screen option.                                                             |

## Sample Output

show security screen ids-option jscreen

```

user@host> show security screen ids-option jscreen
Screen object status:
Name Value
TCP port scan threshold 5000
UDP port scan threshold 10000
ICMP address sweep threshold 5000

```

## Sample Output

### show security screen ids-option jscreen (IPv6)

```
user@host> show security screen ids-option jscreen
```

```
Screen object status:
```

| Name                                  | Value   |
|---------------------------------------|---------|
| ICMP ping of death                    | enabled |
| .....                                 |         |
| IPv6 extension routing                | enabled |
| IPv6 extension shim6                  | enabled |
| IPv6 extension fragment               | enabled |
| IPv6 extension AH                     | enabled |
| IPv6 extension ESP                    | enabled |
| IPv6 extension mobility               | enabled |
| IPv6 extension HIP                    | enabled |
| IPv6 extension no next                | enabled |
| IPv6 extension user-defined           | enabled |
| IPv6 extension HbyH jumbo             | enabled |
| IPv6 extension HbyH RPL               | enabled |
| IPv6 extension HbyH router alert      | enabled |
| IPv6 extension HbyH quick start       | enabled |
| IPv6 extension HbyH CALIPSO           | enabled |
| IPv6 extension HbyH SMF DPD           | enabled |
| IPv6 extension HbyH user-defined      | enabled |
| IPv6 extension Dst tunnel encap limit | enabled |
| IPv6 extension Dst home address       | enabled |
| IPv6 extension Dst ILNP nonce         | enabled |
| IPv6 extension Dst line-id            | enabled |
| IPv6 extension Dst user-defined       | enabled |
| IPv6 extension header limit           | 20      |
| IPv6 Malformed header                 | enabled |
| ICMPv6 malformed packet               | enabled |

## Sample Output

### show security screen ids-option jscreen1 node all

```
user@host> show security screen ids-option jscreen1 node all
```

```
node0:
```

```
Screen object status:
```

| Name                                | Value   |
|-------------------------------------|---------|
| UDP flood threshold                 | 1000    |
| TCP winnuke                         | enabled |
| TCP SYN flood attack threshold      | 200     |
| TCP SYN flood alarm threshold       | 512     |
| TCP SYN flood source threshold      | 4000    |
| TCP SYN flood destination threshold | 4000    |
| TCP SYN flood timeout               | 20      |
| TCP SYN flood queue size            | 1024    |
| ICMP large packet                   | enabled |

```
node1:
```

```
Screen object status:
```

| Name                | Value |
|---------------------|-------|
| UDP flood threshold | 1000  |

|                                     |         |
|-------------------------------------|---------|
| TCP winnuke                         | enabled |
| TCP SYN flood attack threshold      | 200     |
| TCP SYN flood alarm threshold       | 512     |
| TCP SYN flood source threshold      | 4000    |

**Output Fields** Table 69 lists the output fields for the **show security screen statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 243: show security screen statistics Output Fields**

| Field Name             | Field Description                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ICMP flood             | Internet Control Message Protocol (ICMP) flood counter. An ICMP flood typically occurs when ICMP echo requests use all resources in responding, such that valid network traffic can no longer be processed.                      |
| UDP flood              | User Datagram Protocol (UDP) flood counter. UDP flooding occurs when an attacker sends IP packets containing UDP datagrams with the purpose of slowing down the resources, such that valid connections can no longer be handled. |
| TCP winnuke            | Number of Transport Control Protocol (TCP) WinNuke attacks. WinNuke is a denial-of-service (DoS) attack targeting any computer on the Internet running Windows.                                                                  |
| TCP port scan          | Number of TCP port scans. The purpose of this attack is to scan the available services in the hopes that at least one port will respond, thus identifying a service to target.                                                   |
| ICMP address sweep     | Number of ICMP address sweeps. An IP address sweep can occur with the intent of triggering responses from active hosts.                                                                                                          |
| IP tear drop           | Number of teardrop attacks. Teardrop attacks exploit the reassembly of fragmented IP packets.                                                                                                                                    |
| TCP SYN flood          | Number of TCP SYN attacks.                                                                                                                                                                                                       |
| IP spoofing            | Number of IP spoofs. IP spoofing occurs when an invalid source address is inserted in the packet header to make the packet appear to come from a trusted source.                                                                 |
| ICMP ping of death     | ICMP ping of death counter. Ping of death occurs when IP packets are sent that exceed the maximum legal length (65,535 bytes).                                                                                                   |
| IP source route option | Number of IP source route attacks.                                                                                                                                                                                               |
| TCP address sweep      | Number of TCP address sweeps.                                                                                                                                                                                                    |
| TCP land attack        | Number of land attacks. Land attacks occur when an attacker sends spoofed SYN packets containing the IP address of the victim as both the destination and source IP address.                                                     |
| TCP SYN fragment       | Number of TCP SYN fragments.                                                                                                                                                                                                     |
| TCP no flag            | Number of TCP headers without flags set. A normal TCP segment header has at least one control flag set.                                                                                                                          |
| IP unknown protocol    | Number of IPs.                                                                                                                                                                                                                   |
| IP bad options         | Number of invalid options.                                                                                                                                                                                                       |
| IP record route option | Number of packets with the IP record route option enabled. This option records the IP addresses of the network devices along the path that the IP packet travels.                                                                |

Table 243: show security screen statistics Output Fields (*continued*)

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP timestamp option               | Number of IP timestamp option attacks. This option records the time (in Universal Time) when each network device receives the packet during its trip from the point of origin to its destination.                                                                                                                                                             |
| IP security option                | Number of IP security option attacks.                                                                                                                                                                                                                                                                                                                         |
| IP loose source route option      | Number of IP loose source route option attacks. This option specifies a partial route list for a packet to take on its journey from source to destination.                                                                                                                                                                                                    |
| IP strict source route option     | Number of IP strict source route option attacks. This option specifies the complete route list for a packet to take on its journey from source to destination.                                                                                                                                                                                                |
| IP stream option                  | Number of stream option attacks. This option provides a way for the 16-bit SATNET stream identifier to be carried through networks that do not support streams.                                                                                                                                                                                               |
| ICMP fragment                     | Number of ICMP fragments. Because ICMP packets contain very short messages, there is no legitimate reason for ICMP packets to be fragmented. If an ICMP packet is so large that it must be fragmented, something is amiss.                                                                                                                                    |
| ICMP large packet                 | Number of large ICMP packets.                                                                                                                                                                                                                                                                                                                                 |
| TCP SYN FIN                       | Number of TCP SYN FIN packets.                                                                                                                                                                                                                                                                                                                                |
| TCP FIN no ACK                    | Number of TCP FIN flags without the acknowledge (ACK) flag.                                                                                                                                                                                                                                                                                                   |
| Source session limit              | Number of concurrent sessions that can be initiated from a source IP address.                                                                                                                                                                                                                                                                                 |
| TCP SYN-ACK-ACK proxy             | Number of TCP flags enabled with SYN-ACK-ACK. To prevent flooding with SYN-ACK-ACK sessions, you can enable the SYN-ACK-ACK proxy protection screen option. After the number of connections from the same IP address reaches the SYN-ACK-ACK proxy threshold and SRX Series devices running Junos OS reject further connection requests from that IP address. |
| IP block fragment                 | Number of IP block fragments.                                                                                                                                                                                                                                                                                                                                 |
| Destination session limit         | Number of concurrent sessions that can be directed to a single destination IP address.                                                                                                                                                                                                                                                                        |
| UDP address sweep                 | Number of UDP address sweeps.                                                                                                                                                                                                                                                                                                                                 |
| IPv6 extension header             | Number of packets filtered for the defined IPv6 extension headers.                                                                                                                                                                                                                                                                                            |
| IPv6 extension hop by hop option  | Number of packets filtered for the defined IPv6 hop-by-hop option types.                                                                                                                                                                                                                                                                                      |
| IPv6 extension destination option | Number of packets filtered for the defined IPv6 destination option types.                                                                                                                                                                                                                                                                                     |
| IPv6 extension header limit       | Number of packets filtered for crossing the defined IPv6 extension header limit.                                                                                                                                                                                                                                                                              |
| IPv6 malformed header             | Number of IPv6 malformed headers defined for the intrusion detection service (IDS).                                                                                                                                                                                                                                                                           |

Table 243: show security screen statistics Output Fields (*continued*)

|                         |                                                                 |
|-------------------------|-----------------------------------------------------------------|
| ICMPv6 malformed packet | Number of ICMPv6 malformed packets defined for the IDS options. |
|-------------------------|-----------------------------------------------------------------|

## Sample Output

### show security screen statistics zone scrzone

```

user@host> show security screen statistics zone scrzone
Screen statistics:
IDS attack type Statistics
ICMP flood 0
UDP flood 0
TCP winnuke 0
TCP port scan 91
ICMP address sweep 0
TCP sweep 0
UDP sweep 0
IP tear drop 0
TCP SYN flood 0
IP spoofing 0
ICMP ping of death 0
IP source route option 0
TCP land attack 0
TCP SYN fragment 0
TCP no flag 0
IP unknown protocol 0
IP bad options 0
IP record route option 0
IP timestamp option 0
IP security option 0
IP loose source route option 0
IP strict source route option 0
IP stream option 0
ICMP fragment 0
ICMP large packet 0
TCP SYN FIN 0
TCP FIN no ACK 0
Source session limit 0
TCP SYN-ACK-ACK proxy 0
IP block fragment 0
Destination session limit 0

```

## Sample Output

### show security screen statistics zone untrust (IPv6)

```

user@host> show security screen statistics zone untrust
Screen statistics:
IDS attack type Statistics
ICMP flood 0
UDP flood 0
TCP winnuke 0
.....
IPv6 extension header 0
IPv6 extension hop by hop option 0
IPv6 extension destination option 0
IPv6 extension header limit 0
IPv6 malformed header 0

```

|                         |   |
|-------------------------|---|
| ICMPv6 malformed packet | 0 |
|-------------------------|---|

## Sample Output

show security screen statistics interface ge-0/0/3

```
user@host> show security screen statistics interface ge-0/0/3
Screen statistics:
IDS attack type Statistics
ICMP flood 0
UDP flood 0
TCP winnuke 0
TCP port scan 91
ICMP address sweep 0
TCP sweep 0
UDP sweep 0
IP tear drop 0
TCP SYN flood 0
IP spoofing 0
ICMP ping of death 0
IP source route option 0
TCP land attack 0
TCP SYN fragment 0
TCP no flag 0
IP unknown protocol 0
IP bad options 0
IP record route option 0
IP timestamp option 0
IP security option 0
IP loose source route option 0
IP strict source route option 0
IP stream option 0
ICMP fragment 0
ICMP large packet 0
TCP SYN FIN 0
TCP FIN no ACK 0
Source session limit 0
TCP SYN-ACK-ACK proxy 0
IP block fragment 0
Destination session limit 0
```

## Sample Output

show security screen statistics interface ge-0/0/1 (IPv6)

```
user@host> show security screen statistics interface ge-0/0/1
Screen statistics:
IDS attack type Statistics
ICMP flood 0
UDP flood 0
.....
IPv6 extension header 0
IPv6 extension hop by hop option 0
IPv6 extension destination option 0
IPv6 extension header limit 0
IPv6 malformed header 0
ICMPv6 malformed packet 0
```

## Sample Output

### show security screen statistics interface ge-0/0/1 node primary

```
user@host> show security screen statistics interface ge-0/0/1 node primary
node0:
```

```

Screen statistics:
```

| IDS attack type               | Statistics |
|-------------------------------|------------|
| ICMP flood                    | 1          |
| UDP flood                     | 1          |

Output fields are listed in the approximate order in which they appear.                                                                                                          |

**Table 244: show security zones Output Fields**

| Field Name          | Field Description                            |
|---------------------|----------------------------------------------|
| Security zone       | Name of the security zone.                   |
| Description         | Description of the security zone.            |
| Policy configurable | Whether the policy can be configured or not. |
| Interfaces bound    | Number of interfaces in the zone.            |
| Interfaces          | List of the interfaces in the zone.          |
| Zone                | Name of the zone.                            |
| Type                | Type of the zone.                            |

## Sample Output

show security zones

```
user@host> show security zones
Functional zone: management
 Description: This is the management zone.
 Policy configurable: No
 Interfaces bound: 1
 Interfaces:
 ge-0/0/0.0
Security zone: Host
 Description: This is the host zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 fxp0.0
Security zone: abc
 Description: This is the abc zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 ge-0/0/1.0
Security zone: def
 Description: This is the def zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 ge-0/0/2.0
```

## Sample Output

show security zones abc

```
user@host> show security zones abc
Security zone: abc
 Description: This is the abc zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 ge-0/0/1.0
```

## Sample Output

show security zones abc detail

```
user@host> show security zones abc detail
Security zone: abc
 Description: This is the abc zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 ge-0/0/1.0
```

## Sample Output

### show security zones terse

```
user@host> show security zones terse
Zone Type
my-internal Security
my-external Security
dmz Security
```

## show security zones type

# General Packet Radio Service Feature Guide for Security Devices

## PART 29

# Overview

- [Introduction to General Packet Radio Service on page 2189](#)

# Introduction to General Packet Radio Service

- [GPRS Overview on page 2189](#)

## GPRS Overview

---

General Packet Radio Service (GPRS) networks connect to several external networks including those of roaming partners, corporate customers, GPRS Roaming Exchange (GRX) providers, and the public Internet. GPRS network operators face the challenge of protecting their network while providing and controlling access to and from these external networks. Juniper Networks provides solutions to many of the security problems plaguing GPRS network operators.

In the GPRS architecture, the fundamental cause of security threats to an operator's network is the inherent lack of security in the GPRS tunneling protocol (GTP). GTP is the protocol used between GPRS support nodes (GSNs). GTP is used to establish a GTP tunnel for individual mobile stations (MSs) and between a Serving GPRS Support Node (SGSN) and a Gateway GPRS Support Node (GGSN). A GTP tunnel is a channel between GSNs through which two hosts exchange data. The SGSN receives packets from the MS and encapsulates them within a GTP header before forwarding them to the GGSN through the GTP tunnel. When the GGSN receives the packets, it decapsulates them and forwards them to the external host.

Communication between different GPRS networks is not secure because GTP does not provide any authentication, data integrity, or confidentiality protection. Implementing IP Security (IPsec) for connections between roaming partners, setting traffic rate limits, and using stateful inspection can eliminate a majority of the GTP's security risks. The GTP firewall features in Junos OS address key security issues in mobile operators' networks.

Juniper Networks security devices mitigate a wide variety of attacks on the following types of GPRS interfaces:

- Gn—The Gn interface is the connection between an SGSN and a GGSN within the same public land mobile network (PLMN).
- Gp—The Gp interface is the connection between two PLMNs.

- **Gi**—The Gi interface is the connection between a GGSN and the Internet or destination networks connected to a PLMN.

**NOTE:** The term *interface* has different meanings in Junos OS and in GPRS technology. In Junos OS, an interface is a doorway to a security zone that allows traffic to enter and exit the zone. In GPRS, an interface is a connection, or a reference point, between two components of a GPRS infrastructure, for example, an SGSN and a GGSN.

This topic contains the following sections:

- [Gp and Gn Interfaces on page 2190](#)
- [Gi Interface on page 2190](#)
- [Operational Modes on page 2191](#)
- [GTP In-Service Software Upgrade on page 2192](#)

## Gp and Gn Interfaces

You implement a security device on the Gn interface to protect core network assets such as the SGSN and GGSN. To secure GTP tunnels on the Gn interface, you place the security device between SGSNs and GGSNs within a common PLMN.

When you implement a security device to the Gp interface, you protect a PLMN from another PLMN. To secure GTP tunnels on the Gp interface, you place the SGSNs and GGSNs of a PLMN behind the security device so that all traffic, incoming and outgoing, goes through the firewall.

Figure 99 illustrates the placement of Juniper Networks SRX Series devices used to protect PLMNs on the Gp and Gn interfaces.

**Figure 99: Gp and Gn Interfaces**

## Gi Interface

When you implement a security device on the Gi interface, you can simultaneously control traffic for multiple networks, protect a PLMN against the Internet and external networks, and protect mobile users from the Internet and other networks. Junos OS provides a great number of virtual routers, making it possible for you to use one virtual router per customer network and thereby allow the separation of traffic for each customer network.

The security device can securely forward packets to the Internet or destination networks using the Layer 2 Tunneling Protocol (L2TP) for IPsec virtual private network (VPN) tunnels.

**NOTE:** SRX Series devices do not support full L2TP.

Figure 100 illustrates the implementation of a security device to protect a PLMN on the Gi interface.

**Figure 100: Gi Interface**

## Operational Modes

Junos OS supports two interface operational modes with GTP: transparent mode and route mode. If you want the security device to participate in the routing infrastructure of your network, you can run it in route mode. This requires a certain amount of network redesign. Alternatively, you can implement the security device into your existing network in transparent mode without having to reconfigure the entire network. In transparent mode, the security device functions as a Layer 2 switch or bridge, and the IP addresses of interfaces are set at 0.0.0.0, making the presence of the security device invisible, or *transparent*, to users.

Junos OS supports Network Address Translation (NAT) on interfaces and policies that do not have GTP inspection enabled.

Currently in Junos OS, route mode supports active/passive, and active/active chassis cluster. Transparent mode supports active/passive only.

## GTP In-Service Software Upgrade

GTP supports unified in-service software upgrade (ISSU) between two SRX Series devices running two different Junos OS releases. Unified ISSU is performed on a chassis cluster, enabling a software upgrade between two different Junos OS releases with no disruption on the control plane and with minimal disruption of traffic.

## Understanding Policy-Based GTP

---

By default, the public land mobile network (PLMN) that the Juniper Networks device protects is in the Trust zone. The device protects the PLMN in the Trust zone against other PLMNs in other zones. You can place all the PLMNs against which you are protecting your PLMN in the Untrust zone, or you can create user-defined zones for each PLMN. A PLMN can occupy one security zone or multiple security zones.

You must create policies to enable traffic to flow between zones and PLMNs. Policies contain rules that permit, deny, or tunnel traffic. The device performs GPRS tunneling protocol (GTP) policy filtering by checking every GTP packet against policies that regulate GTP traffic and by then forwarding, dropping, or tunneling the packet based on these policies.

By selecting the GTP service in a policy, you enable the device to permit, deny, or tunnel GTP traffic. However, this does not enable the device to inspect GTP traffic. For the device to inspect GTP traffic, you must apply a GTP configuration, also referred to as a *GTP inspection object*, to a policy.

You can apply only one GTP inspection object per policy, but you can apply a GTP inspection object to multiple policies. Using policies, you can permit or deny the establishment of GTP tunnels from certain peers such as a Serving GPRS Support Node (SGSN).

You can configure policies that specify “Any” as the source or destination zone (thereby including all hosts in the zone), and you can configure policies that specify multiple source and destination addresses.

In policies, you can enable traffic logging.

## Example: Enabling GTP Inspection in Policies

This example shows how to enable GTP inspection in policies.

- [Requirements on page 2196](#)
- [Overview on page 2196](#)
- [Configuration on page 2196](#)
- [Verification on page 2199](#)

### Requirements

Before you begin, the device must be restarted after GTP is enabled. By default, GTP is disabled on the device.

### Overview

In this example, you configure interfaces as ge-0/0/1 and ge-0/0/2, the addresses are 2.0.0.254/8 and 3.0.0.254/8. You then configure the security zone and specify address as 2.0.0.5/32 and 3.0.0.6/32. You enable the GTP service in the security policies to allow bidirectional traffic between two networks within the same PLMN.

### Configuration

**CLI Quick Configuration** To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security gprs gtp profile gtp1
set interfaces ge-0/0/1 unit 0 family inet address 2.0.0.254/8
set interfaces ge-0/0/2 unit 0 family inet address 3.0.0.254/8
set security zones security-zone sgsn interfaces ge-0/0/1.0 host-inbound-traffic
 system-services all
set security zones security-zone sgsn host-inbound-traffic protocols all
set security zones security-zone ggsn interfaces ge-0/0/2.0 host-inbound-traffic
 system-services all
set security zones security-zone ggsn host-inbound-traffic protocols all
set security address-book global address local-sgsn 2.0.0.5/32
set security address-book global address remote-ggsn 3.0.0.6/32
set security policies from-zone sgsn to-zone ggsn policy sgsn_to_ggsn match
 source-address local-sgsn destination-address remote-ggsn application junos-gprs-gtp
set security policies from-zone sgsn to-zone ggsn policy sgsn_to_ggsn then permit
 application-services gprs-gtp-profile gtp1
set security policies from-zone ggsn to-zone sgsn policy ggsn_to_sgsn match
 source-address remote-ggsn destination-address local-sgsn application junos-gprs-gtp
set security policies from-zone ggsn to-zone sgsn policy ggsn_to_sgsn then permit
 application-services gprs-gtp-profile gtp1
```

**Step-by-Step Procedure** To configure GTP inspection in policies:

1. Enable GTP.
 

```
[edit]
user@host# set security gprs gtp enable
user@host# commit
user@host# exit
user@host# request system reboot
```
2. Create the GTP inspection object.
 

```
[edit]
user@host# set security gprs gtp profile gtp1
```
3. Configure interfaces.
 

```
[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 2.0.0.254/8
user@host# set ge-0/0/2 unit 0 family inet address 3.0.0.254/8
```
4. Configure security zones.
 

```
[edit security zones]
user@host# set security-zone sgsn interfaces ge-0/0/1.0
user@host# set security-zone sgsn host-inbound-traffic system-services all
user@host# set security-zone sgsn host-inbound-traffic protocols all
user@host# set security-zone ggsn interfaces ge-0/0/2.0
user@host# set security-zone ggsn host-inbound-traffic system-services all
user@host# set security-zone ggsn host-inbound-traffic protocols all
```
5. Specify addresses.
 

```
[edit security address-book global]
user@host# set address local-sgsn 2.0.0.5/32
user@host# set address remote-ggsn 3.0.0.6/32
```
6. Enable the GTP service in the security policies.
 

```
[edit security policies]
user@host# set from-zone sgsn to-zone ggsn policy sgsn_to_ggsn match
 source-address local-sgsn destination-address remote-ggsn application
 junos-gprs-gtp
user@host# set from-zone sgsn to-zone ggsn policy sgsn_to_ggsn then permit
 application-services gprs-gtp-profile gtp1
user@host# set from-zone ggsn to-zone sgsn policy ggsn_to_sgsn match
 source-address remote-ggsn destination-address local-sgsn application
 junos-gprs-gtp
user@host# set from-zone ggsn to-zone sgsn policy ggsn_to_sgsn then permit
 application-services gprs-gtp-profile gtp1
```

**Results** From configuration mode, confirm your configuration by entering the **show security** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
```

```
user@host# show security

# Configuring GTP Inspection Objects

- [Understanding GTP Inspection Objects on page 2201](#)
- [Example: Creating a GTP Inspection Object on page 2201](#)
- [Understanding GTP-U Inspection on page 2202](#)

## Understanding GTP Inspection Objects

---

For the device to perform the inspection of GPRS tunneling protocol (GTP) traffic, you must create a GTP inspection object and then apply it to a policy. GTP inspection objects provide more flexibility in that they allow you to configure multiple policies that enforce different GTP configurations. You can configure the device to control GTP traffic differently based on source and destination zones and addresses, action, and so on.

To configure GTP features, you must enter the context of a GTP configuration. To save your settings in the CLI, you must first exit the GTP configuration, then enter the **commit** command.

## Example: Creating a GTP Inspection Object

---

This example shows how to create a GTP inspection object.

- [Requirements on page 2202](#)
- [Overview on page 2202](#)
- [Configuration on page 2202](#)
- [Verification on page 2202](#)

## Requirements

No special configuration beyond device initialization is required before configuring this feature.

## Overview

In this example, you create a GTP inspection object named LA-NY. You preserve most of the default values, and enable the sequence number validation feature.

## Configuration

### Step-by-Step Procedure

To configure a GTP inspection object:

1. Create a GTP inspection object.  
  
[edit]  
user@host# **set security gprs gtp profile la-ny**
2. If you are done configuring the device, commit the configuration.  
  
[edit]  
user@host# **commit**

## Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding GTP-U Inspection

The GPRS tunneling protocol user plane (GTP-U) inspection performs security checks on GTP-U packets. When GTP-U inspection is enabled, the invalid GTP-U packets are blocked and the GPRS support node (GSN) is protected from a GTP-U attack.

Once GTP-U inspection is enabled and depending on the device configuration, GTP-U inspection might include checks on GTP-in-GTP packets, end-user authorization, packet sequence validity, and tunnel validity. If any configured check fails, the GTP-U packet is dropped.

The following list describes the various types of GTP-U inspections that are performed on the traffic:

- **GTP-U tunnel check**—The GTP-U module checks that the GTP-U packet matches a GTP tunnel. If no tunnel matches the GTP-U packet, then the GTP-U packet is dropped.
- **GTP-in-GTP check**—In the SPU, the GTP module checks to ensure that the GTP-U payload is not a GTP packet. If the payload is a GTP packet, then the GTP packet is dropped.
- **End-user address check**—If the user tunnel is found for the GTP-U packet, then the GTP-U module checks for the end-user address. If the GTP-U payload address does not match the end-user address, then the GTP-U packet is dropped.
- **Sequence number check**—The GTP-U module compares the GTP-U packet sequence number with the sequence number stored in the GTP-U tunnel. If it is not in the specified range, then the GTP-U packet is dropped. If it is in the range, then the GTP-U tunnel refreshes the sequence number and allows the GTP-U packet to pass.

**NOTE:** At the end of the GTP-U inspection, the GTP-U tunnel refreshes the timers and counters.

## Understanding GTP Message Filtering

---

When the device receives a GPRS tunneling protocol (GTP) packet, it checks the packet against policies configured on the device. If the packet matches a policy, the device inspects the packet according to the GTP configuration applied to the policy. If the packet fails to meet any of the GTP configuration parameters, the device will pass or drop the packets based on the configuration of the GTP inspection object.

## Understanding GTP Message-Length Filtering

---

You can configure the device to drop packets that do not meet your specified minimum or maximum message lengths. In the GPRS tunneling protocol (GTP) header, the message

length field indicates the length, in octets, of the GTP payload. It does not include the length of the GTP header itself, the UDP header, or the IP header. The default minimum and maximum GTP message lengths are 0 and 65,535 bytes, respectively.

---

## Example: Setting the GTP Message Lengths

This example shows how to set the GTP message lengths.

- [Requirements on page 2206](#)
- [Overview on page 2206](#)
- [Configuration on page 2206](#)
- [Verification on page 2207](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you configure the minimum GTP message length to 8 octets and the maximum GTP message length to 1200 octets for the GTP inspection object.

### Configuration

**Step-by-Step  
Procedure**

To configure the GTP message lengths:

1. Specify the GTP profile.  
  
[edit]  
user@host# **set security gprs gtp profile gtp1**
2. Specify the minimum message length.  
  
[edit]  
user@host# **set security gprs gtp profile gtp1 min-message-length 8**
3. Specify the maximum message length.  
  
[edit]  
user@host# **set security gprs gtp profile gtp1 max-message-length 1200**
4. If you are done configuring the device, commit the configuration.  
  
[edit]  
user@host# **commit**

Verification

To verify the configuration is working properly, enter the **show security gprs** command.

Understanding GTP Message-Type Filtering

You can configure the device to filter GPRS tunneling protocol (GTP) packets and permit or deny them based on their message type. By default, the device permits all GTP message types.

A GTP message type includes one or many messages. When you permit or deny a message type, you automatically permit or deny all messages of the specified type. For example, if you select to drop the `sgsn-context` message type, you thereby drop `sgsn-context-request`, `sgsn-context-response`, and `sgsn-context-acknowledge` messages.

You permit and deny message types based on the GTP version number. For example, you can deny message types for one version while you permit them for the other version.

Supported GTP Message Types

Table 246 lists the GTP messages supported in GTP Releases 1997 and 1999 (including charging messages for GTP) and the message types that you can use to configure GTP message-type filtering.

Table 246: GTP Messages

| Message                        | Message Type  | Version 0 | Version 1 |
|--------------------------------|---------------|-----------|-----------|
| create AA pdp context request  | create-aa-pdp | b         |           |
| create AA pdp context response | create-aa-pdp | b         |           |
| create pdp context request     | create-pdp    | b         | b         |

Table 246: GTP Messages (*continued*)

| Message                                    | Message Type     | Version 0 | Version 1 |
|--------------------------------------------|------------------|-----------|-----------|
| create pdp context response                | create-pdp       | b         | b         |

## Example: Permitting and Denying GTP Message Types

---

This example shows how to permit and deny GTP message types.

- [Requirements on page 2210](#)
- [Overview on page 2210](#)
- [Configuration on page 2210](#)
- [Verification on page 2210](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, for the gtp1 profile, you configure the device to drop the error-indication and failure-report message types for version 1.

### Configuration

#### Step-by-Step Procedure

To permit and deny GTP message types:

1. Configure the device.  

```
[edit]
user@host# set security gprs gtp profile gtp1
```
2. Drop the error indication.  

```
[edit]
user@host# set security gprs gtp profile gtp1 drop error-indication 1
```
3. Drop the failure report messages.  

```
[edit]
user@host# set security gprs gtp profile gtp1 drop failure-report 1
```
4. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

### Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding GTP Message-Rate Limiting

You can configure the device to limit the rate of network traffic going to a GPRS support node (GSN). You can set separate thresholds, in packets per second, for GGSN tunneling protocol, control (GTP-C) messages. Because GTP-C messages require processing and replies, they can potentially overwhelm a GSN. By setting a rate limit on GTP-C messages, you can protect your GSNs from possible denial-of-service (DoS) attacks such as the following:

- **Border gateway bandwidth saturation**—A malicious operator connected to the same GPRS Roaming Exchange (GRX) as your public land mobile network (PLMN) can direct so much network traffic at your Border Gateway that legitimate traffic is starved for bandwidth in or out of your PLMN, thus denying roaming access to or from your network.
- **GTP flood**—GPRS tunneling protocol (GTP) traffic can flood a GSN, forcing it to spend its CPU cycles processing illegitimate data. This can prevent subscribers from roaming and forwarding data to external networks, and it can prevent a General Packet Radio Service (GPRS) from attaching to the network.

This feature limits the rate of traffic sent to each GSN from the Juniper Networks device. The default rate is unlimited.

### Related Documentation

- [Understanding Policy-Based GTP on page 2195](#)
- [Example: Limiting the Message Rate and Path Rate for GTP Control Messages on page 2212](#)
- [Supported GTP Message Types on page 2207](#)

## Understanding GTP Control Message Path Rate Limiting

You can restrict the maximum packets per second for specific control messages on a path on all high-end SRX Series devices. These GPRS tunneling protocol (GTP) messages include **create-req**, **delete-req**, and other GTP messages. However, you can restrict the maximum packets per minute for an **echo-req** GTP message.

The **path-rate-limit** function controls specific GTP messages in both the forward and reverse directions. A drop threshold and an alarm threshold can be configured for each control message in the forward and reverse direction for one path. If the control messages on one path reach the alarm threshold, an alarm log is generated. If the number of control messages received reaches the drop threshold, a packet drop log is generated and all other control messages of this type received later are dropped.

To control message traffic in the forward and reverse directions, configure a policy on the device such that the direction that is consistent with the configured policy is defined

as forward, and the opposite direction is defined as reverse. Use the **set security gprs gtp profile <profile-name> path-rate-limit** statement to restrict the maximum packets per second for specific control messages on a path.

**NOTE:** You can configure both the **rate-limit** and the **path-rate-limit** options at the same time.

#### Related Documentation

- [Example: Limiting the Message Rate and Path Rate for GTP Control Messages on page 2212](#)

## Example: Limiting the Message Rate and Path Rate for GTP Control Messages

This example shows how to limit the message rate and the path rate for GTP control messages. The **rate-limit** option limits the GTP messages per second and the **path-rate-limit** option controls specific GTP messages in both the forward and reverse directions.

- [Requirements on page 2212](#)
- [Overview on page 2212](#)
- [Configuration on page 2213](#)
- [Verification on page 2215](#)

### Requirements

This example uses the following hardware and software components:

- A high-end SRX Series device
- Junos OS Release 12.1X45-D10

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you limit the rate of incoming GTP messages to 300 packets per second and you limit the path rate for GTP control messages in both the forward and reverse directions. You configure the device to limit the rate of network traffic going to a GPRS support node (GSN), and you restrict the maximum packets per second or per minute for specific control messages on a path. For **create-req**, **delete-req**, and **other** GTP messages you restrict the maximum packets per second. However, for an **echo-req** GTP message, you restrict the maximum packets per minute.

The **path-rate-limit** function controls specific GTP messages in both the forward and reverse directions. Configure the **alarm-threshold** parameter to configure the device to raise an alarm when the GTP control messages on a path have reached the configured limit. Configure the **drop-threshold** to drop traffic when the number of packets per second or per minute exceeds the configured limit.

## Configuration

**CLI Quick Configuration** To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security gprs gtp profile gtp1 rate-limit 300
set security gprs gtp profile gtp1 path-rate-limit message-type create-req alarm-threshold
 forward 50 reverse 50
set security gprs gtp profile gtp1 path-rate-limit message-type delete-req alarm-threshold
 forward 50 reverse 50
set security gprs gtp profile gtp1 path-rate-limit message-type echo-req alarm-threshold
 forward 50 reverse 50
set security gprs gtp profile gtp1 path-rate-limit message-type other alarm-threshold
 forward 50 reverse 50
set security gprs gtp profile gtp1 path-rate-limit message-type create-req drop-threshold
 forward 80 reverse 80
set security gprs gtp profile gtp1 path-rate-limit message-type delete-req drop-threshold
 forward 80 reverse 80
set security gprs gtp profile gtp1 path-rate-limit message-type echo-req drop-threshold
 forward 80 reverse 80
set security gprs gtp profile gtp1 path-rate-limit message-type other drop-threshold
 forward 80 reverse 80
```

**Step-by-Step Procedure** To configure the GTP message rate and path rate limit:

1. Specify the GTP profile.  

```
[edit]
user@host# set security gprs gtp profile gtp1
```
2. Set the GTP message rate limit.  

```
[edit security gprs gtp profile gtp1]
user@host# set rate-limit 300
```
3. Specify the message type to set the path rate limit for GTP control messages.  

```
[edit security gprs gtp profile gtp1]
user@host# set path-rate-limit message-type
```
4. Select GTP control message types.  

```
[edit security gprs gtp profile gtp1]
user@host# set path-rate-limit message-type create-req
user@host# set path-rate-limit message-type delete-req
user@host# set path-rate-limit message-type echo-req
user@host# set path-rate-limit message-type other
```
5. Set the alarm threshold for the GTP control message types.  

```
[edit security gprs gtp profile gtp1 path-rate-limit]
user@host# set message-type create-req alarm threshold
user@host# set message-type delete-req alarm threshold
user@host# set message-type echo-req alarm threshold
user@host# set message-type other alarm threshold
```

6. Limit the control messages in the forward direction.  

```
[edit security gprs gtp profile gtp1 path-rate-limit message-type]
user@host# set create-req alarm threshold forward 50
user@host# set delete-req alarm threshold forward 50
user@host# set echo-req alarm threshold forward 50
user@host# set other alarm threshold forward 50
```
7. Limit the control messages in the reverse direction.  

```
[edit security gprs gtp profile gtp1 path-rate-limit message-type]
user@host# set create-req alarm threshold reverse 50
user@host# set delete-req alarm threshold reverse 50
user@host# set echo-req alarm threshold reverse 50
user@host# set other alarm threshold reverse 50
```
8. Set the drop threshold for the GTP control message types.  

```
[edit security gprs gtp profile gtp1 path-rate-limit]
user@host# set message-type create-req drop threshold
user@host# set message-type delete-req drop threshold
user@host# set message-type echo-req drop threshold
user@host# set message-type other drop threshold
```
9. Limit the control messages in the forward direction.  

```
[edit security gprs gtp profile gtp1 path-rate-limit message-type]
user@host# set create-req drop threshold forward 80
user@host# set delete-req drop threshold forward 80
user@host# set echo-req drop threshold forward 80
user@host# set other drop threshold forward 80
```
10. Limit the control messages in the reverse direction.  

```
[edit security gprs gtp profile gtp1 path-rate-limit message-type]
user@host# set create-req drop threshold reverse 80
user@host# set delete-req drop threshold reverse 80
user@host# set echo-req drop threshold reverse 80
user@host# set other drop threshold reverse 80
```

---

## Results

From configuration mode, confirm your configuration by entering the **show security gprs gtp profile *profile-name*** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security gprs gtp profile p1
rate-limit 300;
path-rate-limit {
 message-type create-req {
 drop-threshold {
 forward 80;
 reverse 80;
 }
 }
 alarm-threshold {
 forward 50;
 reverse 50;
 }
}
```

```

 }
 }
 message-type delete-req {
 drop-threshold {
 forward 80;
 reverse 80;
 }
 alarm-threshold {
 forward 50;
 reverse 50;
 }
 }
 message-type echo-req {
 drop-threshold {
 forward 80;
 reverse 80;
 }
 alarm-threshold {
 forward 50;
 reverse 50;
 }
 }
 message-type other {
 drop-threshold {
 forward 80;
 reverse 80;
 }
 alarm-threshold {
 forward 50;
 reverse 50;
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying the Configuration

**Purpose** Verify that the GTP message rate and path rate limit configuration is correct.

**Action** From operational mode, enter the **show security gprs gtp counters path-rate-limit** command.

Path-rate-limit counters:

|                | Drop | Alarm |
|----------------|------|-------|
| Create Request | 20   | 50    |
| Delete Request | 20   | 50    |
| Echo Request   | 20   | 50    |
| Others         | 20   | 50    |

**Meaning** The `show security gprs gtp counters path-rate-limit` command displays the number of packets received since the alarm threshold or the drop threshold value was reached. If you configure the `alarm-threshold` value as 50 and the `drop-threshold` value as 80 for the Create Request message, and if the device receives 100 packets in a second or minute, then the Drop number will be 20 and the Alarm number will be 50.

## Example: Enabling GTP Sequence Number Validation

This example shows how to enable GTP sequence number validation feature.

- [Requirements on page 2216](#)
- [Overview on page 2216](#)
- [Configuration on page 2216](#)
- [Verification on page 2217](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you set the gtp profile as gtp1 and you also enable the sequence number validation feature.

### Configuration

#### Step-by-Step Procedure

To enable GTP sequence number validation feature:

1. Set the GTP profile.  

```
[edit]
user@host# set security gprs gtp profile gtp1
```
2. Enable the sequence number validation.  

```
[edit]
user@host# set security gprs gtp profile gtp1 seq-number-validated
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding GTP IP Fragmentation

A GPRS tunneling protocol (GTP) packet consists of the message body and three headers: GTP, UDP, and IP. If the resulting IP packet is larger than the maximum transmission unit (MTU) on the transferring link, the sending Serving GPRS Support Node (SGSN) or gateway GPRS support node (GGSN) performs an IP fragmentation.

By default, the device buffers IP fragments until it receives a complete GTP message, and then inspects the GTP message.

## Understanding GTP Information Elements

---

Information elements (IEs) are included in all GPRS tunneling protocol (GTP) control message packets. IEs provide information about GTP tunnels, such as creation, modification, deletion, and status. Junos OS supports IEs consistent with Third-Generation Partnership Project (3GPP) Release 6, Release 7, Release 8, and Release 9. If you have contractual agreements with operators running earlier releases of 3GPP, you can reduce network overhead by restricting control messages containing unsupported IEs.

**NOTE:** If a new information element (IE) is introduced, there will be no drop in GTP messages because GTP passes the messages even if it encounters unknown new IEs.

## Understanding GTP APN Filtering

An access point name (APN) is an information element (IE) included in the header of a GPRS tunneling protocol (GTP) packet that provides information about how to reach a network. An APN comprises two elements:

- Network ID—Identifies the name of an external network such as example.com.
- Operator ID—Uniquely identifies the operators' public land mobile network (PLMN) such as mnc123.mcc456.

By default, the device permits all APNs. However, you can configure the device to perform APN filtering to restrict access to roaming subscribers to external networks.

To enable APN filtering, you must specify one or more APNs. To specify an APN, you need to know the domain name of the network (for example, example.com) and, optionally, the operator ID. Because the domain name (network ID) portion of an APN can potentially be very long and contain many characters, you can use the wildcard (\*) as the first character of the APN. The wildcard indicates that the APN is not limited only to example.com but also includes all the characters that might precede it.

You may also set a *selection mode* for the APN. The selection mode indicates the origin of the APN and whether or not the Home Location Register (HLR) has verified the user subscription. You set the selection mode according to the security needs of your network. Possible selection modes include the following:

- Mobile Station—Mobile station-provided APN, subscription not verified.

This selection mode indicates that the mobile station (MS) provided the APN and that the HLR did not verify the user's subscription to the network.

- Network—Network-provided APN, subscription not verified.

This selection mode indicates that the network provided a default APN because the MS did not specify one, and that the HLR did not verify the user's subscription to the network.

- Verified—MS or network-provided APN, subscription verified.

This selection mode indicates that the MS or the network provided the APN and that the HLR verified the user's subscription to the network.

APN filtering applies only to create-pdp-request messages. When performing APN filtering, the device inspects GTP packets to—look for APNs that match APNs that you set. If the APN of a GTP packet matches an APN that you specified, the device then

verifies the selection mode and only forwards the GTP packet if both the APN and the selection mode match the APN and the selection mode that you specified. Because APN filtering is based on perfect matches, using the wildcard (\*) when setting an APN suffix can prevent the inadvertent exclusion of APNs that you would otherwise authorize.

Additionally, the device can filter GTP packets based on the combination of an International Mobile Subscriber Identity (IMSI) prefix and an APN. When you filter GTP packets based on an IMSI prefix, you must also specify an APN.

An APN string is case-insensitive. For instance, in the following example you set two APN strings, WWW.EXAMPLE.COM.CN and www.example.com.cn, with the same IMSI prefix value. In this configuration, the lowercase string will display after the uppercase string, and the packet will be dropped.

```
user@host# show configuration security gprs gtp | display set
```

```
set security gprs gtp profile test apn WWW.EXAMPLE.COM.CN imsi-prefix * action
pass
```

```
set security gprs gtp profile test apn www.example.com.cn imsi-prefix * action drop
```

If an APN is configured with two IMSI prefix entries, then the IMSI prefix with the longest match takes priority. For example, see the following configuration:

```
user@host# show configuration security gprs gtp | display set
```

```
set security gprs gtp profile test apn WWW.EXAMPLE.COM.CN imsi-prefix 12345678
action pass
```

```
set security gprs gtp profile test apn www.example.com.cn imsi-prefix 12345 action
drop
```

If an incoming packet value matches the IMSI prefix value 12345678, then the packet will pass. The IMSI prefix value 12345678 takes precedence over the IMSI prefix value 12345, as the longest matched IMSI prefix takes priority.

## Example: Setting a GTP APN and a Selection Mode

This example shows how to set a GTP APN and a selection mode.

- [Requirements on page 2222](#)
- [Overview on page 2222](#)

- [Configuration on page 2222](#)
- [Verification on page 2222](#)

## Requirements

No special configuration beyond device initialization is required before configuring this feature.

## Overview

In this example, you set a GTP APN as `example.com.mnc123.mcc456.gprs` and use the wildcard (\*) character. You also set the IMSI prefix and set the selection mode as network.

## Configuration

### Step-by-Step Procedure

To configure a GTP APN and a selection mode:

1. Specify the GTP profile.  

```
[edit]
user@host# set security gprs gtp profile gtp1
```
2. Set a selection mode for the APN.  

```
[edit]
user@host# set security gprs gtp profile gtp1 apn
*example.com.mnc123.mcc456.gprs imsi-prefix * action selection net
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding IMSI Prefix Filtering of GTP Packets

A GPRS support node (GSN) identifies a mobile station (MS) by its International Mobile Station Identity (IMSI). An IMSI consists of three elements: the mobile country code (MCC), the mobile network code (MNC), and the Mobile Subscriber Identification Number (MSIN). The MCC and MNC combined constitute the IMSI prefix and identify the mobile subscriber's home network, or public land mobile network (PLMN).

By setting IMSI prefixes, you can configure the device to deny GPRS tunneling protocol (GTP) traffic coming from nonroaming partners. By default, a device does not perform IMSI prefix filtering on GTP packets. By setting IMSI prefixes, you configure the device to filter create-pdp-request messages and permit only GTP packets with IMSI prefixes that match the ones you set. The device allows GTP packets with IMSI prefixes that do not match any of the IMSI prefixes that you set. To block GTP packets with IMSI prefixes that do not match any of the IMSI prefixes set, use an explicit wildcard for the IMSI filter, and the drop action should be the last IMSI prefix filtering policy.

When you filter GTP packets based on an IMSI prefix, you must also specify an APN.

#### Related Documentation

## Example: Setting a Combined IMSI Prefix and APN Filter

This example shows how to set and combine IMSI prefix and APN filter.

- [Requirements on page 2223](#)
- [Overview on page 2223](#)
- [Configuration on page 2223](#)
- [Verification on page 2224](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you set example.com.mnc123.mcc456.gprs as an APN and use the wildcard(\*). You permit all selection modes for this APN. You also set the IMSI prefix for a known PLMN, which is 246565. The MCC-MNC pair can be five or six digits.

### Configuration

#### Step-by-Step Procedure

To set and combine IMSI prefix and APN filter:

1. Set the GTP profile.  

[edit]  
user@host# set security gprs gtp profile gtp1
2. Set the selection mode for APN.  

[edit]

```
user@host# set security gprs gtp profile gtp1 apn
example.com.mnc123.mcc456.gprs imsi-prefix 246565 action pass
```

- If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding R6, R7, R8, and R9 Information Elements Removal

The Third-Generation Partnership Project (3GPP) R6, R7, R8, and R9 information elements (IEs) removal feature allows you to retain interoperability in roaming between Second-Generation Partnership Project (2GPP) and 3GPP networks. You can configure the GPRS tunneling protocol (GTP)-aware Juniper Networks device, residing on the border of a public land mobile network (PLMN) and a GPRS Roaming Exchange (GRX) and acting as a Gp firewall, to remove 3GPP-specific attributes from the GTP packet header when the packet passes into a 2GPP network. You can configure the device to remove the RAT, RAI, Common Flags, ULI, MS Time Zone, IMEI-SV, and access point name (APN) restriction IEs from GTP messages prior to forwarding these messages to the gateway GPRS support node (GGSN).

## Example: Removing R6 Information Elements from GTP Messages

This example shows how to remove R6 information elements from GTP messages.

- [Requirements on page 2228](#)
- [Overview on page 2228](#)
- [Configuration on page 2228](#)
- [Verification on page 2229](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you configure the Gp interface of the security device to remove newly added R6 IEs (RAT, Common Flags, ULI, IMEI-SV, MS Time Zone, and APN restrictions) from the GTP message.

### Configuration

#### Step-by-Step Procedure

To remove R6 information elements from GTP messages:

1. Specify the GTP profile.

[\[edit\]](#)

```
user@host# set security gprs gtp profile gtp1
```

2. Specify the information element.

```
[edit]
```

```
user@host# set security gprs gtp profile gtp1 remove-ie version v1 release R6
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
```

```
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Example: Removing R7 Information Elements from GTP Messages

---

This example shows how to remove R7 information elements from GTP messages.

- [Requirements on page 2230](#)
- [Overview on page 2230](#)
- [Configuration on page 2230](#)
- [Verification on page 2230](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you configure the Gp interface of the security device to remove newly added R7 IEs from the GTP message.

### Configuration

#### Step-by-Step Procedure

To remove R7 information elements from GTP messages:

1. Specify the GTP profile.  

```
[edit]
user@host# set security gprs gtp profile gtp1
```
2. Specify the information element.  

```
[edit]
user@host# set security gprs gtp profile gtp1 remove-ie version v1 release R7
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

### Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding GTPv1 Information Element Removal

The number of network elements in a mobile network is expanding with the introduction of multiple releases of 3GPP specifications. Every release introduces newer information elements (IEs) that are not defined in the prior releases. Therefore mobile networks have diverse set of network elements creating inter operability problems between different releases of the devices. You can configure the GPRS tunneling protocol (GTP) firewall to remove information elements (IE) by release with the following command.

**set security gprs gtp profile *gtp1* remove-ie.**

However newer IEs that will be introduced in the future releases might also cause inter operability problems. Each information element has a unique ID, the IE number. IE numbers range from 1 to 255. You can configure the GTP firewall to remove specific IEs using the user-configured IE number.

When you configure the IE removal, the GTP firewall deletes the corresponding IEs of the GTPv1 messages; updates the length of the GTP, the UDP, and the IP; and then passes the GTPv1 message. The GTP firewall also updates the cyclic redundancy check (CRC) code. IE removal by IE number supports all IEs, ranging from 1 to 255.

You can remove the IE removal configuration with the following commands:

**delete security gprs gtp profile *gtp1* remove-ie**—Deletes the IE removal configuration for the GTP profile GTP1.

**delete security gprs gtp profile *gtp1* remove-ie version *v1* number *4***—Deletes the IE removal configuration for GTP profile with version *v1* and IE number *4*.

**NOTE:** The IE removal feature supports GTPv1 only.

### Related Documentation

- [Example: Removing GTPv1 Information Elements Using IE Number on page 2234](#)

## Example: Removing GTPv1 Information Elements Using IE Number

This example shows how to configure the GPRS tunnelling protocol (GTP) interface of the security device to remove user-configured IEs from GTP messages.

- [Requirements on page 2234](#)
- [Overview on page 2235](#)
- [Configuration on page 2235](#)

### Requirements

Enable GTP on the device.

```
set security gprs gtp enable
```

## Overview

In this example, you configure IE removal for the GTP profile called gtp1. The IEs are removed using the user-configured IE number 4.

## Configuration

**CLI Quick Configuration** To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security gprs gtp profile gtp1
set security gprs gtp profile gtp1 remove-ie version v1 number 4
```

**Step-by-Step Procedure** To configure the GTP interface of the security device to remove user-configured IEs from the GTP message:

1. Specify the GTP profile.  
[edit]  
user@host# **set security gprs gtp profile gtp1**
2. Specify the IE number.  
[edit security gprs gtp profile gtp1]  
user@host# **set remove-ie version v1 number 4**

**Results** From configuration mode, confirm your configuration by entering the **show security gprs** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
gtp {
 profile gtp1 {
 remove-ie {
 version v1 {
 number 4;
 }
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Understanding NAT for GTP

---

A General Packet Radio Service (GPRS) interface supports both GPRS tunneling protocol (GTP) inspection and Network Address Translation (NAT) simultaneously in the same routing instance. When GTP packets configured with static NAT are inspected in a network, only addresses within IP headers are translated. The addresses within their payloads are not translated. For each endpoint, the related GTP session must belong to the same zone and virtual router. This means the header source IP, C-tunnel IP, and U-tunnel IP in the payload are defined in the same scope for a packet.

**NOTE:** When you enable NAT, only the outer IP packet has to be translated. The embedded IP addresses are not translated.

During a GTP packet flow, the source IP address and destination IP address cannot be translated to NAT simultaneously. When you delete or deactivate NAT rule configuration on a device, the NAT rule related GSN and GTP tunnels are deleted. If the NAT rule related GSN number and tunnel number are huge, this deleting process will take several minutes.

## Example: Configuring GTP Inspection in NAT

This example shows how to configure a NAT rule to map a private IP (one that is inside the network and not routable) to a public IP (one that is outside of the network and is routable). It also shows how to inspect GTP traffic between an internal and external network.

- [Requirements on page 2238](#)
- [Overview on page 2238](#)
- [Configuration on page 2238](#)
- [Verification on page 2242](#)

### Requirements

Before you begin, the device must be restarted after GTP is enabled. By default, GTP is disabled on the device.

### Overview

In this example, you configure interfaces as ge-0/0/0 and ge-0/0/1, with addresses 10.0.0.254/8 and 123.0.0.254/8. You then configure the security zone and static NAT. You enable the GTP service in the security policies to allow bidirectional traffic between two networks, and you check the traffic between the internal and external network.

### Configuration

#### CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/0 unit 0 family inet address 10.0.0.254/8
set interfaces ge-0/0/1 unit 0 family inet address 123.0.0.254/8
set security zones security-zone zone1 interfaces ge-0/0/0.0 host-inbound-traffic
 system-services all
set security zones security-zone zone1 host-inbound-traffic protocols all
set security zones security-zone other-zone interfaces ge-0/0/1.0 host-inbound-traffic
 system-services all
set security zones security-zone other-zone host-inbound-traffic protocols all
set security address-book global address gsn1 10.0.0.1/8
set security address-book global address other-gsn 20.0.0.1/8
set security nat static rule-set rs1 from zone other-zone
set security nat static rule-set rs1 rule r1 match destination-address 123.0.0.1/32
set security nat static rule-set rs1 rule r1 then static-nat prefix 10.0.0.1/32
set security nat proxy-arp interface ge-0/0/0.0 address 123.0.0.1/32
set security gprs gtp enable
set security gprs gtp profile gtp1
set security gprs gtp profile gtp1 timeout 1
set security gprs gtp profile gtp1 seq-number-validated
set security policies from-zone zone1 to-zone other-zone policy out-gtp match
 source-address gsn1
```

```

set security policies from-zone zone1 to-zone other-zone policy out-gtp match
 destination-address other-gsn
set security policies from-zone zone1 to-zone other-zone policy out-gtp match application
 junos-gprs-gtp
set security policies from-zone zone1 to-zone other-zone policy out-gtp then permit
 application-services gprs-gtp-profile gtp1
set security policies from-zone other-zone to-zone zone1 policy in-gtp match
 source-address other-gsn
set security policies from-zone other-zone to-zone zone1 policy in-gtp match
 destination-address gsn1
set security policies from-zone other-zone to-zone zone1 policy in-gtp match application
 junos-gprs-gtp
set security policies from-zone other-zone to-zone zone1 policy in-gtp then permit
 application-services gprs-gtp-profile gtp1

```

**Step-by-Step Procedure** To configure GTP inspection in NAT:

1. Configure interfaces.
 

```

[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet address 10.0.0.254/8
user@host# set interfaces ge-0/0/1 unit 0 family inet address 123.0.0.254/8

```
2. Configure and security zones
 

```

[edit security]
user@host# set zones security-zone zone1 interfaces ge-0/0/0.0
 host-inbound-traffic system-services all
user@host# set zones security-zone zone1 host-inbound-traffic protocols all
user@host# set zones security-zone other-zone interfaces ge-0/0/1.0
 host-inbound-traffic system-services all
user@host# set zones security-zone other-zone host-inbound-traffic protocols all

```
3. Define the address book.
 

```

[edit security]
user@host# set address-book global address gsn1 10.0.0.1/8
user@host# set address-book global address other-gsn 20.0.0.1/8

```
4. Define NAT rule.
 

```

[edit security nat]
user@host# set static rule-set rs1 from zone other-zone
user@host# set static rule-set rs1 rule r1 match destination-address 123.0.0.1/32
user@host# set static rule-set rs1 rule r1 then static-nat prefix 10.0.0.1/32
user@host# set proxy-arp interface ge-0/0/0.0 address 123.0.0.1/32

```
5. Enable GTP profile.
 

```

[edit security gprs gtp]
user@host# set enable
user@host# set profile gtp1
user@host# set profile gtp1 timeout 1
user@host# set profile gtp1 seq-number-validated

```
6. Check GTP traffic.
 

```

[edit security policies]
user@host# set from-zone zone1 to-zone other-zone policy out-gtp match
 source-address gsn1

```

```

user@host# set from-zone zone1 to-zone other-zone policy out-gtp match
destination-address other-gsn
user@host# set from-zone zone1 to-zone other-zone policy out-gtp match application
junos-gprs-gtp
user@host# set from-zone zone1 to-zone other-zone policy out-gtp then permit
application-services gprs-gtp-profile gtp1
user@host# set from-zone other-zone to-zone zone1 policy in-gtp match
source-address other-gsn
user@host# set from-zone other-zone to-zone zone1 policy in-gtp match
destination-address gsn1
user@host# set from-zone other-zone to-zone zone1 policy in-gtp match application
junos-gprs-gtp
user@host# set from-zone other-zone to-zone zone1 policy in-gtp then permit
application-services gprs-gtp-profile gtp1

```

**Results** From configuration mode, confirm your configuration by entering the **show security** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

## Understanding Network Address Translation-Protocol Translation

---

Network Address Translation-Protocol Translation (NAT-PT) is a protocol translation mechanism that can be done in two directions, from IPv4 address format to IPv6 address format and vice versa. NAT-PT binds the addresses in the IPv6 network with addresses in the IPv4 network and vice versa to provide transparent routing for the datagrams traversing between address realms.

In each direction, the static NAT defines a one-to-one mapping from one IP subnet to another IP subnet. The mapping includes a destination IP address translation in one direction and a source IP address translation in the opposite direction.

The main advantage of NAT-PT is that the end devices and networks can run either IPv4 addresses or IPv6 addresses and traffic can be started from any side.

  - [Enhancing Traffic Engineering by Configuring NAT-PT Between an IPv4 and an IPv6 Endpoint with SCTP Multihoming on page 2243](#)

## Enhancing Traffic Engineering by Configuring NAT-PT Between an IPv4 and an IPv6 Endpoint with SCTP Multihoming

This example shows how to enhance traffic engineering by configuring NAT-PT between an IPv4 endpoint and an IPv6 endpoint. NAT-PT is a protocol translation mechanism that allows communication between IPv6-only and IPv4-only nodes through protocol-independent translation of IPv4 and IPv6 datagrams, requiring no state information for the session. NAT-PT binds the addresses in the IPv6 network with addresses in the IPv4 network and vice versa to provide transparent routing for the datagrams traversing between address realms. The main advantage of NAT-PT is that the end devices and networks can run either IPv4 addresses or IPv6 addresses and traffic can be started from any side.

- [Requirements on page 2243](#)
- [Overview on page 2243](#)
- [Configuration on page 2244](#)
- [Verification on page 2248](#)

### Requirements

This example uses the following hardware and software components:

- A high-end SRX Series device
- Endpoint A connected to an SRX Series device using two IPv6 addresses
- Endpoint B connected to an SRX Series device using two IPv4 addresses

### Overview

In this example, you configure NAT-PT between an IPv4 endpoint and an IPv6 endpoint. Endpoint A is connected to the SRX Series device using two IPv6 addresses and endpoint B is connected to the SRX Series device using two IPv4 addresses.

You can configure the SRX Series device to translate the IP header and IP address list (located in the INIT/INT-ACK message) between an IPv4 address format and an IPv6 address format. In each direction, static NAT defines a one-to-one mapping from one IP subnet to another IP subnet. The mapping includes destination IP address translation in one direction and source IP address translation in the opposite direction.

[Figure 101](#) illustrates the network topology used in this example.

Figure 101: NAT-PT Between an IPv4 Endpoint and an IPv6 Endpoint

For configuring NAT-PT details between IPv4 and IPv6 endpoints, see [Table 251](#).

Table 251: Configuring NAT-PT Details Between IPv4 and IPv6 Endpoints

| Endpoints | Address One | Address Two |
|-----------|-------------|-------------|
| A (IPv6)  | 2a.1.1.1/96 | 2c.3.3.3/96 |
| B (IPv4)  | 2.2.2.2/24  | 4.4.4.4/34  |

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-4/0/0 unit 0 family inet address 1.1.1.100/24

```

### Step-by-Step Procedure

To configure NAT-PT between an IPv4 endpoint and an IPv6 endpoint:

1. Configure interfaces.

```

[edit interfaces]
user@host# set ge-4/0/0 unit 0 family inet address 1.1.1.100/24
user@host# set ge-4/0/0 unit 0 family inet6 address 2a::1:100/96
user@host# set ge-4/0/1 unit 0 family inet address 2.2.2.100/24
user@host# set ge-4/0/1 unit 0 family inet6 address 2b::2:2:100/96
user@host# set ge-4/0/2 unit 0 family inet address 3.3.3.100/24
user@host# set ge-4/0/2 unit 0 family inet6 address 2c::3:3:100/96
user@host# set ge-4/0/3 unit 0 family inet address 4.4.4.100/24
user@host# set ge-4/0/3 unit 0 family inet6 address 2d::4:4:100/96

```

2. Configure zones.

```

[edit security zones]
user@host# set security-zone sctp_zone1 host-inbound-traffic system-services all
user@host# set security-zone sctp_zone1 host-inbound-traffic protocols all
user@host# set security-zone sctp_zone1 interfaces ge-4/0/0.0
user@host# set security-zone sctp_zone1 interfaces ge-4/0/2.0
user@host# set security-zone sctp_zone2 host-inbound-traffic system-services all
user@host# set security-zone sctp_zone2 host-inbound-traffic protocols all
user@host# set security-zone sctp_zone2 interfaces ge-4/0/1.0
user@host# set security-zone sctp_zone2 interfaces ge-4/0/3.0

```

3. Configure rules for the first static NAT zone.

```

[edit security nat]
user@host# set static rule-set sctp-natpt-from-zone1 from zone sctp_zone1

```

4. Specify the static NAT rule match criteria for the traffic coming from zone 1.

```

[edit security nat]
user@host# set static rule-set sctp-natpt-from-zone1 rule r1-dst match
 destination-address 2b::2:2/128
user@host# set static rule-set sctp-natpt-from-zone1 rule r1-dst then static-nat
 prefix 2.2.2.2/32
user@host# set static rule-set sctp-natpt-from-zone1 rule r3-dst match
 destination-address 2d::4:4/128
user@host# set static rule-set sctp-natpt-from-zone1 rule r3-dst then static-nat
 prefix 4.4.4.4/32

```

5. Configure rules for the second static NAT zone.

```

[edit security nat]
user@host# set static rule-set sctp-natpt-from-zone2 from zone sctp_zone2

```

6. Specify the static NAT rule match criteria for the traffic coming from zone 2.

```

[edit security nat]
user@host# set static rule-set sctp-natpt-from-zone2 rule r2-dst match
 destination-address 1.1.1.1/32

```

```
user@host# set static rule-set sctp-natpt-from-zone2 rule r2-dst then static-nat
prefix 2a::1:1/128
user@host# set static rule-set sctp-natpt-from-zone2 rule r4-dst match
destination-address 3.3.3.3/32
user@host# set static rule-set sctp-natpt-from-zone2 rule r4-dst then static-nat
prefix 2c::3:3:3/128
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security zones**, and **show security nat static** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces
ge-4/0/0 {
 unit 0 {
 family inet {
 address 1.1.1.100/24;
 }
 family inet6 {
 address 2a::1:1:100/96;
 }
 }
}
ge-4/0/1 {
 unit 0 {
 family inet {
 address 2.2.2.100/24;
 }
 family inet6 {
 address 2b::2:2:100/96;
 }
 }
}
ge-4/0/2 {
 unit 0 {
 family inet {
 address 3.3.3.100/24;
 }
 family inet6 {
 address 2c::3:3:100/96;
 }
 }
}
ge-4/0/3 {
 unit 0 {
 family inet {
 address 4.4.4.100/24;
 }
 family inet6 {
 address 2d::4:4:100/96;
 }
 }
}
```

```
[edit]
user@host# show security zones
security-zone sctp_zone1 {
 host-inbound-traffic {
 system-services {
 all;
 }
 protocols {
 all;
 }
 }
 interfaces {
 ge-4/0/0.0;
 ge-4/0/2.0;
 }
}
security-zone sctp_zone2 {
 host-inbound-traffic {

 all;
 }
 protocols {
 all;
 }
 }
 interfaces {
 ge-4/0/1.0;
 ge-4/0/3.0;
 }
}

[edit]
user@host# show security nat static
rule-set sctp-natpt-from-zone1 {
 from zone sctp_zone1;
 rule r1-dst {
 match {
 destination-address 2b::2:2/128;
 }
 then {
 static-nat {
 prefix {
 2.2.2.2/32;
 }
 }
 }
 }
 rule r3-dst {
 match {
 destination-address 2d::4:4/128;
 }
 then {
 static-nat {
 prefix {
 4.4.4.4/32;
 }
 }
 }
 }
}
```

```

 }
 }
}
rule-set sctp-natpt-from-zone2 {
 from zone sctp_zone2;
 rule r2-dst {
 match {
 destination-address 1.1.1.1/32;
 }
 then {
 static-nat {
 prefix {
 2a::1:1/128;
 }
 }
 }
 }
}
rule r4-dst {
 match {
 destination-address 3.3.3.3/32;
 }
 then {
 static-nat {
 prefix {
 2c::3:3/128;
 }
 }
 }
}
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

### Verifying the Configuration

**Purpose** Verify that the NAT-PT configuration between an IPv4 endpoint and an IPv6 endpoint is correct.

**Action** From operational mode, enter the **show security zones** and **show security nat static rule all** commands.

```
user@host> show security zones
```

```
Security zone: sctp_zone1
Send reset for non-SYN session TCP packets: Off
Policy configurable: Yes
Interfaces bound: 2
Interfaces:
 ge-4/0/0.0
 ge-4/0/2.0
```

```
Security zone: sctp_zone2
Send reset for non-SYN session TCP packets: Off
```

```

Policy configurable: Yes
Interfaces bound: 2
Interfaces:
 ge-4/0/1.0
 ge-4/0/3.0

```

```

user@host> show security nat static rule all
Total static-nat rules: 4
Total referenced IPv4/IPv6 ip-prefixes: 4/4

```

```

Static NAT rule: r1-dst Rule-set: sctp-natpt-from-zone1
 Rule-Id : 1
 Rule position : 1
 From zone : sctp_zone1
 Destination addresses : 2b::2:2:2
 Host addresses : 2.2.2.2
 Netmask : 128
 Host routing-instance : N/A
 Translation hits : 0
 Successful sessions : 0
 Failed sessions : 0
 Number of sessions : 0

```

```

Static NAT rule: r3-dst Rule-set: sctp-natpt-from-zone1
 Rule-Id : 2
 Rule position : 2
 From zone : sctp_zone1
 Destination addresses : 2d::4:4:4
 Host addresses : 4.4.4.4
 Netmask : 128
 Host routing-instance : N/A
 Translation hits : 0
 Successful sessions : 0
 Failed sessions : 0
 Number of sessions : 0

```

```

Static NAT rule: r2-dst Rule-set: sctp-natpt-from-zone2
 Rule-Id : 3
 Rule position : 3
 From zone : sctp_zone2
 Destination addresses : 1.1.1.1
 Host addresses : 2a::1:1:1
 Netmask : 32
 Host routing-instance : N/A
 Translation hits : 0
 Successful sessions : 0
 Failed sessions : 0
 Number of sessions : 0

```

```

Static NAT rule: r4-dst Rule-set: sctp-natpt-from-zone2
 Rule-Id : 4
 Rule position : 4
 From zone : sctp_zone2
 Destination addresses : 3.3.3.3
 Host addresses : 2c::3:3:3
 Netmask : 32
 Host routing-instance : N/A
 Translation hits : 0
 Successful sessions : 0
 Failed sessions : 0
 Number of sessions : 0

```

**Meaning** The **show security zones** command displays all the zones configured and the interfaces associated with the zone. The **show security nat static rule all** command displays all the static NAT rules configured.

## Understanding GGSN Redirection

---

Junos OS supports GPRS tunneling protocol (GTP) traffic and gateway GPRS support node (GGSN) redirection. A GGSN (X) can send create-pdp-context responses in which it can specify different GGSN IP addresses (GGSN Y and GGSN Z) for subsequent GTP-C and GTP-U messages. Consequently, the SGSN sends the subsequent GGSN tunneling protocol, control (GTP-C) and GGSN tunneling protocol, user plane (GTP-U) messages to GGSNs Y and Z, instead of X.

## GGSN Pooling Scenarios Overview

---

The General Packet Radio Service (GPRS) tunneling protocol (GTP) supports different Gateway GPRS Support Node (GGSN) IP addresses during a tunnel creation procedure. There are two GGSN pooling scenarios that support Serving GPRS Support Node (SGSN) roaming.

- [Understanding GGSN Pooling for Scenario 1 on page 2251](#)
- [Understanding GGSN Pooling for Scenario 2 on page 2253](#)

## Understanding GGSN Pooling for Scenario 1

In [Figure 102](#), a packet data protocol (PDP) context request is sent from SGSN A to GGSN B during a GTP tunnel creation procedure. After sending the PDP context request message, GGSN D records the request information and it uses a different destination IP address from the request packet's destination IP address to send the response message to SGSN A.

In this scenario, two GTP packet messages are sent to Services Processing Unit 1 (SPU1) and SPU2 by the central point, and the messages are processed by SPU1 and SPU2 individually. The session is created on SPU1 and SPU 2 for each GTP packet. SPU1 records the request packet information and SPU2 records the response packet information.

The PDP response message sent from GGSN D to SGSN A is dropped because of a lack of request information. Thus the GTP tunnel is not established.

**Figure 102: GGSN Pooling Scenario 1**

**NOTE:** SPU2 cannot retrieve request information from SPU1.

### Install Request Information to Remote SPU

In this scenario, the PDP response packet was dropped because of a lack of request information, and the GTP tunnel was not established. This can be resolved by installing the request information on the correct SPU.

In [Figure 103](#), when creating a tunnel, the response packet's GGSN IP address changes, triggering a new session, and the central point distributes the message to another SPU.

The response packet always sends to the request packet's source address to the SPU. This helps to install the request information to the remote SPU for the next response packet.

Install the request information into the predictable SPU, HASH (req-src-ip) function while processing the request packet. After the expected SPU number ( $\text{Hash}(1.1.1.1) = \text{SPU2}$ ) is calculated by the source IP address of the PDP request message, the request information is installed in the remote SPU2 through the Juniper Message Passing Interface (JMPI).

Figure 103: Functionality : GGSN Pooling Scenario 1

Now the request information is installed on local SPU1 and remote SPU2, so the PDP response message is allowed.

### Workarounds for Scenario 1

In scenario 1, the PDP context request message sent from SGSN A reached the Junos OS default application **junos-gprs-gtp** and the GTP inspection was enabled for PDP context request message. However, the PDP context response message sent from GGSN D cannot reach the Junos OS default application **junos-gprs-gtp**. Thus the packet will not be inspected by the GTP module.

As a workaround, you need to enable GTP inspection for the PDP context response message by configuring the custom policy and applications. See the following examples:

- [Example: Configuring a GGSN Custom Policy on page 2255](#)
- [Example: Configuring Custom Applications on page 2258](#)

## Understanding GGSN Pooling for Scenario 2

In [Figure 104](#), a packet data protocol (PDP) context request is sent from SGSN A to GGSN B during a GTP tunnel creation procedure. After receiving the PDP context request message, GGSN B sends the PDP context response message to SGSN A. After receiving the PDP context response message, the GTP-C tunnel is created between SGSN C and GGSN D. Then SGSN C sends an update PDP context request message to GGSN D using different source and destination IP addresses from the request packet's IP header.

In scenario 2, the SGSN A creates the first GTP context request and sends it to the SPU by the central point. The session is created for the request packet on SPU1. The response packet sent from GGSN B to SGSN A reaches the session correctly.

The request packet sent from SGSN A indicates that GTP-C is established on control IP 1.1.1.2 and the GTP-U is established on data IP 1.1.1.3. Likewise, the response message sent from GGSN indicates that GTP-C is established on control IP 2.2.2.3 and GTP-U is established on data IP 2.2.2.4.

The GTP-C and GTP-U tunnels are created on local SPU1 after all the endpoints are established. However, the tunnel is not established on SPU 2, so the PDP update request message received from SPU2 is dropped.

**Figure 104: GGSN Pooling Scenario 2**

### Install Tunnel Information to Remote SPU

In scenario 2, the update request packet is dropped because of a lack of tunnel information. This can be resolved by installing the tunnel information to the correct SPU after the request and response packets are processed. The SPU that receives the response packet installs the tunnel information on the local or remote SPU.

In [Figure 105](#), after the tunnel is established, the control messages are sent to the control tunnel endpoint. The destination IP address of all the control messages should be the control tunnel's GGSN endpoint IP address. This helps to calculate the remote SPU number in advance for the subsequent control message.

Install the tunnel information into the predictable SPU. After the SPU number is calculated by the control tunnel GGSN endpoint IP, the tunnel information is installed in the remote SPU through JMPI.

Figure 105: Functionality : GGSN Pooling Scenario 2

Now the tunnel information is installed on remote SPU2, so the PDP update response message is allowed.

### Example: Configuring a GGSN Custom Policy

This example shows how to configure a Gateway GPRS Support Node (GGSN) custom policy to support GGSN pooling scenario 1.

- [Requirements on page 2255](#)
- [Overview on page 2256](#)
- [Configuration on page 2256](#)
- [Verification on page 2257](#)

#### Requirements

This example uses the following hardware and software components:

- A high-end SRX Series device
- A PC
- Junos OS Release 12.1X44-D10

Before you begin, you should be familiar with GGSN pooling scenarios. See [“GGSN Pooling Scenarios Overview” on page 2251](#).

## Overview

In this example, you set security zones from zone ggsn and to zone sgsn. Next you set the GGSN policy name to ggsn-pool-g2s. You set the name of the match source address to ggsn-1 and the match destination address to sgsn-1.

Then you set the port based application to src\_2123 and src\_3386. You set the action type to permit. Then you set the application services name to gprs-gtp-profile and the GTP profile name to test. Finally, you set the default policy name to deny-all.

## Configuration

### Configuring a GGSN Custom Policy

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s
set security policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s match
 source-address ggsn-1
set security policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s match
 destination-address sgsn-1
set security policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s match application
 src_2123
set security policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s match application
 src_3386
set security policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s then permit
 application-services gprs-gtp-profile test
set security policies default-policy deny-all
```

#### Step-by-Step Procedure

To configure a GGSN custom policy:

1. Configure the GGSN custom policy.  

```
[edit security]
user@host# set policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s
```
2. Configure the source address.  

```
[edit security]
user@host# set policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s match
 source-address ggsn-1
```
3. Configure the destination address.  

```
[edit security]
user@host# set policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s match
 destination-address sgsn-1
```
4. Configure the policy applications  

```
[edit security]
user@host# set policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s match
 application src_2123
```

```
user@host# set policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s match
application src_3386
```

5. Configure the activity type and specify the GTP profile name.

```
[edit security]
user@host# set policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s then
permit
user@host# set policies from-zone ggsn to-zone sgsn policy ggsn-pool-g2s then
permit application-services gprs-gtp-profile test
```

6. Configure the default policy.

```
[edit security]
user@host# set policies default-policy deny-all
```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security policies
from-zone zone-name to-zone zone-name {
 from-zone ggsn to-zone sgsn {
 policy ggsn-pool-g2s {
 match {
 source-address ggsn-l;
 destination-address sgsn-l;
 application [src_2123 src_3386];
 }
 then {
 permit {
 application-services {
 gprs-gtp-profile test;
 }
 }
 }
 }
 }
}
default-policy {
 deny-all;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Configuration on page 2257](#)

### Verifying the Configuration

**Purpose** Verify that the GGSN custom policy configuration is correct.

**Action** From operational mode, enter the **show security** command.

## Sample Output

```
user@host>show security policies
From zone: ggsn, To zone: ggsn
Policy: ggsn-pool-g2s, State: enabled, Index: 5, Scope Policy: 0, Sequence
number: 1
 Source addresses: ggsn1
 Destination addresses: ggsn1
 Applications: src_2123 src_3386
 Action: permit, application services: gprs-gtp-profile test
 Default policy: Deny-all
```

This output shows a summary of policy configuration.

  - [GGSN Pooling Scenarios Overview on page 2251](#)

---

## Example: Configuring Custom Applications

This example shows how to configure custom applications to support GGSN pooling scenario 1.

- [Requirements on page 2258](#)
- [Overview on page 2258](#)
- [Configuration on page 2259](#)

## Requirements

This example uses the following hardware and software components:

- A high-end SRX Series device
- A PC
- Junos OS Release 12.1X44-D10

Before you begin, configure the required GGSN policy. See [“Example: Configuring a GGSN Custom Policy” on page 2255](#).

## Overview

In this example, you create applications src\_2123 and src\_3386 to identify source ports 2123 and 3386 for both TCP and UDP.

First you configure a custom application called src\_2123. You set the application protocol to gprs-gtp-c. Then you set the networking protocol type to UDP. You set the source port to 2123 and the destination port to 0-0.

Then you configure another custom application called src\_3386. You set the application protocol to gprs-gtp-v0. Then you set the networking protocol type to UDP. Finally, you set the source port to 3386 and the destination port to 0-0.

## Configuration

### Configuring Custom Applications

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set applications application src_2123 application-protocol gprs-gtp-c
set applications application src_2123 protocol udp
set applications application src_2123 source-port 2123
set applications application src_2123 destination-port 0-0
set applications application src_3386 application-protocol gprs-gtp-v0
set applications application src_3386 protocol udp
set applications application src_3386 source-port 3386
set applications application src_3386 destination-port 0-0
```

#### Step-by-Step Procedure

To configure custom policy applications:

1. Configure the first custom application and application protocol name.  

```
[edit applications]
user@host# set application src_2123 application-protocol gprs-gtp-c
```
2. Configure the networking protocol type.  

```
[edit applications]
user@host# set application src_2123 protocol udp
```
3. Configure the source port number.  

```
[edit applications]
user@host# set application src_2123 source-port 2123
```
4. Configure the TCP or UDP destination port number.  

```
[edit applications]
user@host# set application src_2123 destination-port 0-0
```
5. Configure the second custom application and application protocol name.  

```
[edit applications]
user@host# set application src_3386 application-protocol gprs-gtp-v0
```
6. Configure the networking protocol type.  

```
[edit applications]
user@host# set application src_3386 protocol udp
```
7. Configure the source port number.  

```
[edit applications]
user@host# set application src_3386 source-port 3386
```
8. Configure the destination port number.  

```
[edit applications]
user@host# set application src_3386 destination-port 0-0
```

**Results** From configuration mode, confirm your configuration by entering the **show applications** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show applications
 application src_2123 {
 application-protocol gprs-gtp-c;
 protocol udp;
 source-port 2123;
 destination-port 0-0;
 }
 application src_3386 {
 application-protocol gprs-gtp-v0;
 protocol udp;
 source-port 3386;
 destination-port 0-0;
 }
```

If you are done configuring the device, enter **commit** from configuration mode.

## Understanding GTPv2

---

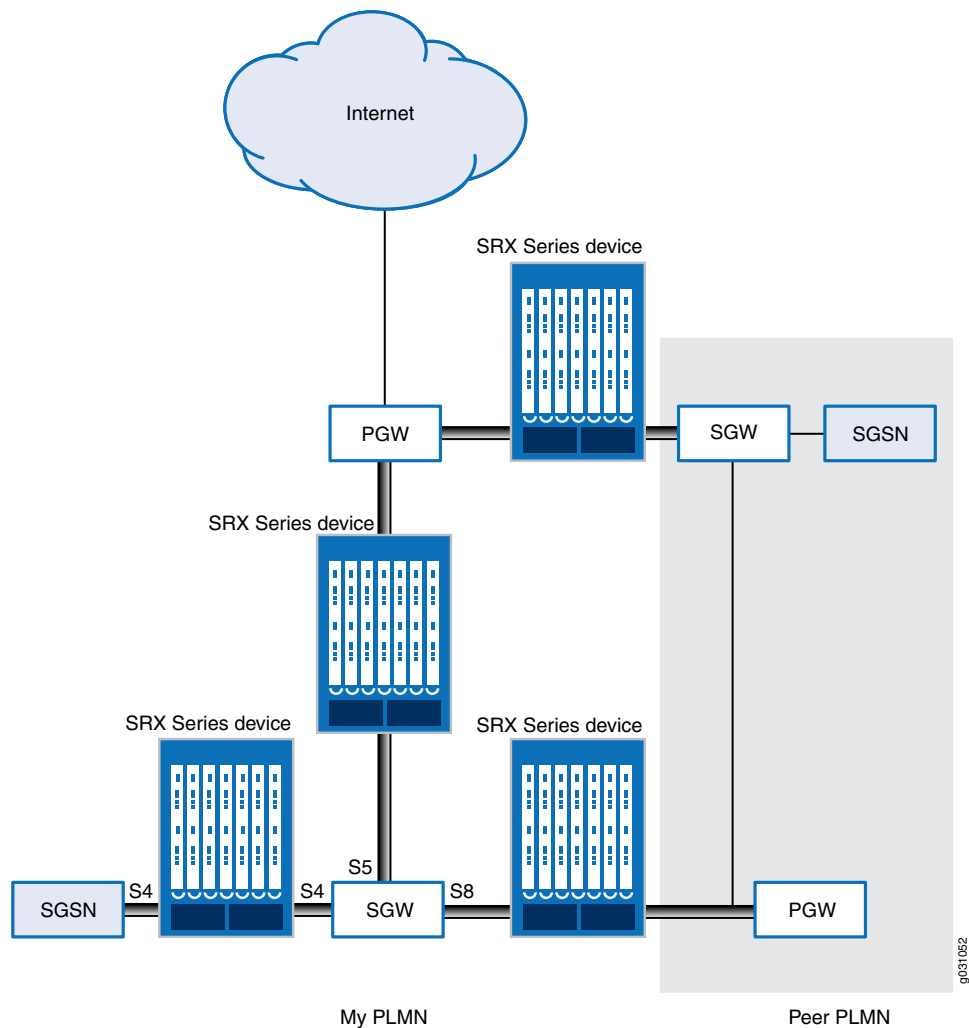

The GPRS tunneling protocol (GTP) establishes a GTP tunnel between a Serving GPRS Support Node (SGSN) and a Gateway GPRS Support Node (GGSN) for individual Mobile Stations (MS). In previous releases, only GTP version 0 (GTPv0) and GTP version 1 (GTPv1) were deployed. GTP version 2 (GTPv2) is implemented in the Junos operating system (Junos OS) Release 11.4.

GTPv2 is part of Long Term Evolution (LTE), a fourth generation (4G) wireless broadband technology developed by Third-Generation Partnership Project (3GPP). 3GPP is the standard body for developing GPRS standards. LTE is designed to increase the capacity and speed of mobile telephone networks. GTPv2 is a protocol designed for LTE networks. An LTE network comprises network elements, LTE interfaces, and protocols.

GTPv0 and GTPv1 are implemented using SGSNs and GGSNs. However, in GTPv2, the traditional SGSNs and GGSNs are replaced by three logical nodes—a serving gateway (SGW), a packet data network gateway (PGW), and a mobility management entity (MME).

[Figure 106](#) shows the following LTE interfaces where SRX Series devices are deployed in the public land mobile network (PLMN).

### Figure 106: LTE Interfaces

- S5—This interface connects an SGW and a PGW. It provides user plane tunneling and tunnel management capability between the SGW and the PGW. It is also used for SGW relocation that happens because of user equipment mobility or SGW connection to a non-collocated PGW. The S5 interface is equivalent to the Gn interface in a Third Generation (3G) mobile network.
- S8—This interface connects an SGW in a visited PLMN (VPLM) and a PGW in a home PLMN (HPLM). S8 is the inter-PLMN variant of S5. The S8 interface is equivalent to the Gp interface in a 3G mobile network.
- S4—This interface connects an S4 SGSN and an SGW. It provides related control and mobility support between GPRS core network and 3GPP Anchor function. It also provides user plane tunneling if direct tunneling is not established. The S4 interface does not have any equivalent interface in the 3G mobile network, because it provides interoperability between 3G and 4G networks.

## Understanding Policy-Based GTPv2

GPRS tunneling protocol version 2 (GTPv2) implements a policy mechanism that checks every GTPv2 packet against security policies that regulate GTPv2 traffic. Based on the security policy, the packet is then forwarded, dropped, or tunneled.

A GTPv2 security policy allows you to forward, deny, or tunnel GTPv2 traffic. However, the security policy does not enable GTPv2 traffic inspection on the device. To enable traffic inspection, you must apply a GTPv2 inspection object to a security policy. A GTPv2 inspection object is a set of configuration parameters for processing GTPv2 traffic.

You can apply only one GTPv2 inspection object per security policy. However, you can apply an inspection object to multiple security policies.

.....

**NOTE:** By default, a GTPv2 inspection object is not applied to a security policy. You need to explicitly apply an inspection object to a security policy.

.....

Using GTPv2 security policies, you can permit or deny GTPv2 tunnel establishment from certain peers, such as a serving gateway (SGW). You can configure GTPv2 security policies that specify multiple source and destination addresses, address groups, or an entire zone.

## Example: Enabling GTPv2 Inspection in Policies

This example shows how to enable GTPv2 inspection in policies.

- [Requirements on page 2266](#)
- [Overview on page 2266](#)
- [Configuration on page 2266](#)
- [Verification on page 2268](#)

## Requirements

Before you begin, the device must be restarted after GTPv2 is enabled. By default, GTPv2 is disabled on the device.

## Overview

In this example, you configure interfaces as ge-0/0/1 and ge-0/0/2, and assign them the interface addresses 4.0.0.254/8 and 5.0.0.254/8, respectively. You then configure the security zones and specify the global addresses as 4.0.0.5/32 and 5.0.0.6/32, respectively. You enable GTPv2 inspection in security policies to allow bidirectional traffic between two networks within the same public land mobile network (PLMN).

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security gprs gtp profile gtp2
set interfaces ge-0/0/1 unit 0 family inet address 4.0.0.254/8
set interfaces ge-0/0/2 unit 0 family inet address 5.0.0.254/8
set security zones security-zone sgw1 interfaces ge-0/0/1.0 host-inbound-traffic
 system-services all
set security zones security-zone sgw1 host-inbound-traffic protocols all
set security zones security-zone pgw1 interfaces ge-0/0/2.0 host-inbound-traffic
 system-services all
set security zones security-zone pgw1 host-inbound-traffic protocols all
set security address-book global address local-sgw1 4.0.0.5/32
set security address-book global address remote-pgw1 5.0.0.6/32
set security policies from-zone sgw1 to-zone pgw1 policy sgw1_to_pgw1 match
 source-address local-sgw1 destination-address remote-pgw1 application junos-gprs-gtp
set security policies from-zone sgw1 to-zone pgw1 policy sgw1_to_pgw1 then permit
 application-services gprs-gtp-profile gtp2
set security policies from-zone pgw1 to-zone sgw1 policy pgw1_to_sgw1 match
 source-address remote-pgw1 destination-address local-sgw1 application junos-gprs-gtp
set security policies from-zone pgw1 to-zone sgw1 policy pgw1_to_sgw1 then permit
 application-services gprs-gtp-profile gtp2
```

### Step-by-Step Procedure

To configure GTPv2 inspection in policies:

1. Enable GTPv2.

```
[edit]
user@host# set security gprs gtp enable
user@host# commit
user@host# exit
user@host# request system reboot
```

**NOTE:** After enabling GTPv2, you must reboot the device for GTPv2 inspection to take effect.

2. Create the GTPv2 inspection object.

```
[edit]
user@host# set security gprs gtp profile gtp2
```

3. Configure the interfaces.

```
[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 4.0.0.254/8
user@host# set ge-0/0/2 unit 0 family inet address 5.0.0.254/8
```

4. Configure the security zones.

```
[edit security zones]
user@host# set security-zone sgw1 interfaces ge-0/0/1.0
user@host# set security-zone sgw1 host-inbound-traffic system-services all
user@host# set security-zone sgw1 host-inbound-traffic protocols all
user@host# set security-zone pgw1 interfaces ge-0/0/2.0
user@host# set security-zone pgw1 host-inbound-traffic system-services all
user@host# set security-zone pgw1 host-inbound-traffic protocols all
```

5. Specify the addresses.

```
[edit security address-book global]
user@host# set address local-sgw1 4.0.0.5/32
user@host# set address remote-pgw1 5.0.0.6/32
```

6. Enable GTPv2 inspection in the security policies.

```
[edit security policies]
user@host# set from-zone sgw1 to-zone pgw1 policy sgw1_to_pgw1 match
 source-address local-sgw1 destination-address remote-pgw1 application
 junos-gprs-gtp
user@host# set from-zone sgw1 to-zone pgw1 policy sgw1_to_pgw1 then permit
 application-services gprs-gtp-profile gtp2
user@host# set from-zone pgw1 to-zone sgw1 policy pgw1_to_sgw1 match
 source-address remote-pgw1 destination-address local-sgw1 application
 junos-gprs-gtp
user@host# set from-zone pgw1 to-zone sgw1 policy pgw1_to_sgw1 then permit
 application-services gprs-gtp-profile gtp2
```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security policies
from-zone sgw1 to-zone pgw1 {
 policy sgw1_to_pgw1 {
 match {
 source-address local-sgw1;
 destination-address remote-pgw1;
 application junos-gprs-gtp;
 }
 then {
 permit {
 application-services {
 gprs-gtp-profile gtp2;
 }
 }
 }
 }
}
```

```
 }
 }
}
from-zone pgw1 to-zone sgw1 {
 policy pgw1_to_sgw1 {
 match {
 source-address remote-pgw1;
 destination-address local-sgw1;
 application junos-gprs-gtp;
 }
 then {
 permit {
 application-services {
 gprs-gtp-profile gtp2;
 }
 }
 }
 }
}
default-policy {
 permit-all;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying GTPv2 Inspection in Policies

---

|                              |                                                                                                                                                                                                                                                                                                                                                                                   |

## Understanding GTP Path Restart

---

Restarting a GPRS tunneling protocol (GTP) path terminates all GTP tunnels between two devices. Each GTP gateway is associated with a restart number. You can obtain a restart number from the Recovery information element (IE) of a GTP message.

You can detect a restart by comparing the locally stored restart number with the newly obtained one. The locally stored restart number is a nonzero value and does not match with the new restart number.

You can use the **set security gprs gtp profile name restart-path (echo | create | all)** configuration statement to restart a GTP path.

After you configure this command, the device detects the changed restart number obtained from the Recovery IE in the messages. You can use the **echo** option to obtain a new restart number from echo messages, the **create** option to obtain a restart number from create-session messages, or the **all** option to obtain a new restart number from all types of GTP messages.

## Example: Restarting a GTPv2 Path

This example shows how to restart a GTPv2 path.

- [Requirements on page 2269](#)
- [Overview on page 2269](#)
- [Configuration on page 2270](#)
- [Verification on page 2270](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

NOTE: For brevity, this example uses GTPv2.

In this example, you restart the GTPv2 path for the GTPv2 inspection object named gtp2. You obtain a new restart number from the Recovery information element (IE) in an echo message.

## Configuration

### Step-by-Step Procedure

To restart the GTPv2 path:

1. Specify the GTPv2 profile.  

```
[edit]
user@host# set security gprs gtp profile gtp2
```
2. Restart the path.  

```
[edit]
user@host# set security gprs gtp profile gtp2 restart-path echo
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding GTPv2 Tunnel Cleanup

A GPRS tunneling protocol version 2 (GTPv2) tunnel enables transmission of GTPv2 traffic between GPRS support nodes (GSNs).

While transmitting traffic, GTPv2 tunnels might hang for a number of reasons. For example, delete-pdp-request messages might get lost in the network, or a GSN might not shut down properly. In such a case, you can remove hanging GTPv2 tunnels either automatically or manually.

To remove a hanging GTPv2 tunnel automatically, you need to set a GTPv2 tunnel timeout value on the device. The device automatically identifies and removes a tunnel that is idle for the period specified by the timeout value. The default GTPv2 tunnel timeout value is 36 hours.

You can use the **set security gprs gtp profile name timeout** configuration statement to configure this value on the device. The timeout range is 1 through 1000 hours.

To remove a hanging GTPv2 tunnel manually, you need to use the **clear security gprs gtp tunnel** operational mode command.

**NOTE:** The default GTP tunnel timeout value is changed from 24 hours to 36 hours in Junos operating system (Junos OS) Release 11.4. The reason being that GTP does not inspect GTP-U (user plane) traffic in Junos OS Release 11.4.

#### Related Documentation

## Example: Setting the Timeout Value for GTPv2 Tunnels

This example shows how to set the timeout value for GTPv2 tunnels.

- [Requirements on page 2271](#)
- [Overview on page 2271](#)
- [Configuration on page 2271](#)
- [Verification on page 2272](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you set the tunnel timeout value to 40 hours for the GTPv2 inspection object named gtp2.

### Configuration

#### Step-by-Step Procedure

To configure the GTPv2 tunnel timeout value:

1. Specify the GTPv2 profile.  

```
[edit]
user@host# set security gprs gtp profile gtp2
```
2. Specify the timeout value.  

```
[edit]
user@host# set security gprs gtp profile gtp2 timeout 40
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding GTPv2 Traffic Logging

---

You can use the console or syslog to view GPRS tunneling protocol version 2 (GTPv2) traffic logs. You can configure the device to log GTPv2 packets based on their status. GTPv2 packet status can be any of the following:

- Forwarded—GTPv2 packet was forwarded because it was valid.
- State-invalid—GTPv2 packet was dropped because it failed stateful inspection or a sanity check. In case of a sanity check failure, the packet is marked as sanity.
- Prohibited—GTPv2 packet was dropped because it failed message length, message type, or International Mobile Subscriber Identity (IMSI) prefix checks.
- Rate-limited—GTPv2 packet was dropped because it exceeded the maximum rate limit of the destination GPRS support node (GSN).

By default, GTPv2 logging is disabled on the device. You can use the **set security gprs gtp profile name log** configuration statement to enable GTPv2 logging on the device.

## Example: Enabling GTPv2 Traffic Logging

---

This example shows how to enable GTPv2 traffic logging on a device.

- [Requirements on page 2273](#)
- [Overview on page 2273](#)
- [Configuration on page 2273](#)
- [Verification on page 2273](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you enable GTPv2 traffic logging for forwarded GTPv2 packets.

### Configuration

#### Step-by-Step Procedure

To enable GTPv2 traffic logging for forwarded GTPv2 packets:

1. Specify the GTPv2 profile.  

```
[edit]
user@host# set security gprs gtp profile gtp2
```
2. Enable logging for GTPv2 forwarded packets.  

```
[edit]
user@host# set security gprs gtp profile gtp2 log forwarded basic
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

### Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding GTPv2 Message Filtering

---

When a device receives a GPRS tunneling protocol version 2 (GTPv2) packet, it checks the packet against GTPv2 policies configured on the device. If the packet matches a policy, then the device inspects the packet based on the GTPv2 inspection object applied to the policy. If the packet fails to match any of the configuration parameters, it is dropped. If the packet matches all the configuration parameters, it is forwarded.

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, for the gtp2 profile, you configure the device to drop the echo and create-session message types for version 2.

### Configuration

#### Step-by-Step Procedure

To permit and deny GTPv2 message types:

1. Specify the GTPv2 profile.  

```
[edit]
user@host# set security gprs gtp profile gtp2
```
2. Drop the echo messages for version 2.  

```
[edit]
user@host# set security gprs gtp profile gtp2 drop echo 2
```
3. Drop the create-session messages for version 2.  

```
[edit]
user@host# set security gprs gtp profile gtp2 drop create-session 2
```
4. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

### Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding GTPv2 Message-Length Filtering

You can configure a device to drop GPRS tunneling protocol version 2 (GTPv2) packets that do not meet the specified minimum or maximum message lengths. In the GTPv2 header, the message length field indicates the length, in octets, of the GTPv2 payload. The message length does not include the length of the GTPv2 header itself, the UDP header, the TCP header, or the IP header.

The default minimum and maximum GTPv2 message lengths are 0 and 65,535 bytes, respectively. Therefore, you can specify the GTPv2 message length range from 0 to 65,535 bytes.

---

## Example: Setting GTPv2 Message Lengths

This example shows how to set GTPv2 message lengths.

- [Requirements on page 2280](#)
- [Overview on page 2281](#)
- [Configuration on page 2281](#)
- [Verification on page 2281](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

## Overview

In this example, you configure the minimum GTPv2 message length to 10 octets and the maximum GTPv2 message length to 1500 octets for the GTPv2 inspection object named `gtp2`.

## Configuration

### Step-by-Step Procedure

To configure GTPv2 message lengths:

1. Specify the GTPv2 profile.  

```
[edit]
user@host# set security gprs gtp profile gtp2
```
2. Specify the minimum message length.  

```
[edit]
user@host# set security gprs gtp profile gtp2 min-message-length 10
```
3. Specify the maximum message length.  

```
[edit]
user@host# set security gprs gtp profile gtp2 max-message-length 1500
```
4. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding GTPv2 Message-Type Filtering

You can configure a device to filter GPRS tunneling protocol version 2 (GTPv2) packets based on their message types. By default, the device permits all GTPv2 message types.

You permit and deny message types based on the GTP version number. For example, you can deny message types for one version while you permit them for the other version.

You can use the **set security gprs gtp profile profile name drop message-type number** configuration statement to discard GTPv2 message types. If the version number is not

mentioned, message types for all versions are discarded. If a configured message type is not valid for the particular GTP version, the specific configuration does not take effect.

**NOTE:** Message types valid for GTP version 1 (GTPv1) might not be valid for GTPv2, and vice versa.

A GTPv2 message type includes one or many messages. When you permit or deny a message type, you automatically permit or deny all messages of the specified message type. For example, if you drop the identification message type, then you automatically drop the identification-request and identification-response messages. Also, if you drop the create-pdp message type for version 2, then only the create-pdp-request and create-pdp-response messages for version 2 are dropped.

## Understanding GTPv2 Message-Rate Limiting

You can configure a device to limit the rate of control traffic going to GPRS tunneling protocol version 2 (GTPv2) gateways. GTPv2 gateways are important resources in a public land mobile network (PLMN) and require protection. You can use the **set security gprs gtp profile name rate-limit messages per second** configuration statement to limit the rate of control traffic to the GTPv2 gateways.

## Example: Limiting the GTPv2 Message Rate

This example shows how to limit the GTPv2 message rate.

- [Requirements on page 2283](#)
- [Overview on page 2283](#)
- [Configuration on page 2283](#)
- [Verification on page 2283](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you limit the rate of incoming GTPv2 messages to 200 packets per second to any GTPv2 gateway.

### Configuration

#### Step-by-Step Procedure

To configure the GTPv2 message rate limit:

1. Specify the GTPv2 profile.  

```
[edit]
user@host# set security gprs gtp profile gtp2
```
2. Set the rate limit.  

```
[edit]
user@host# set security gprs gtp profile gtp2 rate-limit 200
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

### Verification

To verify the configuration is working properly, enter the **show security gprs** command.

## Understanding GTPv2 Information Elements

---

Information elements (IEs) are included in all GPRS tunneling protocol version 2 (GTPv2) control message packets. IEs provide information about GTPv2 tunnels, such as creation, modification, deletion, and status. The Junos operating system (Junos OS) supports IEs consistent with the Third-Generation Partnership Project (3GPP) Release 8.

## Understanding GTPv2 IMSI Prefix and APN Filtering

---

A GPRS support node (GSN) identifies a Mobile Station (MS) by its International Mobile Subscriber Identity (IMSI). An IMSI comprises three elements: the mobile country code (MCC), the mobile network code (MNC), and the Mobile Subscriber Identification Number (MSIN). The MCC is a three-digit number, and the MNC is a two-digit or three-digit number. The MCC and MNC combined constitute the IMSI prefix and identify the mobile subscriber's home network or public land mobile network (PLMN). Therefore, the IMSI prefix acts as the PLMN identifier and is used to identify valid roaming partners.

By default, a device does not perform IMSI prefix filtering on GPRS tunneling protocol version 2 (GTPv2) packets. By setting IMSI prefixes, you configure the device to filter create-session-request messages and permit only GTPv2 packets with IMSI prefixes that match the ones you set.

When you filter GTPv2 packets based on an IMSI prefix, you must also specify an access point name (APN).

An APN is an information element (IE) included in the header of a GTPv2 packet that provides information about how to reach a network. An APN comprises two elements:

- Network ID—Identifies the name of an external network, such as example.com.
- Operator ID—Uniquely identifies the operators' PLMN, such as mnc123.mcc789.gprs.

For example, example.com.mnc123.mcc789.gprs is an APN for reaching the example.com network through the mnc123.mcc789.gprs operator.

By default, a device does not perform APN filtering on GTPv2 packets. However, you can configure the device to perform APN filtering to restrict access to roaming subscribers to external networks.

You can use the **set security gprs gtp profile profile name apn pattern-string imsi-prefix imsi-prefix-digits action (pass |drop |selection)** configuration statement to filter packets based on the combination of an IMSI prefix and an APN.

To specify an APN, you need to know the network ID or the domain name of the network (for example, example.com) and, optionally, the operator ID. Because the network ID portion of an APN can be very long, you can use the wildcard (\*) as the first character of the APN string. For example, if you use \*example.com as the network ID, the wildcard indicates that the APN is not limited only to example.com but also includes all the characters that might precede it.

You can use the **selection** option to set a *selection mode* for the APN. The selection mode indicates the origin of the APN and whether or not the Home Location Register (HLR) has verified the user subscription. You set the selection mode according to the security needs of your network. Possible selection modes include the following:

- ms—MS-provided APN, subscription is not verified.
- net—Network-provided APN, subscription is not verified.
- vrf—MS-provided or network-provided APN, subscription is verified.

You can use the **drop** option to drop all APNs and the **pass** option to pass all APNs for any selection mode.

When performing APN filtering, the device inspects packets to look for APNs that match APNs that you set. If the APN of a packet matches an APN that you specified, then the device verifies the selection mode and forwards the GTPv2 packet.

**NOTE:** The device only forwards the GTPv2 packet if both the APN and the selection mode match the APN and the selection mode that you specified.

Because APN filtering is based on perfect matches, using the wildcard (\*) when setting an APN suffix can prevent the inadvertent exclusion of APNs that you would otherwise authorize.

**NOTE:** IMSI prefix and APN filtering apply to create-session-request messages only.

## Example: Setting a Combined GTPv2 IMSI Prefix and APN Filter

This example shows how to set a combined GTPv2 IMSI prefix and APN filter.

- [Requirements on page 2287](#)
- [Overview on page 2287](#)
- [Configuration on page 2287](#)
- [Verification on page 2288](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you set `example.com.mnc123.mcc789.gprs` as an APN and use the wildcard (\*). You set the selection mode as network for this APN. You also set the IMSI prefix as 123678.

### Configuration

#### Step-by-Step Procedure

To set the combined IMSI prefix and APN filter:

1. Specify the GTPv2 profile.  

```
[edit]
user@host# set security gprs gtp profile gtp2
```
2. Set the selection mode for the APN.  

```
[edit]
user@host# set security gprs gtp profile gtp2 apn
*example.com.mnc123.mcc789.gprs imsi-prefix 123678 action selection net
```
3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security gprs** command.

### Understanding Stream Control Transmission Protocol

---

Stream Control Transmission Protocol (SCTP) is an IP Transport Layer protocol. SCTP exists at an equivalent level with User Datagram Protocol (UDP) and Transmission Control Protocol (TCP), which provides transport layer functions to many Internet applications. SCTP is a reliable transport protocol operating on top of a connectionless packet network such as IP and supports data transfer across the network in single IP or multi-IP cases.

The SCTP module inspects IPv4 and IPv6 traffic and checks all segments of the SCTP packet. The packet is then permitted or dropped based on the policy. For IPv6 traffic, the SCTP module inspects every extension header until it finds the SCTP header, and then only the SCTP header is processed and all the other headers are ignored.

SCTP is used for applications where monitoring and detection of loss of session is required. The SCTP path or session failure detection mechanism, for example, the heartbeat, monitors the connectivity of the session.

[Figure 107](#) illustrates the SCTP 4-way handshake and TCP 3-way handshake.

Figure 107: SCTP 4-way Handshake and TCP 3-way Handshake

SCTP provides the following services:

- Aggregate Server Access Protocol (ASAP)
- Bearer-independent Call Control (BICC)
- Direct Data Placement Segment chunk (DDP-segment)
- Direct Data Placement Stream session control (DDP-stream)
- Diameter in a DTLS/SCTP DATA chunk (Diameter-DTLS)
- Diameter in a SCTP DATA chunk (Diameter-SCTP)
- DPNSS/DASS 2 extensions to IUA Protocol (DUA)
- Endpoint Handlescape Redundancy Protocol (ENRP)
- H.248 Protocol (H248)
- H.323 Protocol (H323)
- ISDN User Adaptation Layer (IUA)
- MTP2 User Peer-to-Peer Adaptation Layer (M2PA)
- MTP2 User Adaptation Layer (M2UA)
- MTP3 User Adaptation Layer (M3UA)

- Other unspecified-configured SCTP payload protocols (Others)
- Q.IPC
- Reserved
- S1 Application Protocol (SIAP)
- Simple Middlebox Configuration (SIMCO)
- SCCP User Adaptation Layer (SUA)
- Transport Adapter Layer Interface (TALI)
- V5.2 User Adaptation Layer (V5UA)
- X2 Application Protocol (X2AP)

SCTP can transport signaling messages to and from Signaling System 7 (SS7) for 3G mobile networks through M3UA, M2UA, or SUA. SCTP is a packet-based transport protocol. SCTP provide reliable and secure transport, minimized end-to-end delay, short failover time in case of network failures and both sequence and no-sequence transport.

SCTP is optimized to:

- Avoid the multithread infrastructure problems, when the traffic is high
- Improve the SCTP association searching rate (association lookup process speed is increased) by SCTP hash table optimization on the SPU
- Improve FSM for retransmission cases

SCTP has the following limitations and constraints:

- IP Addresses
  - A maximum of eight source IP addresses and eight destination IP addresses are allowed in an SCTP communication.
  - Only static IP NAT is supported; the interface packets (from one side: client or server) coming in must belong to the same zone.
- Policies
  - Dynamic policy is not supported. You must configure all policies for SCTP sessions.
  - When policies are deleted, the related sessions and associations are cleared.
  - You configure one policy to permit SCTP traffic from all client IPs to all server IPs, and another policy to permit SCTP traffic from server IPs to client IPs. If one policy has an SCTP profile, then the same SCTP profile is needed for the reverse policy.
  - If you configure different policies for each session belonging to one association, there will be multiple policies related to one association, and the SCTP packet management (drop, rate limit, and so on) uses the profile attached to the handling SCTP session's policy.
- SCTP enable/disable is controlled by whether there is a SCTP profile configured.

- If no profile is attached to a policy, Sctp packets are forwarded without inspection.
- If a profile with the **nat-only** option is attached to a policy, then only NAT translation is done on the Sctp packets matching the policy. If a profile does not have the **nat-only** option set, then both NAT translation and Sctp inspection are done on each Sctp packet matching the policy.
- If you disable Sctp, all associations are deleted, and subsequent Sctp packets are passed or dropped according to the policy.
- If you enable Sctp, all existing Sctp sessions must be cleared or the traffic matching old sessions will be forwarded without any inspection from the Sctp module.

If you want to enable Sctp again, all the running Sctp communications will be dropped, because no associations exist. New Sctp communications can establish an association and perform the inspections.

**NOTE:** Clear old Sctp sessions when Sctp is reenabled; doing this will avoid any impact caused by the old Sctp sessions on the new Sctp communications.

- If you add an Sctp profile to an existing policy, you must do one of the following: clear related sessions or remove the old policy and create a new policy.
- If you change the timeout value in the Sctp profile, the configured handshake and the timeout value in existing associations will not change.
- Sctp Rate Limiting
  - Any change in the rate-limiting configuration will not affect the subsequent traffic of existing associations. It will apply to the newly established associations.
  - The supported protocol decimal value is from 0 to 63. This value includes 48 IANA assigned protocols and 16 unassigned protocols.
  - A maximum of 80 addresses are rate limited in one profile.
  - A maximum of 10 protocols are rate limited for one address in one profile.
  - The supported rate limit value is from 1 to 12000.
- Sctp Payload Protocol Blocking
  - Any change in the protocol-blocking configuration immediately impacts the subsequent traffic of existing associations.
  - The supported protocol decimal value is from 0 to 63. This value includes 48 IANA assigned protocols and 16 unassigned protocols.
- An Sctp endpoint can be a multihomed host with either all IPv4 addresses or all IPv6 addresses. An Sctp endpoint also supports NAT-PT in two directions, from an IPv4 address format to an IPv6 address format, and vice versa. Sctp module does not support IPv4 or IPv6 mixed-up multihoming and IPv4 or IPv6 mixed-up NAT-PT.

- For static NAT to work, the interfaces packets (from one side: client or server side) coming in must belong to the same zone.
- For multihome cases, only IPv4 address parameter or IPv6 address parameter in INIT or INI-ACK is supported.
- Only static NAT is supported for SCTP.
- Only established SCTP associations are synchronized to peer sessions.
- SCTP sessions are not deleted with associations; they time out in 30 minutes, which is the default value. The timeout value is configurable and can be changed.
- If the 4-way handshake process is not handled on one node, and is handled instead on two nodes (for example, two sessions on two nodes in active/active mode) or if the cluster is in failover before the 4-way handshake is completed, the association will not be established successfully.
- One SPU supports a maximum of 20,000 associations and a maximum of 1,280,000 SCTP sessions.

In some cases, the associations might not be distributed to SPUs very evenly because the ports' hash result on the central point is uneven. For example, this event can occur when only two peers of ports are used, and one peer has 100 associations, but another peer has only one association. In this case, the associations cannot be distributed evenly on the firewall with more than one SPU.

- Unified in-service software upgrade (ISSU) to earlier Junos OS releases is not supported.
- The M3UA/SCCP message parsing is checked, but the M3UA/SCCP stateful inspection is not checked.
- Only ITU-T Rec. Q.711-Q.714 (07/96) standard is supported. ANSI, ETSI, China, and other standards are not supported.
- Only RFC 4960 is supported.
- VPN session affinity does not support GPRS tunneling protocol (GTP) and Stream Control Transmission Protocol (SCTP).

---

## SCTP Features Overview

The following are the important features of SCTP:

- Multihoming support where one or both endpoints of a connection can consist of more than one IP address. This enables transparent failover between redundant network paths.
- Delivery of data in chunks within an independent stream eliminates unnecessary head-of-line blocking.
- Path selection and monitoring functionality to select a primary data transmission path and test the connectivity of the transmission path.
- Validation and acknowledgment mechanisms protect against flooding attacks and provide notification of duplicated or missing data chunks.
- Improved error detection suitable for jumbo Ethernet frames.

## Understanding SCTP Behavior in Chassis Cluster

In a chassis cluster configuration mode, the SCTP configuration and the established SCTP association is synced with the peer device. The SCTP module supports both active-active and active-passive modes.

The established SCTP association sends a creation or deletion message to the peer whenever an association is created or deleted on the active device. The secondary device adds or deletes an association respectively upon receiving the message from the established SCTP association. SCTP module then registers the corresponding callback function to receive and handle this message. There is no continuous timer sync between the two associations.

SCTP module will register a cold start sync function when a secondary device joins the cluster or reboots. The SCTP cold start function is called to sync all SCTP associations with the peer devices at the same time.

After the switchover, the established SCTP associations will remain functioning, but the associations in the progress of establishment will be lost and the establishment procedure needs to be re-initiated. It is also possible that the associations in the progress of teardown miss the ack message and leaves unestablished SCTP associations in the firewall. These associations will be cleaned up when the timer expires (5 hours by default) due to no activity in the association.

**NOTE:**

- You should configure all policies for your required SCTP sessions. For example, suppose you have endpoints A and B. Endpoint A has one SCTP association with x number of IPs (IP\_a1, IP\_a2, IP\_a3...IP\_ax). Endpoint B has one SCTP association with y number of IPs (IP\_b1, IP\_b2, IP\_b3...IP\_by.) The policy on the security device should permit all possible x\*y paths in both directions.
- When an SCTP association is removed, the related SCTP sessions still exist and time out by themselves.

## Understanding SCTP Multihoming

A Stream Control Transmission Protocol (SCTP) endpoint can be a multihomed host with either all IPv4 addresses or all IPv6 addresses. In [Figure 108](#), endpoint A is connected to an SRX Series device with two IPv4 addresses, and endpoint B is connected to an SRX Series device with two IPv4 addresses. Therefore, endpoint A and endpoint B can set up an association using four different pairs of IP addresses, resulting in four valid paths for communication.

**Figure 108: SCTP Multihoming with Two IPv4 Endpoints**

In [Figure 109](#), endpoint A is connected to an SRX Series device with two IPv6 addresses, and endpoint B is connected to an SRX Series device with two IPv6 addresses. Therefore, endpoint A and endpoint B can set up an association using four different pairs of IP addresses, resulting in four valid paths for communication.

## Understanding SCTP Multichunk Inspection

The Stream Control Transmission Protocol (SCTP) firewall checks all chunks in a message and then permits or drops the packet based on the policy. Use the **set security gprs sctp multichunk-inspection enable** command to enable SCTP multichunk inspection to check all chunks in a message. Use the **delete security gprs sctp multichunk-inspection enable** or **set security gprs sctp multichunk-inspection disable** command to disable SCTP multichunk inspection to check only the first chunk.

After enabling SCTP multichunk inspection, the SCTP firewall checks all chunks in a message and permits or drops the packet. The SCTP firewall drops the packet in the following cases:

- The layout of the SCTP chunks do not follow RFC 4960.
- A control chunk cannot pass the inspection of the SCTP finite state machine (FSM) or sanity checks.
- A data chunk is not allowed to pass the SCTP profile because of the SCTP FSM or sanity checks.
- A data chunk is not allowed to pass through the SCTP profile because of protocol blocking or rate limiting. The SCTP firewall resets this chunk to a null protocol data unit (PDU) and continues to check the next chunk. A data chunk is set to a null PDU based on the following rules:
  - When you set the null PDU value to **0xFFFF** using the **set security gprs sctp nullpdu protocol ID-0xFFFF** command, then the payload protocol identifier value is replaced with **0xFFFF** and the user data field is not modified.
  - When you set the null PDU value to **0x0000** using the **set security gprs sctp nullpdu protocol ID-0x0000** command, then the payload protocol identifier value is replaced with **0x0000** and the first four bytes of the user data field is replaced with zeroes.

If all chunks in a packet are null PDUs, the SCTP firewall drops the packet.

---

## SCTP Packet Structure Overview

An SCTP packet consists of the following sections:

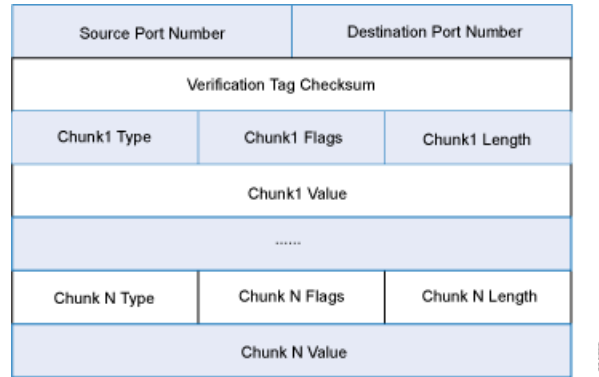

- Common header section

- Data chunk section

Figure 110 illustrates the structure of the SCTP packet.

**Figure 110: SCTP Packet Structure**

Common header section—All SCTP packets require a common header section. This section occupies the first 12 bytes of the packet. Table 253 describes the fields in the common header section:

**Table 253: Common Header Fields**

| Field                   | Description                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Source port number      | Identifies the sending port.                                                                                                                   |
| Destination port number | Identifies the receiving port. The hosts use the destination port number to route the packet to the appropriate destination or an application. |
| Verification tag        | Distinguishes stale packets from a previous connection. This is a 32-bit random value created during initialization.                           |
| Checksum                | Uses the cyclic redundancy check (CRC32) algorithm to detect errors that might have been introduced during data transmission.                  |

Data chunk section—This section occupies the remaining portion of the packet. Table 254 describes the fields in the data chunk section:

**Table 254: Data Chunk Fields**

| Field        | Description                                                                                                                                                                                                                                                  |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chunk Type   | Identifies the contents of the chunk value field. This is 1- byte long.                                                                                                                                                                                      |
| Chunk Flags  | Consists of 8 flag-bits whose definition varies with the chunk type. The default value is zero. This indicates that no application identifier is specified by the upper layer for the data.                                                                  |
| Chunk Length | Specifies the total length of the chunk in bytes. This field is 2 - bytes long. If the chunk does not form a multiple of 4 bytes (that is, the length is not a multiple of 4) it is implicitly padded with zeros which are not included in the chunk length. |

Table 254: Data Chunk Fields (*continued*)

| Field       | Description                   |
|-------------|-------------------------------|
| Chunk Value | A general purpose data field. |

**NOTE:** The resource manager (RM) allows 8 source IP addresses and 8 destination IP addresses during an SCTP communication.

## SCTP Configuration Overview

You must configure at least one SCTP profile to enable the security device to perform stateful inspection on all SCTP traffic. The stateful inspection of SCTP traffic will drop some anomalous SCTP packets.

The SCTP firewall supports deeper inspection of the profiles:

- Packet filtering—The profile configuration of drop packets for special SCTP payload protocol and M3UA service enables packet filtering.
- Limit-rate—Controls the M3UA and SCCP packets rate per association.

The SCTP deeper inspection requires the following settings:

- Creating a SCTP profile
- Configuring the filtering and limit parameters
- Binding the SCTP profile to a policy

## Example: Configuring a GPRS SCTP Profile for Policy-Based Inspection to Reduce Security Risks

In the GPRS architecture, the fundamental cause of security threats to an operator's network is the inherent lack of security in the GPRS tunneling protocol (GTP). This example shows how to configure a GPRS SCTP profile for policy-based inspection to reduce the GTP's security risks.

- [Requirements on page 2301](#)
- [Overview on page 2301](#)
- [Configuration on page 2301](#)
- [Verification on page 2302](#)

### Requirements

Before you begin, understand the GPRS SCTP hierarchy and its options.

### Overview

In this example, you configure a GPRS SCTP profile by setting the limit rate parameter and the payload protocol parameter for SCTP inspection. If your policy includes the **nat-only** option, the payload IP addresses are translated, but they are not inspected.

**NOTE:** The SCTP commands can be applied only to the policy configured with an SCTP profile.

If you remove the SCTP profile from the policy, the packets are forwarded without any inspection, and the IP address list in the packet payload will not be translated, even if the related static NAT is configured.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security gprs sctp profile roam2att limit rate address 10.1.1.0 sctp 100
set security gprs sctp profile roam2att limit rate address 10.1.1.0 ssp 10
set security gprs sctp profile roam2att limit rate address 10.1.1.0 sst 50
set security gprs sctp profile roam2att drop payload-protocol all
set security gprs sctp profile roam2att permit payload-protocol dua
```

#### Step-by-Step Procedure

To configure a GPRS SCTP profile:

1. Configure the limit rate parameter.

**NOTE:** The limit rate is per association.

```
[edit security gprs sctp profile roam2att]
user@host# set limit rate address 10.1.1.0 sccp 100
user@host# set limit rate address 10.1.1.0 ssp 10
user@host# set limit rate address 10.1.1.0 sst 50
```

2. Configure the payload protocol to drop all SCTP payload messages.

```
[edit security gprs sctp profile roam2att]
user@host# set drop payload-protocol all
```

3. Configure the payload protocol to allow certain SCTP payload messages.

```
[edit security gprs sctp profile roam2att]
user@host# set permit payload-protocol dua
```

**Results** From configuration mode, confirm your configuration by entering the **show security gprs** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show security gprs
sctp {
 profile roam2att {
 drop {
 payload-protocol all;
 }
 permit {
 payload-protocol dua;
 }
 limit {
 rate {
 address 10.1.1.0 {
 sccp 100;
 ssp 10;
 sst 50;
 }
 }
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying SCTP Profile Configuration

**Purpose** Verify the SCTP profile configuration.

**Action** From configuration mode, enter the **show configuration security gprs sctp profile roam2att** command.

```
user@host> show configuration security gprs sctp profile roam2att
drop {
 payload-protocol all;
}
permit {
 payload-protocol dua;
}
limit {
 rate {
 address 10.1.1.0 {
 sctp 100;
 ssp 10;
 sst 50;
 }
 }
}
```

**Meaning** The output displays information about the SCTP payload messages allowed and SCTP payload messages that are dropped. Verify the following information:

- Dropped SCTP payload messages
- Allowed SCTP payload messages

- [Example: Configuring a Security Policy to Permit or Deny SCTP Traffic on page 2303](#)

---

## Example: Configuring a Security Policy to Permit or Deny SCTP Traffic

This example shows how to configure a security policy to permit or deny SCTP traffic.

- [Requirements on page 2304](#)
- [Overview on page 2304](#)
- [Configuration on page 2305](#)
- [Verification on page 2307](#)

## Requirements

Before you begin:

- Create zones. See [“Example: Creating Security Zones” on page 1031](#).
- Configure an address book and create addresses for use in the policy. See [“Example: Configuring Address Books and Address Sets” on page 1056](#).
- Create an application (or application set) that indicates that the policy applies to traffic of that type. See [“Example: Configuring Applications and Application Sets” on page 1152](#).
- Configure a GPRS Sctp profile. See [“Example: Configuring a GPRS Sctp Profile for Policy-Based Inspection to Reduce Security Risks” on page 2301](#).

## Overview

The Sctp firewall implements a policy mechanism that is administratively used to determine the packets that can be passed or dropped. Policies can be configured for multiple addresses, address groups, or the entire zone.

**NOTE:** In situations where only a few ports are used for Sctp traffic, the Sctp associations are not evenly distributed to Services Processing Units (SPUs). This occurs in the following cases:

- Uneven hash results on the association ports pairs.
- The number of port pairs is less than, or not much greater than, the number of SPUs.

This configuration example shows how to:

- Deny Sctp traffic from the trust zone to the IP address 10.1.1.0/24 in the untrust zone.
- Permit Sctp traffic from an IP address 10.1.1.1/32 in the trust zone to the untrust zone with the Sctp configuration specified in the roam2att profile.

[Figure 111](#) shows the Sctp firewall implementation.

Figure 111: SCTP Firewall Implementation

903-4208

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security zones security-zone trust interfaces ge-0/0/2
set security zones security-zone untrust interfaces ge-0/0/1
```

```

set security policies from-zone trust to-zone untrust policy deny-all match source-address
any
set security policies policy from-zone trust to-zone untrust policy deny-all match
destination-address 10.1.1.0/24
set security policies policy from-zone trust to-zone untrust policy deny-all match
application junos-gprs-sctp
set security policies from-zone trust to-zone untrust policy deny-all then deny
set security policies from-zone trust to-zone untrust policy allow-att-roaming match
source-address 10.1.2.0/24
set security policies from-zone trust to-zone untrust policy allow-att-roaming match
destination-address any
set security policies policy from-zone trust to-zone untrust policy allow-att-roaming
match application junos-gprs-sctp
set security policies from-zone trust to-zone untrust policy allow-att-roaming then permit
application-services gprs-sctp-profile roam2att

```

### Step-by-Step Procedure

To configure a security policy to permit or deny SCTP traffic:

1. Configure the interfaces and security zones.  

```

[edit security zones]
user@host# set security-zone trust interfaces ge-0/0/2
user@host# set security-zone untrust interfaces ge-0/0/1

```
2. Create the security policy to permit traffic from the trust zone to the untrust zone.  

```

[edit security policies from-zone trust to-zone untrust]
user@host# set policy allow-att-roaming match source-address 10.1.2.0/24
user@host# set policy allow-att-roaming match destination-address any
user@host# set policy allow-att-roaming match application junos-gprs-sctp
user@host# set policy allow-att-roaming then permit application-services
gprs-sctp-profile roam2att

```
3. Create the security policy to deny traffic from the untrust zone to the trust zone.  

```

[edit security policies from-zone untrust to-zone trust]
user@host# set policy deny-all match source-address any
user@host# set policy deny-all match destination-address 10.1.1.0/24
user@host# set policy deny-all match application junos-gprs-sctp
user@host# set policy deny-all then deny

```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show security policies
from-zone trust to-zone untrust {
 policy deny-all {
 match {
 source-address any;
 destination-address 10.1.1.0/24;
 application junos-gprs-sctp;
 }
 then {
 deny;
 }
 }
}

```

```

}
policy allow-att-roaming {
 match {
 source-address 10.1.2.0/24;
 destination-address any;
 application junos-gprs-sctp;
 }
 then {
 permit {
 application-services {
 gprs-sctp-profile roam2att;
 }
 }
 }
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying SCTP Configuration

---

**Purpose** Verify the policy inspection configuration.

**Action** From operational mode, enter **show configuration |display set |match profile**

## apn

```
Syntax apn pattern-string {
 imsi-prefix imsi-prefix-digits {
 action {
 drop;
 pass;
 selection (ms|net|vrf);
 }
 }
 }
```

**Hierarchy Level** [edit security gprs gtp profile *profile-name*]

**Release Information** Statement introduced in Junos OS Release 10.0. Support for GTPv2 added in Junos OS Release 11.4. Option mcc-mnc replaced with imsi-prefix in Junos OS Release 12.1X44-D10.

**Description** Allow or deny access to specific access point names (APNs).

- Options**
- *pattern-string*—Set an APN suffix, such as “example.net.mcc123.mnc456.gprs”.
  - *imsi-prefix-digits*—Specify an IMSI prefix.
  - **drop**—Specify to deny GTP packets from all selection modes for the APN.
  - **pass**—Specify to permit GTP packets from all selection modes for the APN.
  - **selection**—Specify one of the following selection modes for the APN:
    - **ms**—The APN is provided by a Mobile Station (MS), and the user-subscription is not verified.
    - **net**—The APN is provided by a network, and the user-subscription is not verified.
    - **vrf**—The APN is provided by a network or an MS, and the user-subscription is verified.

**NOTE:** Because APN filtering is based on a perfect match, using the wildcard (\*) when setting an APN suffix can prevent the inadvertent exclusion of APNs you would otherwise authorize. The security device automatically denies all other APNs that do not match, if the action is pass. You can only use the wildcard as the first character in the APN string.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## delete-req

---

**Syntax**    delete-req {  
              alarm-threshold {  
                  forward *number*;  
                  reverse *number*;  
              }  
              drop-threshold {  
                  forward *number*;  
                  reverse *number*;  
              }  
          }

**Hierarchy Level**    [edit security gprs gtp profile *profile-name* path-rate-limit message-type]

**Release Information**    Statement introduced in Junos OS Release 12.1X45-D10.

**Description**    Limit the number of packets per second for GTP delete request.

**Options**    *number*—Limit messages in forward or reverse direction.

**Range:** 1 through 10,000

**Required Privilege Level**    security—To view this statement in the configuration.  
                                  security-control—To add this statement to the configuration.

```

**Hierarchy Level** [edit security gprs sctp profile *profile-name*]

**Release Information** Statement introduced in Junos OS Release 10.2. Support for the **payload-protocol** statement was modified in Junos OS Release 12.1X46-D10.

**Description** Display information about the configuration of the current Stream Control Transmission Protocol (SCTP) inspection.

- Options**
- **m3ua-services**—M3UA data service indicator. The following values are supported:
    - **isup**—ISDN Upper Part.
    - **sccp**—Signaling Connection Control Part.
    - **tup**—Telephone User Part.
  - **payload-protocol**—SCTP payload protocol identifier. The following values are supported.

- **id**—Specify payload protocol ID.
- **all**—All SCTP payload protocol identifiers (id:0~63).
- **asap**—Aggregate Server Access Protocol.
- **bicc**—Bearer Independent Call Control.
- **ddp-segment**—Direct Data Placement Segment chunk.
- **ddp-stream**—Direct Data Placement Stream session control.
- **diameter-dtls**—Diameter in a DTLS/SCTP DATA chunk.
- **diameter-sctp**—Diameter in a SCTP DATA chunk.
- **dua**—DPNSS/DASS 2 extensions to IUA Protocol.
- **enrp**—Endpoint Handlespace Redundancy Protocol.
- **h248**—H.248 Protocol.
- **h323**—H.323 Protocol.
- **iua**—ISDN User Adaptation Layer.
- **m2pa**—MTP2 User Peer-to-Peer Adaption Layer.
- **m2ua**—MTP2 User Adaption Layer.
- **m3ua**—MTP3 User Adaption Layer.
- **qipc**—Q.IPC.
- **reserved**—Reserved by SCTP.
- **slap**—S1 Application Protocol (SIAP).
- **simco**—Simple Middlebox Configuration.
- **sua**—SCCP User Adaption Layer.
- **tali**—Transport Adapter Layer Interface.
- **v5ua**—v5.2 User Adaption Layer.
- **x2ap**—X2 Application Protocol (X2AP).

**Hierarchy Level** [edit security gprs]

**Release Information** Statement introduced in Junos OS Release 10.0. The **restart-path** option added in Junos OS Release 11.4. New GTP message types added in Junos OS Release 11.4. Support for GTPv2 added in Junos OS Release 11.4.

**Description** Use the GTP commands to enable the GTP service, configure GTP objects, set traceoptions, remove GTP inspection object configurations, and obtain configuration information.

A Juniper Networks security device provides firewall protection for the following types of GPRS interfaces:

- Gn—The Gn interface is the connection between a Serving GPRS Support Node (SGSN) and a Gateway GPRS Support Node (GGSN) within the same Public Land Mobile Network (PLMN).
- Gp—The Gp interface is the connection between two PLMNs.
- Gi—The Gi interface is the connection between a GGSN and the Internet or destination networks connected to a PLMN.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

---

## **gtp-in-gtp-denied**

---

**Syntax** gtp-in-gtp-denied;

**Hierarchy Level** [edit security gprs gtp profile *profile-name*]

**Release Information** Statement introduced in Junos OS Release 11.4.

**Description** Select this option to enable the security device to detect and drop a GTP packet that contains another GTP packet in its message body.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## log (Security GTP)

**Syntax**    log {  
               forwarded (basic | detail);  
               prohibited (basic | detail);  
               rate-limited {  
                   (basic | detail);  
                   frequency-number *number*;  
               }  
               state-invalid (basic | detail);  
           }

**Hierarchy Level**    [edit security gprs gtp profile *profile-name*]

**Release Information**    Statement introduced in Junos OS Release 10.0. Support for GTPv2 added in Junos OS Release 11.4.

**Description**    Configure GTP logs to be viewed from the console or syslog.

**NOTE:** By default, all logs are disabled on the device.

- Options**
- **forwarded**—A packet that the security device transmitted because it was valid.
  - **prohibited**—A packet that the security device dropped because it was invalid.
  - **rate-limited**—A packet that the security device dropped because it exceeded the maximum rate limit of the destination GSN.
    - **frequency-number *number***—Logging frequency over threshold set by rate-limit (2–500).
  - **state-invalid**—A packet that the security device dropped because it failed stateful inspection.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    security—To view this statement in the configuration.  
                                       security-control—To add this statement to the configuration.

**Hierarchy Level** [edit security gprs sctp]

**Release Information** Statement introduced in Junos OS Release 10.2. Support for the **nat-only** option added in Junos OS Release 12.1X45-D10. Support for the **permit** option is added in Junos OS Release 12.1X46-D10.

**Description** Create a profile of the Stream Control Transmission Protocol (SCTP) feature. This profile includes all subsequent configuration options.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

- [Security Configuration Statement Hierarchy on page 595](#)

## rate-limit (Security GTP)

**Syntax** rate-limit *value*;

**Hierarchy Level** [edit security gprs gtp profile *profile-name*]

**Release Information** Statement introduced in Junos OS Release 10.0. Support for GTPv2 added in Junos OS Release 11.4.

**Description** Set the limit rate of control traffic to any GSN defined in a GTP profile.

**Options** **Range:** 1 through 80,000 messages per second.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

| <b>Hierarchy Level</b>     | [edit security gprs gtp]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Release Information</b> | Statement introduced in Junos OS Release 10.0. Support for GTPv2 added in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>         | Enable the device to identify and log the contents of GTP-U or GTP-C messages based on IMSI prefixes or Mobile Station-Integrated Services Data Network (MS-ISDN) identification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <ul style="list-style-type: none"> <li>• <b>file</b>—Configure the trace file options. <ul style="list-style-type: none"> <li>• <b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>. By default, the name of the file is the name of the process being traced.</li> <li>• <b>files number</b>—Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed to <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.</li> </ul> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p>Range: 2 through 1000 files</p> <p>Default: 10 files</p> </li> <li>• <b>match regular-expression</b>—Refine the output to include lines that contain the regular expression.</li> <li>• <b>size maximum-file-size</b>—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When the <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</li> </ul> <p>If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option and a filename.</p> |

Syntax: **x K** to specify KB, **x m** to specify MB, or **x g** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag**—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.
  - **all**—Trace everything.
  - **chassis-cluster**—Trace chassis cluster events.
  - **configuration**—Trace configuration events.
  - **flow**—Trace flow events.
  - **parser**—Trace parser events.
- **no-remote-trace**—Set remote tracing as disabled.

| <b>Release Information</b> | Statement introduced in Junos OS Release 10.2. The flag statement <b>detail</b> introduced in Junos OS Release 12.1X45-D10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>         | Set the trace options for Stream Control Transmission Protocol (SCTP).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b>file</b>—Configure the trace file options.</p> <p><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. By default, the name of the file is the name of the process being traced.</p> <p><b>files number</b>—Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed to <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000 files.</p> <p><b>Default:</b> 10 files.</p> <p><b>match regular-expression</b>—Refine the output to include lines that contain the regular expression.</p> <p><b>size maximum-file-size</b>—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When the <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option and a filename.</p> <p>Syntax: <b>x K</b> to specify KB, <b>x m</b> to specify MB, or <b>x g</b> to specify GB</p> <p><b>Range:</b> 10 KB through 1 GB.</p> <p><b>Default:</b> 128 KB.</p> |

**world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

**flag**—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.

- **all**—Trace everything.
- **chassis-cluster**—Trace chassis cluster events.
- **configuration**—Trace configuration events.
- **detail**—Trace information used for debugging.
- **flow**—Trace flow events.
- **parser**—Trace parser events.

**no-remote-trace**—Set remote tracing as disabled.

**Required Privilege Level**    **trace**—To view this statement in the configuration.  
                                  **trace-control**—To add this statement to the configuration.

---

## u-tunnel-validated (GTP)

---

**Syntax**    u-tunnel-validated;

**Hierarchy Level**    [edit security gprs gtp profile *profile-name*]

**Release Information**    Statement introduced in Junos OS Release 12.1X45-D10.

**Description**    Specify the validated GTP-U tunnel.

**Required Privilege Level**    **security**—To view this statement in the configuration.  
                                  **security-control**—To add this statement to the configuration.

**Related Documentation**    • [Security Configuration Statement Hierarchy on page 595](#)

## version (Security GTP)

## CHAPTER 106

# Operational Commands

- clear gtp tunnels
- clear security gprs gtp counters
- clear security gprs sctp association
- clear security gprs sctp counters
- show gtp tunnels
- show security gprs gtp counters
- show security gprs gtp counters path-rate-limit
- show security gprs gtp gsn statistics
- show security gprs sctp association
- show security gprs sctp counters

## clear gtp tunnels

---

## Sample Output

### clear security gprs gtp counters all

```
user@host> clear security gprs gtp counters all
All GTP counters have been cleared
```

### clear security gprs gtp counters error

```
user@host> clear security gprs gtp counters error
GTP error counter has been cleared
```

#### clear security gprs gtp counters ha

```
user@host> clear security gprs gtp counters ha
GTP HA counter has been cleared
```

#### clear security gprs gtp counters message v0-create-aa-pdp-req

```
user@host> clear security gprs gtp counters message v0-create-aa-pdp-req
GTPv0 create AA PDP request message counter has been cleared
```

#### clear security gprs gtp counters packet

```
user@host> clear security gprs gtp counters packet
GTP packet counter has been cleared
```

#### clear security gprs gtp counters request

```
user@host> clear security gprs gtp counters request
GTP request counter has been cleared
```

#### clear security gprs gtp counters tunnel

```
user@host> clear security gprs gtp counters tunnel
GTP tunnel counter has been cleared
```

#### clear security gprs gtp counters path-rate-limit

```
user@host> clear security gprs gtp counters path-rate-limit
GTP path-rate-limit counter has been cleared
```

## clear security gprs sctp association

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Understanding Interfaces

---

Interfaces act as a doorway through which traffic enters and exits a device. Juniper Networks devices support a variety of interface types:

- Network interfaces—Networking interfaces primarily provide traffic connectivity.
- Services interfaces—Services interfaces manipulate traffic before it is delivered to its destination.
- Special interfaces—Special interfaces include management interfaces, the loopback interface, and the discard interface.

Each type of interface uses a particular medium to transmit data. The physical wires and Data Link Layer protocols used by a medium determine how traffic is sent. To configure and monitor interfaces, you need to understand their media characteristics, as well as physical and logical properties such as IP addressing, link-layer protocols, and link encapsulation.

**NOTE:** Most interfaces are configurable, but some internally generated interfaces are not configurable.

## Network Interfaces

All Juniper Networks devices use network interfaces to make physical connections to other devices. A connection takes place along media-specific physical wires through an I/O card (IOC) in the SRX Series Services Gateway. Networking interfaces primarily provide traffic connectivity.

You must configure each network interface before it can operate on the device. Configuring an interface can define both the physical properties of the link and the logical properties of a logical interface on the link.

[Table 259](#) describes network interfaces that are available on SRX Series devices.

**Table 259: Network Interfaces**

| Interface Name | Description                                                                                                                                                      |

## Services Interfaces

Services interfaces provide specific capabilities for manipulating traffic before it is delivered to its destination. On Juniper Networks M Series and T Series routing platforms, individual services such as IP-over-IP encapsulation, link services such as multilink protocols, adaptive services such as stateful firewall filters and NAT, and sampling and logging capabilities are implemented by services Physical Interface Cards (PICs). On SRX Series devices, services processing is handled by the Services Processing Card (SPC).

Although the same Junos OS image supports the services features across all routing platforms, on SRX Series devices, services interfaces are not associated with a physical interface. To configure services on these devices, you configure one or more internal interfaces by specifying slot **0**, interface carrier **0**, and port **0**—for example, **gr-0/0/0** for GRE.

[Table 260](#) describes services interfaces that you can configure on SRX Series Services Gateways.

**Table 260: Configurable Services Interfaces**

| Interface Name  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>gr-0/0/0</b> | <p>Configurable generic routing encapsulation (GRE) interface. GRE allows the encapsulation of one routing protocol inside another routing protocol.</p> <p>Packets are routed to this internal interface, where they are first encapsulated with a GRE packet and then sent.</p> <p>You can create multiple instances of this interface for forwarding encapsulated data to multiple destination addresses by using the default interface as the parent and creating extensions, for example, gr-0/0/0.1, gr-0/0/0.2, and so on.</p> <p>The GRE interface is an internal interface only and is not associated with a physical interface. It is used only for processing GRE traffic. See the <a href="#">Junos OS Services Interfaces Library for Routing Devices</a> for information about tunnel services.</p>                                                                                                                                         |
| <b>ip-0/0/0</b> | <p>Configurable IP-over-IP encapsulation (IP-IP tunnel) interface. IP tunneling allows the encapsulation of one IP packet inside another IP packet.</p> <p>With IP routing, you can route IP packets directly to a particular address or route the IP packets to an internal interface where they are encapsulated inside an IP-IP tunnel and forwarded to the encapsulating packet's destination address.</p> <p>You can create multiple instances of this interface for forwarding IP-IP tunnel data to multiple destination addresses by using the default interface as the parent and creating extensions, for example, ip-0/0/0.1, ip-0/0/0.2, and so on.</p> <p>The IP-IP interface is an internal interface only and is not associated with a physical interface. It is used only for processing IP-IP tunnel traffic. See the <a href="#">Junos OS Services Interfaces Library for Routing Devices</a> for information about tunnel services.</p> |
| <b>lt-0/0/0</b> | <p>Configurable logical tunnel interface that interconnects logical systems on SRX Series devices. See the <i>Logical Systems Feature Guide for Security Devices</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>pp0</b>      | <p>Configurable PPPoE encapsulation interface. PPP packets being routed in an Ethernet network use PPPoE encapsulation.</p> <p>Packets are routed to this internal interface for PPPoE encapsulation. The PPPoE encapsulation interface is an internal interface only and is not associated with a physical interface. You must configure the interface for it to forward PPPoE traffic.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 260: Configurable Services Interfaces (*continued*)

| Interface Name | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ppd0</b>    | <p>Protocol Independent Multicast (PIM) de-encapsulation interface. In PIM sparse mode, the first-hop routing platform encapsulates packets destined for the rendezvous point device. The packets are encapsulated with a unicast header and are forwarded through a unicast tunnel to the rendezvous point. The rendezvous point then de-encapsulates the packets and transmits them through its multicast tree.</p> <p>Within a device, packets are routed to this internal interface for de-encapsulation. The PIM de-encapsulation interface is an internal interface only and is not associated with a physical interface. You must configure PIM with the <b>[edit protocol pim]</b> hierarchy to perform PIM de-encapsulation.</p> <p>Use the <b>show pim interfaces</b> command to check the status of ppd0 interface.</p> |
| <b>ppe0</b>    | <p>Protocol Independent Multicast (PIM) encapsulation interface. In PIM sparse mode, the first-hop routing platform encapsulates packets destined for the rendezvous point device. The packets are encapsulated with a unicast header and are forwarded through a unicast tunnel to the rendezvous point. The rendezvous point then de-encapsulates the packets and transmits them through its multicast tree.</p> <p>Within a device, packets are routed to this internal interface for encapsulation. The PIM encapsulation interface is an internal interface only and is not associated with a physical interface. You must configure PIM with the <b>[edit protocol pim]</b> hierarchy to perform PIM encapsulation.</p>                                                                                                      |
| <b>st0</b>     | Secure tunnel interface used for IPSec VPNs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

[Table 261](#) describes non-configurable services interfaces for SRX Series Services Gateways.

Table 261: Non-Configurable Services Interfaces

| Interface Name    | Description                                                                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>gre</b>        | Internally generated Generic Routing Encapsulation (GRE) interface created by Junos OS to handle GRE traffic. It is not a configurable interface.                                                                       |
| <b>ipip</b>       | Internally generated IP-over-IP interface created by Junos OS to handle IP tunnel traffic. It is not a configurable interface.                                                                                          |
| <b>lsi</b>        | Internally generated link services interface created by Junos OS to handle multilink services like MLPPP, MLFR, and CRTP. It is not a configurable interface.                                                           |
| <b>pc-pim/0/0</b> | Internally configured interface used by the system as a control path between the WXC Integrated Services Module and the Routing Engine. It is not a configurable interface. See the <a href="#">WX and WXC Series</a> . |
| <b>pimd</b>       | Internally generated Protocol Independent Multicast (PIM) de-encapsulation interface created by Junos OS to handle PIM de-encapsulation. It is not a configurable interface.                                            |
| <b>pime</b>       | Internally generated Protocol Independent Multicast (PIM) encapsulation interface created by Junos OS to handle PIM encapsulation. It is not a configurable interface.                                                  |

Table 261: Non-Configurable Services Interfaces (*continued*)

| Interface Name               | Description                                                                                                                                                                                                                                                                                        |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tap</b>                   | Internally generated interface created by Junos OS to monitor and record traffic during passive monitoring. Packets discarded by the Packet Forwarding Engine are placed on this interface. It is not a configurable interface.                                                                    |

## Special Interfaces

Special interfaces include management interfaces, which are primarily intended for accessing the device remotely, the loopback interface, which has several uses depending on the particular Junos OS feature being configured, and the discard interface.

[Table 262](#) describes special interfaces for SRX Series Services Gateways.

Table 262: Special Interfaces

| Interface Name               | Description                                                                                                                                                                                                                      |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>fxp0, fxp1</b>            | On SRX Series devices, the fxp0 management interface is a dedicated port located on the Routing Engine.                                                                                                                          |
| <b>lo0</b>                   | Loopback address. The loopback address has several uses, depending on the particular Junos feature being configured.                                                                                                             |
| <b>dsc</b>                   | Discard interface.                                                                                                                                                                                                               |
| <b>Related Documentation</b> | <ul style="list-style-type: none"> <li>• <a href="#">Understanding Interfaces on page 2407</a></li> <li>• <a href="#">Network Interfaces on page 2408</a></li> <li>• <a href="#">Services Interfaces on page 2408</a></li> </ul> |

## Interface Naming Conventions

Each device interface has a unique name that follows a naming convention. If you are familiar with Juniper Networks M Series and T Series routing platforms, be aware that device interface names are similar to but not identical to the interface names on those routing platforms.

The unique name of each network interface identifies its type and location and indicates whether it is a physical interface or an optional logical unit created on a physical interface.

- The name of each network interface has the following format to identify the physical device that corresponds to a single physical network connector:

*type-slot/pim-or-ioc/port*

- Network interfaces that are fractionalized into time slots include a channel number in the name, preceded by a colon (:):

*type-slot/pim-or-ioc/port:channel*

- Each logical interface has an additional logical unit identifier, preceded by a period (.):

*type-slot/pim-or-ioc/port:<channel>.unit*

The parts of an interface name are summarized in [Table 263](#).

**Table 263: Network Interface Names**

| Name Part         | Meaning                                                              | Possible Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>type</i>       | Type of network medium that can connect to this interface.           | ae, at, ei, e3, fe, fxp0, fxp1, ge, lo0, lsq, lt, ppo, pt, sto, t1, t3, xe, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>slot</i>       | Number of the chassis slot in which a PIM or IOC is installed.       | <p>SRX5600 and SRX5800 devices: The slot number begins at <b>0</b> and increases as follows from left to right, bottom to top:</p> <ul style="list-style-type: none"> <li>• SRX5600 device—Slots 0 to 5</li> <li>• SRX5800 device—Slots 0 to 5, 7 to 11</li> </ul> <p>SRX3400 and SRX3600 devices: The Switch Fabric Board (SFB) is always <b>0</b>. Slot numbers increase as follows from top to bottom, left to right:</p> <ul style="list-style-type: none"> <li>• SRX3400 device—Slots 0 to 4</li> <li>• SRX3600 device—Slots 0 to 6</li> </ul> |
| <i>pim-or-ioc</i> | Number of the PIM or IOC on which the physical interface is located. | <p>SRX5600 and SRX5800 devices: For 40-port Gigabit Ethernet IOCs or 4-port 10-Gigabit Ethernet IOCs, this number can be <b>0, 1, 2, or 3</b>.</p> <p>SRX3400 and SRX3600 devices: This number is always <b>0</b>. Only one IOC can be installed in a slot.</p>                                                                                                                                                                                                                                                                                     |

Table 263: Network Interface Names (*continued*)

| Name Part      | Meaning                                                                              | Possible Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|--------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>port</i>    | Number of the port on a PIM or IOC on which the physical interface is located.       | <p>On SRX5600 and SRX5800 devices:</p> <ul style="list-style-type: none"> <li>For 40-port Gigabit Ethernet IOCs, this number begins at <b>0</b> and increases from left to right to a maximum of <b>9</b>.</li> <li>For 4-port 10-Gigabit Ethernet IOCs, this number is always <b>0</b>.</li> </ul> <p>On SRX3400 and SRX3600 devices:</p> <ul style="list-style-type: none"> <li>For the SFB built-in copper Gigabit Ethernet ports, this number begins at <b>0</b> and increases from top to bottom, left to right, to a maximum of <b>7</b>. For the SFB built-in fiber Gigabit Ethernet ports, this number begins at <b>8</b> and increases from left to right to a maximum of <b>11</b>.</li> <li>For 16-port Gigabit Ethernet IOCs, this number begins at <b>0</b> to a maximum of <b>15</b>.</li> <li>For 2-port 10-Gigabit Ethernet IOCs, this number is <b>0</b> or <b>1</b>.</li> </ul> <p>Port numbers appear on the PIM or IOC faceplate.</p> |
| <i>channel</i> | Number of the channel (time slot) on a fractional or channelized T1 or E1 interface. | <ul style="list-style-type: none"> <li>On an E1 interface, a value from <b>1</b> through <b>31</b>. The 1 time slot is reserved.</li> <li>On a T1 interface, a value from <b>1</b> through <b>24</b>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <i>unit</i>    | Number of the logical interface created on a physical interface.                     | <p>A value from <b>0</b> through <b>16384</b>.</p> <p>If no logical interface number is specified, unit <b>0</b> is the default, but must be explicitly configured.</p> <p>In addition to user configured interfaces, there are some logical interfaces that are created dynamically. Hence, for Junos OS, the maximum limit for configuring logical interfaces is 2,62,143 (user configured and dynamically created). Based on performance, for each platform, the maximum number of logical interfaces supported can vary.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Understanding the Data Link Layer

The Data Link Layer is Layer 2 in the Open Systems Interconnection (OSI) model. The Data Link Layer is responsible for transmitting data across a physical network link. Each physical medium has link-layer specifications for network and link-layer protocol characteristics such as physical addressing, network topology, error notification, frame sequencing, and flow control.

- [Physical Addressing on page 2414](#)
- [Network Topology on page 2414](#)
- [Error Notification on page 2414](#)
- [Frame Sequencing on page 2414](#)
- [Flow Control on page 2414](#)

- [Data Link Sublayers on page 2414](#)
- [MAC Addressing on page 2415](#)

## Physical Addressing

Physical addressing is different from network addressing. Network addresses differentiate between nodes or devices in a network, allowing traffic to be routed or switched through the network. In contrast, physical addressing identifies devices at the link-layer level, differentiating between individual devices on the same physical medium. The primary form of physical addressing is the media access control (MAC) address.

## Network Topology

Network topology specifications identify how devices are linked in a network. Some media allow devices to be connected by a bus topology, while others require a ring topology. The bus topology is used by Ethernet technologies, which are supported on Juniper Networks devices.

## Error Notification

The Data Link Layer provides error notifications that alert higher layer protocols that an error has occurred on the physical link. Examples of link-level errors include the loss of a signal, the loss of a clocking signal across serial connections, or the loss of the remote endpoint on a T1 or T3 link.

## Frame Sequencing

The frame sequencing capabilities of the Data Link Layer allow frames that are transmitted out of sequence to be reordered on the receiving end of a transmission. The integrity of the packet can then be verified by means of the bits in the Layer 2 header, which is transmitted along with the data payload.

## Flow Control

Flow control within the Data Link Layer allows receiving devices on a link to detect congestion and notify their upstream and downstream neighbors. The neighbor devices relay the congestion information to their higher layer protocols so that the flow of traffic can be altered or rerouted.

## Data Link Sublayers

The Data Link Layer is divided into two sublayers: logical link control (LLC) and media access control (MAC). The LLC sublayer manages communications between devices over a single link of a network. This sublayer supports fields in link-layer frames that enable multiple higher layer protocols to share a single physical link.

The MAC sublayer governs protocol access to the physical network medium. Through the MAC addresses that are typically assigned to all ports on a device, multiple devices on the same physical link can uniquely identify one another at the Data Link Layer. MAC addresses are used in addition to the network addresses that are typically configured manually on ports within a network.

## MAC Addressing

A MAC address is the serial number permanently stored in a device adapter to uniquely identify the device. MAC addresses operate at the Data Link Layer, while IP addresses operate at the Network Layer. The IP address of a device can change as the device is moved around a network to different IP subnets, but the MAC address remains the same, because it is physically tied to the device.

Within an IP network, devices match each MAC address to its corresponding configured IP address by means of the Address Resolution Protocol (ARP). ARP maintains a table with a mapping for each MAC address in the network.

Most Layer 2 networks use one of three primary numbering spaces—MAC-48, EUI-48 (extended unique identifier), and EUI-64—which are all globally unique. MAC-48 and EUI-48 spaces each use 48-bit addresses, and EUI-64 spaces use a 64-bit addresses, but all three use the same numbering format. MAC-48 addresses identify network hardware, and EUI-48 addresses identify other devices and software.

The Ethernet and ATM technologies supported on devices use the MAC-48 address space. IPv6 uses the EUI-64 address space.

MAC-48 addresses are the most commonly used MAC addresses in most networks. These addresses are 12-digit hexadecimal numbers (48 bits in length) that typically appear in one of the following formats:

- **MM:MM:MM:SS:SS:SS**
- **MM-MM-MM-SS-SS-SS**

The first three octets (**MM:MM:MM** or **MM-MM-MM**) are the ID number of the hardware manufacturer. Manufacturer ID numbers are assigned by the Institute of Electrical and Electronics Engineers (IEEE). The last three octets (**SS:SS:SS** or **SS-SS-SS**) make up the serial number for the device, which is assigned by the manufacturer. For example, an Ethernet interface card might have a MAC address of **00:05:85:c1:a6:a0**.

## Monitoring Interfaces

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | View general information about all physical and logical interfaces for a device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Action</b>  | <p>Select <b>Monitor&gt;Interfaces</b> in the J-Web user interface. The J-Web Interfaces page displays the following details about each device interface:</p> <ul style="list-style-type: none"> <li>• Port—Indicates the interface name.</li> <li>• Admin Status—Indicates whether the interface is enabled (Up) or disabled (Down).</li> <li>• Link Status—Indicates whether the interface is linked (Up) or not linked (Down).</li> <li>• Address—Indicates the IP address of the interface.</li> <li>• Zone—Indicates whether the zone is an untrust zone or a trust zone.</li> </ul> |

- **Services**—Indicates services that are enabled on the device, such as HTTP and SSH.
- **Protocols**—Indicates protocols that are enabled on the device, such as BGP and IGMP.
- **Input Rate graph**—Displays interface bandwidth utilization. Input rates are shown in bytes per second.
- **Output Rate graph**—Displays interface bandwidth utilization. Output rates are shown in bytes per second.
- **Error Counters chart**—Displays input and output error counters in the form of a bar chart.
- **Packet Counters chart**—Displays the number of broadcast, unicast, and multicast packet counters in the form of a pie chart. (Packet counter charts are supported only for interfaces that support MAC statistics.)

To change the interface display, use the following options:

- **Port for FPC**—Controls the member for which information is displayed.
- **Start/Stop button**—Starts or stops monitoring the selected interfaces.
- **Show Graph**—Displays input and output packet counters and error counters in the form of charts.
- **Pop-up button**—Displays the interface graphs in a separate pop-up window.
- **Details**—Displays extensive statistics about the selected interface, including its general status, traffic information, IP address, I/O errors, class-of-service data, and statistics.
- **Refresh Interval**—Indicates the duration of time after which you want the data on the page to be refreshed.
- **Clear Statistics**—Clears the statistics for the selected interface.

Alternatively, you can enter the following **show** commands in the CLI to view interface status and traffic statistics:

- **show interfaces terse**

**NOTE:** On SRX Series devices, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

- **show interfaces detail**
- **show interfaces extensive**
- **show interfaces *interface-name***

## GRE Keepalive Time Overview

Generic routing encapsulation (GRE) tunnel interfaces do not have a built-in mechanism for detecting when a tunnel is down. You can enable keepalive messages to serve as the detection mechanism.

Keepalives can be configured on the physical or on the logical interface. If configured on the physical interface, keepalives are sent on all logical interfaces that are part of the physical interface. If configured on an individual logical interface, keepalives are only sent to that logical interface. In addition to configuring a keepalive, you must configure the hold time.

## Configuring GRE Keepalive Time

- [Configuring Keepalive Time and Hold time for a GRE Tunnel Interface on page 2417](#)
- [Display GRE Keepalive Time Configuration on page 2418](#)
- [Display Keepalive Time Information on a GRE Tunnel Interface on page 2418](#)

## Configuring Keepalive Time and Hold time for a GRE Tunnel Interface

You can configure the keepalives on a generic routing encapsulation (GRE) tunnel interface by including both the **keepalive-time** statement and the **hold-time** statement at the **[edit protocols oam gre-tunnel interface *interface-name*]** hierarchy level.

**NOTE:** For proper operation of keepalives on a GRE interface, you must also include the **family inet** statement at the **[edit interfaces *interface-name* unit *unit*]** hierarchy level. If you do not include this statement, the interface is marked as down.

To configure a GRE tunnel interface:

1. Configure the GRE tunnel interface at **[edit interfaces *interface-name* unit *unit-number*]** hierarchy level, where the interface name is gr-x/y/z, and the family is set as **inet**.

```
user@host# set interfaces interface-name unit unit-number family family-name
```

2. Configure the rest of the GRE tunnel interface options based on requirement.

To configure keepalive time for a GRE tunnel interface:

1. Configure the Operation, Administration, and Maintenance (OAM) protocol at the **[edit protocols]** hierarchy level for the GRE tunnel interface.

```
[edit]
user@host# edit protocols oam
```

2. Configure the GRE tunnel interface option for OAM protocol.

```
[edit protocols oam]
user@host# edit gre-tunnel interface interface-name
```

3. Configure the keepalive time from 1 through 50 seconds for the GRE tunnel interface.

```
[edit protocols oam gre-tunnel interface interface-name]
user@host# set keepalive-time seconds
```

4. Configure the hold time from 5 through 250 seconds. Note that the hold time must be at least twice the keepalive time.

```
[edit protocols oam gre-tunnel interface interface-name]
user@host# set hold-time seconds
```

## Display GRE Keepalive Time Configuration

**Purpose** Display the configured keepalive time value as 10 and hold time value as 30 on a GRE tunnel interface (for example, `gr-1/1/10.1`):

**Action** To display the configured values on the GRE tunnel interface, run the **show oam gre-tunnel** command at the **[edit protocols]** hierarchy level:

```
[edit protocols]
user@host# show oam gre-tunnel
 interface gr-1/1/10.1 {
 keepalive-time 10;
 hold-time 30;
 }
```

## Display Keepalive Time Information on a GRE Tunnel Interface

|                |                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | Display the current status information of a GRE tunnel interface when keepalive time and hold time parameters are configured on it and when the hold time expires. |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Action** To verify the current status information on a GRE tunnel interface (for example, gr-3/3/0.3), run the **show interfaces gr-3/3/0.3 terse** and **show interfaces gr-3/3/0.3 extensive** operational commands.

```
show interfaces gr-3/3/0.3 terse
```

```
user@host> show interfaces gr-3/3/0.3 terse
```

| Interface  | Admin | Link | Proto        | Local        | Remote |
|------------|-------|------|--------------|--------------|--------|
| gr-3/3/0.3 | up    | up   | inet<br>mpls | 200.1.3.1/24 |        |

```
show interfaces gr-3/3/0.3 extensive
```

```

user@host> show interfaces gr-3/3/0.3 extensive
Logical interface gr-3/3/0.3 (Index 73) (SNMP ifIndex 594) (Generation 900)
 Flags: Point-To-Point SNMP-Traps 0x4000 IP-Header
10.1.19.11:10.1.19.12:47:df:64:0000000000000000 Encapsulation: GRE-NULL
 Gre keepalives configured: On, Gre keepalives adjacency state: down
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Transit statistics:
Input bytes : 307406 0 bps
Output bytes : 290914 0 bps
Input packets: 4923 0 pps
Output packets: 4709 0 pps
Protocol inet, MTU: 1476, Generation: 1564, Route table: 0
Flags: Sendbroadcast-pkt-to-re
Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
Destination: 200.1.3/24, Local: 200.1.3.1, Broadcast: 200.1.3.255,
Generation: 1366
Protocol mpls, MTU: 1464, Maximum labels: 3, Generation: 1565, Route table:
0

```

**NOTE:**

When the hold time expires:

- The GRE tunnel will stay up even though the interface cannot send or receive traffic.
- The Link status will be Up and the Gre keepalives adjacency state will be Down.

**Meaning** The current status information of a GRE tunnel interface with keepalive time and hold time parameters is displayed as expected when the hold time expires.

## Understanding Interface Logical Properties

---

The logical properties of an interface are the characteristics that do not apply to the physical interface or the wires connected to it. Logical properties include:

- Protocol families running on the interface (including any protocol-specific MTUs)
- IP address or addresses associated with the interface. A logical interface can be configured with an IPv6 address, IPv4 address, or both. The IP specification requires a unique address on every interface of each system attached to an IP network, so that traffic can be correctly routed. Individual hosts such as home computers must have a single IP address assigned. Devices must have a unique IP address for every interface.
- Virtual LAN (VLAN) tagging
- Any firewall filters or routing policies that are operating on the interface

## Understanding Protocol Families

---

A protocol family is a group of logical properties within an interface configuration. Protocol families include all the protocols that make up a protocol suite. To use a protocol within a particular suite, you must configure the entire protocol family as a logical property for an interface. The protocol families include common and not-so-common protocol suites.

This topic contains the following sections:

- [Common Protocol Suites on page 2422](#)
- [Other Protocol Suites on page 2422](#)

### Common Protocol Suites

Junos OS protocol families include the following common protocol suites:

- **Inet**—Supports IP protocol traffic, including OSPF, BGP, and Internet Control Message Protocol (ICMP).
- **Inet6**—Supports IPv6 protocol traffic, including RIP for IPv6 (RIPng), IS-IS, and BGP.
- **ISO**—Supports IS-IS traffic.
- **MPLS**—Supports MPLS.

**NOTE:** Junos OS security features are flow-based—meaning the device sets up a flow to examine the traffic. Flow-based processing is not supported for ISO or MPLS protocol families.

### Other Protocol Suites

In addition to the common protocol suites, Junos protocol families sometimes use the following protocol suites:

- **ccc**—Circuit cross-connect (CCC).
- **mlfr-uni-nni**—Multilink Frame Relay (MLFR) FRF.16 user-to-network network-to-network (UNI NNI).
- **mlfr-end-to-end**—Multilink Frame Relay end-to-end.
- **mlppp**—Multilink Point-to-Point Protocol.
- **tcc**—Translational cross-connect (TCC).
- **tnp**—Trivial Network Protocol. This Juniper Networks proprietary protocol provides communication between the Routing Engine and the device's packet forwarding components. Junos OS automatically configures this protocol family on the device's internal interfaces only.

## Understanding IPv4 Addressing

IPv4 addresses are 32-bit numbers that are typically displayed in dotted decimal notation. A 32-bit address contains two primary parts: the network prefix and the host number.

All hosts within a single network share the same network address. Each host also has an address that uniquely identifies it. Depending on the scope of the network and the type of device, the address is either globally or locally unique. Devices that are visible to users outside the network (webservers, for example) must have a globally unique IP address. Devices that are visible only within the network must have locally unique IP addresses.

IP addresses are assigned by a central numbering authority called the Internet Assigned Numbers Authority (IANA). IANA ensures that addresses are globally unique where needed and has a large address space reserved for use by devices not visible outside their own networks.

This topic contains the following sections:

- [IPv4 Classful Addressing on page 2423](#)
- [IPv4 Dotted Decimal Notation on page 2424](#)
- [IPv4 Subnetting on page 2424](#)
- [IPv4 Variable-Length Subnet Masks on page 2425](#)

### IPv4 Classful Addressing

To provide flexibility in the number of addresses distributed to networks of different sizes, 4-octet (32-bit) IP addresses were originally divided into three different categories or classes: class A, class B, and class C. Each address class specifies a different number of bits for its network prefix and host number:

- Class A addresses use only the first byte (octet) to specify the network prefix, leaving 3 bytes to define individual host numbers.
- Class B addresses use the first 2 bytes to specify the network prefix, leaving 2 bytes to define host addresses.
- Class C addresses use the first 3 bytes to specify the network prefix, leaving only the last byte to identify hosts.

In binary format, with an x representing each bit in the host number, the three address classes can be represented as follows:

```
00000000 xxxxxxxx xxxxxxxx xxxxxxxx (Class A)
00000000 00000000 xxxxxxxx xxxxxxxx (Class B)
00000000 00000000 00000000 xxxxxxxx (Class C)
```

Because each bit (x) in a host number can have a 0 or 1 value, each represents a power of 2. For example, if only 3 bits are available for specifying the host number, only the following host numbers are possible:

```
111 110 101 100 011 010 001 000
```

In each IP address class, the number of host-number bits raised to the power of 2 indicates how many host numbers can be created for a particular network prefix. Class A addresses have  $2^{24}$  (or 16,777,216) possible host numbers, class B addresses have  $2^{16}$  (or 65,536) host numbers, and class C addresses have  $2^8$  (or 256) possible host numbers.

## IPv4 Dotted Decimal Notation

The 32-bit IPv4 addresses are most often expressed in dotted decimal notation, in which each octet (or byte) is treated as a separate number. Within an octet, the rightmost bit represents  $2^0$  (or 1), increasing to the left until the first bit in the octet is  $2^7$  (or 128).

Following are IP addresses in binary format and their dotted decimal equivalents:

```
11010000 01100010 11000000 10101010 = 208.98.192.170
01110110 00001111 11110000 01010101 = 118.15.240.85
00110011 11001100 00111100 00111011 = 51.204.60.59
```

## IPv4 Subnetting

Because of the physical and architectural limitations on the size of networks, you often must break large networks into smaller subnetworks. Within a network, each wire or ring requires its own network number and identifying subnet address.

Figure 112 shows two subnets in a network.

**Figure 112: Subnets in a Network**

Figure 112 shows three devices connected to one subnet and three more devices connected to a second subnet. Collectively, the six devices and two subnets make up the larger network. In this example, the network is assigned the network prefix **192.14.0.0**, a class B address. Each device has an IP address that falls within this network prefix.

In addition to sharing a network prefix (the first two octets), the devices on each subnet share a third octet. The third octet identifies the subnet. All devices on a subnet must have the same subnet address. In this case, the alpha subnet has the IP address **192.14.126.0** and the beta subnet has the IP address **192.14.17.0**.

The subnet address **192.14.17.0** can be represented as follows in binary notation:

11000000 . 00001110 . 00010001 . xxxxxxxx

Because the first 24 bits in the 32-bit address identify the subnet, the last 8 bits are not significant. To indicate the subnet, the address is written as **192.14.17.0/24** (or just **192.14.17/24**). The **/24** is the subnet mask (sometimes shown as **255.255.255.0**).

## IPv4 Variable-Length Subnet Masks

Traditionally, subnets were divided by address class. Subnets had either 8, 16, or 24 significant bits, corresponding to  $2^8$ ,  $2^{16}$ , or  $2^{24}$  possible hosts. As a result, an entire /16 subnet had to be allocated for a network that required only 400 addresses, wasting 65,136 ( $2^{16} - 400 = 65,136$ ) addresses.

To help allocate address spaces more efficiently, variable-length subnet masks (VLSMs) were introduced. Using VLSM, network architects can allocate more precisely the number of addresses required for a particular subnet.

For example, suppose a network with the prefix **192.14.17/24** is divided into two smaller subnets, one consisting of 18 devices and the other of 46 devices.

To accommodate 18 devices, the first subnet must have  $2^5$  (32) host numbers. Having 5 bits assigned to the host number leaves 27 bits of the 32-bit address for the subnet. The IP address of the first subnet is therefore **192.14.17.128/27**, or the following in binary notation:

11000000 . 00001110 . 00010001 . 100xxxxx

The subnet mask includes 27 significant digits.

To create the second subnet of 46 devices, the network must accommodate  $2^6$  (64) host numbers. The IP address of the second subnet is **192.14.17.64/26**, or

11000000 . 00001110 . 00010001 . 01xxxxxx

By assigning address bits within the larger **/24** subnet mask, you create two smaller subnets that use the allocated address space more efficiently.

## Understanding IPv6 Address Space, Addressing, Address Format, and Address Types

### Understanding IP Version 6 (IPv6)

The ongoing expansive growth of the Internet and the need to provide IP addresses to accommodate it—to support increasing numbers of new users, computer networks, Internet-enabled devices, and new and improved applications for collaboration and communication—is escalating the emergent use of a new IP protocol. IPv6, with its robust architecture, was designed to satisfy these current and anticipated near future requirements.

IP version 4 (IPv4) is widely used throughout the world today for the Internet, intranets, and private networks. IPv6 builds upon the functionality and structure of IPv4 in the following ways:

- Provides a simplified and enhanced packet header to allow for more efficient routing.
- Improves support for mobile phones and other mobile computing devices.
- Enforces increased, mandatory data security through IPsec (which was originally designed for it).
- Provides more extensive quality-of-service (QoS) support.

IPv6 addresses consist of 128 bits, instead of 32 bits, and include a scope field that identifies the type of application suitable for the address. IPv6 does not support broadcast addresses, but instead uses multicast addresses for broadcast. In addition, IPv6 defines a new type of address called anycast.

## Understanding IPv6 Address Types and How Junos OS for SRX Series Services Gateway Uses Them

IP version 6 (IPv6) includes the following types of addresses:

- Unicast

A unicast address specifies an identifier for a single interface to which packets are delivered. Under IPv6, the vast majority of Internet traffic is foreseen to be unicast, and it is for this reason that the largest assigned block of the IPv6 address space is dedicated to unicast addressing. Unicast addresses include all addresses other than loopback, multicast, link-local-unicast, and unspecified.

For SRX Series devices, the flow module supports the following kinds of IPv6 unicast packets:

- Pass-through unicast traffic, including traffic from and to virtual routers. The device transmits pass-through traffic according to its routing table.
- Host-inbound traffic from and to devices directly connected to SRX Series interfaces. For example, host-inbound traffic includes logging, routing protocol, and management types of traffic. The flow module sends these unicast packets to the Routing Engine and receives them from it. Traffic is processed by the Routing Engine instead of by the flow module, based on routing protocols defined for the Routing Engine.

The flow module supports all routing and management protocols that run on the Routing Engine. Some examples are OSPFv3, RIPng, TELNET, and SSH.

- Multicast

A multicast address specifies an identifier for a set of interfaces that typically belong to different nodes. It is identified by a value of 0xFF. IPv6 multicast addresses are distinguished from unicast addresses by the value of the high-order octet of the addresses.

The devices support only host-inbound and host-outbound multicast traffic. Host inbound traffic includes logging, routing protocols, management traffic, and so on.

- Anycast

An anycast address specifies an identifier for a set of interfaces that typically belong to different nodes. A packet with an anycast address is delivered to the nearest node, according to routing protocol rules.

There is no difference between anycast addresses and unicast addresses except for the subnet-router address. For an anycast subnet-router address, the low order bits, typically 64 or more, are zero. Anycast addresses are taken from the unicast address space.

The flow module treats anycast packets in the same way as it handles unicast packets. If an anycast packet is intended for the device, it is treated as host-inbound traffic, and it delivers it to the protocol stack which continues processing it.

## IPv6 Address Scope

Unicast and multicast IPv6 addresses support address scoping, which identifies the application suitable for the address.

Unicast addresses support global address scope and two types of local address scope:

- Link-local unicast addresses—Used only on a single network link. The first 10 bits of the prefix identify the address as a link-local address. Link-local addresses cannot be used outside the link.
- Site-local unicast addresses—Used only within a site or intranet. A site consists of multiple network links. Site-local addresses identify nodes inside the intranet and cannot be used outside the site.

Multicast addresses support 16 different types of address scope, including node, link, site, organization, and global scope. A 4-bit field in the prefix identifies the address scope.

## IPv6 Address Structure

Unicast addresses identify a single interface. Each unicast address consists of  $n$  bits for the prefix, and  $128 - n$  bits for the interface ID.

Multicast addresses identify a set of interfaces. Each multicast address consists of the first 8 bits of all 1s, a 4-bit flags field, a 4-bit scope field, and a 112-bit group ID:

11111111 | flgs | scop | group ID

The first octet of 1s identifies the address as a multicast address. The flags field identifies whether the multicast address is a well-known address or a transient multicast address. The scope field identifies the scope of the multicast address. The 112-bit group ID identifies the multicast group.

Similar to multicast addresses, anycast addresses identify a set of interfaces. However, packets are sent to only one of the interfaces, not to all interfaces. Anycast addresses are allocated from the normal unicast address space and cannot be distinguished from a unicast address in format. Therefore, each member of an anycast group must be configured to recognize certain addresses as anycast addresses.

## Understanding IPv6 Address Space, Addressing, and Address Types

Addressing is the area where most of the differences between IP version 4 (IPv4) and IPv6 exist, but the changes are largely about the ways in which addresses are implemented and used. IPv6 has a vastly larger address space than the impending exhausted IPv4 address space. IPv6 increases the size of the IP address from the 32 bits that compose an IPv4 address to 128 bits. Each extra bit given to an address doubles the size of the address space.

IPv4 has been extended using techniques such as Network Address Translation (NAT), which allows for ranges of private addresses to be represented by a single public address, and temporary address assignment. Although useful, these techniques fall short of the requirements of novel applications and environments such as emerging wireless technologies, always-on environments, and Internet-based consumer appliances.

In addition to the increased address space, IPv6 addresses differ from IPv4 addresses in the following ways:

- Includes a scope field that identifies the type of application that the address pertains to
- Does not support broadcast addresses, but instead uses multicast addresses to broadcast a packet
- Defines a new type of address, called anycast

## Understanding IPv6 Address Format

All IPv6 addresses are 128 bits long, written as 8 sections of 16 bits each. They are expressed in hexadecimal representation, so the sections range from 0 to FFFF. Sections are delimited by colons, and leading zeroes in each section may be omitted. If two or more consecutive sections have all zeroes, they can be collapsed to a double colon.

IPv6 addresses consist of 8 groups of 16-bit hexadecimal values separated by colons (:). IPv6 addresses have the following format:

`aaaa:aaaa:aaaa:aaaa:aaaa:aaaa:aaaa:aaaa`

Each **aaaa** is a 16-bit hexadecimal value, and each **a** is a 4-bit hexadecimal value. Following is a sample IPv6 address:

`3FFE:0000:0000:0001:0200:F8FF:FE75:50DF`

You can omit the leading zeros of each 16-bit group, as follows:

`3FFE:0:0:1:200:F8FF:FE75:50DF`

You can compress 16-bit groups of zeros to double colons (::) as shown in the following example, but only once per address:

`3FFE::1:200:F8FF:FE75:50DF`

An IPv6 address prefix is a combination of an IPv6 prefix (address) and a prefix length. The prefix takes the form *ipv6-prefix/prefix-length* and represents a block of address space (or a network). The *ipv6-prefix* variable follows general IPv6 addressing rules. The

*/prefix-length* variable is a decimal value that indicates the number of contiguous, higher-order bits of the address that make up the network portion of the address. For example, 10FA:6604:8136:6502::/64 is a possible IPv6 prefix.

For more information on the text representation of IPv6 addresses and address prefixes, see RFC 4291, *IP Version 6 Addressing Architecture*.

### Limitations

- On all branch SRX Series devices, changes in source AS and destination AS are not immediately reflected in exported flows.
- On all branch SRX Series devices, IPv6 traffic transiting over IPv4 based IP over IP tunnel (for example, IPv6-over-IPv4 using ip-x/x/x interface) is not supported.

## Configuring the inet6 IPv6 Protocol Family

In configuration commands, the protocol family for IPv6 is named **inet6**. In the configuration hierarchy, instances of **inet6** are parallel to instances of **inet**, the protocol family for IPv4. In general, you configure **inet6** settings and specify IPv6 addresses in parallel to **inet** settings and IPv4 addresses.

**NOTE:** On SRX Series devices, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

The following example shows the CLI commands you use to configure an IPv6 address for an interface:

```
[edit]
user@host# show interfaces
ge-0/0/0 {
 unit 0 {
 family inet {
 address 10.100.37.178/24;
 }
 }
}
```

```
[edit]
user@host# set interfaces ge-0/0/0 unit 0 family ?
Possible completions:
+ apply-groups Groups from which to inherit configuration data
+ apply-groups-except Don't inherit configuration data from these groups
> ccc Circuit cross-connect parameters
> ethernet-switching Ethernet switching parameters
> inet IPv4 parameters
> inet6 IPv6 protocol parameters
> iso OSI ISO protocol parameters
> mpls MPLS protocol parameters
```

```

> tcc Translational cross-connect parameters
> vpls Virtual private LAN service parameters

[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet6 address 8d8d:8d01::1/64
user@host# show interfaces
ge-0/0/0 {
 unit 0 {
 family inet {
 address 10.100.37.178/24;
 }
 family inet6 {
 address 8d8d:8d01::1/64;
 }
 }
}

```

- Related Documentation**
- [Understanding IPv6 Address Space, Addressing, Address Format, and Address Types on page 2425](#)
  - [Enabling Flow-Based Processing for IPv6 Traffic on page 2430](#)

## Enabling Flow-Based Processing for IPv6 Traffic

You have the following options for handling IPv6 traffic:

- Drop—Do not forward IPv6 packets. This is the default behavior.
- Packet-based forwarding—Do not create a session and process according to packet-based features only (includes firewall filters and class of service).
- Flow-based forwarding—Create a session and process according to packet-based features (including firewall filters and class of service) but also flow-based security features, such as screens and firewall security policy.

To enable flow-based processing for IPv6 traffic, modify the **mode** statement at the **[edit security forwarding-options family inet6]** hierarchy level:

```

security {
 forwarding-options {
 family {
 inet6 {
 mode flow-based;
 }
 }
 }
}

```

The following example shows the CLI commands you use to configure forwarding for IPv6 traffic:

```

[edit]
user@host# set security forwarding-options family inet6 mode ?
Possible completions:
drop Disable forwarding
flow-based Enable flow-based forwarding
packet-based Enable packet-based forwarding

```

```
[edit]
user@host# set security forwarding-options family inet6 mode flow-based
user@host# show security forwarding-options
family {
 inet6 {
 mode flow-based;
 }
}
```

If you change the forwarding option mode for IPv6, you might need to perform a reboot to initialize the configuration change. [Table 173](#) summarizes device status upon configuration change.

**Table 264: Device Status Upon Configuration Change**

| Configuration Change       | Commit Warning | Reboot Required | Impact on Existing Traffic Before Reboot | Impact on New Traffic Before Reboot |
|----------------------------|----------------|-----------------|------------------------------------------|-------------------------------------|
| Drop to flow-based         | Yes            | Yes             | Dropped                                  | Dropped                             |
| Drop to packet-based       | No             | No              | Packet-based                             | Packet-based                        |
| Flow-based to packet-based | Yes            | Yes             | None                                     | Flow sessions created               |
| Flow-based to drop         | Yes            | Yes             | None                                     | Flow sessions created               |
| Packet-based to flow-based | Yes            | Yes             | Packet-based                             | Packet-based                        |
| Packet-based to drop       | No             | No              | Dropped                                  | Dropped                             |

## Configuring Flow Aggregation to Use Version 9 Flow Templates

Use of version 9 allows you to define a flow record template suitable for IPv4 traffic, IPv6 traffic, or peer AS billing traffic. Templates and the fields included in the template are transmitted to the collector periodically, and the collector need not be aware of the router configuration.

**NOTE:** Version 9 requires that you install a services PIC, such as the Adaptive Services PIC or the Multiservices PIC, in the device. On MX Series routers, the Multiservices DPC fulfills this requirement.

The following sections contain additional information:

- [Configuring the Traffic to Be Sampled on page 2432](#)
- [Configuring the Version 9 Template Properties on page 2432](#)

- [Restrictions on page 2433](#)
- [Fields Included in Each Template Type on page 2435](#)
- [inet Sampling Behavior on page 2436](#)
- [Verification on page 2436](#)
- [Examples: Configuring Version 9 Flow Templates on page 2437](#)

## Configuring the Traffic to Be Sampled

To specify sampling of IPv4, IPv6, or peer AS billing traffic, include the appropriate configuration of the **family** statement at the **[edit forwarding-options sampling input]** hierarchy level:

```
[edit forwarding-options sampling input]
family (inet) {
 max-packets-per-second number;
 rate number;
 run-length number;
}
```

You can include **family inet**.

**NOTE:** If you specify sampling for peer AS billing traffic, the **family** statement supports only IPv4 and IPv6 traffic (**inet**). Peer AS billing traffic is enabled only at the global instance hierarchy level and is not available for per Packet Forwarding Engine instances.

## Configuring the Version 9 Template Properties

To define the version 9 templates, include the following statements at the **[edit services flow-monitoring version9]** hierarchy level:

```
[edit services flow-monitoring version9]
template name {
 flow-active-timeout seconds;
 flow-inactive-timeout seconds;
 option-refresh-rate packets packets seconds seconds;
 template-refresh-rate packets packets seconds seconds;
 (ipv4-template (Services) | ipv6-template (Services) | mpls-ipv4-template |
 mpls-template | peer-as-billing-template) {
 label-position [positions];
 }
}
```

The following details apply to the configuration statements:

- You assign each template a unique name by including the **template *name*** statement.
- You then specify each template for the appropriate type of traffic by including the **ipv4-template**, **ipv6-template**, **inet-ipv4-template**, **inet-template**, or **peer-as-billing-template**.

- If the template is used for inet traffic, you can also specify up to three label positions for the inet header label data by including the **label-position** statement; the default values are [1 2 3].
- Within the template definition, you can optionally include values for the **flow-active-timeout** and **flow-inactive-timeout** statements. These statements have specific default and range values when they are used in template definitions; the default is 60 seconds and the range is from 10 through 600 seconds. Values you specify in template definitions override the global timeout values configured at the [edit forwarding-options sampling output flow-server] hierarchy level.

**NOTE:** In active flow monitoring, the flow-server records are exported after a time period that is a multiple of 60 seconds and greater than or equal to the configured active timeout value. For example, if the active timeout value is 90 seconds, the flow-server records are exported at 120-second intervals. If the active timeout value is 150 seconds, the flow-server records are exported at 180-second intervals, and so forth.

- You can also include settings for the **option-refresh-rate** and **template-refresh-rate** statements within a template definition. For both of these properties, you can include a timer value (in seconds) or a packet count (in number of packets). For the **seconds** option, the default value is 60 and the range is from 10 through 600. For the **packets** option, the default value is 4800 and the range is from 1 through 480,000.
- To filter IPV6 traffic on a media interface, the following configuration is supported:

```
interfaces interface-name {
 unit 0 {
 family inet {
 sampling {
 input;
 output;
 }
 }
 }
}
```

## Restrictions

The following restrictions apply to version 9 templates:

- You cannot apply the two different types of flow aggregation configuration (flow-server version 5/8 and flow aggregation version 9) at the same time.
- Flow export based on an **inet-ipv4** template assumes that the IPv4 header follows the inet header. In the case of Layer 2 VPNs, the packet on the provider router (P router) would look like this:

```
inet | Layer 2 Header | IPv4
```

In this case, **inet-ipv4** flows are not created on the PIC, because the IPv4 header does not directly follow the inet header. Packets are dropped on the PIC and are accounted as parser errors.

- Outbound Routing Engine traffic is not sampled. A firewall filter is applied as output on the egress interface, which samples packets and exports the data. For transit traffic, egress sampling works correctly. For internal traffic, the next hop is installed in the Packet Forwarding Engine but sampled packets are not exported.
- Flows are created on the monitoring PIC only after the route record resynchronization operation is complete, which is 60 seconds after the PIC comes up. Any packets sent to the PIC would be dropped until the synchronization process is complete.

On all branch SRX Series devices, flow monitoring IPv6 version 9 has the following limitations:

- MPLS in not supported.
- User-defined version 9 templates are not supported.
- Routing Engine based flow monitoring version 9 is not supported.
- Flow monitoring and accounting are not supported in chassis cluster mode.
- Flow monitoring and accounting are not supported on an ae interface.
- J-Web for IPv6 sampled packets is not supported.
- SNMP queries for IPv6 sampled packets are not supported
- Flow monitoring can be configured in version 5, version 8, or version 9 export mode. Up to eight version 9 collectors are supported in export mode.
- Scope of accounting of IPv6 flow monitoring version 9 packets associated with pseudointerfaces (such as IRB, ML, LAG, VLAN, and GRE) is not supported.
- Creation of an SCTP session (parallel to TCP) between an exporter and a collector for gathering flow monitoring information is not supported.
- Maximum flow sessions that might be supported include:
  - A device with 1-GB RAM, such as an SRX220 device, might support up to 15,000 flow monitoring sessions at a time.
  - A device with 2-GB RAM, such as an SRX650 device, might support up to 59,900 flow monitoring sessions at a time.
- Routing Engine based flow monitoring V5 or V8 mode is mutually exclusive with inline flow monitoring V9.
- High-end SRX Series devices do not support multiple collectors like branch SRX Series devices. Only one V9 collector per IPv4 or IPv6 is supported
- Flow aggregation for V9 export is not supported.
- Only UDP over IPv4 or IPv6 protocol can be used as the transport protocol.
- Only the standard IPv4 or IPv6 template is supported for exporting flow monitoring records.
- User-defined or special templates are not supported for exporting flow monitoring records.
- Chassis cluster is supported without flow monitoring session synchronization.

## Fields Included in Each Template Type

The following fields are common to all template types:

- Input interface
- Output interface
- Number of bytes
- Number of packets
- Flow start time
- Flow end time

The IPv4 template includes the following specific fields:

- IPv4 Source Address
- IPv4 Destination Address
- L4 Source Port
- L4 Destination Port
- IPv4 TOS
- IPv4 Protocol
- ICMP type and code
- TCP Flags
- IPv4 Next Hop Address

The IPv6 template includes the following specific fields:

- IPv6 Source Address and Mask
- IPv6 Destination Address and Mask
- L4 Source Port
- L4 Destination Port
- IPv6 TOS
- IPv6 Protocol
- TCP Flags
- IP Protocol Version
- IPv6 Next Hop Address
- Egress Interface Information
- Source Autonomous System (AS) number
- Destination AS number

The inet template includes the following specific fields:

- inet Label #1
- inet Label #2
- inet Label #3
- inet EXP Information
- FEC IP Address

The inet-IPv4 template includes all the fields found in the IPv4 and inet templates.

The peer AS billing template includes the following specific fields:

- IPV4 Class of Service (TOS)
- Ingress Interface
- BGP IPV4 Next Hop Address
- BGP Peer Destination AS Number

## inet Sampling Behavior

This section describes the behavior when inet sampling is used on egress interfaces in various scenarios (label pop or swap) on provider routers (P routers).

1. You configure inet sampling on an egress interface on the P router and configure an inet flow aggregation template. The route action is label *pop* because penultimate hop popping (PHP) is enabled.

Previously, IPv4 packets (only) would have been sent to the PIC for sampling even though you configured inet sampling. No flows should be created, with the result that the parser fails.

With the current capability of applying inet templates, inet flows are created.

2. As in the first case, you configure inet sampling on an egress interface on the P router and configure an inet flow aggregation template. The route action is label swap and the swapped label is 0 (explicit null).

The resulting behavior is that inet packets are sent to the PIC. The flow being sampled corresponds to the label before the swap.

3. You configure a Layer 3 VPN network, in which a customer edge router (CE-1) sends traffic to a provider edge router (PE-A), through the P router, to a similar provider edge router (PE-B) and customer edge router (CE-2) on the remote end.

The resulting behavior is that you cannot sample inet packets on the PE-A to P router link.

## Verification

To verify the configuration properties, you can use the **show services accounting aggregation template template-name *name*** operational mode command.

All other **show services accounting** commands also support version 9 templates, except for **show services accounting flow-detail** and **show services accounting aggregation aggregation-type**.

## Examples: Configuring Version 9 Flow Templates

The following is a sample version 9 template configuration:

```
services {
 flow-monitoring {
 version9 {
 template ip-template {
 flow-active-timeout 20;
 flow-inactive-timeout 120;
 ipv4-template;
 }
 template inet-template-1 {
 inet-template {
 label-position [1 3 4];
 }
 }
 template inet-ipv4-template-1 {
 inet-ipv4-template {
 label-position [1 5 7];
 }
 }
 template peer-as-billing-template-1 {
 peer-as-billing-template;
 }
 }
 }
}
```

The following is a sample firewall filter configuration for inet traffic:

```
firewall {
 family inet {
 filter inet_sample {
 term default {
 then {
 accept;
 sample;
 }
 }
 }
 }
}
```

The following sample configuration applies the inet sampling filter on a networking interface and configures the AS PIC to accept both IPv4 and inet traffic:

```
inline-jflows {
 at-0/1/1 {
 unit 0 {
 family inet {
```

```

 filter {
 input inet_sample;
 }
 }
}
sp-7/0/0 {
 unit 0 {
 family inet;
 family inet;
 }
}
}

```

The following example applies the inet version 9 template to the sampling output and sends it to the AS PIC:

```

forwarding-options {
 sampling {
 input {
 family inet {
 rate 1;
 }
 }
 output {
 flow-active-timeout 60;
 flow-inactive-timeout 30;
 flow-server 1.2.3.4 {
 port 2055;
 version9 {
 template inet-ipv4-template-1;
 }
 }
 inline-jflow sp-7/0/0 {
 source-address 1.1.1.1;
 }
 }
 }
}

```

The following is a sample firewall filter configuration for the peer AS billing traffic:

```

firewall {
 family inet {
 filter peer-as-filter {
 term 0 {
 from {
 destination-class dcu-1;
 inline-jflow ge-2/1/0;
 forwarding-class class-1;
 }
 then count count_team_0;
 }
 }
 term 1 {
 from {

```

```

 destination-class dcu-2;
 inline-jflow ge-2/1/0;
 forwarding-class class-1;
 }
 then count count_team_1;
}
term 2 {
 from {
 destination-class dcu-3;
 inline-jflow ge-2/1/0;
 forwarding-class class-1;
 }
 then count count_team_2;
}
}
}
}

```

The following sample configuration applies the firewall filter as a filter attribute under the forwarding-options hierarchy for CoS-level data traffic usage information collection:

```

forwarding-options {
 family inet {
 filter output peer-as-filter;
 }
}

```

The following example applies the peer-as-billing version 9 template to enable sampling of traffic for billing purposes:

```

forwarding-options {
 sampling {
 }
 input {
 rate 1;
 }
 family inet {
 output {
 flow-server 10.209.15.58 {
 port 300;
 version9 {
 template {
 peer-as;
 }
 }
 }
 }
 inline-jflow sp-5/2/0 {
 source-address 2.3.4.5;
 }
 }
}
}
family inet {
 filter {
 output peer-as-filter;
 }
}

```

```
}
}
```

## Understanding IPv6 Support on ADSL, G.SHDSL, and VDSL2 Interfaces

---

The branch SRX Series devices support IPv6 on the following DSL encapsulations:

- ATM physical interface encapsulations
  - atm-pvc
  - ethernet-over-atm
- ATM logical interface encapsulations
  - atm-snap
  - atm-ppp-vc-mux
  - atm-nlpid
  - atm-cisco-nlpid
  - atm-ppp-llc
  - ether-over-atm-llc

**NOTE:** The encapsulation types atm-vc-mux and ppp-over-ether-over-atm-llc do not include IPv6 support.

---

G.SHDSL and VDSL2 interfaces also include IPv6 support in PTM mode.

To configure IPv6 addresses on DSL interfaces in ATM or PTM mode, include the family protocol type as **inet6** at the **[edit interfaces]** hierarchy level.

**Related  
Documentation**

- [Understanding Interface Logical Properties on page 2421](#)

---

## Example: Configuring the IPv6 Address on an ADSL Interface

---

This example shows how to configure the IPv6 address on an ADSL interface.

- [Requirements on page 2441](#)
- [Overview on page 2441](#)
- [Configuration on page 2441](#)
- [Verification on page 2442](#)

## Requirements

Before you begin, configure network interfaces as necessary. See [“Understanding Ethernet Interfaces” on page 2629](#).

## Overview

In this example, you specify the following configuration parameters:

- Encapsulation type: Ethernet over ATM on DSL logical interface
- ATM virtual path identifier (VPI): 2
- Encapsulation type: Ethernet over ATM on DSL logical interface
- Encapsulation type for the ATM-for-ADSL logical unit: Ethernet over ATM LLC
- ATM virtual channel (VCI): 2.118
- IPv6 address and prefix: 13:13::1/64

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation ethernet-over-atm
set interfaces at-1/0/0 atm-options vpi 2
set interfaces at-1/0/0 unit 0 encapsulation ether-over-atm-llc
set interfaces at-1/0/0 unit 0 vci 2.118
set interfaces at-1/0/0 unit 0 family inet6 address 13:13::1/64
```

### Step-by-Step Procedure

To configure the IPv6 address on an ADSL interface:

1. Configure the encapsulation type.  

```
[edit]
user@host# set interfaces at-1/0/0 encapsulation ethernet-over-atm
```
2. Specify the annex type.  

```
[edit]
user@host# set interfaces at-1/0/0 atm-options vpi 2
```
3. Configure the encapsulation for the logical unit.  

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 encapsulation ether-over-atm-llc
```
4. Configure the VCI value.  

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 vci 2.118
```
5. Configure family protocol type and assign an IPv6 address.  

```
[edit]
```

```
user@host# set interfaces at-1/0/0 unit 0 family inet6 address 13:13::1/64
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation ethernet-over-atm;
atm-options {
 vpi 2;
}
unit 0 {
 encapsulation ether-over-atm-llc;
 vci 2.118;
 family inet6 {
 address 13:13::1/64;
 }
}
```

If you done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying ADSL Interface Properties

**Purpose** Verify that the ADSL interface properties are configured properly.

**Action** From operational mode, enter the **show ipv6 neighbors** command. The output shows a summary of interface information.

```
user@host> show ipv6 neighbors
```

| IPv6 Address | Linklayer Address | State     | Exp Rtr | Secure | Interface  |
|--------------|-------------------|-----------|---------|--------|------------|
| 10:1::2      | 00:00:0a:00:00:00 | reachable | 17      | yes no | reth0.0    |
| 13:13::1     | 00:19:e2:4b:61:83 | stale     | 1197    | yes no | at-1/0/0.0 |
| 12:12::2     | 00:19:e2:4b:61:83 | stale     | 1188    | yes no | at-3/0/0.0 |

**Meaning** The **IPv6 Address** field displays the configured IPv6 address on the interface.

## Understanding MAC Limiting on Layer 3 Routing Interfaces

- [Overview on page 2443](#)
- [Limitations on page 2445](#)

### Overview

The MAC limiting feature provides a mechanism for limiting MAC addresses on devices that are connected to a Layer 3 routed Gigabit Ethernet (GE), Fast Ethernet (FE), or 10 Gigabit Ethernet (XE) interface. With MAC filters, you can allow traffic with specific source MAC. Software-based MAC limiting is supported. MAC limiting is applicable only on interfaces with plain Ethernet or VLAN tagged encapsulation.

Both the physical interface level **source-address-filter** and logical interface level **accept-source-mac** configurations are supported on SRX100, SRX210, SRX220, SRX240, and SRX650 devices. The following considerations apply when you configure the **source-address-filter** and **accept-source-mac** statements:

- If only the logical level **accept-source-mac** statement is configured, traffic from only those configured MAC addresses will be allowed on the logical interface.
- If only the physical interface level **source-address-filter** statement is configured, the physical interface's *allowed* MAC addresses are also considered the *allowed* addresses for all the logical interfaces belonging to the physical interface. Incoming packets from any other source MAC addresses are dropped.
- If the physical interface level **source-address-filter** is configured under **gigether-options** (or **fastether-options**) and **accept-source-mac** is configured for one or more of its logical interfaces or VLANs, the allowed list of addresses is a combination of MAC addresses specified in both the statements. For logical interfaces and VLANs where the **accept-source-mac** statement is not configured, the physical interface's *allowed* list of addresses is considered.

You can configure an interface to receive packets from specific MAC addresses. To do this, specify the MAC addresses in the **source-address-filter** or **accept-source-mac** statements:

- **Logical level MAC filter configuration on an untagged interface**

```
ge-0/0/10 {
 unit 0 {
 accept-source-mac {
 mac-address 00:22:33:44:55:66;
 mac-address 00:26:88:e9:a3:01;
 }
 family inet {
 address 60.60.60.1/24;
 }
 }
}
```

 gigether-options {
 source-address-filter {
 00:55:55:55:55:66;
 00:26:88:e9:a3:01;
 }
 }
 unit 0 {
 family inet {
 address 60.60.60.1/24;
 }
 }
}

```

- Physical and logical level MAC filter configurations on a tagged interface

```

ge-0/0/10 {
 vlan-tagging;
 gigether-options {
 source-address-filter {
 00:26:88:e9:a3:01;
 }
 }
 unit 0 {
 vlan-id 40;
 accept-source-mac {
 mac-address 00:22:33:44:55:66;
 }
 family inet {
 address 40.40.40.1/24;
 }
 }
 unit 1 {
 vlan-id 60;
 accept-source-mac {
 mac-address 00:55:55:55:55:66;
 }
 family inet {
 address 60.60.60.1/24;
 }
 }
}

```

**NOTE:** On untagged Gigabit Ethernet interfaces, you must not configure the `source-address-filter` and the `accept-source-mac` statements simultaneously. If these statements are configured for the same interfaces at the same time, an error message appears. However, in the case of tagged VLANs, both these statements can be configured simultaneously, if no identical MAC addresses are specified.

## Limitations

The following limitations apply to MAC limiting support on Layer 3 routed GE, FE, or XE interfaces:

- You can configure only 32 MAC addresses per device.
- Only software-based MAC filtering is supported. Software-based MAC filtering impacts performance. The performance impact is proportional to the number of MAC addresses configured.
- MAC- based policer or rate limiting is not supported.
- You cannot configure broadcast or multicast address in the source-address-filter statement.
- MAC filtering is not supported on Aggregated Ethernet (AE), Fabric Ethernet, Point-to-Point Protocol over Ethernet (PPPoE), Routed VLAN interface (RVI), or VLAN interfaces.

MAC filtering is not supported on chassis clusters.

## Understanding Interface Physical Properties

---

The physical properties of a network interface are the characteristics associated with the physical link that affect the transmission of either link-layer signals or the data across the links. Physical properties include clocking properties, transmission properties, such as the maximum transmission unit (MTU), and encapsulation methods, such as point-to-point and Frame Relay encapsulation.

The default property values for an interface are usually sufficient to successfully enable a bidirectional link. However, if you configure a set of physical properties on an interface, those same properties must be set on all adjacent interfaces to which a direct connection is made.

[Table 265](#) summarizes some key physical properties of device interfaces.

**Table 265: Interface Physical Properties**

| Physical Property      | Description                                                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bert-error-rate</b> | Bit error rate (BER). The error rate specifies the number of bit errors in a particular bit error rate test (BERT) period required to generate a BERT error condition. See <a href="#">“Understanding Bit Error Rate Testing” on page 2448</a> . |
| <b>bert-period</b>     | Bit error rate test (BERT) time period over which bit errors are sampled. See <a href="#">“Understanding Bit Error Rate Testing” on page 2448</a> .                                                                                              |

Table 265: Interface Physical Properties (*continued*)

| Physical Property        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clocking</b>          | Clock source for the link. Clocking can be provided by the local system (internal) or a remote endpoint on the link (external). By default, all interfaces use the internal clocking mode. If an interface is configured to accept an external clock source, one adjacent interface must be configured to act as a clock source. Under this configuration, the interface operates in a loop timing mode, in which the clocking signal is unique for that individual network segment or loop. See <a href="#">“Understanding Interface Clocking” on page 2449</a> . |
| <b>description</b>       | A user-defined text description of the interface, often used to describe the interface's purpose.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>disable</b>           | Administratively disables the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>encapsulation</b>     | Type of encapsulation on the interface. Common encapsulation types include PPP, Frame Relay, Cisco HDLC, and PPP over Ethernet (PPPoE).                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>fcs</b>               | Frame check sequence (FCS). FCS is an error-detection scheme that appends parity bits to a digital signal and uses decoding algorithms that detect errors in the received digital signal.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>mtu</b>               | Maximum transmission unit (MTU) size. MTU is the largest size packet or frame, specified in bytes or octets, that can be sent in a packet-based or frame-based network. The TCP uses MTU to determine the maximum size of each packet in any transmission. See <a href="#">“MTU Default and Maximum Values” on page 2451</a> .                                                                                                                                                                                                                                     |
| <b>no-keepalives</b>     | Disabling of keepalive messages across a physical link. A keepalive message is sent between network devices to indicate that they are still active. Keepalives help determine whether the interface is operating correctly. Except for ATM-over-ADSL interfaces, all interfaces use keepalives by default.                                                                                                                                                                                                                                                         |
| <b>pap</b>               | Password Authentication Protocol (PAP). Specifying <b>pap</b> enables PAP authentication on the interface. See <a href="#">“Understanding CHAP Authentication on a PPPoE Interface” on page 2745</a> .                                                                                                                                                                                                                                                                                                                                                             |
| <b>payload-scrambler</b> | Scrambling of traffic transmitted out the interface. Payload scrambling randomizes the data payload of transmitted packets. Scrambling eliminates nonvariable bit patterns (strings of all 1s or all 0s) that generate link-layer errors across some physical links.                                                                                                                                                                                                                                                                                               |

## Understanding Bit Error Rate Testing

In telecommunication transmission, the bit error rate (BER) is the percentage of bits that have errors compared to the total number of bits received in a transmission, usually expressed as 10 to a negative power. For example, a transmission with a BER of  $10^{-6}$  received 1 errored bit in 1,000,000 bits transmitted. The BER indicates how often a packet or other data unit must be retransmitted because of an error. If the BER is too high, a

slower data rate might improve the overall transmission time for a given amount of data if it reduces the BER and thereby lowers the number of resent packets.

A bit error rate test (BERT) is a procedure or device that measures the BER for a given transmission. You can configure a device to act as a BERT device by configuring the interface with a bit error rate and a testing period. When the interface receives a BERT request from a BER tester, it generates a response in a well-known BERT pattern. The initiating device checks the BERT-patterned response to determine the number of bit errors.

**Related Documentation** • [Understanding Interface Physical Properties on page 2447](#)

## Understanding Interface Clocking

Clocking determines how individual routing nodes or entire networks sample transmitted data. As streams of information are received by a device in a network, a clock source specifies when to sample the data. In asynchronous networks, the clock source is derived locally, and synchronous networks use a central, external clock source. Interface clocking indicates whether the device uses asynchronous or synchronous clocking.

**NOTE:** Because truly synchronous networks are difficult to design and maintain, most synchronous networks are really plesiochronous networks. In a plesiochronous network, different timing regions are controlled by local clocks that are synchronized (with very narrow constraints). Such networks approach synchronicity and are generally known as synchronous networks.

Most networks are designed to operate as asynchronous networks. Each device generates its own clock signal, or devices use clocks from more than one clock source. The clocks within the network are not synchronized to a single clock source. By default, devices generate their own clock signals to send and receive traffic.

The system clock allows the device to sample (or detect) and transmit data being received and transmitted through its interfaces. Clocking enables the device to detect and transmit the 0s and 1s that make up digital traffic through the interface. Failure to detect the bits within a data flow results in dropped traffic.

Short-term fluctuations in the clock signal are known as *clock jitter*. Long-term variations in the signal are known as *clock wander*.

Asynchronous clocking can either derive the clock signal from the data stream or transmit the clocking signal explicitly.

This topic contains the following sections:

- [Data Stream Clocking on page 2450](#)
- [Explicit Clocking Signal Transmission on page 2450](#)

## Data Stream Clocking

Common in T1 links, data stream clocking occurs when separate clock signals are not transmitted within the network. Instead, devices must extract the clock signal from the data stream. As bits are transmitted across the network, each bit has a time slot of 648 nanoseconds. Within a time slot, pulses are transmitted with alternating voltage peaks and drops. The receiving device uses the period of alternating voltages to determine the clock rate for the data stream.

## Explicit Clocking Signal Transmission

Clock signals that are shared by hosts across a data link must be transmitted by one or both endpoints on the link. In a serial connection, for example, one host operates as a clock master and the other operates as a clock slave. The clock master internally generates a clock signal that is transmitted across the data link. The clock slave receives the clock signal and uses its period to determine when to sample data and how to transmit data across the link.

This type of clock signal controls only the connection on which it is active and is not visible to the rest of the network. An explicit clock signal does not control how other devices or even other interfaces on the same device sample or transmit data.

## Understanding Frame Check Sequences

All packets or frames within a network can be damaged by crosstalk or interference in the network's physical wires. The frame check sequence (FCS) is an extra field in each transmitted frame that can be analyzed to determine if errors have occurred. The FCS uses cyclic redundancy checks (CRCs), checksums, and two-dimensional parity bits to detect errors in the transmitted frames.

This topic contains the following sections:

- [Cyclic Redundancy Checks and Checksums on page 2450](#)
- [Two-Dimensional Parity on page 2451](#)

## Cyclic Redundancy Checks and Checksums

On a link that uses CRCs for frame checking, the data source uses a predefined polynomial algorithm to calculate a CRC number from the data it is transmitting. The result is included in the FCS field of the frame and transmitted with the data. On the receiving end, the destination host performs the same calculation on the data it receives.

If the result of the second calculation matches the contents of the FCS field, the packet was sent and received without bit errors. If the values do not match, an FCS error is generated, the frame is discarded and the originating host is notified of the error.

Checksums function similarly to CRCs, but use a different algorithm.

Two-Dimensional Parity

On a link that uses two-dimensional parity bits for frame checking, the sending and receiving hosts examine each frame in the total packet transmission and create a parity byte that is evaluated to detect transmission errors.

For example, a host can create the parity byte for the following frame sequence by summing up each column (each bit position in the frame) and keeping only the least-significant bit:

|             |   |   |   |   |   |   |   |
|-------------|---|---|---|---|---|---|---|
| Frame 1     | 0 | 1 | 0 | 1 | 0 | 0 | 1 |
| Frame 2     | 1 | 1 | 0 | 1 | 0 | 0 | 1 |
| Frame 3     | 1 | 0 | 1 | 1 | 1 | 1 | 0 |
| Frame 4     | 0 | 0 | 0 | 1 | 1 | 1 | 0 |
| Frame 5     | 0 | 1 | 1 | 0 | 1 | 0 | 0 |
| Frame 6     | 1 | 0 | 1 | 1 | 1 | 1 | 1 |
| Parity Byte | 1 | 1 | 1 | 1 | 0 | 1 | 1 |

If the sum of the bit values in a bit position is even, the parity bit for the position is 0. If the sum is odd, the parity bit is 1. This method is called even parity. Matching parity bytes on the originating and receiving hosts indicate that the packet was received without error.

MTU Default and Maximum Values

The MTU values are by default without any MTU configurations. If the MTU value is set, then the formula **IFF MTU (IP MTU) = IFD MTU (Media MTU) – L2 Overhead** is applicable. See [Table 266](#) for default MTU values.

**NOTE:** For ATM MLPPP irrespective of UIFD MTU, the IP MTU is always 1500 because the IP MTU calculation is based on the LSQ interface. Even if you configure the LSQ family MTU, the IP MTU value cannot exceed 1504.

[Table 266](#) lists MTU values for the SRX Series Services Gateways Physical Interface Modules (PIMs).

Table 266: MTU Values for the SRX Series Services Gateways PIMs

| PIM                                                                | Default Media MTU (Bytes) | Maximum MTU (Bytes) | Default IP MTU (Bytes) |
|--------------------------------------------------------------------|---------------------------|---------------------|------------------------|
| 1-Port Gigabit Ethernet Small Form-Factor Pluggable (SFP) Mini-PIM | 1514                      | 9010                | 1500                   |
| 1-Port Small Form-Factor Pluggable (SFP) Mini-PIM                  | 1514                      | 1518                | 1500                   |
| DOCSIS Mini-PIM                                                    | 1504                      | 1504                | 1500                   |

Table 266: MTU Values for the SRX Series Services Gateways PIMs (*continued*)

| PIM                                    | Default Media MTU (Bytes) | Maximum MTU (Bytes) | Default IP MTU (Bytes) |

## Understanding Jumbo Frames Support for Ethernet Interfaces

SRX Series devices support jumbo frames up to 9192 bytes.

Jumbo frames are Ethernet frames with more than 1500 bytes of payload (maximum transmission unit [MTU]). Jumbo frames can carry up to 9000 bytes of payload.

You configure jumbo frames at the physical interface by using the following command:

**set interface *interface-name* mtu *mtu-value***

Example:

```
user@host# set interfaces ge-0/0/0 mtu 9192
```

The supported range for configuring an MTU packet size is 256 through 9192.

## Understanding Virtual LANs

---

A LAN is a single broadcast domain. When traffic is broadcast, all hosts within the LAN receive the broadcast traffic. A LAN is determined by the physical connectivity of devices within the domain.

Within a traditional LAN, hosts are connected by a hub or repeater that propagates any incoming traffic throughout the network. Each host and its connecting hubs or repeaters make up a LAN segment. LAN segments are connected through switches and bridges to form the broadcast domain of the LAN. [Figure 113](#) shows a typical LAN topology.

**Figure 113: Typical LAN**

Virtual LANs (VLANs) allow network architects to segment LANs into different broadcast domains based on logical groupings. Because the groupings are logical, the broadcast domains are not determined by the physical connectivity of the devices in the network. Hosts can be grouped according to a logical function, to limit the traffic broadcast within the VLAN to only the devices for which the traffic is intended.

Suppose a corporate network has three major organizations: engineering, sales, and support. Using VLAN tagging, hosts within each organization can be tagged with a different VLAN identifier. Traffic sent to the broadcast domain is then checked against the VLAN identifier and broadcast to only the devices in the appropriate VLAN. [Figure 114](#) shows a typical VLAN topology.

**Figure 114: Typical VLAN**

VLAN IDs and Ethernet Interface Types Supported on the SRX Series Devices

Table 267 lists VLAN ID range by interface type supported on SRX Series devices:

Table 267: VLAN ID Range by Interface Type Supported on the SRX Series Devices

| Interface Type                              | Interface Type VLAN ID Range |
|---------------------------------------------|------------------------------|
| 2-Port 10-Gigabit Ethernet                  | 1 through 4094               |
| 10-Gigabit Ethernet                         | 1 through 4094               |
| 16-Port Gigabit Ethernet                    | 1 through 4094               |
| 24-Port Gigabit Ethernet                    | 1 through 4094               |
| Aggregated Ethernet for Fast Ethernet       | 1 through 1023               |
| Aggregate Ethernet for Gigabit Ethernet     | 1 through 4094               |
| Gigabit Ethernet                            | 1 through 4094               |
| Management and internal Ethernet interfaces | 1 through 1023               |

**NOTE:** On SRX210, SRX220, and SRX240 devices, on 1-GE SFP Mini-PIM, the VLAN ID 4093 falls under the reserved VLAN address range. Because of this, you will not be able to configure VLAN ID from this range.

Configuring VLAN Tagging

You can configure the branch SRX Series devices to receive and forward single-tag frames, dual-tag frames, or a mixture of single-tag and dual-tag frames.

See [Table 268](#) for flexible VLANs.

Table 268: Flexible VLANs

| Number of Tags  | VLAN ID |
|-----------------|---------|
| 0 (Untagged)    | Native  |
| 1 (Tagged)      | Single  |
| 2 (Dual tagged) | Dual    |

This topic includes the following sections:

- [Configuring Single-Tag Framing on page 2458](#)
- [Configuring Dual Tagging on page 2458](#)
- [Configuring Mixed Tagging on page 2458](#)
- [Configuring Mixed Tagging Support for Untagged Packets on page 2459](#)

## Configuring Single-Tag Framing

To configure a device to receive and forward single-tag frames with 802.1Q VLAN tags, include the **vlan-tagging** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]
vlan-tagging;
```

**NOTE:** SRX high-end devices only support single-tag framing.

## Configuring Dual Tagging

To configure the device to receive and forward dual-tag frames with 802.1Q VLAN tags, include the **flexible-vlan-tagging** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]
flexible-vlan-tagging;
```

## Configuring Mixed Tagging

Mixed tagging is supported on ethernet interfaces of all branch SRX Series devices. Mixed tagging lets you configure two logical interfaces on the same Ethernet port, one with single-tag framing and one with dual-tag framing.

To configure mixed tagging, include the **flexible-vlan-tagging** statement at the **[edit interfaces *ge-fpc/pic/port*]** hierarchy level. You must also include the **vlan-tags** statement with **inner** and **outer** options or the **vlan-id** statement at the **[edit interfaces *ge-fpc/pic/port* unit *logical-unit-number*]** hierarchy level:

```
[edit interfaces ge-fpc/pic/port]
flexible-vlan-tagging;
unit logical-unit-number {
 vlan-id number;
 family family {
 address address;
 }
}
unit logical-unit-number {
 vlan-tags inner tpid.vlan-id outer tpid.vlan-id;
 family family {
 address address;
 }
}
```

**NOTE:** When you configure the physical interface MTU for mixed tagging, you must increase the MTU to 4 bytes more than the MTU value you would configure for a standard VLAN-tagged interface.

For example, if the MTU value is configured to be 1018 on a VLAN-tagged interface, then the MTU value on a flexible VLAN tagged interface must be 1022—4 bytes more. The additional 4 bytes accommodates the future addition of a stacked VLAN tag configuration on the same physical interface.

The following example configures mixed tagging. Dual-tag and single-tag logical interfaces are under the same physical interface:

```
[edit interfaces ge-0/2/0]
flexible-vlan-tagging;
unit 0 {
 vlan-id 232;
 family inet {
 address 10.66.1.2/30;
 }
}
unit 1 {
 vlan-tags outer 0x8100.222 inner 0x8100.221;
 family inet {
 address 10.66.1.2/30;
 }
}
```

## Configuring Mixed Tagging Support for Untagged Packets

You can configure mixed tagging support for untagged packets on a port. Untagged packets are accepted on the same mixed VLAN-tagged port. To accept untagged packets, include the **native-vlan-id** statement and the **flexible-vlan-tagging** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces ge-fpc/pic/port]
flexible-vlan-tagging;
native-vlan-id number;
```

The logical interface on which untagged packets are to be received must be configured with the same native VLAN ID as that configured on the physical interface. To configure the logical interface, include the **vlan-id** statement (matching the **native-vlan-id** statement on the physical interface) at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level.

The following example configures untagged packets to be mapped to logical unit number 0:

```
[edit interfaces ge-0/2/0]
flexible-vlan-tagging;
native-vlan-id 232;
unit 0 {
 vlan-id 232;
```

```
 family inet {
 address 10.66.1.2/30;
 }
}
unit 1 {
 vlan-tags outer 0x8100.222 inner 0x8100.221;
 family inet {
 address 10.66.1.2/30;
 }
}
```

## Understanding T1 and E1 Interfaces

---

T1 and E1 are equivalent digital data transmission formats that carry DS1 signals. T1 and E1 lines can be interconnected for international use.

This topic contains the following sections:

- [T1 Overview on page 2463](#)
- [E1 Overview on page 2464](#)
- [T1 and E1 Signals on page 2464](#)
- [Encoding on page 2464](#)
- [T1 and E1 Framing on page 2465](#)
- [T1 and E1 Loopback Signals on page 2465](#)

### T1 Overview

T1 is a digital data transmission medium capable of handling 24 simultaneous connections running at a combined 1.544 Mbps. T1 combines these 24 separate connections, called channels or time slots, onto a single link. T1 is also called DS1.

The T1 data stream is broken into frames. Each frame consists of a single framing bit and 24 8-bit channels, totaling 193 bits per T1 frame. Frames are transmitted 8,000 times per second, at a data transmission rate of 1.544 Mbps (8,000 x 193 = 1.544 Mbps).

As each frame is received and processed, the data in each 8-bit channel is maintained with the channel data from previous frames, enabling T1 traffic to be separated into 24 separate flows across a single medium. For example, in the following set of 4-channel frames (without a framing bit), the data in channel 1 consists of the first octet of each frame, the data in channel 2 consists of the second octet of each frame, and so on:

|         | Chan. 1    | Chan. 2    | Chan. 3    | Chan. 4    |
|---------|------------|------------|------------|------------|
| Frame 1 | [10001100] | [00110001] | [11111000] | [10101010] |
| Frame 2 | [11100101] | [01110110] | [10001000] | [11001010] |
| Frame 3 | [00010100] | [00101111] | [11000001] | [00000001] |

## E1 Overview

E1 is the European format for DS1 digital transmission. E1 links are similar to T1 links except that they carry signals at 2.048 Mbps. Each signal has 32 channels, and each channel transmits at 64 Kbps. E1 links have higher bandwidth than T1 links because they use all 8 bits of a channel. T1 links use 1 bit in each channel for overhead.

## T1 and E1 Signals

T1 and E1 interfaces consist of two pairs of wires—a transmit data pair and a receive data pair. Clock signals, which determine when the transmitted data is sampled, are embedded in the T1 and E1 transmissions.

Typical digital signals operate by sending either zeros (0s) or ones (1s), which are usually represented by the absence or presence of a voltage on the line. The receiving device need only detect the presence of the voltage on the line at the particular sampling edge to determine whether the signal is 0 or 1. T1 and E1, however, use bipolar electrical pulses. Signals are represented by no voltage (0), positive voltage (1), or negative voltage (1). The bipolar signal allows T1 and E1 receivers to detect error conditions in the line, depending on the type of encoding that is being used.

## Encoding

The following are common T1 and E1 encoding techniques:

- Alternate mark inversion (AMI)—T1 and E1
- Bipolar with 8-zero substitution (B8ZS)—T1 only
- High-density bipolar 3 code (HDB3)—E1 only

### AMI Encoding

---

AMI encoding forces the 1s signals on a T1 or E1 line to alternate between positive and negative voltages for each successive 1 transmission, as in this sample data transmission:

```
1 1 0 1 0 1 0 1
+ - 0 + 0 - 0 +
```

When AMI encoding is used, a data transmission with a long sequence of 0s has no voltage transitions on the line. In this situation, devices have difficulty maintaining clock synchronization, because they rely on the voltage fluctuations to constantly synchronize with the transmitting clock. To counter this effect, the number of consecutive 0s in a data stream is restricted to 15. This restriction is called the 1s density requirement, because it requires a certain number of 1s for every 15 0s that are transmitted.

On an AMI-encoded line, two consecutive pulses of the same polarity—either positive or negative—are called a bipolar violation (BPV), which is generally flagged as an error.

### B8ZS and HDB3 Encoding

---

Neither B8ZS nor HDB3 encoding restricts the number of 0s that can be transmitted on a line. Instead, these encoding methods detect sequences of 0s and substitute bit patterns

for the sequences to provide the signal oscillations required to maintain timing on the link.

The B8ZS encoding method for T1 lines detects sequences of eight consecutive 0 transmissions and substitutes a pattern of two consecutive BPVs (11110000). Because the receiving end uses the same encoding, it detects the BPVs as 0s substitutions, and no BPV error is flagged. A single BPV, which does not match the 11110000 substitution bit sequence is likely to generate an error, depending on the configuration of the device.

The HDB3 encoding method for E1 lines detects sequences of four consecutive 0 transmissions and substitutes a single BPV (1100). Similar to B8ZS encoding, the receiving device detects the 0s substitutions and does not generate a BPV error.

## T1 and E1 Framing

T1 interfaces use extended superframe (ESF). E1 interfaces use G.704 framing or G.704 with no CRC4 framing, or can be in unframed mode.

### ESF Framing for T1

ESF extends the D4 superframe from 12 frames to 24 frames. By expanding the size of the superframe, ESF increases the number of bits in the superframe framing pattern from 12 to 24. The extra bits are used for frame synchronization, error detection, and maintenance communications through the facilities data link (FDL).

The ESF pattern for synchronization bits is 001011. Only the framing bits from frames 4, 8, 12, 16, 20, and 24 in the superframe sequence are used to create the synchronization pattern.

The framing bits from frames 2, 6, 10, 14, 18, and 22 are used to pass a CRC code for each superframe block. The CRC code verifies the integrity of the received superframe and detects bit errors with a CRC6 algorithm.

The framing bits for frames 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, and 23 are used for the data link channel. These 12 bits enable the operators at the network control center to query the remote equipment for information about the performance of the link.

## T1 and E1 Loopback Signals

The control signal on a T1 or E1 link is the loopback signal. Using the loopback signal, the operators at the network control center can force the device at the remote end of a link to retransmit its received signals back onto the transmit path. The transmitting device can then verify that the received signals match the transmitted signals, to perform end-to-end checking on the link.

Two loopback signals are used to perform the end-to-end testing:

- The loop-up command signal sets the link into loopback mode, with the following command pattern:  
`...100001000010000100...`
- The loop-down signal returns the link to its normal mode, with the following command pattern:

...100100100100100100...

While the link is in loopback mode, the operator can insert test equipment onto the line to test its operation.

## Example: Configuring a T1 Interface

This example shows how to complete the initial configuration on a T1 interface.

- [Requirements on page 2466](#)
- [Overview on page 2466](#)
- [Configuration on page 2466](#)
- [Verification on page 2467](#)

### Requirements

Before you begin, install a PIM, connect the interface cables to the ports, and power on the device. See the *Getting Started Guide* for your device.

### Overview

This example describes the initial configuration that you must complete on each network interface. In this example, you configure the t1-1/0/0 interface as follows:

- You create the basic configuration for the new interface by setting the encapsulation type to ppp. You can enter additional values for physical interface properties as needed.
- You set the logical interface to 0. Note that the logical unit number can range from 0 through 16,384. You can enter additional values for properties you need to configure on the logical interface, such as logical encapsulation or protocol family.

### Configuration

**CLI Quick  
Configuration**

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter commit from configuration mode.

```
set interfaces t1-1/0/0 encapsulation ppp unit 0
```

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a T1 interface:

1. Create the interface.

```
[edit]
user@host# edit interfaces t1-1/0/0
```

2. Create the basic configuration for the new interface.

```
[edit interfaces t1-1/0/0]
user@host# set encapsulation ppp
```

3. Add logical interfaces.

```
[edit interfaces t1-1/0/0]
user@host# set unit 0
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show interfaces** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
...
t1-1/0/0 {
 encapsulation ppp;
 unit 0;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Link State of All Interfaces on page 2467](#)
- [Verifying Interface Properties on page 2468](#)

### Verifying the Link State of All Interfaces

**Purpose** By using the ping tool on each peer address in the network, verify that all interfaces on the device are operational.

**Action** For each interface on the device:

1. In the J-Web interface, select **Troubleshoot>Ping Host**.
2. In the Remote Host box, type the address of the interface for which you want to verify the link state.
3. Click **Start**. The output appears on a separate page.

```
PING 10.10.10.10 : 56 data bytes
64 bytes from 10.10.10.10: icmp_seq=0 ttl=255 time=0.382 ms
64 bytes from 10.10.10.10: icmp_seq=1 ttl=255 time=0.266 ms
```

If the interface is operational, it generates an ICMP response. If this response is received, the round-trip time, in milliseconds, is listed in the time field.

### Verifying Interface Properties

---

**Purpose** Verify that the interface properties are correct.

**Action** From the operational mode, enter the **show interfaces detail** command.

The output shows a summary of interface information. Verify the following information:

- The physical interface is Enabled. If the interface is shown as Disabled, do one of the following:
  - In the CLI configuration editor, delete the **disable** statement at the [edit interfaces t1-1/0/0] level of the configuration hierarchy.
  - In the J-Web configuration editor, clear the **Disable** check box on the Interfaces> t1-1/0/0 page.
- The physical link is Up. A link state of Down indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- The Last Flapped time is an expected value. It indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect expected input and output rates. Verify that the number of input and output bytes and packets matches expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics t1-1/0/0** command.

### Example: Deleting a T1 Interface

---

This example shows how to delete a T1 interface.

- [Requirements on page 2468](#)
- [Overview on page 2468](#)
- [Configuration on page 2469](#)
- [Verification on page 2469](#)

#### Requirements

No special configuration beyond device initialization is required before configuring an interface.

#### Overview

In this example, you delete the t1-1/0/0 interface.

**NOTE:** Performing this action removes the interface from the software configuration and disables it. Network interfaces remain physically present, and their identifiers continue to appear on the J-Web pages.

## Configuration

### Step-by-Step Procedure

To delete a T1 interface:

1. Specify the interface you want to delete.  

```
[edit interfaces]
user@host# delete t1-1/0/0
```
2. If you are done configuring the device, commit the configuration.  

```
[edit interfaces]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show interfaces** command.

## Understanding T3 and E3 Interfaces

---

T3 is a high-speed data-transmission medium formed by multiplexing 28 DS1 signals into seven separate DS2 signals, and combining the DS2 signals into a single DS3 signal. T3 links operate at 43.736 Mbps. T3 is also called DS3.

E3 is the equivalent European transmission format. E3 links are similar to T3 (DS3) links, but carry signals at 34.368 Mbps. Each signal has 16 E1 channels, and each channel transmits at 2.048 Mbps. E3 links use all 8 bits of a channel, whereas T3 links use 1 bit in each channel for overhead.

- [Multiplexing DS1 Signals on page 2471](#)
- [DS2 Bit Stuffing on page 2472](#)
- [DS3 Framing on page 2472](#)

## Multiplexing DS1 Signals

Four DS1 signals combine to form a single DS2 signal. The four DS1 signals form a single DS2 M-frame, which includes subframes M1 through M4. Each subframe has six 49-bit blocks, for a total of 294 bits per subframe. The first bit in each block is a DS2 overhead (OH) bit. The remaining 48 bits are DS1 information bits.

[Figure 115](#) shows the DS2 M-frame format.

**Figure 115: DS2 M-Frame Format**

The four DS2 subframes are not four DS1 channels. Instead, the DS1 data bits within the subframes are formed by data interleaved from the DS1 channels. The  $O_n$  values designate time slots devoted to DS1 inputs as part of the bit-by-bit interleaving process. After every 48 DS1 information bits (12 bits from each signal), a DS2 OH bit is inserted to indicate the start of a subframe.

## DS2 Bit Stuffing

Because the four DS1 signals are asynchronous signals, they might operate at different line rates. To synchronize the asynchronous streams, the multiplexers on the line use bit stuffing.

A DS2 connection requires a nominal transmit rate of 6.304 Mbps. However, because multiplexers increase the overall output rate to the intermediate rate of 6.312 Mbps, the output rate is higher than individual input rates on DS1 signals. The extra bandwidth is used to stuff the incoming DS1 signals with extra bits until the output rate of each signal equals the increased intermediate rate. These stuffed bits are inserted at fixed locations in the DS2 M-frame. When DS2 frames are received and the signal is demultiplexed, the stuffing bits are identified and removed.

## DS3 Framing

A set of four DS1 signals is multiplexed into seven DS2 signals, which are multiplexed into a single DS3 signal. The multiplexing occurs just as with DS1-to-DS2 multiplexing. The resulting DS3 signal uses either the standard M13 asynchronous framing format or the C-bit parity framing format. Although the two framing formats differ in their use of control and message bits, the basic frame structures are identical. The DS3 frame structures are shown in [Figure 116](#) and [Figure 117](#).

### M13 Asynchronous Framing

A DS3 M-frame includes seven subframes, formed by DS2 data bits interleaved from the seven multiplexed DS2 signals. Each subframe has eight 85-bit blocks—a DS3 OH bit plus 84 data bits. The meaning of an OH bit depends on the block it precedes. Standard DS3 M13 asynchronous framing format is shown in [Figure 116](#).

Figure 116: DS3 M13 Frame Format

A DS3 M13 M-frame contains the following types of OH bits:

- Framing bits (F-bits)—Make up a frame alignment signal that synchronizes DS3 subframes. Each DS3 frame contains 28 F-bits (4 bits per subframe). F-bits are located at the beginning of blocks 2, 4, 6, and 8 of each subframe. When combined, the frame alignment pattern for each subframe is 1001. The pattern can be examined to detect bit errors in the transmission.
- Multiframe bits (M-bits)—Make up a multiframe alignment signal that synchronizes the M-frames in a DS3 signal. Each DS3 frame contains 3 M-bits, which are located at the beginning of subframes 5, 6, and 7. When combined, the multiframe alignment pattern for each M-frame is 010.
- Bit stuffing control bits (C-bits)—Serve as bit stuffing indicators for each DS2 input. For example, C<sub>11</sub>, C<sub>12</sub>, and C<sub>13</sub> are indicators for DS2 input 1. Their values indicate whether DS3 bit stuffing has occurred at the multiplexer. If the three C-bits in a subframe are all 0s, no stuffing was performed for the DS2 input. If the three C-bits are all 1s, stuffing was performed.
- Message bits (X-bits)—Used by DS3 transmitters to embed asynchronous in-service messages in the data transmission. Each DS3 frame contains 2 X-bits, which are located at the beginning of subframes 1 and 2. Within an DS3 M-frame, both X-bits must be identical.
- Parity bits (P-bits)—Compute parity over all but 1 bit of the M-frame. (The first X-bit is not included.) Each DS3 frame contains 2 P-bits, which are located at the beginning of subframes 3 and 4. Both P-bits must be identical.

If the previous DS3 frame contained an odd number of 1s, both P-bits are set to 1. If the previous DS3 contained an even number of 1s, both P-bits are set to 0. If, on the receiving

side, the number of 1s for a given frame does not match the P-bits in the following frame, it indicates one or more bit errors in the transmission.

### C-Bit Parity Framing

In M13 framing, every C-bit in a DS3 frame is used for bit stuffing. However, because multiplexers first use bit stuffing when multiplexing DS1 signals into DS2 signals, the incoming DS2 signals are already synchronized. Therefore, the bit stuffing that occurs when DS2 signals are multiplexed is redundant.

C-bit parity framing format redefines the function of C-bits and X-bits, using them to monitor end-to-end path performance and provide in-band data links. The C-bit parity framing structure is shown in [Figure 117](#).

**Figure 117: DS3 C-Bit Parity Framing**

In C-bit parity framing, the X-bits transmit error conditions from the far end of the link to the near end. If no error conditions exist, both X-bits are set to 1. If an out-of-frame (OOF) or alarm indication signal (AIS) error is detected, both X-bits are set to 0 in the upstream direction for 1 second to notify the other end of the link about the condition.

The C-bits that control bit stuffing in M13 frames are typically used in the following ways by C-bit parity framing:

- Application identification channel (AIC)—The first C-bit in the first subframe identifies the type of DS3 framing used. A value of 1 indicates that C-bit parity framing is in use.
- N<sub>a</sub>—A reserved network application bit.
- Far-end alarm and control (FEAC) channel—The third C-bit in the first subframe is used for the FEAC channel. In normal transmissions, the FEAC C-bit transmits all 1s.

When an alarm condition is present, the FEAC C-bit transmits a code word in the format **0xxxxxx 1111111**, in which x can be either 1 or 0. Bits are transmitted from right to left.

[Table 269](#) lists some C-bit code words and the alarm or status condition indicated.

**Table 269: FEAC C-Bit Condition Indicators**

| Alarm or Status Condition                                                                                              | C-Bit Code Word   |
|------------------------------------------------------------------------------------------------------------------------|-------------------|
| DS3 equipment failure requires immediate attention.                                                                    | 00110010 11111111 |
| DS3 equipment failure occurred—such as suspended, not activated, or unavailable service—that is non-service-affecting. | 00011110 11111111 |
| DS3 loss of signal.                                                                                                    | 00011100 11111111 |
| DS3 out of frame.                                                                                                      | 00000000 11111111 |
| DS3 alarm indication signal (AIS) received.                                                                            | 00101100 11111111 |
| DS3 idle received.                                                                                                     | 00110100 11111111 |
| Common equipment failure occurred that is non-service-affecting.                                                       | 00011101 11111111 |
| Multiple DS1 loss of signal.                                                                                           | 00101010 11111111 |
| DS1 equipment failure occurred that requires immediate attention.                                                      | 00001010 11111111 |
| DS1 equipment failure occurred that is non-service-affecting.                                                          | 00000110 11111111 |
| Single DS1 loss of signal.                                                                                             | 00111100 11111111 |

- **Data links**—The 12 C-bits in subframes 2, 5, 6, and 7 are data link (DL) bits for applications and terminal-to-terminal path maintenance.
- **DS3 parity**—The 3 C-bits in the third subframe are DS3 parity C-bits (also called CP-bits). When a DS3 frame is transmitted, the sending device sets the CP-bits to the same value as the P-bits. When the receiving device processes the frame, it calculates the parity of the M-frame and compares this value to the parity in the CP-bits of the following M-frame. If no bit errors have occurred, the two values are typically the same.
- **Far-end block errors (FEBEs)**—The 3 C-bits in the fourth subframe make up the far-end block error (FEBE) bits. If a framing or parity error is detected in an incoming M-frame (via the CP-bits), the receiving device generates a C-bit parity error and sends an error notification to the transmitting (far-end) device. If an error is generated, the FEBE bits are set to 000. If no error occurred, the bits are set to 111.

### Requirements

Before you begin, install a PIM, connect the interface cables to the ports, and power on the device. See the *Getting Started Guide* for your device.

### Overview

This example describes the initial configuration that you must complete on each network interface. In this example, you configure the t3-1/0/0 interface as follows:

- You create the basic configuration for the new interface by setting the encapsulation type to ppp. You can enter additional values for physical interface properties as needed.
- You set the logical interface to 0. Note that the logical unit number can range from 0 to 16,384. You can enter additional values for properties you need to configure on the logical interface, such as logical encapsulation or protocol family.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter commit from configuration mode.

```
set interfaces t3-1/0/0 encapsulation ppp unit 0
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a T3 interface:

1. Create the interface.

```
[edit]
user@host# edit interfaces t3-1/0/0
```

2. Create the basic configuration for the new interface.

```
[edit interfaces t3-1/0/0]
user@host# set encapsulation ppp
```

3. Add logical interfaces.

```
[edit interfaces t3-1/0/0]
user@host# set unit 0
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show interfaces** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
...
t3-1/0/0 {
 encapsulation ppp;
 unit 0;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Link State of All Interfaces on page 2477](#)
- [Verifying Interface Properties on page 2477](#)

### Verifying the Link State of All Interfaces

**Purpose** By using the ping tool on each peer address in the network, verify that all interfaces on the device are operational.

**Action** For each interface on the device:

1. In the J-Web interface, select **Troubleshoot>Ping Host**.
2. In the Remote Host box, type the address of the interface for which you want to verify the link state.
3. Click **Start**. The output appears on a separate page.

```
PING 10.10.10.10 : 56 data bytes
64 bytes from 10.10.10.10: icmp_seq=0 ttl=255 time=0.382 ms
64 bytes from 10.10.10.10: icmp_seq=1 ttl=255 time=0.266 ms
```

If the interface is operational, it generates an ICMP response. If this response is received, the round-trip time in milliseconds is listed in the time field.

### Verifying Interface Properties

**Purpose** Verify that the interface properties are correct.

**Action** From the operational mode, enter the **show interfaces detail** command.

The output shows a summary of interface information. Verify the following information:

- The physical interface is Enabled. If the interface is shown as Disabled, do one of the following:
  - In the CLI configuration editor, delete the **disable** statement at the [edit interfaces t3-1/0/0] level of the configuration hierarchy.
  - In the J-Web configuration editor, clear the **Disable** check box on the Interfaces> t3-1/0/0 page.
- The physical link is Up. A link state of Down indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- The Last Flapped time is an expected value. It indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect expected input and output rates. Verify that the number of input and output bytes and packets matches expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics t3-1/0/0** command.

- [Example: Configuring the 1-Port Clear Channel DS3/E3 GPIM for E3 Port Mode on page 2486](#)

## Understanding the 1-Port Clear Channel DS3/E3 GPIM

---

The 1-Port Clear Channel DS3/E3 Gigabit-Backplane Physical Interface Module (GPIM) for the SRX650 device functions as a clear channel interface that can support full-duplex DS3 (T3) or E3 line rates of 44.796 or 34.368 Mbps, respectively. The DS3/E3 interface is a popular high-bandwidth WAN interface for large enterprise branch locations that enables high-quality voice, video, and data applications with reduced latency. The GPIM device does not support channelization, but it supports a subrate DS3/E3 configuration.

This topic includes the following sections:

- [Supported Features on page 2481](#)
- [Interface Naming on page 2482](#)
- [Physical Interface Settings on page 2482](#)
- [Logical Interface Settings on page 2482](#)

## Supported Features

The clear channel implementation provides such features as subrate and scrambling options used by major DSU vendors. The following key features are available depending on the interface and mode selections:

- Framed and unframed DS3 (default) and E3 port modes
- Support for frame relay, point-to-point, and HDLC serial encapsulation protocols
- Support for popular vendor algorithms for subrate and payload scrambling

- Support for generation and detection of loopback control codes (line-loopback activate and deactivate) and FEAC codes
- External and internal clocking support
- Support for DS3 and E3 network alarms
- Support for chassis clusters
- Support for anti-counterfeit check
- Loopback (local, remote, and payload) and BERT/PRBS/QRSS diagnostics support
- MTU size of 4474 bytes (default) and 9192 bytes (maximum)

## Interface Naming

The following format represents the 1-Port Clear Channel DS3/E3 GPIM interface names:

*type-fpc/pic/port*

where:

- *type*—Media type (T3 or E3)
- *fpc*—Number of the Flexible PIC Concentrator (FPC) card on which the physical interface is located
- *pic*—Number of the PIC on which the physical interface is located
- *port*—Specific port on the PIC

Examples: **t3-1/0/0** and **e3-2/0/0**

## Physical Interface Settings

The 1-Port Clear Channel DS3/E3 GPIM supports IP configurations. Using the CLI, you can configure the 1-Port Clear Channel DS3/E3 GPIM to operate in either DS3 or E3 mode. By default, at installation the physical interface, t3-x/y/z, is enabled on the GPIM port operating in DS3 mode with T3 framing.

You can reset the mode of the physical interface to E3 using the **edit chassis** command:

```
[edit]
user@host# set chassis fpc 1 pic 0 port 0 framing e3
```

## Logical Interface Settings

The logical interface for the device is determined by setting the **t3-options** or **e3-options** of the **edit interfaces** command.

You can specify the MTU size for the GPIM interface. Junos OS supports an MTU value of 4474 bytes for the default value or up to 9192 bytes for maximum jumbo GPIM implementations.

[Table 270](#) identifies network interface specifications for DS3 or E3 modes.

Table 270: 1-Port Clear Channel DS3/E3 GPIM Interface Options

| Description                       | DS3 Mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | E3 Mode                                                                                                                                                                                                                                                                                                                                                                   |

## Example: Configuring the 1-Port Clear-Channel DS3/E3 GPIM for M23 Mapping Mode

The following example configures the GPIM in DS3 with M23 mapping mode. Note that M23 mapping does not provide C-bit parity.

- [Requirements on page 2484](#)
- [Overview on page 2484](#)
- [Configuration on page 2484](#)

### Requirements

Before you begin:

- Install the device as specified in the *SRX Series Services Physical Interface Modules Hardware Guide*.

### Overview

This example configures the basic T3 interface and modifies the framing to M23 mode without C-bit parity.

### Configuration

#### Step-by-Step Procedure

To configure the GPIM:

1. Verify the installation, location, and status of the GPIM. In this example, the GPIM is installed in slot 8/PIC 0 and is currently online.

```
user@host> show chassis fpc pic-status
```

```
Slot 0 Online FPC
 PIC 0 Online 4x GE Base PIC
Slot 2 Offline FPC
Slot 5 Offline FPC
Slot 6 Online FPC
 PIC 0 Online 4x CT1E1 gPIM
Slot 7 Offline FPC
Slot 8 Online FPC
 PIC 0 Online 1x CLR CH T3/E3
```

2. Set the IP address for the logical interface.

```
[edit]
```

```
user@host# set interfaces t3-8/0/0 unit 0 family inet address interface
192.107.1.230/24
```

3. Set the MTU value to 9018.  

```
[edit]
user@host# set interfaces t3-8/0/0 unit 0 family inet mtu 9018
```
4. Set the framing mode.  

```
[edit]
user@host# set interfaces t3-8/0/0 t3-options m23
```
5. Disable C-bit parity for M23 mode.  

```
[edit]
user@host# set interfaces t3-8/0/0 t3-options no-cbit-parity
```
6. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```
7. To verify the configuration for your device, enter the following operational command:  

```
user@host> show interfaces t3-8/0/0 extensive
```

## ADSL Interface Overview

Selected Juniper Networks security devices support DSL features including ATM-over-ADSL and ATM-over-SHDSL interfaces.

**NOTE:** Payload loopback functionality is not supported on ATM-over-SHDSL interfaces.

Asymmetric digital subscriber line (ADSL) technology is part of the xDSL family of modem technologies that use existing twisted-pair telephone lines to transport high-bandwidth data. ADSL lines connect service provider networks and customer sites over the "last mile" of the network—the loop between the service provider and the customer site.

ADSL transmission is asymmetric because the downstream bandwidth is typically greater than the upstream bandwidth. The typical bandwidths of ADSL, ADSL2, and ADSL2+ circuits are defined in [Table 271](#).

**Table 271: Standard Bandwidths of DSL Operating Modes**

| Operating Modes | Upstream       | Downstream |
|-----------------|----------------|------------|
| ADSL            | 800 Kbps–1Mbps | 8 Mbps     |
| ADSL2           | 1–1.5 Mbps     | 12–14 Mbps |
| ADSL2+          | 1–1.5 Mbps     | 24–25 Mbps |

Table 271: Standard Bandwidths of DSL Operating Modes (*continued*)

| Operating Modes | Upstream   | Downstream |
|-----------------|------------|------------|
| ADSL2+ Annex M  | 2.5–3 Mbps | 25 Mbps    |

ADSL, ADSL2, and ADSL2+ support the following standards:

- For Annex A:
  - ITU G.992.1 (ADSL)
- For Annex A only:
  - ANSI T1.413 Issue II
  - ITU G.992.3 (ADSL2)
  - ITU G.992.5 (ADSL2+)
- For Annex M:
  - ITU G.992.3 (ADSL2)
  - ITU G.992.5 (ADSL2+)
- For Annex B:
  - ITU G.992.1 (ADSL)
  - ITU G.992.3 (ADSL2)
  - ITU G.992.5 (ADSL2+)
- For Annex B only
  - ETSI TS 101 388 V1.3

The ADSL Mini-PIM facilitates a maximum of 10 virtual circuits on supported security devices.

Supported security devices with Mini-PIMs can use PPP over Ethernet over ATM (PPPoEoA) and PPP over ATM (PPPoA) to connect through ADSL lines only.

## ADSL Systems

ADSL links run across twisted-pair telephone wires. When ADSL modems are connected to each end of a telephone wire, a dual-purpose ADSL circuit can be created. Once established, the circuit can transmit lower-frequency voice traffic and higher-frequency data traffic.

To accommodate both types of traffic, ADSL modems are connected to plain old telephone service (POTS) splitters that filter out the lower-bandwidth voice traffic and the higher-bandwidth data traffic. The voice traffic can be directed as normal telephone voice traffic. The data traffic is directed to the ADSL modem, which is typically connected to the data network.

## ADSL2 and ADSL2+

The ADSL2 and ADSL2+ standards were adopted by the ITU in July 2002. ADSL2 improves the data rate and reach performance, diagnostics, standby mode, and interoperability of ADSL modems.

ADSL2+ doubles the possible downstream data bandwidth, enabling rates of 20 Mbps on telephone lines shorter than 5000 feet (1.5 km).

ADSL2 uses seamless rate adaptation (SRA) to change the data rate of a connection during operation with no interruptions or bit errors. The ADSL2 transceiver detects changes in channel conditions—for example, the failure of another transceiver in a multicarrier link—and sends a message to the transmitter to initiate a data rate change. The message includes data transmission parameters such as the number of bits modulated and the power on each channel. When the transmitter receives the information, it transitions to the new transmission rate.

## ATM CoS Support

Certain class-of-service (CoS) components for Asynchronous Transmission Mode (ATM) are provided to control data transfer, especially for time-sensitive voice packets. The ADSL Mini-PIM on the SRX210 device provides extended ATM CoS functionality to provide cells across the network. You can define bandwidth utilization, which consists of either a constant rate or a peak cell rate, with sustained cell rate and burst tolerance. By default, unspecified bit rate (UBR) is used because the bandwidth utilization is unlimited.

The following ATM traffic shaping features are supported:

|                                                  |                                                                                                                                                                                                                 |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Constant bit rate (CBR)</b>                   | CBR is the service category for traffic with rigorous timing requirements like voice and certain types of video. CBR traffic needs a constant cell transmission rate throughout the duration of the connection. |
| <b>Variable bit rate non-real-time (VBR-NRT)</b> | VBR-NRT is intended for sources such as data transfer, which do not have strict time or delay requirements. VBR-NRT is suitable for packet data transfers.                                                      |
| <b>Unspecified bit rate (UBR)</b>                | UBR is ATM's best-effort service, which does not provide any CoS guarantees. This is suitable for noncritical applications that can tolerate or quickly adjust to loss of cells.                                |

The ability of a network to guarantee class of service depends on the way in which the source generates cells and also on the availability of network resources. The connection contract between the user and the network thus contains information about the way in which traffic is generated by the source.

A set of traffic descriptors is specified for this purpose. The network provides the class of service for the cells that do not violate these specifications. The following are the traffic descriptors specified for an ATM network:

- Peak cell rate (PCR)—Top rate at which traffic can burst.
- Sustained cell rate (SCR)—Normal traffic rate averaged over time.

- Maximum burst size (MBS)—The maximum burst size that can be sent at the peak rate.
- Cell delay variation tolerance (CDVT)—Allows the user to delay the traffic for a particular time duration in microseconds to follow a rhythmic pattern.

For traffic that does not require the ability to periodically burst to a higher rate, you can specify a CBR. You can configure VBR-NRT for ATM interfaces, which supports VBR data traffic with average and peak traffic parameters. VBR-NRT is scheduled with a lower priority and with a larger sustained cell rate (SCR) limit, allowing it to recover bandwidth if it falls behind.

On all branch SRX Series devices, the ATM interface takes more than 5 minutes to come up when CPE is configured in ANSI-DMT mode and CO is configured in automode. This occurs only with ALU 7300 DSLAM, due to limitation in current firmware version running on the ADSL Mini-PIM.

## ADSL and SHDSL Interfaces Configuration Overview

---

An SRX Series device with an ADSL interface supports LFI through an MLPPP.

**NOTE:** Currently, Junos OS supports bundling of only one xDSL link under bundle interface.

To support MLPPP encapsulation and the family `mlppp` on the ADSL interface on an SRX Series device, you enable an existing Junos OS CLI.

To establish an ADSL link between network devices, you must use some intermediate connections. First, use an RJ-11 cable to connect the CPE (for example, an SRX Series device) to a DSLAM patch panel to form an ADSL link. Then use OC3 or DS3 to connect the DSLAM to M Series or E Series devices to form an ATM backbone.

You can configure the following properties for the ADSL and SHDSL interfaces:

- Physical properties
- Logical properties

You can configure the following physical properties for the interface:

- ATM virtual path identifier (VPI) options for the interface—for example, at-2/0/0:
  - ATM VPI—A number from 0 through 255—for example, 25.
  - Operation, Maintenance, and Administration (OAM) F5 loopback cell thresholds (“liveness”) on ATM virtual circuits. The range is from 1 through 255, and the default is 5 cells.
    - Down count—Number of consecutive OAM loopback cells an ATM virtual circuit must lose to be identified as unavailable—for example, 200.
    - Up count—Number of consecutive OAM loopback cells an ATM virtual interface must receive to be identified as operational—for example, 200.
  - OAM period—Interval, in seconds, at which OAM cells are transmitted on ATM virtual circuits—for example, 100. The range is from 1 through 900 seconds.
- Configure CBR for the interface—for example, at-1/0/0.
  - CBR—Range from 33,000 through 1,199,920
  - CDVT—Range from 1 through 9,999
- Configure VBR for the interface—for example, at-1/0/0.
  - MBS—Range from 33,000 through 1,199,920
  - CDVT—Range from 1 through 9,999
  - PCR—Range from 33,000 through 1,199,920
  - SCR—Range from 33,000 through 1,199,920
- Type of DSL operating mode for the ATM-over-ADSL and ATM-over-SHDSL interfaces—for example, auto:

Annex A (used in North American network implementations) and Annex B (used in European network implementations) support the following operating modes:

- **auto**—Configures the ADSL interface to autonegotiate settings with the DSLAM located at the central office. For Annex A, the ADSL interface trains in either ANSI T1.413 Issue II mode or ITU G.992.1 mode. For Annex B, the ADSL interface trains in ITU G.992.1 mode. For the SHDSL interface, the line rate is available only in two-wire mode and is the default value.
- **itu-dmt**—Configures the ADSL interface to train in ITU G.992.1 mode.
- **192 Kbps or higher**—Speed of transmission of data on the SHDSL connection. For the SHDSL interface, in the four-wire mode, the default line rate is 4,608 Kbps.

Annex A supports the following operating modes:

- **adsl2plus**—Configures the ADSL interface to train in ITU G.992.5 mode. You can configure this mode only when it is supported on the DSLAM.
- **itu-dmt-bis**—Configures the ADSL interface to train in ITU G.992.3 mode. You can configure this mode only when it is supported on the DSLAM.
- **ansi-dmt**—Configures the ADSL interface to train in the ANSI T1.413 Issue II mode.

Annex B supports the following operating modes:

- **etsi**—Configures the ADSL line to train in the ETSI TS 101 388 V1.3.1 mode.
- **itu-annexb-ur2**—Configures the ADSL line to train in the G.992.1 Deutsche Telekom UR-2 mode.
- **itu-annexb-non-ur2**—Configures the ADSL line to train in the G.992.1 Non-UR-2 mode.
- Loopback option for testing the SHDSL connection integrity—for example, local loopback.

The following values are available:

- **local**—Used for testing the SHDSL equipment with local network devices.
- **payload**—Used to command the remote configuration to send back the received payload.
- **remote**—Used to test SHDSL with a remote network configuration.
- Signal-to-noise ratio (SNR) margin—for example, 5 dB for either or both of the following thresholds:
  - **current**—Line trains at higher than current noise margin plus SNR threshold. The range is from 0 to 10 dB. The default value is 0.
  - **snext**—Line trains at higher than self-near-end crosstalk (SNEXT) threshold. The default value is **disabled**.

Setting the SNR creates a more stable SHDSL connection by making the line train at a SNR margin higher than the threshold. If any external noise below the threshold is applied to the line, the line remains stable. You can also disable the SNR margin thresholds.

- Encapsulation type—for example, ethernet-over-atm:
  - **atm-pvc**—ATM permanent virtual circuits is the default encapsulation for ATM-over-ADSL and ATM-over-SHDSL interfaces.  
  
For PPP over ATM (PPPoA)-over-ADSL and over-SHDSL interfaces, use this type of encapsulation.
  - **ethernet-over-atm**—Ethernet over ATM encapsulation.  
  
For PPP over Ethernet (PPPoE) over ATM-over-ADSL and ATM-over-SHDSL interfaces that carry IPv4 traffic, use this type of encapsulation.

You can configure the following logical properties for the interface:

- Logical interface. Set a value from 0 through 16,385—for example, 3. Add other values if required by your network.
- Configure encapsulation for the ATM-for-ADSL or ATM-for-SHDSL logical unit—for example, atm-nlpid.

The following encapsulations are supported on the ATM-over-ADSL and ATM-over-SHDSL interfaces that use inet (IP) protocols only:

- **atm-vc-mux**—Use ATM virtual circuit multiplex encapsulation.
- **atm-nlpid**—Use ATM network layer protocol identifier (NLPID) encapsulation.
- **atm-cisco-nlpid**—Use Cisco NLPID encapsulation.
- **ether-over-atm-llc**—For interfaces that carry IPv4 traffic, use Ethernet over LLC encapsulation. You cannot configure multipoint interfaces if you use this type of encapsulation.

The following encapsulations are supported on the ATM-over-ADSL or ATM-over-SHDSL for PPP-over-ATM (PPPoA) interfaces only:

- **atm-ppp-llc**—AAL5 logical link control (LLC) encapsulation.
- **atm-ppp-vc-mux**—Use AAL5 multiplex encapsulation.

Other encapsulation types supported on the ATM-over-ADSL and ATM-over-SHDSL interfaces are:

- **ppp-over-ether-over-atm-llc**—Use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead you configure the interface address on the PPP interface.
- **atm-snap**—Use ATM subnetwork attachment point (SNAP) encapsulation.
- OAM options for the ATM virtual circuits:
  - OAM F5 loopback cell thresholds (“liveness”) on ATM virtual circuits. The range is from 1 through 255, and the default is 5 cells.
    - Down count—Number of consecutive OAM loopback cells an ATM virtual circuit must lose to be identified as unavailable—for example, 200.
    - Up count—Number of consecutive OAM loopback cells an ATM virtual interface must receive to be identified as operational—for example, 200.
  - OAM period—Interval, in seconds, at which OAM cells are transmitted on ATM virtual circuits—for example, 100. The range is from 1 through 900 seconds.
- Family protocol type—for example, inet. Commands vary depending on the protocol type.
- ATM VCI options for the interface:
  - ATM VCI type—vci
  - ATM VCI value—A number from 0 through 4,089—for example, 35—with VCIs 0 through 31 reserved.

## Example: Configuring ATM-over-SHDSL Network Interfaces

This example shows how to configure ATM-over-SHDSL network interfaces.

- [Requirements on page 2498](#)
- [Overview on page 2498](#)
- [Configuration on page 2498](#)
- [Verification on page 2501](#)

### Requirements

Before you begin:

- Configure network interfaces as necessary. See [“Understanding Ethernet Interfaces” on page 2629](#).
- Configure PPPoE encapsulation on an Ethernet interface or on an ATM-over-ADSL interface. See [“Understanding Point-to-Point Protocol over Ethernet” on page 2731](#).

### Overview

In this example, you set the ATM-over-SHDSL mode on the G.SHDSL interface, if required. You create an interface called at-2/0/0 and configure the physical properties for the interface. You configure the encapsulation type and annex type. You specify the SHDSL line rate for the ATM-over-SHDSL interface and the loopback address for testing the SHDSL connection integrity. Then you configure the SNR margin, set the logical interface, and configure the encapsulation for the ATM-over-SHDSL logical unit.

Additionally, you configure the OAM liveness values for an ATM virtual circuit and set the OAM period. Finally, you add the family protocol type inet and configure the VCI value.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set chassis fpc 6 pic 0 shdsl pic-mode 1-port-atm
set interfaces at-2/0/0 atm-options vpi 25 oam-liveness up-count 200 down-count 200
set interfaces at-2/0/0 atm-options vpi 25 oam-period 100
set interfaces at-2/0/0 encapsulation ethernet-over-atm shdsl-options annex annex-a
set interfaces at-2/0/0 encapsulation ethernet-over-atm shdsl-options line-rate auto
set interfaces at-2/0/0 encapsulation ethernet-over-atm shdsl-options loopback local
```

```

set interfaces at-2/0/0 encapsulation ethernet-over-atm shdsl-options snr-margin
current 5 snext 5
set interfaces at-2/0/0 unit 3 encapsulation atm-nlpid
set interfaces at-2/0/0 unit 3 oam-liveness up-count 200 down-count 200
set interfaces at-2/0/0 unit 3 oam-period 100
set interfaces at-2/0/0 unit 3 oam-period 100
set interfaces at-2/0/0 unit 3 vci 35

```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure ATM-over-SHDSL network interfaces for the device:

1. Set the ATM-over-SHDSL mode on the G.SHDSL interface.  

```

[edit]
user@host# set chassis fpc 6 pic 0 shdsl pic-mode 1-port-atm

```
2. Create an interface.  

```

[edit]
user@host# edit interfaces at-2/0/0

```
3. Configure the physical properties for the interface.  

```

[edit interfaces at-2/0/0]
user@host# set atm-options vpi 25
user@host# set atm-options vpi 25 oam-liveness up-count 200 down-count 200
user@host# set atm-options vpi 25 oam-period 100

```
4. Configure the encapsulation type.  

```

[edit interfaces at-2/0/0]
user@host# set encapsulation ethernet-over-atm

```
5. Set the annex type.  

```

[edit]
user@host# edit interfaces at-2/0/0 shdsl-options
user@host# set annex annex-a

```
6. Configure the SHDSL line rate.  

```

[edit interfaces at-2/0/0 shdsl-options]
user@host# set line-rate auto

```
7. Configure the loopback option for testing the SHDSL connection integrity.  

```

[edit interfaces at-2/0/0 shdsl-options]
user@host# set loopback local

```
8. Configure the signal-to-noise ration margin.  

```

[edit interfaces at-2/0/0 shdsl-options]
user@host# set snr-margin current 5
user@host# set snr-margin snext5

```
9. Configure the logical interface.  

```

[edit]
user@host# edit interfaces at-2/0/0 unit 3

```

10. Configure the encapsulation for the logical unit.  

```
[edit interfaces at-2/0/0 unit 3]
user@host# set encapsulation atm-nlpid
```
11. Configure the OAM liveness values for an ATM virtual circuit  

```
[edit interfaces at-2/0/0 unit 3]
user@host# set oam-liveness up-count 200 down-count 200
```
12. Configure the OAM period.  

```
[edit interfaces at-2/0/0 unit 3]
user@host# set oam-period 100
```
13. Add the Family protocol type.  

```
[edit interfaces at-2/0/0 unit 3]
user@host# set family inet
```
14. Configure the VCI value.  

```
[edit interfaces at-2/0/0 unit 3]
user@host# set vci 35
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-2/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-2/0/0
encapsulation ethernet-over-atm;
atm-options {
 vpi 25 {
 oam-period 100;
 oam-liveness {
 up-count 200;
 down-count 200;
 }
 }
}
shdsl-options {
 annex annex-a;
 line-rate auto;
 loopback local;
 snr-margin {
 current 5
 snext 5;
 }
}
unit 3 {
 encapsulation atm-nlpid;
 vci 35;
 oam-period 100;
 oam-liveness {
 up-count 200;
 down-count 200;
```

```

 }
 family inet;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying an ATM-over-SHDSL Configuration

**Purpose** Verify that the interface properties are correct.

**Action** From operational mode, enter the **show interfaces at-2/0/0 extensive** command.

```

user@host> show interfaces at-2/0/0 extensive

 CRC errors :0
 SEGA errors :1
 LOSW errors :0
 Received cells :1155429
 Transmitted cells :1891375
 HEC errors :0
 Cell drop :0

```

The output shows a summary of interface information. Verify the following information:

- The physical interface is enabled. If the interface is shown as disabled, do either of the following:
  - In the CLI configuration editor, delete the **disable** statement at the [edit *interfaces**interface-name*] level of the configuration hierarchy.
  - In the J-Web configuration editor, clear the **Disable** check box on the Interfaces page (*Interfaces*>*interface-name*).
- The physical link is up. A link state of down indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- The last flapped time is an expected value. The last flapped time indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect expected input and output rates. Verify that the number of inbound and outbound bytes and packets matches expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics *interface-name*** command.
- No SHDSL alarms and defects appear that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm.
  - **LOS**—Loss of signal. No signal was detected on the line.
  - **LOSW**—Loss of sync word. A message ID was sent.

- **Power status**—A power failure has occurred.
- **LOSD**—Loss of signal was detected at the remote application interface.
- **ES**—Errored seconds. One or more cyclic redundancy check (CRC) anomalies were detected.
- **SES**—Severely errored seconds. At least 50 CRC anomalies were detected.
- **UAS**—Unavailable seconds. An interval has occurred during which one or more LOSW defects were detected.

Examine the SHDSL interface status:

- **Line termination**—SHDSL transceiver unit—remote (STU—R). (Only customer premises equipment is supported.)
- **Annex**—Either Annex A or Annex B. Annex A is supported in North America, and Annex B is supported in Europe.
- **Line mode**—SHDSL mode configured on the G.SHDSL interface pair, either two-wire or four-wire.
- **Modem status**—Data. Sending or receiving data.
- **Last fail code**—Code for the last interface failure.
- **Framer mode**—ATM Framer mode of the underlying interface.
- **Chipset version**—Version number of the chipset on the interface
- **Firmware version**—Version number of the firmware on the interface.

Examine the operational statistics for a SHDSL interface.

- **Loop attenuation (dB)**—Reduction in signal strength measured in decibels.
- **Transmit power (dB)**—Amount of SHDSL usage in %.
- **Receiver gain (dB)**—Maximum extraneous signal allowed without causing the output to deviate from an acceptable level.
- **SNR sampling (dB)**—Signal-to-noise ratio at a receiver point in decibels.
- **Bit rate (kbps)**—Data transfer speed on the SHDSL interface.
- **CRC errors**—Number of cyclic redundancy check errors.
- **SEGA errors**—Number of segment anomaly errors. A regenerator operating on a segment received corrupted data.
- **LOSW errors**—Number of loss of signal defect errors. Three or more consecutively received frames contained one or more errors in the framing bits.
- **Received cells**—Number of cells received through the interface.
- **Transmitted cells**—Number of cells sent through the interface.
- **HEC errors**—Number of header error checksum errors.
- **Cell drop**—Number of dropped cells on the interface.

## Example: Configuring MLPPP-over-ADSL Interfaces

This example shows how to configure MLPPP on an ADSL interface.

- [Requirements on page 2504](#)
- [Overview on page 2504](#)
- [Configuration on page 2505](#)
- [Verification on page 2505](#)

### Requirements

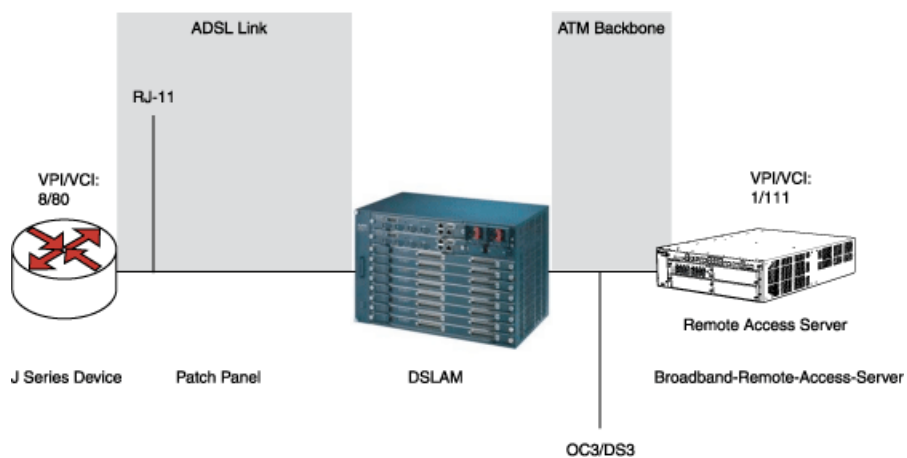

Before you begin, configure network interfaces as necessary. See “[Understanding Ethernet Interfaces](#)” on page 2629.

### Overview

In this example, you set the encapsulation as atm-mlppp-llc for the interface at-5/0/0. You then configure the family MLPPP bundle as lsq-0/0/0.1.

[Figure 118](#) shows a typical example of MLPPP-over-ADSL end-to-end connectivity.

**Figure 118: MLPPP-over-ADSL Interface**

## Configuration

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure MLPPP on an ADSL interface:

1. Configure an interface.  

```
[edit]
user@host# edit interfaces at-5/0/0 unit 0
```
2. Set the MLPPP encapsulation.  

```
[edit interfaces at-5/0/0 unit 0]
user@host# set encapsulation atm-mlppp-llc
```
3. Specify the family MLPPP.  

```
[edit interfaces at-5/0/0 unit 0]
user@host# set family mlppp bundle lsq-0/0/0.1
```
4. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show interfaces at-5/0/0** command.

- Related Documentation**
- [Understanding Interfaces on page 2407](#)
  - [ADSL Interface Overview on page 2491](#)
  - [ADSL and SHDSL Interfaces Configuration Overview on page 2494](#)

## Example: Configuring the DHCP Client on ADSL Interface

This example shows how to configure DHCP client on ADSL or SHDSL or VDSL2 interface (when VDSL2 interface is configured to operate in ADSL fallback mode).

- [Requirements on page 2505](#)
- [Overview on page 2506](#)
- [Configuration on page 2506](#)
- [Verification on page 2508](#)

## Requirements

Before you begin:

- Review the overview section on DHCP client. See *Understanding DHCP Client Operation*

- Establish basic connectivity. See the Quick Start for your device.
- Configure network interfaces as necessary. See [“Example: Creating an Ethernet Interface” on page 2634](#).

## Overview

In this example, you configure the ATM interface as **at-1/0/0**. You then set the logical interface to unit 0 and specify the family protocol type as inet. Finally, you configure the DHCP client.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation ethernet-over-atm
set interfaces at-1/0/0 atm-options vpi 2
set interfaces at-1/0/0 dsl-options operating-mode auto
set interfaces at-1/0/0 unit 0
set interfaces at-1/0/0 unit 0 encapsulation ether-over-atm-llc
set interfaces at-1/0/0 unit 0 vci 2.122
set interfaces at-1/0/0 unit 0 family inet
set interfaces at-1/0/0 unit 0 family inet dhcp
```

**Step-by-Step Procedure** To configure DHCP client on ADSL interfaces:

1. Set the encapsulation mode.  

```
[edit]
user@host# set interfaces at-1/0/0 encapsulation ethernet-over-atm
```
2. Configure the ATM VPI option.  

```
[edit]
user@host# set interfaces at-1/0/0 atm-options vpi 2
```
3. Set operating mode.  

```
[edit]
user@host# set interfaces at-1/0/0 dsl-options operating-mode auto
```
4. Set the logical interface.  

```
[edit]
user@host# set interfaces at-1/0/0 unit 0
```
5. Set the encapsulation mode for logical interface.  

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 encapsulation ether-over-atm-llc
```
6. Set the ATM VCI option.  

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 vci 2.122
```

7. Specify the family protocol type.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet
```

8. Configure the DHCP client.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet dhcp
```

9. Set the DHCP client identifier as a ASCII or hexadecimal value (optional):

Use hexadecimal if the client identifier is a MAC address—for example, 00:0a:12:00:12:12.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet dhcp client-identifier
00:0a:12:00:12:12
```

10. Set the DHCP lease time in seconds—for example, 86400 (24 hours). The range is 60 through 2147483647 seconds (optional).

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet dhcp lease-time 86400
```

11. Define the number of attempts allowed to retransmit a DHCP packet (optional)—for example, 6

The range is 0 through 6. The default is 4 times.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet dhcp retransmission-attempt
6
```

12. Define the interval, in seconds, allowed between retransmission attempts (optional)—for example, 5.

The range is 4 through 64. The default is 4 seconds.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet dhcp retransmission-interval
5
```

13. Set the IPv4 address of the preferred DHCP server (optional)—for example, 10.1.1.1.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet dhcp server-address 10.1.1.1
```

14. Set the vendor class ID for the DHCP client (optional)—for example, ether.

```
[edit]
user@host# set interfaces at-0/0/1 unit 0 family inet dhcp vendor-id ether
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation ethernet-over-atm;
atm-options {
```

```
vpi 2;
}
dsl-options {
 operating-mode auto;
}
unit 0 {
 encapsulation ether-over-atm-llc;
 vci 2.122;
 family inet {
 dhcp {
 client-identifier ascii 00:0a:12:00:12:12;
 lease-time 86400;
 retransmission-attempt 6;
 retransmission-interval 5;
 server-address 10.1.1.1;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the DHCP Configuration on page 2508](#)
- [Verify Interface Status on page 2508](#)

### Verifying the DHCP Configuration

---

**Purpose** Verify that the DHCP options are configured properly.

**Action** Verify the DHCP configuration by using the **run show system services dhcp client** command.

```
user@host# run show system services dhcp client
```

```
Logical Interface name at-1/0/0.0
Hardware address 00:1f:12:e4:71:38
Client status bound
Address obtained 10.40.1.2
Update server disabled
Lease obtained at 2011-05-03 04:58:10 PDT
Lease expires at 2011-05-04 04:58:10 PDT
```

```
DHCP options:
Name: server-identifier, Value: 10.40.1.1
Code: 1, Type: ip-address, Value: 255.255.255.0
Name: name-server, Value: [192.168.5.68, 192.168.60.131, 172.17.28.100,
172.17.28.101]
Name: domain-name, Value: englab.juniper.net
```

### Verify Interface Status

---

**Purpose** Verify the interface status and check traffic statistics.

**Action** Verify interface status by using the **show interface terse** command and test end-to-end data path connectivity by sending the ping packets to the remote end IP address.

```
user@host# run show interfaces at-1/0/0 terse
```

| Interface      | Admin | Link | Proto | Local        | Remote |
|----------------|-------|------|-------|--------------|--------|
| at-1/0/0       | up    | up   |       |              |        |
| at-1/0/0.0     | up    | up   | inet  | 10.40.1.2/24 |        |
| at-1/0/0.32767 | up    | up   |       |              |        |

```
user@host# run ping 10.40.1.1 count 100 rapid
```

```

PING 10.40.1.1 (10.40.1.1): 56 data bytes
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
--- 10.40.1.1 ping statistics ---
100 packets transmitted, 100 packets received, 0% packet loss
round-trip min/avg/max/stddev = 20.086/26.404/61.723/6.194 ms

```

## Example: Configuring CHAP on DSL Interfaces

This example shows how to configure CHAP on either the ATM-over-ADSL or the ATM-over-SHDSL interface.

- [Requirements on page 2509](#)
- [Overview on page 2509](#)
- [Configuration on page 2509](#)
- [Verification on page 2511](#)

### Requirements

Before you begin, configure network interfaces as necessary. See “[Understanding Ethernet Interfaces](#)” on [page 2629](#).

### Overview

In this example, you specify the CHAP access profile and create an interface called at-3/0/0. You configure CHAP on either the ATM-over-ADSL or the ATM-over-SHDSL interface and specify a unique profile name called A-ppp-client containing a client list and access parameters. You then specify a unique hostname called A-at-3/0/0.0 to be used in CHAP. Finally, you set the passive option to handle incoming CHAP packets.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set access profile A-ppp-client client client1 chap-secret my-secret
```

```
set interfaces at-3/0/0 unit 0 ppp-options chap access-profile A-ppp-client local-name
A-at-3/0/0.0 passive
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure CHAP on either the ATM-over-ADSL or the ATM-over-SHDSL interface:

1. Define a CHAP access profile.

```
[edit]
user@host# set access profile A-ppp-client client client1 chap-secret my-secret
```

2. Create an interface.

```
[edit]
user@host# edit interfaces at-3/0/0 unit 0
```

3. Configure CHAP and specify a unique profile name.

```
[edit interfaces at-3/0/0 unit 0]
user@host# set ppp-options chap access-profile A-ppp-client
```

4. Specify a unique hostname.

```
[edit interfaces at-3/0/0 unit 0]
user@host# set ppp-options chap local-name A-at-3/0/0.0
```

5. Set the option to handle incoming CHAP packets only.

```
[edit interfaces at-3/0/0 unit 0]
user@host# set ppp-options chap passive
```

**Results** From configuration mode, confirm your configuration by entering the **show access profile A-ppp-client** and **show interfaces at-3/0/0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show access profile A-ppp-client
client client1 chap-secret "9ikPQtu1Sre0BclMW-dk.P5QnApB"; ## SECRET-DATA
[edit]
user@host# show interfaces at-3/0/0
unit 0 {
 ppp-options {
 chap {
 access-profile A-ppp-client;
 local-name A-at-3/0/0.0;
 passive;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying ADSL Interface Properties on page 2511](#)
- [Verifying a PPPoA Configuration for an ATM-over-ADSL Interface on page 2513](#)
- [Verifying an ATM-over-SHDSL Configuration on page 2514](#)

### Verifying ADSL Interface Properties

**Purpose** Verify that the ADSL interface properties are enabled.

**Action** From operational mode, enter the **show interfaces at-3/0/0 extensive** command.

```
user@host> show interfaces at-3/0/0 extensive

```

The output shows a summary of interface information. Verify the following information:

- The physical interface is Enabled. If the interface is shown as Disabled, do either of the following:
  - In the CLI configuration editor, delete the **disable** statement at the [edit interfaces *interface-name*] level of the configuration hierarchy.
  - In the J-Web configuration editor, clear the **Disable** check box on the Interfaces page (Interfaces>*interface-name*).
- The physical link is up. A link state of dDown indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- The last flapped time is an expected value. It indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect expected input and output rates. Verify that the number of inbound and outbound bytes and packets matches expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics *interface-name*** command.
- No ADSL alarms and defects appear that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm. The following are ADSL-specific alarms:
  - **LOCDI**—Loss of cell delineation for interleaved channel
  - **LOCDNI**—Loss of cell delineation for noninterleaved channel
  - **LOF**—Loss of frame
  - **LOM**—Loss of multiframe
  - **LOP**—Loss of power
  - **LOS**—Loss of signal

Examine the operational statistics for an ADSL interface. Statistics in the ATU-R (ADSL transceiver unit—remote) column are for the near end. Statistics in the ATU-C (ADSL transceiver unit—central office) column are for the far end.

- **Attenuation (dB)**—Reduction in signal strength measured in decibels.
- **Capacity used (%)**—Amount of ADSL usage in %.
- **Noise margin (dB)**—Maximum extraneous signal allowed without causing the output to deviate from an acceptable level.
- **Output power (dBm)**—Amount of power used by the ADSL interface.
- **Bit rate (kbps)**—Data transfer speed on the ADSL interface.

### Verifying a PPPoA Configuration for an ATM-over-ADSL Interface

**Purpose** Verify that the PPPoA configuration for an ATM-over-ADSL interface is correct.

**Action** From operational mode, enter the **show interfaces at-3/0/0** and the **show access** commands.

### Verifying an ATM-over-SHDSL Configuration

**Purpose** Verify that the interface properties are correct.

**Action** From operational mode, enter the **show interfaces at-3/0/0 extensive** command.

```

user@host> show interfaces at-3/0/0 extensive
Physical interface: at-3/0/0, Enabled, Physical link is Up

The output shows a summary of interface information. Verify the following information:

- The physical interface is enabled. If the interface is shown as disabled, do either of the following:
  - In the CLI configuration editor, delete the **disable** statement at the [edit interfaces *interface-name*] level of the configuration hierarchy.
  - In the J-Web configuration editor, clear the **Disable** check box on the Interfaces page (Interfaces>*interface-name*).
- The physical link is up. A link state of down indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- The last flapped time is an expected value. It indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect expected input and output rates. Verify that the number of inbound and outbound bytes and packets matches expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics *interface-name*** command.
- No SHDSL alarms and defects appear that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm.
  - **LOS**—Loss of signal. No signal was detected on the line.
  - **LOSW**—Loss of sync word. A message ID was sent.
  - **Power status**—A power failure has occurred.
  - **LOSD**—Loss of signal was detected at the remote application interface.
  - **ES**—Errored seconds. One or more cyclic redundancy check (CRC) anomalies were detected.

- **SES**—Severely errored seconds. At least 50 CRC anomalies were detected.
- **UAS**—Unavailable seconds. An interval has occurred during which one or more LOSW defects were detected.

Examine the SHDSL interface status:

- **Line termination**—SHDSL transceiver unit—remote (STU—R). (Only customer premises equipment is supported.)
- **Annex**—Either Annex A or Annex B. Annex A is supported in North America, and Annex B is supported in Europe.
- **Line mode**—SHDSL mode configured on the G.SHDSL interface pair, either two-wire or four-wire.
- **Modem Status**—Data. Sending or receiving data.
- **Last fail code**—Code for the last interface failure.
- **Framer mode**—Framer mode of the underlying interface: ATM.
- **Dying gasp**—Ability of a device that has lost power to send a message informing the attached DSL access multiplexer (DSLAM) that it is about to go offline.
- **Chipset version**—Version number of the chipset on the interface
- **Firmware version**—Version number of the firmware on the interface.

Examine the operational statistics for a SHDSL interface.

- **Loop attenuation (dB)**—Reduction in signal strength measured in decibels.
- **Transmit power (dB)**—Amount of SHDSL usage in %.
- **Receiver gain (dB)**—Maximum extraneous signal allowed without causing the output to deviate from an acceptable level.
- **SNR sampling (dB)**—Signal-to-noise ratio at a receiver point in decibels.
- **Bit rate (kbps)**—Data transfer speed on the SHDSL interface.
- **CRC errors**—Number of cyclic redundancy check errors.
- **SEGA errors**—Number of segment anomaly errors. A regenerator operating on a segment received corrupted data.
- **LOSW errors**—Number of loss of signal defect errors. Three or more consecutively received frames contained one or more errors in the framing bits.
- **Received cells**—Number of cells received through the interface.
- **Transmitted cells**—Number of cells sent through the interface.
- **HEC errors**—Number of header error checksum errors.
- **Cell drop**—Number of dropped cells on the interface.

## Example: Configuring ATM-over-ADSL Network Interfaces

This example shows how to configure ATM-over-ADSL network interfaces for the devices.

- [Requirements on page 2517](#)
- [Overview on page 2517](#)
- [Configuration on page 2518](#)
- [Verification on page 2520](#)

### Requirements

Before you begin:

- Configure network interfaces as necessary. See [“Understanding Ethernet Interfaces” on page 2629](#).
- Configure PPPoE encapsulation on an Ethernet interface or on an ATM-over-ADSL interface. See [“Understanding Point-to-Point Protocol over Ethernet” on page 2731](#).

### Overview

This example shows how to use devices with ADSL Annex A or Annex B PIMs to send network traffic through a point-to-point connection to a DSLAM. Within the example, you set the DSL operating mode type to auto so that the ADSL interface will autonegotiate settings with the DSLAM.

The example shows how to create an ATM interface called at-2/0/0. The values for the interface’s physical properties are kept relatively low—the ATM VPI is set to 25; both the OAM down count and up count are set to 200 cells; the OAM period is set to 100 seconds.

The example also shows how to set traffic shaping values on the ATM interface to support CoS. CBR is enabled in order to stabilize the cell transmission rate throughout the duration of the connection. Additionally, the VBR peak is set to 33,000 for data packet transfers.

Within the example, you set the encapsulation mode to ethernet-over-atm to support PPP over Ethernet IPv4 traffic. You also configure a logical interface (unit 3). The logical interface uses ATM NLPID encapsulation. As with the physical interface, the OAM down count and up count are set to 200 cells on the logical interface and the OAM period is set to 100 seconds. The family protocol is set to inet and the VCI is set to 35.

**NOTE:** On all branch SRX Series devices, the ATM interface takes more than 5 minutes to come up when CPE is configured in ANSI-DMT mode and CO is configured in automode. This occurs only with ALU 7300 DSLAM, due to limitation in current firmware version running on the ADSL Mini-PIM.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-2/0/0 atm-options vpi 25 oam-liveness up-count 200 down-count 200
set interfaces at-2/0/0 atm-options vpi 25 oam-period 100
set interfaces at-1/0/0 unit 0 shaping cbr
set interfaces at-1/0/0 unit 0 shaping vbr peak 33000
set interfaces at-1/0/0 dsl-options operating-mode auto
set interfaces at-1/0/0 encapsulation ethernet-over-atm
set interfaces at-1/0/0 unit 3 encapsulation atm-nlpid oam-liveness up-count 200
 down-count 200
set interfaces at-1/0/0 unit 3 oam-period 100
set interfaces at-1/0/0 unit 3 family inet
set interfaces at-1/0/0 unit 3 vci 35
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure ATM-over-ADSL network interfaces for the devices:

1. Create an ATM interface.  

```
[edit]
user@host# edit interfaces at-2/0/0
```
2. Configure the physical properties for the ATM interface.  

```
[edit interfaces at-2/0/0]
user@host# set atm-options vpi 25
user@host# set atm-options vpi 25 oam-liveness up-count 200 down-count 200
user@host# set atm-options vpi 25 oam-period 100
```
3. Specify the CBR value and VBR value for the Ethernet interface.  

```
[edit]
user@host# edit interfaces at-1/0/0 unit 0
user@host# set shaping cbr
user@host# set shaping vbr peak 33000
```
4. Set the DSL operating mode type.  

```
[edit interfaces at-1/0/0.0]
user@host# set dsl-options operating-mode auto
```
5. Configure the encapsulation type.

- ```
[edit interfaces at-1/0/0]
user@host# set encapsulation ethernet-over-atm
```
6. Configure the encapsulation for the logical unit.

```
[edit interfaces at-1/0/0 unit 3]
user@host# set encapsulation atm-nlpid
```
 7. Configure the OAM liveness values for an ATM virtual circuit.

```
[edit interfaces at-1/0/0 unit 3]
user@host# set oam-liveness up-count 200 down-count 200
```
 8. Specify the OAM period.

```
[edit interfaces at-1/0/0 unit 3]
user@host# set oam-period 100
```
 9. Set the family protocol type.

```
[edit interfaces at-1/0/0 unit 3]
user@host# set family inet
```
 10. Configure the VCI value.

```
[edit interfaces at-1/0/0 unit 3]
user@host# set vci 35
```

Results From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** and **show interfaces at-2/0/0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation ethernet-over-atm;
dsl-options {
  operating-mode auto;
}
unit 0 {
  shaping {
    vbr peak 33k;
    burst
  }
}
unit 3 {
  encapsulation atm-nlpid;
  vci 35;
  oam-period 100;
  oam-liveness {
    up-count 200;
    down-count 200;
  }
  family inet;
}
[edit]
user@host# show interfaces at-2/0/0
atm-options {
  vpi 25 {
```

```

        oam-period 100;
        oam-liveness {
        up-count 200;
        down-count 200
        }
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying the ADSL Interface Properties on page 2520](#)
- [Verifying a PPPoA Configuration for an ATM-over-ADSL Interface on page 2523](#)

Verifying the ADSL Interface Properties

Purpose Verify that the interface properties are correct.

Action From operational mode, enter the **show interfaces at-1/0/0 extensive** command.

```

```

But for ADSL MiniPim TI chipset does not send ADSL Chipset Information. Also Adsl minipim does not send any alarms. So we can't show alarm stats for minipim. So following information will not be displayed in Minipim case.

```

ADSL alarms : None
ADSL defects : None
ADSL media:
Seconds      Count State
LOF          1      1 OK
LOS          1      1 OK
LOM          0      0 OK
LOP          0      0 OK
LOC DI       0      0 OK

```

LOCDNI	0	0	OK
ADSL Chipset Information:		ATU-R	ATU-C
Vendor Country :		0x0f	0xb5
Vendor ID :		STMI	IFTN
Vendor Specific:		0x0000	0x70de

The output shows a summary of interface information. Verify the following information:

- The physical interface is enabled. If the interface is shown as disabled, do either of the following:
 - In the CLI, delete the **disable** statement at the [edit interfaces *interface-name*] level of the configuration hierarchy.
 - In J-Web, clear the **Disable** check box on the Interfaces page (Interfaces>*interface-name*).
- The physical link is up. A link state of down indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- The last flapped time is an expected value. It indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect expected input and output rates. Verify that the number of inbound and outbound bytes and packets matches expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics *interface-name*** command.
- No ADSL alarms and defects appear that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm. The following are ADSL-specific alarms:
 - **LOCDI**—Loss of cell delineation for interleaved channel.
 - **LOCDNI**—Loss of cell delineation for noninterleaved channel.
 - **LOF**—Loss of frame.
 - **LOM**—Loss of multiframe.
 - **LOP**—Loss of power.
 - **LOS**—Loss of signal.

Examine the operational statistics for an ADSL interface. Statistics in the ATU-R (ADSL transceiver unit—remote) column are for the near end. Statistics in the ATU-C (ADSL transceiver unit—central office) column are for the far end.

- **Attenuation (dB)**—Reduction in signal strength .
- **Capacity used (%)**—Amount of ADSL usage.
- **Noise margin (dB)**—Maximum extraneous signal allowed without causing the output to deviate from an acceptable level.

- **Output power (dBm)**—Amount of power used by the ADSL interface.
- **Bit rate (kbps)**—Data transfer speed on the ADSL interface.

Verifying a PPPoA Configuration for an ATM-over-ADSL Interface

Purpose Verify that the PPPoA configuration for an ATM-over-ADSL interface is correct.

Action From operational mode, enter the **show interfaces at-1/0/0** and the **show access** commands.

SHDSL Interface Overview

Symmetric high-speed DSL (SHDSL) interfaces on some SRX Series devices support an SHDSL multirate technology for data transfer between a single customer premises equipment (CPE) subscriber and a central office (CO). ITU-T G.991.2 is the official standard for describing SHDSL, also known as G.SHDSL.

Unlike ADSL, which delivers more bandwidth downstream than available upstream, SHDSL is symmetrical and delivers a bandwidth of up to 2.3 Mbps in both directions. Because business applications require high-speed digital transportation methods, SHDSL is becoming very popular and gaining wide acceptance in the industry. Additionally, SHDSL is compatible with ADSL and therefore causes very little, if any, interference between cables.

SHDSL is deployed on a network in much the same manner as ADSL.

SHDSL interfaces support Packet Transfer Mode (PTM). In PTM, packets (IP, PPP, Ethernet, MPLS, and so on) are transported over DSL links as an alternative to using Asynchronous Transfer Mode (ATM). PTM is based on the Ethernet in the First Mile (EFM) IEEE 802.3ah standard.

G.SHDSL Mini-PIM Overview

The G.SHDSL Mini-Physical Interface Module (Mini-PIM) provides the physical connection to DSL network media types.

The G.SHDSL Mini-PIM provides the following Asynchronous Transfer Mode (ATM) key features:

- 2-wire (4-port 2-wire) mode, 4-wire (2-port 4-wire) mode, and 8-wire (1-port 8-wire) mode support
- Virtual circuits (VC) per Mini-PIM (10 maximum including OAM VC)
- ATM-over-G.SHDSL framing
- ATM OAM support
- Maximum MTU size of 9180 bytes
- Noise margin support
- Point-to-Point Protocol over ATM and PPPoE over ATM encapsulation support
- Local loopback mode support
- Dying gasp support

The G.SHDSL Mini-PIM provides extended ATM CoS functionality to cells across the network. You can define bandwidth utilization, which consists of either a constant rate or a peak cell rate, with sustained cell rate and burst tolerance. By default, unspecified bit rate (UBR) is used because the bandwidth utilization is unlimited.

The following ATM traffic shaping features are supported:

- **Constant bit rate (CBR)**—CBR is the service category for traffic with rigorous timing requirements like voice and certain types of video. CBR traffic needs a constant cell transmission rate throughout the duration of the connection.
- **Variable bit rate, non-real-time (VBR-NRT)**—VBR-NRT is intended for sources such as data transfer, which do not have strict time or delay requirements. VBR-NRT is suitable for packet data transfers.
- **Variable bit rate, real-time (VBR-RT)**—VBR-RT is intended for sources such as data transfer, which takes place in real time. VBR-RT requires access to time slots at a rate that can vary significantly from time to time.

Table 272 displays the traffic descriptors specified for an ATM network.

Table 272: Traffic Descriptors

Traffic Descriptors	Description
Peak cell rate (PCR)	Maximum rate at which traffic can burst.
Sustained cell rate (SCR)	Normal traffic rate averaged over time.

Table 272: Traffic Descriptors (*continued*)

Traffic Descriptors	Description
Maximum burst size (MBS)	Maximum burst size that can be sent at the peak rate.

The G.SHDSL Mini-PIM provides the following Packet Transfer Mode (PTM) Ethernet in the First Mile (EFM) key features:

- EFM PIC mode support
- Maximum MTU size of 1514 bytes
- PPPoE encapsulation support
- Local loopback mode support
- Chassis cluster mode support
- Dying gasp support
- IPv6 support
- VLAN over EFM support

The following four annexes are supported on the G.SHDSL Mini-PIM in both ATM and PTM EFM modes:

- Annex A
- Annex B
- Annex F
- Annex G

Operating Modes and Line Rates of the G.SHDSL Mini-PIM

The G.SHDSL Mini-PIM supports 2-wire (4-port 2-wire) mode, 4-wire (2-port 4-wire) mode, 8-wire (1-port 8-wire) mode, and EFM mode. The default operating mode is 2x 4-wire for this G.SHDSL Mini-PIM. G.SHDSL is supported on all SRX210, SRX220, SRX240, and SRX550 devices using the symmetrical WAN speeds shown in [Table 273](#).

Table 273: Symmetrical WAN Speeds

Modes	Symmetrical WAN Speed Using Annex A and B	Symmetrical WAN Speed Using Annex F and G
2-wire	2.3 Mbps	From 768 Kbps to 5.696 Mbps
4-wire	4.6 Mbps	From 1.536 Mbps to 11.392 Mbps
8-wire	9.2 Mbps	From 3.072 Mbps to 22.784 Mbps
EFM mode	2.3 Mbps	From 768 Kbps to 5.696 Mbps

Table 273: Symmetrical WAN Speeds (*continued*)

Modes	Symmetrical WAN Speed Using Annex A and B	Symmetrical WAN Speed Using Annex F and G
NOTE: A maximum of 16 Mbps is supported on SRX210, SRX220, SRX240, and SRX550 devices.

G.SHDSL Mini-PIM Configuration Overview

Specify the wire mode on the G.SHDSL interface using one of the following options:

- **1-port-atm**—Configures an 8-wire (1-port, 8-wire) wire mode.
- **2-port-atm**—Configures a 4-wire (2-port, 4-wire) wire mode.
- **4-port-atm**—Configures a 2-wire (4-port, 2-wire) wire mode.
- **efm**—Configures an efm (1-port, 2-wire) wire mode.

NOTE: The default wire mode is 4-wire (2-port, 4-wire).

Specify the annex type using one of the following options:

- Annex A
- Annex B
- Annex F
- Annex G

NOTE: The default annex type is auto.

Specify the SHDSL line rate (speed of transmission of data on the SHDSL connection) using one of the following values:

- **auto**—Automatically selects a line rate.
- **value**—Selects a value between 192 kbps and 22,784 kbps.

NOTE: The default line rate is **auto**.

Specify the encapsulation type using one of the following values:

NOTE: The **pt** interface does not require encapsulation types.

The at interface encapsulation types are as follows:

- **atm-pvc**—ATM permanent virtual circuits is the default encapsulation for ATM-over-SHDSL interfaces. For PPP over ATM (PPPoA) over SHDSL interfaces, use this type of encapsulation. Use this type of encapsulation if you are using ATM DSLAM.
- **ethernet-over-atm**—Ethernet over ATM encapsulation. For PPP over Ethernet (PPPoE) over ATM-over-SHDSL interfaces that carry IPv4 traffic, use this type of encapsulation. Use this type of encapsulation if you are using IP DSLAM.

Configure the encapsulation type using one of the following values:

- **atm-cisco-nlpid**—Cisco NLPID encapsulation.
- **atm-mlppp-llc**—ATM MLPPP over AAL5/LLC encapsulation.
- **atm-nlpid**—ATM Network Layer protocol identifier (NLPID) encapsulation.
- **atm-ppp-llc**—AAL5 logical link control (LLC) encapsulation.
- **atm-ppp-vc-mux**—AAL5 multiplex encapsulation.
- **atm-vc-mux**—ATM virtual circuit multiplex encapsulation.
- **atm-snap**—ATM subnetwork attachment point (SNAP) encapsulation.
- **ether-over-atm-llc**—For interfaces that carry IPv4 traffic, use Ethernet over LLC encapsulation. You cannot configure multipoint interfaces if you use this type of encapsulation.
- **ppp-over-ether-over-atm-llc**—PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead you configure the interface address on the PPP interface.

Example: Configuring the G.SHDSL Interface

This example shows how to configure the G.SHDSL interface.

- [Requirements on page 2530](#)
- [Overview on page 2530](#)
- [Configuration on page 2530](#)
- [Verification on page 2531](#)

Requirements

Before you begin, configure network interfaces as necessary. See [“Understanding Ethernet Interfaces” on page 2629](#).

Overview

In this example, you specify the wire mode called 2-port-atm and create an interface called at-1/0/0. You then specify the annex type as annex-a and set the line rate to auto. Then you specify the encapsulation type as ethernet-over-atm and define a logical unit as unit 3 that you connect to this physical G.SHDSL interface. You can set a value from 0 through 7. Finally, you configure the encapsulation type as ether-over-atm-llc.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set chassis fpc 1 pic 0 shdsl pic-mode 2-port-atm
set interfaces at-1/0/0 shdsl-options annex annex-a line-rate auto
set interfaces at-1/0/0 encapsulation ethernet-over-atm
set interfaces at-1/0/0 unit 3 encapsulation ether-over-atm-llc
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the G.SHDSL interface:

1. Specify the wire mode.

```
[edit]
user@host# set chassis fpc 1 pic 0 shdsl pic-mode 2-port-atm
```

NOTE: For configuring the G.SHDSL interface in chassis cluster mode, provide the node id also. For example, to configure an shdsl 2 port pic-mode in chassis cluster mode for the fpc slot 1 on the node 0, use the following command:

```
set chassis node 0 fpc 1 pic 0 shdsl pic-mode 2-port-atm
```

2. Create an interface.

```
[edit]
user@host# edit interfaces at-1/0/0 shdsl-options
```
3. Specify the annex type.

```
[edit interfaces at-1/0/0 shdsl-options]
user@host# set annex annex-a
```
4. Configure the line rate.

```
[edit interfaces at-1/0/0 shdsl-options]
user@host# set line-rate auto
```
5. Specify the encapsulation type.

```
[edit interfaces at-1/0/0]
user@host# set encapsulation ethernet-over-atm
```
6. Define one or more logical units.

```
[edit interfaces at-1/0/0]
user@host# edit unit 3
```
7. Configure the encapsulation type.

```
[edit interfaces at-1/0/0 unit 3]
user@host# set encapsulation ether-over-atm-llc
```

Results From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** and **show chassis fpc 1** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation ethernet-over-atm;
shdsl-options {
  annex annex-a;
  line-rate auto;
}
unit 3 {
  encapsulation ether-over-atm-llc;
}
[edit]
user@host# show chassis fpc 1
pic 0 {
  shdsl {
    pic-mode 2-port-atm;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying G.SHDSL Interface Properties

Purpose Verify that the G.SHDSL interface properties are configured properly.

Action From operational mode, enter the **show interfaces at-1/0/0 extensive** command.

```
user@host> show interfaces at-1/0/0 extensive
```

Four-wire mode for interface at-1/0/0:

```

The output shows a summary of interface information. Verify the following information:

- The physical interface is enabled. If the interface is shown as disabled, do either of the following:
 - In the CLI configuration editor, delete the **disable** statement at the [edit *interfaces**interface-name*] level of the configuration hierarchy.
 - In the J-Web configuration editor, clear the **Disable** check box on the Interfaces page (*Interfaces*>*interface-name*).
- The physical link is up. A link state of down indicates a problem with the interface module, interface port, or physical connection (link-layer errors).

- The last flapped time is an expected value. The last flapped time indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect expected input and output rates. Verify that the number of inbound and outbound bytes and packets matches expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics *interface-name*** command.
- No SHDSL alarms and defects appear that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm.
 - **LOS**—Loss of signal. No signal was detected on the line.
 - **LOSW**—Loss of sync word. A message ID was sent.
 - **Power status**—A power failure has occurred.
 - **LOSD**—Loss of signal was detected at the remote application interface.
 - **ES**—Errored seconds. One or more cyclic redundancy check (CRC) anomalies were detected.
 - **SES**—Severely errored seconds. At least 50 CRC anomalies were detected.
 - **UAS**—Unavailable seconds. An interval has occurred during which one or more LOSW defects were detected.

Examine the SHDSL interface status:

- **Line termination**—SHDSL transceiver unit—remote (STU—R). (Only customer premises equipment is supported.)
- **Annex**—Either Annex A or Annex B. Annex A is supported in North America, and Annex B is supported in Europe.
- **Line mode**—SHDSL mode configured on the G.SHDSL interface pair, either two-wire or four-wire.
- **Modem status**—Data. Sending or receiving data.
- **Bit rate (kbps)**—Data transfer speed on the SHDSL interface.
- **Last fail code**—Code for the last interface failure.
- **Framer mode**—ATM framer mode of the underlying interface.
- **Dying gasp**—Ability of a device that has lost power to send a message informing the attached DSLAM that it is about to go offline.
- **Chipset version**—Version number of the chipset on the interface

Examine the operational statistics for a SHDSL interface.

- **Loop attenuation (dB)**—Reduction in signal strength.
- **Transmit power (dB)**—Amount of SHDSL.

- **Receiver gain (dB)**—Maximum extraneous signal allowed without causing the output to deviate from an acceptable level.
- **SNR sampling (dB)**—Signal-to-noise ratio at a receiver point.
- **CRC errors**—Number of cyclic redundancy check errors.
- **SEGA errors**—Number of segment anomaly errors. A regenerator operating on a segment received corrupted data.
- **LOSW errors**—Number of loss of signal defect errors. Three or more consecutively received frames contained one or more errors in the framing bits.
- **Received cells**—Number of cells received through the interface.
- **Transmitted cells**—Number of cells sent through the interface.
- **HEC errors**—Number of header error checksum errors.
- **Cell drop**—Number of dropped cells on the interface.

Example: Configuring the G.SHDSL Interface on SRX Series Devices

This example shows how to configure the G.SHDSL interface on SRX Series devices.

- [Requirements on page 2537](#)
- [Overview on page 2538](#)
- [Configuration on page 2540](#)
- [Verification on page 2547](#)

Requirements

Before you begin:

- Configure the network interfaces as necessary. See “[Understanding Ethernet Interfaces](#)” on page 2629.
- Install the G.SHDSL Mini-PIM in the first slot of the SRX210 chassis.
- Connect the SRX210 device to a DSLAM (IP DSLAM and ATM DSLAM).

NOTE: This example uses an SRX210 Services Gateway. The information is also applicable to the SRX220 and SRX240 devices.

Overview

Figure 119 shows the topology for the G.SHDSL Mini-PIM operating in 2X4-wire mode.

Figure 119: G.SHDSL Mini-PIM Operating in 2X4-Wire Mode

Figure 120 shows the topology for the G.SHDSL Mini-PIM operating in 4X2-wire mode.

Figure 120: G.SHDSL Mini-PIM Operating in 4X2-Wire Mode

Figure 121 shows the topology for the G.SHDSL Mini-PIM operating in 1X8-wire mode.

Figure 121: G.SHDSL Mini-PIM Operating in 1X8-Wire Mode

Determine the operating wire mode (2-wire, 4-wire, or 8-wire) and corresponding CLI code listed in [Table 274](#).

Table 274: Operating Wire Modes

Wire Mode Configuration	CLI Code
2x4-wire Configuration	set chassis fpc 1 pic 0 shdsl pic-mode 2-port-atm NOTE: The 2x4-wire configuration is the default configuration and behavior.
4x2-wire Configuration	set chassis fpc 1 pic 0 shdsl pic-mode 4-port-atm
1x8-wire Configuration	set chassis fpc 1 pic 0 shdsl pic-mode 1-port-atm

NOTE: When the wire mode is set to 8-wire, one physical interface (IFD) is created. Similarly for 4-wire mode and 2-wire mode, two IFDs and four IFDs are created, respectively.

In this example, you first configure a basic G.SHDSL interface. You set the operation wire mode to 2-port-atm, the line rate to 4096, and the annex type to annex-a.

You then configure the G.SHDSL interface when the device is connected to an IP DSLAM. You set the type of encapsulation to ethernet-over-atm and the ATM VPI option to 0. Then you set the type of encapsulation on the G.SHDSL logical interface as ether-over-atm-llc and configure the ATM VCI option to 0.60. Also, you set the interface address for the logical interface to 1.1.1.1/24.

Then you configure the G.SHDSL interface when the device is connected to an ATM DSLAM. You set the type of encapsulation to atm-pvc and the ATM VPI to 0. Then you set the type of encapsulation on the G.SHDSL logical interface to atm-snap and the ATM VCI to 0.65. Also, you set the interface address for the logical interface to 2.1.1.1/24.

Next you configure PPPoE over ATM for the G.SHDSL Interface. You then set the ATM VPI to 0 and set the type of encapsulation to ppp-over-ether-over-atm-llc. You specify a PPPoE interface with the PAP access profile, local-name, and local-password. Then you configure the passive option to handle incoming PAP packets and set the logical interface as the underlying interface for the PPPoE session to at-1/0/0.0. Also, you set the number of seconds to 120 to wait before reconnecting after a PPPoE session is terminated. (The range is 1 through 4,294,967,295 seconds.) You then specify the logical interface as the client for the PPPoE interface and obtain an IP address by negotiation with the remote end.

Finally, you configure PPPoA over ATM for the G.SHDSL Interface. You set the type of encapsulation to atm-pvc and the ATM VPI to 0. You then set the type of encapsulation for PPP over ATM adaptation layer 5 (AAL5) logical link control (LLC) on the logical interface and set the ATM VCI to 122. You configure the PPPoA interface with the CHAP access profile as juniper and set the local-name for the CHAP interface to srx-210. Finally, you obtain an IP address by negotiation with the remote end.

Configuring a Basic G.SHDSL Interface

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set chassis fpc 1 pic 0 shdsl pic-mode 2-port-atm
set interfaces at-1/0/0 shdsl-options line-rate 4096 annex annex-a
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To quickly configure a basic G.SHDSL interface:

1. Select the operating wire mode.

```
[edit]
user@host# set chassis fpc 1 pic 0 shdsl pic-mode 2-port-atm
```
2. Create an interface and set options.

```
[edit]
user@host# edit interfaces at-1/0/0 shdsl-options
```
3. Configure the line rates.

```
[edit interfaces at-1/0/0 shdsl-options]
user@host# set line-rate 4096
```
4. Set the annex type.

```
[edit interfaces at-1/0/0 shdsl-options]
user@host# set annex annex-a
```

Results

From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** and **show chassis fpc 1** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
shdsl-options {
  annex annex-a;
  line-rate 4096;
}
```

```
[edit]
user@host# show chassis fpc 1
pic 0 {
  shdsl {
    pic-mode 2-port-atm;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring a G.SHDSL Interface When Connected to an IP DSLAM

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation ethernet-over-atm
set interfaces at-1/0/0 atm-options vpi 0
set interfaces at-1/0/0 unit 0 encapsulation ether-over-atm-llc vci 0.60
set interfaces at-1/0/0 unit 0 family inet address 1.1.1.1/24
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the G.SHDSL interface on an SRX210 device when the device is connected to an IP DSLAM:

1. Create an interface.

```
[edit]
user@host# edit interfaces at-1/0/0
```

2. Specify the type of encapsulation.

```
[edit interfaces at-1/0/0]
user@host# set encapsulation ethernet-over-atm
```

3. Configure the ATM VPI option.

```
[edit interfaces at-1/0/0]
user@host# set atm-options vpi 0
```

4. Specify the type of encapsulation for logical interface.

```
[edit interfaces at-1/0/0 ]
user@host# edit unit 0
user@host# set encapsulation ether-over-atm-llc
```

5. Configure the ATM VCI options for the logical interface.

```
[edit interfaces at-1/0/0 unit 0]
user@host# set vci 0.60
```

6. Configure the interface address.

```
[edit interfaces at-1/0/0 unit 0]
user@host# set family inet address 1.1.1.1/24
```

Results From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation ethernet-over-atm;
atm-options {
  vpi 0;
}
unit 0 {
  encapsulation ether-over-atm-llc;
  vci 0.60;
  family inet {
    address 1.1.1.1/24;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring a G.SHDSL Interface When Connected to an ATM DSLAM

CLI Quick Configuration To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation atm-pvc atm-options vpi 0
set interfaces at-1/0/0 unit 0 encapsulation atm-snap vci 0.65
set interfaces at-1/0/0 unit 0 family inet address 2.1.1.1/24
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the G.SHDSL interface on an SRX210 device when the device is connected to an ATM DSLAM:

1. Create an interface.

```
[edit]
user@host# edit interfaces at-1/0/0
```

2. Specify the type of encapsulation.

```
[edit interfaces at-1/0/0]
user@host# set encapsulation atm-pvc
```

3. Configure the ATM VPI option.

```
[edit interfaces at-1/0/0]
user@host# set atm-options vpi 0
```

4. Specify the type of encapsulation for the logical interface.

```
[edit interfaces at-1/0/0]
user@host# edit unit 0
```

```
user@host# set encapsulation atm-snap
```

5. Configure the ATM VCI option.

```
[edit interfaces at-1/0/0 unit 0]
```

```
user@host# set vci 0.65
```

6. Configure the interface address.

```
[edit interfaces at-1/0/0 unit 0]
```

```
user@host# set family inet address 2.1.1.1/24
```

Results From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation atm-pvc;
atm-options {
  vpi 0;
}
unit 0 {
  encapsulation atm-snap;
  vci 0.65;
  family inet {
    address 2.1.1.1/24
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring PPPoE over ATM for the G.SHDSL Interface

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation ethernet-over-atm atm-options vpi 0
set interfaces at-1/0/0 unit 0 encapsulation ppp-over-ether-over-atm-llc vci 0.35
set interfaces pp0 unit 0 ppp-options pap access-profile pap_prof local-name srx-210
set interfaces pp0 unit 0 ppp-options pap local-password
"$9$0tLw1SeN-woJDSr-wY2GU69Cp1RSre"
set interfaces pp0 unit 0 ppp-options pap passive
set interfaces pp0 unit 0 pppoe-options underlying-interface at-1/0/0.0
set interfaces pp0 unit 0 pppoe-options auto-reconnect 120 client
set interfaces pp0 unit 0 family inet negotiate-address
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure PPPoE over ATM on the G.SHDSL interface:

1. Create an interface.

- ```
[edit]
user@host# edit interfaces at-1/0/0
```
2. Specify the type of encapsulation.

```
[edit interfaces at-1/0/0]
user@host# set encapsulation ethernet-over-atm
```
  3. Configure the ATM VPI option.

```
[edit interfaces at-1/0/0]
user@host# set atm-options vpi 0
```
  4. Specify the type of encapsulation on the logical interface.

```
[edit interfaces at-1/0/0]
user@host# edit unit 0
user@host# set encapsulation ppp-over-ether-over-atm-llc
```
  5. Configure the ATM VCI option.

```
[edit interfaces at-1/0/0 unit 0]
user@host# set vci 0.35
```
  6. Configure a PPPoE interface with the PAP access profile.

```
[edit]
user@host# edit interfaces pp0 unit 0 ppp-options pap
user@host# set access-profile pap_prof
```
  7. Configure a local-name for the PAP interface.

```
[edit interfaces pp0 unit 0 ppp-options pap]
user@host# set local-name srx-210
```
  8. Configure a local-password for the PAP interface.

```
[edit interfaces pp0 unit 0 ppp-options pap]
user@host# set local-password "$9$0tLw1SeN-woJDSr-wY2GU69Cp1RSre"
```
  9. Set the passive option to handle incoming PAP packets.

```
[edit interfaces pp0 unit 0 ppp-options pap]
user@host# set passive
```
  10. Specify the logical interface as the underlying interface for the PPPoE session.

```
[edit]
user@host# edit interfaces pp0 unit 0 pppoe-options
user@host# set underlying-interface at-1/0/0.0
```
  11. Specify the number of seconds.

```
[edit interfaces pp0 unit 0 pppoe-options]
user@host# set auto-reconnect 120
```
  12. Set the logical interface as the client for the PPPoE interface.

```
[edit interfaces pp0 unit 0 pppoe-options]
user@host# set client
```
  13. Obtain an IP address by negotiation with the remote end.

```
[edit]
user@host# edit interfaces pp0 unit 0
```

```
user@host# set family inet negotiate-address
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** and **show interfaces pp0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation ethernet-over-atm;
atm-options {
 vpi 0;
}
unit 0 {
 encapsulation ppp-over-ether-over-atm-llc;
 vci 0.35;
}
[edit]
user@host# show interfaces pp0
unit 0 {
 ppp-options {
 pap {
 access-profile pap_prof;
 }
 local-name srx-210;
 local-password "$9$0tLw1SeN-woJDSr-wY2GU69Cp1RSre";
 passive;
 }
 pppoe-options {
 underlying-interface at-1/0/0.0;
 auto-reconnect 120;
 client;
 }
 family inet {
 negotiate-address;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoA over ATM for the G.SHDSL Interface

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation atm-pvc atm-options vpi 0
set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc vci 1.122
set interfaces at-1/0/0 unit 0 ppp-options chap access-profile juniper local-name srx-210
set interfaces at-1/0/0 unit 0 family inet negotiate-address
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure PPPoA over ATM on the G.SHDSL interface:

1. Create an interface.

```
[edit]
user@host# edit interfaces at-1/0/0
```

2. Specify the type of encapsulation.

```
[edit interfaces at-1/0/0]
user@host# set encapsulation atm-pvc
```

3. Configure the ATM VPI option.

```
[edit interfaces at-1/0/0]
user@host# set atm-options vpi 0
```

4. Specify the type of encapsulation on the G.SHDSL logical interface.

```
[edit]
user@host# edit interfaces at-1/0/0 unit 0
user@host# set encapsulation atm-ppp-llc
```

5. Configure the ATM VCI option.

```
[edit interfaces at-1/0/0 unit 0]
user@host# set vci 1.122
```

6. Configure a PPPoA interface with the CHAP access profile.

```
[edit]
user@host# edit interfaces at-1/0/0 unit 0 ppp-options chap
user@host# set access-profile juniper
```

7. Configure a local name for the CHAP interface.

```
[edit interfaces at-1/0/0 unit 0 ppp-options chap]
user@host# set local-name srx-210
```

8. Obtain an IP address by negotiation with the remote end.

```
[edit]
user@host# edit interfaces at-1/0/0 unit 0
user@host# set family inet negotiate-address
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation atm-pvc;
atm-options {
 vpi 0;
}
unit 0 {
```

```

encapsulation atm-ppp-llc;
vci 1.122;
ppp-options {
 chap {
 access-profile juniper;
 local-name srx-210;
 }
 family inet {
 negotiate-address;
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying G.SHDSL Interface Properties

|                              |                                                                                                                                                                                                                                                                                                                              |

## Example: Configuring the G.SHDSL Interface in EFM Mode

This example shows how to configure the G.SHDSL interface in Ethernet in the First Mile (EFM) mode on an SRX210 device, but it applies to the SRX220, SRX240, and SRX550 devices as well.

- [Requirements on page 2547](#)
- [Overview and Topology on page 2548](#)
- [Configuration on page 2549](#)
- [Verification on page 2552](#)

## Requirements

This example uses the following hardware and software components:

- An SRX210 device
- Junos OS Release 12.1X44-D10 or later

Before you begin:

- Configure the network interfaces as necessary. See [“Understanding Ethernet Interfaces” on page 2629](#).
- Install the G.SHDSL Mini-PIM in the first slot of the SRX210 chassis.
- Connect the SRX210 device to an EFM supported IP DSLAM.

## Overview and Topology

In this example, you first configure a basic G.SHDSL interface by setting the operation wire mode to efm, the line rate to auto, and the annex type to annex-auto.

You then configure the G.SHDSL interface when the device is connected to an EFM IP DSLAM. You set the logical interface to 10.10.10.1/24.

Next you configure PPPoE for the G.SHDSL Interface. Configure the encapsulation as ppp-over-ether under unit 0 of pt-1/0/0 interface. You specify a PPPoE interface with the PAP access profile, local name, and local password. Then you configure the passive option to handle incoming PAP packets and set the logical interface as the underlying interface for the PPPoE session to pt-1/0/0.0. Also, you set the number of seconds to 120 to wait before reconnecting after a PPPoE session is terminated. (The range is 1 through 4,294,967,295 seconds.) Finally, you specify the logical interface as the client for the PPPoE interface and obtain an IP address by negotiation with the remote end.

[Figure 122](#) shows the topology for the G.SHDSL Mini-PIM operating in EFM mode.

**Figure 122: G.SHDSL Mini-PIM Operating in EFM Mode**

[Table 275](#) lists the operating wire mode for EFM and its corresponding CLI code.

**Table 275: Operating Wire Mode for EFM**

| Wire Mode Configuration | CLI Code                                                |
|-------------------------|---------------------------------------------------------|
| EFM Configuration       | <code>set chassis fpc 1 pic 0 shdsl pic-mode efm</code> |

**NOTE:** When PIC mode is set to EFM, an interface called pt-1/0/0 is created.

## Configuration

- [Configuring a Basic G.SHDSL Interface in EFM PIC Mode on page 2549](#)
- [Configuring PPPoE and VLAN for the G.SHDSL EFM Interface on page 2550](#)

### Configuring a Basic G.SHDSL Interface in EFM PIC Mode

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set chassis fpc 1 pic 0 shdsl pic-mode efm
set interfaces pt-1/0/0 shdsl-options annex annex-g
set interfaces pt-1/0/0 shdsl-options line-rate 5696
set interfaces pt-1/0/0 unit 0 family inet address 10.10.10.1/24
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a basic G.SHDSL interface:

1. Specify the PIC mode.

```
[edit]
user@host# set chassis fpc 1 pic 0 shdsl pic-mode efm
```

**NOTE:** When configuring the G.SHDSL interface in chassis cluster mode, include the node ID. For example, to configure the G.SHDSL interface (operating in EFM PIC mode) in chassis cluster mode for fpc slot 1 on node 0, use the following command:

```
set chassis node 0 fpc 1 pic 0 shdsl pic-mode efm
```

2. Configure the IP address.

```
[edit]
user@host# set interfaces pt-1/0/0 unit 0 family inet address 10.10.10.1/24
```

**NOTE:** By default, annex mode and line rate are set to auto. If you have to configure annex mode (annex-g) and line rate (5696 Kbps), follow Steps 3, 4, and 5.

3. Configure SHDSL options.

```
[edit]
user@host# set interfaces pt-1/0/0 shdsl-options
```

4. Specify the annex type.
 

```
[edit interfaces pt-1/0/0 shdsl-options]
user@host# set annex annex-g
```
5. Configure the line rate.
 

```
[edit interfaces pt-1/0/0 shdsl-options]
user@host# set line-rate 5696
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces pt-1/0/0** and **show chassis fpc 1** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces pt-1/0/0
shdsl-options {
 annex annex-g;
 line-rate 5696;
}
unit 0 {
 family inet {
 address 10.10.10.1/24;
 }
}
[edit]
user@host# show chassis fpc 1
pic 0 {
 shdsl {
 pic-mode efm;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoE and VLAN for the G.SHDSL EFM Interface

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

**NOTE:** In this configuration, we use PAP as the authentication mechanism. If Broadband Remote Access Server (BRAS) uses CHAP, PAP configuration should be replaced with CHAP.

```
set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
set interfaces pp0 unit 0 ppp-options pap access-profile pap_prof local-name srx-210
set interfaces pp0 unit 0 ppp-options pap local-password
"$9$0tLw1SeN-woJDSr-wY2GU69Cp1RSre"
set interfaces pp0 unit 0 ppp-options pap passive
set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
```

```
set interfaces pp0 unit 0 pppoe-options auto-reconnect 120 client
set interfaces pp0 unit 0 family inet negotiate-address
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure PPPoE for the G.SHDSL EFM Interface:

1. Create an interface.  

```
[edit]
user@host# set interfaces pt-1/0/0
```
2. Specify the type of encapsulation.  

```
[edit interfaces pt-1/0/0]
user@host# set unit 0
user@host# set encapsulation ppp-over-ether
```
3. Configure a PPPoE interface with the PAP access profile.  

```
[edit]
user@host# set interfaces pp0 unit 0 ppp-options pap
user@host# set access-profile pap_prof
```
4. Configure a local name for the PAP interface.  

```
[edit interfaces pp0 unit 0 ppp-options pap]
user@host# set local-name srx-210
```
5. Configure a local password for the PAP interface.  

```
[edit interfaces pp0 unit 0 ppp-options pap]
user@host# set local-password "$9$0tLw1SeN-woJDSr-wY2GU69Cp1RSre"
```
6. Set the passive option to handle incoming PAP packets.  

```
[edit interfaces pp0 unit 0 ppp-options pap]
user@host# set passive
```
7. Specify the logical interface as the underlying interface for the PPPoE session.  

```
[edit]
user@host# set interfaces pp0 unit 0 pppoe-options
user@host# set underlying-interface pt-1/0/0.0
```
8. Specify the number of seconds.  

```
[edit interfaces pp0 unit 0 pppoe-options]
user@host# set auto-reconnect 120
```
9. Set the logical interface as the client for the PPPoE interface.  

```
[edit interfaces pp0 unit 0 pppoe-options]
user@host# set client
```
10. Obtain an IP address by negotiation with the remote end.  

```
[edit interfaces]
user@host# set pp0 unit 0 family inet negotiate-address
```
11. Configure VLAN on EFM.

```
[edit interfaces]
user@host# set pt-1/0/0 vlan-tagging
```

12. Specify the VLAN ID.

```
[edit interfaces]
user@host# set pt-1/0/0 unit 0 vlan-id 99
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces pt-1/0/0** and **show interfaces pp0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces pt-1/0/0
vlan-tagging;
unit 0 {
 encapsulation ppp-over-ether;
 vlan-id 99;
}
[edit]
user@host# show interfaces pp0
unit 0 {
 ppp-options {
 pap {
 access-profile pap_prof;
 local-name srx-210;
 local-password "$9$0tLw1SeN-woJDSr-wY2GU69Cp1RSre";
 passive;
 }
 }
 pppoe-options {
 underlying-interface pt-1/0/0.0;
 auto-reconnect 120;
 client;
 }
 family inet {
 negotiate-address;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

### Verifying G.SHDSL Interface Properties

---

**Purpose** Verify that the G.SHDSL interface properties are configured properly.

**Action** From operational mode, enter the **show interfaces pt-1/0/0 extensive** command.

```
user@host> show interfaces pt-1/0/0 extensive
EFM mode for interface pt-1/0/0:
```

```
Physical interface: pt-1/0/0, Enabled, Physical link is Up
Interface index: 158, SNMP ifIndex: 575, Generation: 277
Link-level type: Ethernet, MTU: 1514, Speed: SHDSL(8-Wire)
```

```

```

**Meaning** The output shows a summary of interface information. Verify the following information:

- The physical interface is enabled. If the interface is shown as disabled, do either of the following:
  - In the CLI configuration editor, delete the **disable** statement at the [edit *interfaces**interface-name*] level of the configuration hierarchy.
  - In the J-Web configuration editor, clear the **Disable** check box on the Interfaces page (*Interfaces*>*interface-name*).
- The physical link is up. A link state of down indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- The last flapped time is an expected value. The last flapped time indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect expected input and output rates. Verify that the number of inbound and outbound bytes and packets matches expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics *interface-name*** command.
- The following information is displayed for each line pair:
 

No SHDSL alarms and defects appear that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm.

  - **LOSW**—Loss of sync word. A message ID was sent.
  - **LOSD**—Loss of signal was detected at the remote application interface.
  - **ES**—Errored seconds. One or more cyclic redundancy check (CRC) anomalies were detected.
  - **SES**—Severely errored seconds. At least 50 CRC anomalies were detected.
  - **UAS**—Unavailable seconds. An interval has occurred during which one or more LOSW defects were detected.

Examine the SHDSL interface status:

- **Line termination**—SHDSL transceiver unit—remote (STU—R). (Only customer premises equipment is supported.)
- **Annex**—Either Annex A or Annex B. Annex A is supported in North America, and Annex B is supported in Europe.
- **Line mode**—SHDSL mode configured on the G.SHDSL interface pair, and it should be two-wire.
- **Modem status**—Data. Sending or receiving data.
- **Bit rate (kbps)**—Data transfer speed on the SHDSL interface.
- **Last fail code**—Code for the last interface failure.
- **Framer mode**—ATM framer mode of the underlying interface.
- **PAF Status**—Either Active/Inactive depending upon whether link added to EFM group or not.
- 

Examine the operational statistics for a SHDSL interface.

- **Loop attenuation (dB)**—Reduction in signal strength.
- **Transmit power (dB)**—Amount of SHDSL.
- **SNR sampling (dB)**—Signal-to-noise ratio at a receiver point.
- **CRC errors**—Number of cyclic redundancy check errors.
- **SEGA errors**—Number of segment anomaly errors. A regenerator operating on a segment received corrupted data.
- **LOSW errors**—Number of loss of signal defect errors. Three or more consecutively received frames contained one or more errors in the framing bits.

## VDSL2 Interface Technology Overview

---

Very-high-bit-rate digital subscriber line (VDSL) technology is part of the xDSL family of modem technologies that provide faster data transmission over a single flat untwisted or twisted pair of copper wires. The VDSL lines connect service provider networks and customer sites to provide high bandwidth applications (Triple Play services) such as high-speed Internet access, telephone services like voice over IP (VoIP), high-definition TV (HDTV), and interactive gaming services over a single connection.

VDSL2 is an enhancement to G.993.1 (VDSL) and permits the transmission of asymmetric (half-duplex) and symmetric (full-duplex) aggregate data rates up to 100 Mbps on short copper loops using a bandwidth up to 30 MHz. The VDSL2 technology is based on the ITU-T G.993.2 (VDSL2) standard which is the International Telecommunication Union standard describing a data transmission method for VDSL2 transceivers.

The VDSL2 uses discrete multitone (DMT) modulation. DMT is a method of separating a digital subscriber line signal so that the usable frequency range is separated into 256 frequency bands (or channels) of 4.3125 KHz each. The DMT uses the Fast Fourier Transform (FFT) algorithm for demodulation or modulation for increased speed.

VDSL2 interface supports Packet Transfer Mode (PTM). The PTM mode transports packets (IP, PPP, Ethernet, MPLS, and so on) over DSL links as an alternative to using Asynchronous Transfer Mode (ATM). PTM is based on the Ethernet in the First Mile (EFM) IEEE802.3ah standard.

VDSL2 provides backward compatibility with ADSL, ADSL2, and ADSL2+ because this technology is based on both the VDSL1-DMT and ADSL2/ADSL2+ recommendations.

---

## VDSL2 Network Deployment Topology

---

In standard telephone cables of copper wires, voice signals use only a fraction of the available bandwidth. Like any other DSL technology, the VDSL2 technology utilizes the remaining capacity to carry the data and multimedia on the wire without interrupting the line's ability to carry voice signals.

This example depicts the typical VDSL2 network topology deployed using SRX Series Services Gateways.

A VDSL2 link between network devices is set up as follows:

1. Connect an end-user device such as a LAN, hub, or PC through an Ethernet interface to the customer premises equipment (CPE) (for example, an SRX Series device).
2. Connect the CPE to a DSLAM.
3. The VDSL2 interface uses either Gigabit Ethernet or fiber as second mile to connect to the Broadband Remote Access Server (B-RAS) as shown in [Figure 123](#).
4. The ADSL interface uses either Gigabit Ethernet (in case of IP DSLAM] as the "second mile" to connect to the B-RAS or OC3/DS3 ATM as the second mile to connect the B-RAS as shown in [Figure 124](#).

**NOTE:** The VDSL2 technology is backward compatible with ADSL. VDSL2 provides an ADSL interface in an ATM DSLAM topology and provides a VDSL2 interface in an IP or VDSL DSLAM topology.

---

The DSLAM accepts connections from many customers and aggregates them to a single, high-capacity connection to the Internet.

[Figure 123](#) shows a typical VDSL2 network topology.

Figure 123: Typical VDSL2 End-to-End Connectivity and Topology Diagram

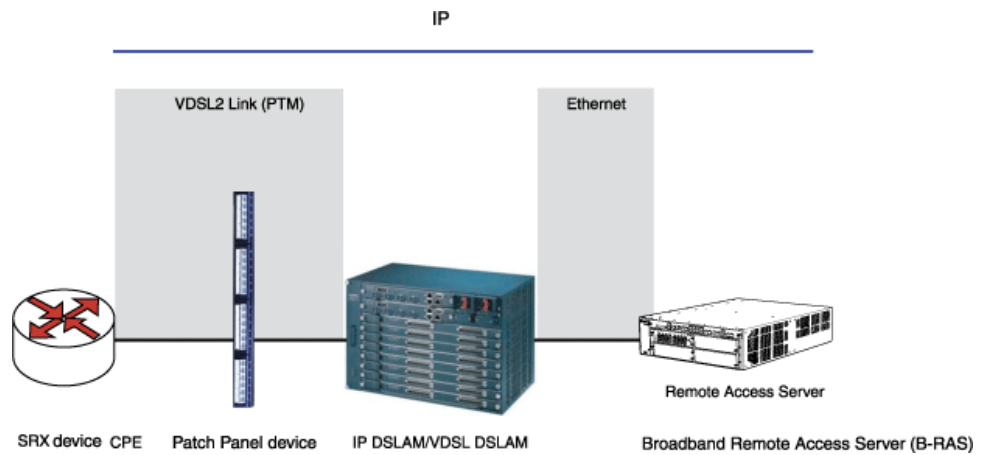

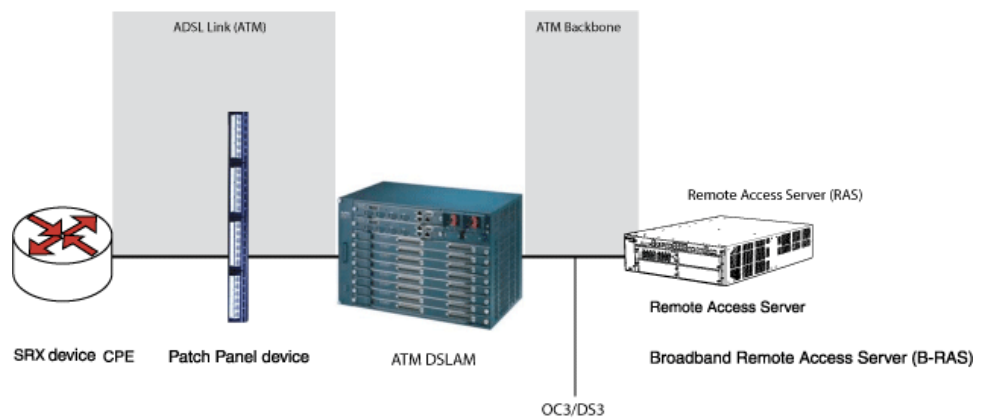

Figure 124 shows a backward-compatible ADSL topology using ATM DSLAM.

## VDSL2 Interface Support on SRX Series Devices

The VDSL2 interface is supported on the following SRX Series devices as shown in [Table 276](#).

Table 276: VDSL2 Annex A and Annex B Features

| Features                        | POTS                                                                               | ISDN                                 |
|---------------------------------|------------------------------------------------------------------------------------|--------------------------------------|
| Devices                         | Integrated VDSL Module (SRX110-POTS)<br><br>VDSL Mini-PIM (SRX210, SRX220, SRX240) | Integrated VDSL Module (SRX110-ISDN) |
| Supported Annex Operating Modes | Annex A and Annex B*                                                               | Annex B                              |
| Supported Bandplans             | 997/998                                                                            | 998                                  |
| Supported standards             | ITU-T G.993.2 (VDSL2)                                                              | ITU-T G.993.2 (VDSL2)                |
| Used in                         | North American network implementations                                             | European network implementations     |
| ADSL backward compatibility     | ADSL G992.5-A (ADSL Annex A)                                                       | ADSL G992.5-B (ADSL Annex B)         |

\* Annex B support is not available on VDSL2 Mini-PIMs.

## VDSL2 Interface Compatibility with ADSL Interfaces

VDSL2 interfaces on SRX Series devices are backward compatible with most ADSL interface standards. The VDSL2 interface uses Ethernet in the First Mile (EFM) mode or Packet Transfer Mode (PTM) and uses the named interface **pt-1/0/0**. In ADSL fallback mode, VDSL2 operates on the ATM encapsulation interface in the first mile and uses the named interface **at-1/0/0**.

### NOTE:

- The VDSL2 interface has backward compatibility with ADSL/ADSL2/ADSL2+. The VDSL2 interface is represented by the **pt** interface when configured to function as VDSL2, and the ADSL interface is represented by the **at** interface when configured to function as ADSL.
- On VDSL2 interfaces, by default the **pt-1/0/0** interface is created when there is no configuration already created for either the **pt-1/0/0** or the **at-1/0/0** interface.

**NOTE:** It requires around 60 seconds to switch from VDSL2 to ADSL or from ADSL to VDSL2 operating modes.

Table 277 lists VDSL2 operating modes and their backward compatibility with ADSL interface standards.

Table 277: VDSL2 Operating Mode Backward Compatibility with ADSL

| VDSL2 Annex Type                                      | Operating Modes | Description                                                                                                                                                                                                                                                                                                                          |

|                                                       | itu-dmt-bis     | Configures the ADSL interface to use ITU G.992.3 mode. You can configure this mode only when it is supported on the DSLAM.                                                                                                                                                                                                           |
|                                                       | adsl2plus       | Configures the ADSL interface to use ITU G.992.5 mode. You can configure this mode only when it is supported on the DSLAM.                                                                                                                                                                                                           |
| VDSL2 Annex B interface (ADSL modes for Annex B only) | auto            | Configures the ADSL interface to autonegotiate settings with the DSLAM located at the central office. For Annex B, the ADSL interface trains in ITU G.992.1 mode.                                                                                                                                                                    |
|                                                       | itu-dmt         | Configures the ADSL interface to use ITU G.992.1 mode.                                                                                                                                                                                                                                                                               |
|                                                       | itu-dmt-bis     | Configures the ADSL interface to use ITU G.992.3 mode. You can configure this mode only when it is supported on the DSLAM.                                                                                                                                                                                                           |
|                                                       | adsl2plus       | Configures the ADSL interface to use ITU G.992.5 mode. You can configure this mode only when it is supported on the DSLAM.                                                                                                                                                                                                           |
|                                                       | itu-annexb-ur2  | Configures the ADSL line to use G.992.1 Deutsche Telekom UR-2 mode.                                                                                                                                                                                                                                                                  |

**NOTE:** On SRX210, SRX220, and SRX240 devices, every time the VDSL2 Mini-PIM is restarted in the ADSL mode, the first packet passing through the Mini-PIM is dropped

## VDSL2 Interfaces Supported Profiles

A profile is a table that contains a list of preconfigured VDSL2 settings. [Table 278](#) lists the different profiles supported on the VDSL2 interfaces and their properties.

**Table 278: Supported Profiles on the VDSL2 Interfaces**

| Profiles | Data Rate                            |
|----------|--------------------------------------|
| 8a       | 50                                   |
| 8b       | 50                                   |
| 8c       | 50                                   |
| 8d       | 50                                   |
| 12a      | 68                                   |
| 12b      | 68                                   |
| 17a      | 100                                  |
| Auto     | Negotiated (based on operating mode) |

## VDSL2 Interfaces Supported Features

The following features are supported on the VDSL2 interfaces:

- ADSL/ADSL2/ADSL2+ backward compatibility with Annex A, Annex M support
- PTM or EFM (802.3ah) support
- Operation, Administration, and Maintenance (OAM) support for ADSL/ADSL2/ADSL2+ mode
- ATM quality of service (QoS) (supported only when the VDSL2 Mini-PIM is operating in ADSL2 mode)
- Multilink Point-to-Point Protocol (MLPPP) (supported only when the VDSL2 Mini-PIM is operating in ADSL2 mode)
- MTU size of 1514 bytes (maximum) in VDSL2 mode and 1496 bytes in ADSL mode.
- Support for maximum of 10 permanent virtual connections (PVCs) (only in ADSL/ADSL2/ADSL2+ mode)
- Dying gasp support (ADSL and VDSL2 mode)

**NOTE:** On SRX210 devices with VDSL2, ATM COS VBR-related functionality cannot be tested.

## Example: Configuring VDSL2 Interfaces in ADSL Mode (Basic)

This example shows how to configure the integrated VDSL2 interfaces for SRX110 (Annex B) in ADSL backward compatible mode.

- [Requirements on page 2563](#)
- [Overview on page 2563](#)
- [Configuration on page 2563](#)
- [Verifying the Configuration on page 2564](#)

### Requirements

Before you begin:

- Set up and perform initial configuration on the SRX Series devices.
- Connect the SRX110 device to a DSLAM
- Establish basic connectivity. See the *Quick Start Guide* for your device for factory default settings.
- On VDSL2 interfaces, by default the `pt-1/0/0` interface is created when there is no configuration already created for either the `pt-1/0/0` or the `at-1/0/0` interface. You can switch to ADSL mode by just configuring `at-1/0/0`. If the configurations are already created for `pt-1/0/0` or `at-1/0/0`, then you need to deactivate `pt-1/0/0` before you create `at-1/0/0` or deactivate `at-1/0/0` to create `pt-1/0/0`.
- Make sure that you have deleted the previous configurations on `pt-1/0/0` and `pp0`.

### Overview

In this example, you create a VDSL2 interface called `pt-1/0/0`, specify the type of encapsulation, and set the VDSL2 profile to `auto`.

### Configuration

- CLI Quick Configuration**
- To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces fe-0/0/3 unit 0 family inet address 10.10.10.24
set interfaces at-1/0/0 atm-options vpi 0
set interfaces at-1/0/0 dsl-options operating-mode auto
set interfaces at-1/0/0 unit 0 vci 0.33
```

**Step-by-Step Procedure** To configure the VDSL2 interfaces for the SRX110 in ADSL backward compatible mode:

1. Set operating mode.  

```
[edit]
user@host# user@host# set interfaces at-1/0/0 dsl-options operating-mode auto
```
2. Configure the ATM VPI option  

```
[edit]
user@host# set interfaces at-1/0/0 atm-options vpi 0
```
3. Set the ATM VCI option.  

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 vci 0.33
```
4. Configure the IP address for the interface.  

```
[edit]
user@host# set interfaces fe-0/0/3 unit 0 family inet address 10.10.10.1/24
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter **commit** from configuration mode.

## Verifying the Configuration

Confirm that the configuration is working properly.

### Verifying the Configuration

**Purpose** Verify the command output.

**Action** From operational mode, enter the **show interfaces at-1/0/0 extensive** command.

The output shows a summary of VDSL2 interface. Verify the following information:

- Status of interface at-1/0/0 is displayed as **Physical link is Up**.
- Modem status is displayed as **Showtime (Adsl2plus)**.
- Time in seconds during which the interface stayed up is displayed as **Seconds** in showtime.
- ADSL profile of the DSLAM is displayed as **Annex B**.

## Example: Configuring VDSL2 Interfaces in ADSL Mode (Detail)

This example shows how to configure ADSL Interfaces for SRX Series devices.

This example uses VDSL2 Mini-PIM installed on SRX210 devices. The information is also applicable to SRX110 (integrated VDSL2), SRX220, and SRX240 devices (with VDSL2 Mini-PIMs).

- [Requirements on page 2568](#)
- [Overview on page 2569](#)
- [Configuration on page 2569](#)
- [Verification on page 2582](#)

### Requirements

Before you begin:

- Install Junos OS Release 10.1 or later for the SRX Series devices.
- Set up and perform initial configuration on the SRX Series device. See *Quick Start Guide* of your device for factory default settings.
- Install the VDSL2 Mini-PIM on the SRX210 device chassis.
- Ensure that the SRX210 device is connected to a DSLAM that supports VDSL2-to-ADSL fallback.

## Overview

In this example, you configure the ADSL interface for end-to-end data path. Then you configure PPPoA on the at-1/0/0 interface with a negotiated IP address and either PAP authentication or CHAP authentication. You also configure a static IP address and an unnumbered IP address (and either PAP authentication or CHAP authentication) for PPPoA on the at-1/0/0 interface.

Finally, you configure PPPoE on the at-1/0/0 interface with a negotiated IP address and either PAP authentication or CHAP authentication.

### Configuring the ADSL Interface for End-to-End Data Path

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation atm-pvc atm-options vpi 2
set interfaces at-1/0/0 dsl-options operating-mode itu-dmt
```

```
set interfaces at-1/0/0 unit 0 encapsulation atm-snap vci 2.119 family inet address
10.10.10.1/24
```

**Step-by-Step Procedure** To configure the ADSL interface for end-to-end data path:

1. Delete any previous configurations.  

```
[edit]
user@host# delete interfaces at-1/0/0
```
2. Specify the basic configuration for the ADSL interface.  

```
[edit]
user@host# set interfaces at-1/0/0 encapsulation atm-pvc
user@host# set interfaces at-1/0/0 atm-options vpi 2
user@host# set interfaces at-1/0/0 dsl-options operating-mode itu-dmt
user@host# set interfaces at-1/0/0 unit 0 encapsulation atm-snap
user@host# set interfaces at-1/0/0 unit 0 vci 2.119
user@host# set interfaces at-1/0/0 unit 0 family inet address 10.10.10.1/24
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation atm-pvc;
atm-options {
 vpi 2;
}
dsl-options {
 operating-mode itu-dmt;
}
encapsulation atm-snap;
vci 2.119;
family inet {
 address 10.10.10.1/24;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoA on the at-1/0/0 Interface with Negotiated IP and PAP Authentication

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation atm-pvc atm-options vpi 2
set interfaces at-1/0/0 dsl-options operating-mode auto
set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc vci 2.119
set interfaces at-1/0/0 unit 0 ppp-options pap access-profile jnpr local-name locky
local-password india
```

```
set interfaces at-1/0/0 unit 0 family inet negotiate-address
set access profile jnpr client sringeri pap-password india
```

**Step-by-Step Procedure** To configure PPPoA on the at-1/0/0 interface with negotiated IP and PAP authentication:

1. Configure encapsulation and ATM options.

```
[edit]
user@host# set interfaces at-1/0/0 encapsulation atm-pvc
user@host# set interfaces at-1/0/0 atm-options vpi 2
user@host# set interfaces at-1/0/0 dsl-options operating-mode auto
user@host# set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc
user@host# set interfaces at-1/0/0 unit 0 vci 2.119
```

2. Specify PPP options.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 ppp-options pap access-profile jnpr
user@host# set interfaces at-1/0/0 unit 0 ppp-options pap local-name locky
user@host# set interfaces at-1/0/0 unit 0 ppp-options pap local-password india
```

3. Configure the negotiated IP address.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet negotiate-address
```

4. Configure the access profile.

```
[edit]
user@host# set access profile jnpr client sringeri pap-password india
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** and **show access profile jnpr** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation atm-pvc;
atm-options {
 vpi 2;
}
dsl-options {
 operating-mode auto;
}
unit 0 {
 encapsulation atm-ppp-llc;
 vci 2.119;
 ppp-options {
 pap {
 access-profile jnpr;
 local-name locky;
 local-password "9tm/auBEx7V2gJevWx"; ## SECRET-DATA
 }
 }
 family inet {
 negotiate-address;
 }
}
```

```

 }
 }
[edit]
user@host# show access profile jnpr
client sringeri pap-password "9FoPYn9peK8N-wRhSe"; ## SECRET-DATA

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoA on the at-1/0/0 Interface with Negotiated IP and CHAP Authentication

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces at-1/0/0 encapsulation atm-pvc atm-options vpi 2
set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc vci 2.119
set interfaces at-1/0/0 unit 0 ppp-options chap access-profile jnpr local-name locky
set interfaces at-1/0/0 unit 0 family inet negotiate-address
set access profile jnpr client sringeri chap-secret india

```

**Step-by-Step Procedure** To configure PPPoA on the at-1/0/0 interface with negotiated IP and CHAP Authentication:

1. Configure encapsulation and ATM options.

```

[edit]
user@host# set interfaces at-1/0/0 encapsulation atm-pvc
user@host# set interfaces at-1/0/0 atm-options vpi 2
user@host# set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc
user@host# set interfaces at-1/0/0 unit 0 vci 2.119

```

2. Specify PPP options.

```

[edit]
user@host# set interfaces at-1/0/0 unit 0 ppp-options chap access-profile jnpr
user@host# set interfaces at-1/0/0 unit 0 ppp-options chap local-name locky

```

3. Configure the negotiated IP address.

```

[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet negotiate-address

```

4. Configure the access profile.

```

[edit]
user@host# set access profile jnpr client sringeri chap-secret india

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** and **show access profile jnpr** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@host# show interfaces at-1/0/0
encapsulation atm-pvc;

```

```

atm-options {
 vpi 2;
}
unit 0 {
 encapsulation atm-ppp-llc;
 vci 2.119;
 ppp-options {
 chap {
 access-profile jnpr;
 local-name locky;
 }
 }
 family inet {
 negotiate-address;
 }
}
[edit]
user@host# show access profile jnpr
client sringeri chap-secret "9qm5FIRSKvLAp0I"; ## SECRET-DATA

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoA on the at-1/0/0 Interface with Static IP and PAP Authentication

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces at-1/0/0 encapsulation atm-pvc atm-options vpi 2
set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc vci 2.119
set interfaces at-1/0/0 unit 0 ppp-options pap access-profile jnpr local-name locky
local-password india
set interfaces at-1/0/0 unit 0 family inet address 100.100.100.1/24
set access profile jnpr client sringeri pap-password india

```

#### Step-by-Step Procedure

To configure PPPoA on the at-1/0/0 interface with static IP and PAP authentication:

1. Configure encapsulation and ATM options.

```

[edit]
user@host# set interfaces at-1/0/0 encapsulation atm-pvc
user@host# set interfaces at-1/0/0 atm-options vpi 2
user@host# set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc
user@host# set interfaces at-1/0/0 unit 0 vci 2.119

```

2. Specify PPP options.

```

[edit]
user@host# set interfaces at-1/0/0 unit 0 ppp-options pap access-profile jnpr
user@host# set interfaces at-1/0/0 unit 0 ppp-options pap local-name locky
user@host# set interfaces at-1/0/0 unit 0 ppp-options pap local-password india

```

3. Configure the negotiated IP address.

```

[edit]

```

```
user@host# set interfaces at-1/0/0 unit 0 family inet address 100.100.100.1/24
```

4. Configure the access profile.

```
[edit]
```

```
user@host# set access profile jnpr client sringeri pap-password india
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** and **show access profile jnpr** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
```

```
user@host# show interfaces at-1/0/0
```

```
encapsulation atm-pvc;
```

```
atm-options {
```

```
 vpi 2;
```

```
}
```

```
unit 0 {
```

```
 encapsulation atm-ppp-llc;
```

```
 vci 2.119;
```

```
 ppp-options {
```

```
 pap {
```

```
 access-profile jnpr;
```

```
 local-name locky;
```

```
 local-password "9GoDHmtpBhclFn/t"; ## SECRET-DATA
```

```
 }
```

```
 }
```

```
 family inet {
```

```
 address 100.100.100.1/24;
```

```
 }
```

```
}
```

```
[edit]
```

```
user@host# show access profile jnpr
```

```
client sringeri pap-password "9p87c01h7Nbg4ZKM87"; ## SECRET-DATA
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoA on the at-1/0/0 Interface with Static IP and CHAP Authentication

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation atm-pvc atm-options vpi 2
set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc vci 2.119
set interfaces at-1/0/0 unit 0 ppp-options chap access-profile jnpr local-name locky
set interfaces at-1/0/0 unit 0 family inet address 100.100.100.1/24
set access profile jnpr client sringeri chap-secret india
```

**Step-by-Step Procedure** To configure PPPoA on the at-1/0/0 interface with static IP and CHAP authentication:

1. Configure encapsulation and ATM options.

```
[edit]
user@host# set interfaces at-1/0/0 encapsulation atm-pvc
user@host# set interfaces at-1/0/0 atm-options vpi 2
user@host# set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc
user@host# set interfaces at-1/0/0 unit 0 vci 2.119
```

- Specify PPP options.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 ppp-options chap access-profile jnpr
user@host# set interfaces at-1/0/0 unit 0 ppp-options chap local-name locky
```

- Configure the negotiated IP address.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet address 100.100.100.1/24
```

- Configure the access profile.

```
[edit]
user@host# set access profile jnpr client sringeri chap-secret india
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** and **show access profile jnpr** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation atm-pvc;
atm-options {
 vpi 2;
}
unit 0 {
 encapsulation atm-ppp-llc;
 vci 2.119;
 ppp-options {
 chap {
 access-profile jnpr;
 local-name locky;
 }
 }
 family inet {
 address 100.100.100.1/24;
 }
}
[edit]
user@host# show access profile jnpr
client sringeri chap-secret "9mfQnEhrMWxp0BE"; ## SECRET-DATA
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoA on the at-1/0/0 Interface with Unnumbered IP and PAP Authentication

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration,

copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation atm-pvc atm-options vpi 2
set interfaces at-1/0/0 dsl-options operating-mode auto
set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc vci 2.119
set interfaces at-1/0/0 unit 0 ppp-options pap access-profile jnpr local-name locky
 local-password india
set interfaces at-1/0/0 unit 0 family inet unnumbered-address lo0.0 destination
 100.100.100.6
set interfaces lo0 unit 0 family inet address 100.100.100.20/32
set access profile jnpr client sringeri pap-password india
```

#### Step-by-Step Procedure

To configure PPPoA on the at-1/0/0 interface with unnumbered IP and PAP authentication:

1. Configure encapsulation and ATM options.

```
[edit]
user@host# set interfaces at-1/0/0 encapsulation atm-pvc
user@host# set interfaces at-1/0/0 atm-options vpi 2
user@host# set interfaces at-1/0/0 dsl-options operating-mode auto
user@host# set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc
user@host# set interfaces at-1/0/0 unit 0 vci 2.119
```

2. Specify PPP options.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 ppp-options pap access-profile jnpr
user@host# set interfaces at-1/0/0 unit 0 ppp-options pap local-name locky
user@host# set interfaces at-1/0/0 unit 0 ppp-options pap local-password india
```

3. Configure the IP address, unnumbered IP address, and destination IP address.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet unnumbered-address lo0.0
user@host# set interfaces at-1/0/0 unit 0 family inet unnumbered-address
 destination 100.100.100.6
user@host# set interfaces lo0 unit 0 family inet address 100.100.100.20/32
```

4. Configure the access profile.

```
[edit]
user@host# set access profile jnpr client sringeri pap-password india
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0**, **show interfaces lo0**, and **show access profile jnpr** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation atm-pvc;
atm-options {
 vpi 2;
}
dsl-options {
```

```

 operating-mode auto;
 }
unit 0 {
 encapsulation atm-ppp-llc;
 vci 2.119;
 ppp-options {
 pap {
 access-profile jnpr;
 local-name locky;
 local-password "9LA7x-wHkPzF/aZUH"; ## SECRET-DATA
 }
 }
 family inet {
 unnumbered-address lo0.0 destination 100.100.100.6;
 }
 }
[edit]
user@host# show interfaces lo0
unit 0 {
 family inet {
 address 100.100.100.20/32;
 }
}
[edit]
user@host# show access profile jnpr
client sringeri pap-password "$9$1mSRclbwgZGiLxNb"; ## SECRET-DATA

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoA on the at-1/0/0 Interface with Unnumbered IP and CHAP Authentication

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces at-1/0/0 encapsulation atm-pvc atm-options vpi 2
set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc vci 2.119
set interfaces at-1/0/0 unit 0 ppp-options chap access-profile jnpr local-name locky
set interfaces at-1/0/0 unit 0 family inet unnumbered-address lo0.0 destination
100.100.100.6
set interfaces lo0 unit 0 family inet address 100.100.100.10/32
set access profile jnpr client sringeri chap-secret india

```

#### Step-by-Step Procedure

To configure PPPoA on the at-1/0/0 interface with unnumbered IP and CHAP authentication:

1. Configure encapsulation and ATM-options.

```

[edit]
user@host# set interfaces at-1/0/0 encapsulation atm-pvc
user@host# set interfaces at-1/0/0 atm-options vpi 2
user@host# set interfaces at-1/0/0 unit 0 encapsulation atm-ppp-llc
user@host# set interfaces at-1/0/0 unit 0 vci 2.119

```

- Specify the PPP-options.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 ppp-options chap access-profile jnpr
user@host# set interfaces at-1/0/0 unit 0 ppp-options chap local-name locky
```

- Configure the IP address, unnumbered IP address, and destination IP address.

```
[edit]
user@host# set interfaces at-1/0/0 unit 0 family inet unnumbered-address lo0.0
user@host# set interfaces at-1/0/0 unit 0 family inet unnumbered-address
destination 100.100.100.6
user@host# set interfaces lo0 unit 0 family inet address 100.100.100.10/32
```

- Configure the access profile.

```
[edit]
user@host# set access profile jnpr client sringeri chap-secret india
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0**, **show interfaces lo0**, and **show access profile jnpr** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
show interfaces at-1/0/0
 atm-options {
 vpi 2;
 }
 unit 0 {
 encapsulation atm-ppp-llc;
 vci 2.119;
 ppp-options {

 address 100.100.100.10/32;
 }
}
[edit]
user@host# show access profile jnpr
client sringeri chap-secret "9.PT3REyvMXtuOR"; ## SECRET-DATA
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoE over ATM on the at-1/0/0 Interface with Negotiated IP and PAP Authentication

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation ethernet-over-atm atm-options vpi 2
set interfaces at-1/0/0 unit 0 vci 2.119 encapsulation ppp-over-ether-over-atm-llc
set interfaces pp0 unit 0 ppp-options pap access-profile my_prf local-name purple
 local-password <password> passive
set interfaces pp0 unit 0 pppoe-options underlying-interface at-1/0/0.0 auto-reconnect
 120 client
set interfaces pp0 unit 0 family inet negotiate-address
set access profile my_prf authentication-order password
set access profile my_prf
```

**Step-by-Step Procedure** To configure PPPoE over ATM on the at-1/0/0 interface with negotiated IP and PAP authentication:

1. Configure encapsulation and ATM options.

```
[edit]
user@host# set interfaces at-1/0/0 encapsulation ethernet-over-atm
user@host# set interfaces at-1/0/0 atm-options vpi 2
user@host# set interfaces at-1/0/0 unit 0 vci 2.119
user@host# set interfaces at-1/0/0 unit 0 encapsulation
 ppp-over-ether-over-atm-llc
```

2. Specify PPP options.

```
[edit]
user@host# set interfaces pp0 unit 0 ppp-options pap access-profile my_prf
user@host# set interfaces pp0 unit 0 ppp-options pap local-name purple
user@host# set interfaces pp0 unit 0 ppp-options pap local-password <password>
user@host# set interfaces pp0 unit 0 ppp-options pap passive
```

3. Specify PPPoE options.

```
[edit]
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface at-1/0/0.0
user@host# set interfaces pp0 unit 0 pppoe-options auto-reconnect 120
user@host# set interfaces pp0 unit 0 pppoe-options client
```

4. Configure the negotiated IP address.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet negotiate-address
```

5. Configure the access profile.

```
[edit]
user@host# set access profile my_prf authentication-order password
user@host# set access profile my_prf
```

**Results** From configuration mode, confirm your configuration by entering the **set access profile my\_prf**, **show access profile my\_prf**, and **show interfaces pp0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation ethernet-over-atm;
atm-options {
 vpi 2;
}
unit 0 {
 encapsulation ppp-over-ether-over-atm-llc;
 vci 2.119;
}
[edit]
user@host# show access profile my_prf
authentication-order password;
[edit]
user@host# show interfaces pp0
unit 0 {
 ppp-options {
 pap {
 access-profile my_prf;
 local-name purple;
 local-password "9YkgoZTQn9CuZU69A0hcdb5YoGikP"; ## SECRET-DATA
 passive;
 }
 }
 pppoe-options {
 underlying-interface at-1/0/0.0;
 auto-reconnect 120;
 client;
 }
 family inet {
 negotiate-address;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoE over ATM on the at-1/0/0 Interface with Negotiated IP and CHAP Authentication

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-1/0/0 encapsulation ethernet-over-atm atm-options vpi 2
set interfaces at-1/0/0 unit 0 vci 2.119 encapsulation ppp-over-ether-over-atm-llc
set interfaces pp0 unit 0 ppp-options chap default-chap-secret <password> local-name purple passive
set interfaces pp0 unit 0 pppoe-options underlying-interface at-1/0/0.0 auto-reconnect 120 client
```

```
set interfaces pp0 unit 0 family inet negotiate-address
```

**Step-by-Step Procedure** To configure PPPoE over ATM on the at-1/0/0 interface with negotiated IP and CHAP authentication:

1. Configure encapsulation and ATM options.

```
[edit]
user@host# set interfaces at-1/0/0 encapsulation ethernet-over-atm
user@host# set interfaces at-1/0/0 atm-options vpi 2
user@host# set interfaces at-1/0/0 unit 0 vci 2.119
user@host# set interfaces at-1/0/0 unit 0 encapsulation
ppp-over-ether-over-atm-llc
```

2. Specify PPP options.

```
[edit]
user@host# set interfaces pp0 unit 0 ppp-options chap default-chap-secret
<password>
user@host# set interfaces pp0 unit 0 ppp-options chap local-name purple
user@host# set interfaces pp0 unit 0 ppp-options chap passive
```

3. Specify PPPoE options.

```
[edit]
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface at-1/0/0.0
user@host# set interfaces pp0 unit 0 pppoe-options auto-reconnect 120
user@host# set interfaces pp0 unit 0 pppoe-options client
```

4. Configure the negotiated IP address.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet negotiate-address
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-1/0/0** and **show interfaces pp0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-1/0/0
encapsulation ethernet-over-atm;
atm-options {
 vpi 2;
}
unit 0 {
 encapsulation ppp-over-ether-over-atm-llc;
 vci 2.119;
}
[edit]
user@host# show interfaces pp0
unit 0 {

### Verifying the ADSL Interface for End-to-End Data Path

**Purpose** Verify the interface status and traffic statistics.

**Action** From operational mode, enter the **show interface at-1/0/0 terse** and **show interfaces at-1/0/0** commands.

```

user@host> show interfaces at-1/0/0 terse

```

| Interface      | Admin | Link | Proto | Local         | Remote |
|----------------|-------|------|-------|---------------|--------|
| at-1/0/0       | up    | up   |       |               |        |
| at-1/0/0.0     | up    | up   | inet  | 10.10.10.1/24 |        |
| at-1/0/0.32767 | up    | up   |       |               |        |

```

[edit]
user@host# run ping 10.10.10.2 count 1000 rapid

```

PING 10.10.10.2 (10.10.10.2): 56 data bytes

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

--- 10.10.10.2 ping statistics ---

1000 packets transmitted, 1000 packets received, 0% packet loss

round-trip min/avg/max/stddev = 7.141/9.356/58.347/3.940 ms

[edit]

## Example: Configuring VDSL2 Interfaces (Basic)

This example shows how to configure the VDSL2 interfaces for SRX110, SRX210, SRX220, and SRX240 devices.

- [Requirements on page 2594](#)
- [Overview on page 2595](#)
- [Configuration on page 2595](#)
- [Verifying the Configuration on page 2597](#)

### Requirements

Before you begin:

- Establish basic connectivity. See the *Quick Start Guide* for your device for factory default settings.
- Configure network interfaces as necessary. See “[Example: Creating an Ethernet Interface](#)” on page 2634.

## Overview

In this example, you create a VDSL2 interface called **pt-1/0/0**, specify the type of encapsulation, and set the VDSL2 profile to auto.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces pt-1/0/0 vdsl-options vdsl-profile auto
set interfaces pt-1/0/0 vlan-tagging
set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
set interfaces pt-1/0/0 unit 0 family inet dhcp
set interfaces pt-1/0/0 unit 0 vlan-id 100
```

**Step-by-Step Procedure** To configure the VDSL2 interfaces for the SRX110, SRX210, and SRX240 devices and enable VLAN tagging:

1. Create an interface.  

```
[edit]
user@host# edit interfaces pt-1/0/0
```
2. Set the type of VDSL2 profile.  

```
[edit interfaces pt-1/0/0]
user@host# set vdsl-options vdsl-profile auto
```
3. Specify the logical unit to connect to this physical VDSL2 interface.  

```
[edit interfaces pt-1/0/0]
user@host# set unit 0
```
4. Specify the family protocol type.  

```
[edit interfaces pt-1/0/0]
user@host# set unit 0 family inet
```
5. To enable the DHCP client on the interface.  

```
[edit interfaces pt-1/0/0]
user@host# set unit 0 family inet dhcp
```
6. Specify the type of encapsulation on the VDSL2 logical interface.  

```
[edit interfaces pt-1/0/0]
user@host# set unit 0 encapsulation ppp-over-ether
```

**NOTE:** The VDSL2 interface supports PPPoE. You can also set no encapsulation for the VDSL2 interface.

**NOTE:** To configure VLAN tagging, continue the configuration with the next step.

7. To enable VLAN tagging on the pt interface.

```
[edit interfaces pt-1/0/0]
user@host# set interface pt-1/0/0 vlan-tagging
```

8. Specify the value of the VLAN ID to be configured.

```
[edit interfaces pt-1/0/0]
user@host# set interface pt-1/0/0 unit 0 vlan-id 100
```

**NOTE:** This feature is supported only on the pt interface, and the range of VLANs that can be configured is 0 to 4093.

**Results** From configuration mode, confirm your configuration by entering the **show interfaces pt-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces pt-1/0/0
vdsl-options {
vdsl-profile auto;
}
unit 0 {
encapsulation ppp-over-ether;
Family inet {
address 100.100.100.1/24;
dhcp;
}
}
```

**NOTE:** When VLAN tagging is configured, the intended output is:

```
[edit]
user@host# show interfaces pt-1/0/0
vlan-tagging;
vdsl-options {
vdsl-profile auto;
}
unit 0 {
encapsulation ppp-over-ether;
vlan-id 100;
Family inet {
address 100.100.100.1/24;
dhcp;
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verifying the Configuration

Confirm that the configuration is working properly.

- [Displaying the Configuration for VDSL2 Interface \(When Connected to the DSLAM Operating in Annex A Mode\) on page 2597](#)

## Example: Configuring VDSL2 Interfaces (Detail)

This example shows how to configure VDSL2 interfaces on SRX Series Services Gateways.

This example uses VDSL2 Mini-PIM installed on SRX210 devices. The information is also applicable to SRX110 (integrated VDSL2), SRX220, and SRX240 devices (with VDSL2 Mini-PIMs).

- [Requirements on page 2601](#)
- [Overview on page 2601](#)
- [Configuration on page 2602](#)
- [Verification on page 2614](#)

### Requirements

Before you begin:

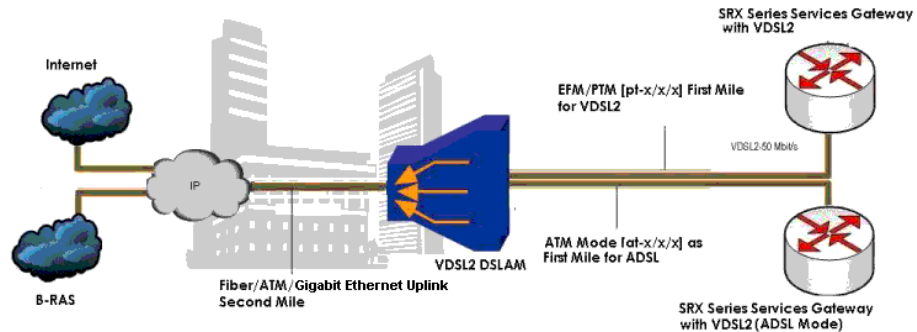

- Install Junos OS Release 10.1 or later on the SRX Series devices.
- Establish basic connectivity and set up and perform initial configuration. See the *Quick Start Guide* for your device for factory default settings.
- Install the VDSL2 Mini-PIM on the SRX210 device chassis.
- Connect the SRX210 device to a DSLAM.
- On VDSL2 Mini-PIMs, by default the **pt-1/0/0** interface is created when there is no configuration already created for either the **pt-1/0/0** or the **at-1/0/0** interface. You can switch to ADSL mode by just configuring **at-1/0/0**. If the configurations are already created for **pt-1/0/0** or **at-1/0/0**, then you need to deactivate **pt-1/0/0** before you create **at-1/0/0** or deactivate **at-1/0/0** to create **pt-1/0/0**.
- Make sure that you have deleted the previous configurations on **pt-1/0/0** and **pp0**.

### Overview

This example uses SRX210 devices. The information is also applicable to SRX240 devices.

[Figure 125](#) shows typical SRX Series devices with VDSL2 Mini-PIM network connections.

**Figure 125: SRX Series Device with VDSL2 Mini-PIMs in an End-to-End Deployment Scenario**

In this example, you begin a new configuration on a VDSL2 Mini-PIM. You first deactivate previous interfaces and delete any old configuration from the device. Then you set the interfaces with the VDSL profile and the Layer 3 configuration for the end-to-end data path.

You then configure the PPPoE on the pt-1/0/0 interface with a static IP address or CHAP authentication. You configure PPPoE on the pt-1/0/0 interface with unnumbered IP address (PAP authentication or CHAP authentication).

Finally, you configure PPPoE on the pt-1/0/0 interface with negotiated IP address (PAP authentication or CHAP authentication).

### Beginning a New Configuration on a VDSL2 Mini-PIM

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration,

copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
[edit]
deactivate interface pt-1/0/0
deactivate interface at-1/0/0
delete interface pt-1/0/0
delete interface pp0
```

**Step-by-Step Procedure** To begin a new configuration on a VDSL2 Mini-PIM:

1. Deactivate any previous interfaces.

```
[edit]
user@host# deactivate interface pt-1/0/0
user@host# deactivate interface at-1/0/0
```

2. Delete any old configurations.

```
[edit]
user@host# delete interface pt-1/0/0
user@host# delete interface pp0
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show chassis fpc** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host# run show chassis fpc
Temp CPU Utilization (%) Memory Utilization
(%)
Slot State (C) Total Interrupt DRAM (MB) Heap Buffer
0 Online ----- CPU less FPC -----
1 Online ----- CPU less FPC -----
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring the VDSL2 Mini-PIM for End-to-End Data Path

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
set interfaces pt-1/0/0 unit 0 family inet address 11.11.11.1/24
```

**Step-by-Step Procedure** To configure the VDSL2 Mini-PIM for end-to-end data path:

1. Configure the interfaces with the VDSL profile and the Layer 3 configuration for end-to-end data path.

```
[edit]
user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 family inet address 11.11.11.1/24
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces pt-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces pt-1/0/0
vdsl-options {
 vdsl-profile 17a;
}
unit 0 {
 family inet {
 address 11.11.11.1/24;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Configuring PPPoE on the pt-1/0/0 Interface with a Static IP Address

---

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
user@host# set interfaces pp0 unit 0 ppp-options pap access-profile pap_prof local-name
locky local-password india passive
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
auto-reconnect 120 client
user@host# set interfaces pp0 unit 0 family inet address 10.1.1.6/24
user@host# set access profile pap_prof authentication-order password client cuttack
pap-password india
```

**NOTE:** To configure VLAN tagging while configuring PPPoE on the pt-1/0/0 interface with

- Static IP address
- Static IP address (CHAP authentication)
- Unnumbered IP address (PAP Authentication)
- Unnumbered IP address (CHAP Authentication)
- Negotiated IP address (PAP Authentication)
- Negotiated IP address (CHAP Authentication)

the following commands must be included at [edit] hierarchy level:

```
set interfaces pt-1/0/0 vlan-tagging
set interfaces pt-1/0/0 unit 0 vlan-id 100
```

#### Step-by-Step Procedure

To configure the PPPoE on the pt-1/0/0 interface with a static IP address:

1. Configure the VDSL options and encapsulation for the interface.
 

```
[edit]
user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
```
2. Configure the PPP options for the interface.
 

```
[edit]
user@host# set interfaces pp0 unit 0 ppp-options pap access-profile pap_prof
user@host# set interfaces pp0 unit 0 ppp-options pap local-name locky
user@host# set interfaces pp0 unit 0 ppp-options pap local-password india
user@host# set interfaces pp0 unit 0 ppp-options pap passive
```
3. Configure the PPPoE options for the interface.
 

```
[edit]
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
user@host# set interfaces pp0 unit 0 pppoe-options auto-reconnect 120
user@host# set interfaces pp0 unit 0 pppoe-options client
```
4. Configure the IP address for the interface.
 

```
[edit]
user@host# set interfaces pp0 unit 0 family inet address 10.1.1.6/24
```
5. Configure the access profile for the interface.
 

```
[edit]
user@host# set access profile pap_prof authentication-order password
user@host# set access profile pap_prof client cuttack pap-password india
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces pp0**, **show interfaces pt-1/0/0** and **show access profile pap\_prof** commands. If the output

does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces pp0
unit 0 {
 ppp-options {
 pap {
 access-profile pap_prof;
 local-name locky;
 local-password "$ABC123"; ## SECRET-DATA
 }
 passive;
 }
 pppoe-options {
 underlying-interface pt-1/0/0.0;
 auto-reconnect 120;
 }
 client;
}
family inet {
 address 10.1.1.6/24;
}
}
[edit]
user@host# show interfaces pt-1/0/0
vdsl-options {
 vdsl-profile 17a;
}
unit 0 {
 encapsulation ppp-over-ether;
}
[edit]
user@host# show access profile pap_prof
authentication-order password;
client cuttack pap-password "$ABC123"; ## SECRET-DATA
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoE on the pt-1/0/0 Interface with a Static IP Address (CHAP Authentication)

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
user@host# set interfaces pp0 unit 0 ppp-options chap default-chap-secret india
local-name locky passive
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
auto-reconnect 120 client
user@host# set interfaces pp0 unit 0 family inet address 10.1.1.6/24
```

- Step-by-Step Procedure** To configure the PPPoE on the pt-1/0/0 interface with a static IP address (CHAP authentication):
1. Configure the VDSL options and encapsulation for the interface.
 

```
[edit]
user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
```
  2. Configure the PPP options for the interface.
 

```
[edit]
user@host# set interfaces pp0 unit 0 ppp-options chap default-chap-secret india
user@host# set interfaces pp0 unit 0 ppp-options chap local-name locky
user@host# set interfaces pp0 unit 0 ppp-options chap passive
```
  3. Configure the PPPoE options for the interface.
 

```
[edit]
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
user@host# set interfaces pp0 unit 0 pppoe-options auto-reconnect 120
user@host# set interfaces pp0 unit 0 pppoe-options client
```
  4. Configure the IP address for the interface.
 

```
[edit]
user@host# set interfaces pp0 unit 0 family inet address 10.1.1.6/24
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces pt-1/0/0** and **show interfaces pp0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces pt-1/0/0
vdsl-options {
 vdsl-profile 17a;
}
unit 0 {
 encapsulation ppp-over-ether;
}
[edit]
user@host# show interfaces pp0
unit 0 {
 ppp-options {
 chap {
 default-chap-secret "$ABC123"; ## SECRET-DATA
 local-name locky;
 passive;
 }
 }
 pppoe-options {
 underlying-interface pt-1/0/0.0;
 auto-reconnect 120;
 client;
 }
 family inet {
 address 10.1.1.6/24;
```

```
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoE on the pt-x/x/x Interface with Unnumbered IP (PAP Authentication)

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
user@host# set interfaces lo0 unit 0 family inet address 10.1.1.24/32
user@host# set interfaces pp0 unit 0 ppp-options pap access-profile pap_prof local-name
 locky local-password india passive
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
 auto-reconnect 120 client
user@host# set interfaces pp0 unit 0 family inet unnumbered-address lo0.0 destination
 10.1.1.1
user@host# set access profile pap_prof authentication-order password client cuttack
 pap-password india
```

#### Step-by-Step Procedure

To configure PPPoE on the pt-1/0/0 interface with unnumbered IP (PAP authentication):

1. Configure the VDSL options and encapsulation for the interface.

```
[edit]
user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
```

2. Configure the IP address for the interface.

```
[edit]
user@host# set interfaces lo0 unit 0 family inet address 10.1.1.24/32
```

3. Configure the PPP options for the interface.

```
[edit]
user@host# set interfaces pp0 unit 0 ppp-options pap access-profile pap_prof
user@host# set interfaces pp0 unit 0 ppp-options pap local-name locky
user@host# set interfaces pp0 unit 0 ppp-options pap local-password india
user@host# set interfaces pp0 unit 0 ppp-options pap passive
```

4. Configure the PPPoE options for the interface.

```
[edit]
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
user@host# set interfaces pp0 unit 0 pppoe-options auto-reconnect 120
user@host# set interfaces pp0 unit 0 pppoe-options client
```

5. Configure the unnumbered address and destination for the interface.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet unnumbered-address lo0.0
```

```
user@host# set interfaces pp0 unit 0 family inet unnumbered-address destination
10.1.1.1
```

6. Configure the access profile for the interface.

```
[edit]
user@host# set access profile pap_prof authentication-order password
user@host# set access profile pap_prof client cuttack pap-password india
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces lo0**, **show interfaces pt-1/0/0**, and **show interfaces pp0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces lo0
unit 0 {
family inet {
address 10.1.1.24/32;
}
}
[edit]
user@host# show interfaces pt-1/0/0
vdsl-options {
vdsl-profile 17a;
}
unit 0 {
encapsulation ppp-over-ether;
}
[edit]
user@host# show interfaces pp0
unit 0 {
ppp-options {
pap {
access-profile pap_prof;
local-name locky;
local-password "$ABC123"; ## SECRET-DATA
passive;
}
}
pppoe-options {
underlying-interface pt-1/0/0.0;
auto-reconnect 120;
client;
}
family inet {
unnumbered-address lo0.0 destination 10.1.1.1;
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoE on the pt-1/0/0 Interface with Unnumbered IP (CHAP Authentication)

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Configuring PPPoE on the pt-1/0/0 Interface with Negotiated IP (PAP Authentication)

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
user@host# set interfaces pp0 unit 0 ppp-options pap access-profile my_prf local-name
purple local-password <password> passive
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
auto-reconnect 120 client
user@host# set interfaces pp0 unit 0 family inet negotiate-address
user@host# set access profile my_prf authentication-order password
user@host# set access profile my_prf

```

- Step-by-Step Procedure** To configure PPPoE on the pt-1/0/0 interface with negotiated IP (PAP authentication):
1. Configure the VDSL options and encapsulation for the interface.
 

```
[edit]
user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
```
  2. Configure the PPP options for the interface.
 

```
[edit]
user@host# set interfaces pp0 unit 0 ppp-options pap access-profile my_prf
user@host# set interfaces pp0 unit 0 ppp-options pap local-name purple
user@host# set interfaces pp0 unit 0 ppp-options pap local-password <password>
user@host# set interfaces pp0 unit 0 ppp-options pap passive
```
  3. Configure the PPPoE options for the interface.
 

```
[edit]
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
user@host# set interfaces pp0 unit 0 pppoe-options auto-reconnect 120
user@host# set interfaces pp0 unit 0 pppoe-options client
```
  4. Configure the negotiated IP address for the interface.
 

```
[edit]
user@host# set interfaces pp0 unit 0 family inet negotiate-address
```
  5. Configure the access profile for the interface.
 

```
[edit]
user@host# set access profile my_prf authentication-order password
user@host# set access profile my_prf
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces pt-1/0/0**, **show interfaces pp0**, and **show access profile my\_prf** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces pt-1/0/0
vdsl-options {
 vdsl-profile 17a;
}
unit 0 {
 encapsulation ppp-over-ether;
}
[edit]
user@host# show interfaces pp0
unit 0 {
 ppp-options {
 pap {
 access-profile my_prf;
 local-name purple;
 local-password "$ABC123"; ## SECRET-DATA
 }
 passive;
 }
}
```

```

pppoe-options {
 underlying-interface pt-1/0/0.0;
 auto-reconnect 120;
 client;
}
family inet {
 negotiate-address;
}
}
[edit]
user@host# show access profile my_prf
authentication-order password;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring PPPoE on the pt-1/0/0 Interface with Negotiated IP (CHAP Authentication)

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether
user@host# set interfaces pp0 unit 0 ppp-options chap default-chap-secret <password>
local-name purple passive
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
auto-reconnect 120 client
user@host# set interfaces pp0 unit 0 family inet negotiate-address

```

#### Step-by-Step Procedure

To configure PPPoE on the pt-1/0/0 interface with negotiated IP (CHAP authentication):

1. Configure the VDSL options and encapsulation for the interface.
 

```

[edit]
user@host# set interfaces pt-1/0/0 vdsl-options vdsl-profile 17a
user@host# set interfaces pt-1/0/0 unit 0 encapsulation ppp-over-ether

```
2. Configure the PPP options for the interface.
 

```

[edit]
user@host# set interfaces pp0 unit 0 ppp-options chap default-chap-secret
<password>
user@host# set interfaces pp0 unit 0 ppp-options chap local-name purple
user@host# set interfaces pp0 unit 0 ppp-options chap passive

```
3. Configure the PPPoE options for the interface.
 

```

[edit]
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface pt-1/0/0.0
user@host# set interfaces pp0 unit 0 pppoe-options auto-reconnect 120
user@host# set interfaces pp0 unit 0 pppoe-options client

```
4. Configure the negotiated IP address for the interface.
 

```

[edit]
user@host# set interfaces pp0 unit 0 family inet negotiate-address

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces pp0** and **show interfaces pt-1/0/0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces pp0
unit 0 {
 ppp-options {
 chap {
 default-chap-secret "$ABC123"; ## SECRET-DATA
 local-name purple;
 passive;
 }
 }
 pppoe-options {
 underlying-interface pt-1/0/0.0;
 auto-reconnect 120;
 client;
 }
 family inet {
 negotiate-address;
 }
}
[edit]
user@host# show interfaces pt-1/0/0
vdsl-options {
 vdsl-profile 17a;
}
unit 0 {
 encapsulation ppp-over-ether;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying PPPoE on the pt-1/0/0 Interface with Negotiated IP \(PAP Authentication\) on page 2624](#)
- [Verifying PPPoE on the pt-1/0/0 Interface with Negotiated IP \(CHAP Authentication\) on page 2625](#)

## Verifying the Configuration

**Purpose** Verify the FPC status and the command output.

**Action** 1. Verify the FPC status by entering the **show chassis fpc** command. The output should display FPC status as online.

```
user@host# run show chassis fpc
Temp CPU Utilization (%) Memory Utilization
(%)
Slot State (C) Total Interrupt DRAM (MB) Heap Buffer
0 Online ----- CPU less FPC -----
1 Online ----- CPU less FPC -----
```

**NOTE:** The VDSL2 Mini-PIM is installed in the first slot of the SRX210 device chassis; therefore, the FPC used here is fpc 1. For SRX240 devices, the FPC used will be fpc 1, fpc 2, fpc 3, or fpc 4.

2. Enter **run show interface pt-1/0/0** and verify the following information in the command output:

- Status of interface pt-1/0/0 is displayed as physical link is up.
- Modem status is displayed as Showtime (Profile-17a).
- Time in seconds during which the interface stayed up is displayed as Seconds in Showtime.
- VDSL profile of DSLAM is displayed as Auto Annex A.

## Understanding Ethernet Interfaces

---

Ethernet is a Layer 2 technology that operates in a shared bus topology. Ethernet supports broadcast transmission, uses best-effort delivery, and has distributed access control. Ethernet is a point-to-multipoint technology.

In a shared bus topology, all devices connect to a single, shared physical link through which all data transmissions are sent. All traffic is broadcast so that all devices within the topology receive every transmission. The devices within a single Ethernet topology make up a broadcast domain.

Ethernet uses best-effort delivery to broadcast traffic. The physical hardware provides no information to the sender about whether the traffic was received. If the receiving host is offline, traffic to the host is lost. Although the Ethernet data link protocol does not inform the sender about lost packets, higher layer protocols such as TCP/IP might provide this type of notification.

This topic contains the following sections:

- [Ethernet Access Control and Transmission on page 2630](#)
- [Collisions and Detection on page 2630](#)
- [Collision Domains and LAN Segments on page 2631](#)

- [Broadcast Domains on page 2632](#)
- [Ethernet Frames on page 2632](#)

## Ethernet Access Control and Transmission

Ethernet's access control is distributed because Ethernet has no central mechanism that grants access to the physical medium within the network. Instead, Ethernet uses carrier-sense multiple access with collision detection (CSMA/CD). Because multiple devices on an Ethernet network can access the physical medium, or wire, simultaneously, each device must determine whether the physical medium is in use. Each host listens on the wire to determine if a message is being transmitted. If it detects no transmission, the host begins transmitting its own data.

The length of each transmission is determined by fixed Ethernet packet sizes. By fixing the length of each transmission and enforcing a minimum idle time between transmissions, Ethernet ensures that no pair of communicating devices on the network can monopolize the wire and block others from sending and receiving traffic.

## Collisions and Detection

When a device on an Ethernet network begins transmitting data, the data takes a finite amount of time to reach all hosts on the network. Because of this delay, or latency, in transmitting traffic, a device might detect an idle state on the wire just as another device initially begins its transmission. As a result, two devices might send traffic across a single wire at the same time. When the two electrical signals collide, they become scrambled so that both transmissions are effectively lost.

### Collision Detection

To handle collisions, Ethernet devices monitor the link while they are transmitting data. The monitoring process is known as collision detection. If a device detects a foreign signal while it is transmitting, it terminates the transmission and attempts to transmit again only after detecting an idle state on the wire. Collisions continue to occur if two colliding devices both wait the same amount of time before retransmitting. To avoid this condition, Ethernet devices use a binary exponential backoff algorithm.

### Backoff Algorithm

With the binary exponential backoff algorithm, each device that sends a colliding transmission randomly selects a value within a range. The value represents the number of transmission times that the device must wait before retransmitting its data. If another collision occurs, the range of values is doubled and retransmission takes place again. Each time a collision occurs, the range of values doubles, to reduce the likelihood that two hosts on the same network can select the same retransmission time. [Table 279](#) shows collision rounds up to round 10.

**Table 279: Collision Backoff Algorithm Rounds**

| Round | Size of Set | Elements in the Set |
|-------|-------------|---------------------|
| 1     | 2           | {0,1}               |

Table 279: Collision Backoff Algorithm Rounds (*continued*)

| Round | Size of Set | Elements in the Set               |
|-------|-------------|-----------------------------------|
| 2     | 4           | {0,1,2,3}                         |
| 3     | 8           | {0,1,2,3,...,7}                   |
| 4     | 16          | {0,1,2,3,4,...,15}                |
| 5     | 32          | {0,1,2,3,4,5,...,31}              |
| 6     | 64          | {0,1,2,3,4,5,6,...,63}            |
| 7     | 128         | {0,1,2,3,4,5,6,7,...,127}         |
| 8     | 256         | {0,1,2,3,4,5,6,7,8,...,255}       |
| 9     | 512         | {0,1,2,3,4,5,6,7,8,9,...,511}     |
| 10    | 1024        | {0,1,2,3,4,5,6,7,8,9,10,...,1023} |

## Collision Domains and LAN Segments

Collisions are confined to a physical wire over which data is broadcast. Because the physical wires are subject to signal collisions, individual LAN segments are known as *collision domains*. Although the physical limitations on the length of an Ethernet cable restrict the length of a LAN segment, multiple collision domains can be interconnected by repeaters, bridges, and switches.

### Repeaters

Repeaters are electronic devices that act on analog signals. Repeaters relay all electronic signals from one wire to another. A single repeater can double the distance between two devices on an Ethernet network. However, the Ethernet specification restricts the number of repeaters between any two devices on an Ethernet network to two, because collision detection with latencies increases in complexity as the wire length and number of repeaters increase.

### Bridges and Switches

Bridges and switches combine LAN segments into a single Ethernet network by using multiple ports to connect the physical wires in each segment. Although bridges and switches are fundamentally the same, bridges generally provide more management and more interface ports. As Ethernet packets flow through a bridge, the bridge tracks the source MAC address of the packets and stores the addresses and their associated input ports in an interface table. As it receives subsequent packets, the bridge examines its interface table and takes one of the following actions:

- If the destination address does not match an address in the interface table, the bridge transmits the packet to all hosts on the network using the Ethernet broadcast address.

- If the destination address maps to the port through which the packet was received, the bridge or switch discards the packet. Because the other devices on the LAN segment also received the packet, the bridge does not need to retransmit it.
- If the destination address maps to a port other than the one through which the packet was received, the bridge transmits the packet through the appropriate port to the corresponding LAN segment.

## Broadcast Domains

The combination of all the LAN segments within an Ethernet network is called a *broadcast domain*. In the absence of any signaling devices such as a repeater, bridge, or switch, the broadcast domain is simply the physical wire that makes up the connections in the network. If a bridge or switch is used, the broadcast domain consists of the entire LAN.

**NOTE:** On all branch SRX Series devices, the subnet directed broadcast feature is not supported.

## Ethernet Frames

Data is transmitted through an Ethernet network in frames. The frames are of variable length, ranging from 64 octets to 1518 octets, including the header, payload, and cyclic redundancy check (CRC) value. Figure 126 shows the Ethernet frame format.

**Figure 126: Ethernet Frame Format**

Ethernet frames have the following fields:

- The preamble (PRE) field is 7 octets of alternating 0s and 1s. The predictable format in the preamble allows receiving interfaces to synchronize themselves to the data being sent. The preamble is followed by a 1-octet start-of-frame delimiter (SFD).
- The destination address (DA) and source address (SA) fields contain the 6-octet (48-bit) MAC addresses for the destination and source ports on the network. These Layer 2 addresses uniquely identify the devices on the LAN.
- The Length/Type field is a 2-octet field that either indicates the length of the frame's data field or identifies the protocol stack associated with the frame. Here are some common frame types:
  - AppleTalk—**0x809B**
  - AppleTalk ARP—**0x80F3**

- DECnet—0x6003
  - IP—0x0800
  - IPX—0x8137
  - Loopback—0x9000
  - XNS—0x0600
- The Data field contains the packet payload.
  - The frame check sequence (FCS) is a 4-octet field that contains the calculated CRC value. This value is calculated by the originating host and appended to the frame. When it receives the frames, the receiving host calculates the CRC and checks it against this appended value to verify the integrity of the received frame.

**NOTE:** On SRX650 devices, MAC pause frame and FCS error frame counters are not supported for the interfaces ge-0/0/0 through ge-0/0/3.

---

## Understanding Static ARP Entries on Ethernet Interfaces

By default, the device responds to an Address Resolution Protocol (ARP) request only if the destination address of the ARP request is on the local network of the incoming interface. For Fast Ethernet or Gigabit Ethernet interfaces, you can configure static ARP entries that associate the IP addresses of nodes on the same Ethernet subnet with their media access control (MAC) addresses. These static ARP entries enable the device to respond to ARP requests even if the destination address of the ARP request is not local to the incoming Ethernet interface.

## Understanding Promiscuous Mode on Ethernet Interface

When promiscuous mode is enabled on a Layer 3 Ethernet interface, all packets received on the interface are sent to the central point or Services Processing Unit (SPU) regardless of the destination MAC address of the packet. You can also enable promiscuous mode on chassis cluster redundant Ethernet interfaces and aggregated Ethernet interfaces. If you enable promiscuous mode on a redundant Ethernet interface, promiscuous mode is

then enabled on any child physical interfaces. If you enable promiscuous mode on an aggregated Ethernet interface, promiscuous mode is then enabled on all member interfaces.

## Understanding Promiscuous Mode on the SRX5K-MPC

The promiscuous mode function is supported on 1-Gigabit, 10-Gigabit, 40-Gigabit, and 100-Gigabit Ethernet interfaces on the I/O cards (IOCs) and the SRX5000 line Module Port Concentrator (SRX5K-MPC).

When promiscuous mode is enabled on a Layer 3 Ethernet interface, all packets received on the interface are sent to the central point or to the Services Processing Unit (SPU) regardless of the destination MAC address of the packet.

By default, an interface enables MAC filtering. You can configure promiscuous mode on the interface to disable MAC filtering. When you delete the promiscuous mode configuration, the interface will perform MAC filtering again.

You can change the MAC address of an interface even when the interface is operating in promiscuous mode. When the interface is operating in normal mode again, the MAC filtering function on the IOC uses the new MAC address to filter the packets.

You can also enable promiscuous mode on chassis cluster redundant Ethernet interfaces and aggregated Ethernet interfaces. If you enable promiscuous mode on a redundant Ethernet interface, promiscuous mode is then enabled on any child physical interfaces. If you enable promiscuous mode on an aggregated Ethernet interface, promiscuous mode is then enabled on all member interfaces.

## Example: Creating an Ethernet Interface

This example shows how to create an Ethernet interface.

- [Requirements on page 2634](#)
- [Overview on page 2635](#)
- [Configuration on page 2635](#)

### Requirements

No special configuration beyond device initialization is required before configuring an interface.

## Overview

In this example, you create the ge-1/0/0 Ethernet interface and set the logical interface to 0. The logical unit number can range from 0 to 16,384. You can also add values for properties that you need to configure on the logical interface, such as logical encapsulation or protocol family.

## Configuration

### Step-by-Step Procedure

To configure an Ethernet interface:

1. Create the Ethernet interface and set the logical interface.  

```
[edit]
user@host# edit interfaces ge-1/0/0 unit 0
```
2. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

---

### Verification

**Purpose** Verify if the configuration is working properly after creating the interface.

**Action** From operational mode, enter the **show interfaces** command.

- Related Documentation**
- [Understanding Ethernet Interfaces on page 2629](#)
  - [Example: Deleting an Ethernet Interface on page 2635](#)

## Example: Deleting an Ethernet Interface

This example shows how to delete an Ethernet interface.

- [Requirements on page 2635](#)
- [Overview on page 2635](#)
- [Configuration on page 2636](#)

## Requirements

No special configuration beyond device initialization is required before configuring an interface.

## Overview

In this example, you delete the ge-1/0/0 interface.

**NOTE:** Performing this action removes the interface from the software configuration and disables it. Network interfaces remain physically present, and their identifiers continue to appear on J-Web pages.

## Configuration

### Step-by-Step Procedure

To delete an Ethernet interface:

1. Specify the interface you want to delete.  

```
[edit]
user@host# delete interfaces ge-1/0/0
```
2. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

### Verification

**Purpose** Verify if the configuration is working properly after deleting the interface.

**Action** From operational mode, enter the **show interfaces** command.

- Related Documentation**
- [Understanding Ethernet Interfaces on page 2629](#)
  - [Example: Creating an Ethernet Interface on page 2634](#)

## Example: Configuring Static ARP Entries on Ethernet Interfaces

- [Requirements on page 2636](#)
- [Overview on page 2636](#)
- [Configuration on page 2637](#)
- [Verification on page 2637](#)

### Requirements

No special configuration beyond device initialization is required before creating an interface.

### Overview

In this example, you configure a static ARP entry on the logical unit 0 of the ge-0/0/3 Gigabit Ethernet interface. The entry consists of the interface's IP address (10.1.1.1/24) and the corresponding MAC address of a node on the same Ethernet subnet (00:ff:85:7f:78:03). The example also configures the device to reply to ARP requests from the node using the publish option.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/3 unit 0 family inet address 10.1.1.1/24 arp 10.1.1.3 mac
00:ff:85:7f:78:03
set interfaces ge-0/0/3 unit 0 family inet address 10.1.1.1/24 arp 10.1.1.3 publish
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a static ARP entry on an Ethernet interface:

1. Create the Gigabit Ethernet interface.  

```
[edit]
user@host# edit interfaces ge-0/0/3
```
2. Configure a static ARP entry.  

```
[edit interfaces ge-0/0/3]
user@host# edit unit 0 family inet address 10.1.1.1/24
```
3. Set the IP address of the subnet node and the corresponding MAC address.  

```
[edit interfaces ge-0/0/3 unit 0 family inet address 10.1.1.1/24]
user@host# set arp 10.1.1.3 mac 00:ff:85:7f:78:03 publish
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces ge-0/0/3** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces ge-0/0/3
unit 0 {
 family inet {
 address 10.1.1.1/24 {
 arp 10.1.1.3 mac 00:ff:85:7f:78:03 publish;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying Static ARP Configurations on page 2638](#)
- [Verifying the Link State of All Interfaces on page 2638](#)
- [Verifying Interface Properties on page 2638](#)

### Verifying Static ARP Configurations

**Purpose** Verify the IP address and MAC (hardware) address of the node.

**Action** From operational mode, enter the **show interfaces ge-0/0/3** command.

### Verifying the Link State of All Interfaces

**Purpose** Verify that all interfaces on the device are operational using the ping tool on each peer address in the network.

**Action** For each interface on the device:

1. In the J-Web interface, select **Troubleshoot>Ping Host**.
2. In the Remote Host box, type the address of the interface for which you want to verify the link state.
3. Click **Start**. The output appears on a separate page.

```
PING 10.10.10.10 : 56 data bytes
64 bytes from 10.10.10.10: icmp_seq=0 ttl=255 time=0.382 ms
64 bytes from 10.10.10.10: icmp_seq=1 ttl=255 time=0.266 ms
```

If the interface is operational, it generates an ICMP response. If this response is received, the round-trip time in milliseconds is listed in the time field..

### Verifying Interface Properties

**Purpose** Verify that the interface properties are correct.

**Action** From operational mode, enter the **show interfaces detail** command.

```
user@host> show interfaces detail
Physical interface: ge-0/0/3, Enabled, Physical link is Up
 Interface index: 134, SNMP ifIndex: 27, Generation: 17
 Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled
 Device flags : Present Running
 Interface flags: SNMP-Traps 16384
 Link flags : None
 CoS queues : 4 supported
 Hold-times : Up 0 ms, Down 0 ms
 Current address: 00:90:69:87:44:9d, Hardware address: 00:90:69:87:44:9d
 Last flapped : 2004-08-25 15:42:30 PDT (4w5d 22:49 ago)
 Statistics last cleared: Never
 Traffic statistics:
 Input bytes : 0 0 bps
 Output bytes : 0 0 bps
 Input packets : 0 0 pps
 Output packets: 0 0 pps
 Queue counters: Queued packets Transmitted packets Dropped packets
 0 best-effort 0 0 0
```

|                |   |   |   |
|----------------|---|---|---|
| 1 expedited-fo | 0 | 0 | 0 |
| 2 assured-forw | 0 | 0 | 0 |
| 3 network-cont | 0 | 0 | 0 |

Active alarms : None  
Active defects : None

The output shows a summary of interface information. Verify the following information:

- The physical interface is Enabled. If the interface is shown as Disabled, do one of the following:
  - In the CLI configuration editor, delete the **disable** statement at the [edit interfaces ge-0/0/3] level of the configuration hierarchy.
  - In the J-Web configuration editor, clear the **Disable** check box on the Interfaces> ge-0/0/3 page.
- The physical link is Up. A link state of Down indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- The Last Flapped time is an expected value. The Last Flapped time indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect expected input and output rates. Verify that the number of inbound and outbound bytes and packets matches expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics ge-0/0/3** command.

## Enabling and Disabling Promiscuous Mode on Ethernet Interfaces (CLI Procedure)

To enable promiscuous mode on an interface:

```
user@host# set interfaces interface-name promiscuous-mode
```

To disable promiscuous mode on an interface:

```
user@host# delete interfaces interface-name promiscuous-mode
```

## Example: Configuring Promiscuous Mode on the SRX5K-MPC

---

This example shows how to configure promiscuous mode on an SRX5K-MPC interface in an SRX5600 to disable MAC address filtering.

- [Requirements on page 2640](#)
- [Overview on page 2640](#)
- [Configuration on page 2640](#)
- [Verification on page 2641](#)

### Requirements

This example uses the following hardware and software components:

- An SRX5600 with an SRX5K-MPC that includes a 100-Gigabit Ethernet CFP transceiver
- Junos OS Release 12.1X47-D10 or later

No special configuration beyond device initialization is required before configuring this feature.

### Overview

By default, the interfaces on an SRX5K-MPC have MAC address filtering enabled. In this example, you configure promiscuous mode on an interface to disable MAC address filtering. Then you delete promiscuous mode to reenable MAC address filtering on the interface.

### Configuration

#### Configuring Promiscuous Mode on an Interface

---

##### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces et-4/0/0 unit 0 family inet address 10.1.1.1/24
set interfaces et-4/0/0 promiscuous-mode
```

##### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure promiscuous mode:

1. Configure the ingress interface.  

```
[edit interfaces]
user@host# set et-4/0/0 unit 0 family inet address 10.1.1.1/24
```
2. Enable promiscuous mode on the interface.

```
[edit interfaces]
user@host# set et-4/0/0 promiscuous-mode
```

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces
et-4/0/0 {
 promiscuous-mode;
 unit 0 {
 family inet {
 address 10.1.1/24;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Disabling Promiscuous Mode on an Interface

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
user@host# delete interfaces et-4/0/0 promiscuous-mode
```

**Step-by-Step Procedure** To disable promiscuous mode:

1. Disable promiscuous mode on the interface.

```
[edit]
user@host# delete interfaces et-4/0/0 promiscuous-mode
```

## Verification

Confirm that the configuration is working properly.

- [Verifying That Promiscuous Mode Is Enabled on the SRX5K-MPC on page 2641](#)
- [Verifying the Status of Promiscuous Mode on page 2642](#)
- [Verifying That Promiscuous Mode Is Disabled on page 2643](#)

### Verifying That Promiscuous Mode Is Enabled on the SRX5K-MPC

**Purpose** Verify that promiscuous mode is enabled on the interface.

**Action** From operational mode, enter the **monitor interface traffic** command.

```
user@host> monitor interface traffic

Physical interface: et-4/0/0, Enabled, Physical link is Up
Interface index: 137, SNMP ifIndex: 511
```

```

Link-level type: Ethernet, MTU: 1518, Speed: 100Gbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Enabled

```

**Meaning** The **Interface flags: Promiscuous** field shows that promiscuous mode is enabled on the interface.

### Verifying the Status of Promiscuous Mode

**Purpose** Verify that promiscuous mode works on the **et-4/0/0** interface.

**Action** Send traffic into the **et-4/0/0** interface with a MAC address that is different from the interface MAC address and turn on promiscuous mode.

From operational mode, enter the **monitor interface traffic** command.

```
user@host> monitor interface traffic
```

| Interface | Link | Input packets | (pps) | Output packets | (pps) |
|-----------|------|---------------|-------|----------------|-------|
| gr-0/0/0  | Up   | 0             | (0)   | 0              | (0)   |
| ip-0/0/0  | Up   | 0             | (0)   | 0              | (0)   |
| lt-0/0/0  | Up   | 0             | (0)   | 0              | (0)   |
| xe-1/2/0  | Down | 0             | (0)   | 0              | (0)   |

|                 |           |                |                 |          |            |
|-----------------|-----------|----------------|-----------------|----------|------------|
| xe-1/2/1        | Down      | 0              | (0)             | 0        | (0)        |

| xe-1/2/3        | Down      | 0              | (0)             | 0        | (0)        |
| xe-1/2/4        | Down      | 0              | (0)             | 0        | (0)        |
| xe-1/2/5        | Down      | 0              | (0)             | 0        | (0)        |
| xe-1/2/6        | Down      | 0              | (0)             | 0        | (0)        |
| xe-1/2/7        | Down      | 0              | (0)             | 0        | (0)        |
| xe-1/2/8        | Down      | 0              | (0)             | 0        | (0)        |
| xe-1/2/9        | Down      | 0              | (0)             | 0        | (0)        |
| <b>et-4/0/0</b> | <b>Up</b> | <b>4403996</b> | <b>(100002)</b> | <b>0</b> | <b>(0)</b> |
| et-4/2/0        | Up        | 3              | (0)             | 4403924  | (99997)    |
| avs0            | Up        | 0              | (0)             | 0        | (0)        |
| avs1            | Up        | 0              | (0)             | 0        | (0)        |
| dsc             | Up        | 0              |                 | 0        |            |
| em0             | Up        | 15965          |                 | 14056    |            |

**Meaning** The **input packets** and **pps** fields show that traffic is passing through the **et-4/0/0** interface as expected after promiscuous mode is enabled.

### Verifying That Promiscuous Mode Is Disabled

**Purpose** Verify that disabled promiscuous mode works on the **et-4/0/0** interface.

**Action** Send traffic into the **et-4/0/0** interface with a MAC address that is different from the interface MAC address and turn off promiscuous mode.

From operational mode, enter the **monitor interface traffic** command.

```
user@host> monitor interface traffic
```

| Interface       | Link      | Input packets   | (pps)      | Output packets | (pps)      |
|-----------------|-----------|-----------------|------------|----------------|------------|
| gr-0/0/0        | Up        | 0               | (0)        | 0              | (0)        |
| ip-0/0/0        | Up        | 0               | (0)        | 0              | (0)        |
| lt-0/0/0        | Up        | 0               | (0)        | 0              | (0)        |
| xe-1/2/0        | Down      | 0               | (0)        | 0              | (0)        |
| xe-1/2/1        | Down      | 0               | (0)        | 0              | (0)        |
| xe-1/2/2        | Down      | 0               | (0)        | 0              | (0)        |
| xe-1/2/3        | Down      | 0               | (0)        | 0              | (0)        |
| xe-1/2/4        | Down      | 0               | (0)        | 0              | (0)        |
| xe-1/2/5        | Down      | 0               | (0)        | 0              | (0)        |
| xe-1/2/6        | Down      | 0               | (0)        | 0              | (0)        |
| xe-1/2/7        | Down      | 0               | (0)        | 0              | (0)        |
| xe-1/2/8        | Down      | 0               | (0)        | 0              | (0)        |
| xe-1/2/9        | Down      | 0               | (0)        | 0              | (0)        |
| <b>et-4/0/0</b> | <b>Up</b> | <b>11505495</b> | <b>(0)</b> | <b>0</b>       | <b>(0)</b> |
| et-4/2/0        | Up        | 6               | (0)        | 11505425       | (0)        |
| avs0            | Up        | 0               | (0)        | 0              | (0)        |
| avs1            | Up        | 0               | (0)        | 0              | (0)        |
| dsc             | Up        | 0               |            | 0              |            |
| em0             | Up        | 37964           |            | 31739          |            |

**Meaning** The **pps** field shows that the traffic is not passing through the **et-4/0/0** interface after promiscuous mode is disabled.

## Understanding Aggregated Ethernet Interfaces

---

Link aggregation of Ethernet interfaces is defined in the IEEE 802.3ad standard. Junos OS implementation of 802.3ad balances traffic across the member links within an aggregated Ethernet bundle based on Layer 3 information carried in the packet, Layer 4 information carried in the packet, or both, or based on session ID data. (The session ID data has higher precedence than the Layer 3 or 4 information.) This implementation uses the same load-balancing algorithm used for per-packet load balancing.

Aggregated Ethernet interfaces can be Layer 3 interfaces (VLAN-tagged or untagged) and Layer 2 interfaces.

**NOTE:** This topic is specific to the SRX3000 and SRX5000 line devices.

This topic contains the following sections:

- [LAGs on page 2646](#)
- [LACP on page 2646](#)

## LAGs

You can combine multiple physical Ethernet ports to form a logical point-to-point link, known as a link aggregation group (LAG) or bundle, such that a media access control (MAC) client can treat the LAG as if it were a single link. Support for LAGs based on IEEE 802.3ad makes it possible to aggregate physical interface links on your device. LAGs provide increased interface bandwidth and link availability by linking physical ports and load-balancing traffic crossing the combined interface. For the LAG to operate correctly, it is necessary to coordinate the two end systems connected by the LAG, either manually or automatically.

Internally, a LAG is a virtual interface presented on SRX3000 and SRX5000 line devices or on any system (consisting of devices such as routers and switches) supporting 802.3ad link aggregation. Externally, a LAG corresponds to a bundle of physical Ethernet links connected between an SRX3000 or SRX5000 line device and another system capable of link aggregation. This bundle of physical links is a virtual link.

Follow these guidelines for aggregated Ethernet support for the SRX3000 and SRX5000 lines:

- The devices support a maximum of 16 physical interfaces per single aggregated Ethernet bundle.
- Aggregated Ethernet interfaces can use interfaces from the same or different Flexible PIC Concentrators (FPCs) and PICs.
- On the aggregated bundle, capabilities such as MAC accounting, VLAN rewrites, and VLAN queuing are available.

## LACP

Junos OS supports the Link Aggregation Control Protocol (LACP), which is a subcomponent of IEEE 802.3ad. LACP provides additional functionality for LAGs, but is only supported on Layer 3.

LACP provides a standardized means for exchanging information between partner (remote or far-end of the link) systems on a link. This exchange allows their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG. This exchange also enables the transmission and reception processes for the link to function in an orderly manner.

For example, when LACP is not enabled, a local LAG might attempt to transmit packets to a remote individual interface, which causes the communication to fail. (An individual

interface is a nonaggregatable interface.) When LACP is enabled, a local LAG cannot transmit packets unless a LAG with LACP is also configured on the remote end of the link.

You configure an aggregated Ethernet virtual link by specifying the link number as a physical device. Then you associate a set of ports that have the same speed and are in full-duplex mode. The physical ports can be 100-megabit Ethernet, 1-Gigabit Ethernet, and 10-Gigabit Ethernet.

When configuring LACP, follow these guidelines:

- LACP does not support automatic configuration on SRX3000 and SRX5000 line devices, but partner systems are allowed to perform automatic configuration. When an SRX3000 or SRX5000 line device is connected to a fully 802.3ad-compliant partner system, static configuration of LAGs is initiated on the SRX3000 and SRX5000 line device side, and static configuration is not needed on the partner side.
- When an SRX3000 or SRX5000 line device is connected to a Juniper Networks MX Series router, static configuration of LAGs is needed at both the actor (local or near-end of the link) and partner systems.
- Although the LACP functions on the SRX3000 and SRX5000 line devices are similar to the LACP features on Juniper Networks MX Series routers, the following LACP features on MX Series routers are not supported on SRX3000 and SRX5000 line devices: link protection, system priority, and port priority for aggregated Ethernet interfaces. Instead, SRX3000 and SRX5000 line devices provide active/standby support with redundant Ethernet interface LAGs in chassis cluster deployments.

LACP is supported in standalone deployments, where aggregated Ethernet interfaces are supported, and in chassis cluster deployments, where aggregated Ethernet interfaces and redundant Ethernet interfaces are supported simultaneously.

## Aggregated Ethernet Interfaces Configuration Overview

**NOTE:** This topic is specific to the SRX3000 and SRX5000 line devices.

To configure an aggregated Ethernet interface:

1. Set the number of aggregated Ethernet interfaces on the device. See [“Example: Configuring the Number of Aggregated Ethernet Interfaces on a Device”](#) on page 2649.
2. Associate a physical interface with the aggregated Ethernet interface. See [“Example: Associating Physical Interfaces with Aggregated Ethernet Interfaces”](#) on page 2650.
3. (Optional) Set the required link speed for all the interfaces included in the bundle. See [“Example: Configuring Aggregated Ethernet Link Speed”](#) on page 2652.
4. (Optional) Configure the minimum number of links that must be up for the bundle as a whole to be labeled as up. See [“Example: Configuring Aggregated Ethernet Minimum Links”](#) on page 2653.
5. (Optional) Enable or disable VLAN tagging. See [“Understanding VLAN Tagging for Aggregated Ethernet Interfaces”](#) on page 2658.
6. (Optional) Enable promiscuous mode. See [“Understanding Promiscuous Mode for Aggregated Ethernet Interfaces”](#) on page 2658.

## Understanding the Aggregated Ethernet Interfaces Device Count

By default, no aggregated Ethernet interfaces are created. You must set the number of aggregated Ethernet interfaces on the routing device before you can configure them. Once you set the device count, the system creates that number of empty aggregated Ethernet interfaces. A globally unique MAC address is assigned to every aggregated Ethernet interface. More aggregated Ethernet interfaces can be created by increasing the parameter.

The maximum number of aggregated devices you can configure is 128. The aggregated interfaces are numbered from ae0 through ae127.

Similarly, you can permanently remove an aggregated Ethernet interface from the device configuration by deleting it from the device count. When you reduce the device count, only the aggregated Ethernet interface objects at the end of the list are removed, leaving the newly specified number of interfaces. That is, if you set the device count to 10 and then reduce it to 6, the system removes the last 4 interface objects from the list.

**WARNING:** Be aware that this approach deletes the aggregated Ethernet interface and *all* of its objects from the device configuration.

## Example: Configuring the Number of Aggregated Ethernet Interfaces on a Device

---

This example shows how to configure the number of aggregated Ethernet interfaces on a device.

- [Requirements on page 2649](#)
- [Overview on page 2649](#)
- [Configuration on page 2649](#)
- [Verification on page 2649](#)

### Requirements

No special configuration beyond device initialization is required before configuring an interface.

### Overview

In this example, you create two aggregate Ethernet interfaces, thereby enabling all the interfaces that you need for your configuration in one step.

### Configuration

#### Step-by-Step Procedure

To configure the number of aggregated Ethernet interfaces on a device:

1. Set the number of aggregated Ethernet interfaces.  
  
[edit]  
user@host# **set chassis aggregated-devices ethernet device-count 2**
2. If you are done configuring the device, commit the configuration.  
  
[edit]  
user@host# **commit**

### Verification

To verify the configuration is working properly, enter the **show chassis aggregated-devices** command.

## Understanding Physical Interfaces for Aggregated Ethernet Interfaces

---

You associate a physical interface with an aggregated Ethernet interface. Doing so associates the physical child links with the logical aggregated parent interface to form a link aggregation group (LAG). You must also specify the constituent physical links by including the **802.3ad** configuration statement.

A physical interface can be added to any aggregated Ethernet interface as long as all member links have the same link speed and the maximum number of member links does not exceed 16. The aggregated Ethernet interface instance number *aex* can be from 0 through 127, for a total of 128 aggregated interfaces.

**NOTE:** If you specify (on purpose or accidentally) that a link already associated with an aggregated Ethernet interface be associated with another aggregated Ethernet interface, the link is removed from the previous interface (there is no need for you to explicitly delete it) and it is added to the other one.

## Example: Associating Physical Interfaces with Aggregated Ethernet Interfaces

---

This example shows how to associate physical interfaces with aggregated Ethernet interfaces.

- [Requirements on page 2650](#)
- [Overview on page 2650](#)
- [Configuration on page 2651](#)
- [Verification on page 2651](#)

### Requirements

Before you begin, set the number of aggregated Ethernet interfaces on the device. See [“Example: Configuring the Number of Aggregated Ethernet Interfaces on a Device” on page 2649](#).

### Overview

In this example, you associate the physical child link of the *ge-1/0/0* and *ge-2/0/0* physical interfaces with the logical aggregate parent, *ae0*, thereby creating a LAG. Similarly, you create a LAG that associate the *ge-3/0/0*, *ge-3/0/1*, and *ge-4/0/1* physical interfaces with the *ae1* aggregated Ethernet interface.

## Configuration

### Step-by-Step Procedure

To associate physical interfaces with aggregated Ethernet interfaces:

1. Create the first LAG.  

```
[edit]
user@host# set interfaces ge-1/0/0 gigether-options 802.3ad ae0
user@host# set interfaces ge-2/0/0 gigether-options 802.3ad ae0
```
2. Create the second LAG.  

```
[edit]
user@host# set interfaces ge-3/0/0 gigether-options 802.3ad ae1
user@host# set interfaces ge-3/0/1 gigether-options 802.3ad ae1
user@host# sset interfaces ge-4/0/0 gigether-options 802.3ad ae1
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show interfaces** command.

## Understanding Aggregated Ethernet Interface Link Speed

On aggregated Ethernet interfaces, you can set the required link speed for all interfaces included in the bundle. All interfaces that make up a bundle must be the same speed. If you include in the aggregated Ethernet interface an individual link that has a speed different from the speed you specify in the **link-speed** parameter, an error message will be logged.

The speed value is specified in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

Aggregated Ethernet interfaces on SRX3000 and SRX5000 line devices can have one of the following speed values:

- 100m—Links are 100 Mbps.
- 10g—Links are 10 Gbps.
- 1g—Links are 1 Gbps.

## Example: Configuring Aggregated Ethernet Link Speed

---

This example shows how to configure the aggregated Ethernet link speed.

- [Requirements on page 2652](#)
- [Overview on page 2652](#)
- [Configuration on page 2652](#)
- [Verification on page 2652](#)

### Requirements

Before you begin:

- Add the aggregated Ethernet interfaces using the device count. See [“Example: Configuring the Number of Aggregated Ethernet Interfaces on a Device” on page 2649](#).
- Associate physical interfaces with the aggregated Ethernet Interfaces. See [“Example: Associating Physical Interfaces with Aggregated Ethernet Interfaces” on page 2650](#).

### Overview

In this example, you set the required link speed for all interfaces included in the bundle to 10 Gbps. All interfaces that make up a bundle must be the same speed.

### Configuration

**Step-by-Step Procedure**

To configure the aggregated Ethernet link speed:

1. Set the link speed.  
  
[edit]  
user@host# **set interfaces ae0 aggregated-ether-options link-speed 10g**
2. If you are done configuring the device, commit the configuration.  
  
[edit]  
user@host# **commit**

### Verification

To verify the configuration is working properly, enter the **show interfaces** command.

- Related Documentation**

  - [Aggregated Ethernet Interfaces Configuration Overview on page 2647](#)
  - [Verifying Aggregated Ethernet Interfaces on page 2656](#)

## Understanding Minimum Links for Aggregated Ethernet Interfaces

---

On aggregated Ethernet interfaces, you can configure the minimum number of links that must be up for the bundle as a whole to be labeled as up. By default, only one link must be up for the bundle to be labeled as up.

On SRX3000 and SRX5000 line devices, the valid range for the minimum links number is 1 through 16. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled as up.

If the number of links configured in an aggregated Ethernet interface is less than the **minimum-links** value configured in the **minimum-links** statement, the configuration commit fails and an error message is displayed.

## Example: Configuring Aggregated Ethernet Minimum Links

---

This example shows how to configure the minimum number of links on an aggregated Ethernet interface that must be up for the bundle as a whole to be labeled as up.

- [Requirements on page 2653](#)
- [Overview on page 2653](#)
- [Configuration on page 2654](#)
- [Verification on page 2654](#)

### Requirements

Before you begin:

- Add the aggregated Ethernet interfaces using the device count. See “[Example: Configuring the Number of Aggregated Ethernet Interfaces on a Device](#)” on page 2649.
- Associate physical interfaces with the aggregated Ethernet Interfaces. See “[Example: Associating Physical Interfaces with Aggregated Ethernet Interfaces](#)” on page 2650.
- Configure the aggregated Ethernet link speed. See “[Example: Configuring Aggregated Ethernet Link Speed](#)” on page 2652.

### Overview

In this example, you specify that on interface ae0 at least eight links must be up for the bundle as a whole to be labeled as up.

## Configuration

**Step-by-Step Procedure** To configure the minimum number of links on an aggregated Ethernet interface:

1. Set the minimum number of links.  

```
[edit]
user@host# set interfaces ae0 aggregated-ether-options minimum-links 8
```
2. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show interfaces** command.

## Requirements

Before you begin, set the number of aggregated Ethernet interfaces on the device. See [“Example: Configuring the Number of Aggregated Ethernet Interfaces on a Device” on page 2649](#).

## Overview

This example shows how to clean up unused aggregated Ethernet interfaces. In this example, you reduce the number of interfaces from 10 to 6, thereby removing the last 4 interfaces from the interface object list.

## Configuration

### Step-by-Step Procedure

To delete an interface:

1. Set the number of aggregated Ethernet interfaces.  
  
[edit]  
user@host# **delete chassis aggregated-devices ethernet device-count 6**
2. If you are done configuring the device, commit the configuration.  
  
[edit]  
user@host# **commit**

## Verification

To verify the configuration is working properly, enter the **show chassis aggregated-devices** command.

- Configure the minimum number of links that must be up for the bundle as a whole to be labeled as up. See [“Example: Configuring Aggregated Ethernet Minimum Links” on page 2653](#).

## Overview

In this example, you delete the contents of the ae4 aggregated Ethernet interface, which sets it to the down state.

## Configuration

### Step-by-Step Procedure

To delete the contents of an aggregated Ethernet interface:

1. Delete the interface.  

```
[edit]
user@host# delete interfaces ae4
```
2. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show interfaces** command.

## Verifying Aggregated Ethernet Interfaces

- [Verifying Aggregated Ethernet Interfaces \(terse\) on page 2656](#)
- [Verifying Aggregated Ethernet Interfaces \(extensive\) on page 2657](#)

### Verifying Aggregated Ethernet Interfaces (terse)

**Purpose** Display status information in terse (concise) format for aggregated Ethernet interfaces.

**Action** From operational mode, enter the **show interfaces ae0 terse** command.

```
user@host> show interfaces ae0 terse
ge-2/0/0.0 up up aenet --> ae0.0
ge-2/0/0.32767 up up aenet --> ae0.32767
ge-2/0/1.0 up up aenet --> ae0.0
ge-2/0/1.32767 up up aenet --> ae0.32767
ae0 up up
ae0.0 up up bridge
ae0.32767 up up multiservice
```

The output shows the bundle relationship for the aggregated Ethernet interface and the overall status of the interface, including the following information:

- The link aggregation control PDUs run on the .0 child logical interfaces for the untagged aggregated Ethernet interface.
- The link aggregation control PDUs run on the .32767 child logical interfaces for the VLAN-tagged aggregated Ethernet interface.
- The .32767 logical interface is created for the parent link and all child links.

## Verifying Aggregated Ethernet Interfaces (extensive)

**Purpose** Display status information and statistics in extensive (detailed) format for aggregated Ethernet interfaces.

**Action** From operational mode, enter the **show interfaces ae0 extensive** command.

```
user@host> show interfaces ae0 extensive
Physical interface: ae0, Enabled, Physical link is Up
...
Logical interface ae0.0 (Index 67) (SNMP ifIndex 628) (Generation 134)
...

## Understanding VLAN Tagging for Aggregated Ethernet Interfaces

Aggregated Ethernet interfaces can be either VLAN-tagged or untagged, with LACP enabled or disabled. Aggregated Ethernet interfaces on the SRX3000 and SRX5000 lines support the configuration of **native-vlan-id**, which consists of the following configuration statements:

- **inner-tag-protocol-id**
- **inner-vlan-id**
- **pop-pop**
- **pop-swap**
- **push-push**
- **swap-push**
- **swap-swap**

  - [Aggregated Ethernet Interfaces Configuration Overview on page 2647](#)

---

## Understanding Promiscuous Mode for Aggregated Ethernet Interfaces

You can enable promiscuous mode on aggregated Ethernet interfaces. When promiscuous mode is enabled on a Layer 3 Ethernet interface, all packets received on the interface are sent to the central point or Services Processing Unit (SPU) regardless of the destination MAC address of the packet. If you enable promiscuous mode on an aggregated Ethernet interface, promiscuous mode is then enabled on all member interfaces.

## Understanding LACP on Standalone Devices

---

Link Aggregation Control Protocol (LACP) provides a standardized means for exchanging information between partner systems on a link. Within LACP, the local end of a child link is known as the actor and the remote end of the link is known as the partner.

LACP is enabled on an aggregated Ethernet interface by setting the mode to either passive or active. However, to initiate the transmission of link aggregation control protocol data units (PDUs) and response link aggregation control PDUs, you must enable LACP at both the local and remote ends of the links, and one end must be active:

- **Active mode**—If either the actor or partner is active, they exchange link aggregation control PDUs. The actor sends link aggregation control PDUs to its protocol partner that convey what the actor knows about its own state and that of the partner's state.
- **Passive mode**—If the actor and partner are both in passive mode, they do not exchange link aggregation control PDUs. As a result, the aggregated Ethernet links do not come up. In passive transmission mode, links send out link aggregation control PDUs only when they receive them from the remote end of the same link.

By default, the actor and partner transmit link aggregation control PDUs every second. You can configure different periodic rates on active and passive interfaces. When you configure the active and passive interfaces at different rates, the transmitter honors the receiver's rate.

You configure the interval at which the interfaces on the remote side of the link transmit link aggregation control PDUs by configuring the **periodic** statement on the interfaces on the local side. It is the configuration on the local side that specifies the behavior of the remote side. That is, the remote side transmits link aggregation control PDUs at the specified interval. The interval can be **fast** (every second) or **slow** (every 30 seconds).

**NOTE:** On all high-end SRX Series devices, the LACP is not supported on Layer 2 interfaces.

---

## Example: Configuring LACP on Standalone Devices

This example shows how to configure LACP on standalone devices.

- [Requirements on page 2660](#)
- [Overview on page 2660](#)
- [Configuration on page 2661](#)
- [Verification on page 2661](#)

### Requirements

Before you begin:

- Add the aggregated Ethernet interfaces using the device count. See “[Example: Configuring the Number of Aggregated Ethernet Interfaces on a Device](#)” on page 2649.
- Associate physical interfaces with the aggregated Ethernet Interfaces. See “[Example: Associating Physical Interfaces with Aggregated Ethernet Interfaces](#)” on page 2650.
- Configure the aggregated Ethernet link speed. See “[Example: Configuring Aggregated Ethernet Link Speed](#)” on page 2652.
- Configure the aggregated Ethernet minimum links speed. See “[Example: Configuring Aggregated Ethernet Minimum Links](#)” on page 2653.

### Overview

In this example, you set LACP to passive mode for the ae0 interface. You set the LACP mode for the ae1 interface to active and set the link aggregation control PDU transmit interval to slow, which is every 30 seconds.

## Configuration

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure LACP on standalone devices:

1. Set the first LACP.  

```
[edit interfaces]
user@host# set ae0 aggregated-ether-options lacp passive
```
2. Set the second LACP.  

```
[edit interfaces]
user@host# set ae1 aggregated-ether-options lacp active
user@host# set ae1 aggregated-ether-options lacp periodic slow
```
3. If you are done configuring the device, commit the configuration.  

```
[edit interfaces]
user@host# commit
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- Related Documentation**
- [Understanding LACP on Standalone Devices on page 2659](#)
  - [Verifying LACP on Standalone Devices on page 2661](#)

## Verifying LACP on Standalone Devices

- [Verifying LACP Statistics on page 2661](#)
- [Verifying LACP Aggregated Ethernet Interfaces on page 2662](#)

### Verifying LACP Statistics

**Purpose** Display LACP statistics for aggregated Ethernet interfaces.

**Action** From operational mode, enter the **show lacp statistics interfaces ae0** command.

```
user@host> show lacp statistics interfaces ae0
Aggregated interface: ae0
 LACP Statistics: LACP Rx LACP Tx Unknown Rx Illegal Rx
 ge-2/0/0 1352 2035 0 0
 ge-2/0/1 1352 2056 0 0
 ge-2/2/0 1352 2045 0 0
 ge-2/2/1 1352 2043 0 0
```

The output shows LACP statistics for each physical interface associated with the aggregated Ethernet interface, such as the following:

- The LACP received counter that increments for each normal hello
- The number of LACP transmit packet errors logged
- The number of unrecognized packet errors logged
- The number of invalid packets received

Use the following command to clear the statistics and see only new changes:

```
user@host# clear lacp statistics interfaces ae0
```

## Verifying LACP Aggregated Ethernet Interfaces

**Purpose** Display LACP status information for aggregated Ethernet interfaces.

**Action** From operational mode, enter the **show lacp interfaces ae0** command.

```
user@host> show lacp interfaces ae0
```

```
Aggregated interface: ae0
```

| LACP state: | Role    | Exp | Def | Dist | Col | Syn | Aggr | Timeout | Activity |
|-------------|---------|-----|-----|------|-----|-----|------|---------|----------|
| ge-2/0/0    | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-2/0/0    | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-2/0/1    | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-2/0/1    | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-2/2/0    | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-2/2/0    | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-2/2/1    | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-2/2/1    | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |

| LACP protocol: | Receive State | Transmit State | Mux State               |
|----------------|---------------|----------------|-------------------------|
| ge-2/0/0       | Current       | Fast periodic  | Collecting distributing |
| ge-2/0/1       | Current       | Fast periodic  | Collecting distributing |
| ge-2/2/0       | Current       | Fast periodic  | Collecting distributing |
| ge-2/2/1       | Current       | Fast periodic  | Collecting distributing |

The output shows aggregated Ethernet interface information, including the following information:

- The LACP state—Indicates whether the link in the bundle is an actor (local or near-end of the link) or a partner (remote or far-end of the link).
- The LACP mode—Indicates whether both ends of the aggregated Ethernet interface are enabled (active or passive)—at least one end of the bundle must be active.
- The periodic link aggregation control PDU transmit rate.
- The LACP protocol state—Indicates the link is up if it is collecting and distributing packets.

---

## Understanding LACP on Chassis Clusters

---

You can combine multiple physical Ethernet ports to form a logical point-to-point link, known as a link aggregation group (LAG) or bundle, such that a media access control (MAC) client can treat the LAG as if it were a single link.

LAGs can be established across nodes in a chassis cluster to provide increased interface bandwidth and link availability.

The Link Aggregation Control Protocol (LACP) provides additional functionality for LAGs. LACP is supported in standalone deployments, where aggregated Ethernet interfaces are supported, and in chassis cluster deployments, where aggregated Ethernet interfaces and redundant Ethernet interfaces are supported simultaneously.

You configure LACP on a redundant Ethernet interface by setting the LACP mode for the parent link with the **lACP** statement. The LACP mode can be off (the default), active, or passive.

This topic contains the following sections:

- [Chassis Cluster Redundant Ethernet Interface Link Aggregation Groups on page 2663](#)
- [Sub-LAGs on page 2664](#)
- [Supporting Hitless Failover on page 2664](#)
- [Managing Link Aggregation Control PDUs on page 2665](#)

### Chassis Cluster Redundant Ethernet Interface Link Aggregation Groups

A redundant Ethernet interface has active and standby links located on two nodes in a chassis cluster. All active links are located on one node, and all standby links are located on the other node. You can configure up to eight active links and eight standby links per node.

When at least two physical child interface links from each node are included in a redundant Ethernet interface configuration, the interfaces are combined within the redundant Ethernet interface to form a redundant Ethernet interface LAG.

Having multiple active redundant Ethernet interface links reduces the possibility of failover. For example, when an active link is out of service, all traffic on this link is distributed to other active redundant Ethernet interface links, instead of triggering a redundant Ethernet active/standby failover.

Aggregated Ethernet interfaces, known as local LAGs, are also supported on either node of a chassis cluster but cannot be added to redundant Ethernet interfaces. Likewise, any child interface of an existing local LAG cannot be added to a redundant Ethernet interface, and vice versa. The total maximum number of combined individual node LAG interfaces (ae) and redundant Ethernet (reth) interfaces per cluster is 128.

However, aggregated Ethernet interfaces and redundant Ethernet interfaces can coexist, because the functionality of a redundant Ethernet interface relies on the Junos OS aggregated Ethernet framework.

For more information, see *Understanding Chassis Cluster Redundant Ethernet Interface Link Aggregation Groups for Branch SRX Series Devices* or *Understanding Chassis Cluster Redundant Ethernet Interface Link Aggregation Groups for High-End SRX Series Devices*.

### Minimum Links

---

Redundant Ethernet interface configuration includes a **minimum-links** setting that allows you to set a minimum number of physical child links in a redundant Ethernet interface LAG that must be working on the primary node for the interface to be up. The default **minimum-links** value is 1. When the number of physical links on the primary node in a redundant Ethernet interface falls below the **minimum-links** value, the interface will be down even if some links are still working. For more information, see *Example: Configuring Chassis Cluster Minimum Links*.

## Sub-LAGs

LACP maintains a point-to-point LAG. Any port connected to the third point is denied. However, a redundant Ethernet interface does connect to two different systems or two remote aggregated Ethernet interfaces by design.

To support LACP on both redundant Ethernet interface active and standby links, a redundant Ethernet interface can be modeled to consist of two sub-LAGs, where all active links form an active sub-LAG and all standby links form a standby sub-LAG.

In this model, LACP selection logic is applied and limited to one sub-LAG at a time. In this way, two redundant Ethernet interface sub-LAGs are maintained simultaneously while all the LACP advantages are preserved for each sub-LAG.

It is necessary for the switches used to connect the nodes in the cluster to have a LAG link configured and 802.3ad enabled for each LAG on both nodes so that the aggregate links will be recognized as such and correctly pass traffic.

**NOTE:** The redundant Ethernet interface LAG child links from each node in the chassis cluster must be connected to a different LAG at the peer devices. If a single peer switch is used to terminate the redundant Ethernet interface LAG, two separate LAGs must be used in the switch.

---

## Supporting Hitless Failover

With LACP, the redundant Ethernet interface supports hitless failover between the active and standby links in normal operation. The term *hitless* means that the redundant Ethernet interface state remains up during a failover.

The lacpd process manages both the active and standby links of the redundant Ethernet interfaces. A redundant Ethernet interface state remains up when the number of active up links is more than the number of minimum links configured. Therefore, to support hitless failover, the LACP state on the redundant Ethernet interface standby links must be collected and distributed before failover occurs.

## Managing Link Aggregation Control PDUs

The protocol data units (PDUs) contain information about the state of the link. By default, aggregated and redundant Ethernet links do not exchange link aggregation control PDUs.

You can configure PDUs exchange in the following ways:

- Configure Ethernet links to actively transmit link aggregation control PDUs
- Configure Ethernet links to passively transmit PDUs, sending out link aggregation control PDUs only when they are received from the remote end of the same link

The local end of a child link is known as the actor and the remote end of the link is known as the partner. That is, the actor sends link aggregation control PDUs to its protocol partner that convey what the actor knows about its own state and that of the partner's state.

You configure the interval at which the interfaces on the remote side of the link transmit link aggregation control PDUs by configuring the **periodic** statement on the interfaces on the local side. It is the configuration on the local side that specifies the behavior of the remote side. That is, the remote side transmits link aggregation control PDUs at the specified interval. The interval can be **fast** (every second) or **slow** (every 30 seconds).

For more information, see [“Example: Configuring LACP on Chassis Clusters” on page 2665](#).

By default, the actor and partner transmit link aggregation control PDUs every second. You can configure different periodic rates on active and passive interfaces. When you configure the active and passive interfaces at different rates, the transmitter honors the receiver's rate.

### Related Documentation

## Example: Configuring LACP on Chassis Clusters

This example shows how to configure LACP on chassis clusters.

- [Requirements on page 2665](#)
- [Overview on page 2666](#)
- [Configuration on page 2666](#)
- [Verification on page 2666](#)

## Requirements

Before you begin:

- Add the aggregated Ethernet interfaces using the device count. See [“Example: Configuring the Number of Aggregated Ethernet Interfaces on a Device” on page 2649](#).
- Associate physical interfaces with the aggregated Ethernet Interfaces. See [“Example: Associating Physical Interfaces with Aggregated Ethernet Interfaces” on page 2650](#).

- Configure the aggregated Ethernet link speed. See [“Example: Configuring Aggregated Ethernet Link Speed” on page 2652](#).
- Configure the aggregated Ethernet minimum links speed. See [“Example: Configuring Aggregated Ethernet Minimum Links” on page 2653](#).
- Configure the LACP on standalone devices. See [“Example: Configuring LACP on Standalone Devices” on page 2660](#).

## Overview

In this example, you set LACP to passive mode for the reth0 interface. You set the LACP mode for the reth1 interface to active and set the link aggregation control PDU transmit interval to slow, which is every 30 seconds.

## Configuration

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the CLI User Guide.

To configure LACP on chassis clusters:

1. Set the first LACP on primary node1.  

```
[edit interfaces]
user@host# set reth0 redundant-ether-options lacp passive
```
2. Set the second LACP.  

```
[edit interfaces]
user@host# set reth1 redundant-ether-options lacp active
user@host# set reth1 redundant-ether-options lacp periodic slow
```
3. If you are done configuring the device, commit the configuration.  

```
[edit interfaces]
user@host# commit
```

## Verification

### Verifying LACP on Redundant Ethernet Interfaces

**Purpose** Display LACP status information for redundant Ethernet interfaces.

**Action** From operational mode, enter the **show lacp interfaces reth0** command.

```
user@host> show lacp interfaces reth0
Aggregated interface: reth0
```

| LACP state: | Role    | Exp | Def | Dist | Co1 | Syn | Aggr | Timeout | Activity |
|-------------|---------|-----|-----|------|-----|-----|------|---------|----------|
| ge-11/0/0   | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-11/0/0   | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-11/0/1   | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-11/0/1   | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-11/0/2   | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-11/0/2   | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| ge-11/0/3   | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |

```

ge-11/0/3 Partner No No Yes Yes Yes Yes Fast Active
ge-3/0/0 Actor No No Yes Yes Yes Yes Fast Active
ge-3/0/0 Partner No No Yes Yes Yes Yes Fast Active
ge-3/0/1 Actor No No Yes Yes Yes Yes Fast Active
ge-3/0/1 Partner No No Yes Yes Yes Yes Fast Active
ge-3/0/2 Actor No No Yes Yes Yes Yes Fast Active
ge-3/0/2 Partner No No Yes Yes Yes Yes Fast Active
ge-3/0/3 Actor No No Yes Yes Yes Yes Fast Active
ge-3/0/3 Partner No No Yes Yes Yes Yes Fast Active
LACP protocol: Receive State Transmit State Mux State
ge-11/0/0 Current Fast periodic Collecting distributing
ge-11/0/1 Current Fast periodic Collecting distributing
ge-11/0/2 Current Fast periodic Collecting distributing
ge-11/0/3 Current Fast periodic Collecting distributing
ge-3/0/0 Current Fast periodic Collecting distributing
ge-3/0/1 Current Fast periodic Collecting distributing
ge-3/0/2 Current Fast periodic Collecting distributing
ge-3/0/3 Current Fast periodic Collecting distributing
{primary:node1}

```

The output shows redundant Ethernet interface information, such as the following:

- The LACP state—Indicates whether the link in the bundle is an actor (local or near-end of the link) or a partner (remote or far-end of the link).
- The LACP mode—Indicates whether both ends of the aggregated Ethernet interface are enabled (active or passive)—at least one end of the bundle must be active.
- The periodic link aggregation control PDU transmit rate.
- The LACP protocol state—Indicates the link is up if it is collecting and distributing packets.

## Verifying LACP on Redundant Ethernet Interfaces

**Purpose** Display LACP status information for redundant Ethernet interfaces.

**Action** From operational mode, enter the **show lacp interfaces reth0** command.

```

user@host> show lacp interfaces reth0
Aggregated interface: reth0
LACP state: Role Exp Def Dist Col Syn Aggr Timeout Activity
ge-11/0/0 Actor No No Yes Yes Yes Yes Fast Active
ge-11/0/0 Partner No No Yes Yes Yes Yes Fast Active
ge-11/0/1 Actor No No Yes Yes Yes Yes Fast Active
ge-11/0/1 Partner No No Yes Yes Yes Yes Fast Active
ge-11/0/2 Actor No No Yes Yes Yes Yes Fast Active
ge-11/0/2 Partner No No Yes Yes Yes Yes Fast Active
ge-11/0/3 Actor No No Yes Yes Yes Yes Fast Active
ge-11/0/3 Partner No No Yes Yes Yes Yes Fast Active
ge-3/0/0 Actor No No Yes Yes Yes Yes Fast Active
ge-3/0/0 Partner No No Yes Yes Yes Yes Fast Active
ge-3/0/1 Actor No No Yes Yes Yes Yes Fast Active
ge-3/0/1 Partner No No Yes Yes Yes Yes Fast Active

```

```

ge-3/0/2 Actor No No Yes Yes Yes Yes Fast Active
ge-3/0/2 Partner No No Yes Yes Yes Yes Fast Active
ge-3/0/3 Actor No No Yes Yes Yes Yes Fast Active
ge-3/0/3 Partner No No Yes Yes Yes Yes Fast Active
LACP protocol: Receive State Transmit State Mux State
ge-11/0/0 Current Fast periodic Collecting distributing
ge-11/0/1 Current Fast periodic Collecting distributing
ge-11/0/2 Current Fast periodic Collecting distributing
ge-11/0/3 Current Fast periodic Collecting distributing
ge-3/0/0 Current Fast periodic Collecting distributing
ge-3/0/1 Current Fast periodic Collecting distributing
ge-3/0/2 Current Fast periodic Collecting distributing
ge-3/0/3 Current Fast periodic Collecting distributing
{primary:node1}

```

The output shows redundant Ethernet interface information, such as the following:

- The LACP state—Indicates whether the link in the bundle is an actor (local or near-end of the link) or a partner (remote or far-end of the link).
- The LACP mode—Indicates whether both ends of the aggregated Ethernet interface are enabled (active or passive)—at least one end of the bundle must be active.
- The periodic link aggregation control PDU transmit rate.
- The LACP protocol state—Indicates the link is up if it is collecting and distributing packets.

## LAG and LACP Support on the SRX5000 Module Port Concentrator

The SRX5000 Module Port Concentrator (SRX5K-MPC) on SRX5600 and SRX5800 devices supports link aggregation groups (LAGs) and Link Aggregation Control Protocol (LACP).

Support for LAGs based on IEEE 802.3ad makes it possible to aggregate physical interface links on your device. LAGs provide increased interface bandwidth and link availability by linking physical ports and load-balancing traffic crossing the combined interface.

LACP provides a standardized means for exchanging information between partner (remote or far-end of the link) systems on a link. This exchange allows their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG. This exchange also enables the transmission and reception processes for the link to function in an orderly manner.

The following LAG and LACP features are supported on the SRX5K-MPC:

- Bandwidth aggregation—Increases bandwidth, provides graceful degradation as failure occurs, and increases availability.

- Link redundancy and load balance (within chassis cluster)—Provides network redundancy by load-balancing traffic across all available links. If one of the links should fail, the system automatically load-balances traffic across all remaining links.
- Dynamic link management—Enables automatic addition and deletion of individual links to the aggregate bundle without user intervention.

LACP supports the following features:

- LACP bundles several physical interfaces to form one logical interface by exchanging LACP packets between the local interface and the remote interface. LACP monitors the link for changes in interface state by exchanging a periodic LACP heartbeat between two sides. Any changes in interface state are reflected in the LACP packet.
- Normally after an LACP is configured and committed, two sides start to exchange interface and port information. Once they identify each other and match the LACP state machine criteria, the LACP is declared as up. You can deactivate or delete the LACP configuration.
- By default, the LACP packets are exchanged in every second. You can configure the LACP interval as fast (every second) or slow (every 30 seconds) to ensure the health of the interfaces.
- LACP supports distributed and centralized modes. Chassis cluster setup is recommended to operate with LACP distributed mode, which handles chassis cluster failover better. The centralized mode might experience traffic loss during failover.

SRX5K-MPCs on SRX5000 line devices provide active and standby support with redundant Ethernet interface LAGs in chassis cluster deployments.

## Understanding the 1-Port Gigabit Ethernet SFP Mini-PIM

---

Small form-factor pluggables (SFPs) are hot-pluggable modular interface transceivers for Gigabit and Fast Ethernet connections. Gigabit Ethernet SFP Mini-PIMs can be used in copper and optical environments to provide maximum flexibility when upgrading from an existing infrastructure to Metro Ethernet.

The 1-Port Gigabit Ethernet SFP Mini-PIM interfaces a single Gigabit Ethernet device or a network. It supports a variety of transceivers with data speeds of 10-Mbps/100-Mbps/1-Gbps with extended LAN or WAN connectivity.

Transceivers are hot-swappable.

This topic includes the following sections:

- [Supported Features on page 2671](#)
- [Interface Names and Settings on page 2672](#)
- [Available Link Speeds and Modes on page 2672](#)
- [Link Settings on page 2673](#)

## Supported Features

The following features are supported on the 1-Port Gigabit Ethernet SFP Mini-PIM:

- 10-Mbps/100-Mbps/1-Gbps link speed
- Half-duplex/full-duplex support

- Autonegotiation
- Encapsulations
- Maximum transmission unit (MTU) size of 1514 bytes (default) and 9010 bytes (jumbo frames)
- Loopback
- Transceivers are hot-swappable

## Interface Names and Settings

The following format is used to represent the 1-Port Gigabit Ethernet SFP Mini-PIM interface names:

*type-fpc/pic/port*

Where:

- **type**—Media type (ge)
- **fpc**—Number of the Flexible PIC Concentrator (FPC) card on which the physical interface is located
- **pic**—Number of the PIC on which the physical interface is located (0)
- **port**—Specific port on a PIC (0)

Examples: **ge-1/0/0** and **ge-2/0/0**

By default, the interfaces on the ports on the uplink module installed on the device are enabled. You can also specify the MTU size for the Gigabit Ethernet interface. Junos OS supports values from 256 through 9010. The default MTU size for Gigabit Ethernet interfaces is 1514.

## Available Link Speeds and Modes

The 1-Port Gigabit Ethernet SFP Mini-PIM supports the following link speeds:

- **10m**—Sets the link speed to 10 Mbps.
- **100m**—Sets the link speed to 100 Mbps.
- **1g**—Sets the link speed to 1 Gbps.

The 1-Port Gigabit Ethernet SFP Mini-PIM supports the following link modes:

- **Full-duplex**—Allows bidirectional communication at a given point in time.
- **Half-duplex**—Allows single directional communication at a given point in time.

## Link Settings

The 1-Port Gigabit Ethernet SFP Mini-PIM includes the following link settings:

- **auto-negotiation**—Enables autonegotiation of link mode and speed.

**NOTE:** By default autonegotiation is enabled. To disable autonegotiation use: `set gigether-options no-autonegotiation`

We recommend enabling autonegotiation.

- **loopback**—Enables loopback.
- **no-auto-negotiation**—Disables autonegotiation of link mode and speed.
- **no-loopback**—Disables loopback.

By default a link speed of 1 Gbps in full-duplex mode is supported.

**NOTE:** On SRX240 High Memory devices, traffic might stop between the SRX240 device and the Cisco switch due to link mode mismatch. We recommend setting the same value to the autonegotiation parameters on both ends.

**NOTE:** On SRX100 devices, the link goes down when you upgrade FPGA on 1-Port Gigabit Ethernet SFP mini-PIM. As a workaround, run the `restart fpc` command and restart the FPC.

**NOTE:** On SRX100, SRX110, SRX210, SRX220, SRX240, and SRX550 devices, LACP is not supported on the 1-Port Gigabit Ethernet SFP Mini-PIM.

- [Example: Configuring the 1-Port Gigabit Ethernet SFP Mini-PIM Interface on page 2673](#)

## Example: Configuring the 1-Port Gigabit Ethernet SFP Mini-PIM Interface

This example shows how to perform basic configuration for the 1-Port Gigabit Ethernet SFP Mini-PIM.

- [Requirements on page 2674](#)
- [Overview on page 2674](#)

- [Configuration on page 2674](#)
- [Verification on page 2677](#)

## Requirements

Before you begin:

- Establish basic connectivity. See the *Getting Started Guide* for your device.
- Configure network interfaces as necessary. See “[Example: Creating an Ethernet Interface](#)” on page 2634.

## Overview

In this example, you configure the ge-2/0/0 interface, set the operating speed to 100 Mbps, and define a logical interface that you can connect to the 1-Port Gigabit Ethernet SFP Mini-PIM. You also set the MTU value to 9010 and set the link option to no-loopback.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-2/0/0 link-mode full-duplex speed 100m
set interface ge-2/0/0 gigether-options no-loopback
```

---

### Configuring Physical Properties

#### GUI Step-by-Step Procedure

To quickly configure the physical properties of a 1-Port Gigabit Ethernet SFP Mini-PIM using J-Web, use the following steps:

1. Select **Configure > Interfaces**.
2. Under Interface, select **ge-2/0/0** and then click **Edit**. A pop-up window appears.
3. In the Description box, type the description for the SFP Mini-PIM.
4. In the MTU box, type **9010**.
5. From the Speed list, select **100Mbps**.
6. From the Link-mode list, select **Full-duplex**.
7. Select the Enable Auto-negotiation checkbox.
8. Select the Enable Per Unit Scheduler checkbox.
9. Click **OK**

---

### Disabling the Interface

#### GUI Step-by-Step Procedure

To disable the 1-Port Gigabit Ethernet SFP Mini-PIM using J-Web, use the following steps:

1. Select **Configure > Interfaces** .

- Under Interface, select **ge-2/0/0** and then click **Disable**.

### Configuring Logical Properties

#### GUI Step-by-Step Procedure

To quickly configure the logical properties of a 1-Port Gigabit Ethernet SFP Mini-PIM using J-Web, use the following steps:

- Select **Configure > Interfaces**.
- Under Interface, select **ge-2/0/0.0**, and then click **Add Logical Interface**. A pop-up window appears.
- In the Unit box, type **0**.
- In the Description box, type a description for the SFP Mini-PIM.
- From the Zone list, select **untrust**.
- To edit the family protocol type to the Mini-PIM interfaces, select the IPv4 tab, and then select **Enable address configuration**.
- Click **Add**, and then type IPv4 address.
- Click **OK**.

### Editing Logical Properties

#### Step-by-Step Procedure

To quickly configure the physical properties of a 1-Port Gigabit Ethernet SFP Mini-PIM using J-Web:

- Under Interface, select the logical interface added to the 1-Port Gigabit Ethernet SFP Mini-PIM and then click **Edit**. A pop-up window appears.
- Under Interface, select **ge-2/0/0.0**, and then click **Edit Logical Interface**. A pop-up window appears.
- From the Zone list, select **trust**.
- To enable DHCP client on the interface, select the IPv4 tab and then select **Enable DHCP**.
- Click **OK**.

**NOTE:** You cannot add or edit Description and Unit for a logical interface.

### Deleting the Logical Interface

#### GUI Step-by-Step Procedure

To delete the logical interface of 1-Port Gigabit Ethernet SFP Mini-PIM using J-Web,

- Select **Configure > Interfaces**.
- Under Interface, select **ge-2/0/0.0**, and then click **Delete**.

### Configuring a 1-Port Gigabit Ethernet SFP Mini-PIM

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a 1-Port Gigabit Ethernet SFP Mini-PIM:

1. Configure the interface.  

```
[edit]
user@host# edit interfaces ge-2/0/0
```
2. Set the operating link-mode full-duplex speed of 100 Mbps for the SFP Mini-PIM.  

```
[edit interfaces ge-2/0/0]
user@host# set link-mode full-duplex speed 100m
```
3. Assign the MTU value.  

```
[edit interfaces ge-2/0/0]
user@host# set mtu 9010
```
4. Add the logical interface.  

```
[edit interfaces ge-2/0/0]
user@host# set unit 0 family inet address 14.1.1.1/24
```
5. Set the link options.  

```
[edit interfaces ge-2/0/0]
user@host# set gigether-options no-loopback
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces ge-2/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces ge-2/0/0
mtu 9010;
speed 100m;
gigether-options {
no-loopback;
}
unit 0 {
family inet {
14.1.1.1/24
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- Verifying That the Correct Hardware Is Installed on page 2677
- Verifying the FPC Status on page 2678
- Verifying the Interface Settings on page 2678

## Verifying That the Correct Hardware Is Installed

**Purpose** Verify that the 1-Port Gigabit Ethernet SFP Mini-PIM is installed on the device.

**Action** From operational mode, enter the **show chassis hardware** command.

```

user@host> show chassis hardware detail
Hardware inventory:
Item Version Part number Serial number Description
Chassis
Routing Engine REV 16 750-021792 AG0309AA0004 SRX240b

 750-029145 122009000061 1x GE SFP mPIM

```

Verify that the output contains the following values:

- FPC 2, PIC 0 —1x GE High-Perf SFP mPIM
- FPC 4, PIC 0 —1x GE SFP mPIM

**NOTE:** In the example shown above, the output for 1-Port SFP Mini-Physical Interface Module is displayed as 1X GE SFP mPIM and the output for 1-Port Gigabit Ethernet SFP Mini-Physical Interface Module is displayed as 1X GE High-Perf SFP mPIM.

**NOTE:** The 1-Port GE SFP Mini-PIM is installed in the second slot of the device chassis; therefore the output displayed is 1x GE High-Perf SFP mPIM and the Flexible PIC Concentrator (FPC) used here is fpc 2.

The 1-Port SFP Mini-PIM is installed in the fourth slot of the device chassis; therefore the output displayed is 1x GE SFP mPIM and Flexible PIC Concentrator (FPC) used here is fpc 4.

### Verifying the FPC Status

**Purpose** Verify the FPC status.

**Action** From operational mode, enter the **show chassis fpc** command.

```
show@host> show chassis fpc
```

| Slot | State  | Temp (C) | CPU Utilization (%) | Memory Utilization (%) |
|------|--------|----------|---------------------|------------------------|
|      |        |          | Total Interrupt     | DRAM (MB) Heap Buffer  |
| 0    | Online | -----    | CPU less FPC        | -----                  |
| 1    | Online | -----    | CPU less FPC        | -----                  |
| 2    | Online | -----    | CPU less FPC        | -----                  |
| 3    | Empty  |          |                     |                        |
| 4    | Online | -----    | CPU less FPC        | -----                  |

The output should show the FPC status as online.

The 1-Port SFP Mini-PIM is installed in the fourth slot of the device chassis; the output shows the FPC status for slot 4 as online.

The 1-Port Gigabit Ethernet SFP Mini-PIM is installed in the second slot of the device chassis; the output shows the FPC status for slot 2 as online.

### Verifying the Interface Settings

**Purpose** Verify that the interface is configured as expected.

**Action** From operational mode, enter the **show interface ge-2/0/0** command.

```
user@host# run show interfaces ge-2/0/0
```

Physical interface: ge-2/0/0, Enabled, Physical link is Up  
 Interface index: 156, SNMP ifIndex: 552  
 Link-level type: Ethernet, MTU: 9010, Link-mode: Full-duplex, Speed: 100mbps,

## Understanding the 2-Port 10-Gigabit Ethernet XPIM

The 10-Gigabit Ethernet (also known as 10GBASE-T or IEEE 802.3an) is a telecommunication technology that offers data speeds up to 10 billion bits per second over unshielded or shielded twisted pair cables.

The 2-Port 10-Gigabit Ethernet Physical Interface Module (XPIM) is a 2 x 10GBASE-T / SFP+ XPIM line card. (SFP+ is a fiber optic transceiver module designed for 10-Gigabit Ethernet and 8.5 Gbps-fiber channel systems.) The 2-Port 10-Gigabit Ethernet XPIM provides a front-end interface connection that includes the following ports:

- 2 X copper ports. The copper ports support 10GBASE-T running with CAT6A or CAT7 Ethernet cable for up to 100 meters.
- 2 X fiber (SFP+) ports. The fiber ports support SFP+ multiple 10G modules.

The 2-Port 10-Gigabit Ethernet XPIM provides interconnects for LANs, WANs, and metropolitan area networks (MANs). The XPIM provides multiple service levels (1-Gigabit Ethernet to 10-Gigabit Ethernet in increments) and a single connection option for a wide range of customer needs and applications.

**NOTE:** By default, the 2-Port 10-Gigabit Ethernet XPIM ports comes up in fiber mode, while auto negotiation is not supported.

NOTE: On SRX650 devices, the last four ports of a 24-Gigabit Ethernet switch GPIM can be used either as RJ-45 or small form-factor pluggable transceiver (SFP) ports. If both are present and providing power, the SFP media is preferred. If the SFP media is removed or the link is brought down, then the interface will switch to the RJ-45 medium. This can take up to 15 seconds, during which the LED for the RJ-45 port might go on and off intermittently. Similarly, when the RJ-45 medium is active and an SFP link is brought up, the interface will transition to the SFP medium, and this transition could also take a few seconds.

This topic includes the following sections:

- [Supported Features on page 2680](#)
- [Interface Names and Settings on page 2680](#)
- [Copper and Fiber Operating Modes on page 2681](#)
- [Link Speeds on page 2681](#)
- [Link Settings on page 2681](#)

## Supported Features

The following features are supported on the 2-Port 10-Gigabit Ethernet XPIM:

- Multiple SFP+ 10G modules and the following SFP modules:
  - SFPP-10GE-SR
  - SFPP-10GE-LR
  - SFPP-10GE-ER
  - SFPP-10GE-LRM
- Copper TWIN-AX 1M and Copper TWIN-AX 3M
- Online Insertion and Removal (OIR ) functionality
- Link speeds of up to 10-Gbps
- Full-duplex and half-duplex modes
- Flow control
- Autonegotiation and autosensing
- Quality of service (QoS)

## Interface Names and Settings

The following format is used to represent the 2-Port 10-Gigabit Ethernet XPIM interface names:

*type-fpc/pic/port*

Where:

- **type** — Media type (xe)
- **fpc** — Number of the Flexible PIC Concentrator (FPC) card on which the physical interface is located
- **pic** — Number of the PIC on which the physical interface is located (0)
- **port** — Specific port on a PIC (0 or 1)

By default, the interfaces (for example, **xe-6/0/0** or **xe-2/0/0**) on the ports on the uplink module installed on the device are enabled. You can also specify the maximum transmission unit (MTU) size for the Gigabit Ethernet interface. Junos OS supports values from 256 through 9192. The default MTU for Gigabit Ethernet interfaces is 1514.

## Copper and Fiber Operating Modes

On the 2-Port 10-Gigabit Ethernet XPIM, one copper port and one fiber port is grouped together as port 0, and another copper port and fiber port are grouped as port 1. Only two ports can be active at the same time (one port from port 0 and another port from port 1).

The 2-Port 10-Gigabit Ethernet XPIM can be configured to operate in two copper mode, two fiber mode, or mixed mode (one copper and one fiber). In mixed mode, the two ports should be from different port groups (one port from port 1 and the other from port 2).

## Link Speeds

The 2-Port 10-Gigabit Ethernet XPIM ports support the following link speeds for copper and fiber:

- **Copper**—10/100/1000 Mbps or 10Gbps (full duplex). Half-duplex is only for 10/100 Mbps.
- **Fiber**—1000 Mbps or 10 Gbps (full duplex). Half-duplex mode is not supported.

To set the link speeds, use the following options:

- **10m**—Sets the link speed to 10 Mbps.
- **10g**—Sets the link speed to 10 Gbps.
- **100m**—Sets the link speed to 100 Mbps.
- **1g**—Sets the link speed to 1 Gbps.

## Link Settings

The 2-Port 10-Gigabit Ethernet XPIM includes the following link settings:

- **802.3ad**—Specifies an aggregated Ethernet bundle.
- **auto-negotiation**—Enables autonegotiation of flow control, link mode, and speed.
- **loopback**—Enables loopback.

- **no-auto-negotiation**—Disables autonegotiation of flow control, link mode, and speed.
- **no-loopback**—Disables loopback.

By default, flow control is enabled on all ports, a link speed of 10 Gbps in full duplex is supported, autonegotiation is disabled on the fiber ports, and autonegotiation is enabled on copper ports.

**NOTE:** Autonegotiation is not supported when the 2-Port 10-Gigabit Ethernet XPIM is operating in fiber mode at a link speed of 10 Gbps.

**NOTE:** On SRX650 devices, LLDP is not supported on the base ports of the device and on the 2-Port 10-Gigabit Ethernet XPIM.

## Example: Configuring the 2-Port 10-Gigabit Ethernet XPIM Interface

This example shows how to perform basic configuration for the 1-Port Gigabit Ethernet SFP Mini-PIM.

- [Requirements on page 2682](#)
- [Overview on page 2682](#)
- [Configuration on page 2682](#)
- [Verification on page 2684](#)

### Requirements

Before you begin:

- Establish basic connectivity. See the *Getting Started Guide* for your device.
- Configure network interfaces as necessary. See “[Example: Creating an Ethernet Interface](#)” on page 2634.

### Overview

In this example, you configure the xe-6/0/0 interface, set the operating mode to copper mode, set the operating speed to 10 Gbps, and define a logical interface that you can connect to the 2-Port 10-Gigabit Ethernet XPIM. Additionally, you set the MTU value to 1514, set the link option to no loopback, and enable the interface.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration,

copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces xe-6/0/0 media-type copper speed 10g unit 0 family inet mtu 1514
set interface xe-6/0/0 gigether-options no-loopback
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a 2-Port 10-Gigabit Ethernet XPIM:

1. Configure the interface.  

```
[edit]
user@host# edit interfaces xe-6/0/0
```
2. Configure the operating mode.  

```
[edit interfaces xe-6/0/0]
user@host# set media-type copper
```
3. Set the operating speed for the XPIM.  

```
[edit interfaces xe-6/0/0]
user@host# set speed 10g
```
4. Add the logical interface.  

```
[edit interfaces xe-6/0/0]
user@host# set unit 0 family inet
```
5. Assign the physical interface MTU value.  

```
[edit interfaces xe-6/0/0]
user@host# set interface xe-6/0/0 mtu 1514
```
6. Assign the logical interface MTU value.  

```
[edit interfaces xe-6/0/0]
user@host# set unit 0 family inet mtu 1500
```
7. Set the link options.  

```
[edit interfaces xe-6/0/0]
user@host# set gigether-options no-loopback
```
8. Disable the interface.  

```
[edit interfaces xe-6/0/0]
user@host# set disable
```
9. Enable the interface.  

```
[edit interfaces xe-6/0/0]
user@host# delete disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces xe-6/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces xe-6/0/0
speed 10g;
media-type copper;
gigether-options {
no-loopback;
}
unit 0 {
family inet {
mtu 1514;
}
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying That the Correct Hardware Is Installed on page 2684](#)
- [Verifying the FPC Status on page 2684](#)
- [Verifying the Interface Settings on page 2685](#)

### Verifying That the Correct Hardware Is Installed

**Purpose** Verify that the 2-Port 10-Gigabit Ethernet XPIM is installed on the device.

**Action** From operational mode, enter the **show chassis hardware** command.

Hardware inventory:

| Item           | Version | Part number  | Serial number | Description      |
|----------------|---------|--------------|---------------|------------------|
| Chassis        |         | AJ0309AC0047 | SRX650        |                  |
| Midplane       | REV 04  | 710-023875   | TV3993        |                  |
| System IO      | REV 04  | 710-023209   | TV4035        | SRXSME System IO |
| Routing Engine | REV 01  | 710-023224   | DT5109        | RE-SRXSME-SRE6   |
| FPC 0          |         | FPC          |               |                  |
| PIC 0          |         | 4x GE Base   | PIC           |                  |
| FPC 2          |         | FPC          |               |                  |
| PIC 0          |         | 2x 10G       | gPIM          |                  |
| FPC 6          |         | FPC          |               |                  |
| PIC 0          |         | 2x 10G       | gPIM          |                  |
| Power Supply 0 | REV 01  | 740-024283   | TA00049WSSSS  | PS 645W AC       |

Verify that the output contains the following values:

- **FPC 2, PIC 0—2x 10G gPIM**
- **FPC 6, PIC 0—2x 10G gPIM**

### Verifying the FPC Status

**Purpose** Verify the FPC status.

**Action** From operational mode, enter the **show chassis fpc** command.

```

Temp CPU Utilization (%) Memory Utilization (%)
Slot State (C) Total Interrupt DRAM (MB) Heap Buffer
0 Online ----- CPU less FPC -----
1 Empty
2 Online ----- CPU less FPC -----
3 Empty
4 Empty
5 Empty
6 Online ----- CPU less FPC -----
7 Empty
8 Empty

```

The output should display FPC status as online.

**NOTE:** The 2-Port 10-Gigabit Ethernet XPIM is installed in the second and sixth slot of the SRX650 device chassis; therefore the FPC used here is fpc 2 and fpc 6.

### Verifying the Interface Settings

**Purpose** Verify that the interface is configured as expected.

**Action** From operational mode, enter the **show interface xe-6/0/0** command.

```

Physical interface: xe-6/0/0, Enabled, Physical link is Up
Interface index: 144, SNMP ifIndex: 501
Link-level type: Ethernet, MTU: 1514, Link-mode: Full-duplex, Speed: 10Gbps,

## Understanding the 8-Port Gigabit Ethernet SFP XPIM

A Gigabit Ethernet Physical Interface Module (XPIM) is a network interface card (NIC) that installs in the front slots of the SRX550 or SRX650 Services Gateway to provide physical connections to a LAN or a WAN.

Small form-factor pluggables (SFPs) are hot-pluggable modular interface transceivers for gigabit and Fast Ethernet connections. The 8-port SFP Gigabit Ethernet interface enables customers to connect to Ethernet WAN services as well as to local servers at gigabit speed.

### Supported Features

The following features are supported on the 8-Port Gigabit Ethernet SFP XPIM:

- Operates on both a slot with a maximum bandwidth of 8 gigabits and a slot with a maximum bandwidth of 1 gigabit
- Operates in tri-rate (10/100/1000 Mbps) mode with copper SFPs
- Routing and switched mode operation
- Layer 2 protocols
  - Link Aggregation Control Protocol (LACP)
  - Link Layer Discovery Protocol (LLDP)
  - GARP VLAN Registration Protocol (GVRP)
  - Internet Group Management Protocol (IGMP) snooping (v1 and v2)
  - Spanning Tree Protocol (STP), Real-Time Streaming Protocol (RTSP), and Multiple Spanning Tree Protocol (MSTP)
  - 802.1x
- Encapsulation (supported at the Physical Layer)

- ethernet-bridge
- ethernet-ccc
- ethernet-tcc
- ethernet-vpls
- extended-vlan-ccc
- extended-vlan-tcc
- flexible-ethernet-services
- vlan-ccc
- Q in Q VLAN tagging
- Integrated routing and bridging (IRB)
- Jumbo frames (9192 byte size)
- Chassis cluster switching
- Chassis cluster fabric link using GE ports

**NOTE:**

The following Layer 2 switching features are not supported when the 8-Port Gigabit Ethernet SFP XPIM is plugged in slots with speeds of less than 1 gigabit:

- Q in Q VLAN tagging
- Link aggregation using ports across multiple XPIMs

## Interface Names and Settings

The following format is used to represent the 8-Port SFP XPIM:

*type-fpc/pic/port*

Where:

- type—Media type (ge)
- fpc—Number of the Flexible PIC Concentrator (FPC) card where the physical interface resides
- pic—Number of the PIC where the physical interface resides (0)
- port—Specific port on a PIC (0)

Examples: **ge-1/0/0** and **ge-2/0/0**

By default, the interfaces on the ports on the uplink module installed on the device are enabled. You can also specify the maximum transmission unit (MTU) size for the XPIM.

Junos OS supports values from 256 through 9192. The default MTU size for the 8-Port Gigabit Ethernet SFP XPIM is 1514.

**Related  
Documentation**

- [Example: Configuring 8-Port Gigabit Ethernet SFP XPIMs on page 2688](#)

---

## Example: Configuring 8-Port Gigabit Ethernet SFP XPIMs

This example shows how to perform a basic back-to-back device configuration with 8-port Gigabit Ethernet small form-factor pluggable (SFP) XPIMs. It describes a common scenario in which SFP XPIMs are deployed.

- [Requirements on page 2688](#)
- [Overview and Topology on page 2688](#)
- [Configuration on page 2689](#)
- [Verification on page 2693](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.1X44-D10 or later for SRX Series Services Gateways.
- Two SRX650 devices connected back-to-back.
- Two 8-port Gigabit Ethernet SFP XPIMs.
- Eight pairs of SFP transceivers as mentioned in *8-Port Gigabit Ethernet SFP XPIM Supported Modules* and eight cables to connect them.

Before you begin:

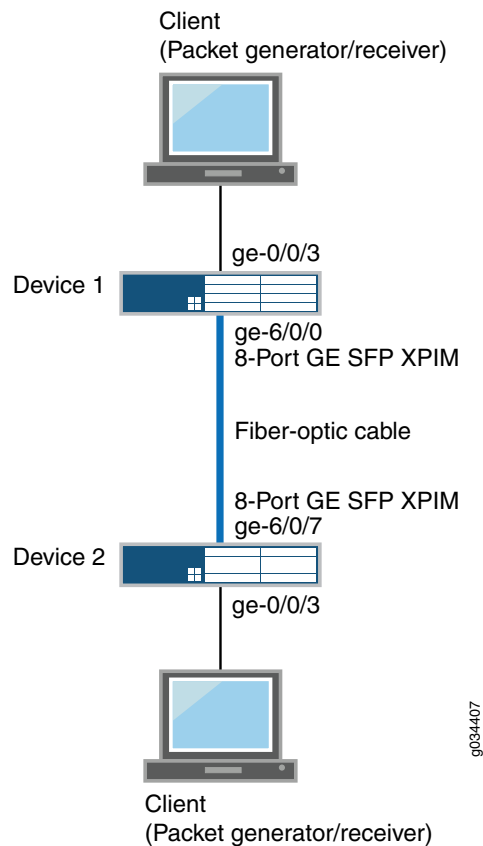

- Establish basic connectivity. See the Getting Started Guide for your device.
- Configure network interfaces as necessary. See [“Example: Creating an Ethernet Interface” on page 2634](#).

### Overview and Topology

In this example, you configure two SRX650 devices. On each device you configure eight interfaces (ge-6/0/0 through ge-6/0/7), set the maximum transmission unit (MTU) value to 9192, and define a logical interface that you can connect to the 8-port SFP XPIM.

[Figure 127](#) shows the topology used in this example.

Figure 127: Basic Back-to-Back Device Configuration

g034407

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
Device 1 set interfaces ge-6/0/0 mtu 9192
 set interfaces ge-6/0/0 unit 0 family inet address 10.1.1.1/24
 set interfaces ge-6/0/1 mtu 9192
 set interfaces ge-6/0/1 unit 0 family inet address 11.1.1.1/24
 set interfaces ge-6/0/2 mtu 9192
 set interfaces ge-6/0/2 unit 0 family inet address 12.1.1.1/24
 set interfaces ge-6/0/3 mtu 9192
 set interfaces ge-6/0/3 unit 0 family inet address 13.1.1.1/24
 set interfaces ge-6/0/4 mtu 9192
 set interfaces ge-6/0/4 unit 0 family inet address 14.1.1.1/24
 set interfaces ge-6/0/5 mtu 9192
 set interfaces ge-6/0/5 unit 0 family inet address 15.1.1.1/24
 set interfaces ge-6/0/6 mtu 9192
 set interfaces ge-6/0/6 unit 0 family inet address 16.1.1.1/24
 set interfaces ge-6/0/7 mtu 9192
 set interfaces ge-6/0/7 unit 0 family inet address 17.1.1.1/24
```

**Device 2**

```

set interfaces ge-6/0/0 mtu 9192
set interfaces ge-6/0/0 unit 0 family inet address 10.1.1.2/24
set interfaces ge-6/0/1 mtu 9192
set interfaces ge-6/0/1 unit 0 family inet address 11.1.1.2/24
set interfaces ge-6/0/2 mtu 9192
set interfaces ge-6/0/2 unit 0 family inet address 12.1.1.2/24
set interfaces ge-6/0/3 mtu 9192
set interfaces ge-6/0/3 unit 0 family inet address 13.1.1.2/24
set interfaces ge-6/0/4 mtu 9192
set interfaces ge-6/0/4 unit 0 family inet address 14.1.1.2/24
set interfaces ge-6/0/5 mtu 9192
set interfaces ge-6/0/5 unit 0 family inet address 15.1.1.2/24
set interfaces ge-6/0/6 mtu 9192
set interfaces ge-6/0/6 unit 0 family inet address 16.1.1.2/24
set interfaces ge-6/0/7 mtu 9192
set interfaces ge-6/0/7 unit 0 family inet address 17.1.1.2/24

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the interfaces on Device 1:

1. Configure the interface.  

```

[edit]
user@host# set interfaces ge-6/0/0

```
2. Assign the maximum transmission unit value for the interface.  

```

[edit interfaces ge-6/0/0]
user@host# set mtu 9192

```
3. Add the logical interface.  

```

[edit interfaces ge-6/0/0]
user@host# set unit 0 family inet address 10.1.1.1/24

```

**NOTE:** Repeat these steps for the remaining seven ports on Device 1.

**Step-by-Step Procedure** To configure the interfaces on Device 2:

1. Configure the interface.  

```

[edit]
user@host# edit interfaces ge-6/0/0

```
2. Assign the maximum transmission unit value for the interface.  

```

[edit interfaces ge-6/0/0]
user@host# set mtu 9192

```
3. Add the logical interface.  

```

[edit interfaces ge-6/0/0]
user@host# set unit 0 family inet address 10.1.1.2/24

```

**NOTE:** Repeat these steps for the remaining seven ports on Device 2.

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
Device 1 [edit]
user@host# show interfaces
ge-6/0/0 {
 mtu 9192;
 unit 0 {
 family inet {
 address 10.1.1.1/24;
 }
 }
}
ge-6/0/1 {
 mtu 9192;
 unit 0 {
 family inet {
 address 11.1.1.1/24;
 }
 }
}
ge-6/0/2 {
 mtu 9192;
 unit 0 {
 family inet {
 address 12.1.1.1/24;
 }
 }
}
ge-6/0/3 {
 mtu 9192;
 unit 0 {
 family inet {
 address 13.1.1.1/24;
 }
 }
}
ge-6/0/4 {
 mtu 9192;
 unit 0 {
 family inet {
 address 14.1.1.1/24;
 }
 }
}
ge-6/0/5 {
 mtu 9192;
 unit 0 {
 family inet {
```

```

 address 15.1.1.1/24;
 }
}
ge-6/0/6 {
 mtu 9192;
 unit 0 {
 family inet {
 address 16.1.1.1/24;
 }
 }
}
ge-6/0/7 {
 mtu 9192;
 unit 0 {
 family inet {
 address 17.1.1.1/24;
 }
 }
}

```

Device 2 [edit]

```

user@host# show interfaces
ge-6/0/0 {
 mtu 9192;
 unit 0 {
 family inet {
 address 10.1.1.2/24;
 }
 }
}
ge-6/0/1 {
 mtu 9192;
 unit 0 {
 family inet {
 address 11.1.1.2/24;
 }
 }
}
ge-6/0/2 {
 mtu 9192;
 unit 0 {
 family inet {
 address 12.1.1.2/24;
 }
 }
}
ge-6/0/3 {
 mtu 9192;
 unit 0 {
 family inet {
 address 13.1.1.2/24;
 }
 }
}
ge-6/0/4 {

```

```

mtu 9192;
unit 0 {
 family inet {
 address 14.1.1.2/24;
 }
}
}
ge-6/0/5 {
 mtu 9192;
 unit 0 {
 family inet {
 address 15.1.1.2/24;
 }
 }
}
ge-6/0/6 {
 mtu 9192;
 unit 0 {
 family inet {
 address 16.1.1.2/24;
 }
 }
}
ge-6/0/7 {
 mtu 9192;
 unit 0 {
 family inet {
 address 17.1.1.2/24;
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Hardware was Properly Installed on page 2693](#)
- [Verifying the FPC Status on page 2694](#)
- [Verifying Interface Link Status on Device 1 on page 2695](#)
- [Verifying the Interface Settings on Device 1 on page 2695](#)
- [Verifying Interface Link Status on Device 2 on page 2698](#)
- [Verifying the Interface Settings on Device 2 on page 2699](#)

### Verifying the Hardware was Properly Installed

**Purpose** Verify that the 8-Port Gigabit Ethernet SFP XPIM is installed on the device.

**Action** From operational mode, enter the **show chassis hardware** command.

```

user@host> show chassis hardware detail
Hardware inventory:

```

| Item           | Version | Part number | Serial number    | Description         |
|----------------|---------|-------------|------------------|---------------------|
| Chassis        |         |             | AJ3009AA0001     | SRX650              |
| Midplane       | REV 08  | 710-023875  | AAAK0059         |                     |

| Xcvr 1         |         | NON-JNPR    | PC602QW          | SFP-SX              |
| Xcvr 2         | k       | NON-JNPR    | BDS3I            | SFP-1000BASE-BX10-D |
| Xcvr 3         | REV 01  | 740-011612  | 9XT702501080     | SFP-LH              |
| Xcvr 4         | REV 01  | 740-011612  | 9XT702501079     | SFP-LH              |
| Xcvr 5         |         | NON-JNPR    | PCH2GTJ          | SFP-SX              |
| Xcvr 6         |         | NON-JNPR    | PC604DL          | SFP-SX              |
| Xcvr 7         | REV 01  | 740-011620  | 5349504          | SFP-FX              |
| FPC 8          | REV 00  | 750-038290  |                  | FPC                 |
| Power Supply 0 |         |             |                  |                     |

**Meaning** The output displays the hardware details of the device and a list of all interfaces configured.

Verify that the output contains the following values:

- **FPC 5, PIC 0** —8x SFP gPIM
- **FPC 6, PIC 0** —8x SFP gPIM

**NOTE:** In the example, the output for 8-Port SFP Gigabit Ethernet XPIM is displayed as 8x GE SFP gPIM.

### Verifying the FPC Status

**Purpose** Verify that the status of the Flexible PIC Concentrator is online.

**Action** From operational mode, enter the **show chassis fpc pic-status** command.

```
user@host> show chassis fpc pic-status
Slot 0 Online FPC
PIC 0 Online 4x GE Base PIC
Slot 1 Present FPC
Slot 5 Online FPC
PIC 0 Online 8x GE SFP gPIM
Slot 6 Online FPC
PIC 0 Online 8x GE SFP gPIM
Slot 8 Present FPC
```

**Meaning** The output shows the FPC status for slot 5 and slot 6 as online. The 8-Port Gigabit Ethernet SFP XPIM is installed in slot 5 and slot 6 of the device.

### Verifying Interface Link Status on Device 1

**Purpose** Verify that the interface link status is up.

**Action** From operational mode, enter the **show interface terse ge-6/0/\*** command.

```
user@host> show interface terse ge-6/0/*
```

#### Output for Device 1

| Interface  | Admin | Link | Proto | Local       | Remote |
|------------|-------|------|-------|-------------|--------|
| ge-6/0/0   | up    | up   |       |             |        |
| ge-6/0/0.0 | up    | up   | inet  | 10.1.1.1/24 |        |
| ge-6/0/1   | up    | up   |       |             |        |
| ge-6/0/1.0 | up    | up   | inet  | 11.1.1.1/24 |        |
| ge-6/0/2   | up    | up   |       |             |        |
| ge-6/0/2.0 | up    | up   | inet  | 12.1.1.1/24 |        |
| ge-6/0/3   | up    | up   |       |             |        |
| ge-6/0/3.0 | up    | up   | inet  | 13.1.1.1/24 |        |
| ge-6/0/4   | up    | up   |       |             |        |
| ge-6/0/4.0 | up    | up   | inet  | 14.1.1.1/24 |        |
| ge-6/0/5   | up    | up   |       |             |        |
| ge-6/0/5.0 | up    | up   | inet  | 15.1.1.1/24 |        |
| ge-6/0/6   | up    | up   |       |             |        |
| ge-6/0/6.0 | up    | up   | inet  | 16.1.1.1/24 |        |
| ge-6/0/7   | up    | up   |       |             |        |
| ge-6/0/7.0 | up    | up   | inet  | 17.1.1.1/24 |        |

**Meaning** The output displays a list of all interfaces configured.

If the link displays **up** for all interfaces, the configuration is working properly. This verifies that the XPIM is up and end-to-end ping is working.

### Verifying the Interface Settings on Device 1

**Purpose** Verify that the interfaces are configured as expected.

**Action** From operational mode, enter the **show interface ge-6/0/0 extensive | no-more** command.

```
user@host>show interface ge-6/0/0 extensive | no-more
```

## Understanding Ethernet OAM Link Fault Management for SRX Series Services Gateways

The Ethernet interfaces on SRX Series devices support the IEEE 802.3ah standard for Operation, Administration, and Maintenance (OAM). The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters. The IEEE 802.3ah standard meets the requirement for OAM capabilities as Ethernet moves from being solely an enterprise technology to a WAN and access technology, and the standard remains backward-compatible with existing Ethernet technology.

**NOTE:** For SRX550 and SRX650 devices, LFM is supported only on devices that have 16-port or 24-port GPIMs.

The following OAM LFM features are supported:

- **Discovery and link monitoring**—The discovery process is triggered automatically when OAM is enabled on the interface. The discovery process permits Ethernet interfaces to discover and monitor the peer on the link if it also supports the IEEE 802.3ah standard. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. After the discovery process has been initiated, both sides participate in discovery. The device performs link monitoring by sending periodic OAM protocol data units (PDUs) to advertise OAM mode, configuration, and capabilities.

You can specify the number of OAM PDUs that an interface can miss before the link between peers is considered down.

- **Remote fault detection**—Remote fault detection uses flags and events. Flags convey Link Fault (a loss of signal), Dying Gasp (an unrecoverable condition such as a power failure), and Critical Event (an unspecified vendor-specific critical event). You can

specify the periodic OAM PDU sending interval for fault detection. SRX Series devices use the Event Notification OAM PDU to notify the remote OAM device when a problem is detected. You can specify the action to be taken by the system when the configured link-fault event occurs.

- Remote loopback—Remote loopback mode ensures link quality between the device and a remote peer during installation or troubleshooting. In this mode, when the interface receives a frame that is not an OAM PDU or a pause frame, it sends it back on the same interface on which it was received. The link appears to be in the active state. You can use the returned loopback acknowledgement to test delay, jitter, and throughput.

Junos OS can place a remote data terminal equipment (DTE) into loopback mode (if remote loopback mode is supported by the remote DTE). When you place a remote DTE into loopback mode, the interface receives the remote loopback request and puts the interface into remote loopback mode. When the interface is in remote loopback mode, all frames except OAM PDUs are looped back without any changes made to the frames. OAM PDUs continue to be sent and processed.

Table 280 lists the interfaces modes supported.

**Table 280: Supported Interface Modes**

| Interfaces                 | Mode                                                                                                                                                                                          |

## Example: Configuring Ethernet OAM Link Fault Management

The Ethernet interfaces on the SRX Series devices support the IEEE 802.3ah standard for Operation, Administration, and Maintenance (OAM). The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example describes how to enable and configure OAM LFM on a Gigabit Ethernet or Fast Ethernet interface:

- [Requirements on page 2705](#)
- [Overview on page 2706](#)
- [Configuration on page 2706](#)
- [Verification on page 2708](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.1 R2 or later for SRX Series Services Gateways
- Any two models of SRX Series devices connected directly

Before you begin:

- Establish basic connectivity. See the Getting Started Guide for your device.
- Configure network interfaces as necessary. See [“Example: Creating an Ethernet Interface” on page 2634](#).

- Ensure that you configure the interfaces as per the interface modules listed in [“Understanding Ethernet OAM Link Fault Management for SRX Series Services Gateways” on page 2703](#)

## Overview

The Ethernet interfaces on the SRX Series devices support the IEEE 802.3ah standard for Operation, Administration, and Maintenance (OAM). The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example uses two SRX Series devices connected directly. Before you begin configuring Ethernet OAM LFM on these two devices, connect the two devices directly through supported interfaces. See [“Understanding Ethernet OAM Link Fault Management for SRX Series Services Gateways” on page 2703](#).

Figure 128 shows the topology used in this example.

**Figure 128: Ethernet LFM with SRX Series Devices**

**NOTE:** For more information about configuring Ethernet OAM Link Fault Management, see [Junos® OS Ethernet Interfaces](#).

## Configuration

To configure Ethernet OAM LFM, perform these tasks:

- [Configuring Ethernet OAM Link Fault Management on Device 1 on page 2706](#)
- [Configuring Ethernet OAM Link Fault Management on Device 2 on page 2707](#)

### Configuring Ethernet OAM Link Fault Management on Device 1

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set protocols oam ethernet link-fault-management interface ge-0/0/0
set protocols oam ethernet link-fault-management interface ge-0/0/0 link-discovery
 active
set protocols oam ethernet link-fault-management interface ge-0/0/0 pdu-interval 800
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Ethernet OAM LFM on device 1:

1. Enable IEEE 802.3ah OAM support.  

```
[edit protocols oam ethernet link-fault-management]
user@device1# set interface ge-0/0/0
```
2. Specify that the interface initiates the discovery process.  

```
[edit protocols oam ethernet link-fault-management]
user@device1# set interface ge-0/0/0 link-discovery active
```
3. Set the periodic OAM PDU-sending interval (in milliseconds) for fault detection.  

```
[edit protocols oam ethernet link-fault-management]
user@device1# set interface pdu-interval 800
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@device1# show protocols
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ge-0/0/0 {
 pdu-interval 800;
 link-discovery active;
 }
 }
 }
 }
}
```

### Configuring Ethernet OAM Link Fault Management on Device 2

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set protocols oam ethernet link-fault-management interface ge-0/0/1
set protocols oam ethernet link-fault-management interface ge-0/0/1 pdu-interval 800
set protocols oam ethernet link-fault-management interface ge-0/0/1 negotiation-options
allow-remote-loopback
```

**Step-by-Step Procedure** To configure Ethernet OAM LFM on device 2:

1. Enable OAM on the peer interface.  

```
[edit protocols oam ethernet link-fault-management]
```

```
user@device2# set interface ge-0/0/1
```

2. Set the periodic OAM PDU-sending interval (in milliseconds) for fault detection.

```
[edit protocols oam ethernet link-fault-management]
user@device2# set interface ge-0/0/1 pdu-interval 800
```

3. Enable remote loopback support for the local interface.

```
[edit protocols oam ethernet link-fault-management]
user@device2# set interface ge-0/0/1 negotiation-options allow-remote-loopback
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@device2# show protocols
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ge-0/0/1 {
 negotiation-options {
 allow-remote-loopback;
 }
 }
 }
 }
 }
}
```

## Verification

---

### Verify the OAM LFM Configuration

---

**Purpose** Verify that OAM LFM is configured properly.

**Action** From operational mode, enter the **show oam ethernet link-fault-management** command.

```
user@device1>show oam ethernet link-fault-management

Interface: ge-0/0/0.0
Status: Running, Discovery state: Send Any
Peer address: 00:19:e2:50:3b:e1
Flags:Remote-Stable Remote-State-Valid Local-Stable 0x50
Remote entity information:
Remote MUX action: forwarding, Remote parser action: forwarding
Discovery mode: active, Unidirectional mode: unsupported
Remote loopback mode: supported, Link events: supported
Variable requests: unsupported
```

**Meaning** The output displays the MAC address and the discovery state is **Send Any** if OAM LFM has been configured properly.

## Understanding Power over Ethernet

Power over Ethernet (PoE) is the implementation of the IEEE 802.3 AF and IEEE 802.3 AT standards that allow both data and electrical power to pass over a copper Ethernet LAN cable.

The SRX Series devices support PoE on Ethernet ports. PoE ports transfer electrical power and data to remote devices over standard twisted-pair cable in an Ethernet network. PoE ports allow you to plug in devices that require both network connectivity and electrical power, such as VoIP and IP phones and wireless LAN access points.

You can configure the SRX Series device to act as power sourcing equipment (PSE), supplying power to powered devices that are connected on designated ports.

This topic contains the following sections:

- [SRX Series Services Gateway PoE Specifications on page 2711](#)
- [PoE Classes and Power Ratings on page 2713](#)
- [PoE Options on page 2713](#)

## SRX Series Services Gateway PoE Specifications

Table 281 lists the PoE specifications for the SRX210, SRX240, and SRX650 devices

**Table 281: PoE Specifications for the SRX210, SRX240 and SRX650 Devices**

| Specifications      | For SRX210 Device                                                                                | For SRX240 Device                                                                                                               | For SRX650 Device                                                                                                               |

## PoE Classes and Power Ratings

A powered device is classified based on the maximum power that it draws across all input voltages and operational modes. When class-based power management mode is configured on the SRX Series devices, power is allocated taking into account the maximum power ratings defined for the different classes of devices.

Table 282 lists the classes and their power ratings as specified by the IEEE standards.

**Table 282: SRX Series Devices PoE Specifications**

| Class | Usage    | Minimum Power Levels Output from PoE Port                                                   |
|-------|----------|---------------------------------------------------------------------------------------------|
| 0     | Default  | 15.4 W                                                                                      |
| 1     | Optional | 4.0 W                                                                                       |
| 2     | Optional | 7.0 W                                                                                       |
| 3     | Optional | 15.4 W                                                                                      |
| 4     | Reserved | Class 4 power devices are eligible to receive power up to 30 W according to IEEE standards. |

## PoE Options

When configuring PoE, you must enable the PoE interface in order for the port to provide power to a connected, powered device. In addition, you can configure the following PoE features:

- **Port priority**—Sets port priority. When it is not possible to maintain power to all connected ports, lower priority ports are powered off before higher priority ports. When a new device is connected on a higher-priority port, a lower priority port will be powered off automatically if available power is insufficient to power on the higher priority port. (For the ports with the same priority configuration, ports on the left are given higher priority than the ports on the right.)
- **Maximum available wattage power available to a port**—Sets the maximum amount of power that can be supplied to the port. The default wattage per port is 15.4 watts.
- **PoE power consumption logging**—Allows logging of per-port PoE power consumption. The telemetry section must be explicitly specified to enable logging. If left unspecified, telemetry is disabled by default. The default telemetry duration is 1 hour. The default telemetry interval is 5 minutes.
- **PoE power management mode**—Has two modes:
  - **Class**—When a powered device is connected to a PoE port, the power allocated to it is equal to the maximum power for the class as defined by the IEEE standards.

- **Static**—When a powered device is connected to a PoE port, the power allocated to it is equal to the maximum power configured for the port.
- **Reserve power**—Reserves the specified amount of power for the gateway in case of a spike in PoE consumption. The default is 0.

## Example: Configuring PoE on All Interfaces

---

This example shows how to configure PoE on all interfaces.

- [Requirements on page 2714](#)
- [Overview on page 2714](#)
- [Configuration on page 2714](#)
- [Verification on page 2715](#)

### Requirements

Before you begin, configure Ethernet interfaces. See “[Example: Creating an Ethernet Interface](#)” on page 2634.

### Overview

This example shows how to configure PoE on all interfaces on a device. In this example, you set the power port priority to low and the maximum power available to a port to 15.4 watts. Then you enable the PoE power consumption logging with the default telemetry settings, and you set the PoE management mode to static. Finally, you set the reserved power consumption to 15 watts in case of a spike in PoE consumption.

### Configuration

**CLI Quick Configuration**

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set poe interface all priority low maximum-power 15.4 telemetries
set poe management static guard-band 15
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure PoE on all interfaces:

1. Enable PoE.  

```
[edit]
user@host# edit poe interface all
```
2. Set the power port priority.  

```
[edit poe interface all]
user@host# set priority low
```
3. Set the maximum PoE wattage available for a port.  

```
[edit poe interface all]
user@host# set maximum-power 15.4
```
4. Enable logging of PoE power consumption.  

```
[edit poe interface all]
user@host# set telemetries
```
5. Set the PoE management mode.  

```
[edit]
user@host# set poe management static
```
6. Reserve power wattage in case of a spike in PoE consumption.  

```
[edit]
user@host# set poe guard-band 15
```

**Results** From configuration mode, confirm your configuration by entering the **show poe interface all** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show poe interface all
priority low;
maximum-power 15.4;
telemetries;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying the Status of PoE Interfaces

**Purpose** Verify that the PoE interfaces on the device are enabled and set to the desired priority settings. (The device used here is the SRX240 Services Gateway.)

**Action** From operational mode, enter the **show poe interface all** command.

```
user@host> show poe interface all
```

| Interface | Admin status | Oper status | Max power | Priority | Power consumption | Class |
|-----------|--------------|-------------|-----------|----------|-------------------|-------|
| ge-0/0/0  | Enabled      | Searching   | 15.4W     | Low      | 0.0W              | 0     |
| ge-0/0/1  | Enabled      | Powered-up  | 15.4W     | High     | 6.6W              | 0     |
| ge-0/0/2  | Disabled     | Disabled    | 15.4W     | Low      | 0.0W              | 0     |
| ge-0/0/3  | Disabled     | Disabled    | 15.4W     | Low      | 0.0W              | 0     |

The **show poe interface all** command lists PoE interfaces configured on the SRX 240 device, including information on status, priority, power consumption, and class. This output shows that the device has four PoE interfaces of which two are enabled with default values. One port has a device connected that is drawing power within expected limits.

## Example: Configuring PoE on an Individual Interface

This example shows how to configure PoE on an individual interface.

- [Requirements on page 2716](#)
- [Overview on page 2716](#)
- [Configuration on page 2716](#)
- [Verification on page 2718](#)

### Requirements

Before you begin:

- Configure Ethernet interfaces. See [“Example: Creating an Ethernet Interface” on page 2634](#).
- Configure PoE on all interfaces. See [“Example: Configuring PoE on All Interfaces” on page 2714](#).

### Overview

This example shows how to configure PoE on the ge-0/0/0 interface. In this example, you set the power port priority to high and the maximum power available to a port to 15.4 watts. Then you enable the PoE power consumption logging with the default telemetry settings, and you set the PoE management mode to static. Finally, you set the reserved power to 15 watts in case of a spike in PoE consumption.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set poe interface ge-0/0/0 priority high maximum-power 15.4 telemetries
set poe management static guard-band 15
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure PoE:

1. Enable PoE.  

```
[edit]
user@host# edit poe interface ge-0/0/0
```
2. Set the power port priority.  

```
[edit poe interface ge-0/0/0]
user@host# set priority high
```
3. Set the maximum PoE wattage available for a port.  

```
[edit poe interface ge-0/0/0]
user@host# set maximum power 15.4
```
4. Enable logging of PoE power consumption.  

```
[edit poe interface ge-0/0/0]
user@host# set telemetries
```
5. Set the PoE management mode.  

```
[edit]
user@host# set poe management static
```
6. Reserve power wattage in case of a spike in PoE consumption.  

```
[edit]
user@host# set poe guard-band 15
```

**Results** From configuration mode, confirm your configuration by entering the **show poe interface ge-0/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show poe interface ge-0/0/0
priority high;
maximum-power 15.4;
telemetries;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Status of PoE Interfaces on page 2718](#)
- [Verifying the Telemetry Data \(History\) for the Specified Interface on page 2718](#)
- [Verifying PoE Global Parameters on page 2719](#)

---

### Verifying the Status of PoE Interfaces

**Purpose** Verify that the PoE interfaces on the device are enabled and set to the desired priority settings. (The device used in this example is the SRX240 Services Gateway.)

**Action** From operational mode, enter the **show poe interface ge-0/0/1** command.

```
user@host> show poe interface ge-0/0/1
PoE interface status:
PoE interface : ge-0/0/1
Administrative status : Enabled
Operational status : Powered-up
Power limit on the interface : 15.4 W
Priority : High
Power consumed : 6.6 W
Class of power device : 0
```

The **show poe interface ge-0/0/1** command lists PoE interfaces configured on the SRX240 device, with their status, priority, power consumption, and class.

---

### Verifying the Telemetry Data (History) for the Specified Interface

**Purpose** Verify the PoE interface's power consumption over a specified period.

**Action** From operational mode, enter the **show poe telemetries interface** command.

For all records:

```
user@host> show poe telemetries interface ge-0/0/1 all
S1 No Timestamp Power Voltage
1 Fri Jan 04 11:41:15 2009 5.1 W 47.3 V
2 Fri Jan 04 11:40:15 2009 5.1 W 47.3 V
3 Fri Jan 04 11:39:15 2009 5.1 W 47.3 V
4 Fri Jan 04 11:38:15 2009 0.0 W 0.0 V
5 Fri Jan 04 11:37:15 2009 0.0 W 0.0 V
6 Fri Jan 04 11:36:15 2009 6.6 W 47.2 V
7 Fri Jan 04 11:35:15 2009 6.6 W 47.2 V
```

For a specific number of records:

```
user@host> show poe telemetries interface ge-0/0/1 5
S1 No Timestamp Power Voltage
1 Fri Jan 04 11:31:15 2009 6.6 W 47.2 V
2 Fri Jan 04 11:30:15 2009 6.6 W 47.2 V
3 Fri Jan 04 11:29:15 2009 6.6 W 47.2 V
4 Fri Jan 04 11:28:15 2009 6.6 W 47.2 V
5 Fri Jan 04 11:27:15 2009 6.6 W 47.2 V
```

The telemetry status displays the power consumption history for the specified interface, provided telemetry has been configured for that interface.

### Verifying PoE Global Parameters

**Purpose** Verify global parameters such as guard band, power limit, and power consumption.

**Action** From operational mode, enter the **show poe controller** command.

```
user@host> show poe controller
Controller Maximum Power Guard band Management
index power consumption
0 150.0 W 0.0 W 0 W Static
```

The **show poe controller** command lists the global parameters configured on the SRX Series device such as controller index, maximum power, power consumption, guard band, and management mode along with their status.

  - [Example: Disabling a PoE Interface on page 2719](#)

## Example: Disabling a PoE Interface

This example shows how to disable PoE on all interfaces or on a specific interface.

- [Requirements on page 2719](#)
- [Overview on page 2719](#)
- [Configuration on page 2720](#)
- [Verification on page 2720](#)

### Requirements

Before you begin:

- Configure PoE on all interfaces. See [“Example: Configuring PoE on All Interfaces” on page 2714](#).
- Configure PoE on an individual interface. See [“Example: Configuring PoE on an Individual Interface” on page 2716](#).

### Overview

In this example, you disable PoE on all interfaces and on a specific interface, which in this case is ge-0/0/0.

## Configuration

### Step-by-Step Procedure

To disable PoE on interfaces:

1. Disable PoE on all interfaces.  

```
[edit]
user@host# set poe interface all disable
```
2. Disable PoE on a specific interface.  

```
[edit]
user@host# set poe interface ge-0/0/0 disable
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show poe interface** command.

## Understanding Physical Encapsulation on an Interface

---

Encapsulation is the process by which a lower level protocol accepts a message from a higher level protocol and places it in the data portion of the lower level frame. As a result, datagrams transmitted through a physical network have a sequence of headers: the first header for the physical network (or Data Link Layer) protocol, the second header for the Network Layer protocol (IP, for example), the third header for the Transport Layer protocol, and so on.

The following encapsulation protocols are supported on physical interfaces:

- Frame Relay Encapsulation. See [“Understanding Frame Relay Encapsulation on an Interface” on page 2724](#).
- Point-to-Point Protocol. See [“Understanding Point-to-Point Protocol” on page 2725](#).

## Understanding Frame Relay Encapsulation on an Interface

The Frame Relay packet-switching protocol operates at the Physical Layer and Data Link Layer in a network to optimize packet transmissions by creating virtual circuits between hosts. [Figure 129](#) shows a typical Frame Relay network.

**Figure 129: Frame Relay Network**

[Figure 129](#) shows multiple paths from Host A to Host B. In a typical routed network, traffic is sent from device to device with each device making routing decisions based on its own routing table. In a packet-switched network, the paths are predefined. Devices switch a packet through the network according to predetermined next-hops established when the virtual circuit is set up.

This topic contains the following sections:

- [Virtual Circuits on page 2724](#)
- [Switched and Permanent Virtual Circuits on page 2724](#)
- [Data-Link Connection Identifiers on page 2725](#)
- [Congestion Control and Discard Eligibility on page 2725](#)

### Virtual Circuits

A virtual circuit is a bidirectional path between two hosts in a network. Frame Relay virtual circuits are logical connections between two hosts that are established either by a call setup mechanism or by an explicit configuration.

A virtual circuit created through a call setup mechanism is known as a switched virtual circuit (SVC). A virtual circuit created through an explicit configuration is called a permanent virtual circuit (PVC).

### Switched and Permanent Virtual Circuits

Before data can be transmitted across an SVC, a signaling protocol like ISDN must set up a call by the exchange of setup messages across the network. When a connection is established, data is transmitted across the SVC. After data transmission, the circuit is

torn down and the connection is lost. For additional traffic to pass between the same two hosts, a subsequent SVC must be established, maintained, and terminated.

Because PVCs are explicitly configured, they do not require the setup and teardown of SVCs. Data can be switched across the PVC whenever a host is ready to transmit. SVCs are useful in networks where data transmission is sporadic and a permanent circuit is not needed.

## Data-Link Connection Identifiers

An established virtual circuit is identified by a data-link connection identifier (DLCI). The DLCI is a value from 16 through 1022. (Values 1 through 15 are reserved.) The DLCI uniquely identifies a virtual circuit locally so that devices can switch packets to the appropriate next-hop address in the circuit. Multiple paths that pass through the same transit devices have different DLCIs and associated next-hop addresses.

## Congestion Control and Discard Eligibility

Frame Relay uses the following types of congestion notification to control traffic within a Frame Relay network. Both are controlled by a single bit in the Frame Relay header.

- Forward explicit congestion notification (FECN)
- Backward explicit congestion notification (BECN)

Traffic congestion is typically defined in the buffer queues on a device. When the queues reach a predefined level of saturation, traffic is determined to be congested. When traffic congestion occurs in a virtual circuit, the device experiencing congestion sets the congestion bits in the Frame Relay header to 1. As a result, transmitted traffic has the FECN bit set to 1, and return traffic on the same virtual circuit has the BECN bit set to 1.

When the FECN and BECN bits are set to 1, they provide a congestion notification to the source and destination devices. The devices can respond in either of two ways: to control traffic on the circuit by sending it through other routes, or to reduce the load on the circuit by discarding packets.

If devices discard packets as a means of congestion (flow) control, Frame Relay uses the discard eligibility (DE) bit to give preference to some packets in discard decisions. A DE value of 1 indicates that the frame is of lower importance than other frames and more likely to be dropped during congestion. Critical data (such as signaling protocol messages) without the DE bit set is less likely to be dropped.

- [Understanding Physical Encapsulation on an Interface on page 2723](#)

## Understanding Point-to-Point Protocol

The Point-to-Point Protocol (PPP) is an encapsulation protocol for transporting IP traffic across point-to-point links. PPP is made up of three primary components:

- Link Control Protocol (LCP)—Establishes working connections between two points.
- Authentication protocol—Enables secure connections between two points.

- Network control protocol (NCP)—Initializes the PPP protocol stack to handle multiple Network Layer protocols, such as IPv4, IPv6, and Connectionless Network Protocol (CLNP).

This topic contains the following sections:

- [Link Control Protocol on page 2726](#)
- [PPP Authentication on page 2726](#)
- [Network Control Protocols on page 2727](#)
- [Magic Numbers on page 2727](#)
- [CSU/DSU Devices on page 2728](#)

## Link Control Protocol

LCP is responsible for establishing, maintaining, and tearing down a connection between two endpoints. LCP also tests the link and determines whether it is active. LCP establishes a point-to-point connection as follows:

1. LCP must first detect a clocking signal on each endpoint. However, because the clocking signal can be generated by a network clock and shared with devices on the network, the presence of a clocking signal is only a preliminary indication that the link might be functioning.
2. When a clocking signal is detected, a PPP host begins transmitting PPP Configure-Request packets.
3. If the remote endpoint on the point-to-point link receives the Configure-Request packet, it transmits a Configure-Acknowledgement packet to the source of the request.
4. After receiving the acknowledgement, the initiating endpoint identifies the link as established. At the same time, the remote endpoint sends its own request packets and processes the acknowledgement packets. In a functioning network, both endpoints treat the connection as established.

During connection establishment, LCP also negotiates connection parameters such as FCS and HDLC framing. By default, PPP uses a 16-bit FCS, but you can configure PPP to use either a 32-bit FCS or a 0-bit FCS (no FCS). Alternatively, you can enable HDLC encapsulation across the PPP connection.

After a connection is established, PPP hosts generate Echo-Request and Echo-Response packets to maintain a PPP link.

## PPP Authentication

PPP's authentication layer uses a protocol to help ensure that the endpoint of a PPP link is a valid device. Authentication protocols include the Password Authentication Protocol (PAP), the Extensible Authentication Protocol (EAP), and the Challenge Handshake Authentication Protocol (CHAP). CHAP is the most commonly used.

**NOTE:** Support for user id and the password to comply with full ASCII character set is supported through RFC 2486.

The user can enable or disable the RFC 2486 support under the PPP options. The RFC 2486 is disabled by default, and enable the support globally use the command `set access ppp-options compliance rfc 2486`.

CHAP ensures secure connections across PPP links. After a PPP link is established by LCP, the PPP hosts at either end of the link initiate a three-way CHAP handshake. Two separate CHAP handshakes are required before both sides identify the PPP link as established.

CHAP configuration requires each endpoint on a PPP link to use a shared secret (password) to authenticate challenges. The shared secret is never transmitted over the wire. Instead, the hosts on the PPP connection exchange information that enables both to determine that they share the same secret. Challenges consist of a hash function calculated from the secret, a numeric identifier, and a randomly chosen challenge value that changes with each challenge. If the response value matches the challenge value, authentication is successful. Because the secret is never transmitted and is required to calculate the challenge response, CHAP is considered very secure.

PAP authentication protocol uses a simple two-way handshake to establish identity. PAP is used after the link establishment phase (LCP up), during the authentication phase. Junos OS can support PAP in one direction (egress or ingress), and CHAP in the other.

## Network Control Protocols

After authentication is completed, the PPP connection is fully established. At this point, any higher level protocols (for example, IP protocols) can initialize and perform their own negotiations and authentication.

PPP NCPs include support for the following protocols. IPCP and IPv6CP are the most widely used on SRX Series devices.

- IPCP—IP Control Protocol
- IPv6CP—IPv6 Control Protocol
- OSINLCP—OSI Network Layer Control Protocol (includes IS-IS, ES-IS, CLNP, and IDRP)

## Magic Numbers

Hosts running PPP can create “magic” numbers for diagnosing the health of a connection. A PPP host generates a random 32-bit number and sends it to the remote endpoint during LCP negotiation and echo exchanges.

In a typical network, each host's magic number is different. A magic number mismatch in an LCP message informs a host that the connection is not in loopback mode and traffic is being exchanged bidirectionally. If the magic number in the LCP message is the same as the configured magic number, the host determines that the connection is in loopback mode, with traffic looped back to the transmitting host.

Looping traffic back to the originating host is a valuable way to diagnose network health between the host and the loopback location. To enable loopback testing, telecommunications equipment typically supports channel service unit/data service unit (CSU/DSU) devices.

## CSU/DSU Devices

A channel service unit (CSU) connects a terminal to a digital line. A data service unit (DSU) performs protective and diagnostic functions for a telecommunications line. Typically, the two devices are packaged as a single unit. A CSU/DSU device is required for both ends of a T1 or T3 connection, and the units at both ends must be set to the same communications standard.

A CSU/DSU device enables frames sent along a link to be looped back to the originating host. Receipt of the transmitted frames indicates that the link is functioning correctly up to the point of loopback. By configuring CSU/DSU devices to loop back at different points in a connection, network operators can diagnose and troubleshoot individual segments in a circuit.

## Understanding High-Level Data Link Control

High-Level Data Link Control (HDLC) is a bit-oriented, switched and nonswitched link-layer protocol. HDLC is widely used because it supports half-duplex and full-duplex connections, point-to-point and point-to-multipoint networks, and switched and nonswitched channels.

This topic contains the following sections:

- [HDLC Stations on page 2728](#)
- [HDLC Operational Modes on page 2729](#)

## HDLC Stations

Nodes within a network running HDLC are called stations. HDLC supports three types of stations for data link control:

- **Primary stations**—Responsible for controlling the secondary and combined other stations on the link. Depending on the HDLC mode, the primary station is responsible for issuing acknowledgement packets to allow data transmission from secondary stations.
- **Secondary stations**—Controlled by the primary station. Under normal circumstances, secondary stations cannot control data transmission across the link with the primary station, are active only when requested by the primary station, and can respond to the primary station only (not to other secondary stations). All secondary station frames are response frames.
- **Combined stations**—A combination of primary and secondary stations. On an HDLC link, all combined stations can send and receive commands and responses without

any permission from any other stations on the link and cannot be controlled by any other station.

## HDLC Operational Modes

HDLC runs in three separate modes:

- Normal Response Mode (NRM)—The primary station on the HDLC link initiates all information transfers with secondary stations. A secondary station on the link can transmit a response of one or more information frames only when it receives explicit permission from the primary station. When the last frame is transmitted, the secondary station must wait for explicit permission before it can transmit more frames.

NRM is used most widely for point-to-multipoint links, in which a single primary station controls many secondary stations.

- Asynchronous Response Mode (ARM)—The secondary station can transmit either data or control traffic at any time, without explicit permission from the primary station. The primary station is responsible for error recovery and link setup, but the secondary station can transmit information at any time.

ARM is used most commonly with point-to-point links, because it reduces the overhead on the link by eliminating the need for control packets.

- Asynchronous Balance Mode (ABM)—All stations are combined stations. Because no other station can control a combined station, all stations can transmit information without explicit permission from any other station. ABM is not a widely used HDLC mode.

## Understanding Point-to-Point Protocol over Ethernet

---

*Point-to-Point Protocol over Ethernet* (PPPoE) combines PPP, which typically runs over broadband connections, with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator. PPPoE enables service providers to maintain access control through PPP connections and also manage multiple hosts at a remote site.

PPPoE connects multiple hosts on an Ethernet LAN to a remote site through a single customer premises equipment (CPE) device—a Juniper Networks device. Hosts share a common digital subscriber line (DSL), a cable modem, or a wireless connection to the Internet.

To use PPPoE, you must initiate a PPPoE session, encapsulate Point-to-Point Protocol (PPP) packets over Ethernet, and configure the device as a PPPoE client. To provide a PPPoE connection, each PPP session must learn the Ethernet address of the remote

peer and establish a unique session identifier during the PPPoE discovery and session stages.

**NOTE:** Juniper Networks devices with asymmetric digital subscriber line (ADSL) or symmetric high-speed DSL (SHDSL) interfaces can use PPPoE over Asynchronous Transfer Mode (ATM) to connect through DSL lines only, not for direct ATM connections.

PPPoE has two stages, the discovery stage and the PPPoE session stage. In the *discovery stage*, the client discovers the access concentrator by identifying the Ethernet media access control (MAC) address of the access concentrator and establishing a PPPoE session ID. In the *session stage*, the client and the access concentrator build a point-to-point connection over Ethernet, based on the information collected in the discovery stage.

This topic contains the following sections:

- [PPPoE Discovery Stage on page 2732](#)
- [PPPoE Session Stage on page 2733](#)

## PPPoE Discovery Stage

To initiate a PPPoE session, a host must first identify the Ethernet MAC address of the remote peer and establish a unique PPPoE session ID for the session. Learning the remote Ethernet MAC address is called *PPPoE discovery*.

During the PPPoE discovery process, the host does not discover a remote endpoint on the Ethernet network. Instead, the host discovers the access concentrator through which all PPPoE sessions are established. Discovery is a client/server relationship, with the host (a device running Junos OS) acting as the client and the access concentrator acting as the server. Because the network might have more than one access concentrator, the discovery stage allows the client to communicate with all of them and select one.

**NOTE:** A device cannot receive PPPoE packets from two different access concentrators on the same physical interface.

The PPPoE discovery stage consists of the following steps:

1. PPPoE Active Discovery Initiation (PADI)—The client initiates a session by broadcasting a PADI packet to the LAN to request a service.
2. PPPoE Active Discovery Offer (PADO)—Any access concentrator that can provide the service requested by the client in the PADI packet replies with a PADO packet that contains its own name, the unicast address of the client, and the service requested. An access concentrator can also use the PADO packet to offer other services to the client.

3. PPPoE Active Discovery Request (PADR)—From the PADOs it receives, the client selects one access concentrator based on its name or the services offered and sends it a PADR packet to indicate the service or services needed.
4. PPPoE Active Discovery Session-Confirmation (PADS)—When the selected access concentrator receives the PADR packet, it accepts or rejects the PPPoE session:
  - To accept the session, the access concentrator sends the client a PADS packet with a unique session ID for a PPPoE session and a service name that identifies the service under which it accepts the session.
  - To reject the session, the access concentrator sends the client a PADS packet with a service name error and resets the session ID to zero.

## PPPoE Session Stage

The PPPoE session stage starts after the PPPoE discovery stage is over. The access concentrator can start the PPPoE session after it sends a PADS packet to the client, or the client can start the PPPoE session after it receives a PADS packet from the access concentrator. A device supports multiple PPPoE sessions on each interface, but no more than 256 PPPoE sessions per device.

Each PPPoE session is uniquely identified by the Ethernet address of the peer and the session ID. After the PPPoE session is established, data is sent as in any other PPP encapsulation. The PPPoE information is encapsulated within an Ethernet frame and is sent to a unicast address. Magic numbers, echo requests, and all other PPP traffic behave exactly as in normal PPP sessions. In this stage, both the client and the server must allocate resources for the PPPoE logical interface.

After a session is established, the client or the access concentrator can send a PPPoE Active Discovery Termination (PADT) packet anytime to terminate the session. The PADT packet contains the destination address of the peer and the session ID of the session to be terminated. After this packet is sent, the session is closed to PPPoE traffic.

**NOTE:** If PPPoE session is already up and the user restarts the PPPoE daemon, a new PPPoE daemon with a new PID starts while the existing session is not terminated.

If PPPoE session is already down and user restarts the PPPoE daemon, the PPPoE discovery establishes a new session.

The PPPoE session is not terminated for the following configuration changes:

- Changing idle time out value
- Changing auto rec timer value
- Deleting idle time out
- Deleting auto rec timer
- Add new auto rec time

- Add new idle time out
- Change negotiate address to static address
- Change static ip address to a new static ip address
- Changing default chap secreta

The PPPoE session is terminated for the following configuration changes:

- Add ac name
- Delete chap ppp options
- Add new chap ppp options
- Configure uifd mac

**NOTE:** When the MTU for an underlying physical interface is changed, it brings down the PPPoE session. For PPPoE, an MTU greater than 1492 cannot be achieved.

## Understanding PPPoE Interfaces

The device's Point-to-Point Protocol over Ethernet (PPPoE) interface to the access concentrator can be a Fast Ethernet interface, a Gigabit Ethernet interface, a redundant Ethernet interface, an ATM-over-ADSL interface, or an ATM-over-SHDSL interface. The PPPoE configuration is the same for all interfaces. The only difference is the encapsulation for the underlying interface to the access concentrator:

- If the interface is Ethernet, use a PPPoE encapsulation.
- If the interface is ATM-over-ADSL or ATM-over-SHDSL, use a PPPoE over ATM encapsulation.

To configure a PPPoE interface, you create an interface with a logical interface unit 0, then specify a logical Ethernet or ATM interface as the underlying interface for the PPPoE session. You then specify other PPPoE options, including the access concentrator and PPPoE session parameters.

**NOTE:** PPPoE over redundant Ethernet (reth) interface is supported on SRX100, SRX210, SRX220, SRX240, and SRX650 devices. This feature allows an existing PPPoE session to continue without starting a new PPPoE session in the event of a failover.

## Example: Configuring PPPoE Interfaces

This example shows how to configure a PPPoE interface.

- [Requirements on page 2735](#)
- [Overview on page 2735](#)
- [Configuration on page 2735](#)
- [Disabling the End-of-List Tag on page 2739](#)

### Requirements

Before you begin, configure an Ethernet interface. See “[Example: Creating an Ethernet Interface](#)” on page 2634.

### Overview

In this example, you create the PPPoE interface pp0.0 and specify the logical Ethernet interface ge-0/0/1.0 as the underlying interface. You also set the access concentrator, set the PPPoE session parameters, and set the MTU of the IPv4 family to 1492.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces pp0 unit 0 pppoe-options underlying-interface ge-0/0/1.0
 access-concentrator ispl.com auto-reconnect 100 idle-timeout 100 client service-name
 video@ispl.com
set interfaces pp0 unit 0 family inet mtu 1492 negotiate-address
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a PPPoE interface:

1. Create a PPPoE interface.  
[edit]

```
user@host# edit interfaces pp0 unit 0
```

2. Configure PPPoE options.

```
[edit interfaces pp0 unit 0]
user@host# set pppoe-options underlying-interface ge-0/0/1.0 access-concentrator
ispl.com auto-reconnect 100 idle-timeout 100 client service-name video@ispl.com
```

3. Configure the MTU.

```
[edit interfaces pp0 unit 0]
user@host# set family inet mtu 1492
```

4. Configure the PPPoE interface address.

```
[edit interfaces pp0 unit 0]
user@host# set family inet negotiate-address
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces pp0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces pp0
unit 0 {
 pppoe-options {
 underlying-interface ge-0/0/1.0;
 idle-timeout 100;
 access-concentrator ispl.com;
 service-name "vide0@ispl.com";
 auto-reconnect 100;
 client;
 }
 family inet {
 mtu 1492;
 negotiate-address;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Verification

Confirm that the configuration is working properly.

- [Verifying PPPoE Interfaces on page 2736](#)
- [Verifying PPPoE Sessions on page 2737](#)
- [Verifying the PPPoE Version on page 2738](#)
- [Verifying PPPoE Statistics on page 2738](#)

#### *Verifying PPPoE Interfaces*

**Purpose** Verify that the PPPoE device interfaces are configured properly.

**Action** From operational mode, enter the **show interfaces pp0** command.

```
user@host> show interfaces pp0
Physical interface: pp0, Enabled, Physical link is Up
 Interface index: 67, SNMP ifIndex: 317
 Type: PPPoE, Link-level type: PPPoE, MTU: 9192
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps
