set security policies from-zone trust to-zone untrust policy p5 match application junos-http
set security policies from-zone trust to-zone untrust policy p5 then permit
 application-services utm-policy utmp5

```

**Step-by-Step Procedure** To attach a UTM policy to a security policy:

1. Create and configure the security policy.  

```

[edit security policies from-zone trust to-zone untrust policy p5]
user@host# set match source-address any
user@host# set match destination-address any
user@host# set match application junos-http

```
2. Attach the UTM policy to the security policy.  

```

[edit security policies from-zone trust to-zone untrust policy p5]
user@host# set then permit application-services utm-policy utmp5

```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
userhost#show security policies
from-zone trust to-zone untrust {
 policy p5 {
 match {
 source-address any;
 destination-address any;
 application junos-http;
 }
 then {
 permit {
 application-services {
 utm-policy utmp5;
 }
 }
 }
 }
}

```

```
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the Configuration of Local Web Filtering Custom Objects on page 6096](#)
- [Verifying the Configuration of Local Web Filtering Feature Profiles on page 6096](#)
- [Verifying the Configuration of Local Web Filtering UTM Policies on page 6096](#)
- [Verifying the Attachment of Local Web Filtering UTM Policies to Security Policies on page 6096](#)

---

### Verifying the Configuration of Local Web Filtering Custom Objects

**Purpose** Verify the configuration of local Web filtering custom objects.

**Action** From operational mode, enter the **show security utm custom-objects** command.

---

### Verifying the Configuration of Local Web Filtering Feature Profiles

**Purpose** Verify the configuration of local Web filtering feature profiles.

**Action** From operational mode, enter the **show security utm feature-profile** command.

---

### Verifying the Configuration of Local Web Filtering UTM Policies

**Purpose** Verify the configuration of local Web filtering UTM policies.

**Action** From operational mode, enter the **show security utm** command.

---

### Verifying the Attachment of Local Web Filtering UTM Policies to Security Policies

**Purpose** Verify the attachment of local Web filtering UTM policies to security policies.

**Action** From operational mode, enter the **show security policies** command.

## Understanding Redirect Web Filtering

With redirect Web filtering, the Web filtering module intercepts an HTTP request. The URL in the request is then sent to the external Websense server, which makes a permit or a deny decision. If access is permitted to the URL in question, the original HTTP request and all the subsequent requests are sent to the intended HTTP server. But if access is denied to the URL in question, a blocking message is sent to the client.

This is a general description of how Web traffic is intercepted, redirected, and acted upon by the Web filtering module:

1. A Web client establishes a TCP connection with the webserver.
2. The Web client then sends an HTTP request.
3. The device intercepts the requests and extract URL. The URL is checked against Global Web filtering whitelists and blacklists. If no match is made, the Websense server configuration parameters are utilized. Otherwise go to step 6.
4. The URL is sent to the Websense server for checking,
5. The Websense server returns a response indicating whether or not the URL is to be permitted or blocked.
6. If access is allowed, then the original HTTP request is sent to the webserver. If access is denied, the device sends a blocking message to the client and tears down the TCP connection.

**NOTE:** Web filtering is performed on all the methods defined in HTTP1.0 and HTTP 1.1. However, redirect Web filtering uses destination IP as URL when it is checking HTTPS traffic.

**NOTE:** Decision making from real-time options provides a higher level of accuracy, therefore caching for redirect Web filtering is not supported.

**NOTE:** Redirect Web filtering does not require a subscription license.

## Example: Enhancing Security by Configuring Redirect Web Filtering Using Custom Objects

---

This example shows how to manage Internet usage by configuring redirect Web filtering using custom objects and preventing access to inappropriate Web content.

- [Requirements on page 6098](#)
- [Overview on page 6098](#)
- [Configuration on page 6099](#)
- [Verification on page 6104](#)

### Requirements

Before you begin, learn more about Web filtering. See [“Web Filtering Overview” on page 6056](#).

### Overview

The benefit of using Web filtering is that it extracts the URLs from HTTP request messages and performs filtering according to the requirements. The advantage of configuring redirect Web filtering is that it extracts the URLs from the HTTP requests and sends them to an external URL filtering server to determine whether to allow or deny access.

In this example you configure redirect Web filtering custom objects, redirect Web filtering feature profiles, and redirect Web filtering UTM policies. You also attach redirect Web filtering UTM policies to security policies.

The default websense-redirect server port number is 15868.

You select fallback settings (block or log and permit) for this profile, in case errors occur in each configured category. This example sets fallback settings to block the profile. You enter the number of sockets used for communicating between the client and the server. The default is 32 for SRX Series devices.

Finally, you enter a timeout value in seconds. Once this limit is reached, fail mode settings are applied. The default is 15 seconds, and you can enter a value from 1 to 1800 seconds. This example sets the timeout value to 10.

Figure 255 shows the overall architecture for the Websense redirect feature.

Figure 255: Websense Redirect Architecture

## Configuration

- [Configuring Redirect Web Filtering Custom Objects on page 6099](#)
- [Configuring the Redirect Web Filtering Feature Profiles on page 6101](#)
- [Configuring Redirect Web Filtering UTM Policies and Attaching the Redirect Web Filtering UTM Policies to Security Policies on page 6102](#)

### Configuring Redirect Web Filtering Custom Objects

#### CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security utm custom-objects url-pattern urllist4 value 1.2.3.4
set security utm custom-objects url-pattern urllistblack value http://www.untrusted.com
set security utm custom-objects url-pattern urllistblack value 13.13.13.13
set security utm custom-objects url-pattern urllistwhite value http://www.trusted.com
set security utm custom-objects url-pattern urllistwhite value 7.7.7.7
set security utm custom-objects custom-url-category custurl4 value urllist4
set security utm custom-objects custom-url-category custblacklist value urllistblack
set security utm custom-objects custom-url-category custwhitelist value urllistwhite

```

#### Step-by-Step Procedure

To configure redirect Web filtering custom objects:

1. Create custom objects and create the URL pattern list.
 

```

[edit security utm]
user@host# set custom-objects url-pattern urllist4 value [http://www.example.net 1.2.3.4]

```
2. Configure the custom URL category list custom object using the URL pattern list.
 

```

[edit security utm]
user@host# set custom-objects custom-url-category custurl4 value urllist4

```

3. Create a list of untrusted sites

```
[edit security utm]
user@host# set custom-objects url-pattern urllistblack value
[http://www.untrusted.com 13.13.13.13]
```

4. Configure the custom URL category list custom object using the URL pattern list of untrusted sites.

```
[edit security utm]
user@host# set custom-objects custom-url-category custblacklist value urllistblack
```

5. Create a list of trusted sites.

```
[edit security utm]
user@host# set custom-objects url-pattern urllistwhite value
[http://www.trusted.com 7.7.7.7]
```

6. Configure the custom URL category list custom object using the URL pattern list of trusted sites.

```
[edit security utm]
user@host# set custom-objects custom-url-category custwhitelist value urllistwhite
```

**Results** From configuration mode, confirm your configuration by entering the **show security utm custom-objects** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
userhost# show security utm custom-objects
url-pattern {
 urllist4 {
 value [http://www.example.net 1.2.3.4];
 }
 urllistblack {
 value [http://www.untrusted.com 13.13.13.13];
 }
 urllistwhite {
 value [http://www.trusted.com 7.7.7.7];
 }
}
custom-url-category {
 custurl4 {
 value urllist4;
 }
 custblacklist {
 value urllistblack;
 }
 custwhitelist {
 value urllistwhite;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring the Redirect Web Filtering Feature Profiles

**CLI Quick Configuration** To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security utm feature-profile web-filtering url-whitelist custwhitelist
set security utm feature-profile web-filtering url-blacklist custblacklist
set security utm feature-profile web-filtering type websense-redirect
set security utm feature-profile web-filtering websense-redirect profile websenseprofile1
server host Websenseserver
set security utm feature-profile web-filtering websense-redirect profile websenseprofile1
server port 15868
set security utm feature-profile web-filtering websense-redirect profile websenseprofile1
fallback-settings server-connectivity block
set security utm feature-profile web-filtering websense-redirect profile websenseprofile1
fallback-settings timeout block
set security utm feature-profile web-filtering websense-redirect profile websenseprofile1
fallback-settings too-many-requests block
set security utm feature-profile web-filtering websense-redirect profile websenseprofile1
timeout 10
set security utm feature-profile web-filtering websense-redirect profile websenseprofile1
sockets 1
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure redirect Web filtering feature profiles:

1. Configure the Web filtering URL Black List.  

```
[edit security utm feature-profile web-filtering]
user@host# set url-blacklist custblacklist
```
2. Configure the Web filtering URL White List.  

```
[edit security utm feature-profile web-filtering]
user@host# set url-whitelist custwhitelist
```
3. Specify the Web filtering type, create a profile name, and set the server name or IP address.  

```
[edit security utm feature-profile web-filtering]
user@host# set websense-redirect profile websenseprofile1 server host
Websenseserver
```
4. Enter the port number for communicating with the server.  

```
[edit security utm feature-profile web-filtering]
user@host# set websense-redirect profile websenseprofile1 server port 15868
```
5. Select fallback settings (block or log and permit) for this profile.  

```
[edit security utm feature-profile web-filtering]
user@host# set websense-redirect profile websenseprofile1 fallback-settings default
block
```

```

user@host# set websense-redirect profile websenseprofile1 fallback-settings
server-connectivity block
user@host# set websense-redirect profile websenseprofile1 fallback-settings
timeout block
user@host# set websense-redirect profile websenseprofile1 fallback-settings
too-many-requests block

```

6. Enter the number of sockets used for communicating between the client and the server.

```

[edit security utm feature-profile web-filtering]
user@host# set websense-redirect profile websenseprofile1 sockets 1

```

7. Enter a timeout value, in seconds.

```

[edit security utm feature-profile web-filtering]
user@host# set .websense-redirect profile websenseprofile1 timeout 10

```

**Results** From configuration mode, confirm your configuration by entering the **show security utm feature-profile** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
userhost# show security utm feature-profile
web-filtering {
 url-whitelist custwhitelist;
 url-blacklist custblacklist;
 type websense-redirect {
 profile websenseprofile1 {
 server {
 host Websenseserver;
 port 15868;
 }
 fallback-settings {
 server-connectivity block;
 timeout block;
 too-many-requests block;
 }
 timeout 10;
 sockets 1;
 }
 }
}
content-filtering {
 profile contentfilter1;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Redirect Web Filtering UTM Policies and Attaching the Redirect Web Filtering UTM Policies to Security Policies

#### CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security utm utm-policy utmp6 web-filtering http-profile websenseprofile1
set security policies from-zone trust to-zone untrust policy p6 match source-address any
set security policies from-zone trust to-zone untrust policy p6 match destination-address
 any
set security policies from-zone trust to-zone untrust policy p6 match application junos-http
set security policies from-zone trust to-zone untrust policy p6 then permit
 application-services utm-policy utmp6

```

### Step-by-Step Procedure

To configure a UTM policy and attach it to a security policy:

1. Create the UTM policy referencing a profile.  

```

[edit security utm]
user@host# set utm-policy utmp6 web-filtering http-profile websenseprofile1

```
2. Create and configure the security policy.  

```

[edit security policies from-zone trust to-zone untrust policy p6]
user@host# set match source-address any
user@host# set match destination-address any
user@host# set match application junos-http

```
3. Attach the UTM policy to the security policy.  

```

[edit security policies from-zone trust to-zone untrust policy p6]
user@host# set then permit application-services utm-policy utmp6

```

### Results

From configuration mode, confirm your configuration by entering the **show security utm** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
userhost# show security utm
utm-policy utmp6 {
 web-filtering {
 http-profile websenseprofile1;
 }
}

```

From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
userhost# show security policies
from-zone trust to-zone untrust {
 policy p6 {
 match {
 source-address any;
 destination-address any;
 application junos-http;
 }
 then {
 permit {
 application-services {
 utm-policy utmp6;
 }
 }
 }
 }
}

```

```
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the Configuration of Redirect Web Filtering Custom Objects on page 6104](#)
- [Verifying the Configuration of Redirect Web Filtering Feature Profiles on page 6104](#)
- [Verifying the Attachment of Redirect Web Filtering UTM Policies to Security Policies on page 6105](#)

---

### Verifying the Configuration of Redirect Web Filtering Custom Objects

**Purpose** Verify the configuration of redirect Web filtering custom objects.

**Action** From the top of the configuration in configuration mode, enter the **show security utm custom-objects** command.

```
[edit]
userhost# show security utm custom-objects
url-pattern {
 urllist4 {
 value [http://www.example.net 1.2.3.4];
 }
 urllistblack {
 value [http://www.untrusted.com 13.13.13.13];
 }
 urllistwhite {
 value [http://www.trusted.com 7.7.7.7];
 }
}
custom-url-category {
 custurl4 {
 value urllist4;
 }
 custblacklist {
 value urllistblack;
 }
 custwhitelist {
 value urllistwhite;
 }
}
```

**Meaning** The sample output shows the list of custom objects created.

---

### Verifying the Configuration of Redirect Web Filtering Feature Profiles

**Purpose** Verify the configuration of redirect Web filtering feature profiles.

**Action** From the top of the configuration in configuration mode, enter the **show security utm feature-profile** command.

```
[edit]
userhost# show security utm feature-profile
web-filtering {
 url-whitelist custwhitelist;
 url-blacklist custblacklist;
 type websense-redirect {
 profile websenseprofile1 {
 server {
 host Websenseserver;
 port 15868;
 }
 fallback-settings {
 server-connectivity block;
 timeout block;
 too-many-requests block;
 }
 timeout 10;
 sockets 1;
 }
 }
}
content-filtering {
 profile contentfilter1;
}
```

**Meaning** The sample output shows the feature profile configured for a Websense redirect server.

### Verifying the Attachment of Redirect Web Filtering UTM Policies to Security Policies

**Purpose** Verify the attachment of the newly created redirect Web filtering UTM policies to the security policies.

**Action** From the top of the configuration in configuration mode, enter the **show security utm** and **show security policies** commands.

```
[edit]
userhost# show security utm
utm-policy utmp6 {
 web-filtering {
 http-profile websenseprofile1;
 }
}

[edit]
userhost# show security policies
from-zone trust to-zone untrust {
 policy p6 {
 match {
 source-address any;
 destination-address any;
```

```
 application junos-http;
 }
 then {
 permit {
 application-services {
 utm-policy utmp6;
 }
 }
 }
}
```

**Meaning** The sample output shows the security policies to which the newly created redirect Web filtering UTM policies are attached.

---

## Displaying Global SurfControl URL categories

**Purpose** View global URL categories defined and maintained by SurfControl.

**Action** Enter the `user@host# show groups junos-defaults` CLI command. You can also look for `custom-url-category`.

- Related Documentation**

## Monitoring Web Filtering Configurations

**Purpose** View Web-filtering statistics.

**Action** To view Web-filtering statistics using the CLI, enter the following commands:

```
user@host> show security utm web-filtering status
user@host> show security utm web-filtering statistics
```

To view Web-filtering statistics using J-Web:

1. Select **Clear Web Filtering Statistics**.

The following information is displayed in the right pane.

Total Requests: #  
White List Hit: #  
Black List Hit: #  
Queries to Server: #  
Server Reply Permit: #  
Server Reply Block: #  
Custom Category Permit: #  
Custom Category Block: #  
Cache Hit Permit: #  
Cache Hit Block: #  
Web Filtering Session Total: #  
Web Filtering Session Inuse: #  
Fall Back: Log-and-Permit Block  
Default # #  
Timeout # #  
Server-Connectivity # #  
Too-Many-Requests # #

2. You can click the **Clear Web Filtering Statistics** button to clear all current viewable statistics and begin collecting new statistics.

## Security Configuration Statement Hierarchy

---

Use the statements in the **security** configuration hierarchy to configure actions, certificates, dynamic virtual private networks (VPNs), firewall authentication, flow, forwarding options, group VPNs, Intrusion Detection Prevention (IDP), Internet Key Exchange (IKE), Internet Protocol Security (IPsec), logging, Network Address Translation (NAT), public key infrastructure (PKI), policies, resource manager, rules, screens, secure shell known hosts, trace options, user identification, Unified Threat Management (UTM), and zones. Statements that are exclusive to the SRX Series devices running Junos OS are described in this section.

Each of the following topics lists the statements at a sub-hierarchy of the **[edit security]** hierarchy.

- [\[edit security address-book\] Hierarchy Level on page 634](#)

## action (Security UTM Web Filtering)

---

<b>Syntax</b>	action (block   log-and-permit   permit   quarantine);
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated profile <i>profile-name</i> category <i>customurl-last-name</i> ] [edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> category <i>customurl-last-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for UTM Enhanced Web Filtering.
<b>Description</b>	Enter an action to go with the customurl-list filter.
<b>Options</b>	<ul style="list-style-type: none"><li>• block—Log the error and deny the traffic.</li><li>• log-and-permit—Log the error and permit the traffic.</li><li>• permit—Permit the traffic.</li><li>• quarantine—Show the warning message and permit/block the traffic based on user input.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## address-blacklist

---

<b>Syntax</b>	address-blacklist <i>list-name</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-spam]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	Enter an address blacklist (or whitelist) custom object for local list spam filtering.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## address-whitelist

---

<b>Syntax</b>	address-whitelist <i>list-name</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-spam]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Enter an address-whitelist (or blacklist) custom-object for local list spam filtering.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## admin-email

---

<b>Syntax</b>	admin-email <i>email-address</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine pattern-update email-notify] [edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update email-notify] [edit security utm feature-profile anti-virus sophos-engine pattern-update email-notify]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	You can configure the device to notify a specified administrator when patterns are updated. This is an e-mail notification with a custom message and a custom subject line.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## administrator-email (Security Fallback Block)

---

<b>Syntax</b>	administrator-email <i>email-address</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Configure the administrator e-mail address that will be notified when a fallback-block occurs. This is an e-mail notification with a custom message and a custom subject line.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## administrator-email (Security Virus Detection)

---

<b>Syntax</b>	administrator-email <i>email address</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile name</i> notification-options virus-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	Configure the administrator e-mail address that will be notified when a virus is detected by Sophos antivirus. This is an e-mail notification with a custom message and a custom subject line.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## allow-email (Security Fallback Block)

<b>Syntax</b>	allow-email;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Enable e-mail notification to notify a specified administrator when a fallback-block occurs.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## allow-email (Security Virus Detection)

<b>Syntax</b>	allow-email;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus profile notification-options virus-detect]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	Enable e-mail notification to notify a specified administrator when a virus is detected.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## application (Security Policies)

---

<b>Syntax</b>	<pre>application {     [application];     any; }</pre>
<b>Hierarchy Level</b>	[edit security policies from-zone <i>zone-name</i> to-zone <i>zone-name</i> policy <i>policy-name</i> match] [edit security policies global policy <i>policy-name</i> match]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the IP or remote procedure call (RPC) application or set of applications to be used as match criteria.
<b>Options</b>	<b><i>application-name-or-set</i></b> —Name of the predefined or custom application or application set used as match criteria.  <b>any</b> —Any predefined or custom applications or application sets.
<div> <b>NOTE:</b> A custom application that does not use a well-known destination port for the application will not be included in the any option, and must be named explicitly.</div>	
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Policies Overview on page 1065</a></li></ul>

---

## application-proxy (Security UTM)

---

<b>Syntax</b>	<pre>application-proxy {   traceoptions {     flag <i>flag</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit security utm]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	Configure trace options for the application proxy.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## anti-spam (Security Feature Profile)

---

<b>Syntax</b>	<pre>anti-spam {   address-blacklist <i>list-name</i>;   address-whitelist <i>list-name</i>;   sbl {     profile <i>profile-name</i> {       custom-tag-string [<i>string</i>];       (sbl-default-server   no-sbl-default-server);       spam-action (block   tag-header   tag-subject);     }   }   traceoptions flag <i>flag</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure UTM antispam features.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## anti-spam (Security UTM Policy)

---

<b>Syntax</b>	<pre>anti-spam {   smtp-profile <i>profile-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the antispam SMTP protocol and attach this policy to a security profile to implement it.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

<b>Hierarchy Level</b>	[edit security utm feature-profile]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure UTM antivirus full and express features.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## anti-virus (Security UTM Policy)

<b>Syntax</b>	<pre> anti-virus {     ftp {         download-profile <i>profile-name</i>;         upload-profile <i>profile-name</i>;     }     http-profile <i>profile-name</i>;     imap-profile <i>profile-name</i>;     pop3-profile <i>profile-name</i>;     smtp-profile <i>profile-name</i>; } </pre>
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the antivirus protocols and attach this policy to a security profile to implement it.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## block-command

<b>Syntax</b>	block-command <i>protocol-command-list</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Apply protocol block command custom-objects to the content-filtering profile.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## block-content-type

---

<b>Syntax</b>	block-content-type (activex   exe   http-cookie   java-applet   zip);
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Apply blocks to other available content such as exe, http-cookie, java-applet. This is for HTTP only.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>activex</b>—Block ActiveX.</li><li>• <b>exe</b>—Block EXE files.</li><li>• <b>http-cookie</b>—Block cookies.</li><li>• <b>java-applet</b>—Block Java applets.</li><li>• <b>zip</b>—Block ZIP files.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## block-extension

---

<b>Syntax</b>	block-extension <i>extension-list</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Apply block extensions to the content-filtering profile.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## block-message (Security UTM)

<b>Syntax</b>	<pre>block-message {   type {     custom-redirect-url;   }   url <i>url</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Configure Juniper enhanced block message settings.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>type</b>—Specify the following type of the block message:           <ul style="list-style-type: none"> <li><b>custom-redirect-url</b>—Specify Custom redirect URL server.</li> </ul> </li> <li><b>url <i>url</i></b>—Specify an URL of the block message.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li><a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## block-mime

<b>Syntax</b>	<pre>block-mime {   exception <i>list-name</i>;   list <i>list-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Apply MIME pattern list custom-objects to the content-filtering profile for blocking MIME types.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li><a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## cache

---

<b>Syntax</b>	<pre>cache {     size <i>value</i>;     timeout <i>value</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated] [edit security utm feature-profile web-filtering juniper-enhanced]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for surf-control integrated. Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Set the cache parameters for Surf-Control-Integrated Web filtering and Enhanced Web Filtering.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## category (Security Logging)

<b>Syntax</b>	category (all   content-security)
<b>Hierarchy Level</b>	[edit security log stream <i>stream-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0 .
<b>Description</b>	Set the category of logging to <b>all</b> or <b>content-security</b> . Note that for the WELF format, the category must be set to <b>content-security</b> .
<div>  <p><b>NOTE:</b> On SRX3400, SRX3600, SRX5600, and SRX 5800 devices, if the stream configuration does not specify a destination port, the default destination port will be the syslog port. If you specify a destination port in the stream configuration, then that port will be used instead.</p> </div>	
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>all</b>— All events are logged.</li> <li>• <b>content-security</b>—Only content security events are logged.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>AppSecure Services Feature Guide for Security Devices</i></li> <li>• <i>Logical Systems Feature Guide for Security Devices</i></li> </ul>

## category (Security Web Filtering)

---

<b>Syntax</b>	<code>category <i>customurl-list name</i> {     action (block   log-and-permit   permit   quarantine); }</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated profile <i>profile-name</i> ] [edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering. Support for new categories and category name updates by Websense added in Junos OS Release 12.1X47-D15 and 12.3X48-D10.
<b>Description</b>	Select a custom URL category list you created (custom objects) for filtering against.

---

## content-filtering (Security Feature Profile)

---

<b>Syntax</b>	<pre>content-filtering {   profile <i>profile-name</i> {     block-command <i>protocol-command-list</i>;     block-content-type (activex   exe   http-cookie   java-applet   zip);     block-extension <i>extension-list</i>;     block-mime {       exception <i>list-name</i>;       list <i>list-name</i>;     }     notification-options {       custom-message <i>message</i>;       (notify-mail-sender   no-notify-mail-sender);       type (message   protocol-only);     }     permit-command <i>protocol-command-list</i>;   }   traceoptions flag <i>flag</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure UTM content-filtering features.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

---

## content-filtering (Security UTM Policy)

---

<b>Syntax</b>	<pre>content-filtering {   ftp {     download-profile <i>profile-name</i>;     upload-profile <i>profile-name</i>;   }   http-profile <i>profile-name</i>;   imap-profile <i>profile-name</i>;   pop3-profile <i>profile-name</i>;   smtp-profile <i>profile-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the content-filtering protocols and attach this policy to a security profile to implement it.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## content-size

<b>Syntax</b>	content-size (block   log-and-permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> fallback-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	If the content size exceeds a set limit, the content is either passed or blocked. The default action is log-and-permit.

**NOTE:** When you configure the content-size value, keep in mind that in certain cases, content size is available in the protocol headers, so the max-content-size fallback is applied before a scan request is sent. However, in many cases, content size is not provided in the protocol headers. In these cases, the TCP payload is sent to the antivirus scanner and accumulates until the end of the payload. If the accumulated payload exceeds the maximum content size value, then max-content-size fallback is applied. The default fallback action is log and permit, so you may want to change this option to block, in which case such a packet is dropped and a block message is sent to the client.

<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>block</b>—Log the error and deny the traffic</li> <li>• <b>log-and-permit</b>—Log the error and permit the traffic</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## content-size (Security Antivirus Sophos Engine)

<b>Syntax</b>	content-size (block   log-and-permit   permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	If the content size exceeds a set limit, the content is either passed or blocked.

**NOTE:** When you configure the content-size value, keep in mind that in certain cases, content size is available in the protocol headers, so the max-content-size fallback is applied before a scan request is sent. However, in many cases, content size is not provided in the protocol headers. In these cases, the TCP payload is sent to the antivirus scanner and accumulates until the end of the payload. If the accumulated payload exceeds the maximum content size value, then max-content-size fallback is applied. You might want to set the fallback action to block, in which case such a packet is dropped and a block message is sent to the client.

<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>block</b>—Log the error and deny the traffic</li> <li>• <b>log-and-permit</b>—Log the error and permit the traffic</li> <li>• <b>permit</b>—Permit the traffic</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Sophos Antivirus Configuration Overview on page 6020</a></li> </ul>

## content-size-limit

---

<b>Syntax</b>	content-size-limit <i>value</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> scan-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> scan-options] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> scan-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	The content size check occurs before the scan request is sent. The content size refers to accumulated TCP payload size.  Range: 20 through 20,000
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## corrupt-file

---

<b>Syntax</b>	corrupt-file (block   log-and-permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Corrupt file is the error returned by the scan engine when engine detects a corrupted file. The default action is log-and-permit.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>block</b>—Log the error and deny the traffic</li><li>• <b>log-and-permit</b>—Log the error and permit the traffic</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Full Antivirus Configuration Overview on page 5948</a></li></ul>

## custom-block-message

---

<b>Syntax</b>	custom-block-message <i>value</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated profile <i>profile-name</i> ] [edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Enter a custom message to be sent when HTTP requests are blocked.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## custom-message (Security Content Filtering)

---

<b>Syntax</b>	custom-message <i>message</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> notification-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Custom message notifications are generally used when content is blocked by the content filter.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Content Filtering Overview on page 6037</a></li> </ul>

## custom-message (Security Email Notify)

---

<b>Syntax</b>	custom-message <i>message</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine pattern-update email-notify] [edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update email-notify] [edit security utm feature-profile anti-virus sophos-engine pattern-update email-notify]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Support for Sophos engine added in Junos OS Release 11.1.
<b>Description</b>	You can configure the device to notify a specified administrator when patterns are updated. This is an e-mail notification with a custom message.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## custom-message (Security Fallback Block)

---

<b>Syntax</b>	custom-message <i>message</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Custom message notifications are mainly used in file replacement or in a response message when the antivirus scan result is to drop the file.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## custom-message (Security Fallback Non-Block)

<b>Syntax</b>	custom-message <i>message</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-non-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-non-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-non-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Custom message notifications are mainly used in file replacement or in a response message when the antivirus scan result is to drop the file.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## custom-message (Security Virus Detection)

<b>Syntax</b>	custom-message <i>message</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options virus-detection] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options virus-detection] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options virus-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Custom message notifications are mainly used in file replacement or in a response message when the antivirus scan result is to drop the file.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## custom-message-subject (Security Email Notify)

---

<b>Syntax</b>	custom-message-subject <i>message-subject</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine pattern-update email-notify] [edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update email-notify] [edit security utm feature-profile anti-virus sophos-engine pattern-update email-notify]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Support for Sophos engine added in Junos OS Release 11.1.
<b>Description</b>	You can configure the device to notify a specified administrator when patterns are updated. This is an e-mail notification with a custom message and a custom subject line.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## custom-message-subject (Security Fallback Block)

---

<b>Syntax</b>	custom-message-subject <i>message-subject</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Custom message notifications are mainly used in file replacement or in a response message when the antivirus scan result is to drop the file. As part of a custom message, you can customize the message subject line.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## custom-message-subject (Security Fallback Non-Block)

<b>Syntax</b>	custom-message-subject <i>message-subject</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-non-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-non-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-non-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Custom message notifications are mainly used in file replacement or in a response message when the antivirus scan result is to drop the file. As part of a custom message, you can customize the message subject line.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## custom-message-subject (Security Virus Detection)

<b>Syntax</b>	custom-message-subject <i>message-subject</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options virus-detection] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options virus-detection] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options virus-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Custom message notifications are mainly used in file replacement or in a response message when the antivirus scan result is to drop the file. As part of a custom message, you can customize the message subject line.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## custom-objects

**Syntax**

```
custom-objects {
 custom-url-category object-name {
 value [value];
 }
 filename-extension object-name {
 value [value];
 }
 mime-pattern object-name {
 value [value];
 }
 protocol-command object-name {
 value [value];
 }
 url-pattern object-name {
 value [value];
 }
}
```

**Hierarchy Level** [edit security utm]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** Configure custom objects before configuring UTM feature-profile features.

**WARNING:** Custom category does not take precedence over predefined categories when it has the same name as one of the predefined categories. We do not recommended having a custom category name be the same as the predefined category name.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

- [\[edit security utm\] Hierarchy Level on page 6122](#)

---

## custom-tag-string

---

<b>Syntax</b>	custom-tag-string [ <i>string</i> ];
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-spam sbl profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a custom string for identifying a message as spam.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Antispam Filtering Overview on page 5897</a></li></ul>

## custom-url-category

---

<b>Syntax</b>	<code>custom-url-category <i>object-name</i> { value [<i>value</i>]; }</code>
<b>Hierarchy Level</b>	[edit security utm custom-objects]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	Use URL pattern lists to create Custom URL category lists. These are lists of patterns that bypass scanning.

**WARNING:** Custom category does not take precedence over predefined categories when it has the same name as one of the predefined categories. We do not recommend having a custom category name be the same as the predefined category name.

<b>Options</b>	<ul style="list-style-type: none"><li>• <b><i>object-name</i></b>—Name of the URL category-list object.</li><li>• <b><i>value value</i></b>—Value of the URL category-list object. You can configure multiple values separated by spaces and enclosed in square brackets.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding UTM Custom Objects on page 5881</a></li><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## decompress-layer

---

<b>Syntax</b>	decompress-layer (block   log-and-permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> fallback-options]
<b>Description</b>	Decompress layer error is the error returned by the scan engine when the scanned file has too many compression layers. The default action is block.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>block</b>—Log the error and deny the traffic</li> <li>• <b>log-and-permit</b>—Log the error and permit the traffic</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> <li>• <a href="#">Full Antivirus Configuration Overview on page 5948</a></li> </ul>

## decompress-layer-limit

---

<b>Syntax</b>	decompress-layer-limit <i>value</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> scan-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	<p>The decompression layer limit specifies how many layers of nested compressed files and files with internal extractable objects, such as archive files (tar), the internal antivirus scanner can decompress before it executes the virus scan.</p> <p>Range: 1 through 4</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> <li>• <a href="#">Full Antivirus Configuration Overview on page 5948</a></li> </ul>

## default (Security Antivirus)

---

<b>Syntax</b>	default (block   log-and-permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> fallback-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	All errors other than those specifically listed fall into this category. This could include either unhandled system exceptions (internal errors) or other unknown errors.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>block</b>—Log the error and deny the traffic</li><li>• <b>log-and-permit</b>—Log the error and permit the traffic</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## default (Security Antivirus Sophos Engine)

---

<b>Syntax</b>	default (block   log-and-permit   permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	All errors other than those specifically listed fall into this category. This could include either unhandled system exceptions (internal errors) or other unknown errors.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>block</b>—Log the error and deny the traffic</li><li>• <b>log-and-permit</b>—Log the error and permit the traffic</li><li>• <b>permit</b>—Permit the traffic</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

---

## default (Security UTM)

---

<b>Syntax</b>	default (block  log-and-permit   permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4 .
<b>Description</b>	Specify the default action to take for a URL.
<b>Options</b>	<ul style="list-style-type: none"><li>• block—Log the error and deny the traffic.</li><li>• log-and-permit—Log the error and permit the traffic.</li><li>• permit—Permit the traffic.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## default (Security Web Filtering)

---

<b>Syntax</b>	default (block   log-and-permit   permit   quarantine);
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated profile <i>profile-name</i> fallback-settings] [edit security utm feature-profile web-filtering websense-redirect profile <i>profile-name</i> fallback-settings] [edit security utm feature-profile web-filtering juniper-local profile <i>profile-name</i> fallback-settings] [edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> fallback-settings]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Specify an action for the profile, for requests that experience internal errors in the Web-filtering module.
<b>Options</b>	<ul style="list-style-type: none"><li>• block—Log the error and deny the traffic.</li><li>• log-and-permit—Log the error and permit the traffic.</li><li>• permit —Permit the traffic.</li><li>• quarantine—Show the warning message and permit/block the traffic based on user input.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## display-host (Security Fallback Block)

<b>Syntax</b>	display-host;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Display the computer host name in the notification e-mail sent to the administrator when a fallback-block notification occurs.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## display-host (Security Virus Detection)

<b>Syntax</b>	display-host;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus profile <i>profile name</i> notification-options virus-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	Display the computer host name in the notification e-mail sent to the administrator when a virus is detected by Sophos antivirus.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## download-profile (Security Antivirus FTP)

---

<b>Syntax</b>	download-profile <i>profile-name</i> ;
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> anti-virus ftp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the antivirus FTP (download) protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## download-profile (Security Content Filtering FTP)

---

<b>Syntax</b>	download-profile <i>profile-name</i> ;
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> content-filtering ftp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the content-filtering FTP (download) protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Content Filtering Overview on page 6037</a></li></ul>

## email-notify

<b>Syntax</b>	email-notify { admin-email <i>email-address</i> ; custom-message <i>message</i> ; custom-message-subject <i>message-subject</i> ; }
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update] [edit security utm feature-profile anti-virus juniper-express-engine pattern-update] [edit security utm feature-profile anti-virus sophos-engine pattern-update]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	You can configure the device to notify a specified administrator when patterns are updated. This is an e-mail notification with a custom message and a custom subject line.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## engine-not-ready

<b>Syntax</b>	engine-not-ready (block   log-and-permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> fallback-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	The scan engine is initializing itself, for example, loading the signature database. During this phase, it is not ready to scan a file. A file could either pass or be blocked according to this setting. The default action is block.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>block</b>—Log the error and deny the traffic</li> <li>• <b>log-and-permit</b>—Log the error and permit the traffic</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## engine-not-ready (Security Antivirus Sophos Engine)

---

<b>Syntax</b>	default (block   log-and-permit   permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Release 11.1 .
<b>Description</b>	The scan engine is initializing itself, for example, loading the signature database. During this phase, it is not ready to scan a file. A file could either pass or be blocked according to this setting.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>block</b>—Log the error and deny the traffic</li><li>• <b>log-and-permit</b>—Log the error and permit the traffic</li><li>• <b>permit</b>—Permit the traffic</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Sophos Antivirus Configuration Overview on page 6020</a></li></ul>

## exception (Security Antivirus Mime Whitelist)

---

<b>Syntax</b>	exception <i>listname</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus mime-whitelist] [edit security utm feature-profile anti-virus mime-whitelist list <i>listname</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure the antivirus scanner to use an exception list to the MIME bypass list (custom objects). To use the exception list, you first create a whitelist custom-object list with the <b>list</b> statement. The system will first look at any existing whitelist mime pattern. If it matches an item, it will then continue to look for any exceptions to the whitelist and will then scan any item in the exception list.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## exception (Security Content Filtering)

<b>Syntax</b>	<code>exception <i>list-name</i>;</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> block-mime]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure the content filter to use an exception list to the MIME block list (custom objects).
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> <li>• <a href="#">Content Filtering Overview on page 6037</a></li> </ul>

## fallback-block (Security Antivirus)

<b>Syntax</b>	<pre> fallback-block {   administrator-email <i>email-address</i>;   allow-email;   custom-message <i>message</i>;   custom-message-subject <i>message-subject</i>;   display-host;   (notify-mail-sender   no-notify-mail-sender);   type (message   protocol-only); } </pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Configure notifications for fallback blocking actions. Fallback options tell the system how to handle the errors returned by either the scan engine or the scan manager.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## fallback-non-block (Security Antivirus)

---

<b>Syntax</b>	<pre>fallback-non-block {     custom-message <i>message</i>;     custom-message-subject <i>message-subject</i>;     (notify-mail-recipient   no-notify-mail-recipient); }</pre>
<b>Hierarchy Level</b>	<pre>[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options]</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Configure notifications for fallback nonblocking actions.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	<pre>security—To view this statement in the configuration. security-control—To add this statement to the configuration.</pre>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## fallback-options (Security Antivirus Juniper Express Engine)

<b>Syntax</b>	<pre> fallback-options {   content-size (block   log-and-permit);   default (block   log-and-permit);   engine-not-ready (block   log-and-permit);   out-of-resources (block   (log-and-permit);   timeout (block   log-and-permit);   too-many-requests (block   log-and-permit); } </pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Fallback options tell the system how to handle the errors.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> <li>• <a href="#">Express Antivirus Configuration Overview on page 5923</a></li> </ul>

## fallback-options (Security Antivirus Kaspersky Lab Engine)

---

<b>Syntax</b>	<pre>fallback-options {   content-size (block   log-and-permit);   corrupt-file (block   log-and-permit);   decompress-layer (block   log-and-permit);   default (block   log-and-permit);   engine-not-ready (block   log-and-permit);   out-of-resources (block   (log-and-permit);   password-file (block   (log-and-permit);   timeout (block   log-and-permit);   too-many-requests (block   log-and-permit); }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Fallback options tell the system how to handle the errors returned by either the scan engine or the scan manager.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Full Antivirus Configuration Overview on page 5948</a></li></ul>

---

## fallback-options (Security Antivirus Sophos Engine)

---

<b>Syntax</b>	<pre>fallback-options {   content-size (block   log-and-permit   permit);   default (block   log-and-permit   permit);   engine-not-ready (block   log-and-permit   permit);   out-of-resources (block   log-and-permit   permit);   timeout (block   log-and-permit   permit);   too-many-requests (block   log-and-permit   permit); }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	Configure fallback options to instruct the system how to handle errors.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Sophos Antivirus Configuration Overview on page 6020</a></li></ul>

## fallback-settings (Security Web Filtering)

---

<b>Syntax</b>	<pre>fallback-settings {   default (block   log-and-permit);   server-connectivity (block   log-and-permit);   timeout (block   log-and-permit);   too-many-requests (block   log-and-permit); }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated profile <i>profile-name</i> ] [edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Fallback settings tell the system how to handle errors.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## fallback-settings (Security Web Filtering Juniper Local)

---

<b>Syntax</b>	<pre>fallback-settings {   default (block   log-and-permit);   server-connectivity (block   log-and-permit);   timeout (block   log-and-permit);   too-many-requests (block   log-and-permit); }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering juniper-local profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0 .
<b>Description</b>	Fallback settings tell the system how to handle errors.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Web Filtering Overview on page 6056</a></li></ul>

## flag (SMTP)

---

<b>Syntax</b>	<pre>flag {     all;     configuration;     IPC;     protocol-exchange;     send-request; }</pre>
<b>Hierarchy Level</b>	[edit smtp traceoptions]
<b>Release Information</b>	Statement added in Junos OS Release 10.0.
<b>Description</b>	Set flag for the SMTP traceoptions.
<b>Options</b>	<p>The following flag options are supported:</p> <ul style="list-style-type: none"><li>• <b>IPC</b>—Trace interprocess communication.</li><li>• <b>all</b>—Trace everything.</li><li>• <b>configuration</b>—Trace configuration event.</li><li>• <b>protocol-exchange</b>—Trace SMTP protocol exchanges.</li><li>• <b>send-request</b>—Trace send mail request event.</li></ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">SMTP Configuration Statement Hierarchy on page 6117</a></li></ul>

## format (Security Log Stream)

---

<b>Syntax</b>	format (binary   sd-syslog   syslog   welf)
<b>Hierarchy Level</b>	[edit security log stream <i>stream-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0 . Updated in Junos OS Release 12.1 .
<b>Description</b>	Set the format for remote security message logging to <b>binary</b> , <b>syslog</b> (system log), <b>sd-syslog</b> (structured system log), or <b>welf</b> . Note that for the WELF format, the category must be set to <b>content-security</b> (see <a href="#">category (Security Logging)</a> ).
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>binary</b>—Binary encoded text to conserve resources.</li><li>• <b>sd-syslog</b>—Structured system log file.</li><li>• <b>syslog</b>—Traditional system log file.</li><li>• <b>welf</b>—Web Trends Extended Log Format.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>AppSecure Services Feature Guide for Security Devices</i></li><li>• <i>Logical Systems Feature Guide for Security Devices</i></li></ul>

```

Hierarchy Level    [edit security policies]

<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for the <b>services-offload</b> option added in Junos OS Release 11.4. Support for the <b>source-identity</b> option added in Junos OS Release 12.1. Support for the <b>description</b> option added in Junos OS Release 12.1. Support for the <b>ssl-termination-profile</b> and <b>web-redirect-to-https</b> options added in Junos OS Release 12.1X44-D10. Support for the <b>user-firewall</b> option added in Junos OS Release 12.1X45-D10. Support for the <b>initial-tcp-mss</b> and <b>reverse-tcp-mss</b> options added in Junos OS Release 12.3X48-D20.
<b>Description</b>	Specify a source zone and destination zone to be associated with the security policy.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>from-zone <i>zone-name</i></b>—Name of the source zone.</li> <li>• <b>to-zone <i>zone-name</i></b>—Name of the destination zone.</li> </ul> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Policies Overview on page 1065</a></li> <li>• <a href="#">Understanding Security Policy Rules on page 1067</a></li> <li>• <a href="#">Understanding Security Policy Elements on page 1071</a></li> </ul>

## ftp (UTM Policy Anti-Virus)

<b>Syntax</b>	<pre>ftp {   download-profile <i>profile-name</i>;   upload-profile <i>profile-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> anti-virus]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the antivirus FTP protocol and attach this policy to a security profile to implement it.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Policies Overview on page 1065</a></li> <li>• <a href="#">Understanding Security Policy Rules on page 1067</a></li> <li>• <a href="#">Understanding Security Policy Elements on page 1071</a></li> </ul>

## ftp (UTM Policy Content Filtering)

---

<b>Syntax</b>	ftp { download-profile <i>profile-name</i> ; upload-profile <i>profile-name</i> ; }
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> content-filtering]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the content-filtering FTP protocol and attach this policy to a security profile to implement it.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Policies Overview on page 1065</a></li><li>• <a href="#">Understanding Security Policy Rules on page 1067</a></li><li>• <a href="#">Understanding Security Policy Elements on page 1071</a></li></ul>

## host (Security Web Filtering)

---

<b>Syntax</b>	host <i>host-name</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated server] [edit security utm feature-profile web-filtering websense-redirect profile <i>profile-name</i> server] [edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> server]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Set server host parameters by entering the server name or IP address.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## http-profile (Security Antivirus)

---

<b>Syntax</b>	<code>http-profile <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security utm utm-policy <i>policy-name</i> anti-virus]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the antivirus HTTP protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## http-profile (Security Content Filtering)

---

<b>Syntax</b>	<code>http-profile <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security utm utm-policy <i>policy-name</i> content-filtering]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the content-filtering HTTP protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> <li>• <a href="#">Content Filtering Overview on page 6037</a></li> </ul>

## http-profile (Security Web Filtering)

---

<b>Syntax</b>	<code>http-profile <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security utm utm-policy <i>policy-name</i> web-filtering]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	Configure a UTM policy for the Web-filtering HTTP protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Web Filtering Overview on page 6056</a></li></ul>

## imap-profile (Security UTM Policy Antivirus)

---

<b>Syntax</b>	<code>imap-profile <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security utm utm-policy <i>policy-name</i> anti-virus]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the antivirus IMAP protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## imap-profile (Security UTM Policy Content Filtering)

<b>Syntax</b>	<code>imap-profile <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security utm utm-policy <i>policy-name</i> content-filtering]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the content-filtering IMAP protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> <li>• <a href="#">Content Filtering Overview on page 6037</a></li> </ul>

## intelligent-prescreening

<b>Syntax</b>	<code>intelligent-prescreening;</code>
<b>Hierarchy Level</b>	<code>[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> scan-options]</code> <code>[edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> scan-options]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	<p>Enable intelligent prescreening.</p> <p>Intelligent prescreening tells the antivirus module to begin scanning a file much earlier. In this case, the scan engine uses the first packet or the first several packets to determine if a file could possibly contain malicious code. The scan engine does a quick check on these first packets and if the scan engine finds that it is unlikely that the file is infected, it then determines that it is safe to bypass the normal scanning procedure.</p> <p>You can disable intelligent prescreening with the <b>no-intelligent-prescreening</b> statement.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## interval (Security Antivirus)

<b>Syntax</b>	<code>interval value;</code>
<b>Hierarchy Level</b>	<code>[edit security utm feature-profile anti-virus juniper-express-engine pattern-update]</code> <code>[edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update]</code> <code>[edit security utm feature-profile anti-virus sophos-engine pattern-update]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for Juniper Express engine and Kaspersky Lab engine. Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Set the pattern data files auto-update interval. You can choose to leave the default interval value or you can change it by using this command. You can also force a manual update, if necessary.
<div>  <p><b>NOTE:</b> The data files used with Sophos are not typical virus pattern files; they are small files that help guide virus scanning logic. The full virus pattern database is stored on an external Sophos server called the Sophos Extensible List (SXL) server.</p> </div>	
<b>Options</b>	<p><b>value</b>—Pattern data files auto-update interval in minutes.</p> <p><b>Range:</b> 10 through 10,080 minutes (10 minutes through 7 days)</p> <p><b>Default:</b> For Juniper Express engine and Kaspersky Lab engine, 60 minutes; for Sophos engine, 1440 minutes (every 24 hours)</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

---

## ipc

---

<b>Syntax</b>	<pre>ipc {   traceoptions flag <i>flag</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	Configure trace options for IPC.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>flag</b>—Trace operation to perform. To specify more than one trace operation, include multiple <b>flag</b> statements.</li><li>• <b>all</b>—Enable trace for all IPC trace options.</li><li>• <b>basic</b>—Trace basic IPC related information.</li><li>• <b>connection-manager</b>—Trace IPC connection manager information.</li><li>• <b>connection-status</b>—Trace IPC connection status information.</li><li>• <b>detail</b>—Trace IPC related detailed information.</li><li>• <b>pfe</b>—Trace communication with PFE.</li><li>• <b>utm-realtime</b>—Trace IPC realtime-thread information.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## juniper-enhanced

```
Syntax juniper-enhanced {
 cache {
 size value;
 timeout value;
 }
 profile profile-name {

 }
}

```

<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure the UTM full file-based antivirus feature.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## limit (UTM Policy)

<b>Syntax</b>	limit <i>value</i> ;
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> traffic-options sessions-per-client]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	In an attempt to consume all available resources and hinder the ability of the device, a malicious user might generate a large amount of traffic all at once. To prevent such activity from succeeding, you can impose a session throttle to limit sessions.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## list (Security Antivirus Mime Whitelist)

---

<b>Syntax</b>	<code>list <i>listname</i> {     exception <i>listname</i>; }</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus mime-whitelist]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure the antivirus scanner to use MIME bypass lists (custom objects). If you want to have exceptions to the whitelist, create a mime-pattern list with the <b>exception</b> statement in addition to the <b>list</b> statement.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## list (Security Content Filtering Block Mime)

---

<b>Syntax</b>	<code>list <i>list-name</i>;</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> block-mime]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure the content filter to use MIME block lists (custom objects).
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Content Filtering Overview on page 6037</a></li></ul>

```

 tls-profile tls-profile-name;
 tcp-connections tcp-connections;
 }
 utc-time-stamp;
}

```

**Hierarchy Level** [edit security]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** You can set the mode of logging (event for traditional system logging or stream for streaming security logs through a revenue port to a server). You can also specify all the other parameters for security logging.

- Options**
- **disable**—Disable the security logging for the device.
  - **event-rate** *rate*—Limits the rate (0 through 1500) at which logs will be streamed per second.
  - **rate-cap** *rate-cap-value*—Works with event mode only. Limits the rate (0 through 5000) at which data plane logs will be generated per second.
  - **source-address** *source-address*—Specify a source IP address or IP address used when exporting security logs.
  - **source-interface** *interface-name*—Specify a source interface name, which is mandatory to configure **stream**.

**NOTE:** The **source-address** and **source-interface** are alternate values. Using one of the options is mandatory.

- **utc-time-stamp**—Specify to use UTC time for security log timestamps.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## mime-pattern

---

<b>Syntax</b>	<code>mime-pattern <i>object-name</i> {     value [<i>value</i>]; }</code>
<b>Hierarchy Level</b>	[edit security utm custom-objects]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	The gateway device uses MIME (Multipurpose Internet Mail Extension) types to decide which traffic is allowed to bypass various types of scanning.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b><i>object-name</i></b>—Name of the MIME object.</li><li>• <b><i>value value</i></b>—Value of the MIME object. You can configure multiple values separated by spaces and enclosed in square brackets.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## mime-whitelist

---

**Syntax**

```
mime-whitelist {
 exception listname;
 list listname {
 exception listname;
 }
}
```

**Hierarchy Level** [edit security utm feature-profile anti-virus]

**Release Information** Statement introduced in Junos OS Release 9.5. Statement updated for Sophos antivirus support in Junos OS Release 11.1.

**Description** Configure the antivirus scanner to use MIME bypass lists and exception lists. You can use your own custom object lists, or you can use the default list that ships with the device called junos-default-bypass-mime.

**WARNING:** When you configure the MIME whitelist feature, be aware that, because header information in HTTP traffic can be spoofed, you cannot always trust HTTP headers to be legitimate. When a Web browser is determining the appropriate action for a given file type, it detects the file type without checking the MIME header contents. However, the MIME whitelist feature does refer to the MIME encoding in the HTTP header. For these reasons, it is possible in certain cases for a malicious website to provide an invalid HTTP header. For example, a network administrator might inadvertently add a malicious website to a MIME whitelist, and, because the site is in the whitelist, it will not be blocked by Sophos even though Sophos has identified the site as malicious in its database. Internal hosts would then be able to reach this site and could become infected.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## no-autoupdate

<b>Syntax</b>	no-autoupdate;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine pattern-update] [edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update] [edit security utm feature-profile anti-virus sophos-engine pattern-update]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for Juniper Express engine and Kaspersky Lab engine. Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Turn off automatic data file (pattern file) update for the Kaspersky Lab, Juniper Express, or Sophos engines.

**NOTE:** The data files used with Sophos are not typical virus pattern files; they are small files that help guide virus scanning logic. The full virus pattern database is stored on an external Sophos server called the Sophos Extensible List (SXL) server.

<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## no-intelligent-prescreening

---

<b>Syntax</b>	no-intelligent-prescreening;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> scan-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> scan-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	<p>Disables intelligent prescreening.</p> <p>Intelligent prescreening tells the antivirus module to begin scanning a file much earlier. In this case, the scan engine uses the first packet or the first several packets to determine if a file could possibly contain malicious code. The scan engine does a quick check on these first packets and if the scan engine finds that it is unlikely that the file is infected, it then determines that it is safe to bypass the normal scanning procedure.</p> <p>You can enable intelligent prescreening with the <b>intelligent-prescreening</b> statement.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## no-notify-mail-recipient

<b>Syntax</b>	no-notify-mail-recipient;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-non-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-non-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-non-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Support for Sophos engine added in Junos OS Release 11.1.
<b>Description</b>	Do not notify the e-mail recipient about errors returned by the antivirus scan engine when a fallback nonblocking action occurs.  You can specify that the e-mail recipient is to be notified with the <b>notify-mail-recipient</b> statement.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## notification-options (Security Content Filtering)

<b>Syntax</b>	notification-options { custom-message <i>message</i> ; (notify-mail-sender   no-notify-mail-sender); type (message   protocol-only); }
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	You can configure a message notification to trigger when a content filter is matched.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> <li>• <a href="#">Content Filtering Overview on page 6037</a></li> </ul>

## notify-mail-recipient

<b>Syntax</b>	notify-mail-recipient;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-non-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-non-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-non-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Support for Sophos engine added in Junos OS Release 11.1.
<b>Description</b>	<p>Notify the e-mail recipient about errors returned by the antivirus scan engine when a fallback nonblocking action occurs.</p> <p>You can specify that the e-mail recipient is not to be notified with the <b>no-notify-mail-recipient</b> statement.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## notify-mail-sender (Security Content Filtering Notification Options)

---

<b>Syntax</b>	notify-mail-sender;
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> notification-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Notify the e-mail sender.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Content Filtering Overview on page 6037</a></li></ul>

## notify-mail-sender (Security Fallback Block)

---

<b>Syntax</b>	notify-mail-sender;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	E-mail notification is used to notify the sender or the recipient about the errors returned by either the scan engine or the scan manager when a fallback action occurs.  You can specify that the sender is not to be notified with the <b>no-notify-mail-sender</b> statement.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## notify-mail-sender (Security Virus Detection)

<b>Syntax</b>	notify-mail-sender;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options virus-detection] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options virus-detection] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options virus-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	<p>E-mail notification is used to notify the sender or the recipient about the detected viruses or the scanning errors. When a virus is detected, an e-mail is sent to the sender upon virus detection.</p> <p>You can specify that the sender is not to be notified with the <b>no-notify-mail-sender</b> statement.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## no-uri-check

<b>Syntax</b>	no-uri-check;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> scan-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	<p>Do not perform Sophos antivirus Uniform Resource Identifier (URI) checking. URI checking is performed by analyzing HTTP traffic URI content against a remote Sophos database server to identify malware or malicious content. URI checking is on by default.</p> <p>You can enable Sophos antivirus URI checking with the <b>uri-check</b> statement.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> <li>• <a href="#">Sophos Antivirus Configuration Overview on page 6020</a></li> </ul>

## out-of-resources

---

<b>Syntax</b>	out-of-resources (block   (log-and-permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> fallback-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Virus scanning requires a great deal of memory and CPU resources. Due to resource constraints, memory allocation requests can be denied by the system. When out-of-resources occurs, scanning is aborted. The default action is block.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>block</b>—Log the error and deny the traffic</li><li>• <b>log-and-permit</b>—Log the error and permit the traffic</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## out-of-resources (Security Antivirus Sophos Engine)

<b>Syntax</b>	default (block   log-and-permit   permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Release 11.1 .
<b>Description</b>	Virus scanning requires a great deal of memory and CPU resources. Due to resource constraints, memory allocation requests can be denied by the system. When out-of-resources occurs, scanning is aborted.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>block</b>—Log the error and deny the traffic</li> <li>• <b>log-and-permit</b>—Log the error and permit the traffic</li> <li>• <b>permit</b>—Permit the traffic</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> <li>• <a href="#">Sophos Antivirus Configuration Overview on page 6020</a></li> </ul>

## over-limit

<b>Syntax</b>	over-limit (block   log-and-permit);
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> traffic-options sessions-per-client]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	In an attempt to consume all available resources and hinder the ability of the device, a malicious user might generate a large amount of traffic all at once. To prevent such activity from succeeding, you can impose a session throttle to limit sessions and configure an action to occur when the limit is exceeded.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>block</b>—Log the error and deny the traffic</li> <li>• <b>log-and-permit</b>—Log the error and permit the traffic</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## packet-filter

<b>Syntax</b>	<pre>packet-filter <i>packet-filter-name</i> {   action-profile (<i>profile-name</i>   default);   destination-port (<i>port-range</i>   <i>protocol-name</i>);   destination-prefix <i>destination-prefix</i>;   interface <i>logical-interface-name</i>;   protocol (<i>protocol-number</i>   <i>protocol-name</i>);   source-port (<i>port-range</i>   <i>protocol-name</i>);   source-prefix <i>source-prefix</i>; }</pre>
<b>Hierarchy Level</b>	[edit security datapath-debug]
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.6 ; Support for IPv6 addresses for the <b>destination-prefix</b> and <b>source-prefix</b> options added in Junos OS Release 10.4.</p> <p>Support for IPv6 filter for the <b>interface</b> option added in Junos OS Release 10.4.</p>
<b>Description</b>	Set packet filter for taking the datapath-debug action. A maximum of four filters are supported at the same time.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>action-profile</b> (<i>profile-name</i>   default)—Identify the action profile to use. You can specify the name of the action profile to use or select default action profile.</li> <li>• <b>destination-port</b> (<i>port-range</i>   <i>protocol name</i>)—Specify a destination port to match TCP/UDP destination port.</li> <li>• <b>destination-prefix</b> <i>destination-prefix</i>—Specify a destination IPv4/IPv6 address prefix.</li> <li>• <b>interface</b> <i>logical-interface-name</i>—Specify a logical interface name.</li> <li>• <b>protocol</b> (<i>protocol-number</i>   <i>protocol-name</i>)—Match IP protocol type.</li> <li>• <b>source-port</b> (<i>port-range</i>   <i>protocol-name</i>)—Match TCP/UDP source port.</li> <li>• <b>source-prefix</b> <i>source-prefix</i>—Specify a source IP address prefix.</li> </ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> </ul>

## password (Security Antivirus)

---

<b>Syntax</b>	<code>password password-string;</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine pattern-update proxy] [edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update proxy] [edit security utm feature-profile anti-virus sophos-engine pattern-update proxy]
<b>Release Information</b>	Statement introduced in Release 11.2 .
<b>Description</b>	Set the password for the proxy server.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## password-file

---

<b>Syntax</b>	<code>password-file (block   (log-and-permit);</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> fallback-options]
<b>Description</b>	Password protected file is the error returned by the scan engine when the scanned file is protected by a password. The default action is log-and-permit.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>block</b>—Log the error and deny the traffic</li> <li>• <b>log-and-permit</b>—Log the error and permit the traffic</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> <li>• <a href="#">Full Antivirus Configuration Overview on page 5948</a></li> </ul>

## pattern-update (Security Antivirus)

---

<b>Syntax</b>	<pre>pattern-update {   email-notify {     admin-email <i>email-address</i>;     custom-message <i>message</i>;     custom-message-subject <i>message-subject</i>;   }   interval <i>value</i>;   no-autoupdate;   proxy {     password <i>password-string</i>;     port <i>port-number</i>;     server <i>address-or-url</i>;     username <i>name</i>;   }   url <i>url</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit security utm feature-profile anti-virus juniper-express-engine] [edit security utm feature-profile anti-virus kaspersky-lab-engine] [edit security utm feature-profile anti-virus sophos-engine]</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for Juniper Express engine and Kaspersky Lab engine. Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Updates to the pattern file are added as new viruses are discovered. You can configure the security device to regularly update the pattern file automatically, or you can update the file manually.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

---

## permit-command

---

<b>Syntax</b>	permit-command <i>protocol-command-list</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Apply protocol permit command custom-objects to the content-filtering profile.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Content Filtering Overview on page 6037</a></li></ul>

Hierarchy Level [edit security]

<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for the <b>services-offload</b> option added in Junos OS Release 11.4. Support for the <b>source-identity</b> option added in Junos OS Release 12.1. Support for the <b>description</b> option added in Junos OS Release 12.1. Support for the <b>ssl-termination-profile</b> and <b>web-redirect-to-https</b> options added in Junos OS Release 12.1X44-D10. Support for the <b>user-firewall</b> option added in Junos OS Release 12.1X45-D10. Support for the <b>domain</b> option, and for the <b>from-zone</b> and <b>to-zone</b> global policy match options added in Junos OS Release 12.1X47-D10. Support for the <b>initial-tcp-mss</b> and <b>reverse-tcp-mss</b> options added in Junos OS Release 12.3X48-D20. Support for the <b>extensive</b> option for <b>policy-rematch</b> added in Junos OS Release 15.1X49-D20.
<b>Description</b>	Configure network security policies.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">Security Policies Overview on page 1065</a></li><li>• <a href="#">[edit security policies] Hierarchy Level on page 320</a></li></ul>

---

## pop3-profile (Security UTM Policy Antivirus)

---

<b>Syntax</b>	pop3-profile <i>profile-name</i> ;
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> anti-virus]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the antivirus POP3 protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## pop3-profile (Security UTM Policy Content Filtering)

---

<b>Syntax</b>	<code>pop3-profile <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> content-filtering]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the content filtering POP3 protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## port (Security Antivirus)

---

<b>Syntax</b>	<code>port <i>port-number</i>;</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine pattern-update proxy] [edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update proxy] [edit security utm feature-profile anti-virus sophos-engine pattern-update proxy]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 .
<b>Description</b>	Set the port number for the proxy server.
<b>Options</b>	<b>Range:</b> 0 through 65,535
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## port (Security Web Filtering Server)

---

<b>Syntax</b>	<code>port <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated server] [edit security utm feature-profile web-filtering websense-redirect profile <i>profile-name</i> server] [edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> server]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Enter the port number for communicating with the server. (Default ports are 80, 8080, and 8081.)
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## primary-server

---

<b>Syntax</b>	<pre>primary-server {     address <i>ipv4-address</i>;     login <i>sender-email-address</i> {         password <i>password</i>;     } }</pre>
<b>Hierarchy Level</b>	[edit smtp]
<b>Release Information</b>	Statement added in Junos OS Release 10.0.
<b>Description</b>	Configure Simple Mail Transfer Protocol (SMTP) primary server for access authorization for SMTP requests.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">SMTP Configuration Statement Hierarchy on page 6117</a></li></ul>

---

## profile (Security Antispam SBL)

---

<b>Syntax</b>	<pre>profile <i>profile-name</i> {     custom-tag-string [<i>string</i>];     (sbl-default-server   no-sbl-default-server);     spam-action (block   tag-header   tag-subject); }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-spam sbl]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Create a profile for the antispam sbl feature. This profile includes all subsequent configuration options.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## profile (Security Antivirus Juniper Express Engine)

<b>Syntax</b>	<pre> profile <i>profile-name</i> {   fallback-options {     content-size (block   log-and-permit);     default (block   log-and-permit);     engine-not-ready (block   log-and-permit);     out-of-resources (block   log-and-permit);     timeout (block   log-and-permit);     too-many-requests (block   log-and-permit);   }   notification-options {     fallback-block {       administrator-email <i>email-address</i>;       allow-email;       custom-message <i>message</i>;       custom-message-subject <i>message-subject</i>;       display-host;       (notify-mail-sender   no-notify-mail-sender);       type (message   protocol-only);     }     fallback-non-block {       custom-message <i>message</i>;       custom-message-subject <i>message-subject</i>;       (notify-mail-recipient   no-notify-mail-recipient);     }     virus-detection {       custom-message <i>message</i>;       custom-message-subject <i>message-subject</i>;       (notify-mail-sender   no-notify-mail-sender);       type (message   protocol-only);     }   }   scan-options {     content-size-limit <i>value</i>;     (intelligent-prescreening   no-intelligent-prescreening);     timeout <i>value</i>;   }   trickling {     timeout <i>value</i>;   } } </pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	Create a profile for the Juniper express engine. This profile includes all subsequent configuration options.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .

<b>Required Privilege</b>	security—To view this statement in the configuration.
<b>Level</b>	security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li><li>• <a href="#">Express Antivirus Configuration Overview on page 5923</a></li></ul>

## protocol-command

<b>Syntax</b>	<code>protocol-command <i>object-name</i> {     value [<i>value</i>]; }</code>
<b>Hierarchy Level</b>	[edit security utm custom-objects]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Different protocols use different commands to communicate between servers and clients. By blocking or allowing certain commands, traffic can be controlled on the protocol command level.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b><i>object-name</i></b>—Name of the command-list object.</li> <li>• <b><i>value value</i></b>—Value of the command-list object. You can configure multiple values separated by spaces and enclosed in square brackets.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding UTM Custom Objects on page 5881</a></li> </ul>

## proxy (Security Antivirus)

<b>Syntax</b>	<code>proxy {     password <i>password-string</i>;     port <i>port-number</i>;     server <i>address-or-url</i>;     username <i>name</i>; }</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine pattern-update] [edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update] [edit security utm feature-profile anti-virus sophos-engine pattern-update]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 .
<b>Description</b>	Update the pattern file on the proxy server.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## quarantine-message (Security UTM)

---

<b>Syntax</b>	<pre>quarantine-message {   type {     custom-redirect-url;   }   url <i>url</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for Enhanced Web Filtering.
<b>Description</b>	Configure Juniper enhanced quarantine message settings.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>type</b>—Specify the following type of the quarantine message:<ul style="list-style-type: none"><li>• <b>custom-redirect-url</b>—Specify Custom redirect URL server.</li></ul></li><li>• <b>url <i>url</i></b>—Specify an URL of the quarantine message.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## sbl

---

<b>Syntax</b>	<pre>sbl {   profile <i>profile-name</i> {     custom-tag-string [<i>string</i>];     (sbl-default-server   no-sbl-default-server);     spam-action (block   tag-header   tag-subject);   } }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-spam]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure UTM server-based antispam features.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## sbl-default-server

---

<b>Syntax</b>	sbl-default-server;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-spam sbl profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Enable the default SBL server lookup. You should enable this feature if you are using server-based spam filtering. (The SBL server is predefined on the device. It ships with the name and address of the SBL server.)
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## scan-extension

---

<b>Syntax</b>	scan-extension <i>filename</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> scan-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	For antivirus file extension scanning, configure the scan extension setting by specifying the name of the defined file extension list.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## scan-mode

---

<b>Syntax</b>	scan-mode (all   by-extension);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> scan-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	You can scan all content or scan content with specific file extensions. You can use a file extension list to define a set of file extensions that are used in file extension scan mode. The antivirus module can then only scan files with extensions on the scan-extension list.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>all</b>—Scan all files.</li><li>• <b>by-extension</b>—Scan only files with extensions specified in a file extension list custom object.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## scan-options (Security Antivirus Juniper Express Engine)

<b>Syntax</b>	<pre>scan-options {   content-size-limit <i>value</i>;   (intelligent-prescreening   no-intelligent-prescreening);   timeout <i>value</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure the antivirus feature to scan specific types of traffic based on various scanning configuration parameters.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## scan-options (Security Antivirus Kaspersky Lab Engine)

<b>Syntax</b>	<pre>scan-options {   content-size-limit <i>value</i>;   decompress-layer-limit <i>value</i>;   (intelligent-prescreening   no-intelligent-prescreening);   scan-extension <i>filename</i>;   scan-mode (all   by-extension);   timeout <i>value</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure the antivirus feature to scan specific types of traffic based on various scanning configuration parameters.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## scan-options (Security Antivirus Sophos Engine)

---

<b>Syntax</b>	<pre>scan-options {   content-size-limit <i>value</i>;   (no-uri-check   uri-check);   timeout <i>value</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1.
<b>Description</b>	Configure the antivirus feature to scan specific types of traffic based on various scanning configuration parameters.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## secondary-server

---

<b>Syntax</b>	<pre>secondary-server {   address <i>ipv4-address</i>;   login <i>sender-email-address</i> {     password <i>password</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit smtp]
<b>Release Information</b>	Statement added in Junos OS Release 10.0.
<b>Description</b>	Configure Simple Mail Transfer Protocol (SMTP) secondary server for access authorization for SMTP requests.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">SMTP Configuration Statement Hierarchy on page 6117</a></li></ul>

## server (Security Antivirus)

---

<b>Syntax</b>	<code>server <i>address-or-url</i>;</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine pattern-update proxy] [edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update proxy] [edit security utm feature-profile anti-virus sophos-engine pattern-update proxy]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 .
<b>Description</b>	Set the IP address or URL for the proxy server.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## server (Security Web Filtering)

---

<b>Syntax</b>	<pre>server {   host <i>host-name</i>;   port <i>number</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated] [edit security utm feature-profile web-filtering websense-redirect profile <i>profile-name</i> ] [edit security utm feature-profile web-filtering juniper-enhanced]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Set server parameters by entering the server name or IP address.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## server-connectivity

---

<b>Syntax</b>	server-connectivity (block   log-and-permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated profile <i>profile-name</i> fallback-settings] [edit security utm feature-profile web-filtering websense-redirect profile <i>profile-name</i> fallback-settings] [edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> fallback-settings]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Fallback settings tell the system how to handle errors. This is the action that occurs when a request fails for this reason.
<b>Options</b>	<ul style="list-style-type: none"><li>• block—Log the error and deny the traffic</li><li>• log-and-permit—Log the error and permit the traffic</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## sessions-per-client

---

**Syntax**    sessions-per-client {  
                  limit *value*;  
                  over-limit (block | log-and-permit);  
          }

**Hierarchy Level**    [edit security utm utm-policy *policy-name* traffic-options]

**Release Information**    Statement introduced in Junos OS Release 9.5 .

**Description**    In an attempt to consume all available resources and hinder the ability of the device, a malicious user might generate a large amount of traffic all at once. To prevent such activity from succeeding, you can impose a session throttle.

**NOTE:** The `sessions-per-client limit` command supports the antispam, content filtering, and antivirus UTM features. It does not support Web filtering.

---

**Options**    The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    security—To view this statement in the configuration.  
                  security-control—To add this statement to the configuration.

**Related Documentation**    • [Security Configuration Statement Hierarchy on page 595](#)  
                  • [\[edit security utm\] Hierarchy Level on page 6122](#)

## site-reputation-action

---

<b>Syntax</b>	<pre>site-reputation-action {     harmful (block   log-and-permit   permit   quarantine);     fairly-safe (block   log-and-permit   permit   quarantine);     moderately-safe (block   log-and-permit   permit   quarantine);     suspicious (block   log-and-permit   permit   quarantine);     very-safe (block   log-and-permit   permit   quarantine); }</pre>
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> category <i>category-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4 .
<b>Description</b>	Specify the action to be taken depending on the site reputation returned for all types of URLs whether it is categorized or uncategorized.
<b>Options</b>	<p><b>fairly-safe</b>—Permit, log-and-permit, block or quarantine a request if a site-reputation of 70 through 79 is returned.</p> <p><b>harmful</b>—Permit, log-and-permit, block or quarantine a request if a site-reputation of zero through 59 is returned.</p> <p><b>moderately-safe</b>—Permit, log-and-permit, block or quarantine a request if a site-reputation of 80 through 89 is returned.</p> <p><b>suspicious</b>—Permit, log-and-permit, block or quarantine a request if a site-reputation of 60 through 69 is returned.</p> <p><b>very-safe</b>—Permit, log-and-permit, block or quarantine a request if a site-reputation of 90 through 100 is returned.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## size (Security Web Filtering Cache)

---

<b>Syntax</b>	<code>size value;</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated cache] [edit security utm feature-profile web-filtering juniper-enhanced cache]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Set the cache size parameters for web filtering.
<b>Options</b>	<b>Range:</b> 0 through 4096 kilobytes.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## smtp-profile (Security UTM Policy Antispam)

---

<b>Syntax</b>	<code>smtp-profile <i>profile-name</i>;</code>
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> anti-spam]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the antispam SMTP protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## smtp-profile (Security UTM Policy Antivirus)

---

<b>Syntax</b>	smtp-profile <i>profile-name</i> ;
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> anti-virus]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the antivirus SMTP protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## smtp-profile (Security UTM Policy Content Filtering)

---

<b>Syntax</b>	smtp-profile <i>profile-name</i> ;
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> content-filtering]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the content-filtering SMTP protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

---

## sockets

---

<b>Syntax</b>	<code>sockets value;</code>
<b>Hierarchy Level</b>	<code>[edit security utm feature-profile web-filtering websense-redirect profile <i>profile-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Enter the number of sockets used for communicating between the client and server. The default is 1.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## sophos-engine

```
Syntax sophos-engine {
 pattern-update {
 email-notify {
 admin-email email-address;
 custom-message message;
 custom-message-subject message-subject;
 }
 interval value;
 no-autoupdate;
 proxy {
 password password-string;
 port port-number;

 custom-message-subject message-subject;
 (notify-mail-sender | no-notify-mail-sender);
 type (message | protocol-only);
 }
 }
 scan-options {
 content-size-limit value;
 (no-uri-check | uri-check);
 timeout value;
 }
 }
 }
```

```

 }
 trickling {
 timeout value;
 }
}
sxl-retry value;
sxl-timeout seconds;
}

```

<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	Configure the UTM Sophos antivirus feature.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## spam-action

<b>Syntax</b>	spam-action (block   tag-header   tag-subject);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-spam sbl profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure the action to be taken by the device when spam is detected.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>block</b>— Block e-mail.</li> <li>• <b>tag-header</b>—Tag header of e-mail.</li> <li>• <b>tag-subject</b>—Tag subject of e-mail.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Server-Based Antispam Filtering on page 5901</a></li> <li>• <a href="#">Example: Configuring Local List Antispam Filtering on page 5910</a></li> </ul>

## surf-control-integrated

```
Syntax surf-control-integrated {
 cache {
 size value;
 timeout value;
 }
 profile profile-name {
 category customurl-list name {
 action (block | log-and-permit | permit);
 }
 custom-block-message value;
 default (block | log-and-permit | permit);
 fallback-settings {
 default (block | log-and-permit);
 server-connectivity (block | log-and-permit);
 timeout (block | log-and-permit);
 too-many-requests (block | log-and-permit);
 }
 timeout value;
 }
}
server {
 host host-name;
 port number;
}
```

**Hierarchy Level** [set security utm feature-profile web-filtering]

**Release Information** Statement introduced in Junos OS Release 9.5 .

**Description** Configure the UTM web-filtering integrated feature.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

## sxl-retry

---

<b>Syntax</b>	<code>sxl-retry <i>value</i>;</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	Configure the number of retry attempts to the remote Sophos Extensible List (SXL) server when a request timeout occurs.
<b>Options</b>	<p><b><i>value</i></b> —Number of retries.</p> <p><b>Range:</b> 0 through 5</p> <p><b>Default:</b> 1</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## sxl-timeout

---

<b>Syntax</b>	<code>sxl-timeout <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	Configure the timeout value for responses to a Sophos checksum or URI query.
<b>Options</b>	<p><b><i>seconds</i></b> —Number of seconds before timeout occurs.</p> <p><b>Range:</b> 1 through 5 seconds</p> <p><b>Default:</b> 2 seconds</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## timeout (Security Antivirus Fallback Options)

---

<b>Syntax</b>	timeout (block   log-and-permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> fallback-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	Scanning a complex file could consume resources and time. If the time it is taking to scan exceeds the timeout setting in the antivirus profile, the processing is aborted and the content is either passed or blocked without completing the virus checking. The decision is made based on the timeout fallback option. The default action is block.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>block</b>—Log the error and deny the traffic</li><li>• <b>log-and-permit</b>—Log the error and permit the traffic</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## timeout (Security Antivirus Fallback Options Sophos Engine)

<b>Syntax</b>	default (block   log-and-permit   permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	Scanning a complex file could consume resources and time. If the time it is taking to scan exceeds the timeout setting in the antivirus profile, the processing is aborted and the content is either passed or blocked without completing the virus checking. The decision is made based on the timeout fallback option.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>block</b>—Log the error and deny the traffic</li> <li>• <b>log-and-permit</b>—Log the error and permit the traffic</li> <li>• <b>permit</b>—Permit the traffic</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## timeout (Security Antivirus Scan Options)

<b>Syntax</b>	timeout <i>value</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> scan-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> scan-options] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> scan-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	The scanning timeout value includes the time frame from when the scan request is generated to when the scan result is returned by the scan engine. The time range can be 1 to 1800 seconds. By default, it is 180 seconds.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## timeout (Security Web Filtering)

---

<b>Syntax</b>	timeout <i>value</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering websense-redirect profile <i>profile-name</i> ] [edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Enter a timeout limit for requests. Once this limit is reached, fail mode settings are applied. The default here is 15 seconds.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## timeout (Security Web Filtering Cache)

---

<b>Syntax</b>	timeout <i>value</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated cache] [edit security utm feature-profile web-filtering juniper-enhanced cache]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Set the cache timeout parameters for surf-control-integrated web filtering (24 hours is the default and the maximum allowed life span of cached items).
<b>Options</b>	<b>Range:</b> 1 through 1800 minutes.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## timeout (Security Web Filtering Fallback Settings)

<b>Syntax</b>	timeout (block   log-and-permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering surf-control-integrated profile <i>profile-name</i> fallback-settings] [edit security utm feature-profile web-filtering websense-redirect profile <i>profile-name</i> fallback-settings] [edit security utm feature-profile web-filtering juniper-enhanced profile <i>profile-name</i> fallback-settings]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Fallback settings tell the system how to handle errors.
<b>Options</b>	<ul style="list-style-type: none"> <li>• log-and-permit—Log the error and permit the traffic</li> <li>• block—Log the error and deny the traffic</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## too-many-requests (Security Antivirus Fallback Options)

---

<b>Syntax</b>	too-many-requests (block   log-and-permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> fallback-options] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	If the total number of messages received concurrently exceeds 4000, the content is either passed or blocked depending on the too-many-request fallback option. The default action is block. (The allowed request limit is not configurable.)
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>block</b>—Log the error and deny the traffic</li><li>• <b>log-and-permit</b>—Log the error and permit the traffic</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## too-many-requests (Security Antivirus Fallback Options Sophos Engine)

---

<b>Syntax</b>	default (block   log-and-permit   permit);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> fallback-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	If the total number of messages received concurrently exceeds the device limits, the content is either passed or blocked depending on the too-many-request fallback option. (The allowed request limit is not configurable.)
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>block</b>—Log the error and deny the traffic</li><li>• <b>log-and-permit</b>—Log the error and permit the traffic</li><li>• <b>permit</b>—Permit the traffic</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

```

**Hierarchy Level** [edit security policies from-zone *zone-name*]

**Release Information** Statement introduced in Junos OS Release 8.5. Support for the **services-offload** and **junos-host** options added in Junos OS Release 11.4. Support for the **source-identity** option added in Junos OS Release 12.1. Support for the **ssl-termination-profile** and **web-redirect-to-https** options added in Junos OS Release 12.1X44-D10.

**Description** Specify a destination zone to be associated with the security policy.

- Options**
- **zone-name**—Name of the destination zone object.
  - **junos-host**—Default security zone for self-traffic of the device.

The remaining statements are explained separately. See [CLI Explorer](#).

<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.

---

## traceoptions (Security Antispam)

---

<b>Syntax</b>	traceoptions flag <i>flag</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-spam]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Define tracing operations for UTM antispam features.
<b>Options</b>	<ul style="list-style-type: none"><li>• <i>flag</i>:<ul style="list-style-type: none"><li>• <b>all</b>—Enable all antispam trace flags.</li><li>• <b>manager</b> —Trace antispam manager information.</li><li>• <b>sbl</b>—Trace SBL server information.</li></ul></li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## traceoptions (Security Antivirus)

<b>Syntax</b>	traceoptions flag <i>flag</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Define tracing operations for UTM antivirus features.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>flag</b>—Trace operation to perform. To specify more than one trace operation, include multiple <b>flag</b> statements. <ul style="list-style-type: none"> <li>• <b>all</b>—Enable trace all antivirus trace options.</li> <li>• <b>basic</b>—Trace antivirus module generic basic information.</li> <li>• <b>detail</b>—Trace antivirus module generic detail information.</li> <li>• <b>engine</b>—Trace scan engine information.</li> <li>• <b>event</b>—Trace communication events between routing engine side processes.</li> <li>• <b>ipc</b>—Trace communication events with Packet Forwarding Engine.</li> <li>• <b>manager</b>—Trace antivirus manager process activities.</li> <li>• <b>pattern</b>—Trace detail information of pattern loading.</li> <li>• <b>sendmail</b>—Trace mail notifying process activities.</li> <li>• <b>statistics</b>—Trace statistics information.</li> <li>• <b>updater</b>—Trace pattern updater process activities.</li> <li>• <b>worker</b>—Trace antivirus worker process activities.</li> </ul> </li> </ul>
<b>Required Privilege Level</b>	trace—To view this statement in the configuration. trace-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## traceoptions (Security Application Proxy)

---

<b>Syntax</b>	<pre>traceoptions {     flag <i>flag</i>; }</pre>
<b>Hierarchy Level</b>	[edit security utm application-proxy]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure tracing options for application proxy.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>flag</b>—Trace operation to perform. To specify more than one trace operation, include multiple <b>flag</b> statements.</li><li>• <b>abort</b>—Trace aborted sessions for application proxy.</li><li>• <b>all</b>—Trace with all flags enabled.</li><li>• <b>anti-virus</b>—Trace anti-virus information.</li><li>• <b>application-objects</b>—Trace application-proxy objects information.</li><li>• <b>basic</b>—Trace application-proxy related basic information.</li><li>• <b>buffer</b>— Trace application-proxy data buffer information.</li><li>• <b>connection-rating</b>—Trace connection rating information.</li><li>• <b>detail</b>—Trace application-proxy related detailed information.</li><li>• <b>express-anti-virus</b>—Trace anti-virus express engine information.</li><li>• <b>ftp-control</b>—Trace FTP control connection information.</li><li>• <b>ftp-data</b>—Trace FTP data connection information.</li><li>• <b>http</b>—Trace HTTP protocol information.</li><li>• <b>imap</b>—Trace IMAP protocol information.</li><li>• <b>memory</b>—Trace memory usage.</li><li>• <b>mime</b>—Trace MIME parser information.</li><li>• <b>parser</b>— Trace protocol parser information.</li><li>• <b>pfe</b>—Trace communication with PFE.</li><li>• <b>pop3</b>—Trace POP3 protocol information.</li><li>• <b>queue</b>—Trace queue information.</li><li>• <b>regex-engine</b>—Trace Pattern Match Engine (PME) information.</li><li>• <b>smtp</b>—Trace SMTP protocol information.</li><li>• <b>sophos-anti-virus</b>—Trace anti-virus sophos engine information.</li><li>• <b>tcp</b>—Trace TCP level information.</li></ul>

- **timer**—Trace timer processing.
- **utm-realtime**—Trace application-proxy realtime-thread information

**Required Privilege Level** trace—To view this statement in the configuration.  
trace-control—To add this statement to the configuration.

**Related Documentation**

- [\[edit security utm\] Hierarchy Level on page 6122](#)

## traceoptions (Security Content Filtering)

**Syntax** traceoptions flag *flag*;

**Hierarchy Level** [edit security utm feature-profile content-filtering]

**Release Information** Statement introduced in Junos OS Release 9.5 .

**Description** Define tracing options for content filtering features.

**Options**

- **flag**:
  - **all**—Enable all content filtering trace flags.
  - **basic** —Trace content filtering basic information.
  - **detail**—Trace content filtering detailed information.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

- [\[edit security utm\] Hierarchy Level on page 6122](#)

## traceoptions (Security UTM)

---

<b>Syntax</b>	traceoptions flag <i>flag</i> ;
<b>Hierarchy Level</b>	[edit security utm]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Define tracing operations for UTM features.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>flag</b>—Trace operation to perform. To specify more than one trace operation, include multiple <b>flag</b> statements.</li><li>• <b>all</b>—Enable trace for all UTM trace options.</li><li>• <b>cli</b>—Trace CLI configuration activity and command changes.</li><li>• <b>daemon</b>—Trace daemon information.</li><li>• <b>ipc</b>—Trace communication events with Packet Forwarding Engine (PFE).</li><li>• <b>pfe</b>—Trace PFE information.</li></ul>
<b>Required Privilege Level</b>	trace—To view this statement in the configuration. trace-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## traceoptions (Security Web Filtering)

<b>Syntax</b>	traceoptions flag <i>flag</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering]
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 . Command introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Define tracing operations for individual Web filtering modules. To specify more than one tracing operation, include multiple flag statements.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>flag</b>:             <ul style="list-style-type: none"> <li>• <b>all</b>—Enable all Web filtering trace flags.</li> <li>• <b>basic</b> —Trace basic information on the Web filtering module.</li> <li>• <b>cache</b>—Enable Web filtering flags for the Web filtering cache maintained on the Web filtering module.</li> <li>• <b>enhanced</b>—Enable Web filtering flags for processing through Enhanced Web Filtering.</li> <li>• <b>heartbeat</b>—Trace connectivity information with Web filter server.</li> <li>• <b>ipc</b>—Trace Web filtering IPC messages.</li> <li>• <b>packet</b>—Trace packet information from session management.</li> <li>• <b>profile</b>—Trace profile configuration information.</li> <li>• <b>requests</b>—Trace requests sent to Web filter server.</li> <li>• <b>response</b>—Trace response received from Web filter server.</li> <li>• <b>session manager</b>—Trace session management information.</li> <li>• <b>socket</b>—Trace the communication socket with Web filter server.</li> <li>• <b>timer</b>—Trace aging information for requests sent to server.</li> </ul> </li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## traceoptions (SMTP)

---

<b>Syntax</b>	<pre>traceoptions {     flag {         all;         configuration;         IPC;         protocol-exchange;         send-request;     } }</pre>
<b>Hierarchy Level</b>	[edit smtp]
<b>Release Information</b>	Statement added in Junos OS Release 10.0.
<b>Description</b>	Set the Simple Mail Transfer Protocol (SMTP) traceoptions.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">SMTP Configuration Statement Hierarchy on page 6117</a></li></ul>

## traffic-options

---

<b>Syntax</b>	<pre>traffic-options {     sessions-per-client {         limit <i>value</i>;         over-limit (block   log-and-permit);     } }</pre>
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	In an attempt to consume all available resources and hinder the ability of the device, a malicious user might generate a large amount of traffic all at once. To prevent such activity from succeeding, you can impose a session throttle.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## trickling

<b>Syntax</b>	trickling { timeout <i>value</i> ; }
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> ] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> ] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Statement updated for Sophos support in Junos OS Release 11.1.
<b>Description</b>	HTTP trickling is a mechanism used to prevent the HTTP client or server from timing-out during a file transfer or during antivirus scanning. HTTP Trickling is time-based and there is only one parameter to configure for this feature, which is the timeout Interval. By default, trickling is disabled.
<div>  <p><b>WARNING:</b> When you enable the trickling option, keep in mind that trickling might send part of a file to the client during its antivirus scan. It is therefore possible that some of the content could be received by the client before the file has been fully scanned.</p> </div>	
<b>Options</b>	<b>value</b> —Timeout interval in seconds. <b>Range:</b> 0 through 600 seconds
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## type (Security Antivirus Feature Profile)

---

<b>Syntax</b>	type (juniper-express-engine   kaspersky-lab-engine   sophos-engine);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Statement updated for Sophos in Junos OS Release 11.1 .
<b>Description</b>	Set the antivirus engine that will be used on the device. You can only have one engine type running and you must restart the device if you change engines.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## type (Security Content Filtering Notification Options)

---

<b>Syntax</b>	type (message   protocol-only);
<b>Hierarchy Level</b>	[edit security utm feature-profile content-filtering profile <i>profile-name</i> notification-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	When content is blocked, the client generally still receives a successful response code but with modified content (file replacement) containing a warning message. But with protocol-only notifications, a protocol-specific error code might be returned to the client.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>message</b>—Send a generic notification.</li><li>• <b>protocol-only</b>—Send a protocol-specific notification.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## type (Security Fallback Block)

---

<b>Syntax</b>	type (message   protocol-only);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options fallback-block] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options fallback-block]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 . Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	You can configure notifications for both fallback blocking and fallback nonblocking actions. With protocol-only notifications, a protocol-specific error code may be returned to the client.
<b>Options</b>	<ul style="list-style-type: none"> <li>• message—Send a generic notification.</li> <li>• protocol-only—Send a protocol-specific notification.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## type (Security Virus Detection)

---

<b>Syntax</b>	type (message   protocol-only);
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine profile <i>profile-name</i> notification-options virus-detection] [edit security utm feature-profile anti-virus kaspersky-lab-engine profile <i>profile-name</i> notification-options virus-detection] [edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> notification-options virus-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Support for Sophos engine added in Junos OS Release 11.1.
<b>Description</b>	When content is blocked because a virus is found or a scan error occurs, the client generally still receives a successful response code but with modified content (file replacement) containing a warning message. But with protocol-only notifications, a protocol-specific error code might be returned to the client.
<b>Options</b>	<ul style="list-style-type: none"><li>• message—Send a generic notification.</li><li>• protocol-only—Send a protocol-specific notification.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## type (Security Web Filtering)

<b>Syntax</b>	type (juniper-enhanced   juniper-local   surf-control-integrated   websense-redirect);
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering]
<b>Release Information</b>	Command introduced in Junos OS Release 9.5 . Command introduced in Junos OS Release 11.4 for Enhanced Web Filtering.
<b>Description</b>	Define the type of Web filtering solution or URL filtering solution used by the device.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>juniper-enhanced</b>—Enable Enhanced Web Filtering on the device.</li> <li>• <b>juniper-local</b> —Enable Juniper Networks local URL filtering on the device.</li> <li>• <b>surf-control-integrated</b>—Enable integrated Web filtering on the device.</li> <li>• <b>websense-redirect</b>—Redirect the URL to the Websense server.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## upload-profile (Security Antivirus FTP)

<b>Syntax</b>	upload-profile <i>profile-name</i> ;
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> anti-virus ftp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the antivirus FTP (upload) protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## upload-profile (Security Content Filtering FTP)

---

<b>Syntax</b>	upload-profile <i>profile-name</i> ;
<b>Hierarchy Level</b>	[edit security utm utm-policy <i>policy-name</i> content-filtering ftp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	Configure a UTM policy for the content-filtering FTP (upload) protocol and attach this policy to a security profile to implement it.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## uri-check

---

<b>Syntax</b>	uri-check;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus sophos-engine profile <i>profile-name</i> scan-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 .
<b>Description</b>	<p>Perform Sophos antivirus Uniform Resource Identifier (URI) checking. URI checking is a way of analyzing URI content in HTTP traffic against a remote Sophos database to identify malware or malicious content. URI checking is on by default.</p> <p>You can disable Sophos antivirus URI checking with the <b>no-uri-check</b> statement.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li><li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li></ul>

## url (Security Antivirus)

---

<b>Syntax</b>	url <i>url</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine pattern-update] [edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update] [edit security utm feature-profile anti-virus sophos-engine pattern-update]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for Juniper Express engine and Kaspersky Lab engine. Support for Sophos engine added in Junos OS Release 11.1 .
<b>Description</b>	Specify the URL for the pattern database. You should not change the default URL unless you are experiencing problems with it and have called for support.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## url-blacklist

---

<b>Syntax</b>	url-blacklist <i>listname</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	This is a global blacklist category, blocking content for Web filtering.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## url-pattern

---

<b>Syntax</b>	<code>url-pattern <i>object-name</i> {     value [<i>value</i>]; }</code>
<b>Hierarchy Level</b>	[edit security utm custom-objects]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	Use URL pattern lists to create custom URL category lists. These are lists of patterns that bypass scanning.

**WARNING:** Custom category does not take precedence over predefined categories when it has the same name as one of the predefined categories. We do not recommend having a custom category name be the same as the predefined category name.

<b>Options</b>	<ul style="list-style-type: none"> <li>• <b><i>object-name</i></b>—Name of the URL list object.</li> <li>• <b><i>value value</i></b>—Value of the URL list object. You can configure multiple values separated by spaces and enclosed in square brackets.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Building Blocks Feature Guide for Security Devices</i></li> </ul>

## url-whitelist (Security Antivirus)

---

<b>Syntax</b>	<code>url-whitelist <i>listname</i>;</code>
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 .
<b>Description</b>	A URL whitelist is a unique custom list that you define in which all the URLs or IP addresses in that list for a specified category are always bypassed for scanning.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## url-whitelist (Security Web Filtering)

---

<b>Syntax</b>	url-whitelist <i>listname</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile web-filtering]
<b>Description</b>	A URL whitelist is a unique custom list that you define in which all the URLs or IP addresses in that list for a specified category are always bypassed for filtering
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## username (Security Antivirus)

---

<b>Syntax</b>	username <i>name</i> ;
<b>Hierarchy Level</b>	[edit security utm feature-profile anti-virus juniper-express-engine pattern-update proxy] [edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update proxy] [edit security utm feature-profile anti-virus sophos-engine pattern-update proxy]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 .
<b>Description</b>	Set the username for the proxy server.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security utm] Hierarchy Level on page 6122</a></li> </ul>

## clear security utm anti-spam statistics

---

<b>Syntax</b>	clear security utm anti-spam statistics
<b>Release Information</b>	Command introduced in Junos OS Release 9.5 . Support for UTM in chassis cluster added in Junos OS Release 11.4 .
<b>Description</b>	Clear antispam statistics information. With chassis cluster support for UTM, statistics from both the nodes is cleared.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security utm anti-spam statistics on page 6320</a></li><li>• <a href="#">show security utm anti-spam status on page 6321</a></li></ul>
<b>Output Fields</b>	This command produces no output.

## Sample Output

### clear security utm anti-spam statistics

```
user@host> clear security utm anti-spam statistics
```

---

## clear security utm antivirus statistics

---

<b>Syntax</b>	clear security utm anti-virus statistics
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Support for Sophos Antivirus added in Junos OS Release 11.1. Support for UTM in chassis cluster added in Junos OS Release 11.4.
<b>Description</b>	Clear antivirus statistics information. With chassis cluster support for UTM, statistics from both the nodes are cleared.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security utm anti-virus statistics on page 6322</a></li><li>• <a href="#">show security utm anti-virus status on page 6324</a></li><li>• <a href="#">request security utm anti-virus juniper-express-engine on page 6303</a></li><li>• <a href="#">request security utm anti-virus kaspersky-lab-engine on page 6304</a></li></ul>
<b>Output Fields</b>	This command produces no output.

### Sample Output

clear security utm antivirus statistics

```
user@host> clear security utm anti-virus statistics
```

## clear security utm content-filtering statistics

---

<b>Syntax</b>	clear security utm content-filtering statistics
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Support for UTM in chassis cluster added in Junos OS Release 11.4.
<b>Description</b>	Clear content-filtering statistics information. With chassis cluster support for UTM, statistics from both the nodes are cleared.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security utm content-filtering statistics on page 6326</a></li></ul>
<b>Output Fields</b>	This command produces no output.

## Sample Output

### clear security utm content-filtering statistics

```
user@host> clear security utm content-filtering statistics
```

## clear security utm session

---

<b>Syntax</b>	clear security utm session
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Support for UTM in chassis cluster added in Junos OS Release 11.4.
<b>Description</b>	Clear UTM session information. With chassis cluster support for UTM, sessions on both the nodes are cleared.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security utm session on page 6327</a></li><li>• <a href="#">show security utm status on page 6328</a></li></ul>
<b>Output Fields</b>	This command produces no output.

## Sample Output

### clear security utm session

```
user@host> clear security utm session
```

## clear security utm web-filtering statistics

---

<b>Syntax</b>	clear security utm web-filtering statistics
<b>Release Information</b>	Command introduced in Junos OS Release 9.5 . Support for UTM in chassis cluster added in Junos OS Release 11.4 .
<b>Description</b>	Clear web filtering statistics information. With chassis cluster support for UTM, statistics from both the nodes is cleared.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security utm web-filtering statistics on page 6329</a></li><li>• <a href="#">show security utm web-filtering status on page 6332</a></li></ul>
<b>Output Fields</b>	This command produces no output.

## Sample Output

### clear security utm web-filtering statistics

```
user@host> clear security utm web-filtering statistics
```

## request security utm anti-virus juniper-express-engine

<b>Syntax</b>	request security utm anti-virus juniper-express-engine
<b>Release Information</b>	Command introduced in Junos OS Release 9.5 . Support for UTM in chassis cluster added in Junos OS Release 11.4 .
<b>Description</b>	Manually update the express antivirus pattern database using the command described. You can update the express antivirus pattern database automatically or manually. With full chassis cluster support for UTM this command is operational on both the nodes.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>pattern-delete</b> — Delete the current express antivirus pattern database.</li> <li>• <b>pattern-reload</b> — Reload the express antivirus pattern database.</li> <li>• <b>pattern-update</b> — Update the express antivirus pattern database with the latest signatures.</li> </ul>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request security utm anti-virus kaspersky-lab-engine on page 6304</a></li> <li>• <a href="#">clear security utm antivirus statistics on page 6299</a></li> <li>• <a href="#">show security utm anti-virus statistics on page 6322</a></li> <li>• <a href="#">show security utm anti-virus status on page 6324</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security utm anti-virus juniper-express-engine pattern-update on page 6303</a>
<b>Output Fields</b>	request security utm anti-virus juniper-express-engine pattern-update  When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request security utm anti-virus juniper-express-engine pattern-update

```
user@host> request security utm anti-virus juniper-express-engine pattern-update
```

## request security utm anti-virus kaspersky-lab-engine

---

<b>Syntax</b>	request security utm anti-virus kaspersky-lab-engine
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 . Support for UTM in chassis cluster added in Junos OS Release 11.4 .
<b>Description</b>	Manually update the full file-based antivirus pattern database using the commands described. You can update the full file-based antivirus pattern database automatically or manually. With full chassis cluster support for UTM this command is operational on both the nodes.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>pattern-delete</b> — Delete the current full file-based antivirus pattern database.</li><li>• <b>pattern-reload</b> — Reload the full file-based antivirus pattern database.</li><li>• <b>pattern-update</b> — Update the full file-based antivirus pattern database with the latest signatures.</li></ul>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request security utm anti-virus juniper-express-engine on page 6303</a></li><li>• <a href="#">clear security utm antivirus statistics on page 6299</a></li><li>• <a href="#">show security utm anti-virus statistics on page 6322</a></li><li>• <a href="#">show security utm anti-virus status on page 6324</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request security utm anti-virus kaspersky-lab-engine pattern-update on page 6304</a>
<b>Output Fields</b>	request security utm anti-virus kaspersky-lab-engine pattern-update  When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request security utm anti-virus kaspersky-lab-engine pattern-update

```
user@host> request security anti-virus kaspersky-lab-engine pattern-update
```

## request security utm anti-virus sophos-engine

<b>Syntax</b>	request security utm anti-virus sophos-engine
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 . Support for UTM in chassis cluster added in Junos OS Release 11.4 .
<b>Description</b>	Manually update the Sophos antivirus pattern database using the command described. You can update the express antivirus pattern database automatically or manually. To update automatically you use the configuration statement <b>set security utm feature-profile anti-virus sophos-engine pattern-update interval seconds</b> . With full chassis cluster support for UTM this command is operational on both the nodes.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>pattern-delete</b> — Delete the current Sophos antivirus pattern database.</li> <li>• <b>pattern-reload</b> — Reload the Sophos antivirus pattern database.</li> <li>• <b>pattern-update</b> — Update the Sophos antivirus pattern database with the latest signatures.</li> </ul>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security utm antivirus statistics on page 6299</a></li> <li>• <a href="#">show security utm anti-virus statistics on page 6322</a></li> <li>• <a href="#">show security utm anti-virus status on page 6324</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security utm anti-virus sophos-engine pattern-update on page 6305</a>
<b>Output Fields</b>	request security utm anti-virus sophos-engine pattern-update  When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security utm anti-virus sophos-engine pattern-update

```
user@host> request security utm anti-virus sophos-engine pattern-update
```

## request system license update

---

<b>Syntax</b>	request system license update
<b>Release Information</b>	Command introduced in Junos OS Release 9.5.
<b>Description</b>	Start autoupdating license keys from the LMS server.
<b>Options</b>	<b>trial</b> —Starts autoupdating trial license keys from the LMS server.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show system license (View)</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request system license update on page 6306</a> <a href="#">request system license update trial on page 6306</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request system license update

```
user@host> request system license update
```

```
Request to automatically update license keys from https://ae1.juniper.net has
been sent, use show system license to check status.
```

#### request system license update trial

```
user@host> request system license update trial
```

```
Request to automatically update trial license keys from https://ae1.juniper.net
has been sent, use show system license to check status.
```

## show configuration smtp

<b>Syntax</b>	show configuration smtp
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 .
<b>Description</b>	Display complete SMTP information.
<b>Options</b>	<ul style="list-style-type: none"> <li>• apply-groups—Groups from which SMTP inherits configuration data.</li> <li>• apply-groups-except—Groups from which SMTP restricts inheriting configuration data.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">SMTP Configuration Statement Hierarchy on page 6117</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show configuration smtp on page 6307</a>
<b>Output Fields</b>	<a href="#">Table 527</a> describes the output fields for the <b>show configuration smtp</b> command.

Table 527: show configuration smtp

Field Name	Field Description	Level of Output
address	SMTP server's IPv4 address	All levels
login	Configure a mail sender account to the server	All levels
password	Default sender password for user authentication	All levels

## Sample Output

### show configuration smtp

```

user@host> show configuration smtp
primary-server {
 address 218.102.48.213;
 login "dayone@example.com" {
 password "$ABC123"; ## SECRET-DATA
 }
}

```

## show groups junos-defaults

---

**Syntax**    show groups junos-defaults

**Release Information**    Command introduced before Junos OS Release 7.4.

**Description**    Display the full set of available preset statements from the Junos OS defaults group.

```
user@host# show groups junos-defaults
groups {
 junos-defaults {
 applications {
 # File Transfer Protocol
 application junos-ftp {
 application-protocol ftp;
 protocol tcp;
 destination-port 21;
 }
 # Trivial File Transfer Protocol
 application junos-tftp {
 application-protocol tftp;
 protocol udp;
 destination-port 69;
 }
 # RPC port mapper on TCP
 application junos-rpc-portmap-tcp {
 application-protocol rpc-portmap;
 protocol tcp;
 destination-port 111;
 }
 # RPC port mapper on UDP
 }
 }
}
```

## show security log

<b>Syntax</b>	<code>show security log {all  destination-address  destination-port  event-id  failure  interface-name  newer-than  older-than  process  protocol  severity  sort-by  source-address  source-port  success  user}</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2 .
<b>Description</b>	Display security event logs. This command continuously displays security events on the screen. To stop the display, press Ctrl+c.
<b>Options</b>	<p><b>all</b>—Displays all audit event logs stored in the device memory.</p> <p><b>destination-address</b>—Displays audit event logs with the specified destination address.</p> <p><b>destination-port</b>—Displays audit event logs with the specified destination port.</p> <p><b>event-id</b>—Displays audit event logs with the specified event identification number.</p> <p><b>failure</b>—Displays failed audit event logs.</p> <p><b>interface-name</b>—Displays audit event logs with the specified interface.</p> <p><b>newer-than</b>—Displays audit event logs newer than the specified date and time.</p> <p><b>older-than</b>—Displays audit event logs older than the specified date and time.</p> <p><b>process</b>—Displays audit event logs with the specified process that generated the event.</p> <p><b>protocol</b>—Displays audit event logs generated through the specified protocol.</p> <p><b>severity</b>—Displays audit event logs generated with the specified severity.</p> <p><b>sort-by</b>—Displays audit event logs generated sorted with the specified options.</p> <p><b>source-address</b>—Displays audit event logs with the specified source address.</p> <p><b>source-port</b>—Displays audit event logs with the specified source port.</p> <p><b>success</b>—Displays successful audit event logs.</p> <p><b>username</b>—Displays audit event logs generated for the specified user.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>exclude (Security Log)</i></li> <li><i>clear security log</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security log on page 6310</a>

**Output Fields** Table 528 lists the output fields for the **show security log** command. Output fields are listed in the approximate order in which they appear.

**Table 528: show security log Output Fields**

Field Name	Field Description
Event time	The timestamp of the events received.  On SRX Series devices, security logs were always timestamped using the UTC time zone by running <b>set system time-zone utc</b> and <b>set security log utc-timestamp</b> CLI commands. Now, time zone can be defined using the local time zone by running the <b>set system time-zone time-zone</b> command to specify the local time zone that the system should use when timestamping the security logs.
Message	Security events are listed.

## Sample Output

## show security policies

---

<b>Syntax</b>	<pre>show security policies &lt;detail&gt; &lt;none&gt; policy-name <i>policy-name</i> &lt;detail&gt; &lt;global&gt;</pre>
<b>Release Information</b>	<p>Command modified in Junos OS Release 9.2. Support for IPv6 addresses added in Junos OS Release 10.2. Support for IPv6 addresses in active/active chassis cluster configurations in addition to the existing support of active/passive chassis cluster configurations added in Junos OS Release 10.4. Support for wildcard addresses added in Junos OS Release 11.1. Support for global policy added in Junos OS Release 11.4. Support for services offloading added in Junos OS Release 11.4. Support for source-identities added in Junos OS Release 12.1. The <b>Description</b> output field added in Junos OS Release 12.1. Support for negated address added in Junos OS Release 12.1X45-D10. The output fields for Policy Statistics expanded, and the output fields for the <b>global</b> and <b>policy-name</b> options expanded to include from-zone and to-zone global match criteria in Junos OS Release 12.1X47-D10. Support for the <b>initial-tcp-mss</b> and <b>reverse-tcp-mss</b> options added in Junos OS Release 12.3X48-D20.</p>
<b>Description</b>	<p>Display a summary of all security policies configured on the device. If a particular policy is specified, display information particular to that policy.</p>
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>none</b>—Display basic information about all configured policies.</li> <li>• <b>detail</b>—(Optional) Display a detailed view of all of the policies configured on the device.</li> <li>• <b>policy-name <i>policy-name</i></b>—(Optional) Display information about the specified policy.</li> <li>• <b>global</b>—Display information about global policies.</li> </ul>
<b>Required Privilege Level</b>	view

<b>List of Sample Output</b>	<p><a href="#">show security policies on page 6315</a>  <a href="#">show security policies policy-name p1 detail on page 6316</a>  <a href="#">show security policies (services-offload) on page 6317</a>  <a href="#">show security policies detail on page 6317</a>  <a href="#">show security policies detail (TCP Options) on page 6318</a>  <a href="#">show security policies policy-name p1 (Negated Address) on page 6318</a>  <a href="#">show security policies policy-name p1 detail (Negated Address) on page 6319</a>  <a href="#">show security policies global on page 6319</a></p>

**Output Fields** Table 51 lists the output fields for the **show security policies** command. Output fields are listed in the approximate order in which they appear.

**Table 529: show security policies Output Fields**

Field Name	Field Description
<b>From zone</b>	Name of the source zone.
<b>To zone</b>	Name of the destination zone.
<b>Policy</b>	Name of the applicable policy.
<b>Description</b>	Description of the applicable policy.
<b>State</b>	Status of the policy: <ul style="list-style-type: none"> <li>• <b>enabled:</b> The policy can be used in the policy lookup process, which determines access rights for a packet and the action taken in regard to it.</li> <li>• <b>disabled:</b> The policy cannot be used in the policy lookup process, and therefore it is not available for access control.</li> </ul>
<b>Index</b>	Internal number associated with the policy.
<b>Sequence number</b>	Number of the policy within a given context. For example, three policies that are applicable in a from-zoneA-to-zoneB context might be ordered with sequence numbers 1, 2, 3. Also, in a from-zoneC-to-zoneD context, four policies might have sequence numbers 1, 2, 3, 4.
<b>Source addresses</b>	For standard display mode, the names of the source addresses for a policy. Address sets are resolved to their individual names.  For detail display mode, the names and corresponding IP addresses of the source addresses for a policy. Address sets are resolved to their individual address name-IP address pairs.
<b>Destination addresses</b>	Name of the destination address (or address set) as it was entered in the destination zone's address book. A packet's destination address must match this value for the policy to apply to it.
<b>Source addresses (excluded)</b>	Name of the source address excluded from the policy.
<b>Destination addresses (excluded)</b>	Name of the destination address excluded from the policy.
<b>Source identities</b>	One or more user roles specified for a policy.

Table 529: show security policies Output Fields (*continued*)

Field Name	Field Description
Applications	<p>Name of a preconfigured or custom application whose type the packet matches, as specified at configuration time.</p> <ul style="list-style-type: none"> <li>• <b>IP protocol</b>: The Internet protocol used by the application—for example, TCP, UDP, ICMP.</li> <li>• <b>ALG</b>: If an ALG is explicitly associated with the policy, the name of the ALG is displayed. If <b>application-protocol ignore</b> is configured, ignore is displayed. Otherwise, 0 is displayed. However, even if this command shows ALG: 0, ALGs might be triggered for packets destined to well-known ports on which ALGs are listening, unless ALGs are explicitly disabled or when <b>application-protocol ignore</b> is not configured for custom applications.</li> <li>• <b>Inactivity timeout</b>: Elapsed time without activity after which the application is terminated.</li> <li>• <b>Source port range</b>: The low-high source port range for the session application.</li> </ul>
Destination Address Translation	<p>Status of the destination address translation traffic:</p> <ul style="list-style-type: none"> <li>• <b>drop translated</b>—Drop the packets with translated destination addresses.</li> <li>• <b>drop untranslated</b>—Drop the packets without translated destination addresses.</li> </ul>
Application Firewall	<p>An application firewall includes the following:</p> <ul style="list-style-type: none"> <li>• <b>Rule-set</b>—Name of the rule set.</li> <li>• <b>Rule</b>—Name of the rule. <ul style="list-style-type: none"> <li>• <b>Dynamic applications</b>—Name of the applications.</li> <li>• <b>Dynamic application groups</b>—Name of the application groups.</li> <li>• <b>Action</b>—The action taken with respect to a packet that matches the application firewall rule set. Actions include the following: <ul style="list-style-type: none"> <li>• <b>permit</b></li> <li>• <b>deny</b></li> </ul> </li> </ul> </li> <li>• <b>Default rule</b>—The default rule applied when the identified application is not specified in any rules of the rule set.</li> </ul>
Action or Action-type	<ul style="list-style-type: none"> <li>• The action taken in regard to a packet that matches the policy's tuples. Actions include the following: <ul style="list-style-type: none"> <li>• <b>permit</b></li> <li>• <b>firewall-authentication</b></li> <li>• <b>tunnel ipsec-vpn <i>vpn-name</i></b></li> <li>• <b>pair-policy <i>pair-policy-name</i></b></li> <li>• <b>source-nat pool <i>pool-name</i></b></li> <li>• <b>pool-set <i>pool-set-name</i></b></li> <li>• <b>interface</b></li> <li>• <b>destination-nat <i>name</i></b></li> <li>• <b>deny</b></li> <li>• <b>reject</b></li> <li>• <b>services-offload</b></li> </ul> </li> </ul>
Session log	<p>Session log entry that indicates whether the <b>at-create</b> and <b>at-close</b> flags were set at configuration time to log session information.</p>

Table 529: show security policies Output Fields (*continued*)

Field Name	Field Description
<b>Scheduler name</b>	Name of a preconfigured scheduler whose schedule determines when the policy is active and can be used as a possible match for traffic.
<b>Policy statistics</b>	<ul style="list-style-type: none"> <li>• <b>Input bytes</b>—The total number of bytes presented for processing by the device. <ul style="list-style-type: none"> <li>• <b>Initial direction</b>—The number of bytes presented for processing by the device from the initial direction.</li> <li>• <b>Reply direction</b>—The number of bytes presented for processing by the device from the reply direction.</li> </ul> </li> <li>• <b>Output bytes</b>—The total number of bytes actually processed by the device. <ul style="list-style-type: none"> <li>• <b>Initial direction</b>—The number of bytes from the initial direction actually processed by the device.</li> <li>• <b>Reply direction</b>—The number of bytes from the reply direction actually processed by the device.</li> </ul> </li> <li>• <b>Input packets</b>—The total number of packets presented for processing by the device. <ul style="list-style-type: none"> <li>• <b>Initial direction</b>—The number of packets presented for processing by the device from the initial direction.</li> <li>• <b>Reply direction</b>—The number of packets presented for processing by the device from the reply direction.</li> </ul> </li> <li>• <b>Output packets</b>—The total number of packets actually processed by the device. <ul style="list-style-type: none"> <li>• <b>Initial direction</b>—The number of packets actually processed by the device from the initial direction.</li> <li>• <b>Reply direction</b>—The number of packets actually processed by the device from the reply direction.</li> </ul> </li> <li>• <b>Session rate</b>—The total number of active and deleted sessions.</li> <li>• <b>Active sessions</b>—The number of sessions currently present because of access control lookups that used this policy.</li> <li>• <b>Session deletions</b>—The number of sessions deleted since system startup.</li> <li>• <b>Policy lookups</b>—The number of times the policy was accessed to check for a match.</li> </ul> <p><b>NOTE:</b> Configure the Policy P1 with the <b>count</b> option to display policy statistics.</p>
<b>Per policy TCP Options</b>	Configured sync and sequence checks, and the configured TCP MSS value for the initial direction and /or the reverse direction.

## Sample Output

## show security utm anti-spam statistics

---

<b>Syntax</b>	show security utm anti-spam statistics
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Support for UTM in chassis cluster added in Junos OS Release 11.4.
<b>Description</b>	Display antispam statistics for connections including total e-mail scanned, tagged, and dropped connections.  Statistics from both the nodes (with full chassis cluster support for UTM) are displayed.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">clear security utm anti-spam statistics on page 6298</a></li><li>• <a href="#">show security utm anti-spam status on page 6321</a></li></ul>
<b>Output Fields</b>	show security utm anti-spam statistics  Output fields are listed in the approximate order in which they appear.

## show security utm anti-spam statistics

```
user@host> show security utm anti-spam statistics
Total connections: 0
Denied connections: 0
Total greetings: 0
Denied greetings: 0
Total e-mail scanned: 0
White list hit: 0
Black list hit: 0
Spam total: 0
Spam tagged: 0
Spam dropped: 0
DNS errors: 0
Timeout errors: 0
Return errors: 0
Invalid parameter errors: 0
```

## show security utm anti-spam status

---

<b>Syntax</b>	show security utm anti-spam status
<b>Release Information</b>	Command introduced in Junos OS Release 9.5 . Support for UTM in chassis cluster added in Junos OS Release 11.4 .
<b>Description</b>	Display antispam status for connections including whitelist and blacklist server information. Status of both the nodes (with full chassis cluster support for UTM) is displayed.

## show security utm web-filtering status

<b>Syntax</b>	show security utm web-filtering status <fpc <fpc-slot fpc-slot pic-slot pic-slot>>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Support for UTM in chassis cluster added in Junos OS Release 11.4. Support for Flexible PIC Concentrator (FPC) and PIC status added in Junos OS Release 12.1X46-D10.
<b>Description</b>	Display whether the Web filtering server connection is up or not. The aggregated status from all FPCs and PICs and status of both the nodes (with full chassis cluster support for UTM) are also displayed.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security utm web-filtering statistics on page 6302</a></li> <li>• <a href="#">show security utm web-filtering statistics on page 6329</a></li> </ul>

## IPsec VPN Overview

---

A virtual private network (VPN) provides a means for securely communicating among remote computers across a public WAN such as the Internet.

A VPN connection can link two LANs (site-to-site VPN) or a remote dial-up user and a LAN. The traffic that flows between these two points passes through shared resources such as routers, switches, and other network equipment that make up the public WAN. To secure VPN communication while passing through the WAN, the two participants create an IP Security (IPsec) tunnel.

**NOTE:** The term *tunnel* does not denote tunnel mode (see [“Packet Processing in Tunnel Mode” on page 6345](#)). Instead, it refers to the IPsec connection.

IPsec is a suite of related protocols for cryptographically securing communications at the IP Packet Layer. IPsec also provides methods for the manual and automatic negotiation of security associations (SAs) and key distribution, all the attributes for which are gathered in a domain of interpretation (DOI). The IPsec DOI is a document containing

definitions for all the security parameters required for the successful negotiation of a VPN tunnel—essentially, all the attributes required for SA and IKE negotiations. See RFC 2407 and RFC 2408 for more information.

This topic includes the following sections:

- [IPsec VPN Topologies on page 6338](#)
- [Comparison of Policy-Based VPNs and Route-Based VPNs on page 6338](#)
- [Security Associations on page 6339](#)
- [IPsec Key Management on page 6340](#)
- [IPsec Security Protocols on page 6342](#)
- [IPsec Tunnel Negotiation on page 6343](#)

## IPsec VPN Topologies

The following are some of the IPsec VPN topologies that Junos operating system (OS) supports:

- **Site-to-site VPNs**—Connects two sites in an organization together and allows secure communications between the sites.
- **Hub-and-spoke VPNs**—Connects branch offices to the corporate office in an enterprise network. You can also use this topology to connect spokes together by sending traffic through the hub.
- **Remote access VPNs**—Allows users working at home or traveling to connect to the corporate office and its resources. This topology is sometimes referred to as an *end-to-site tunnel*.

## Comparison of Policy-Based VPNs and Route-Based VPNs

[Table 530](#) summarizes the differences between policy-based VPNs and route-based VPNs.

**Table 530: Comparison Between Policy-Based VPNs and Route-Based VPNs**

Policy-Based VPNs	Route-Based VPNs
In policy-based VPNs, a tunnel is treated as an object that, together with source, destination, application, and action, constitutes a tunnel policy that permits VPN traffic.	In route-based VPNs, a policy does not specifically reference a VPN tunnel.
A tunnel policy specifically references a VPN tunnel by name.	A route determines which traffic is sent through the tunnel based on a destination IP address.
The number of policy-based VPN tunnels that you can create is limited by the number of tunnels that the device supports.	The number of route-based VPN tunnels that you create is limited by the number of st0 interfaces (for point-to-point VPNs) or the number of tunnels that the device supports, whichever is lower.

Table 530: Comparison Between Policy-Based VPNs and Route-Based VPNs (*continued*)

Policy-Based VPNs	Route-Based VPNs
With a policy-based VPN, although you can create numerous tunnel policies referencing the same VPN tunnel, each tunnel policy pair creates an individual IPsec SA with the remote peer. Each SA counts as an individual VPN tunnel.	Because the route, not the policy, determines which traffic goes through the tunnel, multiple policies can be supported with a single SA or VPN.
In a policy-based VPN, the action must be permit and must include a tunnel.	In a route-based VPN, the regulation of traffic is not coupled to the means of its delivery.
The exchange of dynamic routing information is not supported in policy-based VPNs.	Route-based VPNs support the exchange of dynamic routing information through VPN tunnels. You can enable an instance of a dynamic routing protocol, such as OSPF, on an st0 interface that is bound to a VPN tunnel.
If you need more granularity than a route can provide to specify the traffic sent to a tunnel, using a policy-based VPN with security policies is the best choice.	Route-based VPNs uses routes to specify the traffic sent to a tunnel; a policy does not specifically reference a VPN tunnel.
With a policy-based VPN tunnel, you can consider a tunnel as an element in the construction of a policy.	<p>When the security device does a route lookup to find the interface through which it must send traffic to reach an address, it finds a route through a secure tunnel (st0) interface.</p> <p>With a route-based VPN tunnel, you can consider a tunnel as a means for delivering traffic, and can consider the policy as a method for either permitting or denying the delivery of that traffic.</p>

## Security Associations

A security association (SA) is a unidirectional agreement between the VPN participants regarding the methods and parameters to use in securing a communication channel. Full bidirectional communication requires at least two SAs, one for each direction. Through the SA, an IPsec tunnel can provide the following security functions:

- Privacy (through encryption)
- Content integrity (through data authentication)
- Sender authentication and—if using certificates—nonrepudiation (through data origin authentication)

The security functions you employ depend on your needs. If you need only to authenticate the IP packet source and content integrity, you can authenticate the packet without applying any encryption. On the other hand, if you are concerned only with preserving privacy, you can encrypt the packet without applying any authentication mechanisms. Optionally, you can both encrypt and authenticate the packet. Most network security designers choose to encrypt, authenticate, and replay-protect their VPN traffic.

An IPsec tunnel consists of a pair of unidirectional SAs—one SA for each direction of the tunnel—that specify the security parameter index (SPI), destination IP address, and security protocol (Authentication Header [AH] or Encapsulating Security Payload [ESP]) employed. An SA groups together the following components for securing communications:

- Security algorithms and keys.
- Protocol mode, either transport or tunnel. Junos OS devices always use tunnel mode. (See [“Packet Processing in Tunnel Mode” on page 6345.](#))
- Key-management method, either manual key or AutoKey IKE. (See [“IPsec Key Management” on page 6340.](#))
- SA lifetime.

For inbound traffic, Junos OS looks up the SA by using the following triplet:

- Destination IP address.
- Security protocol, either AH or ESP. (See [“IPsec Security Protocols” on page 6342.](#))
- Security parameter index (SPI) value.

For outbound VPN traffic, the policy invokes the SA associated with the VPN tunnel.

## IPsec Key Management

The distribution and management of keys are critical to using VPNs successfully. Junos OS supports IPsec technology for creating VPN tunnels with three kinds of key creation mechanisms:

- Manual key
- AutoKey IKE with a preshared key or a certificate

You can choose your key creation mechanism—also called authentication method—during Phase 1 and Phase 2 proposal configuration. See [“IPsec Tunnel Negotiation” on page 6343.](#)

This topic includes the following sections:

- [Manual Key on page 6340](#)
- [AutoKey IKE on page 6341](#)
- [Diffie-Hellman Exchange on page 6341](#)

---

### Manual Key

With manual keys, administrators at both ends of a tunnel configure all the security parameters. This is a viable technique for small, static networks where the distribution, maintenance, and tracking of keys are not difficult. However, safely distributing manual-key configurations across great distances poses security issues. Aside from passing the keys face-to-face, you cannot be completely sure that the keys have not been compromised while in transit. Also, whenever you want to change the key, you are faced with the same security issues as when you initially distributed it.

### AutoKey IKE

When you need to create and manage numerous tunnels, you need a method that does not require you to configure every element manually. IPsec supports the automated generation and negotiation of keys and security associations using the Internet Key Exchange (IKE) protocol. Junos OS refers to such automated tunnel negotiation as AutoKey IKE and supports AutoKey IKE with preshared keys and AutoKey IKE with certificates.

- AutoKey IKE with preshared keys—Using AutoKey IKE with preshared keys to authenticate the participants in an IKE session, each side must configure and securely exchange the preshared key in advance. In this regard, the issue of secure key distribution is the same as that with manual keys. However, once distributed, an autokey, unlike a manual key, can automatically change its keys at predetermined intervals using the IKE protocol. Frequently changing keys greatly improves security, and automatically doing so greatly reduces key-management responsibilities. However, changing keys increases traffic overhead; therefore, changing keys too often can reduce data transmission efficiency.

**NOTE:** A preshared key is a key for both encryption and decryption, which both participants must have before initiating communication.

- AutoKey IKE with certificates—When using certificates to authenticate the participants during an AutoKey IKE negotiation, each side generates a public-private key pair and acquires a certificate. As long as the issuing certificate authority (CA) is trusted by both sides, the participants can retrieve the peer's public key and verify the peer's signature. There is no need to keep track of the keys and SAs; IKE does it automatically.

### Diffie-Hellman Exchange

A Diffie-Hellman (DH) exchange allows participants to produce a shared secret value. The strength of the technique is that it allows participants to create the secret value over an unsecured medium without passing the secret value through the wire. The size of the prime modulus used in each group's calculation differs as follows:

- DH Group 1—768-bit modulus
- DH Group 2—1024-bit modulus
- DH Group 5—1536-bit modulus
- DH Group 14—2048-bit modulus
- DH Group 19—256-bit modulus elliptic curve
- DH Group 20—384-bit modulus elliptic curve
- DH Group 24—2048-bit modulus with 256-bit prime order subgroup

**NOTE:** We do not recommend the use of DH groups 1, 2, and 5.

Because the modulus for each DH group is a different size, the participants must agree to use the same group.

## IPsec Security Protocols

IPsec uses two protocols to secure communications at the IP layer:

- Authentication Header (AH)—A security protocol for authenticating the source of an IP packet and verifying the integrity of its content
- Encapsulating Security Payload (ESP)—A security protocol for encrypting the entire IP packet (and authenticating its content)

You can choose your security protocols—also called *authentication and encryption algorithms*—during Phase 2 proposal configuration. See “[IPsec Tunnel Negotiation](#)” on [page 6343](#).

For each VPN tunnel, both AH and ESP tunnel sessions are installed on Services Processing Units (SPUs) and the control plane. For branch SRX Series devices, tunnel sessions are updated with the negotiated protocol after negotiation is completed. For high-end SRX Series devices, tunnel sessions on anchor SPUs are updated with the negotiated protocol while non-anchor SPUs retain ESP and AH tunnel sessions. ESP and AH tunnel sessions are displayed in the outputs for the **show security flow session** and **show security flow cp-session** operational mode commands.

This topic includes the following sections:

- [AH Protocol on page 6342](#)
- [ESP Protocol on page 6343](#)

---

### AH Protocol

The Authentication Header (AH) protocol provides a means to verify the authenticity and integrity of the content and origin of a packet. You can authenticate the packet by the checksum calculated through a Hash Message Authentication Code (HMAC) using a secret key and either MD5 or SHA-1 hash functions.

- Message Digest 5 (MD5)—An algorithm that produces a 128-bit hash (also called a *digital signature* or *message digest*) from a message of arbitrary length and a 16-byte key. The resulting hash is used, like a fingerprint of the input, to verify content and source authenticity and integrity.
- Secure Hash Algorithm (SHA-1)—An algorithm that produces a 160-bit hash from a message of arbitrary length and a 20-byte key. It is generally regarded as more secure than MD5 because of the larger hashes it produces. Because the computational processing is done in the ASIC, the performance cost is negligible.

**NOTE:** For more information on MD5 hashing algorithms, see RFC 1321 and RFC 2403. For more information on SHA hashing algorithms, see RFC 2404. For more information on HMAC, see RFC 2104.

---

## ESP Protocol

The Encapsulating Security Payload (ESP) protocol provides a means to ensure privacy (encryption) and source authentication and content integrity (authentication). ESP in tunnel mode encapsulates the entire IP packet (header and payload) and then appends a new IP header to the now-encrypted packet. This new IP header contains the destination address needed to route the protected data through the network. (See [“Packet Processing in Tunnel Mode” on page 6345](#).)

With ESP, you can both encrypt and authenticate, encrypt only, or authenticate only. For encryption, you can choose one of the following encryption algorithms:

- Data Encryption Standard (DES)—A cryptographic block algorithm with a 56-bit key.
- Triple DES (3DES)—A more powerful version of DES in which the original DES algorithm is applied in three rounds, using a 168-bit key. DES provides significant performance savings but is considered unacceptable for many classified or sensitive material transfers.
- Advanced Encryption Standard (AES)—An encryption standard which offers greater interoperability with other devices. Junos OS supports AES with 128-bit, 192-bit, and 256-bit keys.

For authentication, you can use either the MD5 or the SHA-1 algorithm.

**NOTE:** Even though it is possible to select NULL for encryption, it has been demonstrated that IPsec might be vulnerable to attack under such circumstances. Therefore, we suggest that you choose an encryption algorithm for maximum security.

## IPsec Tunnel Negotiation

To establish an AutoKey IKE IPsec tunnel, two phases of negotiation are required:

- In Phase 1, the participants establish a secure channel in which to negotiate the IPsec security associations (SAs).
- In Phase 2, the participants negotiate the IPsec SAs for encrypting and authenticating the ensuing exchanges of user data.

For a manual key IPsec tunnel, because all the SA parameters have been previously defined, there is no need to negotiate which SAs to use. In essence, the tunnel has already been established. When traffic matches a policy using that manual key tunnel or when a route involves the tunnel, the Juniper Networks device simply encrypts and authenticates the data, as you determined, and forwards it to the destination gateway.

The remote IKE gateway address can be in any virtual routing (VR) instance. VR is determined during IKE Phase 1 and Phase 2 negotiation. VR does not have to be configured in the IKE proposals. If the IKE gateway interface is moved from one VR to another, the

existing IKE Phase 1 and Phase 2 negotiations for the IKE gateway are cleared, and new Phase 1 and Phase 2 negotiations are performed.

NOTE:

- On SRX Series devices, when you enable VPN, overlapping of IP addresses across virtual routers is supported with the following limitations:
  - An IKE external interface address cannot overlap with any other virtual router.
  - An internal or trust interface address can overlap across virtual routers.
  - An st0 interface address cannot overlap in route-based VPN in point-to-multipoint tunnel such as NHTB.
  - An st0 interface address can overlap in route-based VPN in point-to-point tunnel.
- The combinations of local IP addresses and remote gateway IP addresses of IPsec VPN tunnels configured across VRs have to be unique.
- When the loopback interface is used as the IKE gateway external interface, the physical interface for IKE negotiation should be in the same VR.

---

## Understanding IKE and IPsec Packet Processing

---

An IPsec VPN tunnel consists of tunnel setup and applied security. During tunnel setup, the peers establish security associations (SAs), which define the parameters for securing traffic between themselves. (See [“IPsec VPN Overview” on page 6337](#).) After the tunnel is established, IPsec protects the traffic sent between the two tunnel endpoints by applying the security parameters defined by the SAs during tunnel setup. Within the Junos OS implementation, IPsec is applied in tunnel mode, which supports the Encapsulating Security Payload (ESP) and Authentication Header (AH) protocols.

This topic includes the following sections:

- [Packet Processing in Tunnel Mode on page 6345](#)
- [IKE Packet Processing on page 6346](#)
- [IPsec Packet Processing on page 6349](#)

## Packet Processing in Tunnel Mode

IPsec operates in one of two modes—transport or tunnel. When both ends of the tunnel are hosts, you can use either mode. When at least one of the endpoints of a tunnel is a security gateway, such as a Junos OS router or firewall, you must use tunnel mode. Juniper Networks devices always operate in tunnel mode for IPsec tunnels.

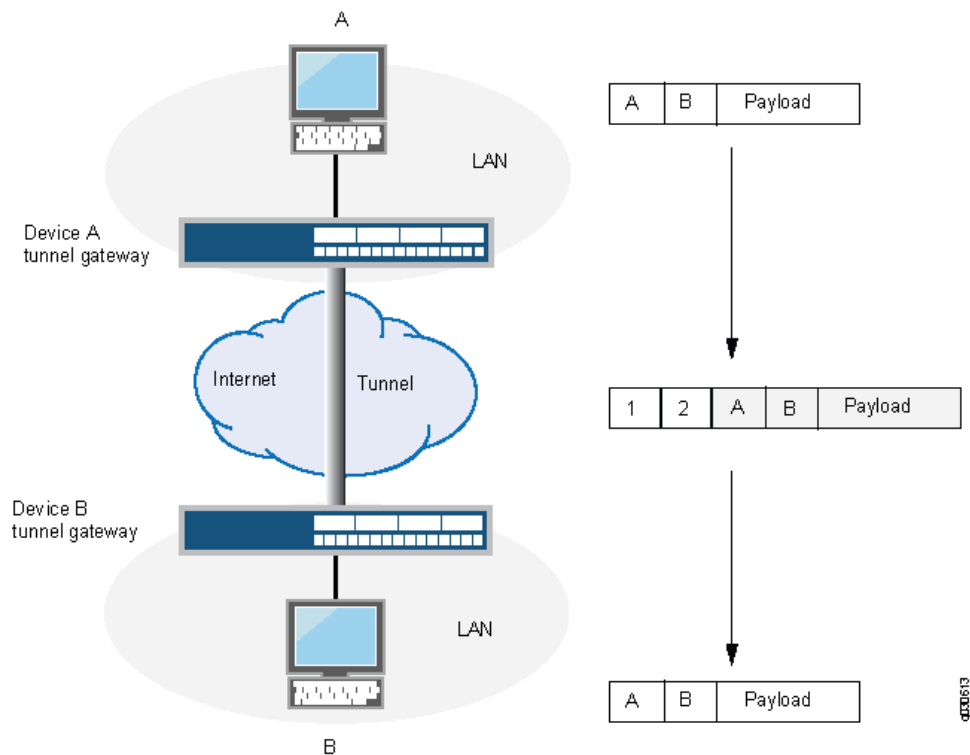

In tunnel mode, the entire original IP packet—payload and header—is encapsulated within another IP payload, and a new header is appended to it, as shown in [Figure 256](#). The entire original packet can be encrypted, authenticated, or both. With the Authentication Header (AH) protocol, the AH and new headers are also authenticated. With the Encapsulating Security Payload (ESP) protocol, the ESP header can also be authenticated.

**Figure 256: Tunnel Mode**

In a site-to-site VPN, the source and destination addresses used in the new header are the IP addresses of the outgoing interface. See [Figure 257](#).

**Figure 257: Site-to-Site VPN in Tunnel Mode**

In a dial-up VPN, there is no tunnel gateway on the VPN dial-up client end of the tunnel; the tunnel extends directly to the client itself (see [Figure 258](#)). In this case, on packets

sent from the dial-up client, both the new header and the encapsulated original header have the same IP address: that of the client's computer.

**NOTE:** Some VPN clients, such as the dynamic VPN client and Netscreen-Remote, use a virtual inner IP address (also called a “sticky address”). Netscreen-Remote enables you to define the virtual IP address. The dynamic VPN client uses the virtual IP address assigned during the XAuth configuration exchange. In such cases, the virtual inner IP address is the source IP address in the original packet header of traffic originating from the client, and the IP address that the ISP dynamically assigns the dial-up client is the source IP address in the outer header.

Figure 258: Dial-Up VPN in Tunnel Mode

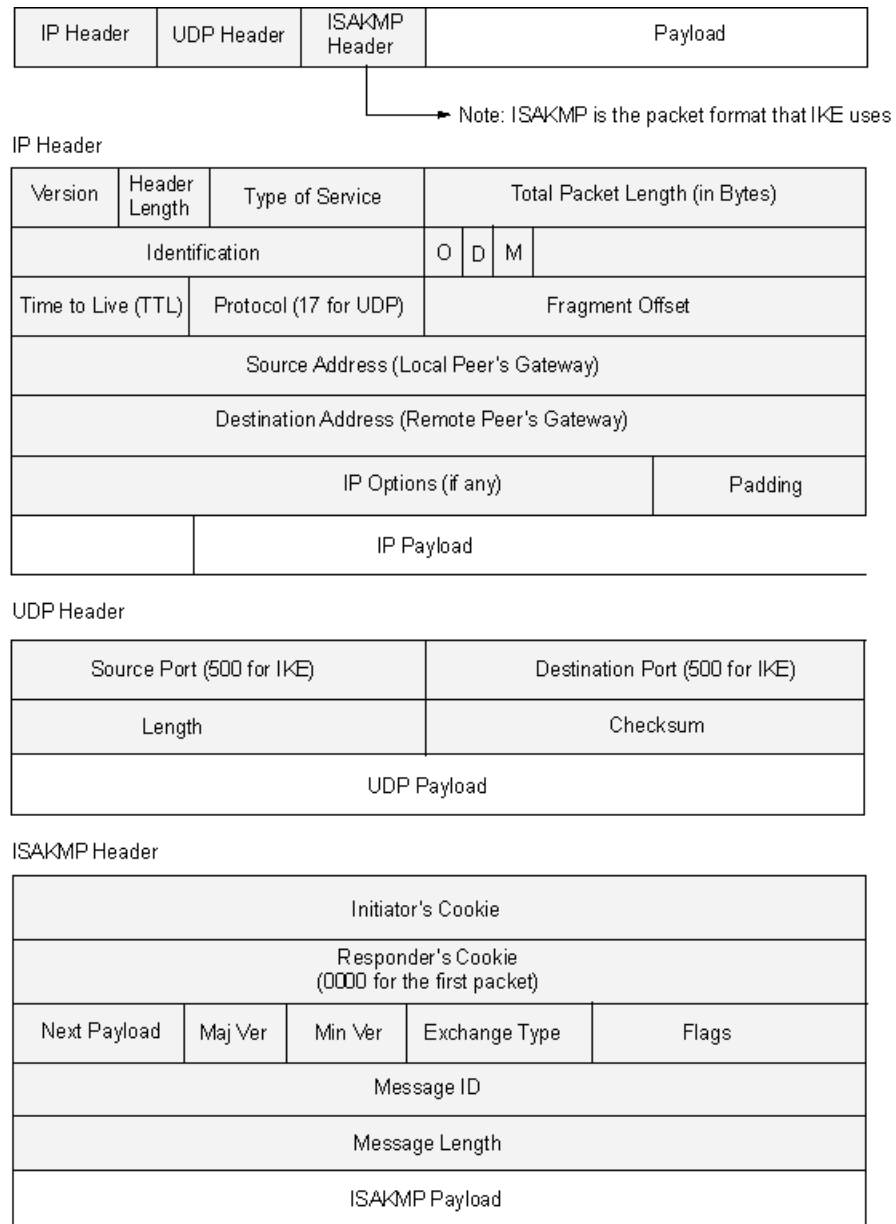

## IKE Packet Processing

When a cleartext packet arrives on a Juniper Networks device that requires tunneling, and no active Phase 2 SA exists for that tunnel, Junos OS begins IKE negotiations and drops the packet. The source and destination addresses in the IP packet header are those of the local and remote IKE gateways, respectively. In the IP packet payload, there is a UDP segment encapsulating an ISAKMP (IKE) packet. The format for IKE packets is the same for Phase 1 and Phase 2. See [Figure 259](#).

Meanwhile, the source host has sent the dropped packet again. Typically, by the time the second packet arrives, IKE negotiations are complete, and Junos OS protects the packet and all subsequent packets in the session—with IPsec before forwarding it.

Figure 259: IKE Packet for Phases 1 and 2

6347

The Next Payload field contains a number indicating one of the following payload types:

- 0002—SA Negotiation Payload contains a definition for a Phase 1 or Phase 2 SA.
- 0004—Proposal Payload can be a Phase 1 or Phase 2 proposal.
- 0008—Transform Payload gets encapsulated in a proposal payload that gets encapsulated in an SA payload.
- 0010—Key Exchange (KE) Payload contains information necessary for performing a key exchange, such as a DH public value.

- 0020—Identification (IDx) Payload.
  - In Phase 1, IDii indicates the initiator ID, and IDir indicates the responder ID.
  - In Phase 2, IDui indicates the user initiator, and IDur indicates the user responder.

The IDs are IKE ID types such as FQDN, U-FQDN, IP address, and ASN.1\_DN.
- 0040—Certificate (CERT) Payload.
- 0080—Certificate Request (CERT\_REQ) Payload.
- 0100—Hash (HASH) Payload contains the digest output of a particular hash function.
- 0200—Signature (SIG) Payload contains a digital signature.
- 0400—Nonce (Nx) Payload contains some pseudorandom information necessary for the exchange).
- 0800—Notify Payload.
- 1000—ISAKMP Delete Payload.
- 2000—Vendor ID (VID) Payload can be included anywhere in Phase 1 negotiations. Junos OS uses it to mark support for NAT-T.

Each ISAKMP payload begins with the same generic header, as shown in [Figure 260](#).

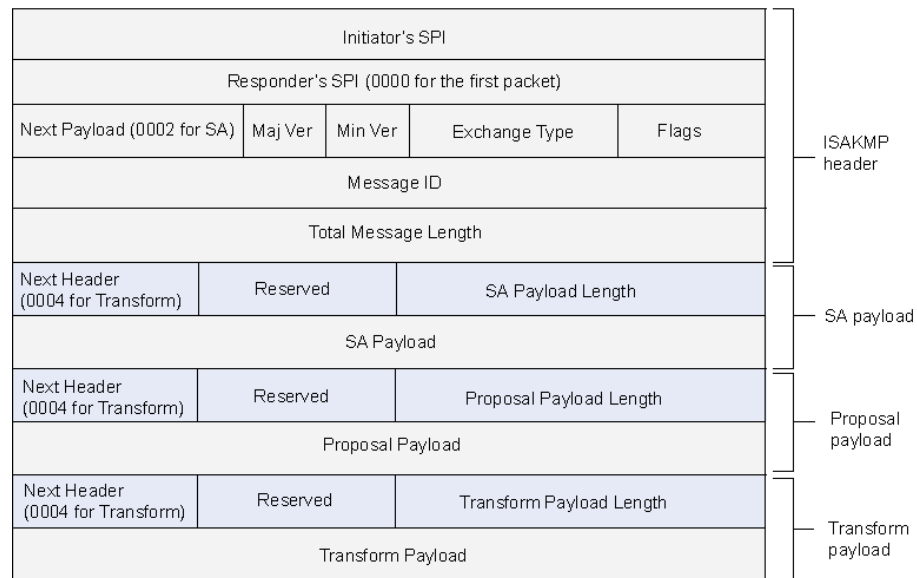

**Figure 260: Generic ISAKMP Payload Header**

Next Header	Reserved	Transform Payload Length (in bytes)
Payload		

98030616

There can be multiple ISAKMP payloads chained together, with each subsequent payload type indicated by the value in the Next Header field. A value of **0000** indicates the last ISAKMP payload. See [Figure 261](#) for an example.

Figure 261: ISAKMP Header with Generic ISAKMP Payloads

g030617

## IPsec Packet Processing

After IKE negotiations complete and the two IKE gateways have established Phase 1 and Phase 2 security associations (SAs), all subsequent packets are forwarded using the tunnel. If the Phase 2 SA specifies the Encapsulating Security Protocol (ESP) in tunnel mode, the packet looks like the one shown in Figure 262. The device adds two additional headers to the original packet that the initiating host sends.

**NOTE:** For information about ESP, see “ESP Protocol” on page 6343. For information about tunnel mode, see “Packet Processing in Tunnel Mode” on page 6345.

As shown in Figure 262, the packet that the initiating host constructs includes the payload, the TCP header, and the inner IP header (IP1).

Figure 262: IPsec Packet—ESP in Tunnel Mode

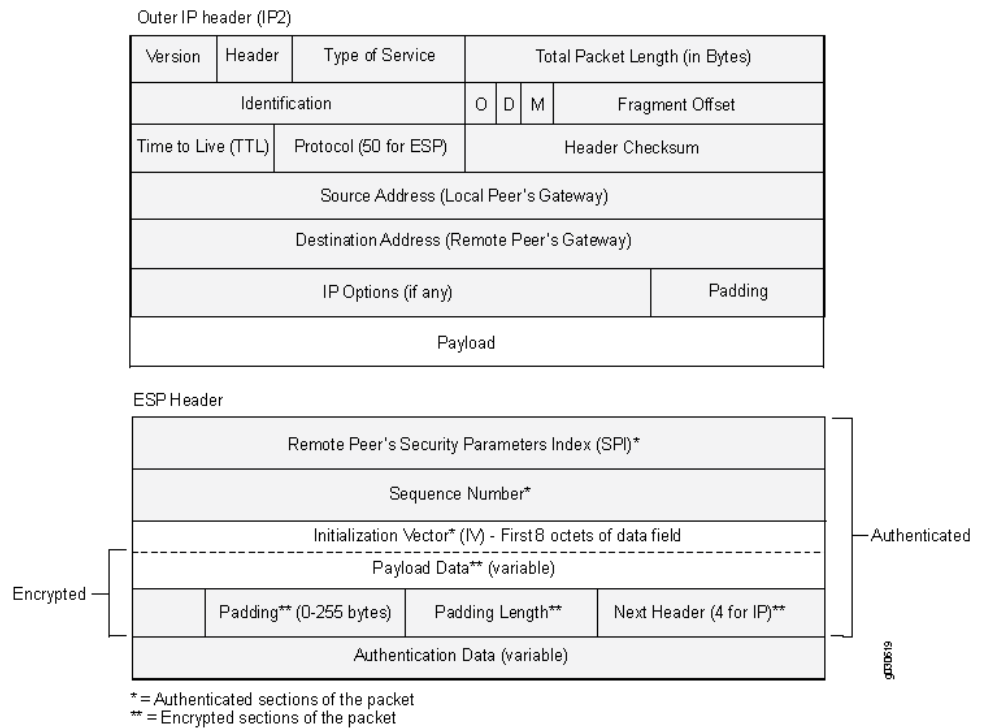

g030618

The router IP header (IP2), which Junos OS adds, contains the IP address of the remote gateway as the destination IP address and the IP address of the local router as the source IP address. Junos OS also adds an ESP header between the outer and inner IP headers.

The ESP header contains information that allows the remote peer to properly process the packet when it receives it. This is shown in [Figure 263](#).

**Figure 263: Outer IP Header (IP2) and ESP Header**

The Next Header field indicates the type of data in the payload field. In tunnel mode, this value is 4, indicating an IP packet is contained within the payload. See [Figure 264](#).

**Figure 264: Inner IP Header (IP1) and TCP Header****Inner IP Header (IP1)**

Version	Header	Type of Service	Total Packet Length (in Bytes)			
Identification			O	D	M	Fragment Offset

- [Example: Configuring a Route-Based VPN on page 6370](#)

**Understanding Phase 1 of IKE Tunnel Negotiation**

Phase 1 of an AutoKey Internet Key Exchange (IKE) tunnel negotiation consists of the exchange of proposals for how to authenticate and secure the channel. The participants exchange proposals for acceptable security services such as:

- Encryption algorithms—Data Encryption Standard (DES), triple Data Encryption Standard (3DES), and Advanced Encryption Standard (AES). (See [“IPsec Security Protocols” on page 6342.](#))
- Authentication algorithms—Message Digest 5 (MD5) and Secure Hash Algorithm (SHA-1). (See [“IPsec Security Protocols” on page 6342.](#))
- Diffie-Hellman (DH) group. (See [“Diffie-Hellman Exchange” on page 6341.](#))
- Preshared key or RSA/DSA certificates. (See [“IPsec Key Management” on page 6340.](#))

A successful Phase 1 negotiation concludes when both ends of the tunnel agree to accept at least one set of the Phase 1 security parameters proposed and then process them. Juniper Networks devices support up to four proposals for Phase 1 negotiations, allowing you to define how restrictive a range of security parameters for key negotiation you will accept.

Junos OS provides the following predefined Phase 1 proposals:

- Standard—pre-g2-aes128-sha and pre-g2-3des-sha
- Compatible—pre-g2-3des-sha, pre-g2-3des-md5, pre-g2-des-sha, and pre-g2-des-md5
- Basic—pre-g1-des-sha and pre-g1-des-md5

You can also define custom Phase 1 proposals.

Phase 1 exchanges can take place in either main mode or aggressive mode. You can choose your mode during IKE policy configuration.

This topic includes the following sections:

- [Main Mode on page 6352](#)
- [Aggressive Mode on page 6353](#)

## Main Mode

In main mode, the initiator and recipient send three two-way exchanges (six messages total) to accomplish the following services:

- First exchange (messages 1 and 2)—Proposes and accepts the encryption and authentication algorithms.
- Second exchange (messages 3 and 4)—Executes a DH exchange, and the initiator and recipient each provide a pseudorandom number.
- Third exchange (messages 5 and 6)—Sends and verifies the identities of the initiator and recipient.

The information transmitted in the third exchange of messages is protected by the encryption algorithm established in the first two exchanges. Thus, the participants' identities are encrypted and therefore not transmitted “in the clear.”

## Aggressive Mode

In aggressive mode, the initiator and recipient accomplish the same objectives as with main mode, but in only two exchanges, with a total of three messages:

- First message—The initiator proposes the security association (SA), initiates a DH exchange, and sends a pseudorandom number and its IKE identity.

**NOTE:** When configuring aggressive mode with multiple proposals for Phase 1 negotiations, use the same DH group in all proposals because the DH group cannot be negotiated. Up to four proposals can be configured.

- Second message—The recipient accepts the SA; authenticates the initiator; and sends a pseudorandom number, its IKE identity, and, if using certificates, the recipient's certificate.
- Third message—The initiator authenticates the recipient, confirms the exchange, and, if using certificates, sends the initiator's certificate.

Because the participants' identities are exchanged in the clear (in the first two messages), aggressive mode does not provide identity protection.

## Understanding Phase 2 of IKE Tunnel Negotiation

After the participants have established a secure and authenticated channel, they proceed through Phase 2, in which they negotiate security associations (SAs) to secure the data to be transmitted through the IPsec tunnel.

Similar to the process for Phase 1, the participants exchange proposals to determine which security parameters to employ in the SA. A Phase 2 proposal also includes a security protocol—either Encapsulating Security Payload (ESP) or Authentication Header (AH)—and selected encryption and authentication algorithms. The proposal can also specify a Diffie-Hellman (DH) group, if Perfect Forward Secrecy (PFS) is desired.

Regardless of the mode used in Phase 1, Phase 2 always operates in quick mode and involves the exchange of three messages.

Juniper Networks devices support up to four proposals for Phase 2 negotiations, allowing you to define how restrictive a range of tunnel parameters you will accept. Junos OS provides the following predefined Phase 2 proposals:

- Standard—g2-esp-3des-sha and g2-esp-aes128-sha

- Compatible—nopfs-esp-3des-sha, nopfs-esp-3des-md5, nopfs-esp-des-sha, and nopfs-esp-des-md5
- Basic—nopfs-esp-des-sha and nopfs-esp-des-md5

You can also define custom Phase 2 proposals.

This topic includes the following sections:

- [Proxy IDs on page 6354](#)
- [Perfect Forward Secrecy on page 6354](#)
- [Replay Protection on page 6354](#)

## Proxy IDs

In Phase 2, the peers exchange proxy IDs. A proxy ID consists of a local and remote IP address prefix. The proxy ID for both peers must match, which means that the local IP address specified for one peer must be the same as the remote IP address specified for the other peer.

## Perfect Forward Secrecy

PFS is a method for deriving Phase 2 keys independent from and unrelated to the preceding keys. Alternatively, the Phase 1 proposal creates the key (the SKEYID\_d key) from which all Phase 2 keys are derived. The SKEYID\_d key can generate Phase 2 keys with a minimum of CPU processing. Unfortunately, if an unauthorized party gains access to the SKEYID\_d key, all your encryption keys are compromised.

PFS addresses this security risk by forcing a new DH key exchange to occur for each Phase 2 tunnel. Using PFS is thus more secure, although the rekeying procedure in Phase 2 might take slightly longer with PFS enabled.

## Replay Protection

A replay attack occurs when an unauthorized person intercepts a series of packets and uses them later either to flood the system, causing a denial of service (DoS), or to gain entry to the trusted network. Junos OS provides a replay protection feature that enables devices to check every IPsec packet to see if it has been received previously. If packets arrive outside a specified sequence range, Junos OS rejects them. Use of this feature does not require negotiation, because packets are always sent with sequence numbers. You simply have the option of checking or not checking the sequence numbers.

## IPsec VPN with Autokey IKE Configuration Overview

---

IPsec VPN negotiation occurs in two phases. In Phase 1, participants establish a secure channel in which to negotiate the IPsec security association (SA). In Phase 2, participants negotiate the IPsec SA for authenticating traffic that will flow through the tunnel.

This overview describes the basic steps to configure a route-based or policy-based IPsec VPN using autokey IKE (preshared keys or certificates).

To configure a route-based or policy-based IPsec VPN using autokey IKE:

1. Configure interfaces, security zones, and address book information.  
(For route-based VPNs) Configure a secure tunnel **st0.x** interface. Configure routing on the device.
2. Configure Phase 1 of the IPsec VPN tunnel.
  - a. (Optional) Configure a custom IKE Phase 1 proposal. This step is optional, as you can use a predefined IKE Phase 1 proposal set (Standard, Compatible, or Basic).
  - b. Configure an IKE policy that references either your custom IKE Phase 1 proposal or a predefined IKE Phase 1 proposal set. Specify autokey IKE preshared key or certificate information. Specify the mode (main or aggressive) for the Phase 1 exchanges.
  - c. Configure an IKE gateway that references the IKE policy. Specify the IKE IDs for the local and remote devices. If the IP address of the remote gateway is not known, specify how the remote gateway is to be identified.
3. Configure Phase 2 of the IPsec VPN tunnel.
  - a. (Optional) Configure a custom IPsec Phase 2 proposal. This step is optional, as you can use a predefined IPsec Phase 2 proposal set (Standard, Compatible, or Basic).
  - b. Configure an IPsec policy that references either your custom IPsec Phase 2 proposal or a predefined IPsec Phase 2 proposal set. Specify perfect forward secrecy (PFS) keys.
  - c. Configure an IPsec VPN tunnel that references both the IKE gateway and the IPsec policy. Specify the proxy IDs to be used in Phase 2 negotiations.  
(For route-based VPNs) Bind the secure tunnel interface **st0.x** to the IPsec VPN tunnel.
4. Configure a security policy to permit traffic from the source zone to the destination zone.  
(For policy-based VPNs) Specify the security policy action **tunnel ipsec-vpn** with the name of the IPsec VPN tunnel that you configured.
5. Update your global VPN settings. See [“Example: Configuring Global SPI and VPN Monitoring Features” on page 6952](#).

  - [Understanding Policy-Based IPsec VPNs on page 6517](#)

## IPsec VPN with Manual Keys Configuration Overview

This overview describes the basic steps to configure a route-based or policy-based IPsec VPN using manual keys.

To configure a route-based or policy-based IPsec VPN using manual keys:

1. Configure interfaces, security zones, and address book information.  
(For route-based VPNs) Configure routing. Configure a secure tunnel **st0.x** interface.
2. Configure an IPsec VPN tunnel by specifying the following parameters:
  - Authentication algorithm and key
  - Encryption algorithm and key
  - Outgoing interface
  - IP address of the peer
  - IPsec protocol for the security association
  - Security parameter index  
(For route-based VPNs) Bind the secure tunnel interface **st0.x** to the IPsec VPN tunnel.
3. Configure security policy to permit traffic from the source zone to the destination zone.  
(For policy-based VPNs) Specify the security policy action **tunnel ipsec-vpn** with the name of the IPsec VPN tunnel that you configured.

## Recommended Configuration Options for Site-to-Site VPN with Static IP Addresses

[Table 531](#) lists the configuration options for a generic site-to-site VPN between two security devices with static IP addresses. The VPN can be either route-based or policy-based.

**Table 531: Recommended Configuration for Site-to-Site VPN with Static IP Addresses**

Configuration Option	Comment
<i>IKE configuration:</i>	
Autokey IKE with certificates	Manual key is not recommended.

**Table 531: Recommended Configuration for Site-to-Site VPN with Static IP Addresses** (*continued*)

Configuration Option	Comment
Main mode	Used when peers have static IP addresses.
RSA or DSA certificates	RSA or DSA certificates can be used on the local device. Specify the type of certificate (PKCS7 or X.509) on the peer.
Diffie-Hellman (DH) group 2	DH group 2 provides more security than DH group 1 and incurs less processing overhead than DH groups 5 and 14.
Advanced Encryption Standard (AES) encryption	AES is cryptographically stronger than Data Encryption Standard (DES) and Triple DES (3DES) when key lengths are equal. Approved encryption algorithm for Federal Information Processing Standards (FIPS) and Common Criteria EAL4 standards.
Secure Hash Algorithm (SHA-1) authentication	SHA-1 provides more cryptographic security than Message Digest 5 (MD5) and incurs less processing overhead than SHA-256.
Local and remote IKE identifiers	IP addresses are used by default if local and remote peers have static IP addresses. Specify the peer's address. IP addresses can be used with a certificate if the IP address appears in the SubjectAltName field.
<i>IPsec configuration:</i>	
Perfect Forward Secrecy (PFS) DH group 2	PFS DH group 2 provides increased security because the peers perform a second DH exchange to produce the key used for IPsec encryption and decryption.
Encapsulating Security Payload (ESP) protocol	ESP provides both confidentiality through encryption and encapsulation of the original IP packet and integrity through authentication.
AES encryption	AES is cryptographically stronger than DES and 3DES when key lengths are equal. Approved encryption algorithm for FIPS and Common Criteria EAL4 standards.
SHA-1 authentication	SHA-1 provides more cryptographic security than MD5.
Anti-replay protection	Enabled by default. Disabling this feature might resolve compatibility issues with third-party peers.

**Related Documentation** • [IPsec VPN Overview on page 6337](#)

## Recommended Configuration Options for Site-to-Site or Dialup VPNs with Dynamic IP Addresses

[Table 532](#) lists the configuration options for a generic site-to-site or dialup VPN, where the peer devices have dynamic IP addresses.

**Table 532: Recommended Configuration for Site-to-Site or Dialup VPNs with Dynamic IP Addresses**

Configuration Option	Comment
<i>IKE configuration:</i>	
Autokey IKE with certificates	Manual key is not recommended.
Aggressive mode	Required when the IP address of one or both of the IPsec peers is dynamically assigned.
1024-bit certificates	RSA or DSA certificates can be used. Specify the certificate to be used on the local device. Specify the type of certificate (PKCS7 or X.509) on the peer.
Diffie-Hellman (DH) group 2	DH group 2 provides more security than DH group 1 and incurs less processing overhead than DH groups 5 and 14.
Advanced Encryption Standard (AES) encryption	AES is cryptographically stronger than Data Encryption Standard (DES) and Triple DES (3DES) when key lengths are equal. Approved encryption algorithm for Federal Information Processing Standards (FIPS) and Common Criteria EAL4 standards.
Secure Hash Algorithm (SHA-1) authentication	SHA-1 provides more cryptographic security than Message Digest 5 (MD5) and incurs less processing overhead than SHA-256.
Local and remote IKE IDs	User-Fully Qualified Domain Name (U-FQDN) is an e-mail address that can be used with a certificate if the U-FQDN appears in the SubjectAltName field.
<i>IPsec configuration:</i>	
Perfect Forward Secrecy (PFS) DH group 2	PFS DH group 2 provides increased security because the peers perform a second DH exchange to produce the key used for IPsec encryption and decryption.
Encapsulating Security Payload (ESP) protocol	ESP provides both confidentiality through encryption and encapsulation of the original IP packet and integrity through authentication.
AES encryption	AES is cryptographically stronger than DES and 3DES when key lengths are equal. Approved encryption algorithm for FIPS and Common Criteria EAL4 standards.
SHA-1 authentication	SHA-1 provides more cryptographic security than MD5.
Anti-replay protection	Enabled by default. Disabling this might resolve compatibility issues with third-party peers.

## Configuring Remote IKE IDs for Site-to-Site VPNs

As of Junos OS Release 11.4, checks are performed to validate the IKE ID received from the VPN peer device. By default, SRX Series devices validate the IKE ID received from the peer with the IP address configured for the IKE gateway. In certain network setups, the

IKE ID received from the peer (which can be an IPv4 or IPv6 address, fully qualified domain name [FQDN], distinguished name, or e-mail address) does not match the IKE gateway configured on the SRX Series device. This can lead to a Phase 1 validation failure.

To modify the configuration of the SRX Series device or the peer device for the IKE ID that is used:

- On the SRX Series device, configure the **remote-identity** statement at the **[edit security ike gateway gateway-name]** hierarchy level to match the IKE ID that is received from the peer. Values can be an IPv4 or IPv6 address, FQDN, distinguished name, or e-mail address.

**NOTE:** If you do not configure **remote-identity**, the device uses the IPv4 or IPv6 address that corresponds to the remote peer by default.

- On the peer device, ensure that the IKE ID is the same as the **remote-identity** configured on the SRX Series device. If the peer device is an SRX Series device, configure the **local-identity** statement at the **[edit security ike gateway gateway-name]** hierarchy level. Values can be an IPv4 or IPv6 address, FQDN, distinguished name, or e-mail address.

## Configuring IPsec VPN Using the VPN Wizard

The VPN Wizard enables you to perform basic IPsec VPN configuration, including both Phase 1 and Phase 2. For more advanced configuration, use the J-Web interface or the CLI.

To configure IPsec VPN using the VPN Wizard:

1. Select **Configure>Tasks>Configure VPN** in the J-Web interface.
2. Click the Launch VPN Wizard button.
3. Follow the wizard prompts.

The upper left area of the wizard page shows where you are in the configuration process. The lower left area of the page shows field-sensitive help. When you click a link under the Resources heading, the document opens in your browser. If the document opens in a new tab, be sure to close only the tab (not the browser window) when you close the document.

## Understanding Suite B Cryptographic Suites

---

Suite B is a set of cryptographic algorithms designated by the U.S. National Security Agency to allow commercial products to protect traffic that is classified at secret or top secret levels. Suite B protocols are defined in RFC 6379, *Suite B Cryptographic Suites for IPsec*. The Suite B cryptographic suites provide Encapsulating Security Payload (ESP) integrity and confidentiality and should be used when ESP integrity protection and encryption are both required.

The following Suite B cryptographic suites are supported:

- Suite-B-GCM-128
  - ESP: Advanced Encryption Standard (AES) encryption with 128-bit keys and 16-octet integrity check value (ICV) in Galois Counter Mode (GCM).
  - IKE: AES encryption with 128-bit keys in cipher block chaining (CBC) mode, integrity using SHA-256 authentication, and key establishment using Diffie-Hellman (DH) group 19 and authentication using Elliptic Curve Digital Signature Algorithm (ECDSA) 256-bit elliptic curve signatures.
- Suite-B-GCM-256
  - ESP: AES encryption with 256-bit keys and 16-octet ICV in GCM for ESP.
  - IKE: AES encryption with 256-bit keys in CBC mode, integrity using SHA-384 authentication, and key establishment using DH group 20 and authentication using ECDSA 384-bit elliptic curve signatures.

IKEv1 and IKEv2 configuration is supported.

**NOTE:** Suite B is not fully supported on SRX5600 and SRX5800 devices that do not have the next-generation SPC installed. You can configure IKE with Suite B options on these devices, but AES-GCM options are not supported. If you configure IKE with Suite B options on these devices, VPN establishment is slower because the devices do not have the hardware processors that can accelerate Suite B algorithm processing.

---

**NOTE:** Suite B is not supported with the group VPN feature.

---

CLI options support Suite B compliance in IKE and IPsec proposal configuration:

- For IKE proposals configured at the `[edit security ike proposal proposal-name]` hierarchy level:
  - **authentication-algorithm** options include `sha-256` and `sha-384`.
  - **authentication-method** options include `ecdsa-signatures-256` and `ecdsa-signatures-384`.
  - **dh-group** options include `group19` and `group20`.
- For IPsec proposals configured at the `[edit security ipsec proposal proposal-name]` hierarchy level, **encryption-algorithm** options include `aes-128-gcm`, `aes-192-gcm`, and `aes-256-gcm`.
- For IPsec policies configured at the `[edit security ipsec policy policy-name]` hierarchy level, the **perfect-forward-secrecy keys** options include `group19` and `group20`.
- For convenience, predefined proposals that provide Suite B compliance—`suiteb-gcm-128` and `suiteb-gcm-256`—are available at the `[edit security ike policy policy-name]` and `[edit security ipsec policy policy-name]` hierarchy levels.

**NOTE:** VPN monitoring and Suite B cryptographic configuration options `ecdsa-signatures-384` (for IKE authentication) and Diffie-Hellman `group20` consume considerable CPU resources. If VPN monitoring and the `ecdsa-signatures-384` and `group20` options are used on an SRX Series device with a large number of tunnels configured, the SRX Series device must have the next-generation SPC installed.

# Understanding VPN Tunnel Management

- [Understanding Distributed VPNs in SRX Series Services Gateways on page 6363](#)
- [Understanding VPN Support for Inserting Services Processing Cards on page 6364](#)

## Understanding Distributed VPNs in SRX Series Services Gateways

In the SRX5000 lines, the IKE provides tunnel management for IPsec and authenticates end entities. The IKE performs a Diffie-Hellman (DH) key exchange to generate an IPsec tunnel between network devices. The IPsec tunnels generated by IKE are used to encrypt, decrypt, and authenticate user traffic between the network devices at the IP layer.

The VPN is created by distributing the IKE and IPsec workload among the multiple Services Processing Units (SPUs) on high-end SRX Series platforms. For site-to-site tunnels, the least-loaded SPU is chosen as the anchor SPU. If multiple SPUs have the same smallest load, any of them can be chosen as an anchor SPU. Here, load corresponds to the number of site-to-site gateways or manual VPN tunnels anchored on an SPU. For dynamic tunnels, the newly established dynamic tunnels employ a round-robin algorithm to select the SPU.

In IPsec, the workload is distributed by the same algorithm that distributes the IKE. The Phase 2 SA for a given VPN tunnel termination point pair is exclusively owned by a particular SPU, and all IPsec packets belonging to this Phase 2 SA are forwarded to the anchoring SPU of that SA for IPsec processing.

Multiple IPsec sessions (Phase 2 SA) can operate over one or more IKE sessions. The SPU that is selected for anchoring the IPsec session is based on the SPU that is anchoring the underlying IKE session. Therefore, all IPsec sessions that run over a single IKE gateway are serviced by the same SPU and are not load-balanced across several SPUs.

[Table 533](#) shows an example of load balancing on an SRX5000 line device with three SPUs running eight IPsec tunnels over four IKE gateways. Note that SPU 0, SPU 1, or SPU 2 could be selected for IKE gateway 4 because all three SPUs have an equal load of one gateway each.

Table 533: Load Balancing Across SPUs

SPU	IKE Gateway	IPsec Tunnel
SPU0	IKE-1	IPsec-1
		IPsec-2
		IPsec-3
SPU1	IKE-2	IPsec-4
		IPsec-5
		IPsec-6
SPU2	IKE-3	IPsec-7
SPU0, SPU1, or SPU2	IKE-4	IPsec-8

Setting up and tearing down existing IPsec tunnels does not affect the underlying IKE session or existing IPsec tunnels.

There is no way to influence the selection of an anchor SPU for a given tunnel.

Use the following **show** command to view the current tunnel count per SPU: **show security ike tunnel-map**.

Use the **summary** option of the command to view the anchor points of each gateway: **show security ike tunnel-map summary**.

**Related Documentation**

- [IPsec VPN Overview on page 6337](#)

## Understanding VPN Support for Inserting Services Processing Cards

High-end SRX Series devices have a chassis-based distributed processor architecture. The flow processing power is shared and is based on the number of Services Processing Cards (SPCs). You can scale the processing power of the device by installing a new SPC.

In a high-end SRX Series chassis cluster, you can insert an SPC on a device without affecting or disrupting the traffic on existing VPN tunnels. However, existing tunnels cannot use the processing power of the Services Processing Units (SPUs) in the new SPC. A new SPU can anchor newly established site-to-site and dynamic tunnels, although newly configured tunnels are not guaranteed to be anchored on the new SPU.

Site-to-site tunnels are anchored on different SPUs based on a load-balancing algorithm. For a new site-to-site tunnel, the SPU with the smallest load is chosen as the anchor SPU. (The load corresponds to the number of site-to-site gateways or manual VPN tunnels anchored on an SPU.) If multiple SPUs have the same smallest load, then any of the SPUs can be chosen as the anchor SPU. A newly configured site-to-site tunnel is

guaranteed to be anchored on the new SPU only if the loads of the existing SPUs are all greater than 0.

Dynamic tunnels are anchored on different SPUs based on a round-robin algorithm. Newly configured dynamic tunnels are not guaranteed to be anchored on the new SPC.

You can view the tunnel mapping on different SPUs using the **show security ike tunnel-map** command.

- [Example: Configuring a Route-Based VPN on page 6370](#)

### Understanding Route-Based IPsec VPNs

---

With route-based VPNs, you can configure dozens of security policies to regulate traffic flowing through a single VPN tunnel between two sites, and there is just one set of IKE and IPsec SAs at work. Unlike policy-based VPNs, for route-based VPNs, a policy refers to a destination address, not a VPN tunnel. When Junos OS looks up a route to find the interface to use to send traffic to the packet's destination address, it finds a route through a secure tunnel interface (st0.x). The tunnel interface is bound to a specific VPN tunnel, and the traffic is routed to the tunnel if the policy action is permit.

**NOTE:** A secure tunnel (st0) interface supports only one IPv4 address and one IPv6 address at the same time. This applies to all route-based VPNs.

Examples of where route-based VPNs can be used:

- There are overlapping subnets or IP addresses between the two LANs.
- A hub-and-spoke VPN topology is used in the network, and spoke-to-spoke traffic is required.
- Primary and backup VPNs are required.
- A dynamic routing protocol (for example, OSPF, RIP, or BGP) is running across the VPN.

**NOTE:** Configuring RIP demand circuits over VPN interfaces is not supported.

We recommend that you use route-based VPN when you want to configure VPN between multiple remote sites. Route-based VPN allows for routing between the spokes between multiple remote sites; it is easier to configure, monitor, and troubleshoot.

## Example: Configuring a Route-Based VPN

---

This example shows how to configure a route-based IPsec VPN to allow data to be securely transferred between a branch office and the corporate office.

- [Requirements on page 6370](#)
- [Overview on page 6370](#)
- [Configuration on page 6374](#)
- [Verification on page 6383](#)

### Requirements

This example uses the following hardware:

- SRX240 device
- SSG140 device

Before you begin, read [“IPsec VPN Overview” on page 6337](#).

### Overview

In this example, you configure a route-based VPN for a branch office in Chicago, Illinois, because you want to conserve tunnel resources but still get granular restrictions on VPN traffic. Users in the Chicago office will use the VPN to connect to their corporate headquarters in Sunnyvale, California.

[Figure 265](#) shows an example of a route-based VPN topology. In this topology, the SRX Series device is located in Sunnyvale, and an SSG Series device (or a third-party device) is located in Chicago.

Figure 265: Route-Based VPN Topology

In this example, you configure interfaces, an IPv4 default route, security zones, and address books. Then you configure IKE Phase 1, IPsec Phase 2, security policy, and TCP-MSS parameters. See [Table 534](#) through [Table 538](#) for specific configuration parameters used in this example.

Table 534: Interface, Static Route, Security Zone, and Address Book Information

Feature	Name	Configuration Parameters
Interfaces	ge-0/0/0.0	10.10.10.1/24
	ge-0/0/3.0	1.1.1.2/30
	st0.0 (tunnel interface)	10.11.11.10/24
Static routes	0.0.0.0/0 (default route)	The next hop is 1.1.1.1.
	192.168.168.0/24	The next hop is st0.0.
Security zones	trust	<ul style="list-style-type: none"> <li>All system services are allowed.</li> <li>The ge-0/0/0.0 interface is bound to this zone.</li> </ul>

Purpose	Name	Configuration Parameters
The security policy permits traffic from the trust zone to the vpn-chicago zone.	vpn-tr-chi	<ul style="list-style-type: none"> <li>Match criteria: <ul style="list-style-type: none"> <li>source-address sunnysvale</li> <li>destination-address chicago</li> <li>application any</li> </ul> </li> <li>Action: permit</li> </ul>
The security policy permits traffic from the vpn-chicago zone to the trust zone.	vpn-chi-tr	<ul style="list-style-type: none"> <li>Match criteria: <ul style="list-style-type: none"> <li>source-address chicago</li> <li>destination-address sunnysvale</li> <li>application any</li> </ul> </li> <li>Action: permit</li> </ul>

Table 538: TCP-MSS Configuration Parameters

Purpose	Configuration Parameters
TCP-MSS is negotiated as part of the TCP three-way handshake and limits the maximum size of a TCP segment to better fit the MTU limits on a network. For VPN traffic, the IPsec encapsulation overhead, along with the IP and frame overhead, can cause the resulting ESP packet to exceed the MTU of the physical interface, which causes fragmentation. Fragmentation increases bandwidth and device resources.	MSS value: 1350
<p><b>NOTE:</b> We recommend a value of 1350 as the starting point for most Ethernet-based networks with an MTU of 1500 or greater. You might need to experiment with different TCP-MSS values to obtain optimal performance. For example, you might need to change the value if any device in the path has a lower MTU, or if there is any additional overhead such as PPP or Frame Relay.</p>	

## Configuration

- [Configuring Interface, Static Route, Security Zone, and Address Book Information on page 6374](#)
- [Configuring IKE on page 6377](#)
- [Configuring IPsec on page 6379](#)
- [Configuring Security Policies on page 6380](#)
- [Configuring TCP-MSS on page 6382](#)
- [Configuring the SSG Series Device on page 6382](#)

### Configuring Interface, Static Route, Security Zone, and Address Book Information

#### CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/0 unit 0 family inet address 10.10.10.1/24
set interfaces ge-0/0/3 unit 0 family inet address 1.1.1.2/30
set interfaces st0 unit 0 family inet address 10.11.11.10/24
set routing-options static route 0.0.0.0/0 next-hop 1.1.1.1
set routing-options static route 192.168.168.0/24 next-hop st0.0
set security zones security-zone untrust interfaces ge-0/0/3.0
set security zones security-zone untrust host-inbound-traffic system-services ike
set security zones security-zone trust interfaces ge-0/0/0.0
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone vpn-chicago interfaces st0.0
set security address-book book1 address sunnyvale 10.10.10.0/24
set security address-book book1 attach zone trust
set security address-book book2 address chicago 192.168.168.0/24
set security address-book book2 attach zone vpn-chicago
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure interface, static route, security zone, and address book information:

1. Configure Ethernet interface information.  

```
[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet address 10.10.10.1/24
user@host# set interfaces ge-0/0/3 unit 0 family inet address 1.1.1.2/30
user@host# set interfaces st0 unit 0 family inet address 10.11.11.10/24
```
2. Configure static route information.  

```
[edit]
user@host# set routing-options static route 0.0.0.0/0 next-hop 1.1.1.1
user@host# set routing-options static route 192.168.168.0/24 next-hop st0.0
```
3. Configure the untrust security zone.  

```
[edit]
```

- ```

user@host# edit security zones security-zone untrust

```
4. Assign an interface to the security zone.

```

[edit security zones security-zone untrust]
user@host# set interfaces ge-0/0/3.0

```
 5. Specify allowed system services for the security zone.

```

[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services ike

```
 6. Configure the trust security zone.

```

[edit]
user@host# edit security zones security-zone trust

```
 7. Assign an interface to the trust security zone.

```

[edit security zones security-zone trust]
user@host# set interfaces ge-0/0/0.0

```
 8. Specify allowed system services for the trust security zone.

```

[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all

```
 9. Configure an address book and attach a zone to it.

```

[edit security address-book book1]
user@host# set address sunnyvale 10.10.10.0/24
user@host# set attach zone trust

```
 10. Configure the vpn-chicago security zone.

```

[edit]
user@host# edit security zones security-zone vpn-chicago

```
 11. Assign an interface to the security zone.

```

[edit security zones security-zone vpn-chicago]
user@host# set interfaces st0.0

```
 12. Configure another address book and attach a zone to it.

```

[edit security address-book book2]
user@host# set address chicago 192.168.168.0/24
user@host# set attach zone vpn-chicago

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, **show security zones**, and **show security address-book** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@host# show interfaces
ge-0/0/0 {
  unit 0 {
    family inet {
      address 10.10.10.1/24;
    }
  }
}

```

```
}
ge-0/0/3 {
  unit 0 {
    family inet {
      address 1.1.1.2/30
    }
  }
}
st0 {
  unit 0 {
    family inet {
      address 10.11.11.10/24
    }
  }
}

[edit]
user@host# show routing-options
static {
  route 0.0.0.0/0 next-hop 1.1.1.1;
  route 192.168.168.0/24 next-hop st0.0;
}

[edit]
user@host# show security zones
security-zone untrust {
  host-inbound-traffic {
    system-services {
      ike;
    }
  }
  interfaces {
    ge-0/0/3.0;
  }
}
security-zone trust {
  host-inbound-traffic {
    system-services {
      all;
    }
  }
  interfaces {
    ge-0/0/0.0;
  }
}
security-zone vpn-chicago {
  interfaces {
    st0.0;
  }
}

[edit]
user@host# show security address-book
book1 {
  address sunnyvale 10.10.10.0/24;
  attach {
    zone trust;
  }
}
```

```

}
book2 {
  address chicago 192.168.168.0/24;
  attach {
    zone vpn-chicago;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring IKE

CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security ike proposal ike-phase1-proposal authentication-method pre-shared-keys
set security ike proposal ike-phase1-proposal dh-group group2
set security ike proposal ike-phase1-proposal authentication-algorithm sha1
set security ike proposal ike-phase1-proposal encryption-algorithm aes-128-cbc
set security ike policy ike-phase1-policy mode main
set security ike policy ike-phase1-policy proposals ike-phase1-proposal
set security ike policy ike-phase1-policy pre-shared-key ascii-text abcpsksecr3t
set security ike gateway gw-chicago external-interface ge-0/0/3.0
set security ike gateway gw-chicago ike-policy ike-phase1-policy
set security ike gateway gw-chicago address 2.2.2.2

```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IKE:

1. Create the IKE Phase 1 proposal.

```
[edit security ike]
user@host# set proposal ike-phase1-proposal
```
2. Define the IKE proposal authentication method.

```
[edit security ike proposal ike-phase1-proposal]
user@host# set authentication-method pre-shared-keys
```
3. Define the IKE proposal Diffie-Hellman group.

```
[edit security ike proposal ike-phase1-proposal]
user@host# set dh-group group2
```
4. Define the IKE proposal authentication algorithm.

```
[edit security ike proposal ike-phase1-proposal]
user@host# set authentication-algorithm sha1
```
5. Define the IKE proposal encryption algorithm.

```
[edit security ike proposal ike-phase1-proposal]
user@host# set encryption-algorithm aes-128-cbc
```

6. Create an IKE Phase 1 policy.

```
[edit security ike]
user@host# set policy ike-phase1-policy
```
7. Set the IKE Phase 1 policy mode.

```
[edit security ike policy ike-phase1-policy]
user@host# set mode main
```
8. Specify a reference to the IKE proposal.

```
[edit security ike policy ike-phase1-policy]
user@host# set proposals ike-phase1-proposal
```
9. Define the IKE Phase 1 policy authentication method.

```
[edit security ike policy ike-phase1-policy]
user@host# set pre-shared-key ascii-text abcpsksecr3t
```
10. Create an IKE Phase 1 gateway and define its external interface.

```
[edit security ike]
user@host# set gateway gw-chicago external-interface ge-0/0/3.0
```
11. Define the IKE Phase 1 policy reference.

```
[edit security ike gateway gw-chicago]
user@host# set ike-policy ike-phase1-policy
```
12. Define the IKE Phase 1 gateway address.

```
[edit security ike gateway gw-chicago]
user@host# set address 2.2.2.2
```

Results From configuration mode, confirm your configuration by entering the **show security ike** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security ike
proposal ike-phase1-proposal {
  authentication-method pre-shared-keys;
  dh-group group2;
  authentication-algorithm sha1;
  encryption-algorithm aes-128-cbc;
}
policy ike-phase1-policy {
  mode main;
  proposals ike-phase1-proposal;
  pre-shared-key ascii-text "$ABC123"; ## SECRET-DATA
}
gateway gw-chicago {
  ike-policy ike-phase1-policy;
  address 2.2.2.2;
  external-interface ge-0/0/3.0;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring IPsec

CLI Quick Configuration To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ipsec proposal ipsec-phase2-proposal protocol esp
set security ipsec proposal ipsec-phase2-proposal authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec-phase2-proposal encryption-algorithm aes-128-cbc
set security ipsec policy ipsec-phase2-policy proposals ipsec-phase2-proposal
set security ipsec policy ipsec-phase2-policy perfect-forward-secrecy keys group2
set security ipsec vpn ike-vpn-chicago ike gateway gw-chicago
set security ipsec vpn ike-vpn-chicago ike ipsec-policy ipsec-phase2-policy
set security ipsec vpn ike-vpn-chicago bind-interface st0.0
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IPsec:

1. Create an IPsec Phase 2 proposal.

```
[edit]
user@host# set security ipsec proposal ipsec-phase2-proposal
```
2. Specify the IPsec Phase 2 proposal protocol.

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@host# set protocol esp
```
3. Specify the IPsec Phase 2 proposal authentication algorithm.

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@host# set authentication-algorithm hmac-sha1-96
```
4. Specify the IPsec Phase 2 proposal encryption algorithm.

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@host# set encryption-algorithm aes-128-cbc
```
5. Create the IPsec Phase 2 policy.

```
[edit security ipsec]
user@host# set policy ipsec-phase2-policy
```
6. Specify the IPsec Phase 2 proposal reference.

```
[edit security ipsec policy ipsec-phase2-policy]
user@host# set proposals ipsec-phase2-proposal
```
7. Specify IPsec Phase 2 PFS to use Diffie-Hellman group 2.

```
[edit security ipsec policy ipsec-phase2-policy]
user@host# set perfect-forward-secrecy keys group2
```
8. Specify the IKE gateway.

```
[edit security ipsec]
```

```
user@host# set vpn ike-vpn-chicago ike gateway gw-chicago
```

9. Specify the IPsec Phase 2 policy.

```
[edit security ipsec]
user@host# set vpn ike-vpn-chicago ike ipsec-policy ipsec-phase2-policy
```

10. Specify the interface to bind.

```
[edit security ipsec]
user@host# set vpn ike-vpn-chicago bind-interface st0.0
```

Results From configuration mode, confirm your configuration by entering the **show security ipsec** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security ipsec
proposal ipsec-phase2-proposal {
  protocol esp;
  authentication-algorithm hmac-sha1-96;
  encryption-algorithm aes-128-cbc;
}
policy ipsec-phase2-policy {
  perfect-forward-secrecy {
    keys group2;
  }
  proposals ipsec-phase2-proposal;
}
vpn ike-vpn-chicago {
  bind-interface st0.0;
  ike {
    gateway gw-chicago;
    ipsec-policy ipsec-phase2-policy;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Security Policies

CLI Quick Configuration To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security policies from-zone trust to-zone vpn-chicago policy vpn-tr-chi match
  source-address sunnyvale
set security policies from-zone trust to-zone vpn-chicago policy vpn-tr-chi match
  destination-address chicago
set security policies from-zone trust to-zone vpn-chicago policy vpn-tr-chi match
  application any
set security policies from-zone trust to-zone vpn-chicago policy vpn-tr-chi then permit
set security policies from-zone vpn-chicago to-zone trust policy vpn-chi-tr match
  source-address chicago
```

```

set security policies from-zone vpn-chicago to-zone trust policy vpn-chi-tr match
destination-address sunnyvale
set security policies from-zone vpn-chicago to-zone trust policy vpn-chi-tr match
application any
set security policies from-zone vpn-chicago to-zone trust policy vpn-chi-tr then permit

```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure security policies:

1. Create the security policy to permit traffic from the trust zone to the vpn-chicago zone.

```

[edit security policies from-zone trust to-zone vpn-chicago]
user@host# set policy vpn-tr-chi match source-address sunnyvale
user@host# set policy vpn-tr-chi match destination-address chicago
user@host# set policy vpn-tr-chi match application any
user@host# set policy vpn-tr-chi then permit

```

2. Create the security policy to permit traffic from the vpn-chicago zone to the trust zone.

```

[edit security policies from-zone vpn-chicago to-zone trust]
user@host# set policy vpn-chi-tr match source-address chicago
user@host# set policy vpn-chi-tr match destination-address sunnyvale
user@host# set policy vpn-chi-tr match application any
user@host# set policy vpn-chi-tr then permit

```

Results From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@host# show security policies
from-zone trust to-zone vpn-chicago {
  policy vpn-tr-vpn {
    match {
      source-address sunnyvale;
      destination-address chicago;
      application any;
    }
    then {
      permit;
    }
  }
}
from-zone vpn-chicago to-zone trust {
  policy vpn-tr-vpn {
    match {
      source-address chicago;
      destination-address sunnyvale;
      application any;
    }
  }
}

```

```
    then {  
        permit;  
    }  
}  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring TCP-MSS

CLI Quick Configuration To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security flow tcp-mss ipsec-vpn mss 1350
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure TCP-MSS information:

1. Configure TCP-MSS information.

```
[edit]  
user@host# set security flow tcp-mss ipsec-vpn mss 1350
```

Results From configuration mode, confirm your configuration by entering the **show security flow** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]  
user@host# show security flow  
tcp-mss {  
    ipsec-vpn {  
        mss 1350;  
    }  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring the SSG Series Device

CLI Quick Configuration For reference, the configuration for the SSG Series device is provided. For information about configuring SSG Series devices, see the *Concepts and Examples ScreenOS Reference Guide*, which is located at <http://www.juniper.net/techpubs>.

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set zone name vpn-chicago
```

```

set interface ethernet0/6 zone Trust
set interface ethernet0/0 zone Untrust
set interface tunnel.1 zone vpn-chicago
set interface ethernet0/6 ip 192.168.168.1/24
set interface ethernet0/6 route
set interface ethernet0/0 ip 2.2.2.2/30
set interface ethernet0/0 route
set interface tunnel.1 ip 10.11.11.11/24
set flow tcp-mss 1350
set address Trust "192.168.168-net" 192.168.168.0 255.255.255.0
set address vpn-chicago "10.10.10-net" 10.10.10.0 255.255.255.0
set ike gateway corp-ike address 1.1.1.2 Main outgoing-interface ethernet0/0 preshare
  395psksecr3t sec-level standard
set vpn corp-vpn gateway corp-ike replay tunnel idletime 0 sec-level standard
set vpn corp-vpn monitor optimized rekey
set vpn corp-vpn bind interface tunnel.1
set policy from Trust to Untrust "ANY" "ANY" "ANY" nat src permit
set policy from Trust to vpn-chicago "192.168.168-net" "10.10.10-net" "ANY" permit
set policy from vpn-chicago to Trust "10.10.10-net" "192.168.168-net" "ANY" permit
set route 10.10.10.0/24 interface tunnel.1
set route 0.0.0.0/0 interface ethernet0/0 gateway 2.2.2.1

```

Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the IKE Phase 1 Status on page 6383](#)
- [Verifying the IPsec Phase 2 Status on page 6385](#)
- [Reviewing Statistics and Errors for an IPsec Security Association on page 6386](#)
- [Testing Traffic Flow Across the VPN on page 6387](#)

Verifying the IKE Phase 1 Status

Purpose Verify the IKE Phase 1 status.

Action

NOTE: Before starting the verification process, you need to send traffic from a host in the 10.10.10/24 network to a host in the 192.168.168/24 network. For route-based VPNs, traffic can be initiated by the SRX Series device through the tunnel. We recommend that when testing IPsec tunnels, test traffic be sent from a separate device on one side of the VPN to a second device on the other side of the VPN. For example, initiate a ping from 10.10.10.10 to 192.168.168.10.

From operational mode, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations index *index_number* detail** command.

```

user@host> show security ike security-associations
Index  Remote Address  State  Initiator cookie  Responder cookie  Mode
1      2.2.2.2         UP     744a594d957dd513  1e1307db82f58387  Main

```

```

user@host> show security ike security-associations index 1 detail
IKE peer 2.2.2.2, Index 1,
  Role: Responder, State: UP
  Initiator cookie: 744a594d957dd513, Responder cookie: 1e1307db82f58387
  Exchange type: Main, Authentication method: Pre-shared-keys
  Local: 1.1.1.2:500, Remote: 2.2.2.2:500
  Lifetime: Expires in 28570 seconds
  Algorithms:
    Authentication      : sha1
    Encryption          : aes-cbc (128 bits)
    Pseudo random function: hmac-sha1
  Traffic statistics:
    Input bytes      :      852
    Output bytes     :      940
    Input packets    :         5
    Output packets   :         5
  Flags: Caller notification sent
  IPSec security associations: 1 created, 0 deleted
  Phase 2 negotiations in progress: 0

```

Meaning The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration.

If SAs are listed, review the following information:

- Index—This value is unique for each IKE SA, which you can use in the **show security ike security-associations index detail** command to get more information about the SA.
- Remote Address—Verify that the remote IP address is correct.
- State
 - UP—The Phase 1 SA has been established.
 - DOWN—There was a problem establishing the Phase 1 SA.
- Mode—Verify that the correct mode is being used.

Verify that the following are correct in your configuration:

- External interfaces (the interface must be the one that receives IKE packets)
- IKE policy parameters
- Preshared key information
- Phase 1 proposal parameters (must match on both peers)

The **show security ike security-associations index 1 detail** command lists additional information about the security association with an index number of 1:

- Authentication and encryption algorithms used
- Phase 1 lifetime
- Traffic statistics (can be used to verify that traffic is flowing properly in both directions)
- Role information

NOTE: Troubleshooting is best performed on the peer using the responder role.

- Initiator and responder information
- Number of IPsec SAs created
- Number of Phase 2 negotiations in progress

Verifying the IPsec Phase 2 Status

Purpose Verify the IPsec Phase 2 status.

Action From operational mode, enter the **show security ipsec security-associations** command. After obtaining an index number from the command, use the **show security ipsec security-associations index *index_number* detail** command.

```
user@host> show security ipsec security-associations
total configured sa: 2
ID      Gateway      Port  Algorithm      SPI      Life:sec/kb  Mon vsys
<16384  2.2.2.2        500   ESP:aes-128/sha1 76d64d1d 3363/ unlim - 0
>16384  2.2.2.2        500   ESP:aes-128/sha1 a1024ee2 3363/ unlim - 0
```

```
user@host> show security ipsec security-associations index 16384 detail
Virtual-system: Root
Local Gateway: 1.1.1.2, Remote Gateway: 2.2.2.2
Local Identity: ipv4_subnet(any:0,[0..7]=10.10.10.0/24)
Remote Identity: ipv4_subnet(any:0,[0..7]=192.168.168.0/24)
DF-bit: clear

Direction: inbound, SPI: 1993755933, AUX-SPI: 0
Hard lifetime: Expires in 3352 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2775 seconds
Mode: tunnel, Type: dynamic, State: installed, VPN Monitoring: -
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: aes-cbc (128 bits)

Anti-replay service: enabled, Replay window size: 32

Direction: outbound, SPI: 2701283042, AUX-SPI: 0
Hard lifetime: Expires in 3352 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2775 seconds
Mode: tunnel, Type: dynamic, State: installed, VPN Monitoring: -
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: aes-cbc
(128 bits)
Anti-replay service: enabled, Replay window size: 32
```

Meaning The output from the **show security ipsec security-associations** command lists the following information:

- The ID number is 16384. Use this value with the **show security ipsec security-associations index** command to get more information about this particular SA.
- There is one IPsec SA pair using port 500, which indicates that no NAT-traversal is implemented. (NAT-traversal uses port 4500 or another random high-number port.)
- The SPIs, lifetime (in seconds), and usage limits (or lifesize in KB) are shown for both directions. The 3363/ unlim value indicates that the Phase 2 lifetime expires in 3363 seconds, and that no lifesize has been specified, which indicates that it is unlimited. Phase 2 lifetime can differ from Phase 1 lifetime, as Phase 2 is not dependent on Phase 1 after the VPN is up.
- VPN monitoring is not enabled for this SA, as indicated by a hyphen in the Mon column. If VPN monitoring is enabled, U indicates that monitoring is up, and D indicates that monitoring is down.
- The virtual system (vsys) is the root system, and it always lists 0.

The output from the **show security ipsec security-associations index 16384 detail** command lists the following information:

- The local identity and remote identity make up the proxy ID for the SA.
A proxy ID mismatch is one of the most common causes for a Phase 2 failure. If no IPsec SA is listed, confirm that Phase 2 proposals, including the proxy ID settings, are correct for both peers. For route-based VPNs, the default proxy ID is local=0.0.0.0/0, remote=0.0.0.0/0, and service=any. Issues can occur with multiple route-based VPNs from the same peer IP. In this case, a unique proxy ID for each IPsec SA must be specified. For some third-party vendors, the proxy ID must be manually entered to match.
- Another common reason for Phase 2 failure is not specifying the ST interface binding. If IPsec cannot complete, check the kmd log or set traceoptions.

Reviewing Statistics and Errors for an IPsec Security Association

Purpose Review ESP and authentication header counters and errors for an IPsec security association.

Action From operational mode, enter the **show security ipsec statistics index *index_number*** command, using the index number of the VPN for which you want to see statistics.

```
user@host> show security ipsec statistics index 16384
ESP Statistics:
  Encrypted bytes:          920
  Decrypted bytes:         6208
  Encrypted packets:        5
  Decrypted packets:       87
AH Statistics:
  Input bytes:              0
  Output bytes:             0
  Input packets:           0
  Output packets:          0
Errors:
  AH authentication failures: 0, Replay errors: 0
```

```
ESP authentication failures: 0, ESP decryption failures: 0
Bad headers: 0, Bad trailers: 0
```

You can also use the **show security ipsec statistics** command to review statistics and errors for all SAs.

To clear all IPsec statistics, use the **clear security ipsec statistics** command.

Meaning If you see packet loss issues across a VPN, you can run the **show security ipsec statistics** or **show security ipsec statistics detail** command several times to confirm that the encrypted and decrypted packet counters are incrementing. You should also check whether the other error counters are incrementing.

Testing Traffic Flow Across the VPN

Purpose Verify the traffic flow across the VPN.

Action You can use the **ping** command from the SRX Series device to test traffic flow to a remote host PC. Make sure that you specify the source interface so that the route lookup is correct and the appropriate security zones are referenced during policy lookup.

From operational mode, enter the **ping** command.

```
ssg-> ping 192.168.168.10 interface ge-0/0/0 count 5
PING 192.168.168.10 (192.168.168.10): 56 data bytes
64 bytes from 192.168.168.10: icmp_seq=0 ttl=127 time=8.287 ms
64 bytes from 192.168.168.10: icmp_seq=1 ttl=127 time=4.119 ms
64 bytes from 192.168.168.10: icmp_seq=2 ttl=127 time=5.399 ms
64 bytes from 192.168.168.10: icmp_seq=3 ttl=127 time=4.361 ms
64 bytes from 192.168.168.10: icmp_seq=4 ttl=127 time=5.137 ms
```

```
--- 192.168.168.10 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max/stddev = 4.119/5.461/8.287/1.490 ms
```

You can also use the **ping** command from the SSG Series device.

```
user@host> ping 10.10.10.10 from ethernet0/6
Type escape sequence to abort
Sending 5, 100-byte ICMP Echos to 10.10.10.10, timeout is 1 seconds from
ethernet0/6
!!!!
Success Rate is 100 percent (5/5), round-trip time min/avg/max=4/4/5 ms
```

Meaning If the **ping** command fails from the SRX Series or SSG Series device, there might be a problem with the routing, security policies, end host, or encryption and decryption of ESP packets.

Understanding Hub-and-Spoke VPNs

If you create two VPN tunnels that terminate at a device, you can set up a pair of routes so that the device directs traffic exiting one tunnel to the other tunnel. You also need to create a policy to permit the traffic to pass from one tunnel to the other. Such an arrangement is known as *hub-and-spoke VPN*. (See [Figure 266](#).)

You can also configure multiple VPNs and route traffic between any two tunnels.

NOTE: SRX Series devices support only the route-based hub-and-spoke feature.

Figure 266: Multiple Tunnels in a Hub-and-Spoke VPN Configuration

Example: Configuring a Hub-and-Spoke VPN

This example shows how to configure a hub-and-spoke IPsec VPN for an enterprise-class deployment.

- [Requirements on page 6390](#)
- [Overview on page 6390](#)
- [Configuration on page 6396](#)
- [Verification on page 6416](#)

Requirements

This example uses the following hardware:

- SRX240 device
- SRX5800 device
- SSG140 device

Before you begin, read [“IPsec VPN Overview” on page 6337](#).

Overview

This example describes how to configure a hub-and-spoke VPN typically found in branch deployments. The hub is the corporate office, and there are two spokes—a branch office in Sunnyvale, California, and a branch office in Westford, Massachusetts. Users in the branch offices will use the VPN to securely transfer data with the corporate office.

[Figure 267](#) shows an example of a hub-and-spoke VPN topology. In this topology, an SRX5800 device is located at the corporate office. An SRX240 device is located at the Westford branch, and an SSG140 device is located at the Sunnyvale branch.

Figure 267: Hub-and-Spoke VPN Topology

In this example, you configure the corporate office hub, the Westford spoke, and the Sunnyvale spoke. First you configure interfaces, IPv4 static and default routes, security zones, and address books. Then you configure IKE Phase 1 and IPsec Phase 2 parameters, and bind the st0.0 interface to the IPsec VPN. On the hub, you configure st0.0 for multipoint and add a static NHTB table entry for the Sunnyvale spoke. Finally, you configure security policy and TCP-MSS parameters. See [Table 539](#) through [Table 543](#) for specific configuration parameters used in this example.

Table 539: Interface, Security Zone, and Address Book Information

| Hub or Spoke | Feature | Name | Configuration Parameters |
|--------------|------------|------------|--------------------------|

| | The security policy permits traffic from the untrust zone to the trust zone. | permit-any | <p>Match criteria:</p> <ul style="list-style-type: none"> source-address any source-destination any application any Permit action: source-nat interface <p>By specifying source-nat interface, the SRX Series device translates the source IP address and port for outgoing traffic, using the IP address of the egress interface as the source IP address and a random high-number port for the source port.</p> |

Table 543: TCP-MSS Configuration Parameters

| Purpose | Configuration Parameters |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <p>TCC-MSS is negotiated as part of the TCP three-way handshake and limits the maximum size of a TCP segment to better fit the MTU limits on a network. For VPN traffic, the IPsec encapsulation overhead, along with the IP and frame overhead, can cause the resulting ESP packet to exceed the MTU of the physical interface, which causes fragmentation. Fragmentation results in increased use of bandwidth and device resources.</p> <p>NOTE: The value of 1350 is a recommended starting point for most Ethernet-based networks with an MTU of 1500 or greater. You might need to experiment with different TCP-MSS values to obtain optimal performance. For example, you might need to change the value if any device in the path has a lower MTU, or if there is any additional overhead such as PPP or Frame Relay.</p> | MSS value: 1350 |

Configuring Basic Network, Security Zone, and Address Book Information for the Hub

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/0 unit 0 family inet address 10.10.10.1/24
set interfaces ge-0/0/3 unit 0 family inet address 1.1.1.2/30
set interfaces st0 unit 0 family inet address 10.11.11.10/24
set routing-options static route 0.0.0.0/0 next-hop 1.1.1.1
set routing-options static route 192.168.168.0/24 next-hop 10.11.11.11
set routing-options static route 192.168.178.0/24 next-hop 10.11.11.12
set security zones security-zone untrust interfaces ge-0/0/3.0
set security zones security-zone untrust host-inbound-traffic system-services ike
set security zones security-zone trust interfaces ge-0/0/0.0
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone vpn interfaces st0.0
set security address-book book1 address local-net 10.10.10.0/24
set security address-book book1 attach zone trust
set security address-book book2 address sunnyvale-net 192.168.168.0/24
set security address-book book2 address westford-net 192.168.178.0/24
set security address-book book2 attach zone vpn
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure basic network, security zone, and address book information for the hub:

1. Configure Ethernet interface information.

```
[edit]
user@hub# set interfaces ge-0/0/0 unit 0 family inet address 10.10.10.1/24
user@hub# set interfaces ge-0/0/3 unit 0 family inet address 1.1.1.2/30
user@hub# set interfaces st0 unit 0 family inet address 10.11.11.10/24
```

2. Configure static route information.

```
[edit]
user@hub# set routing-options static route 0.0.0.0/0 next-hop 1.1.1.1
user@hub# set routing-options static route 192.168.168.0/24 next-hop 10.11.11.11
user@hub# set routing-options static route 192.168.178.0/24 next-hop 10.11.11.12
```

3. Configure the untrust security zone.

```
[edit ]
user@hub# set security zones security-zone untrust
```

4. Assign an interface to the untrust security zone.

```
[edit security zones security-zone untrust]
user@hub# set interfaces ge-0/0/3.0
```

5. Specify allowed system services for the untrust security zone.

```
[edit security zones security-zone untrust]
```

- ```

user@hub# set host-inbound-traffic system-services ike

```
6. Configure the trust security zone.
 

```

[edit]
user@hub# edit security zones security-zone trust

```
  7. Assign an interface to the trust security zone.
 

```

[edit security zones security-zone trust]
user@hub# set interfaces ge-0/0/0.0

```
  8. Specify allowed system services for the trust security zone.
 

```

[edit security zones security-zone trust]
user@hub# set host-inbound-traffic system-services all

```
  9. Create an address book and attach a zone to it.
 

```

[edit security address-book book1]
user@hub# set address local-net 10.10.10.0/24
user@hub# set attach zone trust

```
  10. Configure the vpn security zone.
 

```

[edit]
user@hub# edit security zones security-zone vpn

```
  11. Assign an interface to the vpn security zone.
 

```

[edit security zones security-zone vpn]
user@hub# set interfaces st0.0

```
  12. Create another address book and attach a zone to it.
 

```

[edit security address-book book2]
user@hub# set address sunnyvale-net 192.168.168.0/24
user@hub# set address westford-net 192.168.178.0/24
user@hub# set attach zone vpn

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, **show security zones**, and **show security address-book** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@hub# show interfaces
ge-0/0/0 {
 unit 0 {
 family inet {
 address 10.10.10.1/24;
 }
 }
}
ge-0/0/3 {
 unit 0 {
 family inet {
 address 1.1.1.2/30
 }
 }
}

```

```

}
st0{
 unit 0 {
 family inet {
 address 10.11.11.10/24
 }
 }
}

[edit]
user@hub# show routing-options
static {
 route 0.0.0.0/0 next-hop 1.1.1.1;
 route 192.168.168.0/24 next-hop 10.11.11.11;
 route 192.168.178.0/24 next-hop 10.11.11.12;
}

[edit]
user@hub# show security zones
security-zone untrust {
 host-inbound-traffic {
 system-services {
 ike;
 }
 }
 interfaces {
 ge-0/0/3.0;
 }
}
security-zone trust {
 host-inbound-traffic {
 system-services {
 all;
 }
 }
 interfaces {
 ge-0/0/0.0;
 }
}
security-zone vpn {
 host-inbound-traffic {
 }
 interfaces {
 st0.0;
 }
}

[edit]
user@hub# show security address-book
book1 {
 address local-net 10.10.10.0/24;
 attach {
 zone trust;
 }
}
book2 {
 address sunnyvale-net 192.168.168.0/24;
 address westford-net 192.168.178.0/24;
}

```

```

attach {
 zone vpn;
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring IKE for the Hub

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security ike proposal ike-phase1-proposal authentication-method pre-shared-keys
set security ike proposal ike-phase1-proposal dh-group group2
set security ike proposal ike-phase1-proposal authentication-algorithm sha1
set security ike proposal ike-phase1-proposal encryption-algorithm aes-128-cbc
set security ike policy ike-phase1-policy mode main
set security ike policy ike-phase1-policy proposals ike-phase1-proposal
set security ike policy ike-phase1-policy pre-shared-key ascii-text 395psksecr3t
set security ike gateway gw-westford external-interface ge-0/0/3.0
set security ike gateway gw-westford ike-policy ike-phase1-policy
set security ike gateway gw-westford address 3.3.3.2
set security ike gateway gw-sunnyvale external-interface ge-0/0/3.0
set security ike gateway gw-sunnyvale ike-policy ike-phase1-policy
set security ike gateway gw-sunnyvale address 2.2.2.2

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IKE for the hub:

1. Create the IKE Phase 1 proposal.  

```

[edit security ike]
user@hub# set proposal ike-phase1-proposal

```
2. Define the IKE proposal authentication method.  

```

[edit security ike proposal ike-phase1-proposal]
user@hub# set authentication-method pre-shared-keys

```
3. Define the IKE proposal Diffie-Hellman group.  

```

[edit security ike proposal ike-phase1-proposal]
user@hub# set dh-group group2

```
4. Define the IKE proposal authentication algorithm.  

```

[edit security ike proposal ike-phase1-proposal]
user@hub# set authentication-algorithm sha1

```
5. Define the IKE proposal encryption algorithm.  

```

[edit security ike proposal ike-phase1-proposal]
user@hub# set encryption-algorithm aes-128-cbc

```

6. Create an IKE Phase 1 policy.  

```
[edit security ike]
user@hub# set policy ike-phase1-policy
```
7. Set the IKE Phase 1 policy mode.  

```
[edit security ike policy ike-phase1-policy]
user@hub# set mode main
```
8. Specify a reference to the IKE proposal.  

```
[edit security ike policy ike-phase1-policy]
user@hub# set proposals ike-phase1-proposal
```
9. Define the IKE Phase 1 policy authentication method.  

```
[edit security ike policy ike-phase1-policy]
user@hub# set pre-shared-key ascii-text 395psksecr3t
```
10. Create an IKE Phase 1 gateway and define its external interface.  

```
[edit security ike]
user@hub# set gateway gw-westford external-interface ge-0/0/3.0
```
11. Define the IKE Phase 1 policy reference.  

```
[edit security ike]
user@hub# set gateway gw-westford ike-policy ike-phase1-policy
```
12. Define the IKE Phase 1 gateway address.  

```
[edit security ike]
user@hub# set gateway gw-westford address 3.3.3.2
```
13. Create an IKE Phase 1 gateway and define its external interface.  

```
[edit security ike]
user@hub# set gateway gw-sunnyvale external-interface ge-0/0/3.0
```
14. Define the IKE Phase 1 policy reference.  

```
[edit security ike gateway]
user@hub# set gateway gw-sunnyvale ike-policy ike-phase1-policy
```
15. Define the IKE Phase 1 gateway address.  

```
[edit security ike gateway]
user@hub# set gateway gw-sunnyvale address 2.2.2.2
```

**Results** From configuration mode, confirm your configuration by entering the **show security ike** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@hub# show security ike
proposal ike-phase1-proposal {
 authentication-method pre-shared-keys;
 dh-group group2;
 authentication-algorithm sha1;
 encryption-algorithm aes-128-cbc;
}
```

```

policy ike-phase1-policy {
 mode main;
 proposals ike-phase1-proposal;
 pre-shared-key ascii-text "$ABC123"; ## SECRET-DATA
}
gateway gw-sunnyvale {
 ike-policy ike-phase1-policy;
 address 2.2.2.2;
 external-interface ge-0/0/3.0;
}
gateway gw-westford {
 ike-policy ike-phase1-policy;
 address 3.3.3.2;
 external-interface ge-0/0/3.0;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring IPsec for the Hub

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security ipsec proposal ipsec-phase2-proposal protocol esp
set security ipsec proposal ipsec-phase2-proposal authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec-phase2-proposal encryption-algorithm aes-128-cbc
set security ipsec policy ipsec-phase2-policy proposals ipsec-phase2-proposal
set security ipsec policy ipsec-phase2-policy perfect-forward-secrecy keys group2
set security ipsec vpn vpn-westford ike gateway gw-westford
set security ipsec vpn vpn-westford ike ipsec-policy ipsec-phase2-policy
set security ipsec vpn vpn-westford bind-interface st0.0
set security ipsec vpn vpn-sunnyvale ike gateway gw-sunnyvale
set security ipsec vpn vpn-sunnyvale ike ipsec-policy ipsec-phase2-policy
set security ipsec vpn vpn-sunnyvale bind-interface st0.0
set interfaces st0 unit 0 multipoint
set interfaces st0 unit 0 family inet next-hop-tunnel 10.11.11.11 ipsec-vpn vpn-sunnyvale

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IPsec for the hub:

1. Create an IPsec Phase 2 proposal.
 

```

[edit]
user@hub# set security ipsec proposal ipsec-phase2-proposal

```
2. Specify the IPsec Phase 2 proposal protocol.
 

```

[edit security ipsec proposal ipsec-phase2-proposal]
user@hub# set protocol esp

```
3. Specify the IPsec Phase 2 proposal authentication algorithm.

- ```
[edit security ipsec proposal ipsec-phase2-proposal]
user@hub# set authentication-algorithm hmac-sha1-96
```
4. Specify the IPsec Phase 2 proposal encryption algorithm.

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@hub# set encryption-algorithm aes-128-cbc
```
 5. Create the IPsec Phase 2 policy.

```
[edit security ipsec]
user@hub# set policy ipsec-phase2-policy
```
 6. Specify the IPsec Phase 2 proposal reference.

```
[edit security ipsec policy ipsec-phase2-policy]
user@hub# set proposals ipsec-phase2-proposal
```
 7. Specify IPsec Phase 2 PFS to use Diffie-Hellman group 2.

```
[edit security ipsec policy ipsec-phase2-policy]
user@host# set perfect-forward-secrecy keys group2
```
 8. Specify the IKE gateways.

```
[edit security ipsec]
user@hub# set vpn vpn-westford ike gateway gw-westford
user@hub# set vpn vpn-sunnyvale ike gateway gw-sunnyvale
```
 9. Specify the IPsec Phase 2 policies.

```
[edit security ipsec]
user@hub# set vpn vpn-westford ike ipsec-policy ipsec-phase2-policy
user@hub# set vpn vpn-sunnyvale ike ipsec-policy ipsec-phase2-policy
```
 10. Specify the interface to bind.

```
[edit security ipsec]
user@hub# set vpn vpn-westford bind-interface st0.0
user@hub# set vpn vpn-sunnyvale bind-interface st0.0
```
 11. Configure the st0 interface as multipoint.

```
[edit]
user@hub# set interfaces st0 unit 0 multipoint
```
 12. Add static NHTB table entries for the Sunnyvale and Westford offices.

```
[edit]
user@hub# set interfaces st0 unit 0 family inet next-hop-tunnel 10.11.11.11 ipsec-vpn
vpn-sunnyvale
user@hub# set interfaces st0 unit 0 family inet next-hop-tunnel 10.11.11.12 ipsec-vpn
vpn-westford
```

Results From configuration mode, confirm your configuration by entering the **show security ipsec** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@hub# show security ipsec
proposal ipsec-phase2-proposal {
  protocol esp;
```

```

    authentication-algorithm hmac-sha1-96;
    encryption-algorithm aes-128-cbc;
  }
  policy ipsec-phase2-policy {
    perfect-forward-secrecy {
      keys group2;
    }
    proposals ipsec-phase2-proposal;
  }
  vpn vpn-sunnyvale {
    bind-interface st0.0;
    ike {
      gateway gw-sunnyvale;
      ipsec-policy ipsec-phase2-policy;
    }
  }
  vpn vpn-westford {
    bind-interface st0.0;
    ike {
      gateway gw-westford;
      ipsec-policy ipsec-phase2-policy;
    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Security Policies for the Hub

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security policies from-zone trust to-zone vpn policy local-to-spokes match
  source-address local-net
set security policies from-zone trust to-zone vpn policy local-to-spokes match
  destination-address sunnyvale-net
set security policies from-zone trust to-zone vpn policy local-to-spokes match
  destination-address westford-net
set security policies from-zone trust to-zone vpn policy local-to-spokes match application
  any
set security policies from-zone trust to-zone vpn policy local-to-spokes then permit
set security policies from-zone vpn to-zone trust policy spokes-to-local match
  source-address sunnyvale-net
set security policies from-zone vpn to-zone trust policy spokes-to-local match
  source-address westford-net
set security policies from-zone vpn to-zone trust policy spokes-to-local match
  destination-address local-net
set security policies from-zone vpn to-zone trust policy spokes-to-local match application
  any
set security policies from-zone vpn to-zone trust policy spokes-to-local then permit
set security policies from-zone vpn to-zone vpn policy spoke-to-spoke match
  source-address any
set security policies from-zone vpn to-zone vpn policy spoke-to-spoke match
  destination-address any

```

```

set security policies from-zone vpn to-zone vpn policy spoke-to-spoke match application
any
set security policies from-zone vpn to-zone vpn policy spoke-to-spoke then permit

```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure security policies for the hub:

1. Create the security policy to permit traffic from the trust zone to the vpn zone.

```

[edit security policies from-zone trust to-zone vpn]
user@hub# set policy local-to-spokes match source-address local-net
user@hub# set policy local-to-spokes match destination-address sunnyvale-net
user@hub# set policy local-to-spokes match destination-address westford-net
user@hub# set policy local-to-spokes match application any
user@hub# set policy local-to-spokes then permit

```

2. Create the security policy to permit traffic from the vpn zone to the trust zone.

```

[edit security policies from-zone vpn to-zone trust]
user@hub# set policy spokes-to-local match source-address sunnyvale-net
user@hub# set policy spokes-to-local match source-address westford-net
user@hub# set policy spokes-to-local match destination-address local-net
user@hub# set policy spokes-to-local match application any
user@hub# set policy spokes-to-local then permit

```

3. Create the security policy to permit intrazone traffic.

```

[edit security policies from-zone vpn to-zone vpn]
user@hub# set policy spoke-to-spoke match source-address any
user@hub# set policy spoke-to-spoke match destination-address any
user@hub# set policy spoke-to-spoke match application any
user@hub# set policy spoke-to-spoke then permit

```

Results From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@hub# show security policies
from-zone trust to-zone vpn {
  policy local-to-spokes {
    match {
      source-address local-net;
      destination-address [ sunnyvale-net westford-net ];
      application any;
    }
    then {
      permit;
    }
  }
}
from-zone vpn to-zone trust {
  policy spokes-to-local {

```

```
match {
  source-address [ sunnyvale-net westford-net ];
  destination-address local-net;
  application any;
}
then {
  permit;
}
}
}
from-zone vpn to-zone vpn {
  policy spoke-to-spoke {
    match {
      source-address any;
      destination-address any;
      application any;
    }
    then {
      permit;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring TCP-MSS for the Hub

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security flow tcp-mss ipsec-vpn mss 1350
```

Step-by-Step Procedure To configure TCP-MSS information for the hub:

1. Configure TCP-MSS information.

```
[edit]
user@hub# set security flow tcp-mss ipsec-vpn mss 1350
```

Results From configuration mode, confirm your configuration by entering the **show security flow** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@hub# show security flow
tcp-mss {
  ipsec-vpn {
    mss 1350;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Basic Network, Security Zone, and Address Book Information for the Westford Spoke

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/0 unit 0 family inet address 3.3.3.2/30
set interfaces ge-0/0/3 unit 0 family inet address 192.168.178.1/24
set interfaces st0 unit 0 family inet address 10.11.11.12/24
set routing-options static route 0.0.0.0/0 next-hop 3.1.1.1
set routing-options static route 10.10.10.0/24 next-hop 10.11.11.10
set routing-options static route 192.168.168.0/24 next-hop 10.11.11.10
set security zones security-zone untrust interfaces ge-0/0/0.0
set security zones security-zone untrust host-inbound-traffic system-services ike
set security zones security-zone trust interfaces ge-0/0/3.0
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone vpn interfaces st0.0
set security address-book book1 address local-net 192.168.178.0/24
set security address-book book1 attach zone trust
set security address-book book2 address corp-net 10.10.10.0/24
set security address-book book2 address sunnyvale-net 192.168.168.0/24
set security address-book book2 attach zone vpn
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure basic network, security zone, and address book information for the Westford spoke:

1. Configure Ethernet interface information.

```
[edit]
user@spoke# set interfaces ge-0/0/0 unit 0 family inet address 3.3.3.2/30
user@spoke# set interfaces ge-0/0/3 unit 0 family inet address 192.168.178.1/24
user@spoke# set interfaces st0 unit 0 family inet address 10.11.11.12/24
```
2. Configure static route information.

```
[edit]
user@spoke# set routing-options static route 0.0.0.0/0 next-hop 3.1.1.1
user@spoke# set routing-options static route 10.10.10.0/24 next-hop 10.11.11.10
user@spoke# set routing-options static route 192.168.168.0/24 next-hop 10.11.11.10
```
3. Configure the untrust security zone.

```
[edit]
user@spoke# set security zones security-zone untrust
```
4. Assign an interface to the security zone.

```
[edit security zones security-zone untrust]
user@spoke# set interfaces ge-0/0/0.0
```
5. Specify allowed system services for the untrust security zone.

- ```
[edit security zones security-zone untrust]
user@spoke# set host-inbound-traffic system-services ike
```
6. Configure the trust security zone.
 

```
[edit]
user@spoke# edit security zones security-zone trust
```
  7. Assign an interface to the trust security zone.
 

```
[edit security zones security-zone trust]
user@spoke# set interfaces ge-0/0/3.0
```
  8. Specify allowed system services for the trust security zone.
 

```
[edit security zones security-zone trust]
user@spoke# set host-inbound-traffic system-services all
```
  9. Configure the vpn security zone.
 

```
[edit]
user@spoke# edit security zones security-zone vpn
```
  10. Assign an interface to the vpn security zone.
 

```
[edit security zones security-zone vpn]
user@spoke# set interfaces st0.0
```
  11. Create an address book and attach a zone to it.
 

```
[edit security address-book book1]
user@spoke# set address local-net 192.168.178.0/24
user@spoke# set attach zone trust
```
  12. Create another address book and attach a zone to it.
 

```
[edit security address-book book2]
user@spoke# set address corp-net 10.10.10.0/24
user@spoke# set address sunnyvale-net 192.168.168.0/24
user@spoke# set attach zone vpn
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, **show security zones**, and **show security address-book** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@spoke# show interfaces
ge-0/0/0 {
 unit 0 {
 family inet {
 address 3.3.3.2/30;
 }
 }
}
ge-0/0/3 {
 unit 0 {
 family inet {
 address 192.168.178.1/24;
 }
 }
}
```

```

 }
 }
 st0 {
 unit 0 {
 family inet {
 address 10.11.11.10/24;
 }
 }
 }
}

[edit]
user@spoke# show routing-options
static {
 route 0.0.0.0/0 next-hop 3.1.1.1;
 route 192.168.168.0/24 next-hop 10.11.11.10;
 route 10.10.10.0/24 next-hop 10.11.11.10;
}

[edit]
user@spoke# show security zones
security-zone untrust {

 address corp-net 10.10.10.0/24;
 attach {
 zone trust;
 }
}
book2 {
 address local-net 192.168.178.0/24;
 address sunnyvale-net 192.168.168.0/24;
 attach {

```

```

 zone vpn;
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring IKE for the Westford Spoke

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security ike proposal ike-phase1-proposal authentication-method pre-shared-keys
set security ike proposal ike-phase1-proposal dh-group group2
set security ike proposal ike-phase1-proposal authentication-algorithm sha1
set security ike proposal ike-phase1-proposal encryption-algorithm aes-128-cbc
set security ike policy ike-phase1-policy mode main
set security ike policy ike-phase1-policy proposals ike-phase1-proposal
set security ike policy ike-phase1-policy pre-shared-key ascii-text 395psksecr3t
set security ike gateway gw-corporate external-interface ge-0/0/0.0
set security ike gateway gw-corporate ike-policy ike-phase1-policy
set security ike gateway gw-corporate address 1.1.1.2

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IKE for the Westford spoke:

1. Create the IKE Phase 1 proposal.  

```

[edit security ike]
user@spoke# set proposal ike-phase1-proposal

```
2. Define the IKE proposal authentication method.  

```

[edit security ike proposal ike-phase1-proposal]
user@spoke# set authentication-method pre-shared-keys

```
3. Define the IKE proposal Diffie-Hellman group.  

```

[edit security ike proposal ike-phase1-proposal]
user@spoke# set dh-group group2

```
4. Define the IKE proposal authentication algorithm.  

```

[edit security ike proposal ike-phase1-proposal]
user@spoke# set authentication-algorithm sha1

```
5. Define the IKE proposal encryption algorithm.  

```

[edit security ike proposal ike-phase1-proposal]
user@spoke# set encryption-algorithm aes-128-cbc

```
6. Create an IKE Phase 1 policy.  

```

[edit security ike]
user@spoke# set policy ike-phase1-policy

```

7. Set the IKE Phase 1 policy mode.  

```
[edit security ike policy ike-phase1-policy]
user@spoke# set mode main
```
8. Specify a reference to the IKE proposal.  

```
[edit security ike policy ike-phase1-policy]
user@spoke# set proposals ike-phase1-proposal
```
9. Define the IKE Phase 1 policy authentication method.  

```
[edit security ike policy ike-phase1-policy]
user@spoke# set pre-shared-key ascii-text 395psksecr3t
```
10. Create an IKE Phase 1 gateway and define its external interface.  

```
[edit security ike]
user@spoke# set gateway gw-corporate external-interface ge-0/0/0.0
```
11. Define the IKE Phase 1 policy reference.  

```
[edit security ike]
user@spoke# set gateway gw-corporate ike-policy ike-phase1-policy
```
12. Define the IKE Phase 1 gateway address.  

```
[edit security ike]
user@spoke# set gateway gw-corporate address 1.1.1.2
```

**Results** From configuration mode, confirm your configuration by entering the **show security ike** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@spoke# show security ike
proposal ike-phase1-proposal {
 authentication-method pre-shared-keys;
 dh-group group2;
 authentication-algorithm sha1;
 encryption-algorithm aes-128-cbc;
}
policy ike-phase1-policy {
 mode main;
 proposals ike-phase1-proposal;
 pre-shared-key ascii-text "$ABC123"; ## SECRET-DATA
}
gateway gw-corporate {
 ike-policy ike-phase1-policy;
 address 1.1.1.2;
 external-interface ge-0/0/0.0;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring IPsec for the Westford Spoke

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ipsec proposal ipsec-phase2-proposal protocol esp
set security ipsec proposal ipsec-phase2-proposal authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec-phase2-proposal encryption-algorithm aes-128-cbc
set security ipsec policy ipsec-phase2-policy proposals ipsec-phase2-proposal
set security ipsec policy ipsec-phase2-policy perfect-forward-secrecy keys group2
set security ipsec vpn vpn-corporate ike gateway gw-corporate
set security ipsec vpn vpn-corporate ike ipsec-policy ipsec-phase2-policy
set security ipsec vpn vpn-corporate bind-interface st0.0
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IPsec for the Westford spoke:

1. Create an IPsec Phase 2 proposal.
 

```
[edit]
user@spoke# set security ipsec proposal ipsec-phase2-proposal
```
2. Specify the IPsec Phase 2 proposal protocol.
 

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@spoke# set protocol esp
```
3. Specify the IPsec Phase 2 proposal authentication algorithm.
 

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@spoke# set authentication-algorithm hmac-sha1-96
```
4. Specify the IPsec Phase 2 proposal encryption algorithm.
 

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@spoke# set encryption-algorithm aes-128-cbc
```
5. Create the IPsec Phase 2 policy.
 

```
[edit security ipsec]
user@spoke# set policy ipsec-phase2-policy
```
6. Specify the IPsec Phase 2 proposal reference.
 

```
[edit security ipsec policy ipsec-phase2-policy]
user@spoke# set proposals ipsec-phase2-proposal
```
7. Specify IPsec Phase 2 PFS to use Diffie-Hellman group 2.
 

```
[edit security ipsec policy ipsec-phase2-policy]
user@host# set perfect-forward-secrecy keys group2
```
8. Specify the IKE gateway.
 

```
[edit security ipsec]
user@spoke# set vpn vpn-corporate ike gateway gw-corporate
```
9. Specify the IPsec Phase 2 policy.
 

```
[edit security ipsec]
user@spoke# set vpn vpn-corporate ike ipsec-policy ipsec-phase2-policy
```

10. Specify the interface to bind.

```
[edit security ipsec]
user@spoke# set vpn vpn-corporate bind-interface st0.0
```

**Results** From configuration mode, confirm your configuration by entering the **show security ipsec** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@spoke# show security ipsec
proposal ipsec-phase2-proposal {
 protocol esp;
 authentication-algorithm hmac-sha1-96;
 encryption-algorithm aes-128-cbc;
}
policy ipsec-phase2-policy {
 perfect-forward-secrecy {
 keys group2;
 }
 proposals ipsec-phase2-proposal;
}
vpn vpn-corporate {
 bind-interface st0.0;
 ike {
 gateway gw-corporate;
 ipsec-policy ipsec-phase2-policy;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Security Policies for the Westford Spoke

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security policies from-zone trust to-zone vpn policy to-corporate match source-address local-net
set security policies from-zone trust to-zone vpn policy to-corporate match destination-address corp-net
set security policies from-zone trust to-zone vpn policy to-corporate match destination-address sunnyvale-net
set security policies from-zone trust to-zone vpn policy to-corporate application any
set security policies from-zone trust to-zone vpn policy to-corporate then permit
set security policies from-zone vpn to-zone trust policy from-corporate match source-address corp-net
set security policies from-zone vpn to-zone trust policy from-corporate match source-address sunnyvale-net
set security policies from-zone vpn to-zone trust policy from-corporate match destination-address local-net
set security policies from-zone vpn to-zone trust policy from-corporate application any
set security policies from-zone vpn to-zone trust policy from-corporate then permit
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure security policies for the Westford spoke:

1. Create the security policy to permit traffic from the trust zone to the vpn zone.

```
[edit security policies from-zone trust to-zone vpn]
user@spoke# set policy to-corp match source-address local-net
user@spoke# set policy to-corp match destination-address corp-net
user@spoke# set policy to-corp match destination-address sunnyvale-net
user@spoke# set policy to-corp match application any
user@spoke# set policy to-corp then permit
```

2. Create the security policy to permit traffic from the vpn zone to the trust zone.

```
[edit security policies from-zone vpn to-zone trust]
user@spoke# set policy spokes-to-local match source-address corp-net
user@spoke# set policy spokes-to-local match source-address sunnyvale-net
user@spoke# set policy spokes-to-local match destination-address local-net
user@spoke# set policy spokes-to-local match application any
user@spoke# set policy spokes-to-local then permit
```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@spoke# show security policies
from-zone trust to-zone vpn {
 policy to-corp {
 match {
 source-address local-net;
 destination-address [sunnyvale-net westford-net];
 application any;
 }
 then {
 permit;
 }
 }
}
from-zone vpn to-zone trust {
 policy spokes-to-local {
 match {
 source-address [sunnyvale-net westford-net];
 destination-address local-net;
 application any;
 }
 then {
 permit;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring TCP-MSS for the Westford Spoke

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security flow tcp-mss ipsec-vpn mss 1350
```

**Step-by-Step Procedure** To configure TCP-MSS for the Westford spoke:

1. Configure TCP-MSS information.

```
[edit]
user@spoke# set security flow tcp-mss ipsec-vpn mss 1350
```

**Results** From configuration mode, confirm your configuration by entering the **show security flow** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@spoke# show security flow
tcp-mss {
 ipsec-vpn {
 mss 1350;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring the Sunnyvale Spoke

**CLI Quick Configuration** This example uses an SSG Series device for the Sunnyvale spoke. For reference, the configuration for the SSG Series device is provided. For information about configuring SSG Series devices, see the *Concepts and Examples ScreenOS Reference Guide*, which is located at <http://www.juniper.net/techpubs>.

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set zone name "VPN"
set interface ethernet0/6 zone "Trust"
set interface "tunnel.1" zone "VPN"
set interface ethernet0/6 ip 192.168.168.1/24
set interface ethernet0/6 route
set interface ethernet0/0 ip 2.2.2.2/30
set interface ethernet0/0 route
set interface tunnel.1 ip 10.11.11.1/24
set flow tcp-mss 1350
set address "Trust" "sunnyvale-net" 192.168.168.0 255.255.255.0
set address "VPN" "corp-net" 10.10.10.0 255.255.255.0
```

```

set address "VPN" "westford-net" 192.168.178.0 255.255.255.0
set ike gateway "corp-ike" address 1.1.1.2 Main outgoing-interface ethernet0/0 preshare
 "395psksecr3t" sec-level standard
set vpn corp-vpn monitor optimized rekey
set vpn "corp-vpn" bind interface tunnel.1
set vpn "corp-vpn" gateway "corp-ike" replay tunnel idletime 0 sec-level standard
set policy id 1 from "Trust" to "Untrust" "ANY" "ANY" "ANY" nat src permit
set policy id 2 from "Trust" to "VPN" "sunnyvale-net" "corp-net" "ANY" permit
set policy id 2
exit
set dst-address "westford-net"
exit
set policy id 3 from "VPN" to "Trust" "corp-net" "sunnyvale-net" "ANY" permit
set policy id 3
set src-address "westford-net"
exit
set route 10.10.10.0/24 interface tunnel.1
set route 192.168.178.0/24 interface tunnel.1
set route 0.0.0.0/0 interface ethernet0/0 gateway 2.2.2.1

```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the IKE Phase 1 Status on page 6416](#)
- [Verifying the IPsec Phase 2 Status on page 6418](#)
- [Verifying Next-Hop Tunnel Bindings on page 6419](#)
- [Verifying Static Routes for Remote Peer Local LANs on page 6420](#)
- [Reviewing Statistics and Errors for an IPsec Security Association on page 6420](#)
- [Testing Traffic Flow Across the VPN on page 6421](#)

### Verifying the IKE Phase 1 Status

**Purpose** Verify the IKE Phase 1 status.

**Action**

**NOTE:** Before starting the verification process, you need to send traffic from a host in the 10.10.10/24 network to a host in the 192.168.168/24 and 192.168.178/24 networks to bring the tunnels up. For route-based VPNs, you can send traffic initiated from the SRX Series device through the tunnel. We recommend that when testing IPsec tunnels, you send test traffic from a separate device on one side of the VPN to a second device on the other side of the VPN. For example, initiate a ping from 10.10.10.10 to 192.168.168.10.

From operational mode, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations index *index\_number* detail** command.

```
user@hub> show security ike security-associations
```

Index	Remote Address	State	Initiator cookie	Responder cookie	Mode
6	3.3.3.2	UP	94906ae2263bbd8e	1c35e4c3fc54d6d3	Main
7	2.2.2.2	UP	7e7a1c0367dfe73c	f284221c656a5fbc	Main

```

user@hub> show security ike security-associations index 6 detail
IKE peer 3.3.3.2, Index 6,
 Role: Responder, State: UP
 Initiator cookie: 94906ae2263bbd8e,, Responder cookie: 1c35e4c3fc54d6d3
 Exchange type: Main, Authentication method: Pre-shared-keys
 Local: 1.1.1.2:500, Remote: 3.3.3.2:500
 Lifetime: Expires in 3571 seconds
 Algorithms:
 Authentication : sha1
 Encryption : aes-cbc (128 bits)
 Pseudo random function: hmac-sha1
 Traffic statistics:
 Input bytes : 1128
 Output bytes : 988
 Input packets : 6
 Output packets : 5
 Flags: Caller notification sent
 IPSec security associations: 1 created, 0 deleted
 Phase 2 negotiations in progress: 1
 Negotiation type: Quick mode, Role: Responder, Message ID: 1350777248
 Local: 1.1.1.2:500, Remote: 3.3.3.2:500
 Local identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
 Remote identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
 Flags: Caller notification sent, Waiting for done

```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration.

If SAs are listed, review the following information:

- Index—This value is unique for each IKE SA, which you can use in the **show security ike security-associations index detail** command to get more information about the SA.
- Remote Address—Verify that the remote IP address is correct.
- State
  - UP—The Phase 1 SA has been established.
  - DOWN—There was a problem establishing the Phase 1 SA.
- Mode—Verify that the correct mode is being used.

Verify that the following information is correct in your configuration:

- External interfaces (the interface must be the one that receives IKE packets)
- IKE policy parameters
- Preshared key information
- Phase 1 proposal parameters (must match on both peers)

The **show security ike security-associations index 1 detail** command lists additional information about the security association with an index number of 1:

- Authentication and encryption algorithms used
- Phase 1 lifetime
- Traffic statistics (can be used to verify that traffic is flowing properly in both directions)
- Initiator and responder role information

**NOTE:** Troubleshooting is best performed on the peer using the responder role.

- Number of IPsec SAs created
- Number of Phase 2 negotiations in progress

### Verifying the IPsec Phase 2 Status

**Purpose** Verify the IPsec Phase 2 status.

**Action** From operational mode, enter the **show security ipsec security-associations** command. After obtaining an index number from the command, use the **show security ipsec security-associations index *index\_number* detail** command.

```
user@hub> show security ipsec security-associations
total configured sa: 4
ID Gateway Port Algorithm SPI Life:sec/kb Mon vsys

<16384 2.2.2.2 500 ESP:aes-128/sha1 b2fc36f8 3364/ unlim - 0
>16384 2.2.2.2 500 ESP:aes-128/sha1 5d73929e 3364/ unlim - 0
ID Gateway Port Algorithm SPI Life:sec/kb Mon vsys

<16385 3.3.3.2 500 ESP:3des/sha1 70f789c6 28756/unlim - 0
>16385 3.3.3.2 500 ESP:3des/sha1 80f4126d 28756/unlim - 0
```

```
user@hub> show security ipsec security-associations index 16385 detail
Virtual-system: Root
Local Gateway: 1.1.1.2, Remote Gateway: 3.3.3.2
Local Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/24)
Remote Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
DF-bit: clear
Direction: inbound, SPI: 1895270854, AUX-SPI: 0
Hard lifetime: Expires in 28729 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 28136 seconds
Mode: tunnel, Type: dynamic, State: installed, VPN Monitoring: -
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: aes-cbc (128 bits)

Anti-replay service: enabled, Replay window size: 32

Direction: outbound, SPI: 2163479149, AUX-SPI: 0
Hard lifetime: Expires in 28729 seconds
Lifesize Remaining: Unlimited
```

```

Soft lifetime: Expires in 28136 seconds
Mode: tunnel, Type: dynamic, State: installed, VPN Monitoring: -
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: aes-cbc (128 bits)

```

```

Anti-replay service: enabled, Replay window size: 32

```

**Meaning** The output from the **show security ipsec security-associations** command lists the following information:

- The ID number is 16385. Use this value with the **show security ipsec security-associations index** command to get more information about this particular SA.
- There is one IPsec SA pair using port 500, which indicates that no NAT-traversal is implemented. (NAT-traversal uses port 4500 or another random high-number port.)
- The SPIs, lifetime (in seconds), and usage limits (or lifesize in KB) are shown for both directions. The 28756/ unlim value indicates that the Phase 2 lifetime expires in 28756 seconds, and that no lifesize has been specified, which indicates that it is unlimited. Phase 2 lifetime can differ from Phase 1 lifetime, as Phase 2 is not dependent on Phase 1 after the VPN is up.
- VPN monitoring is not enabled for this SA, as indicated by a hyphen in the Mon column. If VPN monitoring is enabled, U indicates that monitoring is up, and D indicates that monitoring is down.
- The virtual system (vsys) is the root system, and it always lists 0.

The output from the **show security ipsec security-associations index 16385 detail** command lists the following information:

- The local identity and remote identity make up the proxy ID for the SA.

A proxy ID mismatch is one of the most common causes for a Phase 2 failure. If no IPsec SA is listed, confirm that Phase 2 proposals, including the proxy ID settings, are correct for both peers. For route-based VPNs, the default proxy ID is local=0.0.0.0/0, remote=0.0.0.0/0, and service=any. Issues can occur with multiple route-based VPNs from the same peer IP. In this case, a unique proxy ID for each IPsec SA must be specified. For some third-party vendors, the proxy ID must be manually entered to match.

- Another common reason for Phase 2 failure is not specifying the ST interface binding. If IPsec cannot complete, check the kmd log or set traceoptions.

### Verifying Next-Hop Tunnel Bindings

**Purpose** After Phase 2 is complete for all peers, verify the next-hop tunnel bindings.

**Action** From operational mode, enter the **show security ipsec next-hop-tunnels** command.

```

user@hub> show security ipsec next-hop-tunnels
Next-hop gateway interface IPSec VPN name Flag
10.11.11.11 st0.0 sunnyvale-vpn Static
10.11.11.12 st0.0 westford-vpn Auto

```

**Meaning** The next-hop gateways are the IP addresses for the st0 interfaces of all remote spoke peers. The next hop should be associated with the correct IPsec VPN name. If no NHTB entry exists, there is no way for the hub device to differentiate which IPsec VPN is associated with which next hop.

The Flag field has one of the following values:

- Static— NHTB was manually configured in the st0.0 interface configurations, which is required if the peer is not an SRX Series device.
- Auto— NHTB was not configured, but the entry was automatically populated into the NHTB table during Phase 2 negotiations between two SRX Series devices

There is no NHTB table for any of the spoke sites in this example. From the spoke perspective, the st0 interface is still a point-to-point link with only one IPsec VPN binding.

### Verifying Static Routes for Remote Peer Local LANs

**Purpose** Verify that the static route references the spoke peer's st0 IP address.

**Action** From operational mode, enter the **show route** command.

```
user@hub> show route 192.168.168.10
inet.0: 9 destinations, 9 routes (9 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.168.0/24 *[Static/5] 00:08:33
 > to 10.11.11.11 via st0.0

user@hub> show route 192.168.178.10
inet.0: 9 destinations, 9 routes (9 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.178.0/24 *[Static/5] 00:04:04
 > to 10.11.11.12 via st0.0
```

The next hop is the remote peer's st0 IP address, and both routes point to st0.0 as the outgoing interface.

### Reviewing Statistics and Errors for an IPsec Security Association

**Purpose** Review ESP and authentication header counters and errors for an IPsec security association.

**Action** From operational mode, enter the **show security ipsec statistics index** command.

```
user@hub> show security ipsec statistics index 16385
ESP Statistics:
 Encrypted bytes: 920
 Decrypted bytes: 6208
 Encrypted packets: 5
 Decrypted packets: 87
AH Statistics:
 Input bytes: 0
 Output bytes: 0
```

```

Input packets: 0
Output packets: 0
Errors:
 AH authentication failures: 0, Replay errors: 0
 ESP authentication failures: 0, ESP decryption failures: 0
 Bad headers: 0, Bad trailers: 0

```

You can also use the **show security ipsec statistics** command to review statistics and errors for all SAs.

To clear all IPsec statistics, use the **clear security ipsec statistics** command.

**Meaning** If you see packet loss issues across a VPN, you can run the **show security ipsec statistics** or **show security ipsec statistics detail** command several times to confirm that the encrypted and decrypted packet counters are incrementing. You should also check whether the other error counters are incrementing.

### Testing Traffic Flow Across the VPN

**Purpose** Verify the traffic flow across the VPN.

**Action** You can use the **ping** command from the SRX Series device to test traffic flow to a remote host PC. Make sure that you specify the source interface so that the route lookup is correct and the appropriate security zones are referenced during policy lookup.

From operational mode, enter the **ping** command.

```

user@hub> ping 192.168.168.10 interface ge-0/0/0 count 5
PING 192.168.168.10 (192.168.168.10): 56 data bytes
64 bytes from 192.168.168.10: icmp_seq=0 ttl=127 time=8.287 ms
64 bytes from 192.168.168.10: icmp_seq=1 ttl=127 time=4.119 ms
64 bytes from 192.168.168.10: icmp_seq=2 ttl=127 time=5.399 ms
64 bytes from 192.168.168.10: icmp_seq=3 ttl=127 time=4.361 ms
64 bytes from 192.168.168.10: icmp_seq=4 ttl=127 time=5.137 ms

--- 192.168.168.10 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max/stddev = 4.119/5.461/8.287/1.490 ms

```

You can also use the **ping** command from the SSG Series device.

```

user@hub> ping 10.10.10.10 from ethernet0/6
Type escape sequence to abort
Sending 5, 100-byte ICMP Echos to 10.10.10.10, timeout is 1 seconds from
ethernet0/6
!!!!
Success Rate is 100 percent (5/5), round-trip time min/avg/max=4/4/5 ms

ssg-> ping 192.168.178.10 from ethernet0/6
Type escape sequence to abort
Sending 5, 100-byte ICMP Echos to 192.168.178.10, timeout is 1 seconds from
ethernet0/6
!!!!
Success Rate is 100 percent (5/5), round-trip time min/avg/max=8/8/10 ms

```

**Meaning** If the **ping** command fails from the SRX Series or SSG Series device, there might be a problem with the routing, security policies, end host, or encryption and decryption of ESP packets.

### Understanding Internet Key Exchange Version 2

---

Internet Key Exchange version 2 (IKEv2) is the next generation standard for secure key exchange between peer VPN devices, as defined in RFC 5996, *Internet Key Exchange Protocol Version 2 (IKEv2)*.

A VPN peer is configured as either IKEv1 or IKEv2. When a peer is configured as IKEv2, it cannot fall back to IKEv1 if its remote peer initiates IKEv1 negotiation. By default, Juniper Networks security devices are IKEv1 peers. As of Junos OS Release 11.3R1, you can configure a Juniper Networks security device as an IKEv2 peer.

Use the **version v2-only** configuration statement at the `[edit security ike gateway gw-name]` hierarchy level to configure IKEv2. The IKE version is displayed in the output of the **show security ike security-associations** and **show security ipsec security-associations** CLI operational commands.

The advantages of using IKEv2 over IKEv1 are as follows:

- Replaces eight initial exchanges with a single four-message exchange.
- Reduces the latency for the IPsec SA setup and increases connection establishment speed.
- Increases robustness against DOS attacks.
- Improves reliability through the use of sequence numbers, acknowledgements, and error correction.
- Improves reliability, as all messages are requests or responses. The initiator is responsible for retransmitting if it does not receive a response.

IKEv2 includes support for:

- Route-based VPNs.

**NOTE:** IKEv2 does not support policy-based VPNs.

- Site-to-site VPNs.
- Dead peer detection.
- Chassis cluster.
- Certificate-based authentication.
- Child SAs. An IKEv2 child SA is known as a Phase 2 SA in IKEv1. In IKEv2, a child SA cannot exist without the underlying IKE SA. If a child SA is required, it is rekeyed. However, if child SAs are currently active, the corresponding IKE SA is rekeyed.
- AutoVPN.
- Dynamic endpoint VPN.

IKEv2 does not support the following features:

- Policy-based VPN.
- Dialup tunnels.
- VPN monitoring.
- EAP.
- Multiple child SAs for the same traffic selectors for each QoS value.
- IP Payload Compression Protocol (IPComp).
- Traffic selectors.

---

## Understanding IKEv2 Configuration Payload

Configuration payload is an Internet Key Exchange version 2 (IKEv2) feature used to propagate provisioning information from a responder (or server) to an initiator (or client). IKEv2 configuration payload is supported with route-based VPNs only.

RFC 5996, *Internet Key Exchange Protocol Version 2 (IKEv2)*, defines 15 different configuration attributes that can be returned to the initiator by the responder. [Table 544](#) describes the IKEv2 configuration attributes supported on SRX Series devices.

Table 544: IKEv2 Configuration Attributes

Attribute Type	Value	Description	Length
INTERNAL_IP4_ADDRESS	1	Specifies an address on the internal network. Multiple internal addresses can be requested. The responder can send up to the number of addresses requested.	0 or 4 octets
INTERNAL_IP4_NETMASK	2	Specifies the internal network's netmask value. Only one netmask value is allowed in the request and response messages (for example, 255.255.255.0), and it must be used only with an INTERNAL_IP4_ADDRESS attribute.	0 or 4 octets
INTERNAL_IP4_DNS	3	Specifies an address of a DNS server within the network. Multiple DNS servers can be requested. The responder can respond with zero or more DNS server attributes.	0 or 4 octets
INTERNAL_IP4_NBNS	4	Specifies an address of a NetBIOS name server (NBNS), for example, a WINS server, within the network. Multiple NBNS servers can be requested. The responder can respond with zero or more NBNS server attributes.	0 or 4 octets
INTERNAL_IP4_DHCP	6	Instructs the host to send any internal DHCP request to the address contained within the attribute. Multiple DHCP servers can be requested. The responder can respond with zero or more DHCP server attributes.	0 or 4 octets

For the IKE responder to provide the initiator with provisioning information, it must acquire the information from a specified source such as a RADIUS server. Provisioning information can also be returned from a DHCP server through a RADIUS server. On the RADIUS server, the user information should not include an authentication password. The RADIUS server profile is bound to the IKE gateway using the ***xauth access-profile profile-name*** configuration at the **[edit security ike gateway gateway-name]** hierarchy level.

In a route-based VPN, secure tunnel (st0) interfaces operate in either point-to-multipoint or point-to-point mode. Dynamic address assignment through the IKEv2 configuration payload is supported for point-to-multipoint interfaces only. For point-to-multipoint interfaces, the interfaces must be numbered and the addresses in the configuration payload INTERNAL\_IP4\_ADDRESS attribute type must be within the subnetwork range of the associated point-to-multipoint interface.

## Example: Configuring a Route-Based VPN for IKEv2

This example shows how to configure a route-based IPsec VPN to allow data to be securely transferred between a branch office and a corporate office.

- [Requirements on page 6426](#)
- [Overview on page 6426](#)
- [Configuration on page 6428](#)
- [Verification on page 6438](#)

### Requirements

This example uses the following hardware:

- SRX240 device
- SSG140 device

Before you begin, read [“IPsec VPN Overview” on page 6337](#).

### Overview

In this example, you configure a route-based VPN for a branch office in Chicago, Illinois, because you want to conserve tunnel resources but still get granular restrictions on VPN traffic. Users in the Chicago office will use the VPN to connect to their corporate headquarters in Sunnyvale, California.

In this example, you configure interfaces, an IPv4 default route, security zones, and address books. Then you configure IKE Phase 1, IPsec Phase 2, a security policy, and TCP-MSS parameters. See [Table 545](#) through [Table 549](#) for specific configuration parameters used in this example.

**Table 545: Interface, Static Route, Security Zone, and Address Book Information**

Feature	Name	Configuration Parameters
Interfaces	ge-0/0/0.0	10.10.10.1/24
	ge-0/0/3.0	1.1.1.2/30
	st0.0 (tunnel interface)	10.11.11.10/24
Static routes	0.0.0.0/0 (default route)	The next hop is 1.1.1.1.
	192.168.168.0/24	The next hop is st0.0.

Table 545: Interface, Static Route, Security Zone, and Address Book Information (*continued*)

Feature	Name	Configuration Parameters
Security zones	trust	<ul style="list-style-type: none"> <li>All system services are allowed.</li> <li>The ge-0/0/0.0 interface is bound to this zone.</li> </ul>
	untrust	<ul style="list-style-type: none"> <li>IKE is the only allowed system service.</li> <li>The ge-0/0/3.0 interface is bound to this zone.</li> </ul>
	vpn-chicago	The st0.0 interface is bound to this zone.
Address book entries	sunnyvale	<ul style="list-style-type: none"> <li>This address is for the trust zone's address book.</li> <li>The address for this address book entry is 10.10.10.0/24.</li> </ul>
	chicago	<ul style="list-style-type: none"> <li>This address is for the untrust zone's address book.</li> <li>The address for this address book entry is 192.168.168.0/24.</li> </ul>

Table 546: IKE Phase 1 Configuration Parameters

Feature	Name	Configuration Parameters
Proposal	ike-phase1-proposal	<ul style="list-style-type: none"> <li>Authentication method: pre-shared-keys</li> <li>Diffie-Hellman group: group2</li> <li>Authentication algorithm: sha1</li> <li>Encryption algorithm: aes-128-cbc</li> </ul>

Purpose	Name	Configuration Parameters
The security policy permits traffic from the trust zone to the vpn-chicago zone.	vpn-tr-chi	<ul style="list-style-type: none"> <li>Match criteria: <ul style="list-style-type: none"> <li>source-address sunnyvale</li> <li>destination-address chicago</li> <li>application any</li> </ul> </li> <li>Action: permit</li> </ul>
The security policy permits traffic from the vpn-chicago zone to the trust zone.	vpn-chi-tr	<ul style="list-style-type: none"> <li>Match criteria: <ul style="list-style-type: none"> <li>source-address chicago</li> <li>destination-address sunnyvale</li> <li>application any</li> </ul> </li> <li>Action: permit</li> </ul>

Table 549: TCP-MSS Configuration Parameters

Purpose	Configuration Parameters
<p>TCP-MSS is negotiated as part of the TCP three-way handshake and limits the maximum size of a TCP segment to better fit the MTU limits on a network. For VPN traffic, the IPsec encapsulation overhead, along with the IP and frame overhead, can cause the resulting ESP packet to exceed the MTU of the physical interface, which causes fragmentation. Fragmentation increases bandwidth and device resources.</p> <p><b>NOTE:</b> We recommend a value of 1350 as the starting point for most Ethernet-based networks with an MTU of 1500 or greater. You might need to experiment with different TCP-MSS values to obtain optimal performance. For example, you might need to change the value if any device in the path has a lower MTU, or if there is any additional overhead such as PPP or Frame Relay.</p>	MSS value: 1350

### Configuring Interface, Static Route, Security Zone, and Address Book Information

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/0 unit 0 family inet address 10.10.10.1/24
set interfaces ge-0/0/3 unit 0 family inet address 1.1.1.2/30
set interfaces st0 unit 0 family inet address 10.11.11.10/24
set routing-options static route 0.0.0.0/0 next-hop 1.1.1.1
set routing-options static route 192.168.168.0/24 next-hop st0.0
set security zones security-zone untrust interfaces ge-0/0/3.0
set security zones security-zone trust interfaces ge-0/0/0.0
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust address-book address sunnyvale 10.10.10.0/24
set security zones security-zone vpn-chicago interfaces st0.0
set security zones security-zone vpn-chicago address-book address chicago
192.168.168.0/24
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure interface, static route, security zone, and address book information:

1. Configure Ethernet interface information.  

```
[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet address 10.10.10.1/24
user@host# set interfaces ge-0/0/3 unit 0 family inet address 1.1.1.2/30
user@host# set interfaces st0 unit 0 family inet address 10.11.11.10/24
```
2. Configure static route information.  

```
[edit]
user@host# set routing-options static route 0.0.0.0/0 next-hop 1.1.1.1
user@host# set routing-options static route 192.168.168.0/24 next-hop st0.0
```
3. Configure the untrust security zone.  

```
[edit]
user@host# edit security zones security-zone untrust
```
4. Assign an interface to the security zone.  

```
[edit security zones security-zone untrust]
user@host# set interfaces ge-0/0/3.0
```
5. Specify allowed system services for the security zone.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services ike
```

6. Configure the trust security zone.

```
[edit]
user@host# edit security zones security-zone trust
```

7. Assign an interface to the trust security zone.

```
[edit security zones security-zone trust]
user@host# set interfaces ge-0/0/0.0
```

8. Specify allowed system services for the trust security zone.

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
```

9. Configure the address book entry for the trust security zone.

```
[edit security zones security-zone trust]
user@host# set address-book address sunnyvale 10.10.10.0/24
```

10. Configure the vpn-chicago security zone.

```
[edit]
user@host# edit security zones security-zone vpn-chicago
```

11. Assign an interface to the security zone.

```
[edit security zones security-zone vpn-chicago]
user@host# set interfaces st0.0
```

12. Configure the address book entry for the vpn-chicago zone.

```
[edit security zones security-zone vpn-chicago]
user@host# set address-book address chicago 192.168.168.0/24
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, and **show security zones** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces
ge-0/0/0 {
 unit 0 {
 family inet {
 address 10.10.10.1/24;
 }
 }
}
ge-0/0/3 {
 unit 0 {
 family inet {
 address 1.1.1.2/30
 }
 }
}
st0{
```

```

 unit 0 {
 family inet {
 address 10.11.11.10/24
 }
 }
}

[edit]
user@host# show routing-options
static {
 route 0.0.0.0/0 next-hop 1.1.1.1;
 route 192.168.168.0/24 next-hop st0.0;
}

[edit]
user@host# show security zones
security-zone untrust {
 host-inbound-traffic {
 system-services {
 ike;
 }
 }
 interfaces {
 ge-0/0/3.0;
 }
}
security-zone trust {
 address-book {
 address sunnyvale 10.10.10.0/24;
 }
 host-inbound-traffic {
 system-services {
 all;
 }
 }
 interfaces {
 ge-0/0/0.0;
 }
}
security-zone vpn-chicago {
 host-inbound-traffic {
 address-book {
 address chicago 192.168.168.0/24;
 }
 }
 interfaces {
 st0.0;
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring IKE

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ike proposal ike-phase1-proposal authentication-method pre-shared-keys
set security ike proposal ike-phase1-proposal dh-group group2
set security ike proposal ike-phase1-proposal authentication-algorithm sha1
set security ike proposal ike-phase1-proposal encryption-algorithm aes-128-cbc
set security ike policy ike-phase1-policy proposals ike-phase1-proposal
set security ike policy ike-phase1-policy pre-shared-key ascii-text 395psksecr3t
set security ike gateway gw-chicago external-interface ge-0/0/3.0
set security ike gateway gw-chicago ike-policy ike-phase1-policy
set security ike gateway gw-chicago address 2.2.2.2
set security ike gateway gw-chicago version v2-only
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IKE:

1. Create the IKE Phase 1 proposal.  

```
[edit security ike]
user@host# set proposal ike-phase1-proposal
```
2. Define the IKE proposal authentication method.  

```
[edit security ike proposal ike-phase1-proposal]
user@host# set authentication-method pre-shared-keys
```
3. Define the IKE proposal Diffie-Hellman group.  

```
[edit security ike proposal ike-phase1-proposal]
user@host# set dh-group group2
```
4. Define the IKE proposal authentication algorithm.  

```
[edit security ike proposal ike-phase1-proposal]
user@host# set authentication-algorithm sha1
```
5. Define the IKE proposal encryption algorithm.  

```
[edit security ike proposal ike-phase1-proposal]
user@host# set encryption-algorithm aes-128-cbc
```
6. Create an IKE Phase 1 policy.  

```
[edit security ike]
user@host# set policy ike-phase1-policy
```
7. Specify a reference to the IKE proposal.  

```
[edit security ike policy ike-phase1-policy]
user@host# set proposals ike-phase1-proposal
```
8. Define the IKE Phase 1 policy authentication method.  

```
[edit security ike policy ike-phase1-policy]
user@host# set pre-shared-key ascii-text 395psksecr3t
```
9. Create an IKE Phase 1 gateway and define its external interface.

```
[edit security ike]
user@host# set gateway gw-chicago external-interface ge-0/0/3.0
```

10. Define the IKE Phase 1 policy reference.

```
[edit security ike gateway gw-chicago]
user@host# set ike-policy ike-phase1-policy
```

11. Define the IKE Phase 1 gateway address.

```
[edit security ike gateway gw-chicago]
user@host# set address 2.2.2.2
```

12. Define the IKE Phase 1 gateway version.

```
[edit security ike gateway gw-chicago]
user@host# set version v2-only
```

**Results** From configuration mode, confirm your configuration by entering the **show security ike** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security ike
proposal ike-phase1-proposal {
 authentication-method pre-shared-keys;
 dh-group group2;
 authentication-algorithm sha1;
 encryption-algorithm aes-128-cbc;
}
policy ike-phase1-policy {
 proposals ike-phase1-proposal;
 pre-shared-key ascii-text "$ABC123"; ## SECRET-DATA
}
gateway gw-chicago {
 ike-policy ike-phase1-policy;
 address 2.2.2.2;
 external-interface ge-0/0/3.0;
 version v2-only;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring IPsec

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ipsec proposal ipsec-phase2-proposal protocol esp
set security ipsec proposal ipsec-phase2-proposal authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec-phase2-proposal encryption-algorithm aes-128-cbc
set security ipsec policy ipsec-phase2-policy proposals ipsec-phase2-proposal
set security ipsec policy ipsec-phase2-policy perfect-forward-secrecy keys group2
set security ipsec vpn ipsec-vpn-chicago ike gateway gw-chicago
set security ipsec vpn ipsec-vpn-chicago ike ipsec-policy ipsec-phase2-policy
```

```
set security ipsec vpn ipsec-vpn-chicago bind-interface st0.0
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IPsec:

1. Create an IPsec Phase 2 proposal.  

```
[edit]
user@host# set security ipsec proposal ipsec-phase2-proposal
```
2. Specify the IPsec Phase 2 proposal protocol.  

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@host# set protocol esp
```
3. Specify the IPsec Phase 2 proposal authentication algorithm.  

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@host# set authentication-algorithm hmac-sha1-96
```
4. Specify the IPsec Phase 2 proposal encryption algorithm.  

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@host# set encryption-algorithm aes-128-cbc
```
5. Create the IPsec Phase 2 policy.  

```
[edit security ipsec]
user@host# set policy ipsec-phase2-policy
```
6. Specify the IPsec Phase 2 proposal reference.  

```
[edit security ipsec policy ipsec-phase2-policy]
user@host# set proposals ipsec-phase2-proposal
```
7. Specify IPsec Phase 2 PFS to use Diffie-Hellman group 2.  

```
[edit security ipsec policy ipsec-phase2-policy]
user@host# set perfect-forward-secrecy keys group2
```
8. Specify the IKE gateway.  

```
[edit security ipsec]
user@host# set vpn ipsec-vpn-chicago ike gateway gw-chicago
```
9. Specify the IPsec Phase 2 policy.  

```
[edit security ipsec]
user@host# set vpn ipsec-vpn-chicago ike ipsec-policy ipsec-phase2-policy
```
10. Specify the interface to bind.  

```
[edit security ipsec]
user@host# set vpn ipsec-vpn-chicago bind-interface st0.0
```

**Results** From configuration mode, confirm your configuration by entering the **show security ipsec** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security ipsec
proposal ipsec-phase2-proposal {
 protocol esp;
 authentication-algorithm hmac-sha1-96;
 encryption-algorithm aes-128-cbc;
}
policy ipsec-phase2-policy {
 perfect-forward-secrecy {
 keys group2;
 }
 proposals ipsec-phase2-proposal;
}
vpn ipsec-vpn-chicago {
 bind-interface st0.0;
 ike {
 gateway gw-chicago;
 ipsec-policy ipsec-phase2-policy;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Security Policies

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security policies from-zone trust to-zone vpn-chicago policy vpn-tr-chi match
source-address sunnysvale
set security policies from-zone trust to-zone vpn-chicago policy vpn-tr-chi match
destination-address chicago
set security policies from-zone trust to-zone vpn-chicago policy vpn-tr-chi match
application any
set security policies from-zone trust to-zone vpn-chicago policy vpn-tr-chi then permit
set security policies from-zone vpn-chicago to-zone trust policy vpn-chi-tr match
source-address chicago
set security policies from-zone vpn-chicago to-zone trust policy vpn-chi-tr match
destination-address sunnysvale
set security policies from-zone vpn-chicago to-zone trust policy vpn-chi-tr match
application any
set security policies from-zone vpn-chicago to-zone trust policy vpn-chi-tr then permit
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure security policies:

1. Create the security policy to permit traffic from the trust zone to the vpn-chicago zone.

```
[edit security policies from-zone trust to-zone vpn-chicago]
```

```

user@host# set policy vpn-tr-chi match source-address sunnyvale
user@host# set policy vpn-tr-chi match destination-address chicago
user@host# set policy vpn-tr-chi match application any
user@host# set policy vpn-tr-chi then permit

```

2. Create the security policy to permit traffic from the vpn-chicago zone to the trust zone.

```

[edit security policies from-zone vpn-chicago to-zone trust]
user@host# set policy vpn-chi-tr match source-address sunnyvale
user@host# set policy vpn-chi-tr match destination-address chicago
user@host# set policy vpn-chi-tr match application any
user@host# set policy vpn-chi-tr then permit

```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@host# show security policies
from-zone trust to-zone vpn-chicago {
 policy vpn-tr-vpn {
 match {
 source-address sunnyvale;
 destination-address chicago;
 application any;
 }
 then {
 permit;
 }
 }
}
from-zone vpn-chicago to-zone trust {
 policy vpn-tr-vpn {
 match {
 source-address chicago;
 destination-address sunnyvale;
 application any;
 }
 then {
 permit;
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring TCP-MSS

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security flow tcp-mss ipsec-vpn mss 1350

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure TCP-MSS information:

1. Configure TCP-MSS information.

```
[edit]
user@host# set security flow tcp-mss ipsec-vpn mss 1350
```

**Results** From configuration mode, confirm your configuration by entering the **show security flow** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security flow
tcp-mss {
 ipsec-vpn {
 mss 1350;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring the SSG Series Device

**CLI Quick Configuration** For reference, the configuration for the SSG Series device is provided. For information about configuring SSG Series devices, see the *Concepts & Examples ScreenOS Reference Guide*, which is located at <http://www.juniper.net/techpubs>.

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set zone name vpn-chicago
set interface ethernet0/6 zone Trust
set interface ethernet0/0 zone Untrust
set interface tunnel.1 zone vpn-chicago
set interface ethernet0/6 ip 192.168.168.1/24
set interface ethernet0/6 route
set interface ethernet0/0 ip 2.2.2.2/30
set interface ethernet0/0 route
set interface tunnel.1 ip 10.11.11.11/24
set flow tcp-mss 1350
set address Trust "192.168.168-net" 192.168.168.0 255.255.255.0
set address vpn-chicago "10.10.10-net" 10.10.10.0 255.255.255.0
set ike gateway corp-ike address 1.1.1.2 IKEv2 outgoing-interface ethernet0/0 preshare
 395psksecr3t sec-level standard
set vpn corp-vpn gateway corp-ike replay tunnel idletime 0 sec-level standard
set vpn corp-vpn monitor optimized rekey
set vpn corp-vpn bind interface tunnel.1
set policy from Trust to Untrust "ANY" "ANY" "ANY" nat src permit
```

```

set policy from Trust to vpn-chicago "192.168.168-net" "10.10.10-net" "ANY" permit
set policy from vpn-chicago to Trust "10.10.10-net" "192.168.168-net" "ANY" permit
set route 10.10.10.0/24 interface tunnel.1
set route 0.0.0.0/0 interface ethernet0/0 gateway 2.2.2.1

```

## Verification

Confirm that the configuration is working properly.

- [Verifying the IKE Phase 1 Status on page 6438](#)
- [Verifying the IPsec Phase 2 Status on page 6439](#)
- [Reviewing Statistics and Errors for an IPsec Security Association on page 6441](#)
- [Testing Traffic Flow Across the VPN on page 6441](#)

### Verifying the IKE Phase 1 Status

**Purpose** Verify the IKE Phase 1 status.

#### Action

**NOTE:** Before starting the verification process, you need to send traffic from a host in the 10.10.10/24 network to a host in the 192.168.168/24 network. For route-based VPNs, traffic can be initiated by the SRX Series device through the tunnel. We recommend that when testing IPsec tunnels, test traffic be sent from a separate device on one side of the VPN to a second device on the other side of the VPN. For example, initiate a ping from 10.10.10.10 to 192.168.168.10.

From operational mode, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations index *index\_number* detail** command.

```

user@host> show security ike security-associations
Index Remote Address State Initiator cookie Responder cookie Mode
1 2.2.2.2 UP 744a594d957dd513 1e1307db82f58387 IKEv2

```

```

user@host> show security ike security-associations index 1 detail
IKE peer 2.2.2.2, Index 1,
 Role: Responder, State: UP
 Initiator cookie: 744a594d957dd513, Responder cookie: 1e1307db82f58387
 Exchange type: IKEv2, Authentication method: Pre-shared-keys
 Local: 1.1.1.2:500, Remote: 2.2.2.2:500
 Lifetime: Expires in 28570 seconds
 Algorithms:
 Authentication : sha1
 Encryption : aes-cbc (128 bits)
 Pseudo random function: hmac-sha1
 Traffic statistics:
 Input bytes : 852
 Output bytes : 940
 Input packets : 5
 Output packets : 5
 Flags: Caller notification sent

```

IPSec security associations: 1 created, 0 deleted

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration.

If SAs are listed, review the following information:

- Index—This value is unique for each IKE SA, which you can use in the **show security ike security-associations index detail** command to get more information about the SA.
- Remote Address—Verify that the remote IP address is correct.
- State
  - UP—The Phase 1 SA has been established.
  - DOWN—There was a problem establishing the Phase 1 SA.
- Mode—Verify that the correct mode is being used.

Verify that the following are correct in your configuration:

- External interfaces (the interface must be the one that receives IKE packets).
- IKE policy parameters.
- Preshared key information.
- Phase 1 proposal parameters (must match on both peers).

The **show security ike security-associations index 1 detail** command lists additional information about the SA with an index number of 1:

- Authentication and encryption algorithms used
- Phase 1 lifetime
- Traffic statistics (can be used to verify that traffic is flowing properly in both directions)
- Role information

**NOTE:** Troubleshooting is best performed on the peer using the responder role.

- Initiator and responder information
- Number of IPsec SAs created

### Verifying the IPsec Phase 2 Status

**Purpose** Verify the IPsec Phase 2 status.

**Action** From operational mode, enter the **show security ipsec security-associations** command. After obtaining an index number from the command, use the **show security ipsec security-associations index *index\_number* detail** command.

```
user@host> show security ipsec security-associations
total configured sa: 2

Hard lifetime: Expires in 3352 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2775 seconds
Mode: tunnel, Type: dynamic, State: installed, VPN Monitoring: -
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: aes-cbc
(128 bits)
Anti-replay service: enabled, Replay window size: 32
```

**Meaning** The output from the **show security ipsec security-associations** command lists the following information:

- The ID number is 16384. Use this value with the **show security ipsec security-associations index** command to get more information about this particular SA.
- There is one IPsec SA pair using port 500.
- The SPIs, lifetime (in seconds), and usage limits (or lifesize in KB) are shown for both directions. The 3363/ unlim value indicates that the Phase 2 lifetime expires in 3363 seconds, and that no lifesize has been specified, which indicates that it is unlimited. Phase 2 lifetime can differ from Phase 1 lifetime, because Phase 2 is not dependent on Phase 1 after the VPN is up.
- The vsys is the root system, and it is always listed as 0.
- The IKEv2 allows connections from a version 2 peer and will initiate a version 2 negotiation.

The output from the **show security ipsec security-associations index 16384 detail** command lists the following information:

- The local identity and remote identity make up the proxy ID for the SA.

A proxy ID mismatch is one of the most common causes for a Phase 2 failure. If no IPsec SA is listed, confirm that Phase 2 proposals, including the proxy ID settings, are correct for both peers. For route-based VPNs, the default proxy ID is local=0.0.0.0/0, remote=0.0.0.0/0, and service=any. Issues can occur with multiple route-based VPNs from the same peer IP. In this case, a unique proxy ID for each IPsec SA must be specified. For some third-party vendors, the proxy ID must be manually entered to match.

- Another common reason for Phase 2 failure is not specifying the ST interface binding. If IPsec cannot complete, check the kmd log or set traceoptions.

### Reviewing Statistics and Errors for an IPsec Security Association

**Purpose** Review ESP and authentication header counters and errors for an IPsec SA.

**Action** From operational mode, enter the **show security ipsec statistics index *index\_number*** command, using the index number of the VPN for which you want to see statistics.

```
user@host> show security ipsec statistics index 16384
ESP Statistics:
 Encrypted bytes: 920
 Decrypted bytes: 6208
 Encrypted packets: 5
 Decrypted packets: 87
AH Statistics:
 Input bytes: 0
 Output bytes: 0
 Input packets: 0
 Output packets: 0
Errors:
 AH authentication failures: 0, Replay errors: 0
 ESP authentication failures: 0, ESP decryption failures: 0
 Bad headers: 0, Bad trailers: 0
```

You can also use the **show security ipsec statistics** command to review statistics and errors for all SAs.

To clear all IPsec statistics, use the **clear security ipsec statistics** command.

**Meaning** If you see packet loss issues across a VPN, you can run the **show security ipsec statistics** or **show security ipsec statistics detail** command several times to confirm that the encrypted and decrypted packet counters are incrementing. You should also check that the other error counters are incrementing.

### Testing Traffic Flow Across the VPN

**Purpose** Verify the traffic flow across the VPN.

**Action** You can use the **ping** command from the SRX Series device to test traffic flow to a remote host PC. Make sure that you specify the source interface so that the route lookup is correct and the appropriate security zones are referenced during policy lookup.

From operational mode, enter the **ping** command.

```
ssg-> ping 192.168.168.10 interface ge-0/0/0 count 5
PING 192.168.168.10 (192.168.168.10): 56 data bytes
64 bytes from 192.168.168.10: icmp_seq=0 ttl=127 time=8.287 ms
64 bytes from 192.168.168.10: icmp_seq=1 ttl=127 time=4.119 ms
64 bytes from 192.168.168.10: icmp_seq=2 ttl=127 time=5.399 ms
64 bytes from 192.168.168.10: icmp_seq=3 ttl=127 time=4.361 ms
64 bytes from 192.168.168.10: icmp_seq=4 ttl=127 time=5.137 ms
```

```
--- 192.168.168.10 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max/stddev = 4.119/5.461/8.287/1.490 ms
```

You can also use the **ping** command from the SSG Series device.

```
user@host> ping 10.10.10.10 from ethernet0/6
Type escape sequence to abort
Sending 5, 100-byte ICMP Echos to 10.10.10.10, timeout is 1 seconds from
ethernet0/6
!!!!
Success Rate is 100 percent (5/5), round-trip time min/avg/max=4/4/5 ms
```

**Meaning** If the **ping** command fails from the SRX Series or SSG Series device, there might be a problem with the routing, security policies, end host, or encryption and decryption of ESP packets.

## Understanding Pico Cell Provisioning

IKEv2 configuration payload can be used to propagate provisioning information from an IKE responder, such as an SRX Series device, to multiple initiators, such as LTE pico cell base stations in a cellular network. The pico cells ship from the factory with a standard configuration that allows them to connect to the SRX Series device, but the pico cell provisioning information is stored on one or more provisioning servers within a protected network. The pico cells receive full provisioning information after establishing secure connections with the provisioning servers.

The workflow required to bootstrap and provision a pico cell and introduce it to service includes four distinct stages:

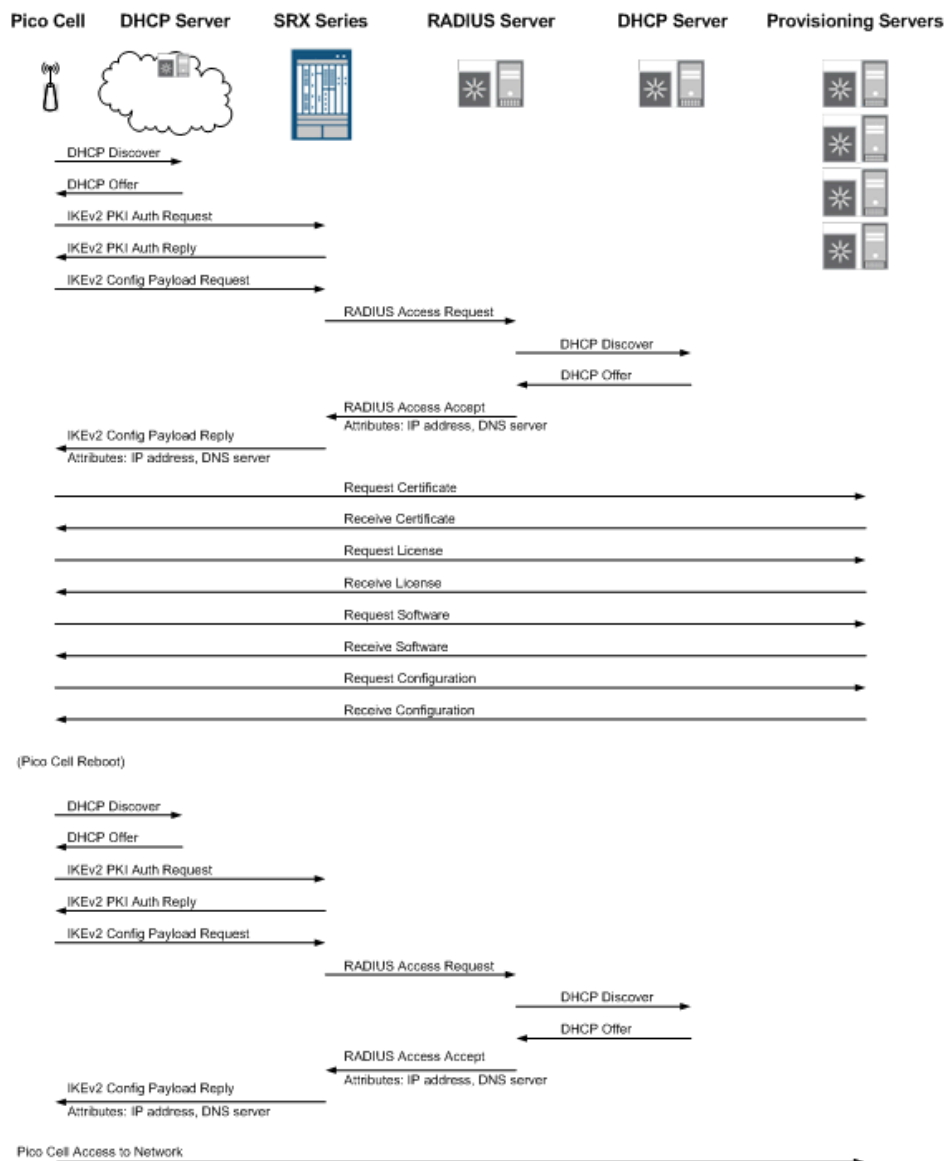

1. Initial addresses acquisition—The pico cell ships from the factory with the following information:
  - Configuration for the secure gateway tunnel to the SRX Series device
  - Digital certificate issued by the manufacturer
  - Fully qualified domain name (FQDN) of the provisioning servers that lie within the protected network

The pico cell boots up and acquires an address to be used for IKE negotiation from a DHCP server. A tunnel is then built to the secure gateway on the SRX Series device using this address. An address for Operation, Administration, and Management (OAM) traffic is also assigned by the DHCP server for use on the protected network.

2. Pico cell provisioning—Using its assigned OAM traffic address, the pico cell requests its provisioning information—typically operator certificate, license, software, and configuration information—from servers within the protected network.
3. Reboot—The pico cell reboots and uses the acquired provisioning information to make it specific to the service provider's network and operation model.
4. Service provision—When the pico cell enters service, it uses a single certificate that contains distinguished name (DN) and subject alternative name values with a FQDN to build two tunnels to the secure gateway on the SRX Series device: one for OAM traffic and the other for Third-Generation Partnership Project (3GPP) data traffic.

[Figure 268](#) shows a typical workflow for a pico cell deployment.

Figure 268: Typical Pico Cell Deployment Workflow

**NOTE:** The IKEv2 configuration payload feature is supported only for point-to-multipoint secure tunnel (st0) interfaces. Point-to-multipoint interfaces must be numbered, and the addresses provided in the configuration payload must be within the subnetwork range of the associated point-to-multipoint interface.

## Example: Configuring the SRX Series for Pico Cell Provisioning with IKEv2 Configuration Payload

In networks where many devices are being deployed, managing the network needs to be simple. The IKEv2 configuration payload feature supports the provisioning of these devices without touching either the device configuration or the SRX Series configuration. This example shows how to configure an SRX Series to support pico cell provisioning using the IKEv2 configuration payload feature.

- [Requirements on page 6445](#)
- [Overview on page 6445](#)
- [Configuration on page 6449](#)
- [Verification on page 6465](#)

### Requirements

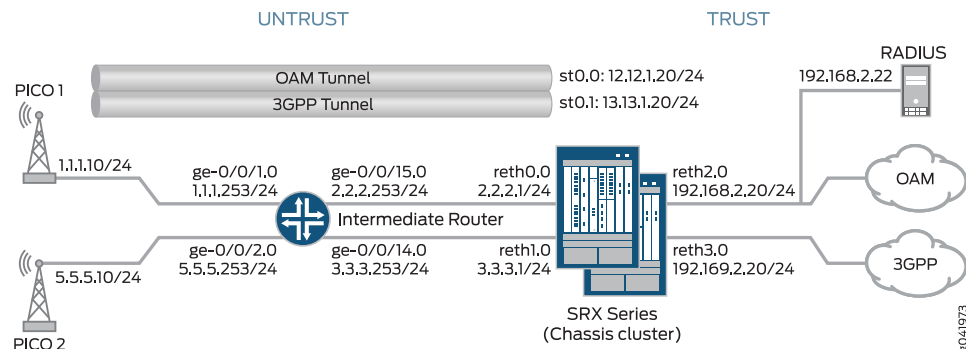

This example uses the following hardware and software components:

- Two SRX Series devices configured in a chassis cluster
- One SRX Series device configured as an intermediate router
- Two pico cell clients
- One RADIUS server configured with pico cell client provisioning information
- Junos OS Release 12.1X46-D10 or later for IKEv2 configuration payload support

### Overview

In this example, an SRX Series uses the IKEv2 configuration payload feature to propagate provisioning information to a series of pico cells. The pico cells ship from the factory with a standard configuration that allows them to connect to the SRX Series, but the pico cell provisioning information is stored on an external RADIUS server. The pico cells receive full provisioning information after establishing secure connections with provisioning servers in a protected network. The IKEv2 configuration payload feature is supported for IPv4 only.

[Figure 269](#) shows a topology in which the SRX Series supports pico cell provisioning using the IKEv2 configuration payload feature.

**Figure 269: SRX Series Support for Pico Cell Provisioning with IKEv2 Configuration Payload**

Each pico cell in this topology initiates two IPsec VPNs: one for management and one for data. In this example, management traffic uses the tunnel labeled OAM Tunnel, while the data traffic flows through the tunnel labeled 3GPP Tunnel. Each tunnel supports connections with OAM and 3GPP provisioning servers on separate, configurable networks, requiring separate routing instances and VPNs. This example provides the IKE Phase 1 and Phase 2 options for establishing the OAM and 3GPP VPNs.

In this example, the SRX Series acts as the IKEv2 configuration payload server, acquiring provisioning information from the RADIUS server and providing that information to the pico cell clients. The SRX Series returns the provisioning information for each authorized client in the IKEv2 configuration payload during tunnel negotiation. The SRX Series cannot be used as a client device.

Additionally, the SRX Series uses the IKEv2 configuration payload information to update the Traffic Selector initiator (TSi) and Traffic Selector responder (TSr) values exchanged with the client during tunnel negotiation. The configuration payload uses the TSi and TSr values that are configured on the SRX Series using the **proxy-identity** statement at the `[edit security ipsec vpn vpn-name ike]` hierarchy level. The TSi and TSr values define the network traffic for each VPN.

The intermediate router routes pico cell traffic to the appropriate interfaces on the SRX Series.

The following process describes the connection sequence:

1. The pico cell initiates an IPsec tunnel with the SRX Series using the factory configuration.
2. The SRX Series authenticates the client using the client certificate information and the root certificate of the CA that is enrolled in the SRX Series. After authentication, the SRX Series passes the IKE identity information from the client certificate to the RADIUS server in an authorization request.
3. After authorizing the client, the RADIUS server responds to the SRX Series with the client provisioning information:
  - IP address (TSi value)
  - IP subnet mask (optional; the default is 32 bit)

- DNS address (optional)
4. The SRX Series returns the provisioning information in the IKEv2 configuration payload for each client connection, and exchanges final TSi and TSr values with the pico cells. In this example, the SRX Series provides the following TSi and TSr information for each VPN:

VPN Connection	TSi/TSr Values Provided by SRX
Pico 1 OAM	TSi: 12.12.1.201/32, TSr: 192.168.2.0/24
Pico 1 3GPP	TSi: 13.13.1.201/32, TSr: 192.169.2.0/24, TSr: 13.13.0.0/16
Pico 2 OAM	TSi: 12.12.1.205/32, TSr: 192.168.2.0/24
Pico 2 3GPP	TSi: 13.13.1.205/32, TSr: 192.169.2.0/24, TSr: 13.13.0.0/16

**NOTE:** If the provisioning information supplied by the RADIUS server includes a subnet mask, the SRX Series returns a second TSr value for the client connection that includes the IP subnet. This enables intrapeer communication for devices on that subnet. In this example, intrapeer communication is enabled for the subnet associated with the 3GPP VPN (13.13.0.0/16).

**NOTE:** The IKEv2 configuration payload feature is supported only for point-to-multipoint secure tunnel (st0) interfaces. For point-to-multipoint interfaces, the interfaces must be numbered, and the addresses provided in the configuration payload must be within the subnetwork range of the associated point-to-multipoint interface.

Table 550 shows the Phase 1 and Phase 2 options configured on the SRX Series, including information for establishing both OAM and 3GPP tunnels.

**Table 550: Phase 1 and Phase 2 Options for the SRX Series**

Option	Value
<b>IKE proposal:</b>	
Proposal name	IKE_PROP
Authentication method	RSA digital certificates
Diffie-Hellman (DH) group	group5
Authentication algorithm	SHA-1
Encryption algorithm	AES 256 CBC

Table 550: Phase 1 and Phase 2 Options for the SRX Series (*continued*)

Option	Value
<b>IKE policy:</b>	
IKE Policy name	IKE_POL
Local certificate	Juniper_SRX
<b>IKE gateway (OAM):</b>	
IKE policy	IKE_POL
Remote IP address	dynamic
IKE user type	group-ike-id
Local IKE ID	hostname srx_series.example.net
Remote IKE ID	hostname .pico_cell.net
External interface	reth0.0
Access profile	radius_pico
IKE version	v2-only
<b>IKE gateway (3GPP):</b>	
IKE policy	IKE_POL
Remote IP address	Dynamic
IKE user type	group-ike-id
Local IKE ID	distinguished-name wildcard OU=srx_series
Remote IKE ID	distinguished-name wildcard OU=pico_cell
External interface	reth1
Access profile	radius_pico
IKE version	v2-only
<b>IPsec proposal:</b>	
Proposal name	IPSEC_PROP
Protocol	ESP
Authentication algorithm	HMAC SHA-1 96

Table 550: Phase 1 and Phase 2 Options for the SRX Series (*continued*)

Option	Value
Encryption algorithm	AES 256 CBC
IPsec policy:	
Policy name	IPSEC_POL
Perfect Forward Secrecy (PFS) keys	group5
IPsec proposals	IPSEC_PROP
IPsec VPN (OAM):	
Bind interface	st0.0
IKE gateway	OAM_GW
Local proxy-identity	192.168.2.0/24
Remote proxy-identity	0.0.0.0/0
IPsec policy	IPSEC_POL
IPsec VPN (3GPP):	
Bind interface	st0.1
IKE gateway	3GPP_GW
Local proxy-identity	192.169.2.0/24
Remote proxy-identity	0.0.0.0/0
IPsec policy	IPSEC_POL

Certificates are stored on the pico cells and the SRX Series.

**NOTE:** In this example, the default security policy that permits all traffic is used for all devices. More restrictive security policies should be configured for production environments. See [“Security Policies Overview” on page 1065](#).

## Configuration

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the SRX Series:

1. Configure the chassis cluster.

```
[edit chassis cluster]
user@host# set reth-count 5
user@host# set node 0
user@host# set node 1
user@host# set redundancy-group 0 node 0 priority 250
user@host# set redundancy-group 0 node 1 priority 150
user@host# set redundancy-group 1 node 0 priority 220
user@host# set redundancy-group 1 node 1 priority 149
user@host# set redundancy-group 1 interface-monitor ge-3/0/0 weight 255
user@host# set redundancy-group 1 interface-monitor ge-8/0/0 weight 255
user@host# set redundancy-group 1 interface-monitor ge-3/0/1 weight 255
user@host# set redundancy-group 1 interface-monitor ge-8/0/1 weight 255
user@host# set redundancy-group 1 interface-monitor ge-3/2/0 weight 255
user@host# set redundancy-group 1 interface-monitor ge-8/2/0 weight 255
user@host# set redundancy-group 1 interface-monitor ge-3/2/1 weight 255
user@host# set redundancy-group 1 interface-monitor ge-8/2/1 weight 255
```

2. Configure interfaces.

```
[edit interfaces]
user@host# set ge-3/0/0 gigether-options redundant-parent reth0
user@host# set ge-3/0/1 gigether-options redundant-parent reth1
user@host# set ge-3/2/0 gigether-options redundant-parent reth2
user@host# set ge-3/2/1 gigether-options redundant-parent reth3
user@host# set ge-8/0/0 gigether-options redundant-parent reth0
user@host# set ge-8/0/1 gigether-options redundant-parent reth1
user@host# set ge-8/2/0 gigether-options redundant-parent reth2
user@host# set ge-8/2/1 gigether-options redundant-parent reth3
user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth0 unit 0 family inet address 2.2.2.1/24
user@host# set reth1 redundant-ether-options redundancy-group 1
user@host# set reth1 unit 0 family inet address 3.3.3.1/24
user@host# set reth2 redundant-ether-options redundancy-group 1
user@host# set reth2 unit 0 family inet address 192.168.2.20/24
user@host# set reth3 redundant-ether-options redundancy-group 1
user@host# set reth3 unit 0 family inet address 192.169.2.20/24
user@host# set st0 unit 0 multipoint
user@host# set st0 unit 0 family inet address 12.12.1.20/24
user@host# set st0 unit 1 multipoint
user@host# set st0 unit 1 family inet address 13.13.1.20/24
```

3. Configure routing options.

```
[edit routing-options]
user@host# set static route 1.1.0.0/16 next-hop 2.2.2.253
user@host# set static route 5.5.0.0/16 next-hop 2.2.2.253
```

4. Specify security zones.

```
[edit security zones security-zone untrust]
```

```

user@host# set host-inbound-traffic protocols all
user@host# set host-inbound-traffic system-services all
user@host# set interfaces reth0.0
user@host# set interfaces reth1.0

```

```

[edit security zones security-zone oam-trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces reth2.0
user@host# set interfaces st0.0

```

```

[edit security zones security-zone 3gpp-trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces reth3.0
user@host# set interfaces st0.1

```

5. Create the RADIUS profile.

```

[edit access profile radius_pico]
user@host# set authentication-order radius
user@host# set radius-server 192.168.2.22 secret "example"
user@host# set radius-server 192.168.2.22 routing-instance VR-OAM

```

6. Configure Phase 1 options.

```

[edit security ike proposal IKE_PROP]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group5
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-256-cbc

```

```

[edit security ike policy IKE_POL]
user@host# set proposals IKE_PROP
user@host# set certificate local-certificate Juniper_SRX

```

```

[edit security ike gateway OAM_GW]
user@host# set ike-policy IKE_POL
user@host# set dynamic hostname .pico_cell.net
user@host# set dynamic ike-user-type group-ike-id
user@host# set local-identity hostname srx.example.net
user@host# set external-interface reth0.0
user@host# set xauth access-profile radius_pico
user@host# set version v2-only

```

```

[edit security ike gateway 3GPP_GW]
user@host# set ike-policy IKE_POL
user@host# set dynamic distinguished-name wildcard OU=pico_cell
user@host# set dynamic ike-user-type group-ike-id
user@host# set local-identity distinguished-name wildcard OU=srx_series
user@host# set external-interface reth1.0
user@host# set xauth access-profile radius_pico
user@host# set version v2-only

```

7. Specify Phase 2 options.

```
[edit set security ipsec proposal IPSEC_PROP]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm aes-256-cbc
user@host# set lifetime-seconds 300
```

```
[edit security ipsec policy IPSEC_POL]
user@host# set perfect-forward-secrecy keys group5
user@host# set proposals IPSEC_PROP
```

```
[edit security ipsec vpn OAM_VPN]
user@host# set bind-interface st0.0
user@host# set ike gateway OAM_GW
user@host# set ike proxy-identity local 192.168.2.0/24
user@host# set ike proxy-identity remote 0.0.0.0/0
user@host# set ike ipsec-policy IPSEC_POL
```

```
[edit security ipsec vpn 3GPP_VPN]
user@host# set bind-interface st0.1

user@host# set ike proxy-identity remote 0.0.0.0/0
user@host# set ike ipsec-policy IPSEC_POL
```

8. Specify the routing instances.

```
[edit routing-instances VR-OAM]
user@host# set instance-type virtual router
user@host# set interface reth2.0
user@host# set interface st0.0
```

```
[edit routing-instances VR-3GPP]
user@host# set instance-type virtual router
user@host# set interface reth3.0
user@host# set interface st0.1
```

9. Specify security policies to permit site-to-site traffic.

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show chassis cluster**, **show interfaces**, **show security zones**, **show access profile radius\_pico**, **show security ike**, **show security ipsec**, **show routing-instances**, and **show security policies** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

### Configuring the Intermediate Router

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/1 unit 0 family inet address 1.1.1.253/24
set interfaces ge-0/0/2 unit 0 family inet address 5.5.5.253/24
set interfaces ge-0/0/14 unit 0 family inet address 3.3.3.253/24
set interfaces ge-0/0/15 unit 0 family inet address 2.2.2.253/24
set routing-options static route 192.169.2.0/24 next-hop 2.2.2.1
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust interfaces ge-0/0/14.0
set security zones security-zone trust interfaces ge-0/0/15.0

```

```

set security zones security-zone untrust host-inbound-traffic system-services all
set security zones security-zone untrust host-inbound-traffic protocols all
set security zones security-zone untrust interfaces ge-0/0/1.0
set security zones security-zone untrust interfaces ge-0/0/2.0
set security policies default-policy permit-all

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the intermediate router:

1. Configure interfaces.

```

[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 1.1.1.253/24
user@host# set ge-0/0/2 unit 0 family inet address 5.5.5.253/24
user@host# set ge-0/0/14 unit 0 family inet address 3.3.3.253/24
user@host# set ge-0/0/15 unit 0 family inet address 2.2.2.253/24

```

2. Configure routing options.

```

[edit routing-options]
user@host# set static route 192.169.2.0/24 next-hop 2.2.2.1

```

3. Specify security zones.

```

[edit security zones security-zone trust]
user@host# set host-inbound-traffic protocols all
user@host# set host-inbound-traffic system-services all
user@host# set interfaces ge-0/0/14.0
user@host# set interfaces ge-0/0/15.0

```

```

[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/1.0
user@host# set interfaces ge-0/0/2.0

```

4. Specify security policies.

```

[edit security policies]
user@host# set default-policy permit-all

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, **show security zones**, and **show security policies** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@host# show interfaces
ge-0/0/1 {
 unit 0 {
 family inet {
 address 1.1.1.253/24;
 }
 }
}

```

```
}
ge-0/0/2 {
 unit 0 {
 family inet {
 address 5.5.5.253/24;
 }
 }
}
ge-0/0/14 {
 unit 0 {
 family inet {
 address 3.3.3.253/24;
 }
 }
}
ge-0/0/15 {
 unit 0 {
 family inet {
 address 2.2.2.253/24;
 }
 }
}
[edit]
user@host# show routing-options
static {
 route 192.169.2.0/24 next-hop 2.2.2.1;
}
[edit]
user@host# show security zones
security-zone trust {
 host-inbound-traffic {
 system-services {
 all;
 }
 protocols {
 all;
 }
 }
 interfaces {
 ge-0/0/14.0;
 ge-0/0/15.0;
 }
}
security-zone untrust {
 host-inbound-traffic {
 system-services {
 all;
 }
 protocols {
 all;
 }
 }
 interfaces {
 ge-0/0/1.0;
 ge-0/0/2.0;
 }
}
```

```

}
}
[edit]
user@host# show security policies
default-policy {
 permit-all;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring the Pico Cell (Sample Configuration)

#### Step-by-Step Procedure

The pico cell information in this example is provided for reference. Detailed pico cell configuration information is beyond the scope of this document. The pico cell factory configuration must include the following information:

- Local certificate (X.509v3) and IKE identity information
- Traffic Selector (TSi, TSr) values set to any/any (0.0.0.0/0)
- SRX Series IKE identity information and public IP address
- Phase 1 and Phase 2 proposals that match the SRX Series configuration

The pico cells in this example use strongSwan open source software for IPsec-based VPN connections. This information is used by the SRX Series for pico cell provisioning using the IKEv2 configuration payload feature. In networks where many devices are being deployed, the pico cell configuration can be identical except for the certificate (leftcert) and identity (leftid) information. The following sample configurations illustrate factory settings.

1. Review the Pico 1 configuration:

```

conn %default
 ikelifetime=8h
 keylife=1h
 rekeymargin=1m
 keyingtries=1
 keyexchange=ikev2
 authby=pubkey
 mobike=no

conn oam
 left=%any
 leftsourceip=%config
 leftcert=/usr/local/etc/ipsec.d/certs/<cert_name>
 leftid=pico1.pico_cell.net
 leftfirewall=yes
 reauth=yes
 right=2.2.2.1/24
 rightid=srx_series.example.net
 rightsubnet=0.0.0.0/0 #peer net for proxy id
 ike=aes256-sha-modp1536!
 esp=aes256-sha-modp1536!
 auto=add

conn 3gpp
 left=%any

```

```

leftsourceip=%config
leftcert=/usr/local/etc/ipsec.d/certs/<cert_name>
leftid="C=US, ST=CA, L=Sunnyvale, O=org, OU=pico_cell, CN=pico1"
leftfirewall=yes
reauth=yes
right=3.3.3.1/24
rightid="OU=srx_series"
rightsubnet=0.0.0.0/0 #peer net for proxy id
ike=aes256-sha-modp1536!
esp=aes256-sha-modp1536!
auto=add

```

2. Review the Pico 2 configuration:

```

conn %default
 ikelifetime=8h
 keylife=1h
 rekeymargin=1m
 keyingtries=1
 keyexchange=ikev2
 authby=pubkey
 mobike=no

conn oam
 left=%any
 leftsourceip=%config
 leftcert=/usr/local/etc/ipsec.d/certs/<cert_name>
 leftid=pico2.pico_cell.net
 leftfirewall=yes
 #reauth=no
 right=2.2.2.1/24
 rightid=srx_series.example.net
 rightsubnet=0.0.0.0/0 #peer net for proxy id
 ike=aes256-sha-modp1536!
 esp=aes256-sha-modp1536!
 auto=add

conn 3gpp
 left=%any
 leftsourceip=%config
 leftcert=/usr/local/etc/ipsec.d/certs/<cert_name>
 leftid="C=US, ST=CA, L=Sunnyvale, O=org, OU=pico_cell, CN=pico2"
 leftfirewall=yes
 #reauth=no
 right=3.3.3.1/24
 rightid="OU=srx_series"
 rightsubnet=0.0.0.0/0 #peer net for proxy id
 ike=aes256-sha-modp1536!
 esp=aes256-sha-modp1536!
 auto=add

```

### Configuring the RADIUS Server (Sample Configuration)

**Step-by-Step Procedure** The RADIUS server information in this example is provided for reference. Complete RADIUS server configuration information is beyond the scope of this document. The following information is returned to the SRX Series by the RADIUS server:

- Framed-IP-Address
- Framed-IP-Netmask (optional)
- Primary-DNS and Secondary-DNS (optional)

In this example, the RADIUS server has separate provisioning information for the OAM and 3GPP connections. The User-Name is taken from the client certificate information provided in the SRX Series authorization request.

**NOTE:** If the RADIUS server acquires client provisioning information from a DHCP server, the client identity information relayed to the DHCP server by the RADIUS server must be consistent with the client IKE identity information relayed to the RADIUS server by the SRX Series device. This ensures the continuity of the client identity across the various protocols.

1. Review the RADIUS configuration for the Pico 1 OAM VPN. The RADIUS server has the following information:

```
DEFAULT User-Name =~ "CN\=pico1\,\ C\=US\,\ ST\=CA\,\ L\=Sunnyvale$",
Cleartext-Password := "example"
 Service-Type = Framed-User,
 Framed-IP-Address = 12.12.1.201,
 Framed-IP-Netmask = 255.255.255.255,
 Primary-Dns = 192.168.2.104,
 Secondary-Dns = 192.168.2.106,
```

In this case, the RADIUS server provides the default subnet mask (255.255.255.255), which blocks intrapeer traffic.

2. Review the RADIUS configuration for the Pico 1 3GPP VPN. The RADIUS server has the following information:

```
DEFAULT User-Name =~ "C\=US\,\ ST\=CA\,\ L\=Sunnyvale\,\ O\=org\,\
OU=pico_cell\,\ CN\=pico1$", Cleartext-Password := "example"
 Service-Type = Framed-User,
 Framed-IP-Address = 13.13.1.201.10,
 Framed-IP-Netmask = 255.255.0.0,
 Primary-Dns = 192.168.2.104,
 Secondary-Dns = 192.168.2.106,
```

In this case, the RADIUS server provides a subnet mask value (255.255.0.0), which enables intrapeer traffic.

**NOTE:** The clear-text password is hard-coded and is not configurable. Additionally, this example creates two tunnels from the same client certificate by using different parts of the certificate for User-Name (IKE identity) information.

## Verification

Confirm that the configuration is working properly.

- [Verifying the IKE Phase 1 Status for the SRX Series on page 6465](#)
- [Verifying IPsec Security Associations for the SRX Series on page 6467](#)

### Verifying the IKE Phase 1 Status for the SRX Series

**Purpose** Verify the IKE Phase 1 status.

**Action** From operational mode on node 0, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations detail** command.

```
user@host# show security ike security-associations
node0:
```

```

Index State Initiator cookie Responder cookie Mode Remote Address
553329718 UP 99919a471d1a5278 3be7c5a49172e6c2 IKEv2 1.1.1.1
1643848758 UP 9e31d4323195a195 4d142438106d4273 IKEv2 1.1.1.1
```

```
user@host# show security ike security-associations index 553329718 detail
node0:
```

```

IKE peer 1.1.1.1, Index 553329718, Gateway Name: OAM_GW
Location: FPC 2, PIC 0, KMD-Instance 1
Role: Responder, State: UP
Initiator cookie: 99919a471d1a5278, Responder cookie: 3be7c5a49172e6c2
Exchange type: IKEv2, Authentication method: RSA-signatures
Local: 2.2.2.1:500, Remote: 1.1.1.1:500
Lifetime: Expires in 28738 seconds
Peer ike-id: C=US, ST=CA, L=Sunnyvale, O=org, OU=pico_cell, CN=pico1
Xauth assigned IP: 12.12.1.201
Algorithms:
Authentication : hmac-sha1-96
Encryption : aes256-cbc
Pseudo random function: hmac-sha1
Diffie-Hellman group : DH-group-5
Traffic statistics:
Input bytes : 2104
Output bytes : 425
Input packets: 2
Output packets: 1
IPSec security associations: 0 created, 0 deleted
Phase 2 negotiations in progress: 1
```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs with pico cells devices. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration. This example shows only the IKE Phase 1 SA for the OAM VPN; however, a separate IKE Phase 1 SA will be displayed showing the IKE Phase 1 parameters for the 3GPP VPN.

If SAs are listed, review the following information:

- Index—This value is unique for each IKE SA: you can use the **show security ike security-associations index detail** command to get more information about the SA.
- Remote address—Verify that the local IP address is correct and that port 500 is being used for peer-to-peer communication.
- Role responder state:
  - Up—The Phase 1 SA has been established.
  - Down—There was a problem establishing the Phase 1 SA.
- Peer (remote) IKE ID—Verify the certificate information is correct.
- Local identity and remote identity—Verify these addresses are correct.
- Mode—Verify that the correct mode is being used.

Verify that the following items are correct in your configuration:

- External interfaces (the interface must be the one that sends IKE packets)
- IKE policy parameters
- Phase 1 proposal parameters (must match between peers)

The **show security ike security-associations** command lists the following additional information about security associations:

- Authentication and encryption algorithms used
- Phase 1 lifetime
- Traffic statistics (can be used to verify that traffic is flowing properly in both directions)
- Role information

**NOTE:** Troubleshooting is best performed on the peer using the responder role.

- Initiator and responder information
- Number of IPsec SAs created
- Number of Phase 2 negotiations in progress

## Verifying IPsec Security Associations for the SRX Series

**Purpose** Verify the IPsec status.

**Action** From operational mode on node 0, enter the **show security ipsec security-associations** command. After obtaining an index number from the command, use the **show security ipsec security-associations detail** command.

```
user@host# show security ipsec security-associations
node0:
```

```

```

**Meaning** This examples shows the active IKE Phase 2 SAs for Pico 1. If no SAs are listed, there was a problem with Phase 2 establishment. Check the IPsec policy parameters in your configuration. For each Phase 2 SA (OAM and 3GPP), information is provided in both the inbound and outboard direction. The output from the **show security ipsec security-associations** command lists the following information:

- The remote gateway has an IP address of 1.1.1.1.
- The SPIs, lifetime (in seconds), and usage limits (or lifeseize in KB) are shown for both directions. The 3529/ value indicates that the Phase 2 lifetime expires in 3529 seconds, and that no lifeseize has been specified, which indicates that it is unlimited. The Phase 2 lifetime can differ from the Phase 1 lifetime, because Phase 2 is not dependent on Phase 1 after the VPN is up.
- VPN monitoring is not enabled for this SA, as indicated by a hyphen in the Mon column. If VPN monitoring is enabled, U indicates that monitoring is up, and D indicates that monitoring is down.
- The virtual system (vsys) is the root system, and it always lists 0.

The above output from the **show security ipsec security-associations index *index\_id* detail** command lists the following information:

- The local identity and remote identity make up the proxy ID for the SA.

A proxy ID mismatch is one of the most common causes for a Phase 2 failure. If no IPsec SA is listed, confirm that Phase 2 proposals, including the proxy ID settings, are correct for both peers. For route-based VPNs, the default proxy ID is local=0.0.0.0/0, remote=0.0.0.0/0, and service=any. Issues can occur with multiple route-based VPNs from the same peer IP. In this case, a unique proxy ID for each IPsec SA must be specified. For some third-party vendors, the proxy ID must be manually entered to match.

- Authentication and encryption algorithms used.
- Phase 2 proposal parameters (must match between peers).
- Secure tunnel (st0.0 and st0.1) bindings to the OAM and 3GPP gateways.

- [Example: Configuring an st0 Interface in a Virtual Router on page 6472](#)

## Understanding Virtual Router Support for Route-Based VPNs

---

For route-based VPNs, you configure a unit of the secure tunnel (st0) interface and bind it to the IPsec VPN tunnel. You can configure a unit of the st0 interface in different virtual router instances. The following functions are supported for nondefault virtual router instances:

- Manual key management
- Transit traffic
- Self-traffic
- VPN monitoring
- Hub-and-spoke VPNs
- Encapsulating Security Payload (ESP) protocol
- Authentication Header (AH) protocol
- Aggressive mode or main mode
- st0 anchored on the loopback (lo0) interface
- Maximum number of virtual routers (VRs) supported on an SRX Series device
- Applications such as Application Layer Gateway (ALG), Intrusion Detection and Prevention (IDP), and Unified Threat Management (UTM)
- Dead peer detection (DPD)
- Chassis cluster active/backup
- Open Shortest Path First (OSPF) over st0

- Routing Information Protocol (RIP) over st0
- Policy-based VPN inside VR

**Related  
Documentation**

---

## Understanding Virtual Router Limitations

The following features are not supported for virtual router (VR):

- Public key infrastructure (PKI) inside VR
- Chassis cluster active/active with VPN inside VR

When you configure VPN on SRX Series devices, overlapping of IP addresses across virtual routers is supported with the following limitations:

- An IKE external interface address cannot overlap with any other virtual router.
- An internal or trust interface address can overlap across any other virtual router.
- An st0 interface address cannot overlap in route-based VPN in point-to-multipoint tunnels such as NHTB.
- An st0 interface address can overlap in route-based VPN in point-to-point tunnels.

## Example: Configuring an st0 Interface in a Virtual Router

This example shows how to configure an st0 interface in a virtual router.

- [Requirements on page 6472](#)
- [Overview on page 6472](#)
- [Configuration on page 6473](#)
- [Verification on page 6476](#)

### Requirements

Before you begin, configure the interfaces and assign the interfaces to security zones. See [“Security Zones and Interfaces Overview” on page 1029](#).

### Overview

In this example, you perform the following operations:

- Configure the interfaces.
- Configure IKE Phase 1 proposals.

- Configure IKE policies, and reference the proposals.
- Configure an IKE gateway, and reference the policy.
- Configure Phase 2 proposals.
- Configure policies, and reference the proposals.
- Configure AutoKey IKE, and reference the policy and gateway.
- Configure the security policy.
- Configure the routing instance.
- Configure the VPN bind to tunnel interface.
- Configure the routing options.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/0 unit 0 family inet address 1.1.1.2/30
set interfaces ge-0/0/1 unit 0 family inet address 2.2.2.2/30
set interfaces st0 unit 0 family inet address 3.3.3.2/30
set security ike proposal first_ikeprop authentication-method pre-shared-keys
set security ike proposal first_ikeprop dh-group group2
set security ike proposal first_ikeprop authentication-algorithm md5
set security ike proposal first_ikeprop encryption-algorithm 3des-cbc
set security ike policy first_ikepol mode main
set security ike policy first_ikepol proposals first_ikeprop
set security ike policy first_ikepol pre-shared-key ascii-text "$ABC123"
set security ike gateway first ike-policy first_ikepol
set security ike gateway first address 4.4.4.2
set security ike gateway first external-interface ge-0/0/0.0
set security ipsec proposal first_ipsecprop protocol esp
set security ipsec proposal first_ipsecprop authentication-algorithm hmac-md5-96
set security ipsec proposal first_ipsecprop encryption-algorithm 3des-cbc
set security ipsec policy first_ipsecpol perfect-forward-secrecy keys group1
set security ipsec policy first_ipsecpol proposals first_ipsecprop
set security ipsec vpn first_vpn bind-interface st0.0
set security ipsec vpn first_vpn ike gateway first
set security ipsec vpn first_vpn ike ipsec-policy first_ipsecpol
set security ipsec vpn first_vpn establish-tunnels immediately
set security policies default-policy permit-all
set routing-instances VR1 instance-type virtual-router
set routing-instances VR1 interface ge-0/0/1.0
set routing-instances VR1 interface st0.0
set routing-instances VR1 routing-options static route 6.6.6.0/24 next-hop st0.0
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an st0 in a VR:

1. Configure the interfaces.

```
[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet address 1.1.1.2/30
user@host# set interfaces ge-0/0/1 unit 0 family inet address 2.2.2.2/30
user@host# set interfaces st0 unit 0 family inet address 3.3.3.2/30
```

2. Configure Phase 1 of the IPsec tunnel.

```
[edit security ike]
user@host# set proposal first_ikeprop authentication-method pre-shared-keys
user@host# set proposal first_ikeprop dh-group group2
user@host# set proposal first_ikeprop authentication-algorithm md5
user@host# set proposal first_ikeprop encryption-algorithm 3des-cbc
```

3. Configure the IKE policies, and reference the proposals.

```
[edit security ike]
user@host# set policy first_ikepol mode main
user@host# set policy first_ikepol proposals first_ikeprop
user@host# set policy first_ikepol pre-shared-key ascii-text "$ABC123"
```

4. Configure the IKE gateway, and reference the policy.

```
[edit security ike]
user@host# set gateway first ike-policy first_ikepol
user@host# set gateway first address 4.4.4.2
user@host# set gateway first external-interface ge-0/0/0.0
```

5. Configure Phase 2 of the IPsec tunnel.

```
[edit security ipsec]
user@host# set proposal first_ipsecprop protocol esp
user@host# set proposal first_ipsecprop authentication-algorithm hmac-md5-96
user@host# set proposal first_ipsecprop encryption-algorithm 3des-cbc
```

6. Configure the policies, and reference the proposals.

```
[edit security ipsec]
user@host# set policy first_ipsecpol perfect-forward-secrecy keys group1
user@host# set policy first_ipsecpol proposals first_ipsecprop
```

7. Configure AutoKey IKE, and reference the policy and gateway.

```
[edit security ipsec]
user@host# set vpn first_vpn ike gateway first
user@host# set vpn first_vpn ike ipsec-policy first_ipsecpol
user@host# set vpn first_vpn establish-tunnels immediately
```

8. Configure the VPN bind to tunnel interface.

```
[edit security ipsec]
user@host# set vpn first_vpn bind-interface st0.0
```

9. Configure the security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

10. Configure the st0 in the routing instance.

```
[edit routing-instances]
user@host# set VR1 instance-type virtual-router
user@host# set VR1 interface ge-0/0/1.0
user@host# set VR1 interface st0.0
```

11. Configure the routing options.

```
[edit routing-instances VR1 routing-options]
user@host# set static route 6.6.6.0/24 next-hop st0.0
```

**Results** From configuration mode, confirm your configuration by entering the **show security** and **show routing-instances** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host# show security
ike {
 proposal first_ikeprop {
 authentication-method pre-shared-keys;
 dh-group group2;
 authentication-algorithm md5;
 encryption-algorithm 3des-cbc;
 }
 policy first_ikepol {
 mode main;
 proposals first_ikeprop;
 pre-shared-key ascii-text "$ABC123"; ## SECRET-DATA
 }
 gateway first {
 ike-policy first_ikepol;
 address 4.4.4.2;
 external-interface ge-0/0/0.0;
 }
}
ipsec {
 proposal first_ipsecprop {
 protocol esp;
 authentication-algorithm hmac-md5-96;
 encryption-algorithm 3des-cbc;
 }
 policy first_ipsecpol {
 perfect-forward-secrecy {
 keys group1;
 }
 proposals first_ipsecprop;
 }
 vpn first_vpn {
 bind-interface st0.0;
 ike {
 gateway first;
 ipsec-policy first_ipsecpol;
 }
 }
}
```

```
 establish-tunnels immediately;
 }
}
policies {
 default-policy {
 permit-all;
 }
}
user@host# show routing-instances
VR1 {
 instance-type virtual-router;
 interface ge-0/0/1.0;
 interface st0.0;
 routing-options {
 static {
 route 6.6.6.0/24 next-hop st0.0;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform this task:

- [Verifying an st0 interface in the Virtual Router on page 6476](#)

---

### Verifying an st0 interface in the Virtual Router

<b>Purpose</b>	Verify the st0 interface in the virtual router.
<b>Action</b>	From operational mode, enter the <b>show interfaces st0.0 detail</b> command. The number listed for routing table corresponds to the order that the routing tables in the <b>show route all</b> command.

# Configuring Dual Stack Tunnels over an External Interface

- [Understanding VPN Tunnel Modes on page 6477](#)
- [Understanding Dual-Stack Tunnels over an External Interface on page 6479](#)
- [Example: Configuring Dual-Stack Tunnels over an External Interface on page 6480](#)

## Understanding VPN Tunnel Modes

In VPN tunnel mode, IPsec encapsulates the original IP datagram—including the original IP header—within a second IP datagram. The outer IP header contains the IP address of the gateway, while the inner header contains the ultimate source and destination IP addresses. The outer and inner IP headers can have a protocol field of IPv4 or IPv6. SRX Series devices support four tunnel modes for route-based site-to-site VPNs.

IPv4-in-IPv4 tunnels encapsulate IPv4 packets inside IPv4 packets, as shown in [Figure 270](#). The protocol fields for both the outer and the inner headers are IPv4.

**Figure 270: IPv4-in-IPv4 Tunnel**

IPv6-in-IPv6 tunnels encapsulate IPv6 packets inside IPv6 packets, as shown in [Figure 271](#). The protocol fields for both the outer and inner headers are IPv6.

Figure 271: IPv6-in-IPv6 Tunnel

IPv6-in-IPv4 tunnels encapsulate IPv6 packets inside IPv4 packets, as shown in Figure 272. The protocol field for the outer header is IPv4 and the protocol field for the inner header is IPv6.

Figure 272: IPv6-in-IPv4 Tunnel

IPv4-in-IPv6 tunnels encapsulate IPv4 packets inside IPv6 packets, as shown in Figure 273. The protocol field for the outer header is IPv6 and the protocol field for the inner header is IPv4.

Figure 273: IPv4-in-IPv6 Tunnel

A single IPsec VPN tunnel can carry both IPv4 and IPv6 traffic. For example, an IPv4 tunnel can operate in both IPv4-in-IPv4 and IPv6-in-IPv4 tunnel modes at the same time. To allow both IPv4 and IPv6 traffic over a single IPsec VPN tunnel, the st0 interface bound to that tunnel must be configured with both **family inet** and **family inet6**.

A physical interface configured with both IPv4 and IPv6 addresses can be used as the external interface for parallel IPv4 and IPv6 tunnels to a peer in a route-based site-to-site VPN. This feature is known as dual-stack tunnels and requires separate st0 interfaces for each tunnel.

**NOTE:** For policy-based VPNs, IPv6-in-IPv6 is the only tunnel mode supported and it is only supported on branch SRX Series devices.

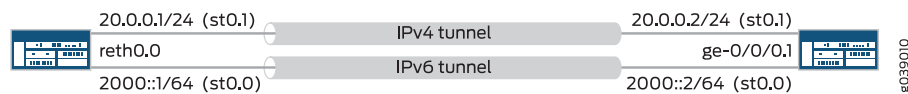

#### Related Documentation

- [VPN Feature Support for IPv6 Addresses on page 6627](#)
- [Understanding Dual-Stack Tunnels over an External Interface on page 6479](#)
- [Understanding IPv6 IKE and IPsec Packet Processing on page 6631](#)

## Understanding Dual-Stack Tunnels over an External Interface

Dual-stack tunnels—parallel IPv4 and IPv6 tunnels over a single physical interface to a peer—are supported for route-based site-to-site VPNs. A physical interface configured with both IPv4 and IPv6 addresses can be used as the external interface to IPv4 and IPv6 gateways on the same peer or on different peers at the same time. In [Figure 274](#), the physical interfaces reth0.0 and ge-0/0/0.1 support parallel IPv4 and IPv6 tunnels between two devices.

**Figure 274: Dual-Stack Tunnels**

**NOTE:** In [Figure 274](#), separate secure tunnel (st0) interfaces must be configured for each IPsec VPN tunnel. Parallel IPv4 and IPv6 tunnels that are bound to the same st0 interface are not supported.

A single IPsec VPN tunnel can carry both IPv4 and IPv6 traffic. For example, an IPv4 tunnel can operate in both IPv4-in-IPv4 and IPv6-in-IPv4 tunnel modes at the same time. To allow both IPv4 and IPv6 traffic over a single IPsec VPN tunnel, the st0 interface bound to that tunnel must be configured with both **family inet** and **family inet6**.

If multiple addresses in the same address family are configured on the same external interface to a VPN peer, we recommend that you configure **local-address** at the `[edit security ike gateway gateway-name]` hierarchy level.

If **local-address** is configured, the specified IPv4 or IPv6 address is used as the local gateway address. If only one IPv4 and one IPv6 address is configured on a physical external interface, **local-address** configuration is not required.

**NOTE:** `local-address` must be an IP address that is configured on an interface on the SRX Series device. We recommend that `local-address` belong to the external interface of the IKE gateway. If `local-address` does not belong to the external interface of the IKE gateway, the interface must be in the same zone as the external interface of the IKE gateway and an intra-zone security policy must be configured to permit traffic.

`local-address` and the remote IKE gateway address must be in the same address family, either IPv4 or IPv6.

If `local-address` is not configured, the local gateway address is based on the remote gateway address. If the remote gateway address is an IPv4 address, the local gateway address is the primary IPv4 address of the external physical interface. If the remote gateway address is an IPv6 address, the local gateway address is the primary IPv6 address of the external physical interface.

#### Related Documentation

- [Understanding VPN Tunnel Modes on page 6477](#)
- [VPN Feature Support for IPv6 Addresses on page 6627](#)

## Example: Configuring Dual-Stack Tunnels over an External Interface

This example shows how to configure parallel IPv4 and IPv6 tunnels over a single external physical interface to a peer for route-based site-to-site VPNs.

- [Requirements on page 6480](#)
- [Overview on page 6480](#)
- [Configuration on page 6483](#)
- [Verification on page 6487](#)

### Requirements

Before you begin, read “[Understanding Dual-Stack Tunnels over an External Interface](#)” on page 6479.

**NOTE:** The configuration shown in this example is only supported with route-based site-to-site VPNs.

### Overview

In this example, a redundant Ethernet interface on the local device supports parallel IPv4 and IPv6 tunnels to a peer device:

- The IPv4 tunnel carries IPv6 traffic; it operates in IPv6-in-IPv4 tunnel mode. The secure tunnel interface `st0.0` bound to the IPv4 tunnel is configured with family `inet6` only.

- The IPv6 tunnel carries both IPv4 and IPv6 traffic; it operates in both IPv4-in-IPv6 and IPv6-in-IPv6 tunnel modes. The secure tunnel interface st0.1 bound to the IPv6 tunnel is configured with both family inet and family inet6.

Table 551 shows the Phase 1 options used in this example. The Phase 1 option configuration includes two IKE gateway configurations, one to the IPv6 peer and the other to the IPv4 peer.

**Table 551: Phase 1 Options for Dual-Stack Tunnel Configuration**

Option	Value
IKE proposal	ike_proposal
Authentication method	Preshared keys
Authentication algorithm	MD5
Encryption algorithm	3DES CBC
Lifetime	3600 seconds
IKE policy	ike_policy
Mode	Aggressive
IKE proposal	ike_proposal
Preshared key	ASCII text
IPv6 IKE gateway	ike_gw_v6
IKE policy	ike_policy
Gateway address	2000::2
External interface	reth1.0
IKE version	IKEv2
IPv4 IKE gateway	ike_gw_v4
IKE policy	ike_policy
Gateway address	20.0.0.2
External interface	reth1.0

Table 552 shows the Phase 2 options used in this example. The Phase 2 option configuration includes two VPN configurations, one for the IPv6 tunnel and the other for the IPv4 tunnel.

Table 552: Phase 2 Options for Dual-Stack Tunnel Configuration

Option	Value
IPsec proposal	ipsec_proposal
Protocol	ESP
Authentication algorithm	HMAC SHA-1 96
Encryption algorithm	3DES CBC
IPsec policy	ipsec_policy
Proposal	ipsec_proposal
IPv6 VPN	test_s2s_v6
Bind interface	st0.1
IKE gateway	ike_gw_v6
IKE IPsec policy	ipsec_policy
Establish tunnels	Immediately
IPv4 VPN	test_s2s_v4
Bind interface	st0.0
IKE gateway	ike_gw_4
IKE IPsec policy	ipsec_policy

The following static routes are configured in the IPv6 routing table:

- Route IPv6 traffic to 3000::1/128 through st0.0.
- Route IPv6 traffic to 3000::2/128 through st0.1.

A static route is configured in the default (IPv4) routing table to route IPv4 traffic to 30.0.0.0/24 through st0.1.

**NOTE:** Flow-based processing of IPv6 traffic must be enabled with the mode **flow-based** configuration option at the [edit security forwarding-options family inet6] hierarchy level.

## Topology

In Figure 275, the SRX Series device A supports IPv4 and IPv6 tunnels to device B. IPv6 traffic to 3000::1/128 is routed through the IPv4 tunnel, while IPv6 traffic to 3000::2/128 and IPv4 traffic to 30.0.0.0/24 are routed through the IPv6 tunnel.

Figure 275: Dual-Stack Tunnel Example

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/1 gigether-options redundant-parent reth1
set interfaces ge-8/0/1 gigether-options redundant-parent reth1
set interfaces reth1 redundant-ether-options redundancy-group 1

set interfaces st0 unit 1 family inet
set interfaces st0 unit 1 family inet6
set security ike proposal ike_proposal authentication-method pre-shared-keys
set security ike proposal ike_proposal authentication-algorithm md5
set security ike proposal ike_proposal encryption-algorithm 3des-cbc
set security ike proposal ike_proposal lifetime-seconds 3600
set security ike policy ike_policy mode aggressive
set security ike policy ike_policy proposals ike_proposal
set security ike policy ike_policy pre-shared-key ascii-text "$ABC123"
set security ike gateway ike_gw_v6 ike-policy ike_policy
set security ike gateway ike_gw_v6 address 2000::2
set security ike gateway ike_gw_v6 external-interface reth1.0
set security ike gateway ike_gw_v6 version v2-only
set security ike gateway ike_gw_v4 ike-policy ike_policy
set security ike gateway ike_gw_v4 address 20.0.0.2
set security ike gateway ike_gw_v4 external-interface reth1.0
set security ipsec proposal ipsec_proposal protocol esp
```

```

set security ipsec proposal ipsec_proposal authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec_proposal encryption-algorithm 3des-cbc
set security ipsec policy ipsec_policy proposals ipsec_proposal
set security ipsec vpn test_s2s_v6 bind-interface st0.1
set security ipsec vpn test_s2s_v6 ike gateway ike_gw_v6
set security ipsec vpn test_s2s_v6 ike ipsec-policy ipsec_policy
set security ipsec vpn test_s2s_v6 establish-tunnels immediately
set security ipsec vpn test_s2s_v4 bind-interface st0.0
set security ipsec vpn test_s2s_v4 ike gateway ike_gw_v4
set security ipsec vpn test_s2s_v4 ike ipsec-policy ipsec_policy
set routing-options rib inet6.0 static route 3000::1/128 next-hop st0.0
set routing-options rib inet6.0 static route 3000::2/128 next-hop st0.1
set routing-options static route 30.0.0.0/24 next-hop st0.1
set security forwarding-options family inet6 mode flow-based

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure dual-stack tunnels:

1. Configure the external interface.

```

[edit interfaces]
user@host# set ge-0/0/1 gigether-options redundant-parent reth1
user@host# set ge-8/0/1 gigether-options redundant-parent reth1
user@host# set reth1 redundant-ether-options redundancy-group 1
user@host# set reth1 unit 0 family inet address 20.0.0.1/24
user@host# set reth1 unit 0 family inet6 address 2000::1/64

```

2. Configure the secure tunnel interfaces.

```

[edit interfaces]
user@host# set st0 unit 0 family inet6
user@host# set st0 unit 1 family inet
user@host# set st0 unit 1 family inet6

```

3. Configure Phase 1 options.

```

[edit security ike proposal ike_proposal]
user@host# set authentication-method pre-shared-keys
user@host# set authentication-algorithm md5
user@host# set encryption-algorithm 3des-cbc
user@host# set lifetime-seconds 3600

```

```

[edit security ike policy ike_policy]
user@host# set mode aggressive
user@host# set proposals ike_proposal
user@host# set pre-shared-key ascii-text "$ABC123"

```

```

[edit security ike gateway ike_gw_v6]
user@host# set ike-policy ike_policy
user@host# set address 2000::2
user@host# set external-interface reth1.0
user@host# set version v2-only

```

```
[edit security ike gateway ike_gw_v4]
user@host# set ike-policy ike_policy
user@host# set address 20.0.0.2
user@host# set external-interface reth1.0
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal ipsec_proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm 3des-cbc
```

```
[edit security ipsec policy ipsec_policy]
user@host# set proposals ipsec_proposal
```

```
[edit security ipsec vpn test_s2s_v6]
user@host# set bind-interface st0.1
user@host# set ike gateway ike_gw_v6
user@host# set ike ipsec-policy ipsec_policy
user@host# set establish-tunnels immediately
```

```
[edit security ipsec vpn test_s2s_v4]
user@host# set bind-interface st0.0
user@host# set ike gateway ike_gw_v4
user@host# set ike ipsec-policy ipsec_policy
```

5. Configure static routes.

```
[edit routing-options rib inet6.0]
user@host# set static route 3000::1/128 next-hop st0.0
user@host# set static route 3000::2/128 next-hop st0.1
```

```
[edit routing-options]
user@host# set static route 30.0.0.0/24 next-hop st0.1
```

6. Enable IPv6 flow-based forwarding.

```
[edit security forwarding-options]
user@host# set family inet6 mode flow-based
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security ike**, **show security ipsec**, **show routing-options**, and **show security forwarding-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces
ge-0/0/1 {
 gige-ether-options {
 redundant-parent reth1;
 }
}
ge-8/0/1 {
 gige-ether-options {
 redundant-parent reth1;
```

```
 }
 }
 reth1 {
 redundant-ether-options {
 redundancy-group 1;
 }
 unit 0 {

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying IKE Phase 1 Status on page 6487](#)
- [Verifying IPsec Phase 2 Status on page 6488](#)
- [Verifying Routes on page 6488](#)

### Verifying IKE Phase 1 Status

**Purpose** Verify the IKE Phase 1 status.

**Action** From operational mode, enter the **show security ike security-associations** command.

```

user@host> show security ike security-associations
Index State Initiator cookie Responder cookie Mode Remote Address

```

```

1081812113 UP 51d9e6df8a929624 7bc15bb40781a902 IKEv2 2000::2
1887118424 UP d80b55b949b54f0a b75ecc815529ae8f Aggressive 20.0.0.2

```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 1 proposal parameters must match on the peer devices.

### Verifying IPsec Phase 2 Status

**Purpose** Verify the IPsec Phase 2 status.

**Action** From operational mode, enter the **show security ipsec security-associations** command.

```

user@host> show security ipsec security-associations
Total active tunnels: 2
ID Algorithm SPI Life:sec/kb Mon lsys Port Gateway
<131074 ESP:3des/sha1 8828bd36 3571/ unlim - root 500 20.0.0.2
>131074 ESP:3des/sha1 c968afd8 3571/ unlim - root 500 20.0.0.2
<131073 ESP:3des/sha1 8e9e695a 3551/ unlim - root 500 2000::2
>131073 ESP:3des/sha1 b3a254d1 3551/ unlim - root 500 2000::2

```

**Meaning** The **show security ipsec security-associations** command lists all active IKE Phase 2 SAs. If no SAs are listed, there was a problem with Phase 2 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 2 proposal parameters must match on the peer devices.

### Verifying Routes

**Purpose** Verify active routes.

**Action** From operational mode, enter the **show route** command.

```

user@host> show route
inet.0: 20 destinations, 20 routes (20 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

## Understanding Traffic Selectors in Route-Based VPNs

---

A traffic selector (also known as a *proxy ID* in IKEv1) is an agreement between IKE peers to permit traffic through a tunnel if the traffic matches a specified pair of local and remote addresses. With this feature, you can define a traffic selector within a specific route-based VPN, which can result in multiple Phase 2 IPsec security associations (SAs). Only traffic that conforms to a traffic selector is permitted through an SA.

- [Traffic Selector Configuration on page 6491](#)
- [Traffic Selector Flexible Matches on page 6492](#)
- [Multiple Tunnels for Traffic Selector Configuration on page 6493](#)
- [Limitations on page 6494](#)

## Traffic Selector Configuration

To configure a traffic selector, use the **traffic-selector** configuration statement at the **[edit security ipsec vpn vpn-name]** hierarchy level. The traffic selector is defined with the mandatory **local-ip ip-address** and **remote-ip ip-address** statements. The CLI operational command **show security ipsec security-association detail** displays traffic selector information for SAs. The **show security ipsec security-association traffic-selector traffic-selector-name** CLI command displays information for a specified traffic selector.

For a given traffic selector, a single address or subnetwork is specified for the local and remote addresses. Traffic selectors can be configured with IPv4 or IPv6 addresses. Address books cannot be used to specify local or remote addresses.

Multiple traffic selectors can be configured for the same VPN. A maximum of 200 traffic selectors can be configured for each VPN. Traffic selectors can be used with IPv4-in-IPv4, IPv4-in-IPv6, IPv6-in-IPv6, or IPv6-in-IPv4 tunnel modes.

**NOTE:** Traffic selectors on AutoVPN hubs can only be configured with IPv4 addresses. IPv4-in-IPv6, IPv6-in-IPv6, or IPv6-in-IPv4 tunnel modes are not supported for AutoVPN with traffic selectors.

When traffic selectors are configured, static routes are automatically added during configuration processing or when traffic selectors are negotiated; this process is known as auto route insertion (ARI). These routes might conflict with those that are populated through routing protocols. We recommend that you do not configure routing protocols on st0 interfaces that are bound to VPNs where traffic selectors are configured.

When a traffic selector is deleted, all corresponding IPsec SAs, routes, and tunnel sessions are cleared. This might affect traffic passing through these tunnels.

When a traffic selector is modified, deleted, or added, traffic selectors that follow it in the configuration are affected. The tunnels, SAs, and routes are cleared and reinstalled. Traffic selectors that precede the new or modified traffic selector in the configuration are unaffected.

For example, three traffic selectors are configured for the same VPN in the following order:

1. ts-red
2. ts-blue
3. ts-green

Changes in the traffic selector configuration have the following results:

Action	Result
Modify local or remote IP address in ts-blue.	Tunnels, SAs, and routes for ts-blue and ts-green are cleared. Tunnel, SA, and route for ts-red are not affected.
Delete ts-blue.	Tunnel, SA, and route for ts-green are cleared. Tunnel, SA, and route for ts-red are not affected.
Insert ts-white after ts-blue.	Tunnels, SAs, and routes for ts-white and ts-green are cleared. Tunnels, SAs, and routes for ts-red and ts-blue are not affected.

## Traffic Selector Flexible Matches

During IKE negotiation, the responder can accept from the initiator a proposed traffic selector that is a subset of the traffic selector configured on the responder. There can be a wide subnetwork configured in a traffic selector on the hub and a narrow portion of

the subnetwork configured in a traffic selector on each spoke. For example, consider the following traffic selectors configured on an AutoVPN hub and spoke:

	Local IP	Remote IP
Spoke:	30.1.2.0/24	40.1.2.0/24
Hub:	40.1.0.0/16	30.1.0.0/16

The initiator (the spoke) negotiates with the responder (the hub) using the /24 netmask. Because the traffic selector IP addresses configured on the spoke are subsets of the traffic selector configured on the hub, the hub accepts the negotiation. The /24 subnetworks are used to match traffic for the negotiated tunnel and the 30.1.2.0/24 static route to the spoke is installed through ARI in the hub's routing table.

Traffic selector flexible matches are supported for both IKEv1 and IKEv2.

Multiple Tunnels for Traffic Selector Configuration

A single traffic selector configuration can result in multiple tunnels. In [Figure 276](#), subnetworks 10.1.0.0/16 and 10.2.0.0/16 are behind device A while subnetwork 20.1.0.0/16 is behind device B.

Figure 276: Multiple Tunnels for Traffic Selector Configuration

Two traffic selectors are configured on device A and one traffic selector is configured on device B, as follows:

	Local IP address	Remote IP address
Device A traffic selectors		
TS1:	10.1.0.0/16	20.1.0.0/16
TS2:	10.2.0.0/16	20.1.0.0/16

Device B traffic selector

TS:	20.1.0.0/16	10.0.0.0/8
-----	-------------	------------

Device A initiates two tunnels with device B using its proposed traffic selectors. Both of device A's proposed traffic selectors match the configured traffic selector on device B. Device B creates two different tunnels for its single traffic selector configuration.

## Limitations

Traffic selectors cannot be configured with the following features:

- Policy-based VPNs
- Shared IKE IDs
- VPN monitoring
- Different address families configured for the local and remote IP addresses
- A remote address of 0.0.0.0/0 (IPv4) or 0::0 (IPv6)
- IKEv2 site-to-site VPN
- Dynamic routing protocols configured on st0 interfaces

## Example: Configuring Traffic Selectors in a Route-Based VPN

This example shows how to configure traffic selectors for a route-based VPN.

- [Requirements on page 6494](#)
- [Overview on page 6494](#)
- [Configuration on page 6497](#)
- [Verification on page 6506](#)

## Requirements

Before you begin, read ["Understanding Traffic Selectors in Route-Based VPNs" on page 6491](#).

## Overview

This example configures traffic selectors to allow traffic to flow between subnetworks on SRX\_A and subnetworks on SRX\_B.

[Table 553](#) shows the traffic selectors used in this example. Traffic selectors are configured with other Phase 2 options (shown in [Table 555](#)).

Table 553: Traffic Selector Configurations

SRX_A			SRX_B		
Traffic Selector Name	Local IP	Remote IP	Traffic Selector Name	Local IP	Remote IP
TS1-ipv6	10::0/64	20::0/64	TS1-ipv6	20::0/64	10::0/64
TS2-ipv4	10.1.1.0/24	20.1.0.0/16	TS2-ipv4	20.1.0.0/16	10.1.1.0/24
TS3-ipv4	10.1.1.0/24	20.1.1.0/24	TS3-ipv4	20.1.1.0/24	10.1.1.0/24

Table 554 shows the Phase 1 options used in this example. The Phase 1 option configuration on each device includes an IKE gateway configuration to the IPv6 peer.

Table 554: Phase 1 Options for Traffic Selector Configurations

Option	SRX_A	SRX_B
IKE proposal	phase1_psk_proposal	phase1_psk_proposal
Authentication method	preshared keys	preshared keys
DH group	group2	group2
Authentication algorithm	SHA 1	SHA 1
Encryption algorithm	3DES CBC	3DES CBC
Lifetime	180 seconds	180 seconds
IKE policy	ike_psk_policy	ike_psk_policy
Mode	main	main
Proposal	phase1_psk_proposal	phase1_psk_proposal
Preshared key	ASCII text	ASCII text
IKE gateway	ike-gateway-to-he-srx	ike-gateway-to-branch-srx
IKE policy	ike_psk_policy	ike_psk_policy
Gateway address	2000::2	2000::1
External interface	ge-0/0/1.0	ge-0/0/1.0
Local address	2000::1	2000::2
IKE version	v1-only (default)	v1-only

Table 555 shows the Phase 2 options used in this example. Traffic selectors shown in Table 553 are configured with the Phase 2 options.

**Table 555: Phase 2 Options for Traffic Selector Configurations**

Option	SRX_A	SRX_B
Isec proposal	phase2-proposal	phase2-proposal
Protocol	ESP	ESP
Authentication algorithm	HMAC SHA-1 96	HMAC SHA-1 96
Encryption algorithm	DES CBC	DES CBC
Isec policy	ipsec-policy	ipsec-policy
Proposal	phase2-proposal	phase2-proposal
VPN	ipsec-vpn-to-he-srx	ipsec-vpn-to-branch-srx
Bind interface	st0.1	st0.1
IKE gateway	ike-gateway-to-he-srx	ike-gateway-to-branch-srx
Isec policy	ipsec-policy	ipsec-policy

**NOTE:** On both devices, flow-based processing of IPv6 traffic must be enabled with the mode flow-based configuration option at the [edit security forwarding-options family inet6] hierarchy level.

### Topology

In Figure 277, an IPv6 VPN tunnel carries both IPv4 and IPv6 traffic between the SRX\_A and SRX\_B devices. That is, the tunnel operates in both IPv4-in-IPv6 and IPv6-in-IPv6 tunnel modes.

**Figure 277: Traffic Selector Configuration Example**

## Configuration

- [Configuring SRX\\_A on page 6497](#)
- [Configuring SRX\\_B on page 6501](#)

### Configuring SRX\_A

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/1 unit 0 family inet6 address 2000::1/64
set interfaces st0 unit 1 family inet
set interfaces st0 unit 1 family inet6
set interfaces ge-1/0/1 unit 0 family inet address 10.1.1.1/24
set interfaces ge-1/0/1 unit 0 family inet6 address 10::1/64
set security ike proposal phase1_psk_proposal authentication- method pre-shared-keys
set security ike proposal phase1_psk_proposal dh-group group2
set security ike proposal phase1_psk_proposal authentication- algorithm sha1

set security policies default-policy permit-all
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure traffic selectors:

1. Configure the external interface.

```
[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet6 address 2000::1/64
```

2. Configure the secure tunnel interface.

```
[edit interfaces]
user@host# set st0 unit 1 family inet
user@host# set st0 unit 1 family inet6
```

3. Configure the internal interface.

```
[edit interfaces]
user@host# set ge-1/0/1 unit 0 family inet address 10.1.1.1/24
user@host# set ge-1/0/1 unit 0 family inet6 address 10::1/64
```

4. Configure Phase 1 options.

```
[edit security ike proposal phase1_psk_proposal]
user@host# set authentication-method pre-shared-keys
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm 3des-cbc
user@host# set lifetime-seconds 180
```

```
[edit security ike policy ike_psk_policy]
user@host# set mode main
user@host# set proposals phase1_psk_proposal
user@host# set pre-shared-key ascii-text "$ABC123"
```

```
[edit security ike gateway ike-gateway-to-he-srx]
user@host# set ike-policy ike_psk_policy
user@host# set address 2000::2
user@host# set external-interface ge-0/0/1.0
user@host# set local-address 2000::1
```

5. Configure Phase 2 options.

```
[edit security ipsec proposal phase2-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm 3des-cbc
```

```
[edit security ipsec policy ipsec_policy]
user@host# set proposals phase2-proposal
```

```
[edit security ipsec vpn ipsec-vpn-to-he-srx]
user@host# set bind-interface st0.1
user@host# set ike gateway ike-gateway-to-he-srx
user@host# set ike ipsec-policy ipsec_policy
```

```

user@host# set traffic-selector TS1-ipv6 local-ip 10::0/64 remote-ip 20::0/64
user@host# set traffic-selector TS2-ipv4 local-ip 10.1.1.0/24 remote-ip 20.1.0.0/16
user@host# set traffic-selector TS3-ipv4 local-ip 10.1.1.0/24 remote-ip 20.1.1.0/24

```

6. Enable IPv6 flow-based forwarding.

```

[edit security forwarding-options]
user@host# set family inet6 mode flow-based

```

7. Configure security zones and the security policy.

```

[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-1/0/1.0

```

```

[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces st0.1
user@host# set interfaces ge-0/0/1.0

```

```

[edit security policies]
user@host# set default-policy permit-all

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security ike**, **show security ipsec**, **show security forwarding-options**, **show security zones**, and **show security policies** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@host# show interfaces

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring SRX\_B

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/1 unit 0 family inet6 address 2000::2/64
set interfaces st0 unit 1 family inet
set interfaces st0 unit 1 family inet6
set interfaces ge-1/0/1 unit 0 family inet address 20.1.1.1/24
set interfaces ge-1/0/1 unit 0 family inet6 address 20::1/64
set interfaces ge-1/1/1 unit 0 family inet address 20.1.2.1/24
set security ike proposal phase1_psk_proposal authentication-method pre-shared-keys
set security ike proposal phase1_psk_proposal dh-group group2
set security ike proposal phase1_psk_proposal authentication-algorithm sha1
set security ike proposal phase1_psk_proposal encryption-algorithm 3des-cbc
set security ike proposal phase1_psk_proposal lifetime-seconds 180

```

```

set security ike policy ike_psk_policy mode main
set security ike policy ike_psk_policy proposals phase1_psk_proposal
set security ike policy ike_psk_policy pre-shared-key ascii-text "$ABC123"
set security ike gateway ike-gateway-to-branch-srx ike-policy ike_psk_policy
set security ike gateway ike-gateway-to-branch-srx address 2000::1
set security ike gateway ike-gateway-to-branch-srx external-interface ge-0/0/1.0
set security ike gateway ike-gateway-to-branch-srx local-address 2000::2
set security ipsec proposal phase2-proposal protocol esp
set security ipsec proposal phase2-proposal authentication-algorithm hmac-sha1-96
set security ipsec proposal phase2-proposal encryption-algorithm 3des-cbc
set security ipsec policy ipsec_policy proposals phase2-proposal
set security ipsec vpn ipsec-vpn-to-branch-srx bind-interface st0.1
set security ipsec vpn ipsec-vpn-to-branch-srx ike ipsec-policy ipsec_policy
set security ipsec vpn ipsec-vpn-to-branch-srx ike gateway ike-gateway-to-branch-srx

set security zones security-zone untrust host-inbound-traffic protocols all
set security zones security-zone untrust interfaces st0.1
set security zones security-zone untrust interfaces ge-0/0/1.0
set security policies default-policy permit-all

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure traffic selectors:

1. Configure the external interface.  

```

[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet6 address 2000::2/64

```
2. Configure the secure tunnel interface.  

```

[edit interfaces]
user@host# set st0 unit 1 family inet
user@host# set st0 unit 1 family inet6

```
3. Configure the internal interfaces.  

```

[edit interfaces]
user@host# set ge-1/0/1 unit 0 family inet address 20.1.1.1/24
user@host# set ge-1/0/1 unit 0 family inet6 address 20::1/64
user@host# set ge-1/1/1 unit 0 family inet address 20.1.2.1/24

```
4. Configure Phase 1 options.  

```

[edit security ike proposal phase1_psk_proposal]

```

```

user@host# set authentication-method pre-shared-keys
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm 3des-cbc
user@host# set lifetime-seconds 180

```

```

[edit security ike policy ike_psk_policy]
user@host# set mode main
user@host# set proposals phase1_psk_proposal
user@host# set pre-shared-key ascii-text "$ABC123"

```

```

[edit security ike gateway ike-gateway-to-branch-srx]
user@host# set ike-policy ike_psk_policy
user@host# set address 2000::1
user@host# set external-interface ge-0/0/1.0
user@host# set local-address 2000::2

```

5. Configure Phase 2 options.

```

[edit security ipsec proposal phase2-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm 3des-cbc

```

```

[edit security ipsec policy ipsec_policy]
user@host# set proposals phase2-proposal

```

```

[edit security ipsec vpn ipsec-vpn-to-branch-srx]
user@host# set bind-interface st0.1
user@host# set ike gateway ike-gateway-to-branch-srx
user@host# set ike ipsec-policy ipsec_policy
user@host# set traffic-selector TS1-ipv6 local-ip 20::0/64 remote-ip 10::0/64
user@host# set traffic-selector TS2-ipv4 local-ip 20.1.0.0/16 remote-ip 10.1.1.0/24
user@host# set traffic-selector TS3-ipv4 local-ip 20.1.1.0/24 remote-ip 10.1.1.0/24

```

6. Enable IPv6 flow-based forwarding.

```

[edit security forwarding-options]
user@host# set family inet6 mode flow-based

```

7. Configure security zones and the security policy.

```

[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-1/0/1.0
user@host# set interfaces ge-1/1/1.0

```

```

[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces st0.1
user@host# set interfaces ge-0/0/1.0

```

```

[edit security policies]
user@host# set default-policy permit-all

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security ike**, **show security ipsec**, **show security forwarding-options**, **show security zones**, and **show security policies** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying IPsec Phase 2 Status on page 6506](#)
- [Verifying Routes on page 6508](#)

### Verifying IPsec Phase 2 Status

**Purpose** Verify the IPsec Phase 2 status.

**Action** From operational mode, enter the **show security ipsec security-associations** command.

```

user@host> show security ipsec security-associations
Total active tunnels: 3
ID Algorithm SPI Life:sec/kb Mon lsys Port Gateway
<268173313 ESP:des/ sha1 3d75aeff 2984/ unlim - root 500 2000::2
>268173313 ESP:des/ sha1 a468fece 2984/ unlim - root 500 2000::2
<268173316 ESP:des/ sha1 417f3cea 3594/ unlim - root 500 2000::2
>268173316 ESP:des/ sha1 a4344027 3594/ unlim - root 500 2000::2
<268173317 ESP:des/ sha1 cc9fb573 3556/ unlim - root 500 2000::2
>268173317 ESP:des/ sha1 a4bde69b 3556/ unlim - root 500 2000::2

```

From operational mode, enter the **show security ipsec security-associations detail** command.

```

user@host> show security ipsec security-associations detail

```

**Meaning** The **show security ipsec security-associations** command lists all active IKE Phase 2 SAs. If no SAs are listed, there was a problem with Phase 2 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 2 proposal parameters must match on the peer devices.

---

### Verifying Routes

**Purpose** Verify active routes

**Action** From operational mode, enter the **show route** command.

```

user@host> show route
inet.0: 24 destinations, 24 routes (24 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

20.1.0.0/16 *[Static/5] 00:00:32
 > via st0.1
20.1.1.0/24 *[Static/5] 00:00:32
 > via st0.1
20::/64 *[Static/5] 00:00:34
 > via st0.1

```

**Meaning** The **show route** command lists active entries in the routing tables. Routes to the remote IP address configured in each traffic selector should be present with the correct st0 interface.

**Related Documentation**

- [Understanding Traffic Selectors in Route-Based VPNs on page 6491](#)

---

## Understanding Auto Route Insertion

Auto route insertion (ARI) automatically inserts a static route for the remote network and hosts protected by a remote tunnel endpoint. A route is created based on the remote IP address configured in the traffic-selector. In the case of traffic selectors, the configured remote address is inserted as a route in the routing instance associated with the st0 interface that is bound to the VPN.

**NOTE:** Routing protocols and traffic selector configuration are mutually exclusive ways of steering traffic to a tunnel. ARI routes might conflict with routes that are populated through routing protocols. Therefore, you should not configure routing protocols on an st0 interface that is bound to a VPN on which traffic selectors are configured.

ARI is also known as reverse route insertion (RRI). ARI routes are inserted in the routing table as follows:

- If the **establish-tunnels immediately** option is configured at the `[edit security ipsec vpn vpn-name]` hierarchy level, ARI routes are added after Phase 1 and Phase 2 negotiations are complete. Because a route is not added until SAs are established, a failed negotiation does not result in traffic being routed to a st0 interface that is down. An alternate or backup tunnel is used instead.
- If the **establish-tunnels immediately** option is not configured at the `[edit security ipsec vpn vpn-name]` hierarchy level, ARI routes are added at configuration commit.
- An ARI route is not added if the configured or negotiated remote address in a traffic selector is 0.0.0.0/0 or 0::0.

The preference for the static ARI route is 5. This value is necessary to avoid conflict with similar routes that might be added by a routing protocol process. There is no configuration of the metric for the static ARI route.

## Understanding Traffic Selectors and Overlapping IP Addresses

This section discusses overlapping IP addresses in traffic selector configurations.

- [Overlapping IP Addresses in Different VPNs Bound to the Same st0 Interface on page 6509](#)
- [Overlapping IP Addresses in the Same VPN Bound to the Same st0 Interface on page 6510](#)
- [Overlapping IP Addresses in Different VPNs Bound to Different st0 Interfaces on page 6510](#)

### Overlapping IP Addresses in Different VPNs Bound to the Same st0 Interface

This scenario is not supported with traffic selectors. Traffic selectors cannot be configured on different VPNs that are bound to the same point-to-multipoint st0 interface, as shown in the following example:

```
[edit]
user@host# show security ipsec
vpn vpn-1 {
 bind-interface st0.1;
}
vpn vpn-2 {
 bind-interface st0.1;
```

```
}
```

## Overlapping IP Addresses in the Same VPN Bound to the Same st0 Interface

When overlapping IP addresses are configured for multiple traffic selectors in the same VPN, the first configured traffic selector that matches the packet determines the tunnel used for packet encryption.

In the following example, four traffic selectors (ts-1, ts-2, ts-3, and ts-4) are configured for the VPN (vpn-1), which is bound to the point-to-point st0.1 interface:

```
[edit]
user@host# show security ipsec vpn vpn-1
vpn vpn-1 {
 bind-interface st0.1;
 traffic-selector ts-1 {
 local-ip 20.1.5.0/24;
 remote-ip 10.1.5.0/24;
 }
 traffic-selector ts-2 {
 local-ip 20.1.0.0/16;
 remote-ip 10.1.0.0/16;
 }
 traffic-selector ts-3 {
 local-ip 40.1.0.0/16;
 remote-ip 50.1.0.0/16;
 }
 traffic-selector ts-4 {
 local-ip 40.1.5.0/24;
 remote-ip 50.1.5.0/24;
 }
}
```

A packet with a source address 20.1.5.5 and a destination address 10.1.5.10 matches traffic selectors ts-1 and ts-2. However, traffic selector ts-1 is the first configured match and the tunnel associated with ts-1 is used for packet encryption.

A packet with a source address 40.1.5.5 and a destination address 50.1.5.10 matches the traffic selectors ts-3 and ts-4. However, traffic selector ts-3 is the first configured match and the tunnel associated with traffic selector ts-3 is used for packet encryption.

## Overlapping IP Addresses in Different VPNs Bound to Different st0 Interfaces

When overlapping IP addresses are configured for multiple traffic selectors in different VPNs that are bound to different point-to-point st0 interfaces, an st0 interface is first selected by the longest prefix match for a given packet. Within the VPN that is bound to the selected st0 interface, the traffic selector is then selected based on the first configured match for the packet.

In the following example, a traffic selector is configured in each of two VPNs. The traffic selectors are configured with the same local subnetwork but different remote subnetworks.

```
[edit]
user@host# show security ipsec
```

```

vpn vpn-1 {
 bind-interface st0.1;
 traffic-selector ts-1 {
 local-ip 20.1.1.0/24;
 remote-ip 10.1.1.0/24;
 }
}
vpn vpn-2 {
 bind-interface st0.2;
 traffic-selector ts-2 {
 local-ip 20.1.1.0/24;
 remote-ip 11.1.1.0/24;
 }
}

```

Different remote subnetworks are configured in each traffic selector, therefore two different routes are added to the routing table. Route lookup uses the st0 interface bound to the appropriate VPN.

In the following example, a traffic selector is configured in each of two VPNs. The traffic selectors are configured with different remote subnetworks. The same local subnetwork is configured for each traffic selector, but different netmask values are specified.

```

[edit]
user@host# show security ipsec
vpn vpn-1 {
 bind-interface st0.1;
 traffic-selector ts-1 {
 local-ip 20.0.0.0/8;
 remote-ip 10.1.1.0/24;
 }
}
vpn vpn-2 {
 bind-interface st0.2;
 traffic-selector ts-2 {
 local-ip 21.1.0.0/16;
 remote-ip 11.1.1.0/24;
 }
}

```

A different remote subnetwork is configured in each traffic selector, therefore two different routes are added to the routing table. Route lookup uses the st0 interface bound to the appropriate VPN.

In the following example, traffic selectors are configured in each of two VPNs. The traffic selectors are configured with different local and remote subnetworks.

```

[edit]
user@host# show security ipsec
vpn vpn-1 {
 bind-interface st0.1;
 traffic-selector ts-1 {
 local-ip 20.1.1.0/24;
 remote-ip 10.1.1.0/24;
 }
}

```

```

vpn vpn-2 {
 bind-interface st0.2;
 traffic-selector ts-2 {
 local-ip 21.1.1.0/24;
 remote-ip 11.1.1.0/24;
 }
}

```

In this case, the traffic selectors do not overlap. The remote subnetworks configured in the traffic selectors are different, therefore two different routes are added to the routing table. Route lookup uses the st0 interface bound to the appropriate VPN.

In the following example, a traffic selector is configured in each of two VPNs. The traffic selectors are configured with the same local subnetwork. The same remote subnetwork is configured for each traffic selector, but different netmask values are specified.

```

[edit]
user@host# show security ipsec
vpn vpn-1 {
 bind-interface st0.1;
 traffic-selector ts-1 {
 local-ip 20.1.1.0/24;
 remote-ip 10.1.1.0/24;
 }
}
vpn vpn-2 {
 bind-interface st0.2;
 traffic-selector ts-2 {
 local-ip 20.1.1.0/24;
 remote-ip 10.1.0.0/16;
 }
}

```

Note that the **remote-ip** configured for ts-1 is 10.1.1.0/24 while the **remote-ip** configured for ts-2 is 10.1.0.0/16. For a packet destined to 10.1.1.1, route lookup selects the st0.1 interface as it has the longer prefix match. The packet is encrypted based on the tunnel corresponding to the st0.1 interface.

In some cases, valid packets can be dropped due to traffic selector traffic enforcement. In the following example, traffic selectors are configured in each of two VPNs. The traffic selectors are configured with different local subnetworks. The same remote subnetwork is configured for each traffic selector, but different netmask values are specified.

```

[edit]
user@host# show security ipsec
vpn vpn-1 {
 bind-interface st0.1;
 traffic-selector ts-1 {
 local-ip 20.1.1.0/24;
 remote-ip 10.1.1.0/24;
 }
}
vpn vpn-2 {
 bind-interface st0.2;
 traffic-selector ts-2 {

```

```
local-ip 21.1.1.0/16;
remote-ip 10.1.0.0/16;
}
}
```

Two routes to 10.1.1.0 (10.1.1.0/24 via interface st0.1 and 10.1.0.0/16 via interface st0.2) are added to the routing table. A packet sent from source 21.1.1.1 to destination 10.1.1.1 matches the routing table entry for 10.1.1.0/24 via interface st0.1. However, the packet does not match the traffic specified by traffic selector ts-1 and is dropped.

**NOTE:** If multiple traffic selectors are configured with the same remote subnetwork and netmask, equal cost routes are added to the routing table. This case is not supported with traffic selectors as the route chosen cannot be predicted.

## Understanding Policy-Based IPsec VPNs

---

For policy-based IPsec VPNs, a security policy specifies as its action the VPN tunnel to be used for transit traffic that meets the policy's match criteria. A VPN is configured independent of a policy statement. The policy statement refers to the VPN by name to specify the traffic that is allowed access to the tunnel. For policy-based VPNs, each policy creates an individual IPsec security association (SA) with the remote peer, each of which counts as an individual VPN tunnel. For example, if a policy contains a group source address and a group destination address, whenever one of the users belonging to the address set attempts to communicate with any one of the hosts specified as the destination address, a new tunnel is negotiated and established. Because each tunnel requires its own negotiation process and separate pair of SAs, the use of policy-based IPsec VPNs can be more resource-intensive than route-based VPNs.

Examples of where policy-based VPNs can be used:

- You are implementing a dial-up VPN.
- Policy-based VPNs allow you to direct traffic based on firewall policies.

**NOTE:** We recommend that you use route-based VPN when you want to configure a VPN between multiple remote sites. Route-based VPNs can provide the same capabilities as policy-based VPNs.

## Example: Configuring a Policy-Based VPN

---

This example shows how to configure a policy-based IPsec VPN to allow data to be securely transferred between a branch office and the corporate office.

- [Requirements on page 6518](#)
- [Overview on page 6518](#)
- [Configuration on page 6522](#)
- [Verification on page 6531](#)

### Requirements

This example uses the following hardware:

- SRX240 device
- SSG140 device

Before you begin, read [“IPsec VPN Overview” on page 6337](#).

### Overview

In this example, you configure a policy-based VPN for a branch office in Chicago, Illinois, because you do not need to conserve tunnel resources or configure many security policies to filter traffic through the tunnel. Users in the Chicago office will use the VPN to connect to their corporate headquarters in Sunnyvale, California.

[Figure 278](#) shows an example of a policy-based VPN topology. In this topology, the SRX Series device is located in Sunnyvale, and an SSG Series device (or it can be another third-party device) is located in Chicago.

Figure 278: Policy-Based VPN Topology

IKE IPsec tunnel negotiation occurs in two phases. In Phase 1, participants establish a secure channel in which to negotiate the IPsec security association (SA). In Phase 2, participants negotiate the IPsec SA for authenticating traffic that will flow through the

tunnel. Just as there are two phases to tunnel negotiation, there are two phases to tunnel configuration.

In this example, you configure interfaces, an IPv4 default route, security zones, and address books. Then you configure IKE Phase 1, IPsec Phase 2, security policy, and TCP-MSS parameters. See [Table 556](#) through [Table 560](#).

**Table 556: Interface, Security Zone, and Address Book Information**

Feature	Name	Configuration Parameters
Interfaces	ge-0/0/0.0	10.10.10.1/24
	ge-0/0/3.0	1.1.1.2/30
Security zones	trust	<ul style="list-style-type: none"> <li>All system services are allowed.</li> <li>The ge-0/0/0.0 interface is bound to this zone.</li> </ul>
	untrust	<ul style="list-style-type: none"> <li>IKE is the only allowed system service.</li> <li>The ge-0/0/3.0 interface is bound to this zone.</li> </ul>
Address book entries	sunnyvale	<ul style="list-style-type: none"> <li>This address is an entry in the address book <b>book1</b>, which is attached to a zone called <b>trust</b>.</li> <li>The address for this address book entry is 10.10.10.0/24.</li> </ul>
	chicago	<ul style="list-style-type: none"> <li>This address is an entry in the address book <b>book2</b>, which is attached to a zone called <b>ch</b>.</li> <li>The address for this address book entry is 192.168.168.0/24.</li> </ul>

**Table 557: IKE Phase 1 Configuration Parameters**

Feature	Name	Configuration Parameters
Proposal	ike-phase1-proposal	<ul style="list-style-type: none"> <li>Authentication method: pre-shared-keys</li> <li>Diffie-Hellman group: group2</li> <li>Authentication algorithm: sha1</li> <li>Encryption algorithm: aes-128-cbc</li> </ul>
Policy	ike-phase1-policy	<ul style="list-style-type: none"> <li>Mode: main</li> <li>Proposal reference: ike-phase1-proposal</li> <li>IKE Phase 1 policy authentication method: pre-shared-key ascii-text</li> </ul>
Gateway	gw-chicago	<ul style="list-style-type: none"> <li>IKE policy reference: ike-phase1-policy</li> <li>External interface: ge-0/0/3.0</li> <li>Gateway address: 2.2.2.2</li> </ul>

Table 558: IPsec Phase 2 Configuration Parameters

Feature	Name	Configuration Parameters

Table 559: Security Policy Configuration Parameters

Purpose	Name	Configuration Parameters
This security policy permits traffic from the trust zone to the untrust zone.	vpn-tr-untr	<ul style="list-style-type: none"> <li>Match criteria: <ul style="list-style-type: none"> <li>source-address sunnyvale</li> <li>destination-address chicago</li> <li>application any</li> </ul> </li> <li>Permit action: tunnel ipsec-vpn ike-vpn-chicago</li> <li>Permit action: tunnel pair-policy vpn-untr-tr</li> </ul>
This security policy permits traffic from the untrust zone to the trust zone.	vpn-untr-tr	<ul style="list-style-type: none"> <li>Match criteria: <ul style="list-style-type: none"> <li>source-address chicago</li> <li>destination-address sunnyvale</li> <li>application any</li> </ul> </li> <li>Permit action: tunnel ipsec-vpn ike-vpn-chicago</li> <li>Permit action: tunnel pair-policy vpn-tr-untr</li> </ul>
<p>This security policy permits all traffic from the trust zone to the untrust zone.</p> <p><b>NOTE:</b> You must put the vpn-tr-untr policy before the permit-any security policy. Junos OS performs a security policy lookup starting at the top of the list. If the permit-any policy comes before the vpn-tr-untr policy, all traffic from the trust zone will match the permit-any policy and be permitted. Thus, no traffic will ever match the vpn-tr-untr policy.</p>	permit-any	<ul style="list-style-type: none"> <li>Match criteria: <ul style="list-style-type: none"> <li>source-address any</li> <li>source-destination any</li> <li>application any</li> </ul> </li> <li>Action: permit</li> </ul>

Table 560: TCP-MSS Configuration Parameters

Purpose	Configuration Parameters
<p>TCP-MSS is negotiated as part of the TCP three-way handshake and limits the maximum size of a TCP segment to better fit the maximum transmission unit (MTU) limits on a network. This is especially important for VPN traffic, as the IPsec encapsulation overhead, along with the IP and frame overhead, can cause the resulting Encapsulating Security Payload (ESP) packet to exceed the MTU of the physical interface, thus causing fragmentation. Fragmentation results in increased use of bandwidth and device resources.</p> <p><b>NOTE:</b> We recommend a value of 1350 as the starting point for most Ethernet-based networks with an MTU of 1500 or greater. You might need to experiment with different TCP-MSS values to obtain optimal performance. For example, you might need to change the value if any device in the path has a lower MTU, or if there is any additional overhead such as PPP or Frame Relay.</p>	MSS value: 1350

## Configuration

### Configuring Basic Network, Security Zone, and Address Book Information

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/0 unit 0 family inet address 10.10.10.1/24
set interfaces ge-0/0/3 unit 0 family inet address 1.1.1.2/30
set routing-options static route 0.0.0.0/0 next-hop 1.1.1.1
set security zones security-zone untrust interfaces ge-0/0/3.0
set security zones security-zone untrust host-inbound-traffic system-services ike
set security zones security-zone trust interfaces ge-0/0/0.0
set security zones security-zone trust host-inbound-traffic system-services all
set security address-book book1 address sunnyvale 10.10.10.0/24
set security address-book book1 attach zone trust
set security address-book book2 address chicago 192.168.168.0/24
set security address-book book2 attach zone untrust
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure basic network, security zone, and address book information:

1. Configure Ethernet interface information.
 

```
[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet address 10.10.10.1/24
user@host# set interfaces ge-0/0/3 unit 0 family inet address 1.1.1.2/30
```
2. Configure static route information.
 

```
[edit]
user@host# set routing-options static route 0.0.0.0/0 next-hop 1.1.1.1
```
3. Configure the untrust security zone.

- ```
[edit ]
user@host# edit security zones security-zone untrust
```
4. Assign an interface to the security zone.

```
[edit security zones security-zone untrust]
user@host# set interfaces ge-0/0/3.0
```
 5. Specify allowed system services for the security zone.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services ike
```
 6. Configure the trust security zone.

```
[edit]
user@host# edit security zones security-zone trust
```
 7. Assign an interface to the security zone.

```
[edit security zones security-zone trust]
user@host# set interfaces ge-0/0/0.0
```
 8. Specify allowed system services for the security zone.

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
```
 9. Create an address book and attach it to a zone.

```
[edit security address-book book1]
user@host# set address sunnyvale 10.10.10.0/24
user@host# set attach zone trust
```
 10. Create another address book and attach it to a zone.

```
[edit security address-book book2]
user@host# set address chicago 192.168.168.0/24
user@host# set attach zone untrust
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, **show security zones**, and **show security address-book** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces
ge-0/0/0 {
  unit 0 {
    family inet {
      address 10.10.10.1/24;
    }
  }
}
ge-0/0/3 {
  unit 0 {
    family inet {
      address 1.1.1.2/30
    }
  }
}
```

```

}

[edit]
user@host# show routing-options
static {
    route 0.0.0.0/0 next-hop 1.1.1.1;
}

[edit]
user@host# show security zones
security-zone untrust {
    host-inbound-traffic {
        system-services {
            ike;
        }
    }
    interfaces {
        ge-0/0/3.0;
    }
}
security-zone trust {
    host-inbound-traffic {
        system-services {
            all;
        }
    }
    interfaces {
        ge-0/0/0.0;
    }
}

[edit]
user@host# show security address-book
book1 {
    address sunnyvale 10.10.10.0/24;
    attach {
        zone trust;
    }
}
book2 {
    address chicago 192.168.168.0/24;
    attach {
        zone untrust;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring IKE

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security ike proposal ike-phase1-proposal authentication-method pre-shared-keys
set security ike proposal ike-phase1-proposal dh-group group2

```

```

set security ike proposal ike-phase1-proposal authentication-algorithm sha1
set security ike proposal ike-phase1-proposal encryption-algorithm aes-128-cbc
set security ike policy ike-phase1-policy mode main
set security ike policy ike-phase1-policy proposals ike-phase1-proposal
set security ike policy ike-phase1-policy pre-shared-key ascii-text 395psksecr3t
set security ike gateway gw-chicago external-interface ge-0/0/3.0
set security ike gateway gw-chicago ike-policy ike-phase1-policy
set security ike gateway gw-chicago address 2.2.2.2

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IKE:

1. Create the IKE Phase 1 proposal.

```

[edit security ike]
user@host# set proposal ike-phase1-proposal

```
2. Define the IKE proposal authentication method.

```

[edit security ike proposal ike-phase1-proposal]
user@host# set authentication-method pre-shared-keys

```
3. Define the IKE proposal Diffie-Hellman group.

```

[edit security ike proposal ike-phase1-proposal]
user@host# set dh-group group2

```
4. Define the IKE proposal authentication algorithm.

```

[edit security ike proposal ike-phase1-proposal]
user@host# set authentication-algorithm sha1

```
5. Define the IKE proposal encryption algorithm.

```

[edit security ike proposal ike-phase1-proposal]
user@host# set encryption-algorithm aes-128-cbc

```
6. Create an IKE Phase 1 policy.

```

[edit security ike]
user@host# set policy ike-phase1-policy

```
7. Set the IKE Phase 1 policy mode.

```

[edit security ike policy ike-phase1-policy]
user@host# set mode main

```
8. Specify a reference to the IKE proposal.

```

[edit security ike policy ike-phase1-policy]
user@host# set proposals ike-phase1-proposal

```
9. Define the IKE Phase 1 policy authentication method.

```

[edit security ike policy ike-phase1-policy]
user@host# set pre-shared-key ascii-text 395psksecr3t

```
10. Create an IKE Phase 1 gateway and define its external interface.

```

[edit security ike]

```

```
user@host# set gateway gw-chicago external-interface ge-0/0/3.0
```

11. Define the IKE Phase 1 policy reference.

```
[edit security ike gateway gw-chicago]
user@host# set ike-policy ike-phase1-policy
```

12. Create an IKE Phase 1 gateway and define its external interface.

```
[edit security ike gateway gw-chicago]
user@host# set gateway gw-chicago external-interface ge-0/0/3.0
```

13. Define the IKE Phase 1 policy reference.

```
[edit security ike gateway gw-chicago]
user@host# set ike-policy ike-phase1-policy
```

Results From configuration mode, confirm your configuration by entering the **show security ike** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security ike
proposal ike-phase1-proposal {
  authentication-method pre-shared-keys;
  dh-group group2;
  authentication-algorithm sha1;
  encryption-algorithm aes-128-cbc;
}
policy ike-phase1-policy {
  mode main;
  proposals ike-phase1-proposal;
  pre-shared-key ascii-text "$ABC123"; ## SECRET-DATA
}
gateway gw-chicago {
  ike-policy ike-phase1-policy;
  address 2.2.2.2;
  external-interface ge-0/0/3.0;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring IPsec

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ipsec proposal ipsec-phase2-proposal protocol esp
set security ipsec proposal ipsec-phase2-proposal authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec-phase2-proposal encryption-algorithm aes-128-cbc
set security ipsec policy ipsec-phase2-policy proposals ipsec-phase2-proposal
set security ipsec policy ipsec-phase2-policy perfect-forward-secrecy keys group2
set security ipsec vpn ike-vpn-chicago ike gateway gw-chicago
set security ipsec vpn ike-vpn-chicago ike ipsec-policy ipsec-phase2-policy
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IPsec:

1. Create an IPsec Phase 2 proposal.

```
[edit]
user@host# set security ipsec proposal ipsec-phase2-proposal
```
2. Specify the IPsec Phase 2 proposal protocol.

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@host# set protocol esp
```
3. Specify the IPsec Phase 2 proposal authentication algorithm.

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@host# set authentication-algorithm hmac-sha1-96
```
4. Specify the IPsec Phase 2 proposal encryption algorithm.

```
[edit security ipsec proposal ipsec-phase2-proposal]
user@host# set encryption-algorithm aes-128-cbc
```
5. Create the IPsec Phase 2 policy.

```
[edit security ipsec]
user@host# set policy ipsec-phase2-policy
```
6. Specify the IPsec Phase 2 proposal reference.

```
[edit security ipsec policy ipsec-phase2-policy]
user@host# set proposals ipsec-phase2-proposal
```
7. Specify IPsec Phase 2 PFS to use Diffie-Hellman group 2.

```
[edit security ipsec policy ipsec-phase2-policy]
user@host# set perfect-forward-secrecy keys group2
```
8. Specify the IKE gateway.

```
[edit security ipsec]
user@host# set vpn ike-vpn-chicago ike gateway gw-chicago
```
9. Specify the IPsec Phase 2 policy.

```
[edit security ipsec]
user@host# set vpn ike-vpn-chicago ike ipsec-policy ipsec-phase2-policy
```

Results From configuration mode, confirm your configuration by entering the **show security ipsec** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security ipsec
proposal ipsec-phase2-proposal {
  protocol esp;
  authentication-algorithm hmac-sha1-96;
  encryption-algorithm aes-128-cbc;
```

```

}
policy ipsec-phase2-policy {
  perfect-forward-secrecy {
    keys group2;
  }
  proposals ipsec-phase2-proposal;
}
vpn ike-vpn-chicago {
  ike {
    gateway gw-chicago;
    ipsec-policy ipsec-phase2-policy;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Security Policies

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security policies from-zone trust to-zone untrust policy vpn-tr-untr match
  source-address sunnyvale
set security policies from-zone trust to-zone untrust policy vpn-tr-untr match
  destination-address chicago
set security policies from-zone trust to-zone untrust policy vpn-tr-untr match application
  any
set security policies from-zone trust to-zone untrust policy vpn-tr-untr then permit tunnel
  ipsec-vpn ike-vpn-chicago
set security policies from-zone trust to-zone untrust policy vpn-tr-untr then permit tunnel
  pair-policy vpn-untr-tr
set security policies from-zone untrust to-zone trust policy vpn-untr-tr match
  source-address chicago
set security policies from-zone untrust to-zone trust policy vpn-untr-tr match
  destination-address sunnyvale
set security policies from-zone untrust to-zone trust policy vpn-untr-tr match application
  any
set security policies from-zone untrust to-zone trust policy vpn-untr-tr then permit tunnel
  ipsec-vpn ike-vpn-chicago
set security policies from-zone untrust to-zone trust policy vpn-untr-tr then permit tunnel
  pair-policy vpn-tr-untr
set security policies from-zone trust to-zone untrust policy permit-any match
  source-address any
set security policies from-zone trust to-zone untrust policy permit-any match
  destination-address any
set security policies from-zone trust to-zone untrust policy permit-any match application
  any
set security policies from-zone trust to-zone untrust policy permit-any then permit
insert security policies from-zone trust to-zone untrust policy vpn-tr-untr before policy
  permit-any

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure security policies:

1. Create the security policy to permit traffic from the trust zone to the untrust zone.

```
[edit security policies from-zone trust to-zone untrust]
user@host# set policy vpn-tr-untr match source-address sunnyvale
user@host# set policy vpn-tr-untr match destination-address chicago
user@host# set policy vpn-tr-untr match application any
user@host# set policy vpn-tr-untr then permit tunnel ipsec-vpn ike-vpn-chicago
user@host# set policy vpn-tr-untr then permit tunnel pair-policy vpn-untr-tr
```

2. Create the security policy to permit traffic from the untrust zone to the trust zone.

```
[edit security policies from-zone untrust to-zone trust]
user@host# set policy vpn-untr-tr match source-address sunnyvale
user@host# set policy vpn-untr-tr match destination-address chicago
user@host# set policy vpn-untr-tr match application any
user@host# set policy vpn-untr-tr then permit tunnel ipsec-vpn ike-vpn-chicago
user@host# set policy vpn-untr-tr then permit tunnel pair-policy vpn-tr-untr
```

3. Create the security policy to permit traffic from the trust zone to the untrust zone.

```
[edit security policies from-zone trust to-zone untrust]
user@host# set policy permit-any match source-address any
user@host# set policy vpn-untr-tr match destination-address any
user@host# set policy vpn-untr-tr match application any
user@host# set policy vpn-untr-tr then permit
```

4. Reorder the security policies so that the vpn-tr-untr security policy is placed above the permit-any security policy.

```
[edit security policies from-zone trust to-zone untrust]
user@host# insert policy vpn-tr-untr before policy permit-any
```

Results From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security policies
from-zone trust to-zone untrust {
  policy vpn-tr-untr {
    match {
      source-address sunnyvale;
      destination-address chicago;
      application any;
    }
    then {
      permit {
        tunnel {
          ipsec-vpn ike-vpn-chicago;
          pair-policy vpn-untr-tr;
        }
      }
    }
  }
}
```

```

    }
  }
}
policy permit-any {
  match {
    source-address any;
    destination-address any;
    application any;
  }
  then {
    permit
  }
}
}
from-zone untrust to-zone trust {
  policy vpn-untr-tr {
    match {
      source-address chicago;
      destination-address sunnyvale;
      application any;
    }
    then {
      permit {
        tunnel {
          ipsec-vpn ike-vpn-chicago;
          pair-policy vpn-tr-untr;
        }
      }
    }
  }
}
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring TCP-MSS

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security flow tcp-mss ipsec-vpn mss 1350
```

Step-by-Step Procedure To configure TCP-MSS information:

1. Configure TCP-MSS information.

```

[edit]
user@host# set security flow tcp-mss ipsec-vpn mss 1350

```

Results From configuration mode, confirm your configuration by entering the **show security flow** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
```

```

user@host# show security flow
tcp-mss {
  ipsec-vpn {
    mss 1350;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring the SSG Series Device

CLI Quick Configuration

For reference, the configuration for the SSG Series device is provided. For information about configuring SSG Series devices, see the *Concepts and Examples ScreenOS Reference Guide*, which is located at <http://www.juniper.net/techpubs>.

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interface ethernet0/6 zone Trust
set interface ethernet0/0 zone Untrust
set interface ethernet0/6 ip 192.168.168.1/24

```

Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the IKE Phase 1 Status on page 6531](#)
- [Verifying the IPsec Phase 2 Status on page 6533](#)
- [Reviewing Statistics and Errors for an IPsec Security Association on page 6534](#)

Verifying the IKE Phase 1 Status

Purpose Verify the IKE Phase 1 status.

Action

NOTE: Before starting the verification process, you need to send traffic from a host in the 10.10.10/24 network to a host in the 192.168.168/24 network. For policy-based VPNs, a separate host must generate the traffic; traffic initiated from the SRX Series device will not match the VPN policy. We recommend that the test traffic be from a separate device on one side of the VPN to a second device on the other side of the VPN. For example, initiate ping from 10.10.10.10 to 192.168.168.10.

From operational mode, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations index *index_number* detail** command.

```
user@host> show security ike security-associations
Index   Remote Address   State   Initiator cookie   Responder cookie   Mode
4       2.2.2.2          UP      5e1db3f9d50b0de6   e50865d9ebf134f8   Main

user@host> show security ike security-associations index 4 detail
IKE peer 2.2.2.2, Index 4,
  Role: Responder, State: UP
  Initiator cookie: 5e1db3f9d50b0de6, Responder cookie: e50865d9ebf134f8
  Exchange type: Main, Authentication method: Pre-shared-keys
  Local: 1.1.1.2:500, Remote: 2.2.2.2:500
  Lifetime: Expires in 28770 seconds
  Algorithms:
    Authentication      : sha1
    Encryption          : aes-128-cbc
    Pseudo random function: hmac-sha1
  Traffic statistics:
    Input bytes      :      852
    Output bytes     :      856
    Input packets    :         5
    Output packets   :         4
  Flags: Caller notification sent
  IPSec security associations: 1 created, 0 deleted
  Phase 2 negotiations in progress: 0
```

Meaning The **show security ike security-associations** command lists all active IKE Phase 1 security associations (SAs). If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration.

If SAs are listed, review the following information:

- Index—This value is unique for each IKE SA, which you can use in the **show security ike security-associations index detail** command to get more information about the SA.
- Remote Address—Verify that the remote IP address is correct.
- State
 - UP—The Phase 1 SA has been established.
 - DOWN—There was a problem establishing the Phase 1 SA.
- Mode—Verify that the correct mode is being used.

Verify that the following are correct in your configuration:

- External interfaces (the interface must be the one that receives IKE packets)
- IKE policy parameters
- Preshared key information
- Phase 1 proposal parameters (must match on both peers)

The **show security ike security-associations index 1 detail** command lists additional information about the security association with an index number of 1:

- Authentication and encryption algorithms used
- Phase 1 lifetime
- Traffic statistics (can be used to verify that traffic is flowing properly in both directions)
- Initiator and responder role information

NOTE: Troubleshooting is best performed on the peer using the responder role.

- Number of IPsec SAs created
- Number of Phase 2 negotiations in progress

Verifying the IPsec Phase 2 Status

Purpose Verify the IPsec Phase 2 status.

Action From operational mode, enter the **show security ipsec security-associations** command. After obtaining an index number from the command, use the **show security ipsec security-associations index *index_number* detail** command.

```
user@host> show security ipsec security-associations
total configured sa: 2
ID      Gateway      Port  Algorithm      SPI      Life:sec/kb  Mon  vsys
<2      2.2.2.2        500   ESP:aes-128/sha1 a63eb26f 3565/ unlim  -   0
>2      2.2.2.2        500   ESP:aes-128/sha1 a1024ed9 3565/ unlim  -   0
```

```
user@host> show security ipsec security-associations index 2 detail
Virtual-system: Root
Local Gateway: 1.1.1.2, Remote Gateway: 2.2.2.2
Local Identity: ipv4_subnet(any:0,[0..7]=10.10.10.0/24)
Remote Identity: ipv4_subnet(any:0,[0..7]=192.168.168.0/24)
DF-bit: clear
Policy-name: vpnpolicy-unt-tr

Direction: inbound, SPI: 2789126767, AUX-SPI: 0
Hard lifetime: Expires in 3558 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2986 seconds
Mode: tunnel, Type: dynamic, State: installed, VPN Monitoring: -
```

```

Protocol: ESP, Authentication: hmac-sha1-96, Encryption: aes-cbc (128 bits)

Anti-replay service: enabled, Replay window size: 32

Direction: outbound, SPI: 2701283033,, AUX-SPI: 0
Hard lifetime: Expires in 3558 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2986 seconds
Mode: tunnel, Type: dynamic, State: installed, VPN Monitoring: -
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: aes-cbc
Anti-replay service: enabled, Replay window size: 32

```

Meaning The output from the **show security ipsec security-associations** command lists the following information:

- The ID number is 2. Use this value with the **show security ipsec security-associations index** command to get more information about this particular SA.
- There is one IPsec SA pair using port 500, which indicates that no NAT-traversal is implemented. (NAT-traversal uses port 4500 or another random high-number port.)
- The SPIs, lifetime (in seconds), and usage limits (or lifesize in KB) are shown for both directions. The 3565/ unlim value indicates that the Phase 2 lifetime expires in 3565 seconds, and that no lifesize has been specified, which indicates that it is unlimited. Phase 2 lifetime can differ from Phase 1 lifetime, as Phase 2 is not dependent on Phase 1 after the VPN is up.
- VPN monitoring is not enabled for this SA, as indicated by a hyphen in the Mon column. If VPN monitoring is enabled, U (up) or D (down) is listed.
- The virtual system (vsys) is the root system, and it always lists 0.

The output from the **show security ipsec security-associations index 16384 detail** command lists the following information:

- The local identity and remote identity make up the proxy ID for the SA.

A proxy ID mismatch is one of the most common reasons for a Phase 2 failure. For policy-based VPNs, the proxy ID is derived from the security policy. The local address and remote address are derived from the address book entries, and the service is derived from the application configured for the policy. If Phase 2 fails because of a proxy ID mismatch, you can use the policy to confirm which address book entries are configured. Verify that the addresses match the information being sent. Check the service to ensure that the ports match the information being sent.

Reviewing Statistics and Errors for an IPsec Security Association

Purpose Review ESP and authentication header counters and errors for an IPsec security association.

Action From operational mode, enter the **show security ipsec statistics index *index_number*** command, using the index number of the VPN for which you want to see statistics.

```
user@host> show security ipsec statistics index 2
```

```
ESP Statistics:
  Encrypted bytes:      920
  Decrypted bytes:     6208
  Encrypted packets:    5
  Decrypted packets:   87
AH Statistics:
  Input bytes:          0
  Output bytes:         0
  Input packets:        0
  Output packets:       0
Errors:
  AH authentication failures: 0, Replay errors: 0
  ESP authentication failures: 0, ESP decryption failures: 0
  Bad headers: 0, Bad trailers: 0
```

You can also use the **show security ipsec statistics** command to review statistics and errors for all SAs.

To clear all IPsec statistics, use the **clear security ipsec statistics** command.

Meaning If you see packet loss issues across a VPN, you can run the **show security ipsec statistics** or **show security ipsec statistics detail** command several times to confirm that the encrypted and decrypted packet counters are incrementing. You should also check if the other error counters are incrementing.

Configuring Route-Based and Policy-Based VPNs with NAT-T

- [Understanding NAT-T on page 6539](#)
- [Example: Configuring a Route-Based VPN with Only the Responder Behind a NAT Device on page 6540](#)
- [Example: Configuring a Policy-Based VPN with Both an Initiator and a Responder Behind a NAT Device on page 6568](#)
- [Example: Configuring NAT-T with Dynamic Endpoint VPN on page 6594](#)

Understanding NAT-T

Network Address Translation-Traversal (NAT-T) is a method for getting around IP address translation issues encountered when data protected by IPsec passes through a NAT device for address translation. Any changes to the IP addressing, which is the function of NAT, causes IKE to discard packets. After detecting one or more NAT devices along the data path during Phase 1 exchanges, NAT-T adds a layer of User Datagram Protocol (UDP) encapsulation to IPsec packets so they are not discarded after address translation. NAT-T encapsulates both IKE and ESP traffic within UDP with port 4500 used as both the source and destination port. Because NAT devices age out stale UDP translations, keepalive messages are required between the peers.

There are two broad categories of NAT:

- Static NAT, where there is a one-to-one relationship between the private and public addresses. Static NAT works in both inbound and outbound directions.
- Dynamic NAT, where there is a many-to-one or many-to-many relationship between the private and public addresses. Dynamic NAT works in the outbound direction only.

The location of a NAT device can be such that:

- Only the IKEv1 or IKEv2 initiator is behind a NAT device. Multiple initiators can be behind separate NAT devices. Initiators can also connect to the responder through multiple NAT devices.
- Only the IKEv1 or IKEv2 responder is behind a NAT device.
- Both the IKEv1 or IKEv2 initiator and the responder are behind a NAT device.

Dynamic endpoint VPN covers the situation where the initiator's IKE external address is not fixed and is therefore not known by the responder. This can occur when the initiator's address is dynamically assigned by an ISP or when the initiator's connection crosses a dynamic NAT device that allocates addresses from a dynamic address pool.

Configuration examples for NAT-T are provided for the topology in which only the responder is behind a NAT device and the topology in which both the initiator and responder are behind a NAT device. Site-to-site IKE gateway configuration for NAT-T is supported on both the initiator and responder. A remote IKE ID is used to validate a peer's local IKE ID during Phase 1 of IKE tunnel negotiation. Both the initiator and responder require a **local-identity** and a **remote-identity** setting.

On all high-end SRX Series devices, the IPsec NAT-T tunnel scaling and sustaining issues are as follows:

- For a given private IP address, the NAT device should translate both 500 and 4500 private ports to the same public IP address.
- The total number of tunnels from a given public translated IP cannot exceed 1000 tunnels.

Example: Configuring a Route-Based VPN with Only the Responder Behind a NAT Device

This example shows how to configure a route-based VPN with a responder behind a NAT device to allow data to be securely transferred between a branch office and the corporate office.

- [Requirements on page 6540](#)
- [Overview on page 6540](#)
- [Configuration on page 6546](#)
- [Verification on page 6561](#)

Requirements

Before you begin, read [“IPsec VPN Overview” on page 6337](#).

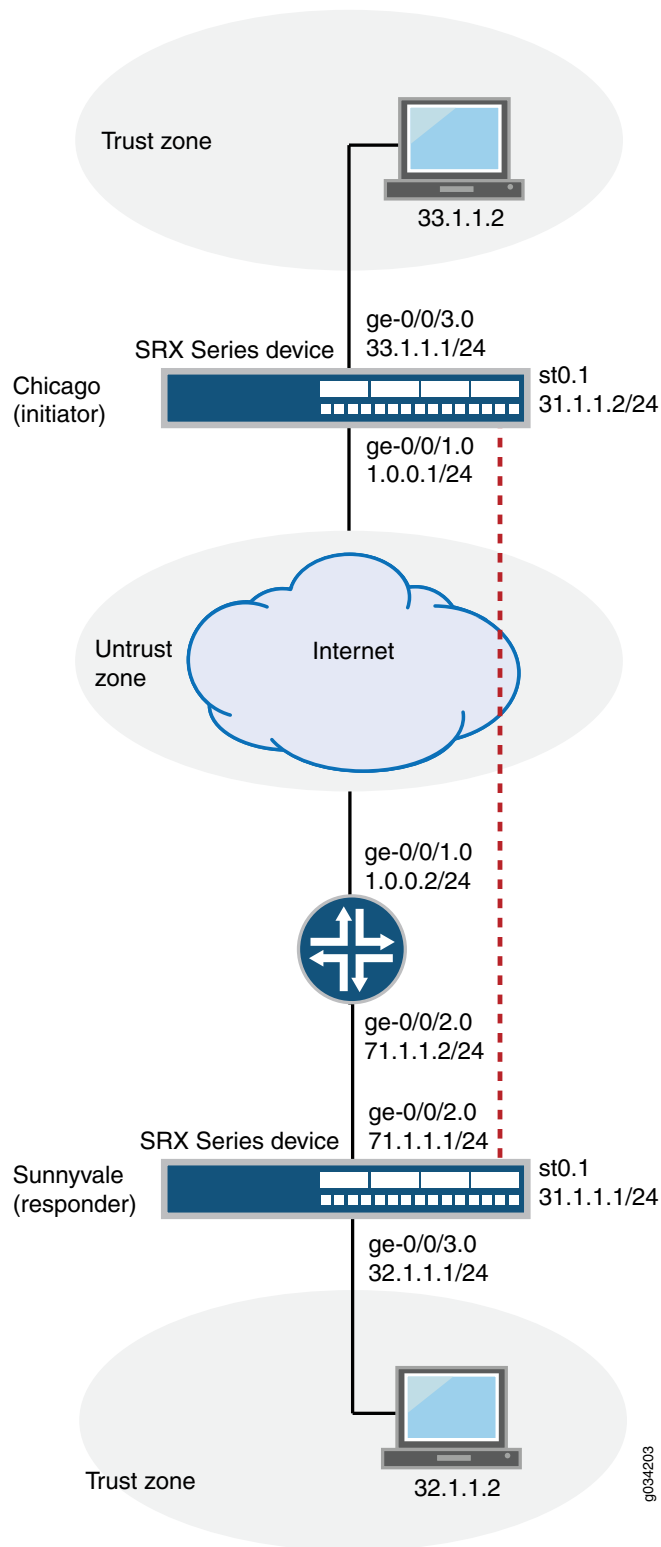

Overview

In this example, you configure a route-based VPN for a branch office in Chicago, Illinois, because you want to conserve tunnel resources but still get granular restrictions on VPN

traffic. Users in the Chicago office will use the VPN to connect to their corporate headquarters in Sunnyvale, California.

[Figure 279](#) shows an example of a topology for route-based VPN with only the responder behind a NAT device.

Figure 279: Route-Based VPN Topology with Only the Responder Behind a NAT Device

In this example, you configure interfaces, routing options, security zones, and security policies for both an initiator in Chicago and a responder in Sunnyvale. Then you configure IKE Phase 1 and IPsec Phase 2 parameters.

Packets sent from the initiator with a destination address 1.1.1.1/32 are translated to the destination address 71.1.1.1/32 on the NAT device.

See [Table 561](#) through [Table 563](#) for specific configuration parameters used for the initiator in the examples.

Table 561: Interface, Routing Options, Zones, and Security Policies for the Initiator

| Feature | Name | Configuration Parameters |
|-------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces | ge-0/0/1 | 1.0.0.1/24 |
| | ge-0/0/3 | 33.1.1.1/24 |
| | st0.1 (tunnel interface) | 31.1.1.2/24 |
| Static routes | 32.1.1.0/24 | The next hop is st0.1. |
| | 1.1.1.1/32 | The next hop is 1.0.0.2. |
| Security zones | untrust | <ul style="list-style-type: none"> Only IKE system service is allowed. The ge-0/0/1.0 and the st0.1 interfaces are bound to this zone. |
| | trust | <ul style="list-style-type: none"> All system services are allowed. All protocols are allowed. The ge-0/0/3.0 interface is bound to this zone. |
| Security policies | to-sunnyvale | Permit traffic from 33.1.1.1/24 in the trust zone to 32.1.1.1/24 in the untrust zone. |
| | from-sunnyvale | Permit traffic from 32.1.1.1/24 in the untrust zone to 33.1.1.1/24 in the trust zone. |

Configuring Interface, Routing Options, Security Zones, and Security Policies for the Initiator

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/1 unit 0 family inet address 1.0.0.1/24
set interfaces ge-0/0/3 unit 0 family inet address 33.1.1.1/24
set interfaces st0 unit 1 family inet address 31.1.1.2/24
set routing-options static route 32.1.1.0/24 next-hop st0.1
set routing-options static route 1.1.1.1/32 next-hop 1.0.0.2
set security zones security-zone untrust host-inbound-traffic system-services ike
set security zones security-zone untrust interfaces st0.1
set security zones security-zone untrust interfaces ge-0/0/1.0
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust interfaces ge-0/0/3.0
set security address-book book1 address Chicago-lan 33.1.1.1/24
set security address-book book1 attach zone trust
set security address-book book2 address Sunnyvale-lan 32.1.1.1/24
set security address-book book2 attach zone untrust
set security policies from-zone trust to-zone untrust policy to-sunnyvale match
  source-address Chicago-lan
set security policies from-zone trust to-zone untrust policy to-sunnyvale match
  destination-address Sunnyvale-lan
set security policies from-zone trust to-zone untrust policy to-sunnyvale match application
  any
set security policies from-zone trust to-zone untrust policy to-sunnyvale then permit
set security policies from-zone untrust to-zone trust policy from-sunnyvale match
  source-address Sunnyvale-lan
set security policies from-zone untrust to-zone trust policy from-sunnyvale match
  destination-address Chicago-lan
set security policies from-zone untrust to-zone trust policy from-sunnyvale match
  application any
set security policies from-zone untrust to-zone trust policy from-sunnyvale then permit
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure interface, static route, security zone, and security policy information:

1. Configure Ethernet interface information.

```
[edit]
user@host# set interfaces ge-0/0/1 unit 0 family inet address 1.0.0.1/24
user@host# set interfaces ge-0/0/3 unit 0 family inet address 33.1.1.1/24
user@host# set interfaces st0 unit 1 family inet address 31.1.1.2/24
```
2. Configure static route information.

```
[edit]
user@host# set routing-options static route 32.1.1.0/24 next-hop st0.1
user@host# set routing-options static route 1.1.1.1/32 next-hop 1.0.0.2
```
3. Configure the untrust security zone.

```
[edit ]
user@host# set security zones security-zone untrust
```
4. Assign interfaces to the untrust security zone.

```
[edit security zones security-zone untrust]
user@host# set interfaces ge-0/0/1.0
user@host# set interfaces st0.1
```
5. Specify allowed system services for the untrust security zone.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services ike
```
6. Configure the trust security zone.

```
[edit]
user@host# set security zones security-zone trust host-inbound-traffic protocols
all
```
7. Assign an interface to the trust security zone.

```
[edit security zones security-zone trust]
user@host# set interfaces ge-0/0/3.0
```
8. Specify allowed system services for the trust security zone.

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
```
9. Configure address books.

```
[edit security address-book]
user@host# set book1 address Chicago-lan 33.1.1.1/24
user@host# set book1 attach zone trust
user@host# set book2 address Sunnyvale-lan 32.1.1.1/24
user@host# set book2 attach zone untrust
```
10. Create security policies.

```
[edit security security-policies from-zone trust to-zone untrust]
user@host# set policy to-sunnyvale match source-address Chicago-lan
```

```
user@host# set policy to-sunnyvale match destination-address Sunnyvale-lan
user@host# set policy to-sunnyvale match application any
user@host# set policy to-sunnyvale then permit
```

```
[edit security security-policies from-zone untrust to-zone trust]
user@host# set policy from-sunnyvale match source-address Sunnyvale-lan
user@host# set policy from-sunnyvale match destination-address Chicago-lan
user@host# set policy from-sunnyvale match application any
user@host# set policy from-sunnyvale then permit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, **show security zones**, **show security address-book**, and **show security policies** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
ge-0/0/1 {
  unit 0 {
    family inet {
      address 1.0.0.1/24;
    }
  }
}
ge-0/0/3 {
  unit 0 {
    family inet {
      address 33.1.1.1/24;
    }
  }
}
st0 {
  unit 1 {
    family inet {
      address 31.1.1.2/24
    }
  }
}

[edit]
user@host# show routing-options
static {
  route 32.1.1.0/24 next-hop st0.1;
  route 1.1.1.1/32 next-hop 1.0.0.2;
}

[edit]
user@host# show security zones
security-zone untrust {
  host-inbound-traffic {
    system-services {
      ike;
    }
  }
}
interfaces {
```

```
    st0.1;
    ge-0/0/1.0;
  }
}
security-zone trust {
  host-inbound-traffic {
    system-services {
      all;
    }
    protocols {
      all;
    }
  }
  interfaces {
    ge-0/0/3.0;
  }
}
[edit]
user@host# show security address-book
book1 {

    }
    then {
      permit;
    }
  }
}
```

```
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring IKE for the Initiator

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ike proposal ike_prop authentication-method pre-shared-keys
set security ike proposal ike_prop dh-group group2
set security ike proposal ike_prop authentication-algorithm sha1
set security ike proposal ike_prop encryption-algorithm 3des-cbc
set security ike policy ike_pol mode main
set security ike policy ike_pol proposals ike_prop
set security ike policy ike_pol pre-shared-key ascii-text "example"
set security ike gateway gw1 ike-policy ike_pol
set security ike gateway gw1 address 1.1.1.1
set security ike gateway gw1 local-identity user-at-hostname branch_natt1@example.net
set security ike gateway gw1 remote-identity user-at-hostname
  responder_natt1@example.net
set security ike gateway gw1 external-interface ge-0/0/1.0
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IKE:

1. Create the IKE Phase 1 proposal.

```
[edit security ike]
user@host# set proposal ike_prop
```
2. Define the IKE proposal authentication method.

```
[edit security ike proposal ike_prop]
user@host# set authentication-method pre-shared-keys
```
3. Define the IKE proposal Diffie-Hellman group.

```
[edit security ike proposal ike_prop]
user@host# set dh-group group2
```
4. Define the IKE proposal authentication algorithm.

```
[edit security ike proposal ike_prop]
user@host# set authentication-algorithm sha1
```
5. Define the IKE proposal encryption algorithm.

```
[edit security ike proposal ike_prop]
user@host# set encryption-algorithm 3des-cbc
```
6. Create an IKE Phase 1 policy.

```
[edit security ike]
```

- ```

user@host# set policy ike_pol

```
7. Set the IKE Phase 1 policy mode.

```

[edit security ike policy ike_pol]
user@host# set mode main

```
  8. Specify a reference to the IKE proposal.

```

[edit security ike policy ike_pol]
user@host# set proposals ike_prop

```
  9. Define the IKE Phase 1 policy authentication method.

```

[edit security ike policy ike_pol]
user@host# set pre-shared-key ascii-text "example"

```
  10. Create an IKE Phase 1 gateway and define its external interface.

```

[edit security ike gateway gw1]
user@host# set external-interface ge-0/0/1.0

```
  11. Define the IKE Phase 1 policy reference.

```

[edit security ike gateway gw1]
user@host# set ike-policy ike_pol

```
  12. Define the IKE Phase 1 gateway address.

```

[edit security ike gateway gw1]
user@host# set address 1.1.1.1

```
  13. Set **local-identity** of the local peer.

```

[edit security ike gateway gw1]
user@host# set local-identity user-at-hostname branch_natt1@example.net

```
  14. Set **remote-identity** of the responder. This is the IKE identifier.

```

[edit security ike gateway gw1]
user@host# set remote-identity user-at-hostname responder_natt1@example.net

```
  15. Define the external interface.

```

[edit security ike gateway gw1]
user@host# set external-interface ge-0/0/1.0

```

**Results** From configuration mode, confirm your configuration by entering the **show security ike** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show security ike
proposal ike_prop {
 authentication-method pre-shared-keys;
 dh-group group2;
 authentication-algorithm sha1;
 encryption-algorithm 3des-cbc;
}
policy ike_pol {
 mode main;
 proposals ike_prop;
}

```

```

 pre-shared-key ascii-text "example";
}
gateway gw1 {
 ike-policy ike_poly;
 address 1.1.1.1;
 local-identity user-at-hostname branch_natt1@example.net;
 remote-identity user-at-hostname responder_natt1@example.net;
 external-interface ge-0/0/1.0;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring IPsec for the Initiator

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security ipsec proposal ipsec_prop protocol esp
set security ipsec proposal ipsec_prop authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec_prop encryption-algorithm 3des-cbc
set security ipsec policy ipsec_pol perfect-forward-secrecy keys group2
set security ipsec policy ipsec_pol proposals ipsec_prop
set security ipsec vpn vpn1 bind-interface st0.1
set security ipsec vpn vpn1 ike gateway gw1
set security ipsec vpn vpn1 ike ipsec-policy ipsec_pol
set security ipsec vpn vpn1 establish-tunnels immediately

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IPsec:

1. Create an IPsec Phase 2 proposal.
 

```
[edit]
user@host# set security ipsec proposal ipsec_prop
```
2. Specify the IPsec Phase 2 proposal protocol.
 

```
[edit security ipsec proposal ipsec_prop]
user@host# set protocol esp
```
3. Specify the IPsec Phase 2 proposal authentication algorithm.
 

```
[edit security ipsec proposal ipsec_prop]
user@host# set authentication-algorithm hmac-sha1-96
```
4. Specify the IPsec Phase 2 proposal encryption algorithm.
 

```
[edit security ipsec proposal ipsec_prop]
user@host# set encryption-algorithm 3des-cbc
```
5. Create the IPsec Phase 2 policy.
 

```
[edit security ipsec]
```

- ```
user@host# set policy ipsec_pol
```
6. Specify IPsec Phase 2 to use perfect forward secrecy (PFS).

```
[edit security ipsec policy ipsec_pol]
user@host# set perfect-forward-secrecy keys group2
```
 7. Specify the IPsec Phase 2 proposal reference.

```
[edit security ipsec policy ipsec_pol]
user@host# set proposals ipsec_prop
```
 8. Specify the IKE gateway.

```
[edit security ipsec]
user@host# set vpn vpn1 ike gateway gw1
```
 9. Specify the IPsec Phase 2 policy.

```
[edit security ipsec]
user@host# set vpn vpn1 ike ipsec-policy ipsec_pol
```
 10. Specify the interface to bind.

```
[edit security ipsec]
user@host# set vpn vpn1 bind-interface st0.1
```
 11. Specify that the tunnel be brought up immediately without waiting for a verification packet to be sent.

```
[edit security ipsec]
user@host# set vpn vpn1 establish-tunnels immediately
```

Results From configuration mode, confirm your configuration by entering the **show security ipsec** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show security ipsec
proposal ipsec_prop {
  protocol esp;
  authentication-algorithm hmac-sha1-96;
  encryption-algorithm 3des-cbc;
}
policy ipsec_pol {
  perfect-forward-secrecy {
    keys group2;
  }
  proposals ipsec_prop;
}
vpn vpn1 {
  bind-interface st0.1;
  ike {
    gateway gw1;
    ipsec-policy ipsec_pol;
  }
  establish-tunnels immediately;
}
proposals ipsec_prop;
```

```
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Interfaces, Routing Options, Security Zones, and Security Policies for the Responder

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/2 unit 0 family inet address 71.1.1.1/24
set interfaces ge-0/0/3 unit 0 family inet address 32.1.1.1/24
set interfaces st0 unit 1 family inet address 31.1.1.1/24
set routing-options static route 0.0.0.0/0 next-hop 71.1.1.2
set routing-options static route 33.1.1.0/24 next-hop st0.1
set security zones security-zone untrust host-inbound-traffic system-services ike
set security zones security-zone untrust interfaces ge-0/0/2.0
set security zones security-zone untrust interfaces st0.1
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust interfaces ge-0/0/3.0
set security address-book book1 address Sunnyvale-lan 32.1.1.1/24
set security address-book book1 attach zone trust
set security address-book book2 address Chicago-lan 33.1.1.1/24
set security address-book book2 attach zone untrust
set security policies from-zone trust to-zone untrust policy to-chicago match
    source-address Sunnyvale-lan
set security policies from-zone trust to-zone untrust policy to-chicago match
    destination-address Chicago-lan
set security policies from-zone trust to-zone untrust policy to-chicago match application
    any
set security policies from-zone trust to-zone untrust policy to-chicago then permit
set security policies from-zone untrust to-zone trust policy from-chicago match
    source-address Chicago-lan
set security policies from-zone untrust to-zone trust policy from-chicago match
    destination-address Sunnyvale-lan
set security policies from-zone untrust to-zone trust policy from-chicago match application
    any
set security policies from-zone untrust to-zone trust policy from-chicago then permit
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure interface, static route, security zones, policies and gateways:

1. Configure Ethernet interface information.

```
[edit]
user@host# set interfaces ge-0/0/2 unit 0 family inet address 71.1.1.1/24
user@host# set interfaces ge-0/0/3 unit 0 family inet address 32.1.1.1/24
user@host# set interfaces st0 unit 1 family inet address 31.1.1.1/24
```

2. Configure static route information.

```
[edit]
user@host# set routing-options static route 0.0.0.0/0 next-hop 71.1.1.2
user@host# set routing-options static route 33.1.1.0/24 next-hop st0.1
```
3. Configure the untrust security zone.

```
[edit ]
user@host# set security zones security-zone untrust
```
4. Assign interfaces to the untrust security zone.

```
[edit security zones security-zone untrust]
user@host# set security zones security-zone untrust interfaces ge-0/0/2.0
user@host# set security zones security-zone untrust interfaces st0.1
```
5. Specify allowed system services for the untrust security zone.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services ike
```
6. Configure the trust security zone.

```
[edit]
user@host# set security zones security-zone trust host-inbound-traffic protocols
all
```
7. Assign an interface to the trust security zone.

```
[edit security zones security-zone trust]
user@host# set interfaces ge-0/0/3.0
```
8. Specify allowed system services for the trust security zone.

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
```
9. Configure address books.

```
[edit security address-book]
user@host# set book1 address Sunnyvale-lan 32.1.1.1/24
user@host# set book1 attach zone trust
user@host# set book2 address Chicago-lan 33.1.1.1/24
user@host# set book2 attach zone untrust
```
10. Create security policies.

```
[edit security security-policies from-zone trust to-zone untrust]
user@host# set policy to-chicago match source-address Sunnyvale-lan
user@host# set policy to-chicago match destination-address Chicago-lan
user@host# set policy to-chicago match application any
user@host# set policy to-chicago then permit

[edit security security-policies from-zone untrust to-zone trust]
user@host# set policy from-chicago match source-address Chicago-lan
user@host# set policy from-chicago match destination-address Sunnyvale-lan
user@host# set policy from-chicago match application any
user@host# set policy from-chicago then permit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, **show security zones**, **show security address-book**, and **show security policies** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
ge-0/0/2 {
  unit 0 {
    family inet {
      address 71.1.1.1/24;
    }
  }
}
ge-0/0/3 {
  unit 0 {
    family inet {
      address 32.1.1.1/24;
    }
  }
}
st0 {
  unit 1 {
    family inet {
      address 31.1.1.1/24
    }
  }
}

[edit]
user@host# show routing-options
static {
  route 0.0.0.0/0 next-hop 71.1.1.2;
  route 33.1.1.0/24 next-hop st0.1;
}

[edit]
user@host# show security zones
security-zone untrust {
  host-inbound-traffic {
    system-services {
      ike;
    }
  }

    st0.1;
  }
}
security-zone trust {
  host-inbound-traffic {
    system-services {
      all;
    }
  }
  protocols {
    all;
  }
}
```

```

    }
  }
  interfaces {
    ge-0/0/3.0;
  }
}
[edit]
user@host# show security address-book
book1 {
  address Sunnyvale-lan 32.1.1.1/24;
  attach {
    zone trust;
  }
}
book2 {
  address Chicago-lan 33.1.1.1/24;
  attach {
    zone untrust;
  }
}
[edit]
user@host# show security policies
from-zone trust to-zone untrust {
  policy to-chicago {
    match {
      source-address Sunnyvale-lan;
      destination-address Chicago-lan;
      application any;
    }
    then {
      permit;
    }
  }
}
from-zone untrust to-zone trust {
  policy from-chicago {
    match {
      source-address Chicago-lan;
      destination-address Sunnyvale-lan;
      application any;
    }
    then {
      permit;
    }
  }
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring IKE for the Responder

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ike proposal ike_prop authentication-method pre-shared-keys
set security ike proposal ike_prop dh-group group2
set security ike proposal ike_prop authentication-algorithm sha1
set security ike proposal ike_prop encryption-algorithm 3des-cbc
set security ike policy ike_pol mode main
set security ike policy ike_pol proposals ike_prop
set security ike policy ike_pol pre-shared-key ascii-text example
set security ike gateway gw1 ike-policy ike_pol
set security ike gateway gw1 address 1.0.0.1
set security ike gateway gw1 local-identity user-at-hostname
responder_natt1@example.net
set security ike gateway gw1 remote-identity user-at-hostname branch_natt1@example.net
set security ike gateway gw1 external-interface ge-0/0/2.0
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IKE:

1. Create the IKE Phase 1 proposal.

```
[edit security ike]
user@host# set proposal ike_prop
```
2. Define the IKE proposal authentication method.

```
[edit security ike proposal ike_prop]
user@host# set authentication-method pre-shared-keys
```
3. Define the IKE proposal Diffie-Hellman group.

```
[edit security ike proposal ike_prop]
user@host# set dh-group group2
```
4. Define the IKE proposal authentication algorithm.

```
[edit security ike proposal ike_prop]
user@host# set authentication-algorithm sha1
```
5. Define the IKE proposal encryption algorithm.

```
[edit security ike proposal ike_prop]
user@host# set encryption-algorithm 3des-cbc
```
6. Create an IKE Phase 1 policy.

```
[edit security ike]
user@host# set policy ike_pol
```
7. Set the IKE Phase 1 policy mode.

```
[edit security ike policy ike_pol]
user@host# set mode main
```
8. Specify a reference to the IKE proposal.

```
[edit security ike policy ike_pol]
user@host# set proposals ike_prop
```
9. Define the IKE Phase 1 policy authentication method.

```
[edit security ike policy ike_pol]
user@host# set pre-shared-key ascii-text "example"
```

10. Create an IKE Phase 1 gateway and define its external interface.

```
[edit security ike gateway gw1]
user@host# set external-interface ge-0/0/2.0
```

11. Define the IKE Phase 1 policy reference.

```
[edit security ike gateway gw1]
user@host# set ike-policy ike_pol
```

12. Define the IKE Phase 1 gateway address.

```
[edit security ike gateway gw1]
user@host# set address 1.0.0.1
```

13. Set **local-identity** of the responder.

```
[edit security ike gateway gw1]
user@host# set local-identity user-at-hostname responder_natt1@example.net
```

14. Set **remote-identity** of the responder. This is the IKE identifier.

```
[edit security ike gateway gw1]
user@host# set remote-identity user-at-hostname branch_natt1@example.net
```

Results From configuration mode, confirm your configuration by entering the **show security ike** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show security ike
proposal ike_prop {
  authentication-method pre-shared-keys;
  dh-group group2;
  authentication-algorithm sha1;
  encryption-algorithm 3des-cbc;
}
policy ike_pol {
  mode main;
  proposals ike_prop;
  pre-shared-key ascii-text example;
}
gateway gw1 {
  ike-policy ike_pol;
  address 1.0.0.1;
  local-identity user-at-hostname "responder_natt1@example.net";
  remote-identity user-at-hostname "branch_natt1@example.net";
  external-interface ge-0/0/2.0;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring IPsec for the Responder

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ipsec proposal ipsec_prop protocol esp
set security ipsec proposal ipsec_prop authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec_prop encryption-algorithm 3des-cbc
set security ipsec policy ipsec_pol perfect-forward-secrecy keys group2
set security ipsec policy ipsec_pol proposals ipsec_prop
set security ipsec vpn vpn1 bind-interface st0.1
set security ipsec vpn vpn1 ike gateway gw1
set security ipsec vpn vpn1 ike ipsec-policy ipsec_pol
set security ipsec vpn vpn1 establish-tunnels immediately
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IPsec:

1. Create an IPsec Phase 2 proposal.

```
[edit]
user@host# set security ipsec proposal ipsec_prop
```
2. Specify the IPsec Phase 2 proposal protocol.

```
[edit security ipsec proposal ipsec_prop]
user@host# set protocol esp
```
3. Specify the IPsec Phase 2 proposal authentication algorithm.

```
[edit security ipsec proposal ipsec_prop]
user@host# set authentication-algorithm hmac-sha1-96
```
4. Specify the IPsec Phase 2 proposal encryption algorithm.

```
[edit security ipsec proposal ipsec_prop ]
user@host# set encryption-algorithm 3des-cbc
```
5. Create the IPsec Phase 2 policy.

```
[edit security ipsec]
user@host# set policy ipsec_pol
```
6. Specify IPsec Phase 2 to use perfect forward secrecy (PFS).

```
[edit security ipsec policy ipsec_pol]
user@host# set perfect-forward-secrecy keys group2
```
7. Specify the IPsec Phase 2 proposal reference.

```
[edit security ipsec policy ipsec_pol]
user@host# set proposals ipsec_prop
```
8. Specify the IKE gateway.

```
[edit security ipsec]
user@host# set security ipsec vpn vpn1 ike gateway gw1
```

9. Specify the IPsec Phase 2 policy.

```
[edit security ipsec]
user@host# set vpn vpn1 ike ipsec-policy ipsec_pol
```

10. Specify the interface to bind.

```
[edit security ipsec]
user@host# set vpn vpn1 bind-interface st0.1
```

11. Specify that the tunnel be brought up immediately without waiting for a verification packet to be sent.

```
[edit security ipsec]
user@host# set vpn vpn1 establish-tunnels immediately
```

Results From configuration mode, confirm your configuration by entering the **show security ipsec** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show security ipsec
proposal ipsec_prop {
  protocol esp;
  authentication-algorithm hmac-sha1-96;
  encryption-algorithm 3des-cbc;
}
policy ipsec_pol {
  perfect-forward-secrecy {
    keys group2;
  }
  proposals ipsec_prop;
}
vpn vpn1 {
  bind-interface st0.1;
  ike {
    gateway gw1;
    ipsec-policy ipsec_pol;
  }
  establish-tunnels immediately;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the IKE Phase 1 Status for the Initiator on page 6562](#)
- [Verifying IPsec Security Associations for the Initiator on page 6563](#)
- [Verifying the IKE Phase 1 Status for the Responder on page 6564](#)
- [Verifying IPsec Security Associations for the Responder on page 6566](#)

Verifying the IKE Phase 1 Status for the Initiator

Purpose Verify the IKE Phase 1 status.

Action

NOTE: Before starting the verification process, you must send traffic from a host in the 33.1.1.0 network to a host in the 32.1.1.0 network. For route-based VPNs, traffic can be initiated by the SRX Series device through the tunnel. We recommend that when testing IPsec tunnels, test traffic be sent from a separate device on one side of the VPN to a second device on the other side of the VPN. For example, initiate a ping operation from 33.1.1.2 to 32.1.1.2.

From operational mode, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations index *index_number* detail** command.

```
user@host> show security ike security-associations
Index   State Initiator cookie Responder cookie Mode Remote Address
106321  UP      d31d6833108fd69f  9ddfe2ce133086aa Main      1.1.1.1
```

```
user@host> show security ike security-associations index 1 detail

Flags: IKE SA is created
```

Meaning The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration.

If SAs are listed, review the following information:

- Index—This value is unique for each IKE SA, which you can use in the **show security ike security-associations index detail** command to get more information about the SA.
- Remote address—Verify that the remote IP address is correct and that port 500 is being used for peer-to-peer communication.
- Role initiator state
 - Up—The Phase 1 SA has been established.
 - Down—There was a problem establishing the Phase 1 SA.
 - Both peers in the IPsec SA pair are using port 500.
 - Peer IKE ID—Verify the remote address is correct.
 - Local identity and remote identity—Verify these are correct.
- Mode—Verify that the correct mode is being used.

Verify that the following are correct in your configuration:

- External interfaces (the interface must be the one that receives IKE packets)
- IKE policy parameters
- Preshared key information
- Phase 1 proposal parameters (must match on both peers)

The **show security ike security-associations** command lists additional information about security associations:

- Authentication and encryption algorithms used
- Phase 1 lifetime
- Traffic statistics (can be used to verify that traffic is flowing properly in both directions)
- Role information

NOTE: Troubleshooting is best performed on the peer using the responder role.

- Initiator and responder information
- Number of IPsec SAs created
- Number of Phase 2 negotiations in progress

Verifying IPsec Security Associations for the Initiator

Purpose Verify the IPsec status.

Action From operational mode, enter the **show security ipsec security-associations** command. After obtaining an index number from the command, use the **show security ipsec security-associations index *index_number* detail** command.

```
user@host> show security ipsec security-associations
Total active tunnels: 1
  ID   Algorithm   SPI      Life:sec/kb  Mon vsys Port  Gateway
<131073 ESP:3des/sha1 ac23df79 2532/ unlim -   root 500  1.1.1.1
>131073 ESP:3des/sha1 cbc9281a 2532/ unlim -   root 500  1.1.1.1

user@host> show security ipsec security-associations detail
Virtual-system: root
Local Gateway: 1.0.0.1, Remote Gateway: 1.1.1.1
Local Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Remote Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Version: IKEv1
DF-bit: clear
Direction: inbound, SPI: ac23df79, AUX-SPI: 0
              , VPN Monitoring: -
Hard lifetime: Expires in 3186 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2578 seconds
Mode: Tunnel, Type: dynamic, State: installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Anti-replay service: counter-based enabled, Replay window size: 64

Direction: outbound, SPI: cbc9281a, AUX-SPI: 0
              , VPN Monitoring: -
Hard lifetime: Expires in 3186 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2578 seconds
Mode: Tunnel, Type: dynamic, State: installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Anti-replay service: counter-based enabled, Replay window size: 64
```

Meaning The output from the **show security ipsec security-associations** command lists the following information:

- The remote gateway has a NAT address of 1.1.1.1.
- Both peers in the IPsec SA pair are using port 500.
- The SPIs, lifetime (in seconds), and usage limits (or lifesize in KB) are shown for both directions. The 2532/ unlim value indicates that the Phase 2 lifetime expires in 2532 seconds, and that no lifesize has been specified, which indicates that it is unlimited. Phase 2 lifetime can differ from Phase 1 lifetime, as Phase 2 is not dependent on Phase 1 after the VPN is up.
- VPN monitoring is not enabled for this SA, as indicated by a hyphen in the Mon column. If VPN monitoring is enabled, U indicates that monitoring is up, and D indicates that monitoring is down.
- The virtual system (vsys) is the root system, and it always lists 0.

Verifying the IKE Phase 1 Status for the Responder

Purpose Verify the IKE Phase 1 status.

Action From operational mode, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations index *index_number* detail** command.

```
user@host> show security ike security-associations
Index   State Initiator cookie Responder cookie Mode Remote Address

5802591 UP      d31d6833108fd69f 9ddfe2ce133086aa Main      1.0.0.1

user@host> show security ike security-associations index 1 detail

```

```
Lifesize Remaining: Unlimited
```

```
Soft lifetime: Expires in 2923 seconds
```

```

Mode: Tunnel, Type: dynamic, State: installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Anti-replay service: counter-based enabled, Replay window size: 64

Direction: outbound, SPI: 82a86a07, AUX-SPI: 0
, VPN Monitoring: -
Hard lifetime: Expires in 3523 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2923 seconds
Mode: Tunnel, Type: dynamic, State: installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Anti-replay service: counter-based enabled, Replay window size: 64

```

Meaning The output from the **show security ipsec security-associations** command lists the following information:

- The remote gateway has an ip address of 1.0.0.1.
- Both peers in the IPsec SA pair are using port 500.
- The SPIs, lifetime (in seconds), and usage limits (or lifesize in KB) are shown for both directions. The 3571/ unlim value indicates that the Phase 2 lifetime expires in 3571 seconds, and that no lifesize has been specified, which indicates that it is unlimited. Phase 2 lifetime can differ from Phase 1 lifetime, as Phase 2 is not dependent on Phase 1 after the VPN is up.
- VPN monitoring is not enabled for this SA, as indicated by a hyphen in the Mon column. If VPN monitoring is enabled, U indicates that monitoring is up, and D indicates that monitoring is down.
- The virtual system (vsys) is the root system, and it always lists 0.

The output from the **show security ipsec security-associations index *index_id* detail** command lists the following information:

- The local identity and remote identity make up the proxy ID for the SA.

A proxy ID mismatch is one of the most common causes for a Phase 2 failure. If no IPsec SA is listed, confirm that Phase 2 proposals, including the proxy ID settings, are correct for both peers. For route-based VPNs, the default proxy ID is local=0.0.0.0/0, remote=0.0.0.0/0, and service=any. Issues can occur with multiple route-based VPNs from the same peer IP. In this case, a unique proxy ID for each IPsec SA must be specified. For some third-party vendors, the proxy ID must be manually entered to match.

- Another common reason for Phase 2 failure is not specifying the ST interface binding. If IPsec cannot complete, check the kmd log or set traceoptions.

Example: Configuring a Policy-Based VPN with Both an Initiator and a Responder Behind a NAT Device

This example shows how to configure a policy-based VPN with both an initiator and a responder behind a NAT device to allow data to be securely transferred between a branch office and the corporate office.

- [Requirements on page 6568](#)
- [Overview on page 6568](#)
- [Configuration on page 6573](#)
- [Verification on page 6588](#)

Requirements

Before you begin, read ["IPsec VPN Overview" on page 6337](#).

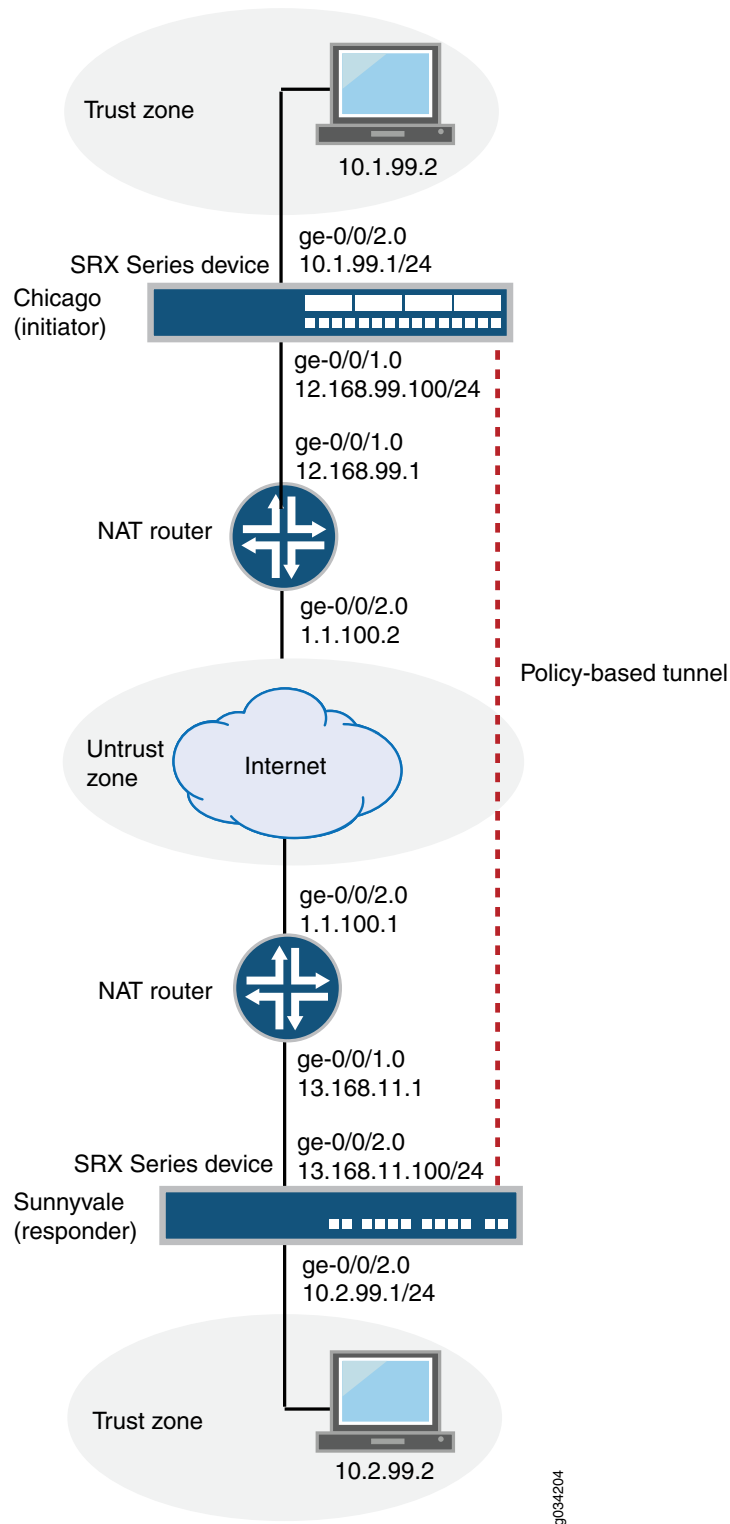

Overview

In this example, you configure a policy-based VPN for a branch office in Chicago, Illinois, because you want to conserve tunnel resources but still get granular restrictions on VPN traffic. Users in the branch office will use the VPN to connect to their corporate headquarters in Sunnyvale, California.

In this example, you configure interfaces, routing options, security zones, security policies for both an initiator and a responder.

[Figure 280](#) shows an example of a topology for a VPN with both an initiator and a responder behind a NAT device.

Figure 280: Policy-Based VPN Topology with Both an Initiator and a Responder Behind a NAT Device

g034204

In this example, you configure interfaces, an IPv4 default route, and security zones. Then you configure IKE Phase 1, including local and remote peers, IPsec Phase 2, and the security policy. Note in the example above, the responder's private IP address 13.168.11.1 is hidden by the NAT device and mapped to public IP address 1.1.100.1.

See [Table 567](#) through [Table 570](#) for specific configuration parameters used for the initiator in the examples.

Table 567: Interface, Routing Options, and Security Zones for the Initiator

| Feature | Name | Configuration Parameters |
|----------------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces | ge-0/0/1 | 12.168.99.100/24 |

Configuring Interface, Routing Options, and Security Zones for the Initiator

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
[edit]
set interfaces ge-0/0/1 unit 0 family inet address 12.168.99.100/24
set interfaces ge-0/0/2 unit 0 family inet address 10.1.99.1/24
set routing-options static route 10.2.99.0/24 next-hop 12.168.99.1
set routing-options static route 13.168.11.0/24 next-hop 12.168.99.1
set routing-options static route 1.1.100.0/24 next-hop 12.168.99.1
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust interfaces ge-0/0/2.0
set security zones security-zone untrust host-inbound-traffic system-services all
set security zones security-zone untrust host-inbound-traffic protocols all
set security zones security-zone untrust interfaces ge-0/0/1.0
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure interfaces, static routes, and security zones:

1. Configure Ethernet interface information.

```
[edit]
user@host# set interfaces ge-0/0/1 unit 0 family inet address 12.168.99.100/24
user@host# set interfaces ge-0/0/2 unit 0 family inet address 10.1.99.1/24
```

2. Configure static route information.

```
[edit]
user@host# set routing-options static route 10.2.99.0/24 next-hop 12.168.99.1
user@host# set routing-options static route 13.168.11.0/24 next-hop 12.168.99.1
```

3. Configure the trust security zone.

```
[edit ]
user@host# set security zones security-zone trust host-inbound-traffic protocols
all
```

4. Assign an interface to the trust security zone.

```
[edit security zones security-zone trust]
user@host# set interfaces ge-0/0/2.0
```

5. Specify system services for the trust security zone.

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
```

6. Configure the untrust security zone.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic protocols all
```

7. Assign an interface to the untrust security zone.

```
[edit security zones security-zone untrust]
user@host# set interfaces ge-0/0/1.0
```

8. Specify system services for the untrust security zone.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, and **show security zones** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
ge-0/0/1 {
  unit 0 {
    family inet {
      address 12.168.99.100/24;
```

```

    }
  }
}
ge-0/0/2 {
  unit 0 {
    family inet {
      address 10.1.99.1/24;
    }
  }
}
[edit]
user@host# show routing-options
static {
  route 10.2.99.0/24 next-hop 12.168.99.1;
  route 13.168.11.0/24 next-hop 12.168.99.1;
  route 1.1.100.0/24 next-hop 12.168.99.1;
}
[edit]
user@host# show security zones
security-zone untrust {
  host-inbound-traffic {
    system-services {
      all;
    }
    protocols {
      all;
    }
  }
  interfaces {
    ge-0/0/1.0.;
  }
}
security-zone trust {
  host-inbound-traffic {
    system-services {
      all;
    }
    protocols {
      all;
    }
  }
  interfaces {
    ge-0/0/2.0;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring IKE for the Initiator

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ike proposal ike_prop authentication-method pre-shared-keys
set security ike proposal ike_prop dh-group group2
set security ike proposal ike_prop authentication-algorithm md5
set security ike proposal ike_prop encryption-algorithm 3des-cbc
set security ike policy ike_pol mode main
set security ike policy ike_pol proposals ike_prop
set security ike policy ike_pol pre-shared-key ascii-text "example"
set security ike gateway gate ike-policy ike_pol
set security ike gateway gate address 1.1.100.23
set security ike gateway gate external-interface ge-0/0/1.0
set security ike gateway gate local-identity inet 11.11.11.11
set security ike gateway gate remote-identity inet 44.44.44.44
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IKE:

1. Create the IKE Phase 1 proposal.

```
[edit security ike]
user@host# set proposal ike_prop
```
2. Define the IKE proposal authentication method.

```
[edit security ike proposal ike_prop]
user@host# set authentication-method pre-shared-keys
```
3. Define the IKE proposal Diffie-Hellman group.

```
[edit security ike proposal ike_prop]
user@host# set dh-group group2
```
4. Define the IKE proposal authentication algorithm.

```
[edit security ike proposal ike_prop]
user@host# set authentication-algorithm md5
```
5. Define the IKE proposal encryption algorithm.

```
[edit security ike proposal ike_prop]
user@host# set encryption-algorithm 3des-cbc
```
6. Create an IKE Phase 1 policy.

```
[edit security ike policy ]
user@host# set policy ike_pol
```
7. Set the IKE Phase 1 policy mode.

```
[edit security ike policy ike_pol]
user@host# set mode main
```
8. Specify a reference to the IKE proposal.

```
[edit security ike policy ike_pol]
user@host# set proposals ike_prop
```
9. Define the IKE Phase 1 policy authentication method.

```
[edit security ike policy ike_pol pre-shared-key]
```

```
user@host# set ascii-text "example"
```

10. Create an IKE Phase 1 gateway and define its external interface.

```
[edit security ike ]
user@host# set gateway gate external-interface ge-0/0/1.0
```

11. Create an IKE Phase 1 gateway address.

```
[edit security ike gateway]
set gate address 1.1.100.23
```

12. Define the IKE Phase 1 policy reference.

```
[edit security ike gateway]
set gate ike-policy ike_pol
```

13. Set **local-identity** for the local peer.

```
[edit security ike gateway gate]
user@host# set local-identity inet 11.11.11.11
```

14. Set **remote-identity** for the responder. This is the responder's local identity.

```
[edit security ike gateway gate ]
user@host# set remote-identity inet 44.44.44.44
```

Results From configuration mode, confirm your configuration by entering the **show security ike** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show security ike
proposal ike_prop {
  authentication-method pre-shared-keys;
  dh-group group2;
  authentication-algorithm md5;
  encryption-algorithm 3des-cbc;
}
policy ike_pol {
  mode main;
  proposals ike_prop;
  pre-shared-key ascii-text "example";
}
gateway gate {
  ike-policy ike_pol;
  address 1.1.100.23;
  local-identity 11.11.11.11;
  remote-identity 44.44.44.44;
  external-interface ge-0/0/1.0;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring IPsec for the Initiator

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ipsec proposal ipsec_prop protocol esp
set security ipsec proposal ipsec_prop authentication-algorithm hmac-md5-96
set security ipsec proposal ipsec_prop encryption-algorithm 3des-cbc
set security ipsec policy ipsec_pol perfect-forward-secrecy keys group1
set security ipsec policy ipsec_pol proposals ipsec_prop
set security ipsec vpn first_vpn ike gateway gate
set security ipsec vpn first_vpn ike ipsec-policy ipsec_pol
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IPsec:

1. Create an IPsec Phase 2 proposal.

```
[edit]
user@host# set security ipsec proposal ipsec_prop
```
2. Specify the IPsec Phase 2 proposal protocol.

```
[edit security ipsec proposal ipsec_prop]
user@host# set protocol esp
```
3. Specify the IPsec Phase 2 proposal authentication algorithm.

```
[edit security ipsec proposal ipsec_prop]
user@host# set authentication-algorithm hmac-md5-96
```
4. Specify the IPsec Phase 2 proposal encryption algorithm.

```
[edit security ipsec proposal ipsec_prop]
user@host# set encryption-algorithm 3des-cbc
```
5. Specify the IPsec Phase 2 proposal reference.

```
[edit security ipsec policy ipsec_pol]
user@host# set proposals ipsec_prop
```
6. Specify IPsec Phase 2 to use perfect forward secrecy (PFS) group1.

```
[edit security ipsec policy ipsec_pol ]
user@host# set perfect-forward-secrecy keys group1
```
7. Specify the IKE gateway.

```
[edit security ipsec]
user@host# set vpn first_vpn ike gateway gate
```
8. Specify the IPsec Phase 2 policy.

```
[edit security ipsec]
user@host# set vpn first_vpn ike ipsec-policy ipsec_pol
```

Results From configuration mode, confirm your configuration by entering the **show security ipsec** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show security ipsec
proposal ipsec_prop {
  protocol esp;
  authentication-algorithm hmac-md5-96;
  encryption-algorithm 3des-cbc;
}
policy ipsec_pol {
  perfect-forward-secrecy {
  keys group1;
  proposals ipsec_prop;
}
}
vpn first_vpn {
  ike {
    gateway gate;
    ipsec-policy ipsec_pol;
  }
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Security Policies for the Initiator

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security policies from-zone trust to-zone untrust policy pol1 match source-address any
set security policies from-zone trust to-zone untrust policy pol1 match destination-address any
set security policies from-zone trust to-zone untrust policy pol1 match application any
set security policies from-zone trust to-zone untrust policy pol1 then permit tunnel ipsec-vpn first_vpn
set security policies from-zone untrust to-zone trust policy pol1 match source-address any
set security policies from-zone untrust to-zone trust policy pol1 match destination-address any
set security policies from-zone untrust to-zone trust policy pol1 match application any
set security policies from-zone untrust to-zone trust policy pol1 then permit tunnel ipsec-vpn first_vpn
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure security policies:

1. Create the security policy to permit traffic from the trust zone to the untrust zone.

```
[edit security policies from-zone trust to-zone untrust]
user@host# set policy pol1 match source-address any
user@host# set policy pol1 match destination-address any
```

```

user@host# set policy pol1 match application any
user@host# set policy pol1 then permit tunnel ipsec-vpn first_vpn

```

2. Create the security policy to permit traffic from the untrust zone to the trust zone.

```

[edit security policies from-zone untrust to-zone trust]
user@host# set policy pol1 match source-address any
user@host# set policy pol1 match destination-address any
user@host# set policy pol1 match application any
user@host# set policy pol1 then permit tunnel ipsec-vpn first_vpn

```

Results From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show security policies
from-zone trust to-zone untrust {
  policy pol1 {
    match {
      source-address any;
      destination-address any;
      application any;
    }
    then {
      permit;
      tunnel {
        ipsec-vpn first_vpn;
      }
    }
  }
}
from-zone untrust to-zone trust {
  policy pol1 {
    match {
      source-address any;
      destination-address any;
      application any;
    }
    then {
      permit;
      tunnel {
        ipsec-vpn first_vpn;
      }
    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Interface, Routing Options, and Security Zones for the Responder

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/2 unit 0 family inet address 13.168.11.100/24
set interfaces ge-0/0/3 unit 0 family inet address 10.2.99.1/24
set routing-options static route 10.1.99.0/24 next-hop 13.168.11.1
set routing-options static route 12.168.99.0/24 next-hop 13.168.11.1
set routing-options static route 1.1.100.0/24 next-hop 13.168.11.1
set security zones security-zone untrust host-inbound-traffic system-services all
set security zones security-zone untrust host-inbound-traffic protocols all
set security zones security-zone untrust interfaces ge-0/0/2.0
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust interfaces ge-0/0/3.0

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure interfaces, static routes, security zones, and security policies:

1. Configure Ethernet interface information.

```

[edit]
user@host# set interfaces ge-0/0/2 unit 0 family inet address 13.168.11.100/24
user@host# set interfaces ge-0/0/3 unit 0 family inet address 10.2.99.1/24

```
2. Configure static route information.

```

[edit]
user@host# set routing-options static route 10.1.99.0/24 next-hop 13.168.11.1
user@host# set routing-options static route 12.168.99.0/24 next-hop 13.168.11.1
user@host# set routing-options static route 1.1.100.0/24 next-hop 13.168.11.1

```
3. Configure the untrust security zone.

```

[edit ]
user@host# set security zones security-zone untrust host-inbound-traffic protocols
all

```
4. Assign an interface to the untrust security zone.

```

[edit security zones security-zone untrust]
user@host# set interfaces ge-0/0/2.0

```
5. Specify allowed system services for the untrust security zone.

```

[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all

```
6. Configure the trust security zone.

```

[edit]
user@host# set security zones security-zone trust host-inbound-traffic protocols
all

```
7. Assign an interface to the trust security zone.

```

[edit security zones security-zone trust]
user@host# set interfaces ge-0/0/3.0

```
8. Specify allowed system services for the trust security zone.

```

[edit security zones security-zone trust]

```

```
user@host# set host-inbound-traffic system-services all
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, and **show security zones** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
ge-0/0/2 {
  unit 0 {
    family inet {
      address 13.168.11.100/24;
    }
  }
}
ge-0/0/3 {
  unit 0 {
    family inet {
      address 10.2.99.1/244;
    }
  }
}

[edit]
user@host# show routing-options
static {
  route 10.1.99.0/24 next-hop 13.168.11.1;
  route 12.168.99.0/24 next-hop 13.168.11.1;
  route 1.1.100.0/24 next-hop 13.168.11.1;
}

[edit]
user@host# show security zones
security-zone untrust {
  host-inbound-traffic {
    system-services {
      all;
    }
    protocols {
      all;
    }
  }
  interfaces {
    ge-0/0/2.0;
  }
}
security-zone trust {
  host-inbound-traffic {
    system-services {
      all;
    }
    protocols {
      all;
    }
  }
  interfaces {
```

```

    ge-0/0/3.0;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring IKE for the Responder

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security ike proposal ike_prop authentication-method pre-shared-keys
set security ike proposal ike_prop dh-group group2
set security ike proposal ike_prop authentication-algorithm md5
set security ike proposal ike_prop encryption-algorithm 3des-cbc
set security ike policy ike_pol mode main
set security ike policy ike_pol proposals ike_prop
set security ike policy ike_pol pre-shared-key ascii-text "example"
set security ike gateway gate ike-policy ike_pol
set security ike gateway gate address 1.1.100.22
set security ike gateway gate dead-peer-detection probe-idle-tunnel
set security ike gateway gate external-interface ge-0/0/2.0
set security ike gateway gate local-identity inet 44.44.44.44
set security ike gateway gate remote-identity inet 11.11.11.11

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IKE:

1. Create the IKE Phase 1 proposal.

```

[edit security ike]
user@host# set proposal ike-phase1-proposal

```
2. Define the IKE proposal authentication method.

```

[edit security ike proposal ike_prop]
user@host# set authentication-method pre-shared-key

```
3. Define the IKE proposal Diffie-Hellman group.

```

[edit security ike proposal ike_prop]
user@host# set dh-group group2

```
4. Define the IKE proposal authentication algorithm.

```

[edit security ike proposal ike_prop]
user@host# set authentication-algorithm md5

```
5. Define the IKE proposal encryption algorithm.

```

[edit security ike proposal ike_prop]
user@host# set encryption-algorithm 3des-cbc

```
6. Create an IKE Phase 1 policy.

- ```
[edit security ike]
user@host# set policy ike_pol
```
7. Set the IKE Phase 1 policy mode.
 

```
[edit security ike policy ike_pol]
user@host# set mode main
```
  8. Specify a reference to the IKE proposal.
 

```
[edit security ike policy ike_pol]
user@host# set proposals ike_prop
```
  9. Define the IKE Phase 1 policy authentication method.
 

```
[edit security ike policy ike_pol proposals ike_prop set security ike policy ike_pol
pre-shared-key]
user@host# set ascii-text "example"
```
  10. Create an IKE Phase 1 gateway and define its external interface.
 

```
[edit security ike]
user@host# set security ike gateway gate external-interface ge-0/0/2.0
```
  11. Define the IKE Phase 1 policy reference.
 

```
[edit security ike gateway]
user@host# set gate ike-policy ike_pol
```
  12. Create an IKE Phase 1 gateway address.
 

```
[edit security ike gateway]
user@host# set gate address 1.1.100.22
```
  13. Set **local-identity** for the local peer (initiator).
 

```
[edit security ike gateway gate]
user@host# set local-identity inet 44.44.44.44
```
  14. Set **remote-identity** for the responder. This is the responder's local identity.
 

```
[edit security ike gateway gate]
user@host# set remote-identity inet 11.11.11.11
```
  15. Set dead peer detection to detect whether the peer is up or down.
 

```
[edit security ike gateway gate]
user@host# set dead-peer-detection probe-idle-tunnel
```

**Results** From configuration mode, confirm your configuration by entering the **show security ike** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show security ike
proposal ike_prop {
 authentication-method pre-shared-keys;
 dh-group group2;
 authentication-algorithm md5;
 encryption-algorithm 3des-cbc;
}
policy ike_pol {
```

```

mode main;
proposals ike_prop;
pre-shared-key ascii-text "example";
}
gateway gate {
ike-policy ike_pol;
address 1.1.100.22;
dead-peer-detection probe-idle-tunnel;
external-interface ge-0/0/2.0;
local-identity inet 44.44.44.44;
remote-identity inet 11.11.11.11;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring IPsec for the Responder

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security ipsec proposal ipsec_prop protocol esp
set security ipsec proposal ipsec_prop authentication-algorithm hmac-md5-96
set security ipsec proposal ipsec_prop encryption-algorithm 3des-cbc
set security ipsec policy ipsec_pol perfect-forward-secrecy keys group1
set security ipsec policy ipsec_pol proposals ipsec_prop
set security ipsec vpn first_vpn ike gateway gate
set security ipsec vpn first_vpn ike ipsec-policy ipsec_pol
set security ipsec vpn first_vpn establish-tunnels immediately

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IPsec:

1. Create an IPsec Phase 2 proposal.  

```
[edit]
user@host# set security ipsec proposal ipsec_prop
```
2. Specify the IPsec Phase 2 proposal protocol.  

```
[edit security security ipsec proposal ipsec_prop]
user@host# set protocol esp
```
3. Specify the IPsec Phase 2 proposal authentication algorithm.  

```
[edit security ipsec proposal ipsec_prop]
user@host# set authentication-algorithm hmac-md5-96
```
4. Specify the IPsec Phase 2 proposal encryption algorithm.  

```
[edit security ipsec proposal ipsec_prop]
user@host# set encryption-algorithm 3des-cbc
```
5. Set IPsec Phase 2 to use perfect forward secrecy (PFS) group1.

```
[edit security ipsec policy ipsec_pol]
user@host# set perfect-forward-secrecy keys group1
```

6. Create the IPsec Phase 2 policy.

```
[edit security ipsec]
user@host# set policy ipsec_pol
```

7. Specify the IPsec Phase 2 proposal reference.

```
[edit security ipsec policy ipsec_pol]
user@host# set proposals ipsec_prop
```

8. Specify the IKE gateway.

```
[edit security ipsec]
user@host# set vpn first_vpn ike gateway gate
```

9. Specify the IPsec Phase 2 policy.

```
[edit security ipsec]
user@host# set vpn first_vpn ike ipsec-policy ipsec_pol
```

10. Specify that the tunnel be brought up immediately without a verification packet.

```
[edit security ipsec]
user@host# set security ipsec vpn first_vpn establish-tunnels immediately
```

**Results** From configuration mode, confirm your configuration by entering the **show security ipsec** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show security ipsec
proposal ipsec_prop {
 protocol esp;
 authentication-algorithm hmac-md5-96;
 encryption-algorithm 3des-cbc;
}
policy ipsec_pol {
 perfect-forward-secrecy {
 keys group1;
 }
 proposals ipsec_prop;
}
vpn first_vpn {
 ike {
 gateway gate;
 ipsec-policy ipsec_pol;
 establish-tunnels immediately;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Security Policies for the Responder

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security policies from-zone trust to-zone untrust policy pol1 match source-address any
set security policies from-zone trust to-zone untrust policy pol1 match destination-address any
set security policies from-zone trust to-zone untrust policy pol1 match application any
set security policies from-zone trust to-zone untrust policy pol1 then permit tunnel ipsec-vpn first_vpn
set security policies from-zone untrust to-zone trust policy pol1 match source-address any
set security policies from-zone untrust to-zone trust policy pol1 match destination-address any
set security policies from-zone untrust to-zone trust policy pol1 match application any
set security policies from-zone untrust to-zone trust policy pol1 then permit tunnel ipsec-vpn first_vpn
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure security policies:

1. Create the security policy to permit traffic from the trust zone to the untrust zone.

```
[edit security policies from-zone trust to-zone untrust]
user@host# set policy pol1 match source-address any
user@host# set policy pol1 match destination-address any
user@host# set policy pol1 match application any
user@host# set policy pol1 then permit tunnel ipsec-vpn first_vpn
```

2. Create the security policy to permit traffic from the untrust zone to the trust zone.

```
[edit security policies from-zone untrust to-zone trust]
user@host# set policy pol1 match source-address any
user@host# set policy pol1 match destination-address any
user@host# set policy pol1 match application any
user@host# set policy pol1 then permit tunnel ipsec-vpn first_vpn
```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show security policies
from-zone trust to-zone untrust {
 policy pol1 {
 match {
 source-address any;
 destination-address any;
```

```

 application any;
 }
 then {
 permit;
 tunnel {
 ipsec-vpn first_vpn;
 }
 }
}
from-zone untrust to-zone trust {
 policy pol1 {
 match {
 source-address any;
 destination-address any;
 application any;
 }
 then {
 permit;
 tunnel {
 ipsec-vpn first_vpn;
 }
 }
 }
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the IKE Phase 1 Status for the Initiator on page 6588](#)
- [Verifying IPsec Security Associations for the Initiator on page 6590](#)
- [Verifying the IKE Phase 1 Status for the Responder on page 6591](#)
- [Verifying IPsec Security Associations for the Responder on page 6593](#)

### Verifying the IKE Phase 1 Status for the Initiator

**Purpose** Verify the IKE Phase 1 status.

**Action**

**NOTE:** Before starting the verification process, you must send traffic from a host in the 10.1.99.0 network to a host in the 10.2.99.0 network. For route-based VPNs, traffic can be initiated by the SRX Series device through the tunnel. We recommend that when testing IPsec tunnels, test traffic be sent from a separate device on one side of the VPN to a second device on the other side of the VPN. For example, initiate a ping operation from 10.1.99.2 to 10.2.99.2.

From operational mode, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations index *index\_number* detail** command.

```
user@host> show security ike security-associations
Index State Initiator cookie Responder cookie Mode Remote Address
5137403 UP b3a24bc00e963c51 7bf96bcc6230e484 Main 1.1.100.23
```

```
user@host> show security ike security-associations index 1 detail
Index State Initiator cookie Responder cookie Mode Remote Address
1400579286 UP 487cfb570908425c 7710c8487f9ff20c Main 1.1.100.22
```

```
{primary:node0}[edit]
```

```
root@poway# run show security ike security-associations detail
node0:
```

```
IKE peer 1.1.100.22, Index 1400579286,
Location: FPC 5, PIC 0, KMD-Instance 4
Role: Initiator, State: UP
Initiator cookie: 487cfb570908425c, Responder cookie: 7710c8487f9ff20c
Exchange type: Main, Authentication method: Pre-shared-keys
Local: 13.168.11.100:4500, Remote: 1.1.100.22:4500
Lifetime: Expires in 28622 seconds
Peer ike-id: 44.44.44.44
Xauth user-name: not available
Xauth assigned IP: 0.0.0.0
Algorithms:
Authentication : hmac-md5-96
Encryption : 3des-cbc
Pseudo random function: hmac-md5
Traffic statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
IPSec security associations: 0 created, 0 deleted
Phase 2 negotiations in progress: 0
```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration.

If SAs are listed, review the following information:

- Index—This value is unique for each IKE SA, which you can use in the **show security ike security-associations index detail** command to get more information about the SA.
- Remote address—Verify that the remote IP address is correct and that port 4500 is being used for peer-to-peer communication.
- Role initiator state
  - Up—The Phase 1 SA has been established.
  - Down—There was a problem establishing the Phase 1 SA.

- Both peers in the IPsec SA pair are using port 4500, which indicates that NAT-T is implemented. (NAT-T uses port 4500 or another random high-numbered port.)
- Peer IKE ID—Verify the remote (responder) address is correct. In this example, the address is 44.44.44.44.
- Local identity and remote identity—Verify these are correct.
- Mode—Verify that the correct mode is being used.

Verify that the following are correct in your configuration:

- External interfaces (the interface must be the one that receives IKE packets)
- IKE policy parameters
- Preshared key information
- Phase 1 proposal parameters (must match on both peers)

The **show security ike security-associations** command lists additional information about security associations:

- Authentication and encryption algorithms used
- Phase 1 lifetime
- Traffic statistics (can be used to verify that traffic is flowing properly in both directions)
- Role information

**NOTE:** Troubleshooting is best performed on the peer using the responder role.

- Initiator and responder information
- Number of IPsec SAs created
- Number of Phase 2 negotiations in progress

### Verifying IPsec Security Associations for the Initiator

**Purpose** Verify the IPsec status.

**Action** From operational mode, enter the **show security ipsec security-associations** command. After obtaining an index number from the command, use the **show security ipsec security-associations index *index\_number* detail** command.

```
user@host> show security ipsec security-associations
```

```
Total active tunnels: 1
```

ID	Algorithm	SPI	Life:sec/kb	Mon	vsys	Port	Gateway
<2	ESP:3des/md5	2bf24122	3390/ unlim	-	root	4500	1.1.100.23
>2	ESP:3des/md5	2baef146	3390/ unlim	-	root	4500	1.1.100.23

```
user@host> show security ipsec security-associations detail
```

```

Local Gateway: 12.168.99.100, Remote Gateway: 1.1.100.23
Local Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Remote Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Version: IKEv1
DF-bit: clear
Policy-name: pol1

Location: FPC 5, PIC 0, KMD-Instance 4
Direction: inbound, SPI: 2bf24122, AUX-SPI: 0
, VPN Monitoring: -
Hard lifetime: Expires in 3388 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2801 seconds
Mode: Tunnel, Type: dynamic, State: installed
Protocol: ESP, Authentication: hmac-md5-96, Encryption: 3des-cbc
Anti-replay service: counter-based enabled, Replay window size: 64

Location: FPC 5, PIC 0, KMD-Instance 4
Direction: outbound, SPI: 2baef146, AUX-SPI: 0
, VPN Monitoring: -
Hard lifetime: Expires in 3388 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2801 seconds
Mode: Tunnel, Type: dynamic, State: installed
Protocol: ESP, Authentication: hmac-md5-96, Encryption: 3des-cbc
Anti-replay service: counter-based enabled, Replay window size: 64

```

**Meaning** The output from the **show security ipsec security-associations** command lists the following information:

- The remote gateway has a NAT address of 1.1.100.23.
- Both peers in the IPsec SA pair are using port 4500, which indicates that NAT-T is implemented. (NAT-T uses port 4500 or another random high-numbered port.).
- The SPIs, lifetime (in seconds), and usage limits (or lifesize in KB) are shown for both directions. The 3390/ unlimited value indicates that the Phase 2 lifetime expires in 3390 seconds, and that no lifesize has been specified, which indicates that it is unlimited. Phase 2 lifetime can differ from Phase 1 lifetime, as Phase 2 is not dependent on Phase 1 after the VPN is up.
- VPN monitoring is not enabled for this SA, as indicated by a hyphen in the Mon column. If VPN monitoring is enabled, U indicates that monitoring is up, and D indicates that monitoring is down.
- The virtual system (vsys) is the root system, and it always lists 0.

### Verifying the IKE Phase 1 Status for the Responder

**Purpose** Verify the IKE Phase 1 status.

**Action** From operational mode, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations index *index\_number* detail** command.

```
user@host> show security ike security-associations
```

Index	State	Initiator cookie	Responder cookie	Mode	Remote Address
5802591	UP	d31d6833108fd69f	9ddfe2ce133086aa	Main	1.0.0.1

```

user@host> show security ike security-associations index 1 detail
IKE peer 1.1.100.23, Index 1400579287,
 Location: FPC 5, PIC 0, KMD-Instance 4
 Role: Responder, State: UP
 Initiator cookie: 487cfb570908425c, Responder cookie: 7710c8487f9ff20c
 Exchange type: Main, Authentication method: Pre-shared-keys
 Local: 12.168.99.100:4500, Remote: 1.1.100.23:4500
 Lifetime: Expires in 28587 seconds
 Peer ike-id: 11.11.11.11
 Xauth user-name: not available
 Xauth assigned IP: 0.0.0.0
 Algorithms:
 Authentication : hmac-md5-96
 Encryption : 3des-cbc
 Pseudo random function: hmac-md5
 Traffic statistics:
 Input bytes : 0
 Output bytes : 0
 Input packets: 0
 Output packets: 0
 IPSec security associations: 0 created, 0 deleted
 Phase 2 negotiations in progress: 0

 Negotiation type: Quick mode, Role: Responder, Message ID: 0
 Local: 71.1.1.1:4500, Remote: 1.0.0.1:4500
 Local identity: branch_natt1@example.net
 Remote identity: limits_natt1@example.net
 Flags: IKE SA is created

```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration.

If SAs are listed, review the following information:

- **Index**—This value is unique for each IKE SA, which you can use in the **show security ike security-associations index detail** command to get more information about the SA.
- **Remote address**—Verify that the remote IP address is correct and that port 4500 is being used for peer-to-peer communication.
- **Role responder state**
  - **Up**—The Phase 1 SA has been established.
  - **Down**—There was a problem establishing the Phase 1 SA.
- **Peer IKE ID**—Verify the local (initiator) address for the peer is correct. In this example, the address is 11.11.11.11.
- **Local identity and remote identity**—Verify these are correct.
- **Mode**—Verify that the correct mode is being used.

Verify that the following are correct in your configuration:

- External interfaces (the interface must be the one that receives IKE packets)
- IKE policy parameters
- Preshared key information
- Phase 1 proposal parameters (must match on both peers)

The **show security ike security-associations** command lists additional information about security associations:

- Authentication and encryption algorithms used
- Phase 1 lifetime
- Traffic statistics (can be used to verify that traffic is flowing properly in both directions)
- Role information

**NOTE:** Troubleshooting is best performed on the peer using the responder role.

- Initiator and responder information
- Number of IPsec SAs created
- Number of Phase 2 negotiations in progress

### Verifying IPsec Security Associations for the Responder

**Purpose** Verify the IPsec status.

**Action** From operational mode, enter the **show security ipsec security-associations** command. After obtaining an index number from the command, use the **show security ipsec security-associations index *index\_number* detail** command.

```
user@host> show security ipsec security-associations
Total active tunnels: 1
 ID Algorithm SPI Life:sec/kb Mon vsys Port Gateway
<131073 ESP:3des/sha1 a5224cd9 3571/ unlim - root 4500 1.0.0.1
>131073 ESP:3des/sha1 82a86a07 3571/ unlim - root 4500 1.0.0.1
```

```
user@host> show security ipsec security-associations detail
Virtual-system: root
Local Gateway: 71.1.1.1, Remote Gateway: 1.0.0.1
Local Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Remote Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Version: IKEv1
DF-bit: clear
Direction: inbound, SPI: a5224cd9, AUX-SPI: 0
, VPN Monitoring: -
Hard lifetime: Expires in 3523 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2923 seconds
Mode: Tunnel, Type: dynamic, State: installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
```

```
Anti-replay service: counter-based enabled, Replay window size: 64

Direction: outbound, SPI: 82a86a07, AUX-SPI: 0
 , VPN Monitoring: -
Hard lifetime: Expires in 3523 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 2923 seconds
Mode: Tunnel, Type: dynamic, State: installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Anti-replay service: counter-based enabled, Replay window size: 64
```

**Meaning** The output from the **show security ipsec security-associations** command lists the following information:

- The remote gateway has a NAT address of 1.0.0.1.
- Both peers in the IPsec SA pair are using port 4500, which indicates that NAT-T is implemented. (NAT-T uses port 4500 or another random high-numbered port.)
- The SPIs, lifetime (in seconds), and usage limits (or lifesize in KB) are shown for both directions. The 3571/ unlim value indicates that the Phase 2 lifetime expires in 3571 seconds, and that no lifesize has been specified, which indicates that it is unlimited. Phase 2 lifetime can differ from Phase 1 lifetime, as Phase 2 is not dependent on Phase 1 after the VPN is up.
- VPN monitoring is not enabled for this SA, as indicated by a hyphen in the Mon column. If VPN monitoring is enabled, U indicates that monitoring is up, and D indicates that monitoring is down.
- The virtual system (vsys) is the root system, and it always lists 0.

  - [Understanding NAT-T on page 6539](#)
  - [Example: Configuring a Route-Based VPN with Only the Responder Behind a NAT Device on page 6540](#)

---

## Example: Configuring NAT-T with Dynamic Endpoint VPN

This example shows how to configure a route-based VPN where the IKEv2 initiator is a dynamic endpoint behind a NAT device.

- [Requirements on page 6595](#)
- [Overview on page 6595](#)
- [Configuration on page 6596](#)
- [Verification on page 6608](#)

## Requirements

This example uses the following hardware and software components:

- Two SRX Series devices configured in a chassis cluster
- One SRX Series device providing NAT
- One SRX Series device providing branch office network access
- Junos OS Release 12.1X46-D10 or later for IKEv2 NAT-T support

## Overview

In this example, an IPsec VPN is configured between the branch office (IKEv2 initiator) and headquarters (IKEv2 responder) to secure network traffic between the two locations. The branch office is located behind the NAT device. The branch office address is assigned dynamically and is unknown to the responder. The initiator is configured with the remote identity of the responder for tunnel negotiation. This configuration establishes a dynamic endpoint VPN between the peers across the NAT device.

Figure 281 shows an example of a topology with NAT-Traversal (NAT-T) and dynamic endpoint VPN.

**Figure 281: NAT-T with Dynamic Endpoint VPN**

In this example, the initiator's IP address, 192.179.100.50, which has been dynamically assigned to the device, is hidden by the NAT device and translated to 100.10.1.253.

The following configuration options apply in this example:

- The local identity configured on the initiator must match the remote gateway identity configured on the responder.
- Phase 1 and Phase 2 options must match between the initiator and responder.

**NOTE:** In this example, the default security policy that permits all traffic is used for all devices. More restrictive security policies should be configured for production environments. See [“Security Policies Overview” on page 1065](#).

**NOTE:** Starting with Junos OS 12.1X46-D10, the default value for the `nat-keepalive` option configured at the `[edit security ike gateway gateway-name]` hierarchy level has been changed from 5 seconds to 20 seconds.

**NOTE:** In SRX5600 and SRX5800 devices, IKE negotiations involving NAT traversal do not work if the IKE peer is behind a NAT device that will change the source IP address of the IKE packets during the negotiation. For example, if the NAT device is configured with DIP, it changes the source IP because the IKE protocol switches the UDP port from 500 to 4500.

## Configuration

### Configuring the Branch Office Device (IKEv2 Initiator)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/1 unit 0 family inet address 192.179.100.50/24
set interfaces ge-0/0/2 unit 0 family inet address 192.179.2.20/24
set interfaces st0 unit 0 family inet address 172.168.100.1/16
set routing-options static route 192.179.1.0/24 next-hop st0.0
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust interfaces ge-0/0/2.0
set security zones security-zone untrust host-inbound-traffic system-services all
set security zones security-zone untrust host-inbound-traffic protocols all
```

```

set security zones security-zone untrust interfaces ge-0/0/1.0
set security zones security-zone untrust interfaces st0.0
set security ike proposal IKE_PROP authentication-method pre-shared-keys
set security ike proposal IKE_PROP dh-group group5
set security ike proposal IKE_PROP authentication-algorithm sha1
set security ike proposal IKE_PROP encryption-algorithm aes-256-cbc
set security ike policy IKE_POL proposals IKE_PROP
set security ike policy IKE_POL pre-shared-key ascii-text "example"
set security ike gateway HQ_GW ike-policy IKE_POL
set security ike gateway HQ_GW address 100.10.1.50
set security ike gateway HQ_GW local-identity hostname branch.example.net
set security ike gateway HQ_GW external-interface ge-0/0/1.0
set security ike gateway HQ_GW version v2-only
set security ipsec proposal IPSEC_PROP protocol esp
set security ipsec proposal IPSEC_PROP authentication-algorithm hmac-sha1-96
set security ipsec proposal IPSEC_PROP encryption-algorithm aes-256-cbc
set security ipsec policy IPSEC_POL perfect-forward-secrecy keys group5
set security ipsec policy IPSEC_POL proposals IPSEC_PROP
set security ipsec vpn HQ_VPN bind-interface st0.0
set security ipsec vpn HQ_VPN ike gateway HQ_GW
set security ipsec vpn HQ_VPN ike ipsec-policy IPSEC_POL
set security ipsec vpn HQ_VPN establish-tunnels immediately
set security policies default-policy permit-all

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the branch office device:

1. Configure interfaces.

```

[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 192.179.100.50/24
user@host# set ge-0/0/2 unit 0 family inet address 192.179.2.20/24
user@host# set st0 unit 0 family inet address 172.168.100.1/16

```

2. Configure routing options.

```

[edit routing-options]
user@host# set static route 192.179.1.0/24 next-hop st0.0

```

3. Configure zones.

```

[edit security zones security-zones trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/2.0

```

```

[edit security zones security-zones untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/1.0
user@host# set interfaces st0.0

```

4. Configure Phase 1 options.

```

[edit security ike proposal IKE_PROP]

```

```

user@host# set authentication-method pre-shared-keys
user@host# set dh-group group5
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-256-cbc

```

```

[edit security ike policy IKE_POL]
user@host# set proposals IKE_PROP
user@host# set pre-shared-key ascii-text "example"

```

```

[edit security ike gateway HQ_GW]
user@host# set ike-policy IKE_POL
user@host# set address 100.10.1.50
user@host# set local-identity hostname branch.example.net
user@host# set external-interface ge-0/0/1.0
user@host# set version v2-only

```

5. Configure Phase 2 options.

```

[edit security ipsec proposal IPSEC_PROP]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm aes-256-cbc

```

```

[edit security ipsec policy IPSEC_POL]
user@host# set proposals IPSEC_PROP
user@host# set perfect-forward-secrecy keys group5

```

```

[edit security ipsec vpn HQ_VPN]
user@host# set bind-interface st0.0
user@host# set ike gateway HQ_GW
user@host# set ike ipsec-policy IPSEC_POL
user@host# set establish-tunnels immediately

```

6. Configure the security policy.

```

[edit security policies]
user@host# set default-policy permit-all

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show routing-options**, **show security zones**, **show security ike**, **show security ipsec**, and **show security policies** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring the NAT Device

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/1 unit 0 family inet address 100.10.1.253/24
set interfaces fe-0/0/2 unit 0 family inet address 192.179.100.253/24
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust interfaces ge-0/0/1.0
set security zones security-zone untrust host-inbound-traffic system-services all
set security zones security-zone untrust host-inbound-traffic protocols all
set security zones security-zone untrust interfaces fe-0/0/2.0
set security nat source rule-set DYNAMIC from zone untrust
set security nat source rule-set DYNAMIC to zone trust
set security nat source rule-set DYNAMIC rule R2R3 match source-address 0.0.0.0/0

```

```
set security nat source rule-set DYNAMIC rule R2R3 then source-nat interface
set security policies default-policy permit-all
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the intermediate router providing NAT:

1. Configure interfaces.

```
[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 100.10.1.253/24
user@host# set fe-0/0/2 unit 0 family inet address 192.179.100.253/24
```

2. Configure zones.

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/1.0
```

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces fe-0/0/2.0
```

3. Configure NAT.

```
[edit security nat source rule-set DYNAMIC]
user@host# set from zone untrust
user@host# set to zone trust
user@host# set rule R2R3 match source-address 0.0.0.0/0
user@host# set rule R2R3 then source-nat interface
```

4. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security zones**, **show security nat source**, and **show security policies** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces
ge-0/0/1 {
 unit 0 {
 family inet {
 address 100.10.1.253/24;
 }
 }
}
fe-0/0/2 {
 unit 0 {
 family inet {
```

```
 address 192.179.100.253/24;
 }
}
[edit]
user@host# show security zones
security-zone trust {
 host-inbound-traffic {
 system-services {
 all;
 }
 protocols {
 all;
 }
 }
 interfaces {
 ge-0/0/1.0;
 }
}
security-zone untrust {
 host-inbound-traffic {
 system-services {
 all;
 }
 protocols {
 all;
 }
 }
 interfaces {
 fe-0/0/2.0;
 }
}
[edit]
user@host# show security nat source
rule-set DYNAMIC {
 from zone untrust;

 rule R2R3 {
 match {
 source-address 0.0.0.0/0;
 }
 then {
 source-nat {
 interface;
 }
 }
 }
}
[edit]
user@host# show security policies
default-policy {
 permit-all;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring the Headquarters Device (IKEv2 Responder)

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set chassis cluster reth-count 5
set chassis cluster redundancy-group 1 node 0 priority 220
set chassis cluster redundancy-group 1 node 1 priority 149
set chassis cluster redundancy-group 1 interface-monitor ge-0/0/1 weight 255

set security ipsec vpn Branch_VPN bind-interface st0.0
set security ipsec vpn Branch_VPN ike gateway Branch_GW
set security ipsec vpn Branch_VPN ike ipsec-policy IPSEC_POL
set security policies default-policy permit-all
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure two nodes as the chassis cluster.

```
[edit chassis cluster]
user@host# set reth-count 5
user@host# set redundancy-group 1 node 0 priority 220
user@host# set redundancy-group 1 node 1 priority 149
user@host# set redundancy-group 1 interface-monitor ge-0/0/1 weight 255
user@host# set redundancy-group 1 interface-monitor ge-8/0/1 weight 255
user@host# set redundancy-group 1 interface-monitor ge-0/0/2 weight 255
user@host# set redundancy-group 1 interface-monitor ge-8/0/2 weight 255
```

2. Configure interfaces.

```
[edit interfaces]
user@host# set ge-0/0/1 gigether-options redundant-parent reth0
user@host# set ge-0/0/2 gigether-options redundant-parent reth1
user@host# set ge-8/0/1 gigether-options redundant-parent reth0
user@host# set ge-8/0/2 gigether-options redundant-parent reth1
user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth0 unit 0 family inet address 192.179.1.10/24
user@host# set reth1 redundant-ether-options redundancy-group 1
user@host# set reth1 unit 0 family inet address 100.10.1.50/24
user@host# set st0 unit 0 family inet address 172.168.100.2/16
```

3. Configure routing options.

```
[edit routing-options]
user@host# set static route 192.179.2.0/24 next-hop st0.0
user@host# set static route 192.179.100.0/24 next-hop 100.10.1.253
```

4. Configure zones.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic protocols all
user@host# set host-inbound-traffic system-services all
user@host# set interfaces st0.0
user@host# set interfaces reth1.0
```

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces reth0.0
```

5. Configure Phase 1 options.

```
[edit security ike proposal IKE_PROP]
user@host# set authentication-method pre-shared-keys
user@host# set dh-group group5
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-256-cbc
```

```
[edit security ike policy IKE_POL]
user@host# set proposals IKE_PROP
user@host# set pre-shared-key ascii-text "juniper"
```

```
[edit security ike gateway Branch_GW]
user@host# set ike-policy IKE_POL
user@host# set dynamic hostname branch.example.net
user@host# set dead-peer-detection optimized
user@host# set external-interface reth1.0
user@host# set version v2-only
```

6. Configure Phase 2 options.

```
[edit security ipsec proposal IPSEC_PROP]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm aes-256-cbc
```

```
[edit security ipsec policy IPSEC_POL]
user@host# set perfect-forward-secrecy keys group5
user@host# set proposals IPSEC_PROP
```

```
[edit security ipsec vpn Branch_VPN]
user@host# set bind-interface st0.0
user@host# set ike gateway Branch_GW
user@host# set ike ipsec-policy IPSEC_POL
```

7. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show chassis cluster**, **show interfaces**, **show routing-options**, **show security zones**, **show security ike**, **show security ipsec**, and **show security policies** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

## Verification

Confirm that the configuration is working properly.

- [Verifying the IKE Phase 1 Status for the Responder on page 6608](#)
- [Verifying IPsec Security Associations for the Responder on page 6609](#)

### Verifying the IKE Phase 1 Status for the Responder

**Purpose** Verify the IKE Phase 1 status.

**Action** From operational mode on node 0, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations detail** command.

```

user@host# show security ike security-associations
node0:
Index State Initiator cookie Responder cookie Mode Remote Address
1367024684 UP f82c54347e2f3fb1 020e28e1e4cae003 IKEv2 100.10.1.253

```

```

user@host# show security ike security-associations detail
node0:
IKE peer 100.10.1.253, Index 1367024684, Gateway Name: Branch_GW
 Location: FPC 5, PIC 0, KMD-Instance 2
 Role: Responder, State: UP
 Initiator cookie: f82c54347e2f3fb1, Responder cookie: 020e28e1e4cae003
 Exchange type: IKEv2, Authentication method: Pre-shared-keys
 Local: 100.10.1.50:4500, Remote: 100.10.1.253:2541
 Lifetime: Expires in 3593 seconds
 Peer ike-id: branch.example.net
 Xauth assigned IP: 0.0.0.0
 Algorithms:
 Authentication : hmac-sha1-96
 Encryption : aes256-cbc
 Pseudo random function: hmac-sha1
 Diffie-Hellman group : DH-group-5
 Traffic statistics:
 Input bytes : 683
 Output bytes : 400
 Input packets: 2
 Output packets: 1
 IPsec security associations: 0 created, 0 deleted
 Phase 2 negotiations in progress: 1

```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration.

If SAs are listed, review the following information:

- Index—This value is unique for each IKE SA, which you can use in the **show security ike security-associations index *index\_id* detail** command to get more information about the SA.
- Remote address—Verify that the local IP address is correct and that port 4500 is being used for peer-to-peer communication.
- Role responder state
  - Up—The Phase 1 SA has been established.
  - Down—There was a problem establishing the Phase 1 SA.
  - Peer IKE ID—Verify the address is correct.
  - Local identity and remote identity—Verify these addresses are correct.
- Mode—Verify that the correct mode is being used.

Verify that the following are correct in your configuration:

- External interfaces (the interface must be the one that sends IKE packets)
- IKE policy parameters
- Preshared key information
- Phase 1 proposal parameters (must match on both peers)

The **show security ike security-associations** command lists additional information about security associations:

- Authentication and encryption algorithms used
- Phase 1 lifetime
- Traffic statistics (can be used to verify that traffic is flowing properly in both directions)
- Role information

**NOTE:** Troubleshooting is best performed on the peer using the responder role.

- Initiator and responder information
- Number of IPsec SAs created
- Number of Phase 2 negotiations in progress

### Verifying IPsec Security Associations for the Responder

**Purpose** Verify the IPsec status.

**Action** From operational mode on node 0, enter the **show security ipsec security-associations** command. After obtaining an index number from the command, use the **show security ipsec security-associations detail** command.

```
user@host# show security ipsec security-associations
node0
Total active tunnels: 1
ID Algorithm SPI Life:sec/kb Mon lsys Port Gateway
<77856771 ESP:aes-cbc-256/sha1 4ad5af40 7186/unlim - root 2541 100.10.1.253

>77856771 ESP:aes-cbc-256/sha1 5bb0a5ee 7186/unlim - root 2541 100.10.1.253
```

```
user@host# show security ipsec security-associations detail
node0
ID: 77856771 Virtual-system: root, VPN Name: Branch_VPN
Local Gateway: 100.10.1.50, Remote Gateway: 100.10.1.253
Local Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Remote Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Version: IKEv2
DF-bit: clear
Bind-interface: st0.0

Port: 2541, Nego#: 0, Fail#: 0, Def-Del#: 0 Flag: 608a29
Tunnel Down Reason: SA not initiated
Location: FPC 5, PIC 0, KMD-Instance 2
Direction: inbound, SPI: 4ad5af40, AUX-SPI: 0
, VPN Monitoring: -
Hard lifetime: Expires in 7182 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 6587 seconds
Mode: Tunnel(0 0), Type: dynamic, State: installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: aes-cbc (256 bits)
Anti-replay service: counter-based enabled, Replay window size: 64
```

**Meaning** The output from the **show security ipsec security-associations** command lists the following information:

- The remote gateway has an IP address of 100.10.1.253.
- The SPIs, lifetime (in seconds), and usage limits (or lifesize in KB) are shown for both directions. The lifetime value indicates that the Phase 2 lifetime expires in 7186 seconds, and that no lifesize has been specified, which indicates that it is unlimited. Phase 2 lifetime can differ from Phase 1 lifetime, as Phase 2 is not dependent on Phase 1 after the VPN is up.
- The virtual system (vsys) is the root system, and it always lists 0.

The output from the **show security ipsec security-associations index *index\_id* detail** command lists the following information:

- The local identity and remote identity make up the proxy ID for the SA.

A proxy ID mismatch is one of the most common causes for a Phase 2 failure. If no IPsec SA is listed, confirm that Phase 2 proposals, including the proxy ID settings, match for both peers. For route-based VPNs, the default proxy ID is local=0.0.0.0/0, remote=0.0.0.0/0, and service=any. Issues can occur with multiple route-based VPNs from the same peer IP. In this case, a unique proxy ID for each IPsec SA must be

specified. For some third-party vendors, the proxy ID must be manually entered to match.

- Another common reason for Phase 2 failure is not specifying the ST interface binding. If IPsec cannot complete, check the kmd log or set traceoptions.

## Understanding Dual Active-Backup IPsec VPN Chassis Clusters

In an active/passive chassis cluster, all VPN tunnels terminate on the same node, as shown in [Figure 282](#).

**Figure 282: Active/Passive Chassis Cluster with IPsec VPN Tunnels**

In an active/active chassis cluster, VPN tunnels can terminate on either node. Both nodes in the chassis cluster can actively pass traffic through VPN tunnels on both nodes at the same time, as shown in [Figure 283](#). This deployment is known as *dual active-backup IPsec VPN chassis clusters*.

**Figure 283: Dual Active-Backup IPsec VPN Chassis Clusters**

The following features are supported with dual active-backup IPsec VPN chassis clusters:

- Route-based VPNs only. Policy-based VPNs are not supported.
- IKEv2 only. IKEv1 is not supported.
- IKE and secure tunnel interfaces (st0) in virtual routers.
- Network Address Translation-Traversal (NAT-T).
- VPN monitoring.
- Dead peer detection.
- In-service software upgrade (ISSU).
- Insertion of Services Processing Cards (SPCs) on a chassis cluster device without disrupting the traffic on the existing VPN tunnels. See [“Understanding VPN Support for Inserting Services Processing Cards” on page 6364](#).
- Dynamic routing protocols.
- Secure tunnel interfaces (st0) configured in point-to-multipoint mode.
- AutoVPN with st0 interfaces in point-to-point mode with traffic selectors.
- IPv4-in-IPv4, IPv6-in-IPv4, IPv6-in-IPv6 and IPv4-in-IPv6 tunnel modes.
- Fragmented traffic.
- The loopback interface can be configured as the external interface for the VPN.

Dual active-backup IPsec VPN chassis clusters are only supported on high-end SRX Series chassis clusters. Dual active-backup IPsec VPN chassis clusters cannot be configured with the following features:

- VPNs with manual or preshared keys.
- Z-mode flows. Z-mode flows occur when traffic enters an interface on a chassis cluster node, passes through the fabric link, and exits through an interface on the other cluster node.

## Understanding Loopback Interface for a High Availability VPN

---

An Internet Key Exchange (IKE) gateway needs an external interface to communicate with a peer device. In a high availability chassis cluster setup, the node on which the external interface is active selects a Services Processing Unit (SPU) to support the VPN tunnel. IKE and IPsec packets are processed on that SPU. Therefore, the active external interface decides the anchor SPU.

In a chassis cluster setup, the external interface is a redundant Ethernet interface. A redundant Ethernet interface can go down when its physical (child) interfaces are down.

You can configure a loopback interface as an alternate physical interface to reach the peer gateway.

This feature allows the loopback interface to be configured for any redundancy group. This redundancy group configuration is only checked for VPN packets, because only VPN packets must find the anchor SPU through the active interface.

On branch SRX Series devices, the lo0 pseudointerface can be configured in any redundancy group; for example, RG0, RG1, RG2, and so on. However, on high-end SRX Series devices, the lo0 pseudointerface cannot be configured in RG0 when it is used as an IKE gateway external interface. Because a VPN is only supported in an active-passive chassis cluster environment on high-end SRX Series devices, the lo0 pseudointerface can be configured in such a setup for RG1. In a chassis cluster setup, the node on which the external interface is active selects an SPU to anchor the VPN tunnel. IKE and IPsec packets are processed on that SPU. Thus an active external interface decides the anchor SPU.

**Related Documentation**

- [IPsec VPN Overview on page 6337](#)

## Example: Configuring Redundancy Groups for Loopback Interfaces

This example shows how to configure a redundancy group (RG) for a loopback interface in order to prevent VPN failure. Redundancy groups are used to bundle interfaces into a group for failover purpose in a chassis cluster setup.

- [Requirements on page 6617](#)
- [Overview on page 6617](#)
- [Configuration on page 6619](#)
- [Verification on page 6622](#)

### Requirements

This example uses the following hardware and software:

- A pair of supported chassis cluster SRX Series devices
- An SSG140 device or equivalent
- Two switches
- Junos OS Release 12.1x44-D10 or later for SRX Series Services Gateways

Before you begin:

Understand chassis cluster redundant Ethernet interfaces. See *Understanding Chassis Cluster Redundant Ethernet Interfaces*.

### Overview

An Internet Key Exchange (IKE) gateway needs an external interface to communicate with a peer device. In a chassis cluster setup, the node on which the external interface is active selects a Services Processing Unit (SPU) to support the VPN tunnel. IKE and IPsec

packets are processed on that SPU. Therefore, the active external interface decides the anchor SPU.

In a chassis cluster setup, the external interface is a redundant Ethernet interface. A redundant Ethernet interface can go down when its physical (child) interfaces are down. You can configure a loopback interface as an alternative physical interface to reach the peer gateway. Loopback interfaces can be configured on any redundancy group. This redundancy group configuration is only checked for VPN packets, because only VPN packets must find the anchor SPU through the active interface.

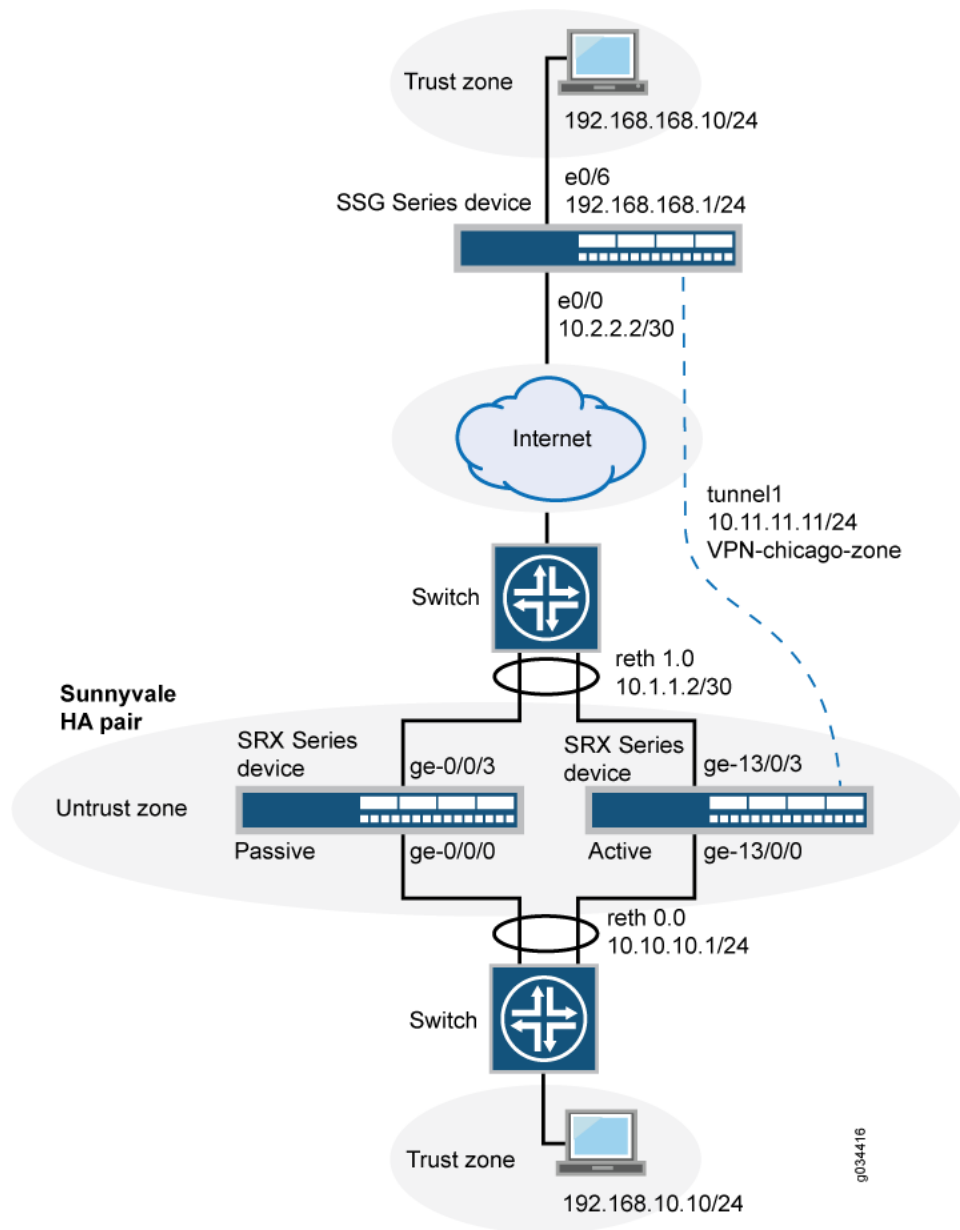

**NOTE:** You must configure lo0.x in a custom virtual router, since lo0.0 is in the default virtual router and only one loopback interface is allowed in a virtual router.

Figure 284 shows an example of a loopback chassis cluster VPN topology. In this topology, the SRX Series chassis cluster device is located in Sunnyvale, California. The SRX Series chassis cluster device works as a single gateway in this setup. The SSG Series device (or a third-party device) is located in Chicago, Illinois. This device acts as a peer device to the SRX chassis cluster and it helps to build a VPN tunnel.

Figure 284: Loopback Interface for Chassis Cluster VPN

lo0.1 10.3.3.3/30 Untrust zone	A logical interface on loopback that may be active on either node in the cluster depending on the activeness of its RG.
st0.0 10.11.11.10/24 vpn-chicago-zone	A logical interface on the secure tunnel interface for IPsec VPN tunnel.

## Configuration

**CLI Quick Configuration** To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your

network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces lo0 redundant-pseudo-interface-options redundancy-group 1
set interfaces lo0 unit 1 family inet address 3.3.3.3/30
set routing-instances vr1 instance-type virtual-router
set routing-instances vr1 interface lo0.1
set routing-instances vr1 interface reth0.0
set routing-instances vr1 interface reth1.0
set routing-instances vr1 interface st0.0
set routing-instances vr1 routing-options static route 192.168.168.1/24 next-hop st0.0
set security ike policy ike-policy1 mode main
set security ike policy ike-policy1 proposal-set standard
set security ike policy ike-policy1 pre-shared-key ascii-text "$ABC123"
set security ike gateway t-ike-gate ike-policy ike-policy1
set security ike gateway t-ike-gate address 2.2.2.2

set security ipsec proposal p2-std-p2 lifetime-seconds 180
set security ipsec policy vpn-policy1 perfect-forward-secrecy keys group2
set security ipsec policy vpn-policy1 proposals p2-std-p1
set security ipsec policy vpn-policy1 proposals p2-std-p2
set security ipsec vpn t-ike-vpn bind-interface st0.0
set security ipsec vpn t-ike-vpn ike gateway t-ike-gate
set security ipsec vpn t-ike-vpn ike proxy-identity local 10.10.10.1/24
set security ipsec vpn t-ike-vpn ike proxy-identity remote 192.168.168.1/24
set security ipsec vpn t-ike-vpn ike ipsec-policy vpn-policy1
```

#### Step-by-Step Procedure

To configure a redundancy group for a loopback interface:

1. Configure the loopback interface in one redundancy group.  

```
[edit interfaces]
user@host# set lo0 redundant-pseudo-interface-options redundancy-group 1
```
2. Configure the IP address for the loopback interface.  

```
[edit interfaces]
user@host# set lo0 unit 1 family inet address 3.3.3.3/30
```
3. Configure routing options.  

```
[edit routing-instances]
user@host# set vr1 instance-type virtual-router
user@host# set vr1 interface lo0.1
user@host# set vr1 interface reth0.0
user@host# set vr1 interface reth1.0
user@host# set vr1 interface st0.0
user@host# set vr1 routing-options static route 192.168.168.1/24 next-hop st0.0
```
4. Configure the loopback interface as an external interface for the IKE gateway.  

```
[edit security ike]
user@host# set policy ike-policy1 mode main
```

```

user@host# set policy ike-policy1 proposal-set standard
user@host# set policy ike-policy1 pre-shared-key ascii-text "$ABC123"
user@host# set gateway t-ike-gate ike-policy ike-policy1
user@host# set gateway t-ike-gate address 2.2.2.2
user@host# set gateway t-ike-gate external-interface lo0.1

```

5. Configure an IPsec proposal.

```

[edit security ipsec]
user@host# set proposal p2-std-p1 authentication-algorithm hmac-sha1-96
user@host# set proposal p2-std-p1 encryption-algorithm 3des-cbc
user@host# set proposal p2-std-p1 lifetime-seconds 180
user@host# set proposal p2-std-p2 authentication-algorithm hmac-sha1-96
user@host# set proposal p2-std-p2 encryption-algorithm aes-128-cbc
user@host# set proposal p2-std-p2 lifetime-seconds 180
user@host# set policy vpn-policy1 perfect-forward-secrecy keys group2
user@host# set policy vpn-policy1 proposals p2-std-p1
user@host# set policy vpn-policy1 proposals p2-std-p2
user@host# set vpn t-ike-vpn bind-interface st0.0
user@host# set vpn t-ike-vpn ike gateway t-ike-gate
user@host# set vpn t-ike-vpn ike proxy-identity local 10.10.10.1/24
user@host# set vpn t-ike-vpn ike proxy-identity remote 192.168.168.1/24
user@host# set vpn t-ike-vpn ike ipsec-policy vpn-policy1

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces lo0**, **show routing-instances**, **show security ike**, and **show security ipsec** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show interfaces lo0
unit 1 {
 family inet {
 address 3.3.3.3/30;
 }
}
redundant-pseudo-interface-options {
 redundancy-group 1;
}

[edit]
user@host# show routing-instances
vr1 {

 keys group2;
 }
 proposals [p2-std-p1 p2-std-p2];
}
policy vpn-policy2 {
 perfect-forward-secrecy {
 keys group2;
 }
 proposals [p2-std-p1 p2-std-p2];
}
vpn t-ike-vpn {
 bind-interface st0.0;
 ike {
 gateway t-ike-gate;
 proxy-identity {
 local 10.10.10.1/24;
 remote 192.168.168.1/24;
 }
 ipsec-policy vpn-policy1;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

### Verifying the Configuration

---

**Purpose** Verify that the configuration for redundancy groups for loopback interfaces is correct.

**Action** From operational mode, enter the **show chassis cluster interfaces** command.

```
user@host> show chassis cluster interfaces
Control link status: Up
Control interfaces:
Index Interface Status
0 em0 Up
1 em1 Down
Fabric link status: Up
Fabric interfaces:
Name Child-interface Status
fab0 ge-0/0/7 Up / Up
fab0
fab1 ge-13/0/7 Up / Up
fab1
Redundant-ethernet Information:
Name Status Redundancy-group
reth0 Up 1
reth1 Up 1
reth2 Up 1
reth3 Down Not configured
reth4 Down Not configured
Redundant-pseudo-interface Information:
Name Status Redundancy-group
lo0 Up 1
```

**Meaning** The **show chassis cluster interfaces** command displays the chassis cluster interfaces information. If the status of the Redundant-pseudo-interface Information field shows the lo0 interface as Up and the status of the Redundant-ethernet Information field shows reth0, reth1, and reth2 fields as Up then your configuration is correct.

### VPN Feature Support for IPv6 Addresses

A route-based site-to-site VPN tunnel with a point-to-point secure tunnel interface can operate in IPv4-in-IPv4, IPv6-in-IPv6, IPv6-in-IPv4, or IPv4-in-IPv6 tunnel modes. IPv6 addresses can be in the outer IP header, which represents the tunnel endpoint, or in the inner IP header, which represents the final source and destination addresses for a packet.

[Table 575](#) defines the support for IPv6 addresses in VPN features.

**Table 575: IPv6 Address Support in VPN Features**

Feature	Supported	Not Supported	Exceptions
IKE and IPsec Support:			
IKEv1 and IKEv2	X		Unless specified, all supported features are applicable for IKEv1 and IKEv2.
Route-based VPN	X		—
Policy-based VPN	X	X	IPv6 policy-based VPNs are not supported on high-end SRX Series devices or on branch SRX Series devices in chassis cluster configurations. IPv6 policy-based VPNs are only supported with IPv6-in-IPv6 tunnels on standalone branch SRX Series devices.
Site-to-site VPN	X		Only one-to-one, site-to-site VPN is supported. Many-to-one, site-to-site VPN (NHTB) is not supported. NHTB configuration cannot be committed for tunnel modes other than IPv4-in-IPv4 tunnels.

Table 575: IPv6 Address Support in VPN Features (*continued*)

Feature	Supported	Not Supported	Exceptions
Dynamic endpoint VPN		X	IPv6 dynamic endpoint VPNs are blocked during negotiation.
Dialup VPN		X	IPv6 dialup VPNs are blocked during negotiation.
AutoVPN		X	—
Group VPN		X	—
Point-to-point tunnel interfaces	X		—
Point-to-multipoint tunnel interfaces		X	—
Hub-and-spoke scenario for site-to-site VPNs	X		—
Numbered and unnumbered tunnel interfaces	X		—
Unicast static and dynamic (RIP, OSPF, BGP) routing	X		—
Multicast dynamic routing (PIM)		X	—
Virtual router	X		—
Logical system		X	—
Automatic and manual SA and key management	X		—
Multiple SPUs	X		—
Chassis cluster	X		IPsec VPN with active-active mode is supported only on branch SRX Series devices for route-based IPv6 tunnels. IPsec VPN with active-active mode is not supported on high-end SRX Series devices.
Statistics, logs, per-tunnel debugging	X		—
SNMP MIB	X		—
Local address selection	X		When multiple addresses in the same address family are configured on a physical external interface to a VPN peer, we recommend that you also configure <b>local-address</b> at the <b>[edit security ike gateway gateway-name]</b> hierarchy level.
Loopback address termination	X		—

Table 575: IPv6 Address Support in VPN Features (*continued*)

Feature	Supported	Not Supported	Exceptions
Xauth or modecfg over IPv6		X	—
SPC insert	X		—
ISSU	X		—
DNS name as IKE gateway address	X		As with IPv4 tunnels, peer gateway address changes in the DNS name are not supported with IPv6 tunnels.
Preshared key or certificate authentication	X		—
NAT-Traversal (NAT-T) for IPv4 IKE peers	X		NAT-T is supported only for IPv6-in-IPv4 and IPv4-in-IPv4 tunnel modes with IKEv1. IPv6-in-IPv6 and IPv4-in-IPv6 tunnel modes are not supported. IKEv2 is not supported for NAT-T. NAT-T from IPv6 to IPv4 or from IPv4 to IPv6 is not supported.
Dead peer detection (DPD) and DPD gateway failover	X		DPD gateway failover is only supported for different gateway addresses within the same family. Failover from an IPv6 gateway address to an IPv4 gateway address, or vice versa, is not supported.
Encryption sets, authentication algorithms, and DH groups supported in Junos OS Release 12.1X45-D10 release for SRX Series devices.	X		—
Generic proposals and policies for IPv6 and IPv4	X		—
General IKE ID	X		—
ESP and AH transport modes		X	These modes are not supported for IPv4.
ESP and AH tunnel modes	X		AH tunnel mode with mutable extension headers and options is not supported.
Extended sequence number		X	—
Single proxy ID pairs	X		—
Multiple traffic selector pairs	X		Supported with IKEv1 only.
Lifetime of IKE or IPsec SA, in seconds	X		—
Lifetime of IKE SA, in kilobytes	X		—

Table 575: IPv6 Address Support in VPN Features (*continued*)

Feature	Supported	Not Supported	Exceptions
VPN monitoring		X	Configuration with IPv6 tunnels cannot be committed.
DF bit	X		For IPv6-in-IPv6 tunnels, the DF bit is set only if configured at the <code>[edit security ipsec vpn vpn-name]</code> hierarchy level. <code>df-bit clear</code> is the default.
Dual-stack over tunnel external interface	X		—
IPv6 extension headers	X		IPv6 extension headers and IPv4 options for IKE and IPsec packets are accepted but are not processed. AH with mutable EHs and options is not supported.
Fragmentation and reassembly	X		—
VPN session affinity	X		—
Multicast traffic		X	—
Tunnel IP services (Screen, NAT, ALG, IPS, AppSecure)	X		—
Packet reordering for IPv6 fragments over tunnel		X	—
PKI Support:			
PKI in virtual router	X		—
RSA signature authentication (512-, 1024-, 2048-, or 4096-bit key size)	X		—
DSA signature authentication (512-, 1024-, 2048-, or 4096-bit key size)	X		—
ECDSA signatures	X		—
Certificate chain authentication		X	—
Automatic or manual enrollment over IPv4	X		—
Automatic or manual revocation over IPv4	X		—
Automatic or manual enrollment over IPv6		X	—
Automatic or manual revocation over IPv6		X	—

Table 575: IPv6 Address Support in VPN Features (*continued*)

## Understanding IPv6 IKE and IPsec Packet Processing

This topic includes the following sections:

- [IPv6 IKE Packet Processing on page 6631](#)
- [IPv6 IPsec Packet Processing on page 6632](#)

### IPv6 IKE Packet Processing

Internet Key Exchange (IKE) is part of the IPsec suite of protocols. It automatically enables two tunnel endpoints to set up security associations (SAs) and negotiate secret keys with each other. There is no need to manually configure the security parameters. IKE also provides authentication for communicating peers.

IKE packet processing in IPv6 networks involves the following elements:

- Internet Security Association and Key Management Protocol (ISAKMP) Identification Payload

ISAKMP identification payload is used to identify and authenticate the communicating IPv6 peers. Two ID types (ID\_IPV6\_ADDR and ID\_IPV6\_ADDR\_SUBNET) are enabled for IPv6. The ID type indicates the type of identification to be used. The ID\_IPV6\_ADDR type specifies a single 16-octet IPv6 address. This ID type represents an IPv6 address. The ID\_IPV6\_ADDR\_SUBNET type specifies a range of IPv6 addresses represented by two 16-octet values. This ID type represents an IPv6 network mask. [Table 576](#) lists the ID types and their assigned values in the identification payload.

Table 576: ISAKMP ID Types and Their Values

ID Type	Value
RESERVED	0
ID_IPV4_ADDR	1
ID_FQDN	2
ID_USER_FQDN	3
ID_IPV4_ADDR_SUBNET	4

Table 576: ISAKMP ID Types and Their Values (*continued*)

ID Type	Value
ID_IPV6_ADDR	5
ID_IPV6_ADDR_SUBNET	6
ID_IPV4_ADDR_RANGE	7
ID_IPV6_ADDR_RANGE	8
ID_DER_ASN1_DN	9
ID_DER_ASN1_GN	10
ID_KEY_ID	11
ID_LIST	12

The ID\_IPV6\_ADDR\_RANGE type specifies a range of IPv6 addresses represented by two 16-octet values. The first octet value represents the starting IPv6 address and the second octet value represents the ending IPv6 address in the range. All IPv6 addresses falling between the first and last IPv6 addresses are considered to be part of the list.

**NOTE:** Two ID types in ISAKMP identification payload (ID\_IPV6\_ADDR\_RANGE and ID\_IPV4\_ADDR\_RANGE) are not supported in this release.

- Proxy ID

A proxy ID is used during Phase 2 of IKE negotiation. It is generated before an IPsec tunnel is established. A proxy ID identifies the SA to be used for the VPN. Two proxy IDs are generated—local and remote. The local proxy ID refers to the local IPv4 or IPv6 address/network and subnet mask. The remote proxy ID refers to the remote IPv4 or IPv6 address/network and subnet mask.

- Security Association

An SA is an agreement between VPN participants to support secure communication. SAs are differentiated based on three parameters—security parameter index (SPI), destination IPv6 address, and security protocol (either AH or ESP). The SPI is a unique value assigned to an SA to help identify an SA among multiple SAs. In an IPv6 packet, the SA is identified from the destination address in the outer IPv6 header and the security protocol is identified from either the AH or the ESP header.

## IPv6 IPsec Packet Processing

After IKE negotiations are completed and the two IKE gateways have established Phase 1 and Phase 2 SAs, IPv6 IPsec employs authentication and encryption technologies to

secure the IPv6 packets. Because IPv6 addresses are 128 bits long compared to IPv4 addresses, which are 32-bits long, IPv6 IPsec packet processing requires more resources.

**NOTE:** Packet reordering for IPv6 fragments over a tunnel is not supported.

Devices with IPv6 addressing do not perform fragmentation. IPv6 hosts should either perform path MTU discovery or send packets smaller than the IPv6 minimum MTU size of 1280 bytes.

This topic includes the following sections:

- [AH Protocol in IPv6 on page 6633](#)
- [ESP Protocol in IPv6 on page 6633](#)
- [IPv4 Options and IPv6 Extension Headers with AH and ESP on page 6634](#)
- [Integrity Check Value \(ICV\) Calculation in IPv6 on page 6634](#)
- [Header Construction in Tunnel Modes on page 6635](#)

### AH Protocol in IPv6

The AH protocol provides data integrity and data authentication for IPv6 packets. IPv6 IPsec uses extension headers (for example, hop-by-hop and routing options) that must be arranged in a particular way in the IPv6 datagram. In AH tunnel mode, the AH header immediately follows the new outer IPv6 header similar to that in IPv4 AH tunnel mode. The extension headers are placed after the original inner header. Therefore, in AH tunnel mode, the entire packet is encapsulated by adding a new outer IPv6 header, followed by an authentication header, an inner header, extension headers, and the rest of the original datagram as shown in [Figure 285](#).

**Figure 285: IPv6 AH Tunnel Mode**

Unlike ESP, the AH authentication algorithm covers the outer header as well as any new extension headers and options.

**NOTE:** AH tunnel mode on SRX Series devices does not support IPv4 mutable options or IPv6 mutable extension headers. See [Table 577](#).

### ESP Protocol in IPv6

ESP protocol provides both encryption and authentication for IPv6 packets. Because IPv6 IPsec uses extension headers (for example, hop-by-hop and routing options) in the IPv6 datagram, the most important difference between IPv6 ESP tunnel mode and IPv4 ESP tunnel mode is the placement of extension headers in the packet layout. In ESP

tunnel mode, the ESP header immediately follows the new outer IPv6 header similar to that in IPv4 ESP tunnel mode. Therefore, in ESP tunnel mode, the entire packet is encapsulated by adding a new outer IPv6 header, followed by an ESP header, an inner header, extension headers, and the rest of the original datagram as shown in [Figure 286](#).

**Figure 286: IPv6 ESP Tunnel Mode**

### IPv4 Options and IPv6 Extension Headers with AH and ESP

IPsec packets with IPv4 options or IPv6 extension headers can be received for decapsulation on SRX Series devices. [Table 577](#) shows the IPv4 options or IPv6 extension headers that are supported with the ESP or AH protocol on SRX Series devices. If an unsupported IPsec packet is received, ICV calculation fails and the packet is dropped.

**Table 577: Support for IPv4 Options or IPv6 Extension Headers**

Options or Extension Headers	Branch SRX Series Devices	High-End SRX Series Devices
ESP with IPv4 options	Supported	Supported
ESP with IPv6 extension headers	Supported	Supported
AH with IPv4 immutable options	Supported	Supported
AH with IPv6 immutable extension headers	Supported	Supported
AH with IPv4 mutable options	Not supported	Not supported
AH with IPv6 mutable extension headers	Not supported	Not supported

### Integrity Check Value (ICV) Calculation in IPv6

AH protocol verifies the integrity of the IPv6 packet by computing an ICV on the packet contents. ICV is usually built over an authentication algorithm such as MD5 or SHA-1. The IPv6 ICV calculations differ from that in IPv4 in terms of two header fields—mutable header and optional extension header.

You can calculate the AH ICV over the IPv6 header fields that are either immutable in transit or predictable in value upon arrival at the tunnel endpoints. You can also calculate the AH ICV over the AH header and the upper level protocol data (considered to be immutable in transit). You can calculate the ESP ICV over the entire IPv6 packet, excluding the new outer IPv6 header and the optional extension headers.

**NOTE:** Unlike IPv4, IPv6 has a method for tagging options as mutable in transit. IPv6 optional extension headers contain a flag that indicates mutability. This flag determines the appropriate processing.

IPv4 mutable options and IPv6 extension headers are not supported with the AH protocol.

### Header Construction in Tunnel Modes

In tunnel mode, the source and destination addresses of the outer IPv4 or IPv6 header represent the tunnel endpoints, while the source and destination addresses of the inner IPv4 or IPv6 header represent the final source and destination addresses. [Table 578](#) summarizes how the outer IPv6 header relates to the inner IPv6 or IPv4 header for IPv6-in-IPv6 or IPv4-in-IPv6 tunnel modes. In outer header fields, “Constructed” means that the value of the outer header field is constructed independently of the value in the inner header field.

**Table 578: IPv6 Header Construction for IPv6-in-IPv6 and IPv4-in-IPv6 Tunnel Modes**

Header Fields	Outer Header at Encapsulator	Inner Header at Decapsulator
version	6.	No change.
DS field	Copied from the inner header.	No change.
ECN field	Copied from the inner header.	Constructed.
flow label	0.	No change.
payload length	Constructed.	No change.
next header	AH, ESP, and routing header.	No change.
hop limit	64.	Decrement.
src address	Constructed.	No change.
dest address	Constructed.	No change.
Extension headers	Never copied.	No change.

[Table 579](#) summarizes how the outer IPv4 header relates to the inner IPv6 or IPv4 header for IPv6-in-IPv4 or IPv4-in-IPv4 tunnel modes. In outer header fields, “Constructed” means that the value of the outer header field is constructed independently of the value in the inner header field.

Table 579: IPv4 Header Construction for IPv6-in-IPv4 and IPv4-in-IPv4 Tunnel Modes

Header Fields	Outer Header	Inner Header
version	4.	No change.
header length	Constructed.	No change.
DS field	Copied from the inner header.	No change.
ECN field	Copied from the inner header.	Constructed.
total length	Constructed.	No change.
ID	Constructed.	No change.
flags (DF, MF)	Constructed.	No change.
fragment offset	Constructed.	No change.
TTL	64.	Decrement.
protocol	AH, ESP	No change.
checksum	Constructed.	Constructed.
src address	Constructed.	No change.
dest address	Constructed.	No change.
options	Never copied.	No change.

For IPv6-in-IPv4 tunnel mode, the Don't Fragment (DF) bit is cleared by default. If the **df-bit set** or **df-bit copy** options are configured at the `[edit security ipsec vpn vpn-name]` hierarchy level for the corresponding IPv4 VPN, the DF bit is set in the outer IPv4 header.

For IPv4-in-IPv4 tunnel mode, the DF bit in the outer IPv4 header is based on the **df-bit** option configured for the inner IPv4 header. If **df-bit** is not configured for the inner IPv4 header, the DF bit is cleared in the outer IPv4 header.

---

## IPv6 IPsec Configuration Overview

---

Juniper Networks supports manual and autokey IKE with preshared keys configurations for IPv6 IPsec VPN.

- **Manual VPN**—In a manual VPN configuration, the secret keys and security associations (SAs) are manually configured on the tunnel endpoints using the manual key mechanism. To create an IPv6 IPsec manual VPN, see [“Example: Configuring an IPv6 IPsec Manual VPN” on page 6637](#).
- **AutoKey IKE VPN**—In an autoKey IKE VPN configuration, the secret keys and SAs are automatically created using the autoKey IKE mechanism. To set up an IPv6 autoKey IKE VPN, two phases of negotiations are required—Phase 1 and Phase 2.
  - **Phase 1**—In this phase, the participants establish a secure channel for negotiating the IPsec SAs. For more information on Phase 1 negotiations, see [“Understanding Phase 1 of IKE Tunnel Negotiation” on page 6351](#).
  - **Phase 2**—In this phase, the participants negotiate the IPsec SAs for authenticating and encrypting the IPv6 data packets. For more information on Phase 2 negotiations, see [“Understanding Phase 2 of IKE Tunnel Negotiation” on page 6353](#).

### Related Documentation

- [Understanding IPv6 IKE and IPsec Packet Processing on page 6631](#)

---

## Example: Configuring an IPv6 IPsec Manual VPN

---

This example shows how to configure an IPv6 IPsec manual VPN.

- [Requirements on page 6637](#)
- [Overview on page 6637](#)
- [Configuration on page 6638](#)
- [Verification on page 6639](#)

### Requirements

Before you begin:

- Understand how VPNs work. See [“IPsec VPN Overview” on page 6337](#).
- Understand IPv6 IPsec packet processing. See [“Understanding IPv6 IKE and IPsec Packet Processing” on page 6631](#).

### Overview

In a Manual VPN configuration, the secret keys are manually configured on the two IPsec endpoints.

In this example, you:

- Configure the authentication parameters for a VPN named vpn-sunnyvale.
- Configure the encryption parameters for vpn-sunnyvale.
- Specify the outgoing interface for the SA.
- Specify the IPv6 address of the peer.
- Define the IPsec protocol. Select the ESP protocol because the configuration includes both authentication and encryption.
- Configure a security parameter index (SPI).

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ipsec vpn vpn-sunnyvale manual authentication algorithm hmac-md5-96
key ascii-text 1111111111111111
set security ipsec vpn vpn-sunnyvale manual encryption algorithm 3des-cbc key ascii-text
11111111111111111111111111111111
set security ipsec vpn vpn-sunnyvale manual external-interface ge-0/0/14.0
set security ipsec vpn vpn-sunnyvale manual gateway 1212::1112
set security ipsec vpn vpn-sunnyvale manual protocol esp
set security ipsec vpn vpn-sunnyvale manual spi 12435
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure security algorithms:

1. Configure the authentication parameters.  

```
[edit security ipsec vpn vpn-sunnyvale manual]
user@host# set authentication algorithm hmac-md5-96 key ascii-text 1111111111111111
```
2. Configure the encryption parameters.  

```
[edit security ipsec vpn vpn-sunnyvale manual]
user@host# set encryption algorithm 3des-cbc key ascii-text 11111111111111111111111111111111
```
3. Specify the outgoing interface for the SA.  

```
[edit security ipsec vpn vpn-sunnyvale manual]
user@host# set external-interface ge-0/0/14.0
```
4. Specify the IPv6 address of the peer.  

```
[edit security ipsec vpn vpn-sunnyvale manual]
user@host# set gateway 1212::1112
```
5. Define the IPsec protocol.  

```
[edit security ipsec vpn vpn-sunnyvale manual]
user@host# set protocol esp
```

6. Configure an SPI.

```
[edit security ipsec vpn vpn-sunnyvale manual]
user@host# set spi 12435
```

**Results** From configuration mode, confirm your configuration by entering the **show security ipsec vpn vpn-sunnyvale** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
[user@host]show security ipsec vpn vpn-sunnyvale
manual {
 gateway 1212::1112 ;
 external-interface ge-0/0/14.0 ;
 protocol esp ;
 spi 12435 ;
 authentication {
 algorithm hmac-md5-96 ;
 key ascii-text $ABC123" ;## SECRET DATA
 }
 encryption {
 algorithm 3des-cbc ;
 key ascii-text $ABC123" ;## SECRET DATA
 }
}
```

## Verification

To confirm that the configuration is working properly, perform this task:

- [Verifying Security Algorithms on page 6639](#)

### Verifying Security Algorithms

**Purpose** Determine if security algorithms are applied or not.

**Action** From operational mode, enter the **show security ipsec security-associations** command.

- [Digital Certificates Configuration Overview on page 6648](#)

## Understanding Certificates and PKI

---

A digital certificate is an electronic means for verifying your identity through a trusted third party, known as a certificate authority (CA). Alternatively, you can use a self-signed certificate to attest to your identity.

The CA server you use can be owned and operated by an independent CA or by your own organization, in which case you become your own CA. If you use an independent CA, you must contact them for the addresses of their CA and certificate revocation list (CRL) servers (for obtaining certificates and CRLs) and for the information they require when submitting personal certificate requests. When you are your own CA, you determine this information yourself.

The Public Key Infrastructure (PKI) provides an infrastructure for digital certificate management.

This topic includes the following sections:

- [Certificate Signatures and Verification on page 6643](#)
- [Public Key Infrastructure on page 6644](#)
- [PKI Management and Implementation on page 6646](#)
- [Internet Key Exchange on page 6647](#)

## Certificate Signatures and Verification

The CA that issues a certificate uses a hash algorithm to generate a digest, and then “signs” the certificate by encrypting the digest with its private key. The result is a digital signature. The CA then makes the digitally signed certificate available for download to the person who requested it. [Figure 287](#) illustrates this process.

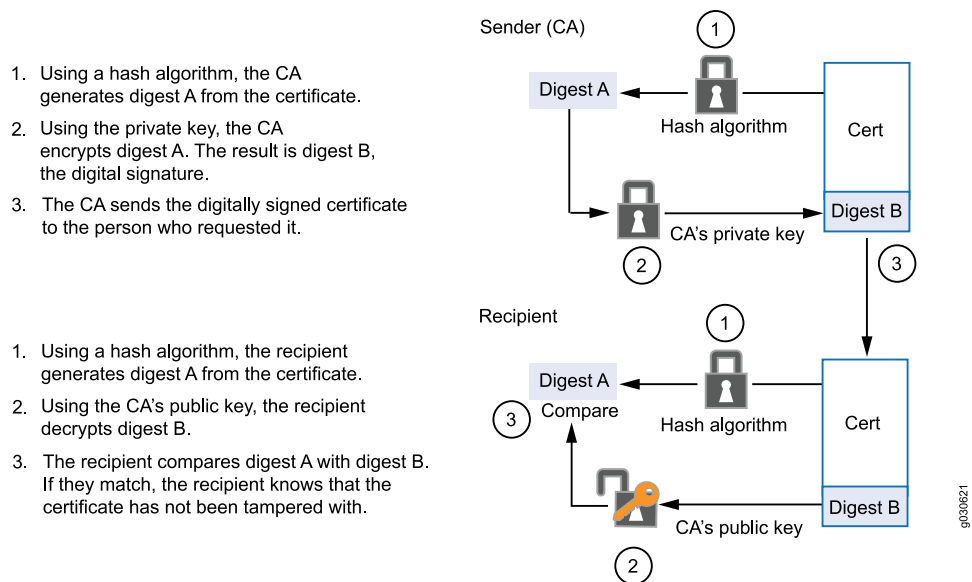

The recipient of the certificate generates another digest by applying the same hash algorithm to the certificate file, then uses the CA's public key to decrypt the digital signature. By comparing the decrypted digest with the digest just generated, the recipient

can confirm the integrity of the CA's signature and, by extension, the integrity of the accompanying certificate. [Figure 287](#) illustrates this process.

**NOTE:** A certificate is considered valid if the digital signature can be verified and the serial number of the certificate is not listed in a certificate revocation list.

**Figure 287: Digital Signature Verification**

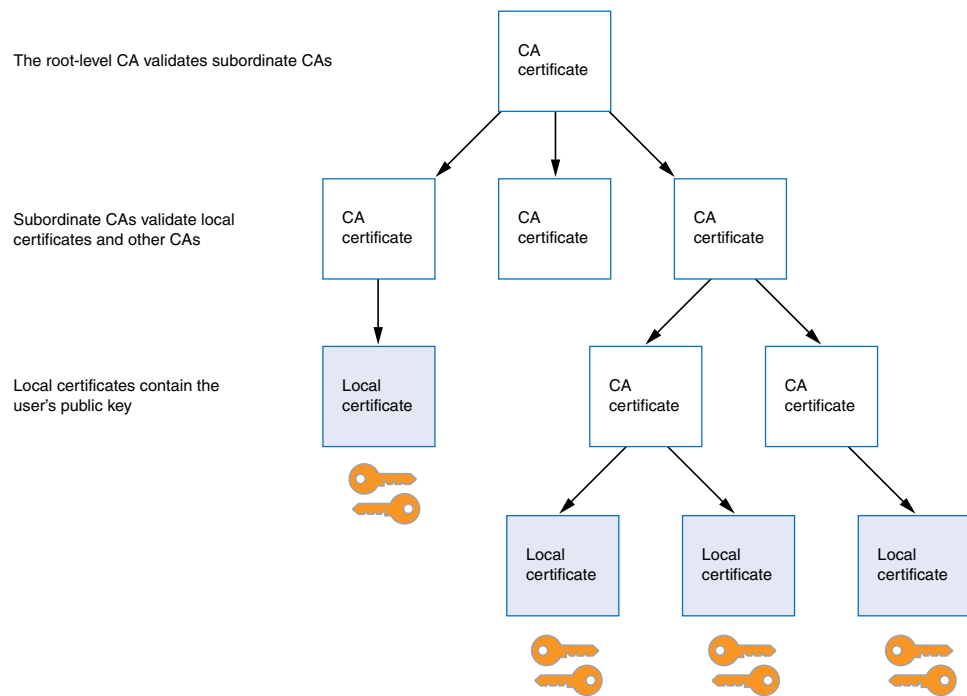

When Digital Signature Algorithm (DSA) signatures are used, the SHA-1 hash algorithm is used to generate the digest. When Rivest-Shamir-Adleman (RSA) signatures are used, SHA-1 is the default hash algorithm used to generate the digest; you can specify the SHA-256 hash algorithm with the **digest** option of the **request security pki generate-certificate-request** or **request security pki local-certificate generate-self-signed** commands. When Elliptic Curve Digital Signature Algorithm (ECDSA) signatures are used, the SHA-256 hash algorithm is used for ECDSA-256 signatures and the SHA-384 hash algorithm is used for ECDSA-384 signatures.

## Public Key Infrastructure

To verify the trustworthiness of a certificate, you must be able to track a path of certified certificate authorities (CAs) from the one issuing your local certificate to the root authority of a CA domain. Public key infrastructure (PKI) refers to the hierarchical structure of trust required for the successful implementation of public key cryptography.

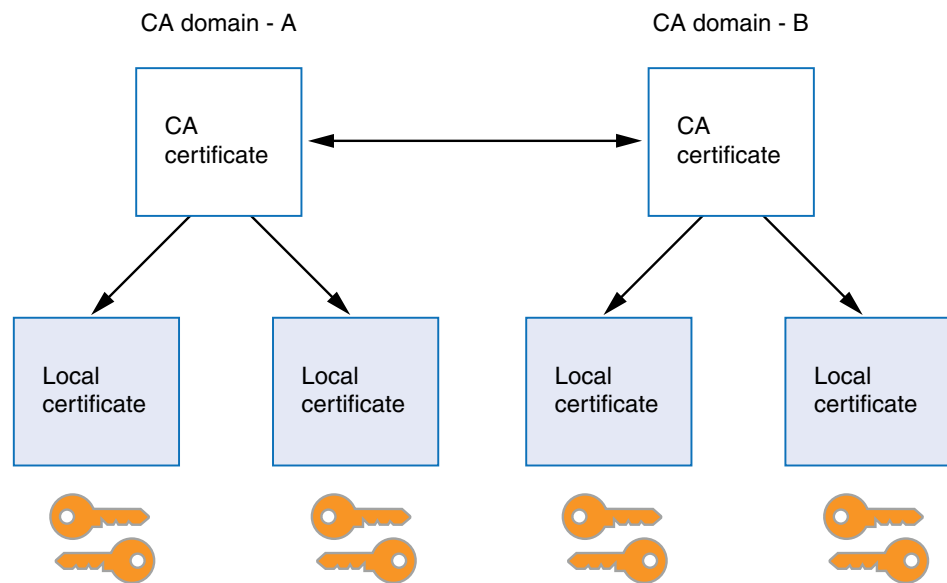

[Figure 288](#) shows the structure of a single-domain certificate authority with multiple hierarchy levels.

Figure 288: PKI Hierarchy of Trust—CA Domain

If certificates are used solely within an organization, that organization can have its own CA domain within which a company CA issues and validates certificates for its employees. If that organization later wants its employees to exchange their certificates with certificates from another CA domain (for example, with employees at another organization that has its own CA domain), the two CAs can develop cross-certification by agreeing to trust the authority of each other. In this case, the PKI structure does not extend vertically but does extend horizontally. See [Figure 289](#).

Figure 289: Cross-Certification

Users in the CA domain A can use their certificates and key pairs with users in CA domain B because the CA's have cross-certified each other.

## PKI Management and Implementation

The minimum PKI elements required for certificate-based authentication in Junos OS are:

- CA certificates and authority configuration.
- Local certificates including the device's identity (example: IKE ID type and value) and private and public keys
- Certificate validation through a CRL.

Junos OS supports three different types of PKI objects:

- Private/public key pair
- Certificates
  - Local certificate—The local certificate contains the public key and identity information for the Juniper Networks device. The Juniper Networks device owns the associated private key. This certificate is generated based on a certificate request from the Juniper Networks device.
  - Pending certificate — A pending certificate contains a key pair and identity information that is generated into a PKCS10 certificate request and manually sent to a certificate authority (CA). While the Juniper Networks device waits for the certificate from the CA, the existing object (key pair and the certificate request) is tagged as a certificate request or pending certificate.

**NOTE:** Junos OS supports automatic sending of certificate requests through the Simple Certificate Enrollment Protocol (SCEP).

- CA certificate — When the certificate is issued by the CA and loaded into the Junos device, the pending certificate is replaced by the newly generated local certificate. All other certificates loaded into the device are considered CA certificates.
- Certificate revocation lists (CRLs)

For convenience and practicality, PKI must be transparently managed and implemented. Toward this goal, Junos OS supports the following features:

- Generates a public-private key pair.
- Loads multiple local certificates from different CAs.
- Delivers a certificate when establishing an IPsec tunnel.
- Validates a certificate path upward through a single level of CA authorities.
- Supports the Public-Key Cryptography Standards #7 (PKCS #7) cryptographic . As a result, the device can accept X.509 certificates and certificate revocation lists (CRLs) packaged within a PKCS #7 envelope.

**NOTE:** Junos OS supports a PKCS #7 file size of up to 7 KB.

- Retrieves CRLs online retrieval through Lightweight Directory Access Protocol (LDAP) or Hypertext Transfer Protocol (HTTP).

## Internet Key Exchange

The procedure for digitally signing messages sent between two participants in an Internet Key Exchange (IKE) session is similar to digital certificate verification, with the following differences:

- Instead of making a digest from the CA certificate, the sender makes it from the data in the IP packet payload.
- Instead of using the CA's public-private key pair, the participants use the sender's public-private key pair.

## Cryptographic Key Handling Overview

---

With cryptographic key handling, persistent keys are stored in the memory of the device without any attempt to alter them. While the internal memory device is not directly accessible to a potential adversary, those who require a second layer of defence, may enable special handling for cryptographic keys. When enabled, the cryptographic key handling encrypts keys when not immediately in use, performs error detection when copying a key from one memory location to another, and overwrites the memory location of a key with a random bit pattern when the key is no longer in use. Keys are also protected when they are stored in the flash memory of the device. Enabling cryptographic key handling feature does not cause any externally observable change in the behavior of the device, and the device continues to interoperate with the other devices.

**NOTE:** A cryptographic administrator can enable and disable the cryptographic self-test functions, however the security administrator can modify the behavior of the cryptographic self test functions like configuring periodic self-test or selecting a subset of cryptographic self-tests.

The following persistent keys are currently under the management of IKE and PKI:

- IKE preshared keys (IKE PSKs)
- PKI private keys
- Manual VPN keys

## Digital Certificates Configuration Overview

---

You can obtain CA and local certificates manually, or online using the Simple Certificate Enrollment Protocol (SCEP). Certificates are verifiable and renewable, and you can delete them when they are no longer needed.

Junos OS Release 8.5 and earlier support only manual certificate requests. This process includes generation of a PKCS10 request, submission to the CA, retrieval of the signed certificate, and manually loading of the certificate into the Juniper Networks device.

Automatic sending of certificate requests through SCEP is supported only in Junos OS Release 9.0 or later.

To use a digital certificate to authenticate your identity when establishing a secure VPN connection, you must first do the following:

- Obtain a CA certificate from which you intend to obtain a local certificate, and then load the CA certificate onto the device. The CA certificate can contain a CRL to identify invalid certificates.

- Obtain a local certificate from the CA whose CA certificate you have previously loaded, and then load the local certificate in the device. The local certificate establishes the identity of the Juniper Networks device with each tunnel connection.

This topic includes the following sections:

- [Enabling Digital Certificates Online: Configuration Overview on page 6649](#)
- [Manually Generating Digital Certificates: Configuration Overview on page 6649](#)

## Enabling Digital Certificates Online: Configuration Overview

SCEP uses the online method to request digital certificates. To obtain a certificate online:

1. Generate a key pair on the device. See [“Example: Generating a Public-Private Key Pair” on page 6662](#).
2. Create a CA profile or profiles containing information specific to a CA. See [“Example: Configuring a CA Profile” on page 6663](#).
3. Enroll the CA certificate. See [“Enrolling a CA Certificate Online Using SCEP” on page 6666](#).
4. Enroll the local certificate from the CA whose CA certificate you have previously loaded. See [“Example: Enrolling a Local Certificate Online Using SCEP” on page 6667](#).
5. Configure automatic reenrollment. See [“Example: Using SCEP to Automatically Renew a Local Certificate” on page 6669](#).

## Manually Generating Digital Certificates: Configuration Overview

To obtain digital certificates manually:

1. Generate a key pair on the device. See [“Example: Generating a Public-Private Key Pair” on page 6662](#).
2. Create a CA profile or profiles containing information specific to a CA. See [“Example: Configuring a CA Profile” on page 6663](#).
3. Generate the CSR for the local certificate and send it to the CA server. See [“Example: Manually Generating a CSR for the Local Certificate and Sending it to the CA Server” on page 6670](#).
4. Load the certificate onto the device. See [“Example: Loading CA and Local Certificates Manually” on page 6672](#).
5. Configure automatic reenrollment. See [“Example: Using SCEP to Automatically Renew a Local Certificate” on page 6669](#).
6. If necessary, load the certificate's CRL on the device. See [“Example: Manually Loading a CRL onto the Device” on page 6721](#).
7. If necessary, configure the CA profile with CRL locations. See [“Example: Configuring a Certificate Authority Profile with CRL Locations” on page 6722](#).

# Configuring Digital Certificate Validation

- [Understanding Digital Certificate Validation on page 6651](#)
- [Example: Improving Digital Certificate Validation by Configuring Policy OIDs on an SRX Series Device on page 6656](#)

## Understanding Digital Certificate Validation

---

During IKE negotiation, the PKI daemon on an SRX Series device validates X509 certificates received from VPN peers. The certificate validation performed is specified in RFC 5280, *Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile*. Basic certificate and certificate chain validations include signature and date validation as well as revocation checks. This topic describes additional digital certificate validations performed by the PKI daemon.

- [Policy Validation on page 6651](#)
- [Path Length Validation on page 6653](#)
- [Key Usage on page 6654](#)
- [Issuer and Subject Distinguished Name Validation on page 6655](#)

## Policy Validation

X509 certificates can include optional policy validation fields. If a policy validation field is present, policy validation is performed for the entire certificate chain including the end entity (EE) certificate and intermediate certificate authority (CA) certificates. Policy validation is not applicable to the root certificate. Policy validation ensures that the EE and intermediate CA certificates have a common policy. If no common policy exists for the certificate chain being validated, certificate validation fails.

Prior to policy validation, a certificate chain containing the self-signed root certificate, intermediate CA certificates, and EE certificate must be built. The policy validation starts with the intermediate CA certificate issued by the self-signed root certificate and continues through the EE certificate.

The following optional certificate fields are used for policy validation:

- **policy-oids**
- **requireExplicitPolicy**

- **skipCerts**

These fields are described in the following sections.

### Policy OIDs Configured on SRX Series Devices

In some situations, it might be desirable to only accept certificates with known policy object identifiers (OIDs) from peers. This optional configuration allows certificate validation to succeed only if the certificate chain received from the peer contains at least one policy OID that is configured on the SRX Series device.

On the SRX Series device, policy OIDs are configured in an IKE policy with the **policy-oids** configuration statement at the `[edit security ike policy policy-name certificate]` hierarchy level. You can configure up to five policy OIDs. For a peer's certificate to be validated successfully, the peer's certificate chain must contain at least one of the policy OIDs configured on the SRX Series device. Note that the **policy-oids** field in a certificate is optional. If you configure policy OIDs on the SRX Series device but the peer's certificate chain does not contain any policy OIDs, certificate validation fails.

### No Policy OIDs Configured on SRX Series Devices

If no policy OID is configured on the SRX Series device, policy validation starts whenever the **requireExplicitPolicy** field is encountered in the certificate chain. A certificate may contain one or more certificate policy OIDs. For policy validation to succeed, there must be a common policy OID in the certificate chain.

Figure 290 shows a certificate chain that consists of certificates for a root CA, three intermediate CAs, and an EE. The CA certificate for Int-CA-2 contains the **requireExplicitPolicy** field; therefore, policy validation starts with Int-CA-2 and continues through EE-1. The certificate for Int-CA-2 contains policy OIDs P1, P2, and P3. The certificate for Int-CA-3 contains policy OIDs P2, P3, and P4. The certificate for EE-1 contains policy OIDs P2 and P5. Because the policy OID P2 is common to the certificates being validated, policy validation succeeds.

**Figure 290: Policy Validation with requireExplicitPolicy Field**

The optional **skipCerts** field in an intermediate CA certificate indicates the number of certificates, including the current CA certificate, that are to be excluded from policy validation. If **skipCerts** is 0, policy validation starts from the current certificate. If **skipCerts** is 1, the current certificate is excluded from policy validation. The value of the **skipCerts**

field is checked in every intermediate CA certificate. If a **skipCerts** value is encountered that is lower than the current number of certificates being excluded, the lower **skipCerts** value is used.

Figure 291 shows a certificate chain consisting of a root CA, four intermediate CAs, and an EE. The **skipCerts** value in Int-CA-1 is 12, which skips 12 certificates including the certificate for Int-CA-1. However, the **skipCerts** value is checked in every intermediate CA certificate in the chain. The **skipCerts** value in Int-CA-2 is 2, which is lower than 12, so now 2 certificates are skipped. The **skipCerts** value in Int-CA-4 is 5, which is greater than 2, so the Int-CA-4 **skipCerts** value is ignored.

Figure 291: Policy Validation with skipCerts Field

When policy OIDs are configured on the SRX Series device, the certificate fields **requireExplicitPolicy** and **skipCerts** are ignored.

## Path Length Validation

Certificate validation can involve a certificate chain that includes a root CA, one or more optional intermediate CAs, and an EE certificate. The number of intermediate CAs can grow depending upon the deployment scenario. Path length validation provides a mechanism to limit the number of intermediate certificates involved in certificate validation. **path-length** is an optional field in an X509 certificate. The value of **path-length** indicates the number of non-self-signed intermediate CA certificates allowed for certificate validation. The last certificate, which is generally the EE certificate, is not included in the path limit. If the root certificate contains a **path-length** value of 0, no intermediate CA certificates are allowed. If the **path-length** value is 1, there can be 0 or 1 intermediate CA certificates.

**path-length** can be present in multiple CA certificates in the certificate chain. The path length validation always begins with the self-signed root certificate. The path limit is decremented by 1 at each intermediate certificate in the chain. If an intermediate certificate contains a **path-length** value less than the current path limit, the new limit is enforced. On the other hand, if the **path-length** value is larger than the current path limit, it is ignored.

Figure 292 shows a certificate chain that consists of a root CA, four intermediate CAs, and an EE. The **path-length** value in Root-CA is 10, therefore the initial path limit of non-self-signed intermediate CA certificates allowed for certificate validation is 10. At

Int-CA-1, the path limit is 10-1 or 9. The **path-length** value in Int-CA-1 is 4, which is less than the path limit of 9, so the new path limit becomes 4. At Int-CA-2, the path limit is 4-1 or 3. The **path-length** value in Int-CA-2 is 5, which is larger than the path limit of 3, so it is ignored. At Int-CA-3, the path limit is 3-1 or 2. The **path-length** value in Int-CA-3 is 20, which is larger than the path limit of 2, so it is also ignored.

**Figure 292: Path Length Validation**

## Key Usage

The key usage field in an EE or CA certificate defines the purpose of the key contained in the certificate.

### EE Certificates

For EE certificates, if the key usage field is present but the certificate does not contain **digitalSignature** or **nonrepudiation** flags, the certificate is rejected. If the key usage field is not present, then key usage is not checked.

### CA Certificates

The key can be used for certificate or CRL signature validation. Because the PKI daemon is responsible for both X509 certificate validation and CRL downloads, key usage must be checked before validating the certificate or CRL.

#### **Certificate Signature Validation**

The **keyCertSign** flag indicates that a CA certificate can be used for certificate signature validation. If this flag is not set, certificate validation is aborted.

#### **CRL Signature Validation**

In Phase 1 negotiations, participants check the certificate revocation list (CRL) to see if certificates received during an IKE exchange are still valid. The CRL is periodically downloaded for CA profiles configured with CRL as the certificate revocation check. Downloaded CRL files must be verified before they are downloaded into the device. One of the verification steps is to validate the CRL signature using a CA certificate. The downloaded CRL is signed with the CA certificate's private key and it must be verified with the CA certificate's public key stored in the device. The key usage field in the CA

certificate must contain the **CRLSign** flag to verify the downloaded CRL. If this flag is not present, the CRL is discarded.

## Issuer and Subject Distinguished Name Validation

Signature validation is performed for certificates received from a peer as well as for the CRL file downloaded from a CA server. Signature validation involves looking up the CA certificate in a CA database based on the issuer's distinguished name (DN) in the certificate or the CRL being verified.

Figure 293 shows the lookup for CA certificates based on the issuer DN. In the EE certificate, the issuer DN is CA-1, which is the subject DN of the intermediate CA certificate in the chain. In the intermediate CA certificate, the issuer DN is CA-Root, which is the subject DN of the self-signed Root-CA certificate in the chain. In the CRL, the issuer DN is CA-Root, which is the subject DN of the self-signed Root-CA certificate.

**Figure 293: Issuer and Subject DN Validation**

The lookup for the issuer or subject DN must follow these rules for attribute values:

- Attribute values encoded in different ASN.1 types (for example, PrintableString and BMPString) are assumed to represent different strings.
- Attribute values encoded in PrintableString types are not case-sensitive. These attribute values are compared after removing leading and trailing white spaces and converting internal substrings of one or more consecutive white spaces to a single space.
- Attribute values encoded in types other than PrintableString are case-sensitive.

### Related Documentation

## Example: Improving Digital Certificate Validation by Configuring Policy OIDs on an SRX Series Device

In some situations, it might be desirable to only accept certificates with known policy object identifiers (OIDs) from peers. This optional configuration allows certificate validation to succeed only if the certificate chain received from the peer contains at least one policy OID that is configured on the SRX Series device. This example shows how to configure policy OIDs in the IKE policy on an SRX Series device.

**NOTE:** You must ensure that at least one of the policy OIDs configured on the SRX Series device is included in a peer's certificate or certificate chain. Note that the `policy-oids` field in a peer's certificate is optional. If you configure policy OIDs in an IKE policy and the peer's certificate chain does not contain any policy OIDs, certificate validation for the peer fails.

- [Requirements on page 6656](#)
- [Overview on page 6656](#)
- [Configuration on page 6656](#)
- [Verification on page 6657](#)

### Requirements

Before you begin:

- Ensure that you are using Junos OS Release 12.3X48-D10 or later for SRX Series devices.
- Configure an IPsec VPN tunnel. See [“IPsec VPN with Autokey IKE Configuration Overview” on page 6355](#). The complete IKE phase 1 and phase 2 VPN tunnel configuration is not shown in this example.

### Overview

This example shows an IKE policy configuration where policy OIDs 2.16.840.1.101.3.1.48.2 and 5.16.40.1.101.3.1.55.2 are specified. The IKE policy `ike_cert_pol` references the IKE proposal `ike_cert_prop`, which is not shown. The local certificate on the SRX Series device is `lc-igloo-root`.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ike policy ike_cert_pol mode main
set security ike policy ike_cert_pol proposals ike_cert_prop
set security ike policy ike_cert_pol certificate local-certificate lc-igloo-root
set security ike policy ike_cert_pol certificate policy-oids 2.16.840.1.101.3.1.48.2
set security ike policy ike_cert_pol certificate policy-oids 5.16.40.1.101.3.1.55.2
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure policy OIDs for certificate validation:

- Configure the IKE policy:

```
[edit security ike policy ike_cert_pol]
user@host# set mode main
user@host# set proposals ike_cert_prop
user@host# set certificate local-certificate lc-igloo-root
user@host# set certificate policy-oids 2.16.840.1.101.3.1.48.2
user@host# set certificate policy-oids 5.16.40.1.101.3.1.55.2
```

**Results** From configuration mode, confirm your configuration by entering the **show security ike policy ike\_cert\_pol** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show security ike policy ike_cert_pol
mode main;
proposals ike_cert_prop;
certificate {
 local-certificate lc-igloo-root;
 policy-oids [2.16.840.1.101.3.1.48.2 5.16.40.1.101.3.1.55.2];
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying the CA Certificate

**Purpose** Display the CA certificate configured on the device.

**Action** From operational mode, enter the **show security pki ca-certificate ca-profile ca-tmp** command.

```
user@host> show security pki ca-certificate ca-profile ca-tmp detail
Certificate identifier: ca-tmp
Certificate version: 3

### Verifying Policy OID Validation

**Purpose** If the peer's certificate is successfully validated, IKE and IPsec security associations are established. If the validation of the peer's certificate fails, no IKE security association is established.

**Action** From operational mode, enter the **show security ike security-associations** and **show security ipsec security-associations** commands.

```
user@host> show security ike security-associations
```

```
node0:
```

```

```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. In this case, check for the PKID\_CERT\_POLICY\_CHECK\_FAIL message in the system logs. This message indicates that the peer's certificate chain does not contain a policy OID that is configured

on the SRX Series device. Check the **policy-oids** values in the peer's certificate chain with the values configured on the SRX Series device.

It might also be that the peer's certificate chain does not contain any **policy-oids** fields, which are optional fields. If this is the case, certificate validation fails if there are any policy OIDs configured on the SRX Series device.

# Generating a Public-Private Key Pair

- [Understanding Public Key Cryptography on page 6661](#)
- [Example: Generating a Public-Private Key Pair on page 6662](#)

## Understanding Public Key Cryptography

---

The public-private key pairs used in public key cryptography play an important role in the use of digital certificates. A public-private key pair encrypts and decrypts data. Data encrypted with a public key, which the owner makes available to the public, can be decrypted with the corresponding private key only, which the owner keeps secret and protected. For example, if Alice wants to send Bob an encrypted message, Alice can encrypt it with Bob's public key and send it to him. Bob then decrypts the message with his private key.

The reverse process is also useful: encrypting data with a private key and decrypting it with the corresponding public key. This process is known as creating a digital signature. For example, if Alice wants to present her identity as the sender of a message, she can encrypt the message with her private key and send the message to Bob. Bob then decrypts the message with Alice's public key, thus verifying that Alice is indeed the sender.

When you generate a public-private key pair, the device automatically saves the key pair in a file in the certificate store, where it is subsequently used in certificate request commands. The generated key pair is saved as *certificate-id*.

**NOTE:** The default RSA and DSA key size is 1024 bits. If you are using the Simple Certificate Enrollment Protocol (SCEP), Junos OS supports RSA only.

**NOTE:** If the device renews a great number of certificates at once, thus using up keys rapidly, it might run out of pregenerated keys and have to generate them promptly for each new request. In this case, the generation of keys might affect the performance of the device, especially in a high-availability environment where the performance of the device might slow down for a number of minutes.

## Example: Generating a Public-Private Key Pair

---

This example shows how to generate a public-private key pair.

- [Requirements on page 6662](#)
- [Overview on page 6662](#)
- [Configuration on page 6662](#)
- [Verification on page 6662](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you generate a public-private key pair named ca-ipsec.

### Configuration

**Step-by-Step Procedure**

To generate a public-private key pair:

1. Create a certificate key pair.

[edit]

```
user@host> request security pki generate-key-pair certificate-id ca-ipsec
```

### Verification

After the public-private key pair is generated, the Juniper Networks device displays the following:

```
generated key pair ca-ipsec, key size 1024 bits
```

# Configuring Certificate Authority Profiles

- [Understanding Certificate Authority Profiles on page 6663](#)
- [Example: Configuring a CA Profile on page 6663](#)

## Understanding Certificate Authority Profiles

---

A certificate authority (CA) profile configuration contains information specific to a CA. You can have multiple CA profiles on the device. For example, you might have one profile for Microsoft and one for Entrust. Each profile is associated with a CA certificate. If you want to load a new CA certificate without removing the older one, you must create a new CA profile (for example, Microsoft-2008).

**NOTE:** The following CAs are supported: Entrust, Microsoft, and Verisign. SCEP only supports the Microsoft CA.

### Related Documentation

- [Understanding Certificates and PKI on page 6643](#)
- [Example: Configuring a CA Profile on page 6663](#)

## Example: Configuring a CA Profile

---

This example shows how to configure a CA profile.

- [Requirements on page 6663](#)
- [Overview on page 6664](#)
- [Configuration on page 6664](#)
- [Verification on page 6664](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

## Overview

In this example, you create a CA profile called `ca-profile-ipsec` with CA identity `microsoft-2008`. The configuration specifies that the CRL be refreshed every 48 hours, and the location to retrieve the CRL is `http://www.my-ca.com`. Within the example, you set the enrollment retry value to 20. (The default retry value is 10.)

Automatic certificate polling is set to every 30 minutes. If you configure retry only without configuring a retry interval, then the default retry interval is 900 seconds (or 15 minutes). If you do not configure retry or a retry interval, then there is no polling.

## Configuration

### Step-by-Step Procedure

To configure a CA profile:

1. Create a CA profile.  

```
[edit]
user@host# set security pki ca-profile ca-profile-ipsec ca-identity microsoft-2008
revocation-check crl refresh-interval 48 url http://www.my-ca.com/my-crl.crl
```
2. Specify the enrollment retry value.  

```
[edit]
user@host# set security pki ca-profile ca-profile-ipsec enrollment retry 20
```
3. Specify the time interval in seconds between attempts to automatically enroll the CA certificate online.  

```
[edit]
user@host# set security pki ca-profile ca-profile-ipsec enrollment retry-interval
1800
```
4. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security pki** command.

## Understanding Online CA Certificate Enrollment

---

With Simple Certificate Enrollment Protocol (SCEP), you can configure your Juniper Networks device to obtain a certificate authority (CA) certificate online and start the online enrollment for the specified certificate ID. The CA public key verifies certificates from remote peers.

## Understanding Local Certificate Requests

---

When you create a local certificate request, the device generates a CA certificate in PKCS #10 format from a key pair you previously generated using the same certificate ID.

A subject name is associated with the local certificate request in the form of a common name (CN), organizational unit (OU), organization (O), locality (L), state (ST), country (C), and domain component (DC). Additionally, a subject alternative name is associated in the following form:

- IP address
- E-mail address
- Fully qualified domain name (FQDN)

**NOTE:** Some CAs do not support an e-mail address as the domain name in a certificate. If you do not include an e-mail address in the local certificate request, you cannot use an e-mail address as the local IKE ID when configuring the device as a dynamic peer. Instead, you can use a fully qualified domain name (if it is in the local certificate), or you can leave the local ID field empty. If you do not specify a local ID for a dynamic peer, enter the *hostname.domain-name* of that peer on the device at the other end of the IPsec tunnel in the peer ID field.

---

## Enrolling a CA Certificate Online Using SCEP

---

Before you begin:

1. Generate a public and private key pair. See “[Example: Generating a Public-Private Key Pair](#)” on page 6662.
2. Create a CA profile. See “[Example: Configuring a CA Profile](#)” on page 6663.

To enroll a CA certificate online:

1. Retrieve the CA certificate online using SCEP. (The attributes required to reach the CA server are obtained from the defined CA profile.)

```
user@host> request security pki ca-certificate enroll ca-profile ca-profile-ipsec
```

The command is processed synchronously to provide the fingerprint of the received CA certificate.

Fingerprint:

e6:fa:d6:da:e8:8d:d3:00:e8:59:12:e1:2c:b9:3c:c0:9d:6c:8f:8d (sha1)

82:e2:dc:ea:48:4c:08:9a:fd:b5:24:b0:db:c3:ba:59 (md5)

Do you want to load the above CA certificate ? [yes,no]

2. Confirm that the correct certificate is loaded. The CA certificate is loaded only when you type **yes** at the CLI prompt.

For more information on the certificate, such as the bit length of the key pair, use the command **show security pki ca-certificate**.

## Example: Enrolling a Local Certificate Online Using SCEP

This example shows how to enroll a local certificate online.

- [Requirements on page 6667](#)
- [Overview on page 6667](#)
- [Configuration on page 6668](#)
- [Verification on page 6668](#)

### Requirements

Before you begin:

- Generate a public and private key pair. See “[Example: Generating a Public-Private Key Pair](#)” on page 6662.
- Configure a certificate authority profile. See “[Example: Configuring a CA Profile](#)” on page 6663.
- Enroll the CA certificate. See “[Enrolling a CA Certificate Online Using SCEP](#)” on page 6666.

### Overview

In this example, you configure your Juniper Networks device to obtain a local certificate online and start the online enrollment for the specified certificate ID with SCEP. You specify the CA profile name as `ca-profile-ipsec` and the CA location as `http://10.155.8.1/certsrv/mscep/mscep.dll`.

You will use the **request security pki local-certificate enroll** command to start the online enrollment for the specified certificate ID. You must specify the CA profile name (for example, **ca-profile-ipsec**), the certificate ID corresponding to a previously generated key-pair (for example, **qqq**), and the following information:

**NOTE:** SCEP sends a PKCS #10 format certificate request enveloped in PKCS #7 format.

- The challenge CA password for certificate enrollment and revocation—for example, **aaa**. If the CA does not provide the challenge password, then choose your own password.

- At least one of the following values:
  - The domain name to identify the certificate owner in IKE negotiations—for example, **qqq.example.net**.
  - The identity of the certificate owner for IKE negotiation with the e-mail statement—for example, **qqq@example.net**.
  - The IP address if the device is configured for a static IP address—for example, **10.10.10.10**.
- Specify the subject name in the distinguished name format in quotation marks, including the domain component (DC), common name (CN), serial number (SN), organizational unit name (OU), organization name (O), locality (L), state (ST), and country (C).

Once the device certificate is obtained and the online enrollment begins for the certificate ID. The command is processed asynchronously.

## Configuration

**Step-by-Step Procedure** To enroll a local certificate online:

1. Specify the CA profile.
 

```
[edit]
user@host# set security pki ca-profile ca-profile-ipsec enrollment url
http://10.155.8.1/certsrv/mscep/mscep.dll
```
2. If you are done configuring the device, commit the configuration.
 

```
[edit]
user@host# commit
```
3. Initiate the enrollment process by running the operational mode command.
 

```
user@host> request security pki local-certificate enroll ca-profile ca-profile-ipsec
certificate-id qqq challenge-password aaa domain-name qqq.example.net email
qqq@example.net ip-address 10.10.10.10 subject DC=example, CN=router3, SN,
OU=marketing, O=example, L=sunnyvale, ST=california, C=us
```

**NOTE:** If you define SN in the subject field without the serial number, then the serial number will be read directly from the device and added to the certificate signing request (CSR).

## Verification

To verify the configuration is working properly, enter the **show security pki** command.

### Related Documentation

## Example: Using SCEP to Automatically Renew a Local Certificate

---

This example shows how to renew the local certificates automatically using SCEP.

- [Requirements on page 6669](#)
- [Overview on page 6669](#)
- [Configuration on page 6670](#)
- [Verification on page 6670](#)

### Requirements

Before you begin:

- Obtain a certificate either on line or manually. See [“Enabling Digital Certificates Online: Configuration Overview” on page 6649](#).
- Obtain a local certificate. See [“Example: Enrolling a Local Certificate Online Using SCEP” on page 6667](#).

### Overview

You can enable the device to automatically renew certificates that were acquired by online enrollment or loaded manually. Automatic certificate renewal saves you from having to remember to renew certificates on the device before they expire, and helps to maintain valid certificates at all times.

Automatic certificate renewal is disabled by default. You can enable automatic certificate renewal and configure the device to automatically send out a request to reenroll a certificate before it expires. You can specify when the certificate reenrollment request is to be sent; the trigger for reenrollment is the percentage of the certificate's lifetime that remains before expiration. For example, if the renewal request is to be sent when the certificate's remaining lifetime is 10 percent, then configure 10 for the reenrollment trigger.

For this feature to work, the device must be able to reach the SCEP server, and the certificate must be present on the device during the renewal process. Furthermore, you must also ensure that the CA issuing the certificate can return the same DN. The CA must not modify the subject name or alternate subject name extension in the new certificate.

In this example, you can enable and disable automatic SCEP certificate renewal either for all SCEP certificates or on a per-certificate basis. You set the **security pki auto-re-enrollment** command to enable and configure certificate reenrollment. You specify the certificate ID of the CA certificate as `sm1` and set the CA profile name associated with the certificate to `aaa`. You set the challenge password for CA certificate to `abc`. This password must be the same one configured previously for the CA. You also set the percentage for the reenrollment trigger to 10. During automatic reenrollment, by default, the Juniper Networks device uses the existing key pair. To generate a new key pair, use the **re-generate-keypair** command.

## Configuration

### Step-by-Step Procedure

To enable and configure local certificate reenrollment:

1. To enable and configure certificate reenrollment.

[edit]

```
user@host# set security pki auto-re-enrollment certificate-id ca-ipsec
ca-profile-name ca-profile-ipsec challenge-password abc
re-enroll-trigger-time-percentage 10 re-generate-keypair
```

2. If you are done configuring the device, commit the configuration.

[edit]

```
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security pki local-certificate detail** operational mode command.

### Related Documentation

## Example: Manually Generating a CSR for the Local Certificate and Sending it to the CA Server

---

This example shows how to generate a certificate signing request manually.

- [Requirements on page 6670](#)
- [Overview on page 6670](#)
- [Configuration on page 6671](#)
- [Verification on page 6671](#)

## Requirements

Generate a public and private key. See [“Example: Generating a Public-Private Key Pair” on page 6662](#).

## Overview

In this example, you generate a certificate request using the certificate ID of a public-private key pair you previously generated (ca-ipsec). Then you specify the domain name (example.net) and the associated common name (abc). The certificate request is displayed in PEM format.

You copy the generated certificate request and paste it into the appropriate field at the CA website to obtain a local certificate. (Refer to the CA server documentation to

determine where to paste the certificate request.) When the PKCS #10 content is displayed, the MD5 hash and SHA-1 hash of the PKCS #10 file is also displayed.

## Configuration

### Step-by-Step Procedure

To generate a local certificate manually:

1. Specify certificate ID, domain name, and common name.

```
user@host> request security pki generate-certificate-request certificate-id ca-ipsec
domain-name example.net subject CN=abc
```

## Verification

To view the certificate signing request, enter the **show security pki certificate-request detail** command.

```
Certificate identifier: ca-ipsec
Certificate version: 1
Issued to: CN = abc
Public key algorithm: rsaEncryption(1024 bits)

## Understanding Certificate Loading

After you download certificates from a CA, you transfer them to the device (for example, using FTP), and then load them.

You can load the following certificate files onto a device running Junos OS:

- A local or end-entity (EE) certificate that identifies your local device. This certificate is your public key.
- A CA certificate that contains the CA's public key.
- A CRL that lists any certificates revoked by the CA.

**NOTE:** You can load multiple EE certificates onto the device.

- Related Documentation**
- [Understanding Certificates and PKI on page 6643](#)
  - [Example: Loading CA and Local Certificates Manually on page 6672](#)

## Example: Loading CA and Local Certificates Manually

---

This example shows how to load CA and local certificates manually.

- [Requirements on page 6672](#)
- [Overview on page 6672](#)
- [Configuration on page 6672](#)
- [Verification on page 6673](#)

### Requirements

Before you begin:

- Generate a public-private key pair. See [“Example: Generating a Public-Private Key Pair” on page 6662](#).
- Create a CA profile. See [“Understanding Certificate Authority Profiles” on page 6663](#).

**NOTE:** CA Profile is only required for the CA certificate and not for the local certificate

- Generate a certificate request. See [“Example: Manually Generating a CSR for the Local Certificate and Sending it to the CA Server” on page 6670](#).

### Overview

In this example, you download the local.cert and ca.cert certificates and save them to the /var/tmp/ directory on the device.

### Configuration

#### Step-by-Step Procedure

To load the certificate files onto a device:

1. Load the local certificate.  
  
[edit]  
user@host> request security pki local-certificate load certificate-id local.cert  
filename /var/tmp/local.cert
2. Load the CA certificate.  
  
[edit]  
user@host> request security pki ca-certificate load ca-profile ca-profile-ipsec  
filename /var/tmp/ca.cert
3. Examine the fingerprint of the CA certificate, if it is correct for this CA certificate say yes to accept.

## Verification

To verify the certificates loaded properly, enter the **show security pki local-certificate** and **show security pki ca-certificate** commands in operational mode.

```
Fingerprint:
e8:bf:81:6a:cd:26:ad:41:b3:84:55:d9:10:c4:a3:cc:c5:70:f0:7f (sha1)
19:b0:f8:36:e1:80:2c:30:a7:31:79:69:99:b7:56:9c (md5)
Do you want to load this CA certificate ? [yes,no] (no) yes
```

### Related Documentation

- [Example: Configuring a Certificate Authority Profile with CRL Locations on page 6722](#)

## Deleting Certificates (CLI Procedure)

You can delete a local or trusted CA certificate that is automatically or manually generated.

Use the following command to delete a local certificate:

```
user@host> clear security pki local certificate certificate-id (certificate-id | all |
system-generated)
```

Specify a certificate ID to delete a local certificate with a specific ID, use **all** to delete all local certificates, or specify **system-generated** to delete the automatically generated self-signed certificate.

When you delete an automatically generated self-signed certificate, the device generates a new one.

To delete a CA certificate:

```
user@host> clear security pki ca-certificate ca-profile (ca-profile-name | all)
```

Specify a CA profile to delete a specific CA certificate, or use **all** to delete all CA certificates present in the persistent store.

**NOTE:** You are asked for confirmation before a CA certificate can be deleted.

### Related Documentation

## Example: Configuring PKI

---

This example shows how to configure, verify, and troubleshoot the PKI. This topic includes the following sections:

- [Requirements on page 6674](#)
- [Overview on page 6674](#)
- [Configuration on page 6678](#)
- [Verification on page 6686](#)
- [Troubleshooting IKE, PKI, and IPsec Issues on page 6692](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.4 or later
- SRX Series devices

Before you begin:

- Ensure that the remote VPN peer is a Juniper Networks SSG5 Secure Services Gateway device (most commonly used for branch offices).
- Ensure that the internal LAN interface of the device is ge-0/0/0 in zone trust and has a private IP subnet.
- Ensure that the Internet interface of the device is ge-0/0/3 in zone untrust and has a public IP.
- Ensure that all traffic between the local and remote LANs is permitted, and traffic can be initiated from either side.
- Ensure that the SSG5 has been preconfigured correctly and loaded with a ready-to-use local certificate, CA certificate, and CRL.
- Ensure that the SSG5 device is configured to use the FQDN of ssg5.example.net (IKE ID).
- Ensure that PKI certificates with 1024-bit keys are used for the IKE negotiations on both sides.
- Ensure that the CA is a standalone CA at the domain labdomain.com for both VPN peers.

### Overview

[Figure 294](#) shows the network topology used for this example to configure a policy-based IPsec VPN to allow data to be securely transferred between a corporate office and a remote office.

Figure 294: Network Topology Diagram

**NOTE:** The PKI administration is the same for both policy-based VPNs and route-based VPNs.

In this example, the VPN traffic is incoming on interface ge-0/0/0.0 with the next hop of 1.1.1.1. Thus the traffic is outgoing on interface ge-0/0/3.0. Any tunnel policy must consider incoming and outgoing interfaces.

**NOTE:** Optionally, you can use a dynamic routing protocol such as OSPF (not described in this document). When processing the first packet of a new session, the device running Junos OS first performs a route lookup. The static route, which is also the default route, dictates the zone for the outgoing VPN traffic.

Many CAs use hostnames (for example, FQDN) to specify various elements of the PKI. Because the CDP is usually specified using a URL containing an FQDN, you must configure a DNS resolver on the device running Junos OS.

The certificate request can be generated by the following methods:

- Creating a CA profile to specify the CA settings
- Generating the PKCS10 certificate request

The PKCS10 certificate request process involves generating a public or private key pair and then generating the certificate request itself, using the key pair.

**NOTE:** Take note of the following information about the CA profile:

- The CA profile defines the attributes of a certificate authority.
- Each CA profile is associated with a CA certificate. If a new or renewed CA certificate needs to be loaded without removing the older CA certificate, a new profile must be created. This profile can also be used for online fetching of the CRL.
- There can be multiple such profiles present in the system created for different users.

**NOTE:** If you specify a CA administrator e-mail address to send the certificate request to, then the system composes an e-mail from the certificate request file and forwards it to the specified e-mail address. The e-mail status notification is sent to the administrator.

**NOTE:** The certificate request can be sent to the CA through an out-of-band method.

The following options are available to generate the PKCS10 certificate request:

- **certificate-id** — Name of the local digital certificate and the public/private key pair. This ensures that the proper key pair is used for the certificate request and ultimately for the local certificate.
- **subject** — Distinguished name format that contains the common name, department, company name, state, and country:
  - CN — Common name
  - OU — Department
  - O — Company name
  - L — Locality
  - ST — State
  - C — Country
  - CN — Phone
  - DC — Domain component

**NOTE:** You are not required to enter all subject name components. Note also that you can enter multiple values of each type.

- **domain-name** — FQDN. The FQDN provides the identity of the certificate owner for IKE negotiations and provides an alternative to the subject name.
- **filename (path | terminal)** — (Optional) Location where the certificate request should be placed, or the login terminal.
- **ip-address** — (Optional) IP address of the device.
- **email** — (Optional) E-mail address of the CA administrator.

**NOTE:** You must use a domain-name, an ip-address, or an e-mail address.

The generated certificate request is stored in a specified file location. A local copy of the certificate request is saved in the local certificate storage. If the administrator reissues this command, the certificate request is generated again.

The PKCS10 certificate request is stored in a specified file and location, from which you can download it and send it to the CA for enrollment. If you have not specified the file name or location, you can get PKCS10 certificate request details by using the **show security pki certificate-request certificate-id <id-name>** command in the CLI. You can copy the command output and paste it into a Web front end for the CA server or into an e-mail.

The PKCS10 certificate request is generated and stored on the system as a pending certificate or certificate request. An e-mail notification is sent to the administrator of the CA (in this example, certadmin@labdomain.com).

**NOTE:** Currently the Junos OS supports only the RSA algorithm and does not support the Digital Signature Algorithm (DSA). A unique identity called certificate-ID is used to name the generated key pair. This ID is also used in certificate enrollment and request commands to get the right key pair. The generated key pair is saved in the certificate store in a file with the same name as the certificate-ID. The file size can be 512, 1024, or 2048 bits.

**NOTE:**

A default (fallback) profile can be created if intermediate CAs are not preinstalled in the device. The default profile values are used in the absence of a specifically configured CA profile.

In the case of a CDP, the following order is followed:

- Per CA profile
- CDP embedded in CA certificate
- Default CA profile

We recommend using a specific CA profile instead of a default profile.

The administrator submits the certificate request to the CA. The CA administrator verifies the certificate request and generates a new certificate for the device. The administrator for the Juniper Networks device retrieves it, along with the CA certificate and CRL.

The process of retrieving the CA certificate, the device's new local certificate, and the CRL from the CA depends on the CA configuration and software vendor in use.

**NOTE:**

Junos OS supports the following CA vendors:

- Entrust
- Verisign
- Microsoft

Although other CA software services such as OpenSSL can be used to generate certificates, these certificates are not verified by Junos OS.

---

## Configuration

- [PKI Basic Configuration on page 6678](#)
- [Configuring a CA Profile on page 6679](#)
- [Generating a Public-Private Key Pair on page 6680](#)
- [Enrolling a Local Certificate on page 6680](#)
- [Loading CA and Local Certificates on page 6681](#)
- [Configuring the IPsec VPN with the Certificates on page 6683](#)

### PKI Basic Configuration

---

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure PKI:

1. Configure an IP address and protocol family on the Gigabit Ethernet interfaces.  

```
[edit interfaces]
user@host# set ge-0/0/0 unit 0 family inet address 10.10.10.1/24
user@host# set ge-0/0/3 unit 0 family inet address 1.1.1.2/30
```
2. Configure a default route to the Internet next hop.  

```
[edit]
user@host# set routing-options static route 0.0.0.0/0 next-hop 1.1.1.1
```
3. Set the system time and date.  

```
[edit]
user@host# set system time-zone PST8PDT
```

After the configuration is committed, verify the clock settings using the **show system uptime** command.

```
user@host> show system uptime
Current time: 2007-11-01 17:57:09 PDT
System booted: 2007-11-01 14:36:38 PDT (03:20:31 ago)
Protocols started: 2007-11-01 14:37:30 PDT (03:19:39 ago)
Last configured: 2007-11-01 17:52:32 PDT (00:04:37 ago) by root
5:57PM up 3:21, 4 users, load averages: 0.00, 0.00, 0.00
```

4. Set the NTP server address.

```
user@host> set date ntp 130.126.24.24
1 Nov 17:52:52 ntpdate[5204]: step time server 130.126.24.24 offset -0.220645
sec
```

5. Set the DNS configuration.

```
[edit]
user@host# set system name-server 4.2.2.1
user@host# set system name-server 4.2.2.2
```

### Configuring a CA Profile

#### Step-by-Step Procedure

1. Create a trusted CA profile.  

```
[edit]
user@host# set security pki ca-profile ms-ca ca-identity labdomain.com
```
2. Create a revocation check to specify a method for checking certificate revocation.  

```
[edit]
user@host# set security pki ca-profile ms-ca revocation-check crl
```

**NOTE:** You can use the **disable** option to disable the revocation check or select the **crl** option to configure the CRL attributes.

3. Set the refresh interval, in hours, to specify the frequency in which to update the CRL. The default values are next-update time in CRL, or 1 week, if no next-update time is specified.  

```
[edit]
user@host# set security pki ca-profile ms-ca revocation-check crl refresh-interval 48
```
4. Specify the location (URL) to retrieve the CRL (HTTP or LDAP). By default, the URL is empty and uses CDP information embedded in the CA certificate.  

```
[edit]
user@host# set security pki ca-profile ms-ca revocation-check crl url
http://labsrv1.labdomain.com/CertEnroll/LABDOMAIN.crl
```

**NOTE:** Currently you can configure only one URL. Support for backup URL configuration is not available.

- Specify an e-mail address to send the certificate request directly to a CA administrator.

```
user@host# set security pki ca-profile ms-ca administrator email-address
certadmin@labdomain.com
```

- Commit the configuration:

```
user@host# commit and-quit
commit complete
Exiting configuration mode
```

### Generating a Public-Private Key Pair

**Step-by-Step Procedure** When the CA profile is configured, the next step is to generate a key pair on the Juniper Networks device. To generate the private and public key pair:

- Create a certificate key pair.

```
user@host> request security pki generate-key-pair certificate-id ms-cert size 1024
```

**Results** After the public-private key pair is generated, the Juniper Networks device displays the following:

Generated key pair ms-cert, key size 1024 bits

### Enrolling a Local Certificate

**Step-by-Step Procedure**

- Generate a local digital certificate request in the PKCS-10 format.

```
user@host> request security pki generate-certificate-request certificate-id ms-cert subject
"CN=john doe,CN=1.1.1.2,OU=sales,O=Juniper Networks,L=Sunnyvale,ST=CA,C=US" email
user@example.net filename ms-cert-req
```

Generated certificate request

```
-----BEGIN CERTIFICATE REQUEST-----
```

```

-----END CERTIFICATE REQUEST-----
```

Fingerprint:

```
47:b0:e1:4c:be:52:f7:90:c1:56:13:4e:35:52:d8:8a:50:06:e6:c8 (sha1)
a9:a1:cd:f3:0d:06:21:f5:31:b0:6b:a8:65:1b:a9:87 (md5)
```

**NOTE:** In the sample of the PKCS10 certificate, the request starts with and includes the BEGIN CERTIFICATE REQUEST line and ends with and includes the END CERTIFICATE REQUEST line. This portion can be copied and pasted to your CA for enrollment. Optionally, you can also offload the ms-cert-req file and send that to your CA.

2. Generate the PKCS10 certificate request to be sent to the CA.

```
user@host> request security pki generate-certificate-request certificate-id id-name
subject subject-name (domain-name domain-name | ip-address device-ip | email
email-id) filename filename
```

3. Submit the certificate request to the CA, and retrieve the certificate.

### Loading CA and Local Certificates

#### Step-by-Step Procedure

1. Load the local certificate, CA certificate, and CRL.

```
user@host> file copy ftp://10.10.10.10/certnew.cer certnew.cer
/var/tmp/...transferring.file.....crYdEC/100% of 1459 B 5864 kBps
user@host> file copy ftp://10.10.10.10/CA-certnew.cer CA-certnew.cer
/var/tmp/...transferring.file.....UKXUWu/100% of 1049 B 3607 kBps
user@host> file copy ftp://10.10.10.10/certcrl.crl certcrl.crl
/var/tmp/...transferring.file.....wpqnpA/100% of 401 B 1611 kBps
```

**NOTE:** You can verify that all files have been uploaded by using the command `file list`.

2. Load the certificate into local storage from the specified external file.

You must also specify the certificate ID to keep the proper linkage with the private or public key pair. This step loads the certificate into the RAM cache storage of the PKI module, checks the associated private key, and verifies the signing operation.

```
user@host> request security pki local-certificate load certificate-id ms-cert filename
certnew.cer
Local certificate loaded successfully
```

3. Load the CA certificate from the specified external file.

You must specify the CA profile to associate the CA certificate to the configured profile.

```
user@host> request security pki ca-certificate load ca-profile ms-ca filename
CA-certnew.cer
Fingerprint:
1b:02:cc:cb:0f:d3:14:39:51:aa:0f:ff:52:d3:38:94:b7:11:86:30 (sha1)
90:60:53:c0:74:99:f5:da:53:d0:a0:f3:b0:23:ca:a3 (md5)
Do you want to load this CA certificate ? [yes,no] (no) yes
CA certificate for profile ms-ca loaded successfully
```

4. Load the CRL into the local storage.

The maximum size of the CRL is 5 MB. You must specify the associated CA profile in the command.

```
user@host> request security pki crl load ca-profile ms-ca filename certcrl.crl
CRL for CA profile ms-ca loaded successfully
```

**Results** Verify that all local certificates are loaded.

```
user@host> show security pki local-certificate certificate-id ms-cert detail Certificate
```

```

aa:bb:53:c0:74:99:f5:da:53:d0:a0:f3:b0:23:ca:a3 (md5)

```

Verify all loaded CRLs or the CRLs of the specified individual CA profile.

Syntax (operational mode):

```
user@host> show security pki crl ca-profile ca-profile [brief | detail]
```

Example:

```

user@host> show security pki crl ca-profile ms-ca detail
CA profile: ms-ca
CRL version: V00000001
CRL issuer: emailAddress = certadmin@example.net, C = US, ST = CA,
L = Sunnyvale, O = ExampleComs, OU = JTAC, CN = TACLAB
Effective date: 10-30-2007 20:32
Next update: 11- 7-2007 08:52

```

Verify the certificate path for the local certificate and the CA certificate.

```

user@host> request security pki local-certificate verify certificate-id ms-cert
Local certificate ms-cert verification success

```

```

user@host> request security pki ca-certificate verify ca-profile ms-ca
CA certificate ms-ca verified successfully

```

## Configuring the IPsec VPN with the Certificates

### Step-by-Step Procedure

To configure the IPsec VPN with the certificate, refer to the network diagram shown in [Figure 294](#)

1. Configure security zones and assign interfaces to the zones.

In this example packets are incoming on **ge-0/0/0**, and the ingress zone is the trust zone.

```

[edit security zones security-zone]
user@host# set trust interfaces ge-0/0/0.0
user@host# set untrust interfaces ge-0/0/3.0

```

2. Configure host-inbound services for each zone.

Host-inbound services are for traffic destined for the Juniper Networks device. These settings include but are not limited to the FTP, HTTP, HTTPS, IKE, ping, rlogin, RSH, SNMP, SSH, Telnet, TFTP, and traceroute.

```

[edit security zones security-zone]
user@host# set trust host-inbound-traffic system-services all

```

```
user@host# set untrust host-inbound-traffic system-services ike
```

3. Configure the address book entries for each zone.

```
[edit security zones security-zone]
user@host# set trust address-book address local-net 10.10.10.0/24
user@host# set untrust address-book address remote-net 192.168.168.0/24
```

4. Configure the IKE (Phase 1) proposal to use RSA encryption.

```
[edit security ike proposal rsa-prop1]
user@host# set authentication-method rsa-signatures
user@host# set encryption-algorithm 3des-cbc
user@host# set authentication-algorithm sha1
user@host# set dh-group group2
```

5. Configure an IKE policy.

The phase 1 exchange can take place in either main mode or aggressive mode.

```
[edit security ike policy ike-policy1]
user@host# set mode main
user@host# set proposals rsa-prop1
user@host# set certificate local-certificate ms-cert
user@host# set certificate peer-certificate-type x509- signature
user@host# set certificate trusted-ca use-all
```

6. Configure an IKE gateway.

In this example, the peer is identified by an FQDN (hostname). Therefore the gateway IKE ID should be the remote peer domain name. You must specify the correct external interface or peer ID to properly identify the IKE gateway during Phase 1 setup.

```
[edit security ike gateway ike-gate]
user@host# set external-interface ge-0/0/3.0
user@host# set ike-policy ike-policy1
user@host# set dynamic hostname ssg5.example.net
```

7. Configure the IPsec policy.

This example uses the Standard proposal set, which includes **esp-group2-3des-sha1** and **esp-group2-aes128-sha1** proposals. However, a unique proposal can be created and then specified in the IPsec policy if needed.

```
[edit security ipsec policy vpn-policy1]
user@host# set proposal-set standard
user@host# set perfect-forward-secrecy keys group2
```

8. Configure the IPsec VPN with an IKE gateway and IPsec policy.

In this example, the ike-vpn VPN name must be referenced in the tunnel policy to create a security association. Additionally, if required, an idle time and a proxy ID can be specified if they are different from the tunnel policy addresses.

```
[edit security ipsec vpn ike-vpn ike]
user@host# set gateway ike-gate
user@host# set ipsec-policy vpn-policy1
```

9. Configure bidirectional tunnel policies for VPN traffic.

In this example, traffic from the host LAN to the remote office LAN requires a from-zone trust to-zone untrust tunnel policy. However, if a session needs to originate from the remote LAN to the host LAN, then a tunnel policy in the opposite direction from from-zone untrust to-zone trust is also required. When you specify the policy in the opposite direction as the pair-policy, the VPN becomes bidirectional. Note that in addition to the permit action, you also need to specify the IPsec profile to be used. Note that for tunnel policies, the action is always permit. In fact, if you are configuring a policy with the deny action, you will not see an option for specifying the tunnel.

```
[edit security policies from-zone trust to-zone untrust]
user@host# set policy tunnel-policy-out match source-address local-net
user@host# set policy tunnel-policy-out match destination-address remote-net
user@host# set policy tunnel-policy-out match application any
user@host# set policy tunnel-policy-out then permit tunnel ipsec-vpn ike-vpn
pair-policy tunnel-policy-in
user@host# top edit security policies from-zone untrust to-zone trust
user@host# set policy tunnel-policy-in match source-address remote-net
user@host# set policy tunnel-policy-in match destination-address local-net
user@host# set policy tunnel-policy-in match application any
user@host# set policy tunnel-policy-in then permit tunnel ipsec-vpn ike-vpn
pair-policy tunnel-policy-out
```

10. Configure a source NAT rule and a security policy for Internet traffic.

The device uses the specified source-nat interface, and translates the source IP address and port for outgoing traffic, using the IP address of the egress interface as the source IP address and a random higher port for the source port. If required, more granular policies can be created to permit or deny certain traffic.

```
[edit security nat source rule-set nat-out]
user@host# set from zone trust
user@host# set to zone untrust
user@host# set rule interface-nat match source-address 192.168.10.0/24
user@host# set rule interface-nat match destination-address 0.0.0.0/0
user@host# set rule interface-nat then source-nat interface

[edit security policies from-zone trust to-zone untrust]
user@host# set policy any-permit match source-address any
user@host# set policy any-permit match destination-address any
user@host# set policy any-permit match application any
user@host# set policy any-permit then permit
```

11. Move the tunnel policy above the any-permit policy.

```
[edit security policies from-zone trust to-zone untrust]
user@host# insert policy tunnel-policy-out before policy any-permit
```

**NOTE:** The security policy should be below the tunnel policy in the hierarchy because the policy list is read from top to bottom. If this policy were above the tunnel policy, then the traffic would always match this policy and would not continue to the next policy. Thus no user traffic would be encrypted.

12. Configure the tcp-mss setting for TCP traffic across the tunnel.

TCP-MSS is negotiated as part of the TCP 3-way handshake. It limits the maximum size of a TCP segment to accommodate the MTU limits on a network. This is very important for VPN traffic because the IPsec encapsulation overhead along with the IP and frame overhead can cause the resulting ESP packet to exceed the MTU of the physical interface, causing fragmentation. Because fragmentation increases the bandwidth and device resources usage, and in general it should be avoided.

The recommended value to use for tcp-mss is 1350 for most Ethernet-based networks with an MTU of 1500 or higher. This value might need to be altered if any device in the path has a lower value of MTU or if there is any added overhead such as PPP, Frame Relay, and so on. As a general rule, you might need to experiment with different tcp-mss values to obtain optimal performance.

```
user@host# set security flow tcp-mss ipsec-vpn mss mss-value
```

Example:

```
[edit]
```

```
user@host# set security flow tcp-mss ipsec-vpn mss 1350
```

```
user@host# commit and-quit
```

```
commit complete
```

```
Exiting configuration mode
```

## Verification

Confirm that the configuration is working properly.

- [Confirming IKE Phase 1 Status on page 6686](#)
- [Getting Details on Individual Security Associations on page 6687](#)
- [Confirming IPsec Phase 2 Status on page 6688](#)
- [Displaying IPsec Security Association Details on page 6688](#)
- [Checking IPsec SA Statistics on page 6690](#)
- [Testing Traffic Flow Across the VPN on page 6691](#)
- [Confirming the Connectivity on page 6691](#)

---

### Confirming IKE Phase 1 Status

**Purpose** Confirm the VPN status by checking any IKE Phase 1 security associations status.

PKI related to IPsec tunnels is formed during Phase 1 setup. Completion of Phase 1 indicates that PKI was successful.

**Action** From operational mode, enter the **show security ike security-associations** command.

```
user@host> show security ike security-associations
```

```
Index Remote Address State Initiator cookie Responder cookie Mode
202.2.2.2 UP af4f78bc135e4365 48a35f853ee95d21 Main
```

**Meaning** The output indicates that:

- The remote peer is 2.2.2.2 and the status is UP, which means the successful association of Phase 1 establishment.
- The remote peer IKE ID, IKE policy, and external interfaces are all correct.
- Index 20 is a unique value for each IKE security association. You can use this output details to get further details on each security association. See [“Getting Details on Individual Security Associations” on page 6687](#).

Incorrect output would indicate that:

- The remote peer status is Down.
- There are no IKE security associations .
- There are IKE policy parameters, such as the wrong mode type (Aggr or Main), PKI issues, or Phase 1 proposals (all must match on both peers). For more information, see [“Troubleshooting IKE, PKI, and IPsec Issues” on page 6692](#).
- External interface is invalid for receiving the IKE packets. Check the configurations for PKI-related issues, check the key management daemon (kmd) log for any other errors, or run traceoptions to find the mismatch. For more information, see [“Troubleshooting IKE, PKI, and IPsec Issues” on page 6692](#).

### Getting Details on Individual Security Associations

**Purpose** Get details on individual IKE.

**Action** From operational mode, enter the **show security ike security-associations index 20 detail** command.

```
user@host> show security ike security-associations index 20 detail
IKE peer 2.2.2.2, Index 20,
Role: Responder, State: UP
Initiator cookie: af4f78bc135e4365, Responder cookie: 48a35f853ee95d21
Exchange type: Main, Authentication method: RSA-signatures
Local: 1.1.1.2:500, Remote: 2.2.2.2:500
Lifetime: Expires in 23282 seconds
Algorithms:
Authentication : sha1
Encryption : 3des-cbc
Pseudo random function: hmac-sha1
Traffic statistics:
Input bytes : 10249
Output bytes : 4249
Input packets: 10
Output packets: 9
Flags: Caller notification sent
IPsec security associations: 2 created, 1 deleted
Phase 2 negotiations in progress: 0
```

**Meaning** The output displays the details of the individual IKE SAs such as role (initiator or responder), status, exchange type, authentication method, encryption algorithms, traffic statistics, Phase 2 negotiation status, and so on.

You can use the output data to:

- Know the role of the IKE SA. Troubleshooting is easier when the peer has the responder role.
- Get the traffic statistics to verify the traffic flow in both directions.
- Get the number of IPsec security associations created or in progress.
- Get the status of any completed Phase 2 negotiations.

### Confirming IPsec Phase 2 Status

**Purpose** View IPsec (Phase 2) security associations.

When IKE Phase 1 is confirmed, view the IPsec (Phase 2) security associations.

**Action** From operational mode, enter the **show security ipsec security-associations** command.

```
user@host> show security ipsec security-associations

total configured sa: 2
ID Gateway Port Algorithm SPI Life:sec/kb Mon vsys
<2 2.2.2.2 500 ESP:3des/sha1 bce1c6e0 1676/ unlim - 0
>2 2.2.2.2 500 ESP:3des/sha1 1a24eab9 1676/ unlim - 0
```

**Meaning** The output indicates that:

- There is a configured IPsec SA pair available . The port number 500 indicates that a standard IKE port is used. Otherwise, it is Network Address Translation-Traversal (NAT-T), 4500, or random high port.
- The security parameter index (SPI) is used for both directions. The lifetime or usage limits of the SA is expressed either in seconds or in kilobytes. In the output, 1676/ unlim indicates Phase 2 lifetime is set to expire in 1676 seconds and there is no specified lifetime size.
- The ID number shows the unique index value for each IPsec SA.
- A hyphen (-) in the Mon column indicates that VPN monitoring is not enabled for this SA.
- The virtual system (vsys) is zero, which is the default value.

**NOTE:** Phase 2 lifetime can be different from the Phase 1 lifetime because Phase 2 is not dependent on Phase 1 after the VPN is up.

### Displaying IPsec Security Association Details

**Purpose** Display the individual IPsec SA details identified by the index number.

**Action** From operational mode, enter the **show security ipsec security-associations index 2 detail** command.

```
user@host> show security ipsec security-associations index 2 detail
Virtual-system: Root
Local Gateway: 1.1.1.2, Remote Gateway: 2.2.2.2
Local Identity: ipv4_subnet(any:0,[0..7]=10.10.10.0/24)
Remote Identity: ipv4_subnet(any:0,[0..7]=192.168.168.0/24)
DF-bit: clear
Policy-name: tunnel-policy-out
Direction: inbound, SPI: bce1c6e0, AUX-SPI: 0
Hard lifetime: Expires in 1667 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 1093 seconds
Mode: tunnel, Type: dynamic, State: installed, VPN Monitoring: -
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Anti-replay service: enabled, Replay window size: 32
Direction: outbound, SPI: 1a24eab9, AUX-SPI: 0
Hard lifetime: Expires in 1667 seconds
Lifesize Remaining: Unlimited
Soft lifetime: Expires in 1093 seconds
Mode: tunnel, Type: dynamic, State: installed, VPN Monitoring: -
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Anti-replay service: enabled, Replay window size: 32
```

**Meaning** The output displays the local Identity and the remote Identity.

Note that a proxy ID mismatch may cause Phase 2 completion to fail. The proxy ID is derived from the tunnel policy (for policy-based VPNs). The local address and remote address are derived from the address book entries, and the service is derived from the application configured for the policy.

If Phase 2 fails due to a proxy ID mismatch, verify which address book entries are configured in the policy and ensure that the correct addresses are sent. Also ensure that the ports are matching. Double-check the service to ensure that the ports match for the remote and local servers.

**NOTE:** If multiple objects are configured in a tunnel policy for source address, destination address, or application, then the resulting proxy ID for that parameter is changed to zeroes.

For example, assume the following scenario for a tunnel policy:

- Local addresses of 10.10.10.0/24 and 10.10.20.0/24
- Remote address of 192.168.168.0/24
- Application as junos-http

The resulting proxy ID is local 0.0.0.0/0, remote 192.168.168.0/24, service 80.

The resulting proxy IDs can affect the interoperability if the remote peer is not configured for the second subnet. Also if you are employing a third-party vendor's application, you may have to manually enter the proxy ID to match.

If IPsec fails to complete, then check the kmd log or use the `set traceoptions` command. For more information, see [“Troubleshooting IKE, PKI, and IPsec Issues” on page 6692](#).

---

### Checking IPsec SA Statistics

---

**Purpose** Check statistics and errors for an IPsec SA.

For troubleshooting purpose, check the Encapsulating Security Payload/Authentication Header (ESP/AH) counters for any errors with a particular IPsec SA.

**Action** From operational mode, enter the `show security ipsec statistics index 2` command.

```
user@host> show security ipsec statistics index 2
ESP Statistics:
Encrypted bytes: 674784
Decrypted bytes: 309276
Encrypted packets: 7029
Decrypted packets: 7029
AH Statistics:
Input bytes: 0
```

```

Output bytes: 0
Input packets: 0
Output packets: 0
Errors:
AH authentication failures: 0, Replay errors: 0
ESP authentication failures: 0, ESP decryption failures: 0
Bad headers: 0, Bad trailers: 0

```

**Meaning** An error value of zero in the output indicates a normal condition.

We recommend running this command multiple times to observe any packet loss issues across a VPN. Output from this command also displays the statistics for encrypted and decrypted packet counters, error counters, and so on.

You must enable security flow traceoptions to investigate which ESP packets are experiencing errors and why. For more information, see [“Troubleshooting IKE, PKI, and IPsec Issues” on page 6692](#).

### Testing Traffic Flow Across the VPN

**Purpose** Test traffic flow across the VPN after Phase 1 and Phase 2 have completed successfully. You can test traffic flow by using the **ping** command. You can ping from local host to remote host. You can also initiate pings from the Juniper Networks device itself.

This example shows how to initiate a ping request from the Juniper Networks device to the remote host. Note that when pings are initiated from the Juniper Networks device, the source interface must be specified to ensure that the correct route lookup takes place and the appropriate zones are referenced in the policy lookup.

In this example, the ge-0/0/0.0 interface resides in the same security zone as the local host and must be specified in the ping request so that the policy lookup can be from zone trust to zone untrust.

**Action** From operational mode, enter the **ping 192.168.168.10 interface ge-0/0/0 count 5** command.

```

user@host> ping 192.168.168.10 interface ge-0/0/0 count 5
PING 192.168.168.10 (192.168.168.10): 56 data bytes
64 bytes from 192.168.168.10: icmp_seq=0 ttl=127 time=8.287 ms
64 bytes from 192.168.168.10: icmp_seq=1 ttl=127 time=4.119 ms
64 bytes from 192.168.168.10: icmp_seq=2 ttl=127 time=5.399 ms
64 bytes from 192.168.168.10: icmp_seq=3 ttl=127 time=4.361 ms
64 bytes from 192.168.168.10: icmp_seq=4 ttl=127 time=5.137 ms
--- 192.168.168.10 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max/stddev = 4.119/5.461/8.287/1.490 ms

```

### Confirming the Connectivity

**Purpose** Confirm the connectivity between a remote host and a local host.

**Action** From operational mode, enter the **ping 10.10.10.10 from ethernet0/6** command.

```

ssg5-> ping 10.10.10.10 from ethernet0/6

```

```
Type escape sequence to abort
Sending 5, 100-byte ICMP Echos to 10.10.10.10, timeout is 1 seconds from
ethernet0/6
!!!!
Success Rate is 100 percent (5/5), round-trip time min/avg/max=4/4/5 ms
```

**Meaning** You can confirm end-to-end connectivity by using the **ping** command from the remote host to the local host. In this example, the command is initiated from the SSG5 device.

Failed end-to-end connectivity can indicate an issue with routing, policy, end host, or encryption/decryption of the ESP packets. To verify the exact causes of the failure:

- Check IPsec statistics for details on errors as described in [“Checking IPsec SA Statistics” on page 6690](#).
- Confirm end host connectivity by using the **ping** command from a host on the same subnet as the end host. If the end host is reachable by other hosts, then you can assume that the issue is not with the end host.
- Enable security flow traceoptions for troubleshooting the routing-related and policy-related issues.

## Troubleshooting IKE, PKI, and IPsec Issues

Troubleshoot IKE, PKI, and IPsec issues.

- [Basic Troubleshooting Steps on page 6692](#)
- [Checking the Free Disk Space on Your Device on page 6693](#)
- [Checking the Log Files to Verify Different Scenarios and Uploading Log Files to an FTP on page 6694](#)
- [Enabling IKE Traceoptions to View Messages on IKE on page 6694](#)
- [Enabling PKI Traceoptions to View Messages on IPsec on page 6695](#)
- [Setting up IKE and PKI Traceoptions to Troubleshoot IKE Setup Issues with Certificates on page 6696](#)
- [Analyzing the Phase 1 Success Message on page 6696](#)
- [Analyzing the Phase 1 Failure Message \(Proposal Mismatch\) on page 6697](#)
- [Analyzing the Phase 1 Failure Message \(Authentication Failure\) on page 6697](#)
- [Analyzing the Phase 1 Failure Message \(Timeout Error\) on page 6698](#)
- [Analyzing the Phase 2 Failure Message on page 6698](#)
- [Analyzing the Phase 2 Failure Message on page 6699](#)
- [Troubleshooting Common Problems Related to IKE and PKI on page 6700](#)

### Basic Troubleshooting Steps

**Problem** The basic troubleshooting steps are as follows:

1. Identifying and isolating the problem.

## 2. Debugging the problem.

The common approach of starting troubleshooting is with the lowest layer of the OSI layers and working your way up the OSI stack to confirm the layer in which the failure occurs.

**Solution** Basic steps for troubleshooting IKE, PKI, and IPsec are as follows:

- Confirm the physical connectivity of the Internet link at the physical and data link levels.
- Confirm that the Juniper Networks device has connectivity to the Internet next hop and connectivity to the remote IKE peer.
- Confirm IKE Phase 1 completion.
- Confirm IKE Phase 2 completion if IKE Phase 1 completion is successful.
- Confirm the traffic flow across the VPN (if the VPN is up and active).

Junos OS includes the traceoptions feature. Using this feature, you can enable a traceoption flag to write the data from the traceoption to a log file, which may be predetermined or manually configured and stored in flash memory. These trace logs can be retained even after a system reboot. Check the available flash storage before implementing traceoptions.

You can enable the traceoptions feature in configuration mode and commit the configuration to use the traceoptions feature. Similarly to disable traceoptions, you must deactivate traceoptions in configuration mode and commit the configuration.

### Checking the Free Disk Space on Your Device

**Problem** Check the statistics on the free disk space in your device file systems.

**Solution** From operational mode, enter the **show system storage** command.

```
user@host> show system storage
Filesystem Size Used Avail Capacity Mounted on
/dev/ad0s1a 213M 74M 137M 35% /
devfs 1.0K 1.0K 0B 100% /dev
devfs 1.0K 1.0K 0B 100% /dev/
/dev/md0 180M 180M 0B 100% /junos
/cf 213M 74M 137M 35% /junos/cf
devfs 1.0K 1.0K 0B 100% /junos/dev/
procfs 4.0K 4.0K 0B 100% /proc
/dev/bo0s1e 24M 13K 24M 0% /config
/dev/md1 168M 7.6M 147M 5% /mfs
/cf/var/jail 213M 74M 137M 35% /jail/var
```

The **/dev/ad0s1a** represents the onboard flash memory and is currently at 35 percent capacity.

### Checking the Log Files to Verify Different Scenarios and Uploading Log Files to an FTP

**Problem** View the log files to check security IKE debug messages, security flow debugs, and the state of logging to the syslog.

**Solution** From operational mode, enter the **show log kmd**, **show log pkid**, **show log security-trace**, and **show log messages** commands.

```
user@host> show log kmd
user@host> show log pkid
user@host> show log security-trace
user@host> show log messages
```

**NOTE:** You can view a list of all logs in the `/var/log` directory by using the **show log** command.

Log files can also be uploaded to an FTP server by using the **file copy** command.

(operational mode):  
 user@host> **file copy path/filename dest-path/filename**  
 Example:

```
user@host> file copy /var/log/kmd ftp://10.10.10.10/kmd.log
ftp://10.10.10.10/kmd.log 100% of 35 kB 12 MBps
```

### Enabling IKE Traceoptions to View Messages on IKE

**Problem** To view success or failure messages for IKE or IPsec, you can view the kmd log by using the **show log kmd** command. Because the kmd log displays some general messages, it can be useful to obtain additional details by enabling IKE and PKI traceoptions.

**NOTE:** Generally, it is best practice to troubleshoot the peer that has the responder role. You must obtain the trace output from the initiator and responder to understand the cause of a failure.

Configure IKE tracing options.

**Solution**

```
user@host> configure
Entering configuration mode

[edit]
user@host# edit security ike traceoptions
[edit security ike traceoptions]

user@host# set file ?
Possible completions:
<filename> Name of file in which to write trace information
```

```

files Maximum number of trace files (2..1000)
match Regular expression for lines to be logged
no-world-readable Don't allow any user to read the log file
size Maximum trace file size (10240..1073741824)
world-readable Allow any user to read the log file

```

[edit security ike traceoptions]

```

user@host# set flag ?
Possible completions:
all Trace everything
certificates Trace certificate events
database Trace security associations database events
general Trace general events
ike Trace IKE module processing
parse Trace configuration processing
policy-manager Trace policy manager processing
routing-socket Trace routing socket messages
timer Trace internal timer events

```

**NOTE:** If you do not specify file names for the <filename> field, then all IKE traceoptions are written to the kmd log.

You must specify at least one flag option to write trace data to the log. For example:

- **file size** — Maximum size of each trace file, in bytes. For example, 1 million (1,000,000 ) can generate a maximum file size of 1 MB.
- **files** — Maximum number of trace files to be generated and stored in a flash memory device.

**NOTE:** You must commit your configuration to start the trace.

### Enabling PKI Traceoptions to View Messages on IPsec

**Problem** Enable PKI traceoptions to identify whether an IKE failure is related to the certificate or to a non-PKI issue.

**Solution** [edit security pki traceoptions]

```

user@host# set file ?
Possible completions:
<filename> Name of file in which to write trace information
files Maximum number of trace files (2..1000)
match Regular expression for lines to be logged
no-world-readable Don't allow any user to read the log file
size Maximum trace file size (10240..1073741824)
world-readable Allow any user to read the log file

```

```
[edit security pki traceoptions]
```

```
user@host# set flag ?
```

```
Possible completions:
```

```
all Trace with all flags enabled
```

```
certificate-verification PKI certificate verification tracing
```

```
online-crl-check PKI online crl tracing
```

## Setting up IKE and PKI Traceoptions to Troubleshoot IKE Setup Issues with Certificates

---

**Problem** Configure the recommended settings for IKE and PKI traceoptions.

**NOTE:** The IKE and PKI traceoptions use the same parameters, but the default filename for all PKI-related traces is found in the pkid log.

**Solution** user@host> configure  
Entering configuration mode

```
[edit security ike traceoptions]
```

```
user@host# set file size 1m
```

```
user@host# set flag ike
```

```
user@host# set flag policy-manager
```

```
user@host# set flag routing-socket
```

```
user@host# set flag certificates
```

```
[edit security pki traceoptions]
```

```
user@host# set file size 1m
```

```
user@host# set flag all
```

```
user@host# commit and-quit
```

```
commit complete
```

```
Exiting configuration mode
```

## Analyzing the Phase 1 Success Message

---

**Problem** Understand the output of the **show log kmd** command when the IKE Phase 1 and Phase 2 conditions are successful.

**Solution** Nov 7 11:52:14 Phase-1 [responder] done for local=ipv4(udp:500,[0..3]=1.1.1.2) remote=fqdn(udp:500,[0..15]=ssg5.example.net)  
 Nov 7 11:52:14 Phase-2 [responder] done for  
 p1\_local=ipv4(udp:500,[0..3]=1.1.1.2)  
 p1\_remote=fqdn(udp:500,[0..15]=ssg5.example.net)  
 p2\_local=ipv4\_subnet(any:0,[0..7]=10.10.10.0/24)  
 p2\_remote=ipv4\_subnet(any:0,[0..7]=192.168.168.0/24)

The sample output indicates:

- 1.1.1.2—Local address.
- ssg5.example.net —Remote peer (hostname with FQDN).
- udp: 500—NAT-T was not negotiated.
- Phase 1 [responder] done—Phase 1 status, along with the role (initiator or responder).
- Phase 2 [responder] done—Phase 1 status, along with the proxy ID information.

You can also confirm the IPsec SA status by using the verification commands mentioned in [“Confirming IKE Phase 1 Status” on page 6686](#).

### Analyzing the Phase 1 Failure Message (Proposal Mismatch)

**Problem** Understanding the output of the **show log kmd** command, where the IKE Phase 1 condition is a failure, helps in determining the reason for the VPN not establishing Phase 1.

**Solution** Nov 7 11:52:14 Phase-1 [responder] failed with error(No proposal chosen) for local=unknown(any:0,[0..0]=) remote=fqdn(udp:500,[0..15]=ssg5.example.net)  
 Nov 7 11:52:14 1.1.1.2:500 (Responder) <-> 2.2.2.2:500 { 011359c9 ddef501d - 2216ed2a bfc50f5f [- 1] / 0x00000000 } IP; Error = No proposal chosen (14)

The sample output indicates:

- 1.1.1.2—Local address.
- ssg5.example.net —Remote peer (hostname with FQDN).
- udp: 500—NAT-T was not negotiated.
- Phase-1 [responder] failed with error (No proposal chosen)—Phase 1 failure because of proposal mismatch.

To resolve this issue, ensure that the parameters for the IKE gateway Phase 1 proposals on both the responder and the initiator match. Also confirm that a tunnel policy exists for the VPN.

### Analyzing the Phase 1 Failure Message (Authentication Failure)

**Problem** Understand the output of the **show log kmd** command when the IKE Phase 1 condition is a failure. This helps in determining the reason for the VPN not establishing Phase 1.

**Solution** Nov 7 12:06:36 Unable to find phase-1 policy as remote peer:2.2.2.2 is not recognized.  
Nov 7 12:06:36 Phase-1 [responder] failed with error(Authentication failed) for local=ipv4(udp:500,[0..3]=1.1.1.2) remote=ipv4(any:0,[0..3]=2.2.2.2)  
Nov 7 12:06:36 1.1.1.2:500 (Responder) <-> 2.2.2.2:500 { f725ca38 dad47583 - dab1ba4c ae26674b [- 1] / 0x00000000 } IP; Error = Authentication failed (24)

The sample output indicates:

- **1.1.1.2**—Local address.
- **2.2.2.2**—Remote peer
- **Phase 1 [responder] failed with error (Authentication failed)**—Phase 1 failure due to the responder not recognizing the incoming request originating from a valid gateway peer. In the case of IKE with PKI certificates, this failure typically indicates that an incorrect IKE ID type was specified or entered.

To resolve this issue, confirm that the correct peer IKE ID type is specified on the local peer based on the following:

- How the remote peer certificate was generated
- Subject Alternative Name or DN information in the received remote peer certificate

---

### Analyzing the Phase 1 Failure Message (Timeout Error)

**Problem** Understand the output of the **show log kmd** command when the IKE Phase 1 condition is a failure.

**Solution** Nov 7 13:52:39 Phase-1 [responder] failed with error(Timeout) for local=unknown(any:0,[0..0]=) remote=ipv4(any:0,[0..3]=2.2.2.2)

The sample output indicates:

- **1.1.1.2**—Local address.
- **2.2.2.2**—Remote peer.
- **Phase 1 [responder] failed with error(Timeout)**—Phase 1 failure.

This error indicates that either the IKE packet is lost enroute to the remote peer or there is a delay or no response from the remote peer.

Because this timeout error is the result of waiting on a response from the PKI daemon, you must review the PKI traceoptions output to see whether there is a problem with PKI.

---

### Analyzing the Phase 2 Failure Message

**Problem** Understand the output of the **show log kmd** command when the IKE Phase 2 condition is a failure.

**Solution** Nov 7 11:52:14 Phase-1 [responder] done for local=ipv4(udp:500,[0..3]=1.1.1.2) remote=fqdn(udp:500,[0..15]=ssg5.example.net)  
 Nov 7 11:52:14 Failed to match the peer proxy ids  
 p2\_remote=ipv4\_subnet(any:0,[0..7]=192.168.168.0/24)  
 p2\_local=ipv4\_subnet(any:0,[0..7]=10.10.20.0/24) for the remote  
 peer:ipv4(udp:500,[0..3]=2.2.2.2)  
 Nov 7 11:52:14 KMD\_PM\_P2\_POLICY\_LOOKUP\_FAILURE: Policy lookup for Phase-2 [responder] failed for  
 p1\_local=ipv4(udp:500,[0..3]=1.1.1.2) p1\_remote=ipv4(udp:500,[0..3]=2.2.2.2)  
 p2\_local=ipv4\_subnet(any:0,[0..7]=10.10.20.0/24)  
 p2\_remote=ipv4\_subnet(any:0,[0..7]=192.168.168.0/24)  
 Nov 7 11:52:14 1.1.1.2:500 (Responder) <-> 2.2.2.2:500 { 41f638eb cc22bbfe - 43fd0e85 b4f619d5 [0]  
 / 0xc77fafcf } QM; Error = No proposal chosen (14)

The sample output indicates:

- **1.1.1.2**—Local address.
- **ssg5.example.net**—Remote peer (IKE ID type hostname with FQDN).
- **Phase 1 [responder] done**—Phase 1 success.
- **Failed to match the peer proxy ids**—The Incorrect proxy IDs are received. In the previous sample, the two proxy IDs received are 192.168.168.0/24 (remote) and 10.10.20.0/24 (local) (for service=any). Based on the configuration given in this example, the expected local address is 10.10.10.0/24. This shows that there is a mismatch of configurations on the local peer, resulting in the failure of proxy ID match.

To resolve this issue, correct the address book entry or configure the proxy ID on either peer so that it matches the other peer.

The output also indicates the reason for failure is **No proposal chosen**. However in this case you also see the message **Failed to match the peer proxy ids**.

### Analyzing the Phase 2 Failure Message

**Problem** Understand the output of the **show log kmd** command when the IKE Phase 2 condition is a failure.

**Solution** Nov 7 11:52:14 Phase-1 [responder] done for local=ipv4(udp:500,[0..3]=1.1.1.2) remote=fqdn(udp:500,[0..15]=ssg5.example.net)  
 Nov 7 11:52:14 1.1.1.2:500 (Responder) <-> 2.2.2.2:500 { cd9dff36 4888d398 - 6b0d3933 f0bc8e26 [0]  
 / 0x1747248b } QM; Error = No proposal chosen (14)

The sample output indicates:

- 1.1.1.2 —Local address.
- fqdn(udp:500,[0..15]=ssg5.example.net—Remote peer.
- Phase 1 [responder] done—Phase 1 success.
- Error = No proposal chosen—No proposal was chosen during Phase 2. This issue is due to proposal mismatch between the two peers.

To resolve this issue, confirm that the Phase 2 proposals match on both peers.

### Troubleshooting Common Problems Related to IKE and PKI

**Problem** Troubleshoot common problems related to IKE and PKI.

Enabling the traceoptions feature helps you to gather more information on the debugging issues than is obtainable from the normal log entries. You can use the traceoptions log to understand the reasons for IKE or PKI failures.

**Solution** Methods for troubleshooting the IKE -and-PKI-related issues:

- Ensure that the clock, date, time zone, and daylight savings settings are correct. Use NTP to keep the clock accurate.
- Ensure that you use a two-letter country code in the "C=" (country) field of the DN.  
 For example: use "US" and not "USA" or "United States." Some CAs require that the country field of the DN be populated, allowing you to enter the country code value only with a two-letter value.
- Ensure that if a peer certificate is using multiple OU=or CN= fields, you are using the distinguished name with container method (the sequence must be maintained and is case-sensitive).
- If the certificate is not valid yet, check the system clock and, if required, adjust the system time zone or just add a day in the clock for a quick test.
- Ensure that a matching IKE ID type and value are configured.
- PKI can fail due to a revocation check failure. To confirm this, temporarily disable revocation checking and see whether IKE Phase 1 is able to complete.

To disable revocation checking, use the following command in configure mode:

```
set security pki ca-profile <ca-profile> revocation-check disable
```

## Understanding Online Certificate Status Protocol

---

OCSP is used to check the revocation status of X509 certificates. OCSP provides revocation status on certificates in real time and is useful in time-sensitive situations such as bank transactions and stock trades.

The revocation status of a certificate is checked by sending a request to an OCSP server that resides outside of an SRX Series device. Based on the response from the server, the VPN connection is allowed or denied. OCSP responses are not cached on SRX Series devices.

The OCSP server can be the certificate authority (CA) that issues a certificate or a designated authorized responder. The location of the OCSP server can be configured manually or extracted from the certificate that is being verified. Requests are sent first to OCSP server locations that are manually configured in CA profiles with the **ocsp url** statement at the **[edit security pki ca-profile *profile-name* revocation-check]** hierarchy level; up to two locations can be configured for each CA profile. If the first configured OCSP server is not reachable, the request is sent to the second OCSP server. If the second OCSP server is not reachable, the request is then sent to the location in the certificate's AuthorityInfoAccess extension field. The **use-ocsp** option must also be configured, as certificate revocation list (CRL) is the default checking method.

SRX Series devices accept only signed OCSP responses from the CA or authorized responder. The response received is validated using trusted certificates. The response is validated as follows:

1. The CA certificate enrolled for the configured CA profile is used to validate the response.
2. The OCSP response might contain a certificate to validate the OCSP response. The received certificate must be signed by a CA certificate enrolled in the SRX Series device. After the received certificate is validated by the CA certificate, it is used to validate the OCSP response.

The response from the OCSP server can be signed by different CAs. The following scenarios are supported:

- The CA server that issues the end entity certificate for a device also signs the OCSP revocation status response. The SRX Series device verifies the OCSP response signature using the CA certificate enrolled in the SRX Series device. After the OCSP response is validated, the certificate revocation status is checked.
- An authorized responder signs the OCSP revocation status response. The certificate for the authorized responder and the end entity certificate being verified must be issued by the same CA. The authorized responder is first verified using the CA certificate enrolled in the SRX Series device. The OCSP response is validated using the responder's CA certificate. The SRX Series device then uses the OCSP response to check the revocation status of the end entity certificate.
- There are different CA signers for the end entity certificate being verified and the OCSP response. The OCSP response is signed by a CA in the certificate chain for the end entity certificate being verified. (All peers participating in an IKE negotiation need to have at least one common trusted CA in their respective certificate chains.) The OCSP responder's CA is verified using a CA in the certificate chain. After validating the responder CA certificate, the OCSP response is validated using the responder's CA certificate.

To prevent replay attacks, a nonce payload can be sent in an OCSP request. Nonce payloads are sent by default unless it is explicitly disabled. If enabled, the SRX Series device expects the OCSP response to contain a nonce payload, otherwise the revocation check fails. If OCSP responders are not capable of responding with a nonce payload, then the nonce payload must be disabled on the SRX Series device.

---

## Understanding Certificate Revocation Lists

In the normal course of business, certificates are revoked for various reasons. You might wish to revoke a certificate if you suspect that it has been compromised, for example, or when a certificate holder leaves the company.

You can manage certificate revocations and validations in two ways:

- Locally— This is a limited solution.
- By referencing a Certificate Authority (CA) certificate revocation list (CRL)— You can automatically access the CRL online at intervals you specify or at the default interval set by the CA.

In Phase 1 negotiations, participants check the CRL list to see if certificates received during an IKE exchange are still valid. If a CRL did not accompany a CA certificate and is not loaded on the device, the device tries to download it automatically from the CRL distribution point of the local certificate. If the device fails to connect to the URL in the certificate distribution point (CDP), it tries to retrieve the CRL from the URL configured in the CA profile.

If the certificate does not contain a certificate distribution point extension, and you cannot automatically retrieve the CRL through Lightweight Directory Access Protocol (LDAP) or Hypertext Transfer Protocol (HTTP), you can retrieve a CRL manually and load that in the device.

## Comparison of Online Certificate Status Protocol and Certificate Revocation List

Online Certificate Status Protocol (OCSP) and certificate revocation list (CRL) can both be used to check the revocation status of a certificate. There are advantages and disadvantages to each method.

- OCSP provides certificate status in real time, while CRL uses cached data. For time-sensitive applications, OCSP is the preferred approach.
- CRL checking is faster because lookup for certificate status is done on information cached on the VPN device. OCSP requires time to obtain the revocation status from an external server.
- CRL requires additional memory to store the revocation list received from a CRL server. OCSP does not require additional memory to save the revocation status of certificates.
- OCSP requires that the OCSP server be available at all times. CRL can use cached data to check the revocation status of certificates when the server is unreachable.

**NOTE:** On SRX Series devices, CRL is the default method used to check the revocation status of a certificate.

## Improving Security by Configuring OCSP for Certificate Revocation Status

This example shows how to improve security by configuring two peers using the Online Certificate Status Protocol (OCSP) to check the revocation status of the certificates used in Phase 1 negotiations for the IPsec VPN tunnel.

- [Requirements on page 6706](#)
- [Overview on page 6706](#)
- [Configuration on page 6708](#)
- [Verification on page 6716](#)

### Requirements

On each device:

- Obtain and enroll a local certificate. This can be done either manually or by using the Simple Certificate Enrollment Protocol (SCEP).
- Optionally, enable automatic renewal of the local certificate.
- Configure security policies to permit traffic to and from the peer device.

### Overview

On both peers, a certificate authority (CA) profile OCSP-ROOT is configured with the following options:

- CA name is OCSP-ROOT.
- Enrollment URL is `http://1.1.1.1:8080/scep/OCSP-ROOT/`. This is the URL where SCEP requests to the CA are sent.
- The URL for the OCSP server is `http://10.157.88.56:8210/OCSP-ROOT/`.
- OCSP is used first to check the certificate revocation status. If there is no response from the OCSP server, then the certificate revocation list (CRL) is used to check the status. The CRL URL is `http://1.1.1.1:8080/crl-as-der/currentcrl-45.crlid=45`.
- The CA certificate received in an OCSP response is not checked for certificate revocation. Certificates received in an OCSP response generally have shorter lifetimes and a revocation check is not required.

[Table 580](#) shows the Phase 1 options used in this example.

**Table 580: Phase 1 Options for OCSP Configuration Example**

Option	Peer A	Peer B
IKE proposal	ike_prop	ike_prop

Table 580: Phase 1 Options for OCSP Configuration Example (*continued*)

Option	Peer A	Peer B
Authentication method	RSA signatures	RSA signatures
DH group	group2	group2
Authentication algorithm	SHA 1	SHA 1
Encryption algorithm	3DES CBC	3DES CBC
IKE policy	ike_policy	ike_policy
Mode	aggressive	aggressive
Proposal	ike_prop	ike_prop

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure VPN peer A to use OCSP:

1. Configure interfaces.

```

[edit interfaces]
set ge-0/0/3 gigether-options redundant-parent reth1
set ge-9/0/3 gigether-options redundant-parent reth1
set lo0 unit 0 family inet address 100.100.1.100/24
set lo0 redundant-pseudo-interface-options redundancy-group 1
set reth1 redundant-ether-options redundancy-group 1

```

```
set reth1 unit 0 family inet address 100.10.1.50/24
set st0 unit 1 family inet address 202.2.1.100/24
```

2. Configure the CA profile.

```
[edit security pki ca-profile OSCP-ROOT]
set ca-identity OSCP-ROOT
set enrollment url http://1.1.1.1:8080/scep/OCSP-ROOT/
set revocation-check ocs url http://10.157.88.56:8210/OCSP-ROOT/
set revocation-check use-ocsp
set revocation-check ocs disable-responder-revocation-check
set revocation-check ocs connection-failure fallback-crl
set revocation-check crl url http://1.1.1.1:8080/crl-as-der/currentcrl-45.crlid=45
```

3. Configure Phase 1 options.

```
[edit security ike proposal ike_prop]
set authentication-method rsa-signatures
set dh-group group2
set authentication-algorithm sha1
set encryption-algorithm 3des-cbc
```

```
[edit security ike policy ike_policy]
set mode aggressive
set proposals ike_prop
set certificate local-certificate localcert1
```

```
[edit security ike gateway jsr_gateway]
set ike-policy ike_policy
set address 101.10.2.50
set remote-identity hostname localcert11.example.net
set external-interface reth1
set version v2-only
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal ipsec_prop]
set protocol esp
set authentication-algorithm hmac-sha1-96
set encryption-algorithm 3des-cbc
set lifetime-seconds 1200
set lifetime-kilobytes 150000
```

```
[edit security ipsec policy ipsec_policy]
set perfect-forward-secrecy keys group2
set proposals ipsec_prop
```

```
[edit security ipsec vpn test_vpn]
set bind-interface st0.1
set ike gateway jsr_gateway
set ike ipsec-policy ipsec_policy
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security pki ca-profile OSCP-ROOT**, **show security ike**, and **show security ipsec**

commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]

set security ike gateway jsr_gateway local-identity hostname localcert11.example.net
set security ike gateway jsr_gateway external-interface ge-0/0/2.0
set security ike gateway jsr_gateway version v2-only
set security ipsec proposal ipsec_prop protocol esp
set security ipsec proposal ipsec_prop authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec_prop encryption-algorithm 3des-cbc
set security ipsec proposal ipsec_prop lifetime-seconds 1200
set security ipsec proposal ipsec_prop lifetime-kilobytes 150000
set security ipsec policy ipsec_policy perfect-forward-secrecy keys group2
set security ipsec policy ipsec_policy proposals ipsec_prop
set security ipsec vpn test_vpn bind-interface st0.1
set security ipsec vpn test_vpn ike gateway jsr_gateway
set security ipsec vpn test_vpn ike ipsec-policy ipsec_policy
set security ipsec vpn test_vpn establish-tunnels immediately

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure VPN peer B to use OCSP:

1. Configure interfaces.
 

```

[edit interfaces]
set ge-0/0/2 unit 0 family inet address 101.10.2.50/24
set lo0 unit 0 family inet address 102.100.1.100/24
set st0 unit 1 family inet address 202.2.1.1/24

```
2. Configure the CA profile.
 

```

[edit security pki ca-profile OCSP-ROOT]
set ca-identity OCSP-ROOT

```

```

set enrollment url http://1.1.1.1:8080/scep/OCSP-ROOT/
set revocation-check ocsp url http://10.157.88.56:8210/OCSP-ROOT/
set revocation-check use-ocsp
set revocation-check ocsp disable-responder-revocation-check
set revocation-check ocsp connection-failure fallback-crl
set revocation-check crl url http://1.1.1.1:8080/crl-as-der/currentcrl-45.crlid=45

```

3. Configure Phase 1 options.

```

[edit security ike proposal ike_prop]
set authentication-method rsa-signatures
set dh-group group2
set authentication-algorithm sha1
set encryption-algorithm 3des-cbc

```

```

[edit security ike policy ike_policy]
set mode aggressive
set proposals ike_prop
set certificate local-certificate localcert1

```

```

[edit security ike gateway jsr_gateway]
set ike-policy ike_policy
set address 100.10.1.50
set local-identity hostname localcert11.example.net
set external-interface ge-0/0/2.0
set version v2-only

```

4. Configure Phase 2 options.

```

[edit security ipsec proposal ipsec_prop]
set protocol esp
set authentication-algorithm hmac-sha1-96
set encryption-algorithm 3des-cbc
set lifetime-seconds 1200
set lifetime-kilobytes 150000

```

```

[edit security ipsec policy ipsec_policy]
set perfect-forward-secrecy keys group2
set proposals ipsec_prop

```

```

[edit security ipsec vpn test_vpn]
set bind-interface st0.1
set ike gateway jsr_gateway
set ike ipsec-policy ipsec_policy
set establish-tunnels immediately

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security pki ca-profile OCSP-ROOT**, **show security ike**, and **show security ipsec** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

- [Verifying IKE Phase 1 Status on page 6719](#)
- [Verifying IPsec Phase 2 Status on page 6720](#)

### Verifying CA Certificates

---

**Purpose** Verify the validity of a CA certificate on each peer device.

**Action** From operational mode, enter the **show security pki ca-certificate ca-profile OCSP-ROOT** or **show security pki ca-certificate ca-profile OCSP-ROOT detail** command.

```
user@host> show security pki ca-certificate ca-profile OCSP-ROOT
Certificate identifier: OCSP-ROOT
Issued to: OCSP-ROOT, Issued by: C = US, O = Example, CN = OCSP-ROOT
Validity:
 Not before: 11-15-2013 22:26 UTC
 Not after: 11-14-2016 22:26 UTC
Public key algorithm: rsaEncryption(2048 bits)
```

```
user@host> show security pki ca-certificate ca-profile OCSP-ROOT detail
```

```

Certificate identifier: OCSP-ROOT
Certificate version: 3
Serial number: 0000a17f
Issuer:
 Organization: Example, Country: US, Common name: OCSP-ROOT
Subject:
 Organization: Example, Country: US, Common name: OCSP-ROOT
Subject string:
 C=US, O=Example, CN=OCSP-ROOT
Validity:
 Not before: 11-15-2013 22:26 UTC
 Not after: 11-14-2016 22:26 UTC

Signature algorithm: sha1WithRSAEncryption
Distribution CRL:
 http://1.1.1.1:8080/crl-as-der/currentcrl-45.crl?id=45
Authority Information Access OCSP:
 http://1.1.1.1:8090/OCSP-ROOT/
Use for key: CRL signing, Certificate signing, Key encipherment, Digital signature
Fingerprint:
 aa:bb:ec:13:1a:d2:ab:0a:76:e5:26:6d:2c:29:5d:49:90:57:f9:41 (sha1)
 aa:bb:07:69:f0:3e:f7:c6:b8:2c:f8:df:0b:ae:b0:28 (md5)

```

**NOTE:** In this example, IP addresses are used in the URLs in the CA profile configuration. If IP addresses are not used with CA-issued certificates or CA certificates, DNS must be configured in the device's configuration. DNS must be able to resolve the host in the distribution CRL and in the CA URL in the CA profile configuration. Additionally, you must have network reachability to the same host to receive revocation checks.

**Meaning** The output shows the details and validity of CA certificate on each peer as follows:

- **C**—Country.
- **O**—Organization.
- **CN**—Common name.

- **Not before**—Begin date of validity.
- **Not after**—End date of validity.

### Verifying Local Certificates

<b>Purpose</b>	Verify the validity of a local certificate on each peer device.
<b>Action</b>	<p>From operational mode, enter the <b>show security pki local-certificate certificate-id localcert1 detail</b> command.</p> <pre> user@host&gt; show security pki local-certificate certificate-id localcert1 detail Certificate identifier: localcert1 Certificate version: 3 Serial number: 013e3f1d Issuer:   Organization: Example, Country: US, Common name: OCSP-ROOT Subject:   Organization: Example1, Organizational unit: bu1, State: california1, Locality: sunnyvale1,   Common name: localcert1, Domain component: domain_component1 Subject string:   DC=domain_component1, CN=localcert1, OU=bu1, O=example1, L=sunnyvale1,   ST=california1, C=us1 Alternate subject: "localcert1@exampl.net", localcert1.example.net, 100.10.1.50 Validity:   Not before: 01-28-2014 22:23 UTC   Not after: 03-29-2014 22:53 UTC Public key algorithm: rsaEncryption(1024 bits) aa:bb:89:02:81:81:00:a6:df:c1:57:59:f8:4d:0f:c4:a8:96:25:97 03:c4:a0:fb:df:d5:f3:d5:56:b6:5a:26:65:b8:1a:ec:be:f6:c6:5f b3:d7:d3:59:39:48:52:4a:e3:1b:e4:e0:6d:24:c3:c1:50:8c:55:3b c0:c1:29:a0:45:29:8e:ec:3e:52:2f:84:b3:e8:89:9a:0f:8b:7d:e8 90:4b:c1:28:48:95:b3:aa:11:ab:b4:8c:a8:80:ce:90:07:2a:13:a2 2f:84:44:92:3b:be:7d:39:5b:2f:9a:4c:7a:2f:2d:31:8b:12:6d:52 34:7d:6b:e4:69:7e:f3:86:55:e2:89:31:98:c9:15:02:03:01:00:01 Signature algorithm: sha1WithRSAEncryption Distribution CRL:   http://1.1.1.1:8080/crl-as-der/currentcrl-45.crl?id=45 Authority Information Access OCSP:   http://1.1.1.1:8090/OCSP-ROOT/ Fingerprint:   aa:bb:56:64:ad:e3:ce:8e:26:6b:df:17:1e:de:fc:14:a4:bb:8c:e4 (sha1)   aa:bb:c6:ed:e4:b3:7a:4f:9a:8c:0b:61:95:01:c9:52 (md5) Auto-re-enrollment:   Status: Disabled   Next trigger time: Timer not started </pre>
<b>Meaning</b>	<p>The output shows the details and validity of a local certificate on each peer as follows:</p> <ul style="list-style-type: none"> <li>• <b>DC</b>—Domain component.</li> <li>• <b>CN</b>—Common name.</li> <li>• <b>OU</b>—Organizational unit.</li> </ul>

- **O**—Organization.
- **L**—Locality
- **ST**—State.
- **C**—Country.
- **Not before**—Begin date of validity.
- **Not after**—End date of validity.

### Verifying IKE Phase 1 Status

**Purpose** Verify the IKE Phase 1 status on each peer device.

**Action** From operational mode, enter the **show security ike security-associations** command.

```
user@host> show security ike security-associations
Index State Initiator cookie Responder cookie Mode Remote Address
6534660 UP aa62e05abd6a703f bb52b238e8a26668 IKEv2 101.10.2.50
```

From operational mode, enter the **show security ike security-associations detail** command.

```
user@host> show security ike security-associations detail
IKE peer 101.10.2.50, Index 6534660, Gateway Name: jsr_gateway
Role: Responder, State: UP
Initiator cookie: aa62e05abd6a703f, Responder cookie: bb52b238e8a26668
Exchange type: IKEv2, Authentication method: RSA-signatures
Local: 100.10.1.50:500, Remote: 101.10.2.50:500
Lifetime: Expires in 26906 seconds
Peer ike-id: localcert11.example.net
Xauth assigned IP: 0.0.0.0
Algorithms:
Authentication : hmac-sha1-96
Encryption : 3des-cbc
Pseudo random function: hmac-sha1
Diffie-Hellman group : DH-group-2
Traffic statistics:
Input bytes : 2152
Output bytes : 2097
Input packets: 4
Output packets: 4
Flags: IKE SA is created
IPSec security associations: 4 created, 0 deleted
Phase 2 negotiations in progress: 0

Negotiation type: Quick mode, Role: Responder, Message ID: 0
Local: 100.10.1.50:500, Remote: 101.10.2.50:500
Local identity: 100.10.1.50
Remote identity: localcert11.example.net
Flags: IKE SA is created
```

**Meaning** The **flags** field in the output shows that, IKE security association is created.

## Verifying IPsec Phase 2 Status

**Purpose** Verify the IPsec Phase 2 status on each peer device.

**Action** From operational mode, enter the **show security ipsec security-associations** command.

```
user@host> show security ipsec security-associations
Total active tunnels: 1
ID Algorithm SPI Life:sec/kb Mon lsys Port Gateway
<131073 ESP:3des/sha1 9d1066e2 252/ 150000 - root 500 101.10.2.50
>131073 ESP:3des/sha1 82079c2c 252/ 150000 - root 500 101.10.2.50
```

From operational mode, enter the **show security ipsec security-associations detail** command.

```
user@host> show security ipsec security-associations detail
ID: 131073 Virtual-system: root, VPN Name: test_vpn
Local Gateway: 100.10.1.50, Remote Gateway: 101.10.2.50
Local Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Remote Identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Version: IKEv2
DF-bit: clear
Bind-interface: st0.1

## Example: Manually Loading a CRL onto the Device

This example shows how to load a CRL manually onto the device.

- [Requirements on page 6721](#)
- [Overview on page 6721](#)
- [Configuration on page 6721](#)
- [Verification on page 6722](#)

### Requirements

Before you begin:

1. Generate a public and private key pair. See [“Example: Generating a Public-Private Key Pair” on page 6662](#).
2. Generate a certificate request. See [“Example: Manually Generating a CSR for the Local Certificate and Sending it to the CA Server” on page 6670](#).
3. Configure a certificate authority (CA) profile. See [“Example: Configuring a CA Profile” on page 6663](#).
4. Load your certificate onto the device. See [“Example: Loading CA and Local Certificates Manually” on page 6672](#).

### Overview

You can load a CRL manually, or you can have the device load it automatically, when you verify certificate validity. To load a CRL manually, you obtain the CRL from a CA and transfer it to the device (for example, using FTP).

In this example, you load a CRL certificate called **revoke.crl** from the `/var/tmp` directory on the device. The CA profile is called **ca-profile-ipsec**. (Maximum file size is 5 MB.)

**NOTE:** If a CRL is already loaded into the ca-profile the command `clear security pki crl ca-profile ca-profile-ipsec` must be run first to clear the old CRL.

### Configuration

#### Step-by-Step Procedure

To load a CRL certificate manually:

1. Load a CRL certificate.

[edit]

```
user@host> request security pki crl load ca-profile ca-profile-ipsec filename
/var/tmp/revoke.crl
```

**NOTE:** Junos OS supports loading of CA certificates in X509, PKCS #7, DER, or PEM formats.

## Verification

To verify the configuration is working properly, enter the **show security pki crt** operational mode command.

---

## Example: Configuring a Certificate Authority Profile with CRL Locations

This example shows how to configure a certificate authority profile with CRL locations.

- [Requirements on page 6722](#)
- [Overview on page 6722](#)
- [Configuration on page 6723](#)
- [Verification on page 6723](#)

## Requirements

Before you begin:

1. Generate a key pair in the device. See [“Example: Generating a Public-Private Key Pair” on page 6662](#).
2. Create a CA profile or profiles containing information specific to a CA. See [“Example: Configuring a CA Profile” on page 6663](#).
3. Obtain a personal certificate from the CA. See [“Example: Manually Generating a CSR for the Local Certificate and Sending it to the CA Server” on page 6670](#).
4. Load the certificate onto the device. See [“Example: Loading CA and Local Certificates Manually” on page 6672](#).
5. Configure automatic reenrollment. See [“Example: Configuring SecurID User Authentication” on page 5545](#).
6. If necessary, load the certificate's CRL on the device. See [“Example: Manually Loading a CRL onto the Device” on page 6721](#).

## Overview

In Phase 1 negotiations, you check the CRL list to see if the certificate that you received during an IKE exchange is still valid. If a CRL did not accompany a CA certificate and is not loaded on the device, Junos OS tries to retrieve the CRL through the LDAP or HTTP CRL location defined within the CA certificate itself. If no URL address is defined in the CA certificate, the device uses the URL of the server that you define for that CA certificate.

If you do not define a CRL URL for a particular CA certificate, the device gets the CRL from the URL in the CA profile configuration.

**NOTE:** The CRL distribution point extension (.cdp) in an X509 certificate can be added to either an HTTP URL or an LDAP URL.

In this example, you direct the device to check the validity of the CA profile called **my\_profile** and, if a CRL did not accompany a CA certificate and is not loaded on the device, to retrieve the CRL from the URL **http://abc/abc-crl.crl**.

## Configuration

### Step-by-Step Procedure

To configure certificate using CRL:

1. Specify the CA profile and URL.

[edit]

```
user@host# set security pki ca-profile my_profile revocation-check url
http://abc/abc-crl.crl
```

2. If you are done configuring the device, commit the configuration.

[edit]

```
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show security pki operational** mode command.

### Related Documentation

- [Example: Verifying Certificate Validity on page 6723](#)
- [Deleting a Loaded CRL \(CLI Procedure\) on page 6725](#)
- [Deleting Certificates \(CLI Procedure\) on page 6673](#)

## Example: Verifying Certificate Validity

This example shows how to verify the validity of a certificate.

- [Requirements on page 6724](#)
- [Overview on page 6724](#)
- [Configuration on page 6724](#)
- [Verification on page 6724](#)

## Requirements

No special configuration beyond device initialization is required before configuring this feature.

## Overview

In this example, you verify certificates manually to find out whether a certificate has been revoked or whether the CA certificate used to create a local certificate is no longer present on the device.

When you verify certificates manually, the device uses the CA certificate (**ca-cert**) to verify the local certificate ( **local.cert**). If the local certificate is valid, and if **revocation-check** is enabled in the CA profile, the device verifies that the CRL is loaded and valid. If the CRL is not loaded and valid, the device downloads the new CRL.

For CA-issued certificates or CA certificates, a DNS must be configured in the device's configuration. The DNS must be able to resolve the host in the distribution CRL and in the CA cert/revocation list url in the ca-profile configuration. Additionally, you must have network reachability to the same host in order for the checks to receive.

## Configuration

### Step-by-Step Procedure

To manually verify the validity of a certificate:

1. Verify the validity of a local certificate.

[edit]

```
user@host> request security pki local-certificate verify certificate-id local.cert
```

2. Verify the validity of a CA certificate.

[edit]

```
user@host> request security pki ca-certificate verify ca-profile ca-profile-ipsec
```

**NOTE:** The associated private key and the signature are also verified.

## Verification

To verify the configuration is working properly, enter the **show security pki ca-profile** command.

**NOTE:** If an error is returned instead of a positive verification the failure is logged in pkid.

### Related Documentation

- [Understanding Certificate Revocation Lists on page 6704](#)
- [Example: Manually Loading a CRL onto the Device on page 6721](#)

- [Example: Configuring a Certificate Authority Profile with CRL Locations on page 6722](#)
- [Deleting a Loaded CRL \(CLI Procedure\) on page 6725](#)

---

## Deleting a Loaded CRL (CLI Procedure)

---

You can choose to delete a loaded CRL if you no longer need to use it to manage certificate revocations and validation.

Use the following command to delete a loaded certificate revocation list:

```
user@host> clear security pki crl ca-profile (ca-profile all)
```

Specify a CA profile to delete a CRL associated with the CA identified by the profile, or use **all** to delete all CRLs.

# Generating Self-Signed Certificates

- [Understanding Self-Signed Certificates on page 6727](#)
- [Example: Manually Generating Self-Signed Certificates on page 6728](#)
- [Using Automatically Generated Self-Signed Certificates \(CLI Procedure\) on page 6729](#)

## Understanding Self-Signed Certificates

---

A self-signed certificate is a certificate that is signed by its creator rather than by a Certificate Authority (CA).

Self-signed certificates allow for use of SSL-based (Secure Sockets Layer) services without requiring that the user or administrator to undertake the considerable task of obtaining an identity certificate signed by a CA.

**NOTE:** Self-signed certificates do not provide additional security as do those generated by CAs. This is because a client cannot verify that the server he or she has connected to is the one advertised in the certificate.

This topic includes the following sections:

- [Generating Self-Signed Certificates on page 6727](#)
- [Automatically Generating Self-Signed Certificates on page 6728](#)
- [Manually Generating Self-Signed Certificates on page 6728](#)

## Generating Self-Signed Certificates

Junos OS provides two methods for generating a self-signed certificate:

- Automatic generation

In this case, the creator of the certificate is the Juniper Networks device. An automatically generated self-signed certificate is configured on the device by default.

After the device is initialized, it checks for the presence of an automatically generated self-signed certificate. If it does not find one, the device generates one and saves it in the file system.

- Manual generation

In this case, you create the self-signed certificate for the device.

At any time, you can use the CLI to generate a self-signed certificate. These certificates are also used to gain access to SSL services.

Self-signed certificates are valid for five years from the time they were generated.

## Automatically Generating Self-Signed Certificates

An automatically generated self-signed certificate allows for use of SSL-based services without requiring that the administrator obtain an identity certificate signed by a CA.

A self-signed certificate that is automatically generated by the device is similar to a Secure Shell (SSH) host key. It is stored in the file system, not as part of the configuration. It persists when the device is rebooted, and it is preserved when a **request system snapshot** command is issued.

## Manually Generating Self-Signed Certificates

A self-signed certificate that you manually generate allows for use of SSL-based services without requiring that you obtain an identity certificate signed by a CA. A manually generated self-signed certificate is one example of a public key infrastructure (PKI) local certificate. As is true of all PKI local certificates, manually generated self-signed certificates are stored in the file system.

### Related Documentation

- [Understanding Certificates and PKI on page 6643](#)
- [Using Automatically Generated Self-Signed Certificates \(CLI Procedure\) on page 6729](#)
- [Example: Manually Generating Self-Signed Certificates on page 6728](#)

## Example: Manually Generating Self-Signed Certificates

---

This example shows how to generate self-signed certificates manually.

- [Requirements on page 6728](#)
- [Overview on page 6728](#)
- [Configuration on page 6729](#)
- [Verification on page 6729](#)

### Requirements

Before you begin, generate a public private key pair. See [“Example: Generating a Public-Private Key Pair” on page 6662](#).

### Overview

For a manually generated self-signed certificate, you specify the DN when you create it. For an automatically generated self-signed certificate, the system supplies the DN, identifying itself as the creator.

In this example, you generate a self-signed certificate with the e-mail address as **user@example.net**. You specify a certificate-id of **self-cert** to be referenced by web management, which refers a key-pair of the same certificate-id.

## Configuration

### Step-by-Step Procedure

To generate the self-signed certificate manually:

- Create the self-signed certificate.

```
user@host> request security pki local-certificate generate-self-signed certificate-id
self-cert subject CN=abc domain-name example.net ip-address 1.2.3.4 email
mholmes@example.net
```

## Verification

To verify the certificate was properly generated and loaded, enter the **show security pki local-certificate** operational mode command.

### Related Documentation

- [Understanding Self-Signed Certificates on page 6727](#)
- [Digital Certificates Configuration Overview on page 6648](#)
- [Using Automatically Generated Self-Signed Certificates \(CLI Procedure\) on page 6729](#)

---

## Using Automatically Generated Self-Signed Certificates (CLI Procedure)

After the device is initialized, it checks for the presence of a self-signed certificate. If a self-signed certificate is not present, the device automatically generates one.

You can add the following statement to your configuration if you want to use the automatically generated self-signed certificate to provide access to HTTPS services:

```
system {
 services {
 web-management {
 http {
 interface [...];
 } https {
 system-generated-certificate;
 interface [...];
 }
 }
 }
}
```

The device uses the following distinguished name for the automatically generated certificate:

**“CN=<device serial number>, CN=system generated, CN=self-signed”**

Use the following command to specify that the automatically generated self-signed certificate is to be used for Web management HTTPS services:

```
user@host# set system services web-management https system-generated-certificate
```

Use the following operational command to delete the automatically generated self-signed certificate:

```
user@host# clear security pki local-certificate system-generated
```

After you delete the system-generated self-signed certificate, the device automatically generates a new one and saves it in the file system.

# Configuring a Device for Certificate Chains

- [Understanding Certificate Chains on page 6731](#)
- [Example: Configuring a Device for Peer Certificate Chain Validation on page 6734](#)

## Understanding Certificate Chains

---

- [Multilevel Hierarchy for Certificate Authentication on page 6731](#)
- [Dynamic CRL Download and Checking on page 6733](#)

### Multilevel Hierarchy for Certificate Authentication

Certificate-based authentication is an authentication method supported on SRX Series devices during IKE negotiation. In large networks, multiple certificate authorities (CAs) can issue end entity (EE) certificates to their respective end devices. It is common to have separate CAs for individual locations, departments, or organizations.

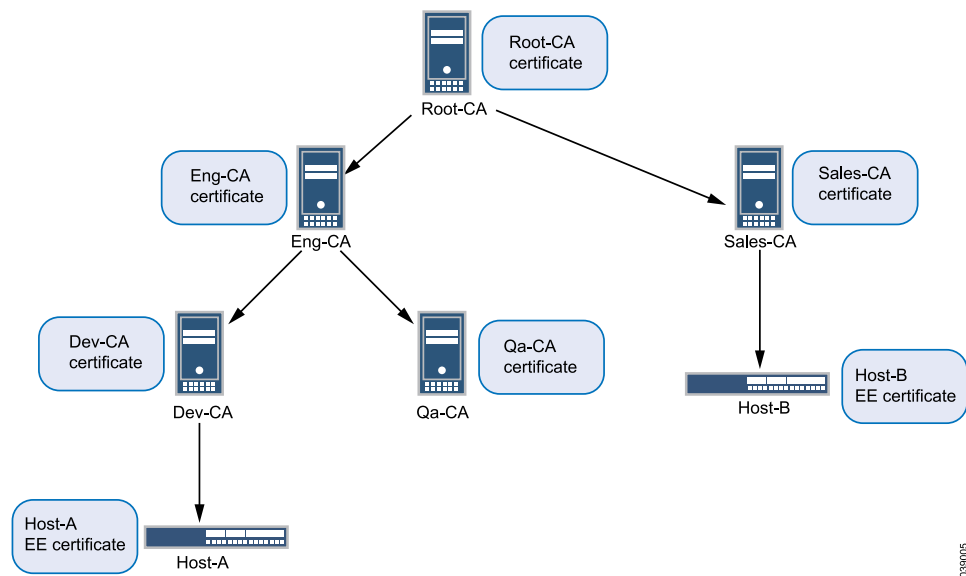

When a single-level hierarchy for certificate-based authentication is employed, all EE certificates in the network must be signed by the same CA. All firewall devices must have the same CA certificate enrolled for peer certificate validation. The certificate payload sent during IKE negotiation only contains EE certificates.

Alternatively, the certificate payload sent during IKE negotiation can contain a chain of EE and CA certificates. A certificate chain is the list of certificates required to validate a peer's EE certificate. The certificate chain includes the EE certificate and any CA certificates that are not present in the local peer.

The network administrator needs to ensure that all peers participating in an IKE negotiation have at least one common trusted CA in their respective certificate chains. The common trusted CA does not have to be the root CA. The number of certificates in the chain, including certificates for EEs and the topmost CA in the chain, cannot exceed 10.

In the example CA hierarchy shown in [Figure 296](#), Root-CA is the common trusted CA for all devices in the network. Root-CA issues CA certificates to the engineering and sales CAs, which are identified as Eng-CA and Sales-CA, respectively. Eng-CA issues CA certificates to the development and quality assurance CAs, which are identified as Dev-CA and Qa-CA, respectively. Host-A receives its EE certificate from Dev-CA while Host-B receives its EE certificate from Sales-CA.

Figure 296: Multilevel Hierarchy for Certificate-Based Authentication

Each end device needs to be loaded with the CA certificates in its hierarchy. Host-A must have Root-CA, Eng-CA, and Dev-CA certificates; Sales-CA and Qa-CA certificates are not necessary. Host-B must have Root-CA and Sales-CA certificates. Certificates can be loaded manually in a device or enrolled using the Simple Certificate Enrollment Process (SCEP).

Each end device must be configured with a CA profile for each CA in the certificate chain. The following output shows the CA profiles configured on Host-A:

```

admin@host-A# show security
pki {
 ca-profile Root-CA {
 ca-identity Root-CA;
 enrollment {
 url "www.example.net/scep/Root/";
 }
 }
 ca-profile Eng-CA {
 ca-identity Eng-CA;
 enrollment {
 url "www.example.net/scep/Eng/";
 }
 }
 ca-profile Dev-CA {
 ca-identity Dev-CA;
 enrollment {
 url "www.example.net/scep/Dev/";
 }
 }
}

```

The following output shows the CA profiles configured on Host-B:

```

admin@host-B# show security
pki {
 ca-profile Root-CA {

```

```

 ca-identity Root-CA;
 enrollment {
 url "www.example.net/scep/Root/";
 }
}
ca-profile Sales-CA {
 ca-identity Sales-CA;
 enrollment {
 url "www.example.net/scep/Sales/";
 }
}
}

```

## Dynamic CRL Download and Checking

Digital certificates are issued for a set period of time and are invalid after the specified expiration date. A CA can revoke an issued certificate by listing it in a certificate revocation list (CRL). During peer certificate validation, the revocation status of a peer certificate is checked by downloading the CRL from a CA server to the local device.

A VPN device must be able to check a peer's certificate for its revocation status. A device can use the CA certificate received from its peer to extract the URL to dynamically download the CA's CRL and check the revocation status of the peer's certificate. A dynamic CA profile is automatically created on the local device with the format **dynamic-*nnn***. A dynamic CA profile allows the local device to download the CRL from the peer's CA and check the revocation status of the peer's certificate. In [Figure 296](#), Host-A can use the Sales-CA and EE certificates received from Host-B to dynamically download the CRL for Sales-CA and check the revocation status of Host-B's certificate.

To enable dynamic CA profiles, the **revocation-check crl** option must be configured on a parent CA profile at the `[edit security pki ca-profile profile-name]` hierarchy level.

The properties of a parent CA profile are inherited for dynamic CA profiles. In [Figure 296](#), the CA profile configuration on Host-A for Root-CA enables dynamic CA profiles as shown in the following output:

```

admin@host-A# show security
pki {
 ca-profile Root-CA {
 ca-identity Root-CA;
 enrollment {
 url "www.example.net/scep/Root/";
 }
 revocation-check {
 crl;
 }
 }
}

```

A dynamic CA profile is created on Host-A for Sales-CA. Revocation checking is inherited for the Sales-CA dynamic CA profile from Root-CA.

If the **revocation-check disable** statement is configured in a parent CA profile, dynamic CA profiles are not created and dynamic CRL download and checking is not performed.

The data for CRLs downloaded from dynamic CA profiles are displayed with the **show security pki crl** command in the same way as CRLs downloaded by configured CA profiles. The CRL from a dynamic CA profile is updated periodically as are those for CA profiles that are configured in the device.

**NOTE:** The CA certificate is required to validate the CRL received from a CA server; therefore, the CA certificate received from a peer is stored on the local device. Because the CA certificate is not enrolled by an administrator, it is used only for validating the CRL received from the CA server and not for validating the peer certificate.

#### Related Documentation

---

## Example: Configuring a Device for Peer Certificate Chain Validation

This example shows how to configure a device for certificate chains used to validate peer devices during IKE negotiation.

- [Requirements on page 6734](#)
- [Overview on page 6734](#)
- [Configuration on page 6735](#)
- [Verification on page 6740](#)
- [IKE and IPsec SA Failure for a Revoked Certificate on page 6741](#)

### Requirements

Before you begin, obtain the address of the certificate authority (CA) and the information they require (such as the challenge password) when you submit requests for local certificates.

### Overview

This example shows how to configure a local device for certificate chains, enroll CA and local certificates, check the validity of enrolled certificates, and check the revocation status of the peer device.

This example shows the configuration and operational commands on Host-A, as shown in [Figure 297](#). A dynamic CA profile is automatically created on Host-A to allow Host-A to download the CRL from Sales-CA and check the revocation status of Host-B's certificate.

Figure 297: Certificate Chain Example

**NOTE:** The IPsec VPN configuration for Phase 1 and Phase 2 negotiation is shown for Host-A in this example. The peer device (Host-B) must be properly configured so that Phase 1 and Phase 2 options are successfully negotiated and security associations (SAs) are established. See [“Configuring Remote IKE IDs for Site-to-Site VPNs” on page 6358](#) for examples of configuring peer devices for VPNs.

## Configuration

To configure a device for certificate chains:

- [Configure CA Profiles on page 6735](#)
- [Enroll Certificates on page 6737](#)
- [Configure IPsec VPN Options on page 6738](#)

### Configure CA Profiles

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security pki ca-profile Root-CA ca-identity CA-Root
set security pki ca-profile Root-CA enrollment url http://10.157.88.230:8080/scep/Root/
set security pki ca-profile Root-CA revocation-check crl
set security pki ca-profile Eng-CA ca-identity Eng-CA
set security pki ca-profile Eng-CA enrollment url http://10.157.88.230:8080/scep/Eng/
set security pki ca-profile Eng-CA revocation-check crl
set security pki ca-profile Dev-CA ca-identity Dev-CA
set security pki ca-profile Dev-CA enrollment url http://10.157.88.230:8080/scep/Dev/

```

```
set security pki ca-profile Dev-CA revocation-check crl
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure CA profiles:

1. Create the CA profile for Root-CA.

```
[edit security pki]
user@host# set ca-profile Root-CA ca-identity CA-Root
user@host# set ca-profile Root-CA enrollment url
http://10.157.88.230:8080/scep/Root/
user@host# set ca-profile Root-CA revocation-check crl
```

2. Create the CA profile for Eng-CA.

```
[edit security pki]
user@host# set ca-profile Eng-CA ca-identity Eng-CA
user@host# set ca-profile Eng-CA enrollment url
http://10.157.88.230:8080/scep/Eng/
user@host# set ca-profile Eng-CA revocation-check crl
```

3. Create the CA profile for Dev-CA.

```
[edit security pki]
user@host# set ca-profile Dev-CA ca-identity Dev-CA
user@host# set ca-profile Dev-CA enrollment url
http://10.157.88.230:8080/scep/Dev/
user@host# set ca-profile Dev-CA revocation-check crl
```

**Results** From configuration mode, confirm your configuration by entering the **show security pki** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security pki
ca-profile Root-CA {
 ca-identity Root-CA;
 enrollment {
 url "http://10.157.88.230:8080/scep/Root/";
 }
 revocation-check {
 crl;
 }
}
ca-profile Eng-CA {
 ca-identity Eng-CA;
 enrollment {
 url "http://10.157.88.230:8080/scep/Eng/";
 }
 revocation-check {
 crl;
 }
}
```

```

ca-profile Dev-CA {
 ca-identity Dev-CA;
 enrollment {
 url "http://10.157.88.230:8080/scep/Dev/";
 }
 revocation-check {
 crl;
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Enroll Certificates

### Step-by-Step Procedure

To enroll certificates:

1. Enroll the CA certificates.

```

user@host> request security pki ca-certificate enroll ca-profile Root-CA
user@host> request security pki ca-certificate enroll ca-profile Eng-CA
user@host> request security pki ca-certificate enroll ca-profile Dev-CA

```

Type **yes** at the prompts to load the CA certificate.

2. Verify that the CA certificates are enrolled in the device.

```

user@host> show security pki ca-certificate ca-profile Root-CA
Certificate identifier: Root-CA
 Issued to: Root-CA, Issued by: C = us, O = example, CN = Root-CA
 Validity:
 Not before: 08-14-2012 22:19
 Not after: 08-13-2017 22:19
 Public key algorithm: rsaEncryption(2048 bits)

user@host> show security pki ca-certificate ca-profile Eng-CA
Certificate identifier: Eng-CA
 Issued to: Eng-CA, Issued by: C = us, O = example, CN = Root-CA
 Validity:
 Not before: 08-15-2012 01:02
 Not after: 08-13-2017 22:19
 Public key algorithm: rsaEncryption(2048 bits)

user@host> show security pki ca-certificate ca-profile Dev-CA
Certificate identifier: Dev-CA
 Issued to: Dev-CA, Issued by: C = us, O = example, CN = Eng-CA
 Validity:
 Not before: 08-15-2012 17:41
 Not after: 08-13-2017 22:19
 Public key algorithm: rsaEncryption(2048 bits)

```

3. Verify the validity of the enrolled CA certificates.

```

user@host> request security pki ca-certificate verify ca-profile Root-CA
CA certificate Root-CA verified successfully

user@host> request security pki ca-certificate verify ca-profile Eng-CA
CA certificate Eng-CA verified successfully

user@host> request security pki ca-certificate verify ca-profile Dev-CA
CA certificate Dev-CA verified successfully

```

4. Enroll the local certificate.

```
user@host> request security pki local-certificate enroll certificate-id Host-A
ca-profile Dev-CA challenge-password example domain-name host-a.example.net
email host-a@example.net subject DC=example,CN=Host-A,
OU=DEV,O=PKI,L=Sunnyvale,ST=CA,C=US
```

5. Verify that the local certificate is enrolled in the device.

```
user@host> show security pki local-certificate
Issued to: Host-A, Issued by: C = us, O = example, CN = Dev-CA
Validity:
 Not before: 09-17-2012 22:22
 Not after: 08-13-2017 22:19
 Public key algorithm: rsaEncryption(1024 bits)
```

6. Verify the validity of the enrolled local certificate.

```
user@host> request security pki local-certificate verify certificate-id Host-A
Local certificate Host-A verification success
```

7. Check the CRL download for configured CA profiles.

```
user@host> show security pki crl
CA profile: Root-CA
 CRL version: V00000001
 CRL issuer: C = us, O = example, CN = Root-CA
 Effective date: 09- 9-2012 13:08
 Next update: 09-21-2012 02:55

CA profile: Eng-CA
 CRL version: V00000001
 CRL issuer: C = us, O = example, CN = Eng-CA
 Effective date: 08-22-2012 17:46
 Next update: 10-24-2015 03:33

CA profile: Dev-CA
 CRL version: V00000001
 CRL issuer: C = us, O = example, CN = Dev-CA
 Effective date: 09-14-2012 21:15
 Next update: 09-26-2012 11:02
```

### Configure IPsec VPN Options

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security ike proposal ike_cert_prop_01 authentication-method rsa-signatures
set security ike proposal ike_cert_prop_01 dh-group group5
set security ike proposal ike_cert_prop_01 authentication-algorithm sha1
set security ike proposal ike_cert_prop_01 encryption-algorithm aes-256-cbc
set security ike policy ike_cert_pol_01 mode main
set security ike policy ike_cert_pol_01 proposals ike_cert_prop_01
set security ike policy ike_cert_pol_01 certificate local-certificate Host-A
set security ike gateway ike_cert_gw_01 ike-policy ike_cert_pol_01
set security ike gateway ike_cert_gw_01 address 30.1.1.51
set security ike gateway ike_cert_gw_01 external-interface ge-0/0/1.0
set security ike gateway ike_cert_gw_01 local-identity 30.1.1.31
```

```

set security ipsec proposal ipsec_prop_01 protocol esp
set security ipsec proposal ipsec_prop_01 authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec_prop_01 encryption-algorithm 3des-cbc
set security ipsec proposal ipsec_prop_01 lifetime-seconds 300
set security ipsec policy ipsec_pol_01 proposals ipsec_prop_01
set security ipsec vpn ipsec_cert_vpn_01 bind-interface st0.1
set security ipsec vpn ipsec_cert_vpn_01 ike gateway ike_cert_gw_01
set security ipsec vpn ipsec_cert_vpn_01 ike ipsec-policy ipsec_pol_01

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IPsec VPN options:

1. Configure Phase 1 options.

```

[edit security ike proposal ike_cert_prop_01]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group5
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-256-cbc

```

```

[edit security ike policy ike_cert_pol_01]
user@host# set mode main
user@host# set proposals ike_cert_prop_01
user@host# set certificate local-certificate Host-A

```

```

[edit security ike gateway ike_cert_gw_01]
user@host# set ike-policy ike_cert_pol_01
user@host# set address 30.1.1.51
user@host# set external-interface ge-0/0/1.0
user@host# set local-identity 30.1.1.31

```

2. Configure Phase 2 options.

```

[edit security ipsec proposal ipsec_prop_01]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm 3des-cbc
user@host# set lifetime-seconds 300

```

```

[edit security ipsec policy ipsec_pol_01]
user@host# set proposals ipsec_prop_01

```

```

[edit security ipsec vpn ipsec_cert_vpn_01]
user@host# set bind-interface st0.1
user@host# set ike gateway ike_cert_gw_01
user@host# set ike ipsec-policy ipsec_pol_01

```

**Results** From configuration mode, confirm your configuration by entering the **show security ike** and **show security ipsec** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security ike
proposal ike_cert_prop_01 {
 authentication-method rsa-signatures;
 dh-group group5;
 authentication-algorithm sha1;
 encryption-algorithm aes-256-cbc;
}
policy ike_cert_pol_01 {
 mode main;
 proposals ike_cert_prop_01;
 certificate {
 local-certificate Host-A;
 }
}
gateway ike_cert_gw_01 {
 ike-policy ike_cert_pol_01;
 address 30.1.1.51;
 external-interface ge-0/0/1.0;
}
[edit]
user@host# show security ipsec
proposal ipsec_prop_01 {
 protocol esp;
 authentication-algorithm hmac-sha1-96;
 encryption-algorithm 3des-cbc;
 lifetime-seconds 300;
}
policy ipsec_pol_01 {
 proposals ipsec_prop_01;
}
vpn ipsec_cert_vpn_01 {
 bind-interface st0.1;
 ike {
 gateway ike_cert_gw_01;
 ipsec-policy ipsec_pol_01;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

If certificate validation is successful during IKE negotiation between peer devices, both IKE and IPsec security associations (SAs) are established.

- [Verifying IKE Phase 1 Status on page 6740](#)
- [Verifying IPsec Phase 2 Status on page 6741](#)

---

### Verifying IKE Phase 1 Status

**Purpose** Verify the IKE Phase 1 status.

**Action** Enter the **show security ike security-associations** command from operational mode.

```
user@host> show security ike security-associations
Index State Initiator cookie Responder cookie Mode Remote
Address
2090205 UP 285feacb50824495 59fca3f72b64da10 Main 30.1.1.51
```

### Verifying IPsec Phase 2 Status

**Purpose** Verify the IPsec Phase 2 status.

**Action** Enter the **show security ipsec security-associations** command from operational mode.

```
user@host> show security ipsec security-associations
Total active tunnels: 1
ID Algorithm SPI Life:sec/kb Mon vsys Port Gateway
<131073 ESP:3des/sha1 a4756de9 207/ unlim - root 500 30.1.1.51
>131073 ESP:3des/sha1 353bacd3 207/ unlim - root 500 30.1.1.51
```

## IKE and IPsec SA Failure for a Revoked Certificate

- [Checking for Revoked Certificates on page 6741](#)

### Checking for Revoked Certificates

**Problem** If certificate validation fails during IKE negotiation between peer devices, check to make sure that the peer's certificate has not been revoked. A dynamic CA profile allows the local device to download the CRL from the peer's CA and check the revocation status of the peer's certificate. To enable dynamic CA profiles, the **revocation-check crl** option must be configured on a parent CA profile.

**Solution** To check the revocation status of a peer's certificate:

1. Identify the dynamic CA profile that will show the CRL for the peer device by entering the **show security pki crl** command from operational mode.

```
user@host> show security pki crl
CA profile: Root-CA
CRL version: V00000001
CRL issuer: C = us, O = example, CN = Root-CA
Effective date: 09- 9-2012 13:08
Next update: 09-21-2012 02:55

CA profile: Eng-CA
CRL version: V00000001
CRL issuer: C = us, O = example, CN = Eng-CA
Effective date: 08-22-2012 17:46
Next update: 10-24-2015 03:33

CA profile: Dev-CA
CRL version: V00000001
CRL issuer: C = us, O = example, CN = Dev-CA
```

Effective date: 09-14-2012 21:15  
Next update: 09-26-2012 11:02

CA profile: dynamic-001  
CRL version: V00000001  
CRL issuer: C = us, O = example, CN = Sales-CA  
Effective date: 09-14-2012 21:15  
Next update: 09-26-2012 11:02

The CA profile **dynamic-001** is automatically created on Host-A so that Host-A can download the CRL from Host-B's CA (Sales-CA) and check the revocation status of the peer's certificate.

2. Display CRL information for the dynamic CA profile by entering the **show security pki crl ca-profile dynamic-001 detail** command from operational mode.

Enter

```
user@host> show security pki crl ca-profile dynamic-001 detail
CA profile: dynamic-001
CRL version: V00000001
CRL issuer: C = us, O = example, CN = Sub11
Effective date: 09-19-2012 17:29
Next update: 09-20-2012 01:49
Revocation List:
 Serial number Revocation date
 10647C84 09-19-2012 17:29 UTC
```

Host-B's certificate (serial number 10647084) has been revoked.

- [Example: Configuring AutoVPN with iBGP and Active-Backup Tunnels on page 6825](#)

## Understanding AutoVPN

---

AutoVPN supports an IPsec VPN aggregator (known as a *hub*) that serves as a single termination point for multiple tunnels to remote sites (known as *spokes*). AutoVPN allows network administrators to configure a hub for current and future spokes. No configuration changes are required on the hub when spoke devices are added or deleted, thus allowing administrators flexibility in managing large-scale network deployments.

- [Secure Tunnel Modes on page 6745](#)
- [Authentication on page 6746](#)
- [Configuration and Management on page 6746](#)

## Secure Tunnel Modes

AutoVPN is supported on route-based IPsec VPNs. For route-based VPNs, you configure a secure tunnel (st0) interface and bind it to an IPsec VPN tunnel. st0 interfaces in AutoVPN networks can be configured in one of two modes:

- Point-to-point mode—By default, an st0 interface configured at the `[edit interfaces st0 unit x]` hierarchy level is in point-to-point mode.
- Point-to-multipoint mode—In this mode, the **multipoint** option is configured at the `[edit interfaces st0 unit x]` hierarchy level on both AutoVPN hub and spokes. st0

interfaces on the hub and spokes must be numbered and the IP address configured on a spoke must exist in the hub's st0 interface subnetwork.

[Table 582](#) compares AutoVPN point-to-point and point-to-multipoint secure tunnel interface modes.

**Table 582: Comparison Between AutoVPN Point-to-Point and Point-to-Multipoint Secure Tunnel Modes**

Point-to-Point Mode	Point-to-Multipoint Mode
Uses traffic selectors to forward packets through VPN tunnels. Traffic selectors must be configured on each spoke. Administrator needs to be aware of the types of traffic that need to be permitted through the VPN tunnel.	Uses dynamic routing protocol to forward packets through VPN tunnels. The dynamic routing protocol must run in point-to-multipoint mode.
Does not support dynamic routing protocols on the st0 interface when traffic selectors are configured.	Cannot configure an st0 interface in point-to-multipoint mode with traffic selectors.
Supports IPv4 traffic only.	Supports IPv4 traffic only.
Allows spoke devices to be non-SRX Series devices.	Requires that hub and spoke devices are SRX Series devices.
Supports IKEv1 or IKEv2.	Supports IKEv1 only.
Supports dead peer detection only.	Supports dead peer detection and VPN monitoring.
Supports larger numbers of tunnels and spokes.	

## Authentication

The supported authentication for AutoVPN hubs and spokes is X.509 public key infrastructure (PKI) certificates. The group IKE user type configured on the hub allows strings to be specified to match the alternate subject field in spoke certificates. Partial matches for the subject fields in spoke certificates can also be specified. See [“Understanding Spoke Authentication in AutoVPN Deployments”](#) on page 6748.

## Configuration and Management

AutoVPN is configured and managed on SRX Series devices using the CLI. Multiple AutoVPN hubs can be configured on a single SRX Series device. The maximum number of spokes supported by a configured hub is specific to the model of the SRX Series device.

- [Understanding Spoke Authentication in AutoVPN Deployments on page 6748](#)
- [AutoVPN Configuration Overview on page 6750](#)

## Understanding AutoVPN Limitations

---

The following features are not supported for AutoVPN:

- AutoVPN does not support IPv6 traffic.
- AutoVPN tunnels are only supported on SRX Series devices for specific releases of Junos OS. AutoVPN tunnels cannot interoperate with any other Juniper Networks devices or other vendors' devices. However, host-protected third-party devices like LTE eNodeBs and dial-up clients are supported with point-to-point secure tunnel mode.
- Policy-based VPNs are not supported.
- The RIP dynamic routing protocol is not supported with AutoVPN tunnels. We recommend using OSPF and iBGP for dynamic routing when using point-to-multipoint VPN tunnels.
- Manual keys and Autokey IKE with preshared keys are not supported.
- Configuring static next-hop tunnel binding (NHTB) on the hub for spokes is not supported.
- AutoVPN does not support multicast traffic.
- When IKE main mode is used with PKI authentication, all gateway configurations that use the same external interface on a device must use the same IKE policy.
- The IKE gateway connections-limit configuration is not supported for high-end SRX Series devices.
- The group IKE ID user type is not supported with an IP address as the IKE ID.
- The IKE ID should not overlap with other IKE gateways when the group IKE ID user type is used.
- VPNs on SRX Series devices support only one IKE connection between two peers. The IKE connection is identified by a set of local IP addresses and ports and remote IP addresses and ports.
- ASN1 distinguished names that are longer than 2047 characters are not supported for PKI authentication.
- A secure tunnel (st0) interface supports only one IPv4 address and one IPv6 address at the same time. This applies to all route-based VPNs, including AutoVPNs.
- Configuring XAuth with AutoVPN st0 interfaces in point-to-multipoint mode and dynamic IKE gateways is not supported.

## Understanding Spoke Authentication in AutoVPN Deployments

---

In AutoVPN deployments, the hub and spoke devices must have valid X.509 PKI certificates loaded. You can use the **show security pki local-certificate detail** command to display information about the certificates loaded in a device.

This topic covers the configuration on the hub that allows spokes to authenticate and connect to the hub:

- [Group IKE ID Configuration on the Hub on page 6748](#)
- [Excluding a Spoke Connection on page 6750](#)

### Group IKE ID Configuration on the Hub

The group IKE ID feature allows a number of spoke devices to share an IKE configuration on the hub. The certificate holder's identification, in the subject or alternate subject fields in each spoke's X.509 certificate, must contain a part that is common to all spokes; the common part of the certificate identification is specified for the IKE configuration on the hub.

For example, the IKE ID **example.net** can be configured on the hub to identify spokes with the hostnames **host1.example.net**, **host2.example.net**, and **host3.example.net**. The certificate on each spoke must contain a hostname identity in the alternate subject field with **example.net** in the right-most part of the field; for example, **host1.example.net**. In this example, all spokes use this hostname identity in their IKE ID payload. During IKE negotiation, the IKE ID from a spoke is used to match the common part of the peer IKE identity configured on the hub. A valid certificate authenticates the spoke.

The common part of the certificate identification can be one of the following:

- A partial hostname in the right-most part of the alternate subject field of the certificate, for example **example.net**.
- A partial e-mail address in the right-most part of the alternate subject field of the certificate, for example **@example.net**.
- A container string, a set of wildcards, or both to match the subject fields of the certificate. The subject fields contain details of the digital certificate holder in Abstract Syntax Notation One (ASN.1) distinguished name (DN) format. Fields can include organization, organizational unit, country, locality, or common name.

To configure a group IKE ID to match subject fields in certificates, you can specify the following types of identity matches:

- **Container**—The hub authenticates the spoke's IKE ID if the subject fields of the spoke's certificate exactly match the values configured on the hub. Multiple entries can be specified for each subject field (for example, **ou=eng,ou=sw**). The order of values in the fields must match.
- **Wildcard**—The hub authenticates the spoke's IKE ID if the subject fields of the spoke's certificate match the values configured on the hub. The wildcard match supports

only one value per field (for example, **ou=eng** or **ou=sw** but not **ou=eng,ou=sw**). The order of the fields is inconsequential.

The following example configures a group IKE ID with the partial hostname **example.net** in the alternate subject field of the certificate.

```
[edit]
security {
 ike {
 policy common-cert-policy {
 proposals common-ike-proposal;
 certificate {
 local-certificate hub-local-certificate;
 }
 }
 gateway common-gateway-to-all-spoke-peer {
 ike-policy common-cert-policy;
 dynamic {
 hostname example.net;
 ike-user-type group-ike-id;
 }
 external-interface fe-0/0/2;
 }
 }
}
```

In this example, **example.net** is the common part of the hostname identification used for all spokes. All X.509 certificates on the spokes must contain a hostname identity in the alternate subject field with **example.net** in the right-most part. All spokes must use the hostname identity in their IKE ID payload.

The following example configures a group IKE ID with wildcards to match the values **sales** in the organizational unit and **example** in the organization subject fields of the certificate.

```
[edit]
security {
 ike {
 policy common-cert-policy {
 proposals common-ike-proposal;
 certificate {
 local-certificate hub-local-certificate;
 }
 }
 gateway common-gateway-to-all-spoke-peer {
 ike-policy common-cert-policy;
 dynamic {
 distinguished-name {
 wildcard ou=sales,o=example;
 }
 ike-user-type group-ike-id;
 }
 external-interface fe-0/0/2;
 }
 }
}
```

```
}

```

In this example, the fields **ou=sales,o=example** are the common part of the subject field in the certificates expected from the spokes. During IKE negotiation, if a spoke presents a certificate with the subject fields **cn=alice,ou=sales,o=example** in its certificate, authentication succeeds and the tunnel is established. If a spoke presents a certificate with the subject fields **cn=thomas,ou=engineer,o=example** in its certificate, the certificate is rejected by the hub as the organization unit should be **sales**.

## Excluding a Spoke Connection

To exclude a particular spoke from connecting to the hub, the certificate for that spoke must be revoked. The hub needs to retrieve the latest certificate revocation list (CRL) from the CA that contains the serial number of the revoked certificate. The hub will then refuse a VPN connection from the revoked spoke. Until the latest CRL is available in the hub, the hub might continue to establish a tunnel from the revoked spoke. For more information, see [“Understanding Certificate Revocation Lists” on page 6704](#) and [“Understanding Certificate Authority Profiles” on page 6663](#).

  - [AutoVPN Configuration Overview on page 6750](#)

## AutoVPN Configuration Overview

The following steps describe the basic tasks for configuring AutoVPN on hub and spoke devices. The AutoVPN hub is configured *once* for all current and new spokes.

To configure the AutoVPN hub:

1. Enroll a CA certificate and the local certificate in the device.
2. Create a secure tunnel (st0) interface and configure it in point-to-multipoint mode.
3. Configure a single IKE policy.
4. Configure an IKE gateway with a group IKE ID that is common to all spokes.
5. Configure a single IPsec policy and VPN.
6. Configure a dynamic routing protocol.

To configure an SRX Series AutoVPN spoke device:

1. Enroll a CA certificate and the local certificate in the device.
2. Create an st0 interface and configure it in point-to-multipoint mode.
3. Configure an IKE policy to match the IKE policy configured on the hub.
4. Configure an IKE gateway with an ID to match the group IKE ID configured on the hub.

**NOTE:** Only IKEv1 is supported on an SRX Series spoke with st0 interfaces in point-to-point mode.

5. Configure an IPsec policy to match the IPsec policy configured on the hub.
6. Configure a dynamic routing protocol.

- [Understanding AutoVPN on page 6745](#)

## Example: Configuring Basic AutoVPN with iBGP

This example shows how to configure an AutoVPN hub to act as a single termination point, and then configure two spokes to act as tunnels to remote sites. This example configures iBGP to forward packets through the VPN tunnels.

- [Requirements on page 6751](#)
- [Overview on page 6751](#)
- [Configuration on page 6754](#)
- [Verification on page 6774](#)

## Requirements

This example uses the following hardware and software components:

- Three supported SRX Series devices as AutoVPN hub and spokes
- Junos OS Release 12.1X44-D10 and later that support AutoVPN

Before you begin:

- Obtain the address of the certificate authority (CA) and the information they require (such as the challenge password) when you submit requests for local certificates.

**NOTE:** You should be familiar with the dynamic routing protocol that is used to forward packets through the VPN tunnels. For more information about specific requirements for a dynamic routing protocol, see the *Routing Protocols Overview for Security Devices*.

## Overview

This example shows the configuration of an AutoVPN hub and the subsequent configurations of two spokes.

In this example, the first step is to enroll digital certificates in each device using the Simple Certificate Enrollment Protocol (SCEP). The certificates for the spokes contain the organizational unit (OU) value “SLT” in the subject field; the hub is configured with a group IKE ID to match the value “SLT” in the OU field.

The spokes establish IPsec VPN connections to the hub, which allows them to communicate with each other as well as access resources on the hub. Phase 1 and Phase

2 IKE tunnel options configured on the AutoVPN hub and all spokes must have the same values. [Table 583](#) shows the options used in this example.

**Table 583: Phase 1 and Phase 2 Options for AutoVPN Hub and Spoke Configurations**

Option	Value
<i>IKE proposal:</i>	
Authentication method	RSA digital certificates
Diffie-Hellman (DH) group	2
Authentication algorithm	SHA-1
Encryption algorithm	AES 128 CBC
<i>IKE policy:</i>	
Mode	Main
<i>IPsec proposal:</i>	
Protocol	ESP
Authentication algorithm	HMAC MD5 96
Encryption algorithm	DES CBC
<i>IPsec policy:</i>	
Perfect Forward Secrecy (PFS) group	14

The same certificate authority (CA) is configured on all devices.

**NOTE:** Junos OS only supports a single level of certificate hierarchy.

[Table 584](#) shows the options configured on the hub and on all spokes.

**Table 584: AutoVPN Configuration for Hub and All Spokes**

Option	Hub	All Spokes
<i>IKE gateway:</i>		
Remote IP address	Dynamic	1.1.1.1
Remote IKE ID	Distinguished name (DN) on the spoke's certificate with the string <b>SLT</b> in the organizational unit (OU) field	DN on the hub's certificate

Table 584: AutoVPN Configuration for Hub and All Spokes (*continued*)

Option	Hub	All Spokes
Local IKE ID	DN on the hub's certificate	DN on the spoke's certificate
External interface	ge-0/0/1.0	Spoke 1: fe-0/0/1.0 Spoke 2: ge-0/0/1.0
VPN:		
Bind interface	st0.0	st0.0
Establish tunnels	(not configured)	Immediately on configuration commit

Table 585 shows the configuration options that are different on each spoke.

Table 585: Comparison Between the Spoke Configurations

Option	Spoke 1	Spoke 2
st0.0 interface	10.10.10.2/24	10.10.10.3/24
Interface to internal network	(fe-0.0/4.0) 60.60.60.1/24	(fe-0.0/4.0) 70.70.70.1/24
Interface to Internet	(fe-0/0/1.0) 2.2.2.1/30	(ge-0/0/1.0) 3.3.3.1/30

Routing information for all devices is exchanged through the VPN tunnels.

**NOTE:** In this example, the default security policy that permits all traffic is used for all devices. More restrictive security policies should be configured for production environments. See [“Security Policies Overview” on page 1065](#).

Topology

Figure 298 shows the SRX Series devices to be configured for AutoVPN in this example.

Figure 298: Basic AutoVPN Deployment with iBGP

## Configuration

To configure AutoVPN, perform these tasks:

**NOTE:** The first section describes how to obtain CA and local certificates online using the Simple Certificate Enrollment Protocol (SCEP) on the hub and spoke devices.

- [Enroll Device Certificates with SCEP on page 6754](#)
- [Configuring the Hub on page 6758](#)
- [Configuring Spoke 1 on page 6763](#)
- [Configuring Spoke 2 on page 6769](#)

### Enroll Device Certificates with SCEP

#### Step-by-Step Procedure

To enroll digital certificates with SCEP on the hub:

1. Configure the CA.

[edit]

```
user@host# set security pki ca-profile ca-profile1 ca-identity ca-profile1
user@host# set security pki ca-profile ca-profile1 enrollment url
http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set security pki ca-profile ca-profile1 revocation-check disable
```

```
user@host# commit
```

2. Enroll the CA certificate.

```
user@host> request security pki ca-certificate enroll ca-profile ca-profile1
```

Type **yes** at the prompt to load the CA certificate.

3. Generate a key pair.

```
user@host> request security pki generate-key-pair certificate-id Local1
```

4. Enroll the local certificate.

```
user@host> request security pki local-certificate enroll ca-profile ca-profile1
certificate-id Local1 domain-name example.net email hub@example.net ip-address
1.1.1.1 subject
DC=example.net,CN=hub,OU=SLT,O=example,L=Bangalore,ST=KA,C=IN
challenge-password <password>
```

5. Verify the local certificate.

```
user@host> show security pki local-certificate detail
```

```

**Step-by-Step Procedure** To enroll digital certificates with SCEP on spoke 1:

1. Configure the CA.

```
[edit]
user@host# set security pki ca-profile ca-profile1 ca-identity ca-profile1
user@host# set security pki ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set security pki ca-profile ca-profile1 revocation-check disable
user@host# commit
```

2. Enroll the CA certificate.

```
user@host> request security pki ca-certificate enroll ca-profile ca-profile1
```

Type **yes** at the prompt to load the CA certificate.

3. Generate a key pair.

```
user@host> request security pki generate-key-pair certificate-id Local1
```

4. Enroll the local certificate.

```
user@host> request security pki local-certificate enroll ca-profile ca-profile1
certificate-id Local1 domain-name example.net email spoke1@example.net
ip-address 2.2.2.1 subject
DC=example.net,CN=spoke1,OU=SLT,O=example,L=Mysore,ST=KA,C=IN
challenge-password <password>
```

5. Verify the local certificate.

```
user@host> show security pki local-certificate detail
```

```

**NOTE:** The organizational unit (OU) shown in the subject field is SLT. The IKE configuration on the hub includes `ou=SLT` to identify the spoke.

### Step-by-Step Procedure

To enroll digital certificates with SCEP on spoke 2:

1. Configure the CA.

```
[edit]
user@host# set security pki ca-profile ca-profile1 ca-identity ca-profile1
user@host# set security pki ca-profile ca-profile1 enrollment url
http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set security pki ca-profile ca-profile1 revocation-check disable
user@host# commit
```

2. Enroll the CA certificate.

```
user@host> request security pki ca-certificate enroll ca-profile ca-profile1
```

Type **yes** at the prompt to load the CA certificate.

3. Generate a key pair.

```
user@host> request security pki generate-key-pair certificate-id Local1
```

4. Enroll the local certificate.

```
user@host> request security pki local-certificate enroll ca-profile ca-profile1
certificate-id Local1 domain-name example.net email spoke2@example.net
ip-address 3.3.3.1 subject
DC=example.net,CN=spoke2,OU=SLT,O=example,L=Tumkur,ST=KA,C=IN
challenge-password <password>
```

5. Verify the local certificate.

```
user@host> show security pki local-certificate detail
```

```

```

**NOTE:** The organizational unit (OU) shown in the subject field is SLT. The IKE configuration on the hub includes ou=SLT to identify the spoke.

### Configuring the Hub

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/1 unit 0 family inet address 1.1.1.1/30
set interfaces ge-0/0/3 unit 0 family inet address 50.50.50.1/24
set interfaces st0 unit 0 multipoint
set interfaces st0 unit 0 family inet address 10.10.10.1/24
set policy-options policy-statement lan_nw from interface ge-0/0/3.0
set policy-options policy-statement lan_nw then accept
set protocols bgp group ibgp type internal
set protocols bgp group ibgp local-address 10.10.10.1
set protocols bgp group ibgp export lan_nw
set protocols bgp group ibgp cluster 1.2.3.4

set security pki ca-profile ca-profile1 revocation-check disable

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the hub:

1. Configure the interfaces.

```

[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 1.1.1.1/30
user@host# set ge-0/0/3 unit 0 family inet address 50.50.50.1/24
user@host# set st0 unit 0 multipoint
user@host# set st0 unit 0 family inet address 10.10.10.1/24

```

2. Configure routing protocol.

```

[edit policy-options]
user@host# set policy-statement lan_nw from interface ge-0/0/3.0
user@host# set policy-statement lan_nw then accept

```

```

[edit protocols bgp]
user@host# set group ibgp type internal
user@host# set group ibgp local-address 10.10.10.1
user@host# set group ibgp export lan_nw
user@host# set group ibgp cluster 1.2.3.4
user@host# set group ibgp peer-as 10
user@host# set group ibgp allow 10.10.10.0/24

```

```

[edit routing-options]
user@host# set static route 2.2.2.0/30 next-hop 1.1.1.2
user@host# set static route 3.3.3.0/30 next-hop 1.1.1.2
user@host# set autonomous-system 10

```

3. Configure Phase 1 options.

```
[edit security ike proposal ike-proposal]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-128-cbc
```

```
[edit security ike policy ike-policy1]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local1
```

```
[edit security ike gateway hub-to-spoke-gw]
user@host# set ike-policy ike-policy1
user@host# set dynamic distinguished-name wildcard OU=SLT
user@host# set dynamic ike-user-type group-ike-id
user@host# set local-identity distinguished-name
user@host# set external-interface ge-0/0/1.0
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal ipsec-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-md5-96
user@host# set encryption-algorithm des-cbc
```

```
[edit security ipsec policy vpn-policy1]
user@host# set perfect-forward-secrecy keys group14
user@host# set proposals ipsec-proposal
```

```
[edit security ipsec vpn hub-to-spoke-vpn]
user@host# set bind-interface st0.0
user@host# set ike gateway hub-to-spoke-gw
user@host# set ike ipsec-policy vpn-policy1
```

5. Configure zones.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/1.0
user@host# set interfaces st0.0
```

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/3.0
```

6. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

7. Configure the CA profile.

```
[edit security pki]
user@host# set ca-profile ca-profile1 ca-identity ca-profile1
```

```

user@host# set ca-profile ca-profile1 enrollment url
http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set ca-profile ca-profile1 revocation-check disable

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security zones**, **show security policies**, and **show security pki** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

 }
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Spoke 1

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces fe-0/0/1 unit 0 family inet address 2.2.2.1/30
set interfaces fe-0/0/4 unit 0 family inet address 60.60.60.1/24
set interfaces st0 unit 0 multipoint
set interfaces st0 unit 0 family inet address 10.10.10.2/24
set policy-options policy-statement lan_nw from interface fe-0/0/4.0
set policy-options policy-statement lan_nw then accept

```

```

set protocols bgp group ibgp type internal
set protocols bgp group ibgp local-address 10.10.10.2
set protocols bgp group ibgp export lan_nw
set protocols bgp group ibgp neighbor 10.10.10.1
set routing-options static route 1.1.1.0/30 next-hop 2.2.2.2
set routing-options autonomous-system 10
set security ike proposal ike-proposal authentication-method rsa-signatures
set security ike proposal ike-proposal dh-group group2
set security ike proposal ike-proposal authentication-algorithm sha1
set security ike proposal ike-proposal encryption-algorithm aes-128-cbc
set security ike policy ike-policy1 mode main
set security ike policy ike-policy1 proposals ike-proposal
set security ike policy ike-policy1 certificate local-certificate Local1
set security ike gateway spoke-to-hub-gw ike-policy ike-policy1
set security ike gateway spoke-to-hub-gw address 1.1.1.1
set security ike gateway spoke-to-hub-gw local-identity distinguished-name
set security ike gateway spoke-to-hub-gw remote-identity distinguished-name
set security ike gateway spoke-to-hub-gw external-interface fe-0/0/1.0
set security ipsec proposal ipsec-proposal protocol esp
set security ipsec proposal ipsec-proposal authentication-algorithm hmac-md5-96
set security ipsec proposal ipsec-proposal encryption-algorithm des-cbc
set security ipsec policy vpn-policy1 perfect-forward-secrecy keys group14
set security ipsec policy vpn-policy1 proposals ipsec-proposal
set security ipsec vpn spoke-to-hub bind-interface st0.0
set security ipsec vpn spoke-to-hub ike gateway spoke-to-hub-gw
set security ipsec vpn spoke-to-hub ike ipsec-policy vpn-policy1
set security ipsec vpn spoke-to-hub establish-tunnels immediately
set security zones security-zone untrust host-inbound-traffic system-services all
set security zones security-zone untrust host-inbound-traffic protocols all
set security zones security-zone untrust interfaces fe-0/0/1.0
set security zones security-zone untrust interfaces st0.0
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust interfaces fe-0/0/4.0
set security policies default-policy permit-all
set security pki ca-profile ca-profile1 ca-identity ca-profile1
set security pki ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
set security pki ca-profile ca-profile1 revocation-check disable

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure spoke 1:

1. Configure interfaces.

```

[edit interfaces]
user@host# set fe-0/0/1 unit 0 family inet address 2.2.2.1/30
user@host# set fe-0/0/4 unit 0 family inet address 60.60.60.1/24
user@host# set st0 unit 0 multipoint
user@host# set st0 unit 0 family inet address 10.10.10.2/24

```

2. Configure routing protocol.

```
[edit policy-options]
user@host# set policy-statement lan_nw from interface fe-0/0/4.0
user@host# set policy-statement lan_nw then accept
```

```
[edit protocols bgp]
user@host# set group ibgp type internal
user@host# set group ibgp local-address 10.10.10.2
user@host# set group ibgp export lan_nw
user@host# set group ibgp neighbor 10.10.10.1
```

```
[edit routing-options]
user@host# set static route 1.1.1.0/30 next-hop 2.2.2.2
user@host# set autonomous-system 10
```

3. Configure Phase 1 options.

```
[edit security ike proposal ike-proposal]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-128-cbc
```

```
[edit security ike policy ike-policy1]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local1
```

```
[edit security ike gateway spoke-to-hub-gw]
user@host# set ike-policy ike-policy1
user@host# set address 1.1.1.1
user@host# set local-identity distinguished-name
user@host# set remote-identity distinguished-name
user@host# set external-interface fe-0/0/1.0
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal ipsec-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-md5-96
user@host# set encryption-algorithm des-cbc
```

```
[edit security ipsec policy vpn-policy1]
user@host# set perfect-forward-secrecy keys group14
user@host# set proposals ipsec-proposal
```

```
[edit security ipsec vpn spoke-to-hub]
user@host# set bind-interface st0.0
user@host# set ike gateway spoke-to-hub-gw
user@host# set ike ipsec-policy vpn-policy1
user@host# set establish-tunnels immediately
```

5. Configure zones.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
```

```
user@host# set interfaces fe-0/0/1.0
user@host# set interfaces st0.0
```

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces fe-0/0/4.0
```

6. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

7. Configure the CA profile.

```
[edit security pki]
user@host# set ca-profile ca-profile1 ca-identity ca-profile1
user@host# set ca-profile ca-profile1 enrollment url
http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set ca-profile ca-profile1 revocation-check disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security zones**, **show security policies**, and **show security pki** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust interfaces fe-0/0/4.0
set security policies default-policy permit-all
set security pki ca-profile ca-profile1 ca-identity ca-profile1
set security pki ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
set security pki ca-profile ca-profile1 revocation-check disable

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure spoke 2:

1. Configure interfaces.

```
[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 3.3.3.1/30
user@host# set fe-0/0/4 unit 0 family inet address 70.70.70.1/24
user@host# set st0 unit 0 multipoint
user@host# set st0 unit 0 family inet address 10.10.10.3/24
```

2. Configure routing protocol.

```
[edit policy-options]
user@host# set policy-statement lan_nw from interface fe-0/0/4.0
user@host# set policy-statement lan_nw then accept
```

```
[edit protocols bgp]
user@host# set group ibgp type internal
user@host# set group ibgp local-address 10.10.10.3
user@host# set group ibgp export lan_nw
user@host# set group ibgp neighbor 10.10.10.1
```

```
[edit routing-options]
user@host# set static route 1.1.1.0/30 next-hop 3.3.3.2
user@host# set autonomous-system 10
```

3. Configure Phase 1 options.

```
[edit security ike proposal ike-proposal]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-128-cbc
```

```
[edit security ike policy ike-policy1]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local1
```

```
[edit security ike gateway spoke-to-hub-gw]
user@host# set ike-policy ike-policy1
user@host# set address 1.1.1.1
user@host# set local-identity distinguished-name
user@host# set remote-identity distinguished-name
user@host# set external-interface ge-0/0/1.0
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal ipsec-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-md5-96
user@host# set encryption-algorithm des-cbc
```

```
[edit security ipsec policy vpn-policy1]
user@host# set perfect-forward-secrecy keys group14
user@host# set proposals ipsec-proposal
```

```
[edit security ipsec vpn spoke-to-hub]
user@host# set bind-interface st0.0
user@host# set ike gateway spoke-to-hub-gw
user@host# set ike ipsec-policy vpn-policy1
user@host# set establish-tunnels immediately
```

5. Configure zones.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/1.0
user@host# set interfaces st0.0
```

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces fe-0/0/4.0
```

6. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

7. Configure the CA profile.

```
[edit security pki]
user@host# set ca-profile ca-profile1 ca-identity ca-profile1
user@host# set ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set ca-profile ca-profile1 revocation-check disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security zones**, **show security policies**, and **show security pki** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying IKE Phase 1 Status on page 6774](#)
- [Verifying IPsec Phase 2 Status on page 6774](#)
- [Verifying IPsec Next-Hop Tunnels on page 6775](#)
- [Verifying BGP on page 6775](#)
- [Verifying Learned Routes on page 6775](#)

---

### Verifying IKE Phase 1 Status

**Purpose** Verify the IKE Phase 1 status.

**Action** From operational mode, enter the **show security ike security-associations** command.

```
user@host> show security ike security-associations
Index State Initiator cookie Responder cookie Mode Remote Address
5480163 UP a558717f387074ab 6d0135c5ecaed61d Main 3.3.3.1
5480162 UP 7a63d16a5a723df1 c471f7ae166d3a34 Main 2.2.2.1
```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 1 proposal parameters must match on the hub and spokes.

---

### Verifying IPsec Phase 2 Status

**Purpose** Verify the IPsec Phase 2 status.

**Action** From operational mode, enter the **security ipsec security-associations** command.

```
user@host> security ipsec security-associations
Total active tunnels: 2
ID Algorithm SPI Life:sec/kb Mon vsys Port Gateway
<268173400 ESP:des/ md5 9bf33bc7 3567/ unlim - root 500 2.2.2.1
>268173400 ESP:des/ md5 aae5196b 3567/ unlim - root 500 2.2.2.1
<268173401 ESP:des/ md5 69c24d81 622/ unlim - root 500 3.3.3.1
>268173401 ESP:des/ md5 e3fe0231 622/ unlim - root 500 3.3.3.1
```

**Meaning** The **show security ipsec security-associations** command lists all active IKE Phase 2 SAs. If no SAs are listed, there was a problem with Phase 2 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 2 proposal parameters must match on the hub and spokes.

### Verifying IPsec Next-Hop Tunnels

**Purpose** Verify the IPsec next-hop tunnels.

**Action** From operational mode, enter the **show security ipsec next-hop-tunnels** command.

```
user@host> show security ipsec next-hop-tunnels
Next-hop gateway interface IPSec VPN name Flag IKE-ID
 XAUTH username
10.10.10.2 st0.0 hub-to-spoke-vpn Auto C=IN,
DC=example.net, ST=KA, L=Mysore, O=example, OU=SLT, CN=spoke1
10.10.10.3 st0.0 hub-to-spoke-vpn Auto C=IN,
DC=example.net, ST=KA, L=Tumkur, O=example, OU=SLT, CN=spoke2
```

**Meaning** The next-hop gateways are the IP addresses for the **st0** interfaces of the spokes. The next hop should be associated with the correct IPsec VPN name.

### Verifying BGP

**Purpose** Verify that BGP references the IP addresses for the **st0** interfaces of the spokes.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@host> show bgp summary
Groups: 1 Peers: 2 Down peers: 0
Unconfigured peers: 2
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 2 2 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
10.10.10.2 10 116 119 0 0 50:25
1/1/1/0 0/0/0/0
10.10.10.3 10 114 114 0 0 50:04
1/1/1/0 0/0/0/0
```

### Verifying Learned Routes

**Purpose** Verify that routes to the spokes have been learned.

**Action** From operational mode, enter the **show route 60.60.60.0** command.

```
user@host> show route 60.60.60.0
inet.0: 45 destinations, 45 routes (44 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

60.60.60.0/24 *[BGP/170] 00:50:57, localpref 100
 AS path: I
 > to 10.10.10.2 via st0.0
```

From operational mode, enter the **show route 70.70.70.0** command.

```
user@host> show route 70.70.70.0
inet.0: 45 destinations, 45 routes (44 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

70.70.70.0/24 *[BGP/170] 00:50:42, localpref 100
 AS path: I
 > to 10.10.10.3 via st0.0
```

## Example: Configuring Basic AutoVPN with OSPF

This example shows how to configure an AutoVPN hub to act as a single termination point, and then configure two spokes to act as tunnels to remote sites. This example configures OSPF to forward packets through the VPN tunnels.

- [Requirements on page 6776](#)
- [Overview on page 6777](#)
- [Configuration on page 6779](#)
- [Verification on page 6798](#)

### Requirements

This example uses the following hardware and software components:

- Three supported SRX Series devices as AutoVPN hub and spokes
- Junos OS Release 12.1X44-D10 and later that support AutoVPN

Before you begin:

- Obtain the address of the certificate authority (CA) and the information they require (such as the challenge password) when you submit requests for local certificates.

**NOTE:** You should be familiar with the dynamic routing protocol that is used to forward packets through the VPN tunnels. For more information about specific requirements for a dynamic routing protocol, see the *Routing Protocols Overview for Security Devices*.

## Overview

This example shows the configuration of an AutoVPN hub and the subsequent configurations of two spokes.

In this example, the first step is to enroll digital certificates in each device using the Simple Certificate Enrollment Protocol (SCEP). The certificates for the spokes contain the organizational unit (OU) value “SLT” in the subject field; the hub is configured with a group IKE ID to match the value “SLT” in the OU field.

The spokes establish IPsec VPN connections to the hub, which allows them to communicate with each other as well as access resources on the hub. Phase 1 and Phase 2 IKE tunnel options configured on the AutoVPN hub and all spokes must have the same values. [Table 586](#) shows the options used in this example.

**Table 586: Phase 1 and Phase 2 Options for AutoVPN Hub and Spoke Basic OSPF Configurations**

Option	Value
<i>IKE proposal:</i>	
Authentication method	RSA digital certificates
Diffie-Hellman (DH) group	2
Authentication algorithm	SHA-1
Encryption algorithm	AES 128 CBC
<i>IKE policy:</i>	
Mode	Main
<i>IPsec proposal:</i>	
Protocol	ESP
Authentication algorithm	HMAC MD5 96
Encryption algorithm	DES CBC

**Table 586: Phase 1 and Phase 2 Options for AutoVPN Hub and Spoke Basic OSPF Configurations (*continued*)**

Option	Value
<i>IPsec policy:</i>	
Perfect Forward Secrecy (PFS) group	14

The same certificate authority (CA) is configured on all devices.

**NOTE:** Junos OS only supports a single level of certificate hierarchy.

Table 587 shows the options configured on the hub and on all spokes.

**Table 587: AutoVPN Basic OSPF Configuration for Hub and All Spokes**

Option	Hub	All Spokes
<i>IKE gateway:</i>		
Remote IP address	Dynamic	1.1.1.1
Remote IKE ID	Distinguished name (DN) on the spoke's certificate with the string <b>SLT</b> in the organizational unit (OU) field	DN on the hub's certificate
Local IKE ID	DN on the hub's certificate	DN on the spoke's certificate
External interface	ge-0/0/1.0	Spoke 1: fe-0/0/1.0 Spoke 2: ge-0/0/1.0
<i>VPN:</i>		
Bind interface	st0.0	st0.0
Establish tunnels	(not configured)	Immediately on configuration commit

Table 588 shows the configuration options that are different on each spoke.

**Table 588: Comparison Between the Basic OSPF Spoke Configurations**

Option	Spoke 1	Spoke 2
st0.0 interface	10.10.10.2/24	10.10.10.3/24
Interface to internal network	fe-0.0/4.0: 60.60.60.1/24	fe-0.0/4.0: 70.70.70.1/24
Interface to Internet	fe-0/0/1.0: 2.2.2.1/30	ge-0/0/1.0: 3.3.3.1/30

Routing information for all devices is exchanged through the VPN tunnels.

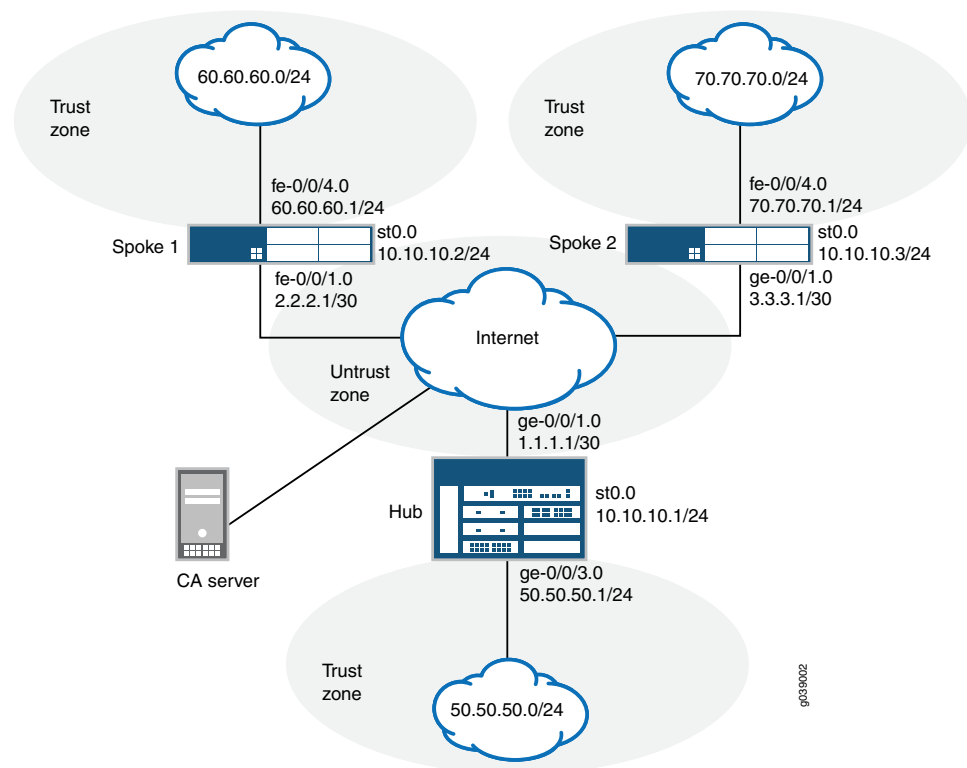

**NOTE:** In this example, the default security policy that permits all traffic is used for all devices. More restrictive security policies should be configured for production environments. See [“Security Policies Overview” on page 1065](#).

## Topology

Figure 299 shows the SRX Series devices to be configured for AutoVPN in this example.

**Figure 299: Basic AutoVPN Deployment with OSPF**

## Configuration

To configure AutoVPN, perform these tasks:

**NOTE:** The first section describes how to obtain CA and local certificates online using the Simple Certificate Enrollment Protocol (SCEP) on the hub and spoke devices.

- [Enroll Device Certificates with SCEP on page 6780](#)
- [Configuring the Hub on page 6783](#)

- [Configuring Spoke 1 on page 6788](#)
- [Configuring Spoke 2 on page 6793](#)

### Enroll Device Certificates with SCEP

#### Step-by-Step Procedure

To enroll digital certificates with SCEP on the hub:

1. Configure the CA.

```
[edit]
user@host# set security pki ca-profile ca-profile1 ca-identity ca-profile1
user@host# set security pki ca-profile ca-profile1 enrollment url
http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set security pki ca-profile ca-profile1 revocation-check disable
user@host# commit
```

2. Enroll the CA certificate.

```
user@host> request security pki ca-certificate enroll ca-profile ca-profile1
```

Type **yes** at the prompt to load the CA certificate.

3. Generate a key pair.

```
user@host> request security pki generate-key-pair certificate-id Local1
```

4. Enroll the local certificate.

```
user@host> request security pki local-certificate enroll ca-profile ca-profile1
certificate-id Local1 domain-name example.net email hub@example.net ip-address
1.1.1.1 subject
DC=example.net,CN=hub,OU=SLT,O=example,L=Bangalore,ST=KA,C=IN
challenge-password <password>
```

5. Verify the local certificate.

```
user@host> show security pki local-certificate detail
```

```

### Step-by-Step Procedure

To enroll digital certificates with SCEP on spoke 1:

1. Configure the CA.

```

[edit]
user@host# set security pki ca-profile ca-profile1 ca-identity ca-profile1
user@host# set security pki ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set security pki ca-profile ca-profile1 revocation-check disable
user@host# commit

```

2. Enroll the CA certificate.

```
user@host> request security pki ca-certificate enroll ca-profile ca-profile1
```

Type **yes** at the prompt to load the CA certificate.

3. Generate a key pair.

```
user@host> request security pki generate-key-pair certificate-id Local1
```

4. Enroll the local certificate.

```

user@host> request security pki local-certificate enroll ca-profile ca-profile1
 certificate-id Local1 domain-name example.net email spoke1@example.net
 ip-address 2.2.2.1 subject
 DC=example.net,CN=spoke1,OU=SLT,O=example,L=Mysore,ST=KA,C=IN
 challenge-password <password>

```

5. Verify the local certificate.

```
user@host> show security pki local-certificate detail
```

```

 Status: Disabled
 Next trigger time: Timer not started

```

**NOTE:** The organizational unit (OU) shown in the subject field is SLT. The IKE configuration on the hub includes ou=SLT to identify the spoke.

### Step-by-Step Procedure

To enroll digital certificates with SCEP on spoke 2:

1. Configure the CA.

```

[edit]
user@host# set security pki ca-profile ca-profile1 ca-identity ca-profile1
user@host# set security pki ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set security pki ca-profile ca-profile1 revocation-check disable
user@host# commit

```

2. Enroll the CA certificate.

```

user@host> request security pki ca-certificate enroll ca-profile ca-profile1

```

Type **yes** at the prompt to load the CA certificate.

3. Generate a key pair.

```

user@host> request security pki generate-key-pair certificate-id Local1

```

4. Enroll the local certificate.

```

user@host> request security pki local-certificate enroll ca-profile ca-profile1
 certificate-id Local1 domain-name example.net email spoke2@example.net
 ip-address 3.3.3.1 subject
 DC=example.net,CN=spoke2,OU=SLT,O=example,L=Tumkur,ST=KA,C=IN
 challenge-password <password>

```

5. Verify the local certificate.

```

user@host> show security pki local-certificate detail

```

```

Certificate identifier: Local1
Certificate version: 3
Serial number: 40bb71d400000000258f
Issuer:

 http://systest-pc4/certsrv/mscep/mscep.dll
set security pki ca-profile ca-profile1 revocation-check disable

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the hub:

1. Configure the interfaces.

```

[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 1.1.1/30
user@host# set ge-0/0/3 unit 0 family inet address 50.50.50.1/24
user@host# set st0 unit 0 multipoint
user@host# set st0 unit 0 family inet address 10.10.10.1/24

```

2. Configure the routing protocol.

```

[edit protocols ospf]
user@host# set area 0.0.0.0 interface st0.0 interface-type p2mp
user@host# set area 0.0.0.0 interface st0.0 dynamic-neighbors
user@host# set area 0.0.0.0 interface ge-0/0/3.0

```

```

[edit routing-options]
user@host# set static route 2.2.2.0/30 next-hop 1.1.1.2
user@host# set static route 3.3.3.0/30 next-hop 1.1.1.2

```

3. Configure Phase 1 options.

```

[edit security ike proposal ike-proposal]

```

```

user@host# set authentication-method rsa-signatures
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-128-cbc

[edit security ike policy ike-policy1]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local1

[edit security ike gateway hub-to-spoke-gw]
user@host# set ike-policy ike-policy1
user@host# set dynamic distinguished-name wildcard OU=SLT
user@host# set dynamic ike-user-type group-ike-id
user@host# set local-identity distinguished-name
user@host# set external-interface ge-0/0/1.0

```

4. Configure Phase 2 options.

```

[edit security ipsec proposal ipsec-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-md5-96
user@host# set encryption-algorithm des-cbc

[edit security ipsec policy vpn-policy1]
user@host# set perfect-forward-secrecy keys group14
user@host# set proposals ipsec-proposal

[edit security ipsec vpn hub-to-spoke-vpn]
user@host# set bind-interface st0.0
user@host# set ike gateway hub-to-spoke-gw
user@host# set ike ipsec-policy vpn-policy1

```

5. Configure zones.

```

[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/1.0
user@host# set interfaces st0.0

[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/3.0

```

6. Configure the default security policy.

```

[edit security policies]
user@host# set default-policy permit-all

```

7. Configure the CA profile.

```

[edit security pki]
user@host# set ca-profile ca-profile1 ca-identity ca-profile1
user@host# set ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll

```

```
user@host# set ca-profile ca-profile1 revocation-check disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security zones**, **show security policies**, and **show security pki** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Spoke 1

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces fe-0/0/1 unit 0 family inet address 2.2.2.1/30
set interfaces fe-0/0/4 unit 0 family inet address 60.60.60.1/24
set interfaces st0 unit 0 multipoint
set interfaces st0 unit 0 family inet address 10.10.10.2/24
set protocols ospf area 0.0.0.0 interface st0.0 interface-type p2mp
set protocols ospf area 0.0.0.0 interface st0.0 neighbor 10.10.10.1
set protocols ospf area 0.0.0.0 interface fe-0/0/4.0
set routing-options static route 1.1.1.0/30 next-hop 2.2.2.2
set security ike proposal ike-proposal authentication-method rsa-signatures
set security ike proposal ike-proposal dh-group group2
set security ike proposal ike-proposal authentication-algorithm sha1
set security ike proposal ike-proposal encryption-algorithm aes-128-cbc
set security ike policy ike-policy1 mode main

```

```

set security ike policy ike-policy1 proposals ike-proposal
set security ike policy ike-policy1 certificate local-certificate Local1
set security ike gateway spoke-to-hub-gw ike-policy ike-policy1
set security ike gateway spoke-to-hub-gw address 1.1.1.1
set security ike gateway spoke-to-hub-gw local-identity distinguished-name
set security ike gateway spoke-to-hub-gw remote-identity distinguished-name
set security ike gateway spoke-to-hub-gw external-interface fe-0/0/1.0
set security ipsec proposal ipsec-proposal protocol esp
set security ipsec proposal ipsec-proposal authentication-algorithm hmac-md5-96
set security ipsec proposal ipsec-proposal encryption-algorithm des-cbc
set security ipsec policy vpn-policy1 perfect-forward-secrecy keys group14
set security ipsec policy vpn-policy1 proposals ipsec-proposal

set security zones security-zone trust interfaces fe-0/0/4.0
set security policies default-policy permit-all
set security pki ca-profile ca-profile1 ca-identity ca-profile1
set security pki ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
set security pki ca-profile ca-profile1 revocation-check disable

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure spoke 1:

1. Configure interfaces.

```

[edit interfaces]
user@host# set fe-0/0/1 unit 0 family inet address 2.2.2.1/30
user@host# set fe-0/0/4 unit 0 family inet address 60.60.60.1/24
user@host# set st0 unit 0 multipoint
user@host# set st0 unit 0 family inet address 10.10.10.2/24

```

2. Configure the routing protocol.

```

[edit protocols ospf]
user@host# set area 0.0.0.0 interface st0.0 interface-type p2mp
user@host# set area 0.0.0.0 interface st0.0 neighbor 10.10.10.1
user@host# set area 0.0.0.0 interface fe-0/0/4.0

```

```

[edit routing-options]
user@host# set static route 1.1.1.0/30 next-hop 2.2.2.2

```

3. Configure Phase 1 options.

```

[edit security ike proposal ike-proposal]

```

```
user@host# set authentication-method rsa-signatures
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-128-cbc
```

```
[edit security ike policy ike-policy1]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local1
```

```
[edit security ike gateway spoke-to-hub-gw]
user@host# set ike-policy ike-policy1
user@host# set address 1.1.1.1
user@host# set local-identity distinguished-name
user@host# set remote-identity distinguished-name
user@host# set external-interface fe-0/0/1.0
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal ipsec-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-md5-96
user@host# set encryption-algorithm des-cbc
```

```
[edit security ipsec policy vpn-policy1]
user@host# set perfect-forward-secrecy keys group14
user@host# set proposals ipsec-proposal
```

```
[edit security ipsec vpn spoke-to-hub]
user@host# set bind-interface st0.0
user@host# set ike gateway spoke-to-hub-gw
user@host# set ike ipsec-policy vpn-policy1
user@host# set establish-tunnels immediately
```

5. Configure zones.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces fe-0/0/1.0
user@host# set interfaces st0.0
```

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces fe-0/0/4.0
```

6. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

7. Configure the CA profile.

```
[edit security pki]
user@host# set ca-profile ca-profile1 ca-identity ca-profile1
```

```

user@host# set ca-profile ca-profile1 enrollment url
http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set ca-profile ca-profile1 revocation-check disable

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security zones**, **show security policies**, and **show security pki** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

If you are done configuring the device, enter **commit** from configuration mode.

## Configuring Spoke 2

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/1 unit 0 family inet address 3.3.3.1/30
set interfaces fe-0/0/4 unit 0 family inet address 70.70.70.1/24
set interfaces st0 unit 0 multipoint
set interfaces st0 unit 0 family inet address 10.10.10.3/24
set protocols ospf area 0.0.0.0 interface st0.0 interface-type p2mp
set protocols ospf area 0.0.0.0 interface st0.0 neighbor 10.10.10.1
set protocols ospf area 0.0.0.0 interface fe-0/0/4.0
set routing-options static route 1.1.1.1/32 next-hop 3.3.3.2
set security ike proposal ike-proposal authentication-method rsa-signatures
set security ike proposal ike-proposal dh-group group2
set security ike proposal ike-proposal authentication-algorithm sha1
set security ike proposal ike-proposal encryption-algorithm aes-128-cbc
set security ike policy ike-policy1 mode main
set security ike policy ike-policy1 proposals ike-proposal
set security ike policy ike-policy1 certificate local-certificate Local1
set security ike gateway spoke-to-hub-gw ike-policy ike-policy1
set security ike gateway spoke-to-hub-gw address 1.1.1.1
set security ike gateway spoke-to-hub-gw local-identity distinguished-name

```

```

set security ike gateway spoke-to-hub-gw remote-identity distinguished-name
set security ike gateway spoke-to-hub-gw external-interface ge-0/0/1.0
set security ipsec proposal ipsec-proposal protocol esp
set security ipsec proposal ipsec-proposal authentication-algorithm hmac-md5-96
set security ipsec proposal ipsec-proposal encryption-algorithm des-cbc
set security ipsec policy vpn-policy1 perfect-forward-secrecy keys group14
set security ipsec policy vpn-policy1 proposals ipsec-proposal
set security ipsec vpn spoke-to-hub bind-interface st0.0
set security ipsec vpn spoke-to-hub ike gateway spoke-to-hub-gw
set security ipsec vpn spoke-to-hub ike ipsec-policy vpn-policy1
set security ipsec vpn spoke-to-hub establish-tunnels immediately
set security zones security-zone untrust host-inbound-traffic system-services all
set security zones security-zone untrust host-inbound-traffic protocols all
set security zones security-zone untrust interfaces ge-0/0/1.0
set security zones security-zone untrust interfaces st0.0
set security zones security-zone trust host-inbound-traffic system-services all
set security zones security-zone trust host-inbound-traffic protocols all
set security zones security-zone trust interfaces fe-0/0/4.0
set security policies default-policy permit-all
set security pki ca-profile ca-profile1 ca-identity ca-profile1
set security pki ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
set security pki ca-profile ca-profile1 revocation-check disable

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure spoke 2:

1. Configure interfaces.

```

[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 3.3.3.1/30
user@host# set fe-0/0/4 unit 0 family inet address 70.70.70.1/24
user@host# set st0 unit 0 multipoint
user@host# set st0 unit 0 family inet address 10.10.10.3/24

```

2. Configure the routing protocol.

```

[edit protocols ospf]
user@host# set area 0.0.0.0 interface st0.0 interface-type p2mp
user@host# set area 0.0.0.0 interface st0.0 neighbor 10.10.10.1
user@host# set area 0.0.0.0 interface fe-0/0/4.0

```

```

[edit routing-options]
user@host# set static route 1.1.1.1/32 next-hop 3.3.3.2

```

3. Configure Phase 1 options.

```

[edit security ike proposal ike-proposal]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-128-cbc

```

```
[edit security ike policy ike-policy1]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local1
```

```
[edit security ike gateway spoke-to-hub-gw]
user@host# set ike-policy ike-policy1
user@host# set address 1.1.1.1
user@host# set local-identity distinguished-name
user@host# set remote-identity distinguished-name
user@host# set external-interface ge-0/0/1.0
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal ipsec-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-md5-96
user@host# set encryption-algorithm des-cbc
```

```
[edit security ipsec policy vpn-policy1]
user@host# set perfect-forward-secrecy keys group14
user@host# set proposals ipsec-proposal
```

```
[edit security ipsec vpn spoke-to-hub]
user@host# set bind-interface st0.0
user@host# set ike gateway spoke-to-hub-gw
user@host# set ike ipsec-policy vpn-policy1
user@host# set establish-tunnels immediately
```

5. Configure zones.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/1.0
user@host# set interfaces st0.0
```

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces fe-0/0/4.0
```

6. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

7. Configure the CA profile.

```
[edit security pki]
user@host# set ca-profile ca-profile1 ca-identity ca-profile1
user@host# set ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set ca-profile ca-profile1 revocation-check disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security zones**, **show security policies**, and **show security pki** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]

}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying IKE Phase 1 Status on page 6798](#)
- [Verifying IPsec Phase 2 Status on page 6799](#)
- [Verifying IPsec Next-Hop Tunnels on page 6799](#)
- [Verifying OSPF on page 6799](#)
- [Verifying Learned Routes on page 6800](#)

### Verifying IKE Phase 1 Status

**Purpose** Verify the IKE Phase 1 status.

**Action** From operational mode, enter the **show security ike security-associations** command.

```

user@host> show security ike security-associations
Index State Initiator cookie Responder cookie Mode Remote Address

5480159 UP 22432fb6f7fbc389 412b751f79b45099 Main 2.2.2.1
5480161 UP d455050707bc3eaf b3dde111232270d2 Main 3.3.3.1

```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy

parameters and external interface settings in your configuration. Phase 1 proposal parameters must match on the hub and spokes.

### Verifying IPsec Phase 2 Status

**Purpose** Verify the IPsec Phase 2 status.

**Action** From operational mode, enter the **security ipsec security-associations** command.

```
user@host> security ipsec security-associations
Total active tunnels: 2
ID Algorithm SPI Life:sec/kb Mon vsys Port Gateway
<268173400 ESP:des/ md5 f38eea12 2954/ unlim - root 500 2.2.2.1
>268173400 ESP:des/ md5 bb48d228 2954/ unlim - root 500 2.2.2.1
<268173401 ESP:des/ md5 bcd1390b 3530/ unlim - root 500 3.3.3.1
>268173401 ESP:des/ md5 77fcf6e2 3530/ unlim - root 500 3.3.3.1
```

**Meaning** The **show security ipsec security-associations** command lists all active IKE Phase 2 SAs. If no SAs are listed, there was a problem with Phase 2 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 2 proposal parameters must match on the hub and spokes.

### Verifying IPsec Next-Hop Tunnels

**Purpose** Verify the IPsec next-hop tunnels.

**Action** From operational mode, enter the **show security ipsec next-hop-tunnels** command.

```
user@host> show security ipsec next-hop-tunnels
Next-hop gateway interface IPSec VPN name Flag IKE-ID
XAUTH username
10.10.10.2 st0.0 hub-to-spoke-vpn Auto C=IN,
DC=example.net, ST=KA, L=Mysore, O=example, OU=SLT, CN=spoke1
10.10.10.3 st0.0 hub-to-spoke-vpn Auto C=IN,
DC=example.net, ST=KA, L=Tumkur, O=example, OU=SLT, CN=spoke2
```

**Meaning** The next-hop gateways are the IP addresses for the **st0** interfaces of the spokes. The next hop should be associated with the correct IPsec VPN name.

### Verifying OSPF

**Purpose** Verify that OSPF references the IP addresses for the **st0** interfaces of the spokes.

**Action** From operational mode, enter the **show ospf neighbor** command.

```
user@host> show ospf neighbor
Address Interface State ID Pri Dead
10.10.10.3 st0.0 Full 10.255.226.179 128 32
10.10.10.2 st0.0 Full 10.207.36.182 128 38
```

### Verifying Learned Routes

**Purpose** Verify that routes to the spokes have been learned.

**Action** From operational mode, enter the **show route 60.60.60.0** command.

```
user@host> show route 60.60.60.0
inet.0: 48 destinations, 48 routes (47 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

60.60.60.0/24 *[OSPF/10] 00:51:13, metric 2
 > to 10.10.10.2 via st0.0
```

From operational mode, enter the **show route 70.70.70.0** command.

```
user@host> show route 70.70.70.0
inet.0: 48 destinations, 48 routes (47 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

70.70.70.0/24 *[OSPF/10] 00:51:48, metric 2
 > to 10.10.10.3 via st0.0
```

## Example: Configuring AutoVPN with iBGP and ECMP

This example shows how to configure two IPsec VPN tunnels between an AutoVPN hub and spoke. This example configures iBGP with equal-cost multipath (ECMP) to forward packets through the VPN tunnels.

- [Requirements on page 6800](#)
- [Overview on page 6801](#)
- [Configuration on page 6803](#)
- [Verification on page 6822](#)

### Requirements

This example uses the following hardware and software components:

- Two supported SRX Series devices as AutoVPN hub and spoke
- Junos OS Release 12.1X44-D10 and later that support AutoVPN

Before you begin:

- Obtain the address of the certificate authority (CA) and the information they require (such as the challenge password) when you submit requests for local certificates.

**NOTE:** You should be familiar with the dynamic routing protocol that is used to forward packets through the VPN tunnels. For more information about specific requirements for a dynamic routing protocol, see the *Routing Protocols Overview for Security Devices*.

## Overview

This example shows the configuration of an AutoVPN hub and a spoke with two IPsec VPN tunnels.

In this example, the first step is to enroll digital certificates in each device using the Simple Certificate Enrollment Protocol (SCEP). Certificates are enrolled in the hub and in the spoke for each IPsec VPN tunnel. One of the certificates for the spoke contains the organizational unit (OU) value “SLT” in the distinguished name (DN); the hub is configured with a group IKE ID to match the value “SLT” in the OU field. The other certificate for the spoke contains the OU value “SBU” in the DN; the hub is configured with a group IKE ID to match the value “SBU” in the OU field.

The spoke establishes IPsec VPN connections to the hub, which allows it to access resources on the hub. Phase 1 and Phase 2 IKE tunnel options configured on the AutoVPN hub and the spoke must have the same values. [Table 589](#) shows the options used in this example.

**Table 589: Phase 1 and Phase 2 Options for AutoVPN Hub and Spoke iBGP ECMP Configurations**

Option	Value
<i>IKE proposal:</i>	
Authentication method	RSA digital certificates
Diffie-Hellman (DH) group	2
Authentication algorithm	SHA-1
Encryption algorithm	AES 128 CBC
<i>IKE policy:</i>	
Mode	Main
<i>IPsec proposal:</i>	
Protocol	ESP

**Table 589: Phase 1 and Phase 2 Options for AutoVPN Hub and Spoke iBGP ECMP Configurations (*continued*)**

Option	Value
Authentication algorithm	HMAC MD5 96
Encryption algorithm	DES CBC
<i>IPsec policy:</i>	
Perfect Forward Secrecy (PFS) group	14

The same certificate authority (CA) is configured on all devices.

**NOTE:** Junos OS only supports a single level of certificate hierarchy.

Table 590 shows the options configured on the hub and on the spoke.

**Table 590: AutoVPN iBGP ECMP Configuration for Hub and Spoke 1**

Option	Hub	Spoke 1
<i>IKE gateway:</i>		
Remote IP address	hub-to-spoke-gw-1: Dynamic	spoke-to-hub-gw-1: 1.1.1.1
	hub-to-spoke-gw-2: Dynamic	spoke-to-hub-gw-2: 1.1.2.1
Remote IKE ID	hub-to-spoke-gw-1: DN on the spoke's certificate with the string <b>SLT</b> in the OU field	spoke-to-hub-gw-1: DN on the hub's certificate
	hub-to-spoke-gw-2: DN on the spoke's certificate with the string <b>SBU</b> in the OU field	spoke-to-hub-gw-2: DN on the hub's certificate
Local IKE ID	DN on the hub's certificate	DN on the spoke's certificate
External interface	hub-to-spoke-gw-1: ge-0/0/1.0	spoke-to-hub-gw-1: fe-0/0/1.0
	hub-to-spoke-gw-2: ge-0/0/2.0	spoke-to-hub-gw-2: fe-0/0/2.0
<i>VPN:</i>		
Bind interface	hub-to-spoke-vpn-1: st0.0	spoke-to-hub-1: st0.0
	hub-to-spoke-vpn-2: st0.1	spoke-to-hub-2: st0.1
Establish tunnels	(not configured)	Immediately on configuration commit

Routing information for all devices is exchanged through the VPN tunnels.

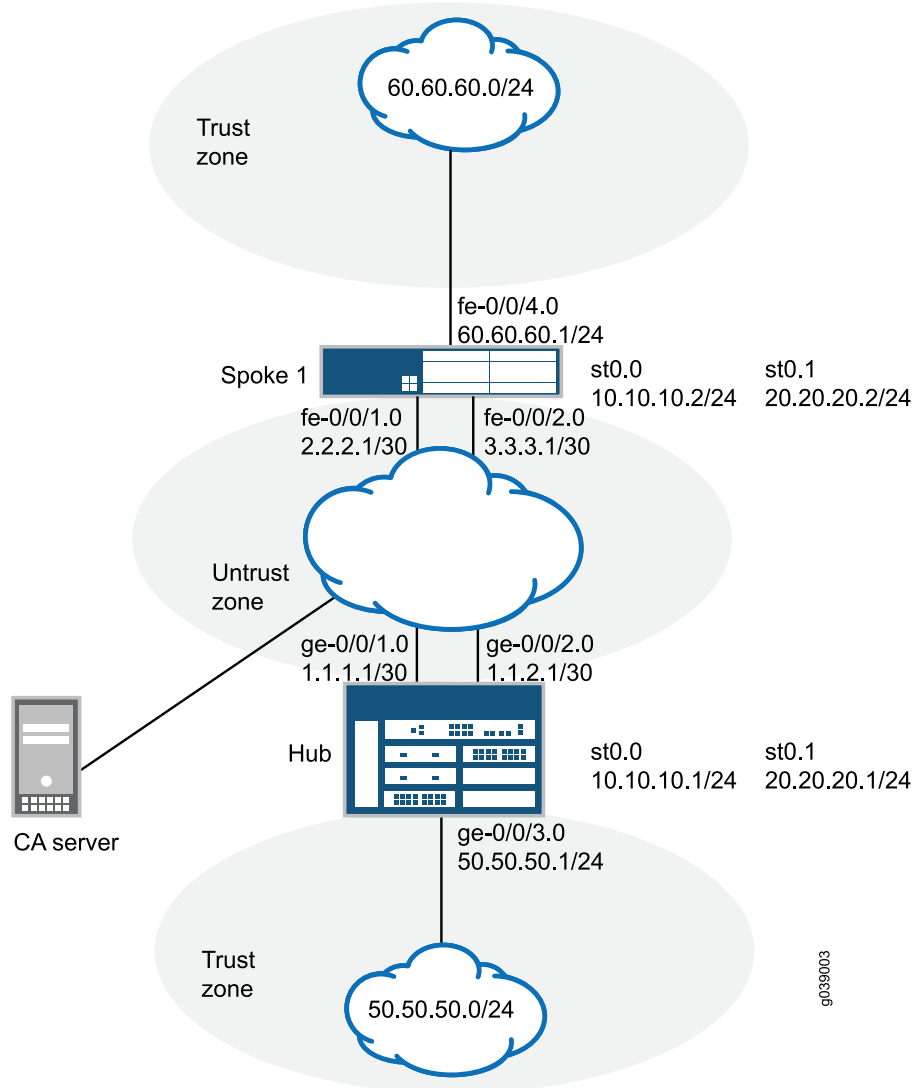

**NOTE:** In this example, the default security policy that permits all traffic is used for all devices. More restrictive security policies should be configured for production environments. See [“Security Policies Overview” on page 1065](#).

### Topology

Figure 300 shows the SRX Series devices to be configured for AutoVPN in this example.

**Figure 300: AutoVPN Deployment with iBGP and ECMP**

### Configuration

To configure AutoVPN, perform these tasks:

**NOTE:** The first section describes how to obtain CA and local certificates online using the Simple Certificate Enrollment Protocol (SCEP) on the hub and spoke devices.

- [Enroll Device Certificates with SCEP on page 6804](#)
- [Configuring the Hub on page 6808](#)
- [Configuring Spoke 1 on page 6815](#)

### Enroll Device Certificates with SCEP

#### Step-by-Step Procedure

To enroll digital certificates with SCEP on the hub:

1. Configure the CA.

```
[edit]
user@host# set security pki ca-profile ca-profile1 ca-identity ca-profile1
user@host# set security pki ca-profile ca-profile1 enrollment url
http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set security pki ca-profile ca-profile1 revocation-check disable

```

2. Enroll the CA certificate.

```
user@host> request security pki ca-certificate enroll ca-profile ca-profile1
```

Type **yes** at the prompt to load the CA certificate.

3. Generate a key pair for each certificate.

```
user@host> request security pki generate-key-pair certificate-id Local1
user@host> request security pki generate-key-pair certificate-id Local2
```

4. Enroll the local certificates.

```
user@host> request security pki local-certificate enroll ca-profile ca-profile1
certificate-id Local1 domain-name example.net email hub@example.net ip-address
1.1.1.1 subject
DC=example.net,CN=hub,OU=SLT,O=example,L=Bangalore,ST=KA,C=IN
challenge-password <password>
user@host> request security pki local-certificate enroll ca-profile ca-profile1

**Step-by-Step Procedure** To enroll digital certificates with SCEP on spoke 1:

1. Configure the CA.

```

[edit]
user@host# set security pki ca-profile ca-profile1 ca-identity ca-profile1
user@host# set security pki ca-profile ca-profile1 enrollment url
http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set security pki ca-profile ca-profile1 revocation-check disable
user@host# commit

```

2. Enroll the CA certificate.

```

user@host> request security pki ca-certificate enroll ca-profile ca-profile1

```

Type **yes** at the prompt to load the CA certificate.

3. Generate a key pair for each certificate.

```

user@host> request security pki generate-key-pair certificate-id Local1
user@host> request security pki generate-key-pair certificate-id Local2

```

4. Enroll the local certificates.

```

user@host> request security pki local-certificate enroll ca-profile ca-profile1
certificate-id Local1 domain-name example.net email spoke1@example.net
ip-address 2.2.2.1 subject
DC=example.net,CN=spoke1,OU=SLT,O=example,L=Mysore,ST=KA,C=IN
challenge-password <password>
user@host> request security pki local-certificate enroll ca-profile ca-profile1
certificate-id Local2 domain-name example.net email
spoke1_backup@example.net ip-address 3.3.3.1 subject
DC=example.net,CN=spoke1_backup,OU=SBU,O=example,L=Mysore,ST=KA,C=IN
challenge-password <password>

```

5. Verify the local certificates.

```

user@host> show security pki local-certificate certificate-id Local1 detail

```

```

```

**NOTE:** The organizational unit (OU) shown in the subject field is SLT for Local1 and SBU for Local2. The IKE configurations on the hub include OU=SLT and OU=SBU to identify the spoke.

## Configuring the Hub

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/1 unit 0 family inet address 1.1.1.1/30

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the hub:

1. Configure the interfaces.

```

[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 1.1.1.1/30
user@host# set ge-0/0/2 unit 0 family inet address 1.1.2.1/30
user@host# set ge-0/0/3 unit 0 family inet address 50.50.50.1/24
user@host# set st0 unit 0 multipoint
user@host# set st0 unit 0 family inet address 10.10.10.1/24
user@host# set st0 unit 1 multipoint
user@host# set st0 unit 1 family inet address 20.20.20.1/24

```

2. Configure routing protocol.

```

[edit policy-options]
user@host# set policy-statement lan_nw from interface ge-0/0/3.0
user@host# set policy-statement lan_nw then accept
user@host# set policy-statement load_balance then load-balance per-packet

```

```

[edit protocols bgp]
user@host# set group ibgp-1 type internal
user@host# set group ibgp-1 local-address 10.10.10.1
user@host# set group ibgp-1 export lan_nw
user@host# set group ibgp-1 cluster 1.2.3.4
user@host# set group ibgp-1 multipath
user@host# set group ibgp-1 allow 10.10.10.0/24

```

```
user@host# set group ibgp-2 type internal
user@host# set group ibgp-2 local-address 20.20.20.1
user@host# set group ibgp-2 export lan_nw
user@host# set group ibgp-2 cluster 1.2.3.5
user@host# set group ibgp-2 multipath
user@host# set group ibgp-2 allow 20.20.20.0/24
```

```
[edit routing-options]
user@host# set static route 2.2.2.0/30 next-hop 1.1.1.2
user@host# set static route 3.3.3.0/30 next-hop 1.1.2.2
user@host# set autonomous-system 10
user@host# set forwarding-table export load_balance
```

3. Configure Phase 1 options.

```
[edit security ike proposal ike-proposal]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-128-cbc
```

```
[edit security ike policy ike-policy-1]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local1
```

```
[edit security ike policy ike-policy-2]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local2
```

```
[edit security ike gateway hub-to-spoke-gw-1]
user@host# set ike-policy ike-policy-1
user@host# set dynamic distinguished-name wildcard OU=SLT
user@host# set dynamic ike-user-type group-ike-id
user@host# set local-identity distinguished-name
user@host# set external-interface ge-0/0/1.0
```

```
[edit security ike gateway hub-to-spoke-gw-2]
user@host# set ike-policy ike-policy-2
user@host# set dynamic distinguished-name wildcard OU=SBU
user@host# set dynamic ike-user-type group-ike-id
user@host# set local-identity distinguished-name
user@host# set external-interface ge-0/0/2.0
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal ipsec-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-md5-96
user@host# set encryption-algorithm des-cbc
```

```
[edit security ipsec policy vpn-policy]
user@host# set perfect-forward-secrecy keys group14
user@host# set proposals ipsec-proposal
```

```
[edit security ipsec vpn hub-to-spoke-vpn-1]
user@host# set bind-interface st0.0
user@host# set ike gateway hub-to-spoke-gw-1
user@host# set ike ipsec-policy vpn-policy
```

```
[edit security ipsec vpn hub-to-spoke-vpn-2]
user@host# set bind-interface st0.1
user@host# set ike gateway hub-to-spoke-gw-2
user@host# set ike ipsec-policy vpn-policy
```

5. Configure zones.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces st0.0
user@host# set interfaces ge-0/0/1.0
user@host# set interfaces ge-0/0/2.0
user@host# set interfaces st0.1
```

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/3.0
```

6. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

7. Configure the CA profile.

```
[edit security pki]
user@host# set ca-profile ca-profile1 ca-identity ca-profile1
user@host# set ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set ca-profile ca-profile1 revocation-check disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security zones**, **show security policies**, and **show security pki** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

### Configuring Spoke 1

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces fe-0/0/1 unit 0 family inet address 2.2.2.1/30
set interfaces fe-0/0/2 unit 0 family inet address 3.3.3.1/30
set interfaces fe-0/0/4 unit 0 family inet address 60.60.60.1/24

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure spoke 1:

1. Configure interfaces.

```

[edit interfaces]
user@host# set fe-0/0/1 unit 0 family inet address 2.2.2.1/30
user@host# set fe-0/0/2 unit 0 family inet address 3.3.3.1/30
user@host# set fe-0/0/4 unit 0 family inet address 60.60.60.1/24
user@host# set st0 unit 0 family inet address 10.10.10.2/24
user@host# set st0 unit 1 family inet address 20.20.20.2/24

```

2. Configure routing protocol.

```

[edit policy-options]
user@host# set policy-statement lan_nw from interface fe-0/0/4.0

```

```
user@host# set policy-statement lan_nw then accept
```

```
[edit protocols bgp]
```

```
user@host# set group ibgp-1 type internal
user@host# set group ibgp-1 local-address 10.10.10.2
user@host# set group ibgp-1 export lan_nw
user@host# set group ibgp-1 neighbor 10.10.10.1
```

```
user@host# set group ibgp-2 type internal
user@host# set group ibgp-2 local-address 20.20.20.2
user@host# set group ibgp-2 export lan_nw
user@host# set group ibgp-2 neighbor 20.20.20.1
```

```
[edit routing-options]
```

```
user@host# set static route 1.1.1.0/30 next-hop 2.2.2.2
user@host# set static route 1.1.2.0/30 next-hop 3.3.3.2
user@host# set autonomous-system 10
```

### 3. Configure Phase 1 options.

```
[edit security ike proposal ike-proposal]
```

```
user@host# set authentication-method rsa-signatures
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-128-cbc
```

```
[edit security ike policy ike-policy-1]
```

```
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local1
```

```
[edit security ike policy ike-policy-2]
```

```
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local2
```

```
[edit security ike gateway spoke-to-hub-gw-1]
```

```
user@host# set ike-policy ike-policy-1
user@host# set address 1.1.1.1
user@host# set local-identity distinguished-name
user@host# set remote-identity distinguished-name
user@host# set external-interface fe-0/0/1.0
```

```
[edit security ike gateway spoke-to-hub-gw-2]
```

```
user@host# set ike-policy ike-policy-2
user@host# set address 1.1.2.1
user@host# set local-identity distinguished-name
user@host# set remote-identity distinguished-name
user@host# set external-interface fe-0/0/2.0
```

### 4. Configure Phase 2 options.

```
[edit security ipsec proposal ipsec-proposal]
```

```
user@host# set protocol esp
user@host# set authentication-algorithm hmac-md5-96
```

```
user@host# set encryption-algorithm des-cbc
```

```
[edit security ipsec policy vpn-policy]
user@host# set perfect-forward-secrecy keys group14
user@host# set proposals ipsec-proposal
```

```
[edit security ipsec vpn spoke-to-hub-1]
user@host# set bind-interface st0.0
user@host# set ike gateway spoke-to-hub-gw-1
user@host# set ike ipsec-policy vpn-policy
user@host# set establish-tunnels immediately
```

```
[edit security ipsec vpn spoke-to-hub-2]
user@host# set bind-interface st0.1
user@host# set ike gateway spoke-to-hub-gw-2
user@host# set ike ipsec-policy vpn-policy
user@host# set establish-tunnels immediately
```

5. Configure zones.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces fe-0/0/1.0
user@host# set interfaces st0.0
user@host# set interfaces fe-0/0/2.0
user@host# set interfaces st0.1
```

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces fe-0/0/4.0
```

6. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

7. Configure the CA profile.

```
[edit security pki]
user@host# set ca-profile ca-profile1 ca-identity ca-profile1
user@host# set ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set ca-profile ca-profile1 revocation-check disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security zones**, **show security policies**, and **show security pki** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying IKE Phase 1 Status on page 6822](#)
- [Verifying IPsec Phase 2 Status on page 6822](#)
- [Verifying IPsec Next-Hop Tunnels on page 6823](#)
- [Verifying BGP on page 6823](#)
- [Verifying Learned Routes on page 6823](#)
- [Verifying Route Installation in Forwarding Table on page 6824](#)

---

### Verifying IKE Phase 1 Status

**Purpose** Verify the IKE Phase 1 status.

**Action** From operational mode, enter the **show security ike security-associations** command.

```
user@host> show security ike security-associations
```

Index	State	Initiator cookie	Responder cookie	Mode	Remote Address
3733049	UP	bc9686796c2e52e9	1fbe46eee168f24e	Main	2.2.2.1
3733048	UP	a88db7ed23ec5f6b	c88b81dff52617a5	Main	3.3.3.1

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 1 proposal parameters must match on the hub and spoke.

---

### Verifying IPsec Phase 2 Status

**Purpose** Verify the IPsec Phase 2 status.

**Action** From operational mode, enter the **security ipsec security-associations** command.

```
user@host> security ipsec security-associations
Total active tunnels: 2
ID Algorithm SPI Life:sec/kb Mon vsys Port Gateway
<268173315 ESP:des/ md5 93cfb417 1152/ unlim - root 500 2.2.2.1
>268173315 ESP:des/ md5 101de6f7 1152/ unlim - root 500 2.2.2.1
<268173313 ESP:des/ md5 272e29c0 1320/ unlim - root 500 3.3.3.1
>268173313 ESP:des/ md5 a3bf8fad 1320/ unlim - root 500 3.3.3.1
```

**Meaning** The **show security ipsec security-associations** command lists all active IKE Phase 2 SAs. If no SAs are listed, there was a problem with Phase 2 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 2 proposal parameters must match on the hub and spoke.

### Verifying IPsec Next-Hop Tunnels

**Purpose** Verify the IPsec next-hop tunnels.

**Action** From operational mode, enter the **show security ipsec next-hop-tunnels** command.

```
user@host> show security ipsec next-hop-tunnels
Next-hop gateway interface IPSec VPN name Flag IKE-ID
 XAUTH username
10.10.10.2 st0.0 hub-to-spoke-vpn-1 Auto C=IN,
DC=example.net, ST=KA, L=Mysore, O=example, OU=SLT, CN=spoke1
20.20.20.2 st0.1 hub-to-spoke-vpn-2 Auto C=IN,
DC=example.net, ST=KA, L=Mysore, O=example, OU=SBU, CN=spoke1_backup
```

**Meaning** The next-hop gateways are the IP addresses for the **st0** interfaces of the spokes. The next hop should be associated with the correct IPsec VPN name.

### Verifying BGP

**Purpose** Verify that BGP references the IP addresses for the **st0** interfaces of the spoke.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@host> show bgp summary
Groups: 2 Peers: 2 Down peers: 0
Unconfigured peers: 2
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 2 2 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
10.10.10.2 10 4819 4820 0 2 1d 12:15:14
1/1/1/0 0/0/0/0
20.20.20.2 10 4926 4928 0 0 1d 13:03:03
1/1/1/0 0/0/0/0
```

### Verifying Learned Routes

**Purpose** Verify that routes to the spoke have been learned.

**Action** From operational mode, enter the **show route 60.60.60.0 detail** command.

```

user@host> show route 60.60.60.0 detail
inet.0: 47 destinations, 48 routes (46 active, 0 holddown, 1 hidden)
60.60.60.0/24 (2 entries, 1 announced)

```

### Verifying Route Installation in Forwarding Table

**Purpose** Verify that routes to the spoke have been installed in the forwarding table.

**Action** From operational mode, enter the **show route forwarding-table matching 60.60.60.0** command.

```
user@host> show route forwarding-table matching 60.60.60.0
Routing table: default.inet
Internet:
Destination Type RtRef Next hop Type Index NhRef Netif
60.60.60.0/24 user 0
 10.10.10.2 ucst 572 3 st0.0
 20.20.20.2 ucst 573 3 st0.1
```

## Example: Configuring AutoVPN with iBGP and Active-Backup Tunnels

This example shows how to configure active and backup IPsec VPN tunnels between an AutoVPN hub and spoke. This example configures iBGP to forward traffic through the VPN tunnels.

- [Requirements on page 6825](#)
- [Overview on page 6825](#)
- [Configuration on page 6828](#)
- [Verification on page 6848](#)

### Requirements

This example uses the following hardware and software components:

- Two supported SRX Series devices as AutoVPN hub and spoke
- Junos OS Release 12.1X44-D10 and later that support AutoVPN

Before you begin:

- Obtain the address of the certificate authority (CA) and the information they require (such as the challenge password) when you submit requests for local certificates.

**NOTE:** You should be familiar with the dynamic routing protocol that is used to forward packets through the VPN tunnels. For more information about specific requirements for a dynamic routing protocol, see the *Routing Protocols Overview for Security Devices*.

### Overview

This example shows the configuration of an AutoVPN hub and a spoke with two IPsec VPN tunnels.

In this example, the first step is to enroll digital certificates in each device using the Simple Certificate Enrollment Protocol (SCEP). Certificates are enrolled in the hub and in the spoke for each IPsec VPN tunnel. One of the certificates for the spoke contains the organizational unit (OU) value “SLT” in the distinguished name (DN); the hub is configured with a group IKE ID to match the value “SLT” in the OU field. The other certificate for the spoke contains the OU value “SBU” in the DN; the hub is configured with a group IKE ID to match the value “SBU” in the OU field.

The spoke establishes IPsec VPN connections to the hub, which allows it to access resources on the hub. Phase 1 and Phase 2 IKE tunnel options configured on the AutoVPN hub and the spoke must have the same values. [Table 591](#) shows the options used in this example.

**Table 591: Phase 1 and Phase 2 Options for AutoVPN Hub and Spoke iBGP Active-Backup Tunnel Configurations**

Option	Value
<i>IKE proposal:</i>	
Authentication method	RSA digital certificates
Diffie-Hellman (DH) group	2
Authentication algorithm	SHA-1
Encryption algorithm	AES 128 CBC
<i>IKE policy:</i>	
Mode	Main
<i>IPsec proposal:</i>	
Protocol	ESP
Authentication algorithm	HMAC MD5 96
Encryption algorithm	DES CBC
<i>IPsec policy:</i>	
Perfect Forward Secrecy (PFS) group	14

The same certificate authority (CA) is configured on all devices.

**NOTE:** Junos OS only supports a single level of certificate hierarchy.

[Table 592](#) shows the options configured on the hub and on the spoke.

Table 592: AutoVPN IBGP Active-Backup Tunnel Configuration for Hub and Spoke 1

Option	Hub	Spoke 1
<i>IKE gateway:</i>		
Remote IP address	hub-to-spoke-gw-1: Dynamic	spoke-to-hub-gw-1: 1.1.1.1
	hub-to-spoke-gw-2: Dynamic	spoke-to-hub-gw-2: 1.1.2.1
Remote IKE ID	hub-to-spoke-gw-1: DN on the spoke's certificate with the string <b>SLT</b> in the OU field	spoke-to-hub-gw-1: DN on the hub's certificate
	hub-to-spoke-gw-2: DN on the spoke's certificate with the string <b>SBU</b> in the OU field	spoke-to-hub-gw-2: DN on the hub's certificate
Local IKE ID	DN on the hub's certificate	DN on the spoke's certificate
External interface	hub-to-spoke-gw-1: ge-0/0/1.0	spoke-to-hub-gw-1: fe-0/0/1.0
	hub-to-spoke-gw-2: ge-0/0/2.0	spoke-to-hub-gw-2: fe-0/0/2.0
<i>VPN:</i>		
Bind interface	hub-to-spoke-vpn-1: st0.0	spoke-to-hub-1: st0.0
	hub-to-spoke-vpn-2: st0.1	spoke-to-hub-2: st0.1
VPN monitor	hub-to-spoke-vpn-1: ge-0/0/1.0 (source interface)	spoke-to-hub-1: 1.1.1.1 (destination IP)
	hub-to-spoke-vpn-2: ge-0/0/2.0 (source interface)	spoke-to-hub-2: 1.1.2.1 (destination IP)
Establish tunnels	(not configured)	Immediately on configuration commit

Routing information for all devices is exchanged through the VPN tunnels.

**NOTE:** In this example, the default security policy that permits all traffic is used for all devices. More restrictive security policies should be configured for production environments. See [“Security Policies Overview” on page 1065](#).

### Topology

[Figure 301](#) shows the SRX Series devices to be configured for AutoVPN in this example.

Figure 301: AutoVPN Deployment with iBGP and Active-Backup Tunnels

In this example, two IPsec VPN tunnels are established between the hub and spoke 1. Routing information is exchanged through iBGP sessions in each tunnel. The longest prefix match for the route to 60.60.60.0/24 is through the st0.0 interface on the hub. Thus, the primary tunnel for the route is through the st0.0 interfaces on the hub and spoke 1. The default route is through the backup tunnel on the st0.1 interfaces on the hub and spoke 1.

VPN monitoring checks the status of the tunnels. If there is a problem with the primary tunnel (for example, the remote tunnel gateway is not reachable), the tunnel status changes to down and data destined for 60.60.60.0/24 is rerouted through the backup tunnel.

## Configuration

To configure AutoVPN, perform these tasks:

**NOTE:** The first section describes how to obtain CA and local certificates online using the Simple Certificate Enrollment Protocol (SCEP) on the hub and spoke devices.

- [Enroll Device Certificates with SCEP on page 6829](#)
- [Configuring the Hub on page 6833](#)
- [Configuring Spoke 1 on page 6840](#)

### Enroll Device Certificates with SCEP

#### Step-by-Step Procedure

To enroll digital certificates with SCEP on the hub:

1. Configure the CA.

```
[edit]
user@host# set security pki ca-profile ca-profile1 ca-identity ca-profile1
user@host# set security pki ca-profile ca-profile1 enrollment url
http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set security pki ca-profile ca-profile1 revocation-check disable
user@host# commit
```

2. Enroll the CA certificate.

```
user@host> request security pki ca-certificate enroll ca-profile ca-profile1
```

Type **yes** at the prompt to load the CA certificate.

3. Generate a key pair for each certificate.

```
user@host> request security pki generate-key-pair certificate-id Local1
user@host> request security pki generate-key-pair certificate-id Local2
```

4. Enroll the local certificates.

```
user@host> request security pki local-certificate enroll ca-profile ca-profile1
certificate-id Local1 domain-name example.net email hub@example.net ip-address
1.1.1.1 subject
DC=example.net,CN=hub,OU=SLT,O=example,L=Bangalore,ST=KA,C=IN
challenge-password <password>
user@host> request security pki local-certificate enroll ca-profile ca-profile1
certificate-id Local2 domain-name example.net email hub_backup@example.net
ip-address 1.1.2.1 subject
DC=example.net,CN=hub_backup,OU=SBU,O=example,L=Bangalore,ST=KA,C=IN
challenge-password <password>
```

5. Verify the local certificates.

```
user@host> show security pki local-certificate certificate-id Local1 detail
```

```

**Step-by-Step Procedure** To enroll digital certificates with SCEP on spoke 1:

1. Configure the CA.

```

[edit]
user@host# set security pki ca-profile ca-profile1 ca-identity ca-profile1
user@host# set security pki ca-profile ca-profile1 enrollment url
http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set security pki ca-profile ca-profile1 revocation-check disable
user@host# commit

```

2. Enroll the CA certificate.

```

user@host> request security pki ca-certificate enroll ca-profile ca-profile1

```

Type **yes** at the prompt to load the CA certificate.

3. Generate a key pair for each certificate.

```

user@host> request security pki generate-key-pair certificate-id Local1
user@host> request security pki generate-key-pair certificate-id Local2

```

4. Enroll the local certificates.

```

user@host> request security pki local-certificate enroll ca-profile ca-profile1
certificate-id Local1 domain-name example.net email spoke1@example.net
ip-address 2.2.2.1 subject
DC=example.net,CN=spoke1,OU=SLT,O=example,L=Mysore,ST=KA,C=IN

```

**NOTE:** The organizational unit (OU) shown in the subject field is SLT for Local1 and SBU for Local2. The IKE configurations on the hub include OU=SLT and OU=SBU to identify the spoke.

### Configuring the Hub

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/1 unit 0 family inet address 1.1.1.1/30

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the hub:

1. Configure the interfaces.

```

[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 1.1.1.1/30
user@host# set ge-0/0/2 unit 0 family inet address 1.1.2.1/30
user@host# set ge-0/0/3 unit 0 family inet address 50.50.50.1/24
user@host# set st0 unit 0 multipoint
user@host# set st0 unit 0 family inet address 10.10.10.1/24
user@host# set st0 unit 1 multipoint
user@host# set st0 unit 1 family inet address 20.20.20.1/24

```

2. Configure routing protocol.

```

[edit policy-options]
user@host# set policy-statement lan_nw from interface ge-0/0/3.0
user@host# set policy-statement lan_nw then accept

```

```

[edit protocols bgp]
user@host# set group ibgp-1 type internal
user@host# set group ibgp-1 local-address 10.10.10.1
user@host# set group ibgp-1 export lan_nw
user@host# set group ibgp-1 cluster 1.2.3.4
user@host# set group ibgp-1 allow 10.10.10.0/24

```

```

user@host# set group ibgp-2 type internal

```

```

user@host# set group ibgp-2 local-address 20.20.20.1
user@host# set group ibgp-2 export lan_nw
user@host# set group ibgp-2 cluster 1.2.3.5
user@host# set group ibgp-2 allow 20.20.20.0/24

```

```

[edit routing-options]
user@host# set static route 2.2.2.0/30 next-hop 1.1.1.2
user@host# set static route 3.3.3.0/30 next-hop 1.1.2.2
user@host# set autonomous-system 10

```

### 3. Configure Phase 1 options.

```

[edit security ike proposal ike-proposal]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-128-cbc

```

```

[edit security ike policy ike-policy-1]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local1

```

```

[edit security ike policy ike-policy-2]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local2

```

```

[edit security ike gateway hub-to-spoke-gw-1]
user@host# set ike-policy ike-policy-1
user@host# set dynamic distinguished-name wildcard OU=SLT
user@host# set dynamic ike-user-type group-ike-id
user@host# set local-identity distinguished-name
user@host# set external-interface ge-0/0/1.0

```

```

[edit security ike gateway hub-to-spoke-gw-2]
user@host# set ike-policy ike-policy-2
user@host# set dynamic distinguished-name wildcard OU=SBU
user@host# set dynamic ike-user-type group-ike-id
user@host# set local-identity distinguished-name
user@host# set external-interface ge-0/0/2.0

```

### 4. Configure Phase 2 options.

```

[edit security ipsec vpn-monitor]
user@host# set options interval 5
user@host# set options threshold 2

```

```

[edit security ipsec proposal ipsec-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-md5-96
user@host# set encryption-algorithm des-cbc

```

```

[edit security ipsec policy vpn-policy]
user@host# set perfect-forward-secrecy keys group14

```

```
user@host# set proposals ipsec-proposal
```

```
[edit security ipsec vpn hub-to-spoke-vpn-1]
user@host# set bind-interface st0.0
user@host# set vpn-monitor source-interface ge-0/0/1.0
user@host# set ike gateway hub-to-spoke-gw-1
user@host# set ike ipsec-policy vpn-policy
```

```
[edit security ipsec vpn hub-to-spoke-vpn-2]
user@host# set bind-interface st0.1
user@host# set vpn-monitor source-interface ge-0/0/2.0
user@host# set ike gateway hub-to-spoke-gw-2
user@host# set ike ipsec-policy vpn-policy
```

5. Configure zones.

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces st0.0
user@host# set interfaces ge-0/0/1.0
user@host# set interfaces ge-0/0/2.0
user@host# set interfaces st0.1
```

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/3.0
```

6. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

7. Configure the CA profile.

```
[edit security pki]
user@host# set ca-profile ca-profile1 ca-identity ca-profile1
user@host# set ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set ca-profile ca-profile1 revocation-check disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security zones**, **show security policies**, and **show security pki** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

### Configuring Spoke 1

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces fe-0/0/1 unit 0 family inet address 2.2.2.1/30
set interfaces fe-0/0/2 unit 0 family inet address 3.3.3.1/30
set interfaces fe-0/0/4 unit 0 family inet address 60.60.60.1/24
set interfaces st0 unit 0 family inet address 10.10.10.2/24
set interfaces st0 unit 1 family inet address 20.20.20.2/24
set policy-options policy-statement default_route from protocol static

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure spoke 1:

1. Configure interfaces.

```
[edit interfaces]
user@host# set fe-0/0/1 unit 0 family inet address 2.2.2.1/30
user@host# set fe-0/0/2 unit 0 family inet address 3.3.3.1/30
user@host# set fe-0/0/4 unit 0 family inet address 60.60.60.1/24
user@host# set st0 unit 0 family inet address 10.10.10.2/24
user@host# set st0 unit 1 family inet address 20.20.20.2/24
```

2. Configure routing protocol.

```
[edit policy-options]
user@host# set policy-statement default_route from protocol static
user@host# set policy-statement default_route from route-filter 0.0.0.0/0 exact
user@host# set policy-statement default_route then accept
user@host# set policy-statement lan_nw from interface fe-0/0/4.0
user@host# set policy-statement lan_nw then accept
```

```
[edit protocols bgp]
user@host# set group ibgp-1 type internal
user@host# set group ibgp-1 local-address 10.10.10.2
user@host# set group ibgp-1 export lan_nw
user@host# set group ibgp-1 neighbor 10.10.10.1
```

```
user@host# set group ibgp-2 type internal
user@host# set group ibgp-2 local-address 20.20.20.2
user@host# set group ibgp-2 export default_route
user@host# set group ibgp-2 neighbor 20.20.20.1
```

```
[edit routing-options]
user@host# set static route 1.1.1.0/30 next-hop 2.2.2.2
user@host# set static route 1.1.2.0/30 next-hop 3.3.3.2
user@host# set static route 0.0.0.0/0 next-hop st0.1
user@host# set autonomous-system 10
```

3. Configure Phase 1 options.

```
[edit security ike proposal ike-proposal]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group2
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-128-cbc
```

```
[edit security ike policy ike-policy-1]
user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local1
```

```
[edit security ike policy ike-policy-2]
```

```

user@host# set mode main
user@host# set proposals ike-proposal
user@host# set certificate local-certificate Local2

```

```

[edit security ike gateway spoke-to-hub-gw-1]
user@host# set ike-policy ike-policy-1
user@host# set address 1.1.1.1
user@host# set local-identity distinguished-name
user@host# set remote-identity distinguished-name
user@host# set external-interface fe-0/0/1.0

```

```

[edit security ike gateway spoke-to-hub-gw-2]
user@host# set ike-policy ike-policy-2
user@host# set address 1.1.2.1
user@host# set local-identity distinguished-name
user@host# set remote-identity distinguished-name
user@host# set external-interface fe-0/0/2.0

```

4. Configure Phase 2 options.

```

[edit security ipsec vpn-monitor]
user@host# set options interval 5
user@host# set options threshold 2

```

```

[edit security ipsec proposal ipsec-proposal]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-md5-96
user@host# set encryption-algorithm des-cbc

```

```

[edit security ipsec policy vpn-policy]
user@host# set perfect-forward-secrecy keys group14
user@host# set proposals ipsec-proposal

```

```

[edit security ipsec vpn spoke-to-hub-1]
user@host# set bind-interface st0.0
user@host# set vpn-monitor destination-ip 1.1.1.1
user@host# set ike gateway spoke-to-hub-gw-1
user@host# set ike ipsec-policy vpn-policy
user@host# set establish-tunnels immediately

```

```

[edit security ipsec vpn spoke-to-hub-2]
user@host# set bind-interface st0.1
user@host# set vpn-monitor destination-ip 1.1.2.1
user@host# set ike gateway spoke-to-hub-gw-2
user@host# set ike ipsec-policy vpn-policy
user@host# set establish-tunnels immediately

```

5. Configure zones.

```

[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces fe-0/0/1.0
user@host# set interfaces st0.0
user@host# set interfaces fe-0/0/2.0

```

```
user@host# set interfaces st0.1
```

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces fe-0/0/4.0
```

6. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

7. Configure the CA profile.

```
[edit security pki]
user@host# set ca-profile ca-profile1 ca-identity ca-profile1
user@host# set ca-profile ca-profile1 enrollment url
 http://systest-pc4/certsrv/mscep/mscep.dll
user@host# set ca-profile ca-profile1 revocation-check disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security zones**, **show security policies**, and **show security pki** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces
fe-0/0/1 {
 unit 0 {
 family inet {
 address 2.2.2.1/30;
 }
 }
}

## Verification

Confirm that the configuration is working properly.

- [Verifying IKE Phase 1 Status \(Both Tunnels Are Up\) on page 6848](#)
- [Verifying IPsec Phase 2 Status \(Both Tunnels Are Up\) on page 6848](#)
- [Verifying IPsec Next-Hop Tunnels \(Both Tunnels Are Up\) on page 6849](#)
- [Verifying BGP \(Both Tunnels Are Up\) on page 6849](#)
- [Verifying Learned Routes \(Both Tunnels Are Up\) on page 6850](#)
- [Verifying IKE Phase 1 Status \(Primary Tunnel Is Down\) on page 6850](#)
- [Verifying IPsec Phase 2 Status \(Primary Tunnel Is Down\) on page 6851](#)
- [Verifying IPsec Next-Hop Tunnels \(Primary Tunnel Is Down\) on page 6851](#)
- [Verifying BGP \(Primary Tunnel Is Down\) on page 6851](#)
- [Verifying Learned Routes \(Primary Tunnel Is Down\) on page 6852](#)

### Verifying IKE Phase 1 Status (Both Tunnels Are Up)

**Purpose** Verify the IKE Phase 1 status when both IPsec VPN tunnels are up.

**Action** From operational mode, enter the **show security ike security-associations** command.

```
user@host> show security ike security-associations
Index State Initiator cookie Responder cookie Mode Remote Address
3733075 UP d4f51c28c0a82101 05b125993a864d3c Main 3.3.3.1
3733076 UP d53c8a0b7d4c319b c23c5f7a26388247 Main 2.2.2.1
```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 1 proposal parameters must match on the hub and spoke.

### Verifying IPsec Phase 2 Status (Both Tunnels Are Up)

**Purpose** Verify the IPsec Phase 2 status when both IPsec VPN tunnels are up.

**Action** From operational mode, enter the **security ipsec security-associations** command.

```
user@host> security ipsec security-associations
Total active tunnels: 2
ID Algorithm SPI Life:sec/kb Mon vsys Port Gateway
<268173316 ESP:des/ md5 3cd96946 3555/ unlim U root 500 2.2.2.1
>268173316 ESP:des/ md5 1c09b9b 3555/ unlim U root 500 2.2.2.1
<268173313 ESP:des/ md5 7c6ffca3 3340/ unlim U root 500 3.3.3.1
>268173313 ESP:des/ md5 33bf6f2f 3340/ unlim U root 500 3.3.3.1
```

**Meaning** The **show security ipsec security-associations** command lists all active IKE Phase 2 SAs. If no SAs are listed, there was a problem with Phase 2 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 2 proposal parameters must match on the hub and spoke.

### Verifying IPsec Next-Hop Tunnels (Both Tunnels Are Up)

**Purpose** Verify the IPsec next-hop tunnels.

**Action** From operational mode, enter the **show security ipsec next-hop-tunnels** command.

```
user@host> show security ipsec next-hop-tunnels
Next-hop gateway interface IPSec VPN name Flag IKE-ID
 XAUTH username
10.10.10.2 st0.0 hub-to-spoke-vpn-1 Auto C=IN,
DC=example.net, ST=KA, L=Mysore, O=example, OU=SLT, CN=spoke1
20.20.20.2 st0.1 hub-to-spoke-vpn-2 Auto C=IN,
DC=example.net, ST=KA, L=Mysore, O=example, OU=SBU, CN=spoke1_backup
```

**Meaning** The next-hop gateways are the IP addresses for the **st0** interfaces of the spoke. The next hop should be associated with the correct IPsec VPN name.

### Verifying BGP (Both Tunnels Are Up)

**Purpose** Verify that BGP references the IP addresses for the **st0** interfaces of the spoke when both IPsec VPN tunnels are up.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@host> show bgp summary
Groups: 2 Peers: 2 Down peers: 0
Unconfigured peers: 2
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 2 2 0 0 0 0 0

1/1/1/0 0/0/0/0
```

### Verifying Learned Routes (Both Tunnels Are Up)

**Purpose** Verify that routes to the spoke have been learned when both tunnels are up. The route to 60.60.60.0/24 is through the st0.0 interface and the default route is through the st0.1 interface.

**Action** From operational mode, enter the **show route 60.60.60.0** command.

```
user@host> show route 60.60.60.0
inet.0: 48 destinations, 48 routes (47 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

60.60.60.0/24 *[BGP/170] 00:01:11, localpref 100
 AS path: I
 > to 10.10.10.2 via st0.0
```

From operational mode, enter the **show route 0.0.0.0** command.

```
user@host> show route 0.0.0.0
inet.0: 48 destinations, 48 routes (47 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

0.0.0.0/0 *[BGP/170] 00:04:55, localpref 100
 AS path: I
 > to 20.20.20.2 via st0.1
```

### Verifying IKE Phase 1 Status (Primary Tunnel Is Down)

**Purpose** Verify the IKE Phase 1 status when the primary tunnel is down.

**Action** From operational mode, enter the **show security ike security-associations** command.

```
user@host> show security ike security-associations
Index State Initiator cookie Responder cookie Mode Remote Address
3733075 UP d4f51c28c0a82101 05b125993a864d3c Main 3.3.3.1
3733076 UP d53c8a0b7d4c319b c23c5f7a26388247 Main 2.2.2.1
```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. If no SAs are listed, there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 1 proposal parameters must match on the hub and spoke.

### Verifying IPsec Phase 2 Status (Primary Tunnel Is Down)

**Purpose** Verify the IPsec Phase 2 status when the primary tunnel is down.

**Action** From operational mode, enter the **security ipsec security-associations** command.

```
user@host> security ipsec security-associations
Total active tunnels: 1
ID Algorithm SPI Life:sec/kb Mon vsys Port Gateway
<268173313 ESP:des/ md5 7c6ffca3 3156/ unlim U root 500 3.3.3.1
>268173313 ESP:des/ md5 33bf6f2f 3156/ unlim U root 500 3.3.3.1
```

**Meaning** The **show security ipsec security-associations** command lists all active IKE Phase 2 SAs. If no SAs are listed, there was a problem with Phase 2 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 2 proposal parameters must match on the hub and spoke.

### Verifying IPsec Next-Hop Tunnels (Primary Tunnel Is Down)

**Purpose** Verify the IPsec next-hop tunnel.

**Action** From operational mode, enter the **show security ipsec next-hop-tunnels** command.

```
user@host> show security ipsec next-hop-tunnels
Next-hop gateway interface IPsec VPN name Flag IKE-ID
 XAUTH username
20.20.20.2 st0.1 hub-to-spoke-vpn-2 Auto C=IN,
DC=example.net, ST=KA, L=Mysore, O=example, OU=SBU, CN=spoke1_backup
```

**Meaning** The next-hop gateways are the IP addresses for the **st0** interfaces of the spoke. The next hop should be associated with the correct IPsec VPN name, in this case the backup VPN tunnel.

### Verifying BGP (Primary Tunnel Is Down)

**Purpose** Verify that BGP references the IP addresses for the **st0** interfaces of the spoke when the primary tunnel is down.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@host> show bgp summary
Groups: 2 Peers: 1 Down peers: 0
Unconfigured peers: 1
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 1 1 0 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
20.20.20.2 10 20 24 0 0 7:24
1/1/1/0 0/0/0/0
```

### Verifying Learned Routes (Primary Tunnel Is Down)

**Purpose** Verify that routes to the spoke have been learned when the primary tunnel is down. Both the route to 60.60.60.0/24 and the default route are through the st0.1 interface.

**Action** From operational mode, enter the **show route 60.60.60.0** command.

```
user@host> show route 60.60.60.0
inet.0: 46 destinations, 46 routes (45 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

0.0.0.0/0 * [BGP/170] 00:07:41, localpref 100
 AS path: I
 > to 20.20.20.2 via st0.1
```

From operational mode, enter the **show route 0.0.0.0** command.

```
user@host> show route 0.0.0.0
inet.0: 46 destinations, 46 routes (45 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

0.0.0.0/0 * [BGP/170] 00:07:47, localpref 100
 AS path: I
 > to 20.20.20.2 via st0.1
```

## Understanding Auto Discovery VPN

---

AutoVPN deployments can use the Auto Discovery VPN (ADVPN) protocol to dynamically establish spoke-to-spoke VPN tunnels. When passing traffic from one spoke to another spoke, the hub can suggest that the spokes establish a direct security association (SA), called a shortcut, between each other. Shortcuts can be established and torn down dynamically between spokes, resulting in better network resource utilization and less reliance on a centrally located hub.

- [ADVPN Protocol on page 6853](#)
- [Establishing a Shortcut on page 6854](#)
- [Shortcut Initiator and Responder Roles on page 6855](#)
- [Shortcut Attributes on page 6855](#)
- [Shortcut Termination on page 6856](#)
- [ADVPN Configuration Limitations on page 6857](#)

## ADVPN Protocol

The ADVPN protocol is an extension of IKEv2 that allows a shortcut to be created between two VPN peers. Devices that support the ADVPN protocol send an ADVPN\_SUPPORTED notification in the IKEv2 Notify payload during the initial IKE exchange. A device that supports ADVPN can act as either a shortcut suggester or a shortcut partner, but not both. This shortcut capability information, along with the ADVPN version number, is also exchanged.

## Establishing a Shortcut

An IPsec VPN gateway can act as a shortcut suggester when it notices that traffic is exiting a tunnel with one of its peers and entering a tunnel with another peer. [Figure 302](#) shows traffic from Spoke 1 to Spoke 3 passing through the hub.

**Figure 302: Spoke-to-Spoke Traffic Passing Through Hub**

When ADVPN is configured on the devices, ADVPN shortcut capability information is exchanged between the hub and spokes. As long as Spokes 1 and 3 have previously advertised ADVPN shortcut partner capability to the hub, the hub can suggest that Spokes 1 and 3 establish a shortcut between each other.

The shortcut suggester uses its already established IKEv2 SAs with the peers to begin a shortcut exchange with one of the two peers. If the peer accepts the shortcut exchange, then the shortcut suggester begins a shortcut exchange with the other peer. The shortcut exchange includes information to allow the peers (referred to as shortcut partners) to establish IKE and IPsec SAs with each other. The creation of the shortcut between the shortcut partners starts only after both peers accept the shortcut exchange.

[Figure 303](#) shows traffic passing through a shortcut between Spokes 1 and 3. Traffic from Spoke 1 to Spoke 3 does not need to traverse the hub.

Figure 303: Spoke-to-Spoke Traffic Passing Through Shortcut

Shortcut Initiator and Responder Roles

The shortcut suggester chooses one of the shortcut partners to act as the initiator for the shortcut; the other partner acts as the responder. If one of the partners is behind a NAT device, then the partner behind the NAT device is chosen as the initiator. If none of the partners is behind a NAT device, then the suggester randomly chooses one of the partners as the initiator; the other partner acts as the responder. If both partners are behind NAT devices, then a shortcut cannot be created between them; the suggester does not send a shortcut exchange to any of the peers.

The shortcut suggester begins the shortcut exchange with the responder first. If the responder accepts the shortcut suggestion, then the suggester notifies the initiator.

Using information contained in the shortcut suggester’s notification, the shortcut initiator establishes an IKEv2 exchange with the responder, and a new IPsec SA is established between the two partners. On each partner, the route to the network behind its partner now points to the shortcut instead of to the tunnel between the partner and the suggester. Traffic originating behind one of the partners that is destined to a network behind the other shortcut partner flows over the shortcut.

If the partners decline the shortcut suggestion, then the partners notify the suggester with the reason for the rejection. In this case, traffic between the partners continues to flow through the shortcut suggester.

Shortcut Attributes

The shortcut receives some of its attributes from the shortcut suggester while other attributes are inherited from the suggester-partner VPN tunnel configuration. [Table 593](#) shows the parameters of the shortcut.

Table 593: Shortcut Parameters

Attributes	Received/Inherited From
ADVPN	Configuration

Table 593: Shortcut Parameters (*continued*)

Attributes	Received/Inherited From
Antireplay	Configuration
Authentication algorithm	Configuration
Dead peer detection	Configuration
DF bit	Configuration
Encryption algorithm	Configuration
Establish tunnels	Suggester
External interface	Configuration
Gateway policy	Configuration
General IKE ID	Configuration
IKE version	Configuration

Local identity	Suggester
NAT traversal	Configuration
Perfect forward secrecy	Configuration
Protocol	Configuration
Proxy ID	Not applicable
Remote address	Suggester
Remote identity	Suggester
Respond bad SPI	Configuration
Traffic selector	Not applicable

## Shortcut Termination

By default, the shortcut lasts indefinitely. Shortcut partners terminate the shortcut if traffic falls below a specified rate for a specified time. By default, the shortcut is terminated if traffic falls below 5 packets per second for 900 seconds; the idle time and

idle threshold values are configurable for partners. The shortcut can be manually deleted on either shortcut partner with the **clear security ike security-association** or **clear security ipsec security-association** commands to clear the corresponding IKE or IPsec SA. Either of the shortcut partners can terminate the shortcut at any time by sending an IKEv2 delete payload to the other shortcut partner.

When the shortcut is terminated, the corresponding IKE SA and all child IPsec SAs are deleted. After the shortcut is terminated, the corresponding route is deleted on both shortcut partners and traffic between the two peers again flows through the suggester. Shortcut termination information is sent from a partner to the suggester.

The lifetime of a shortcut is independent of the tunnel between the shortcut suggester and shortcut partner. The shortcut is not terminated simply because the tunnel between the suggester and partner is terminated.

## ADVPN Configuration Limitations

Note the following limitations when configuring ADVPN:

- You can only configure a shortcut suggester or partner for site-to-site VPNs.
- You cannot configure both suggester and partner roles on the same gateway. When ADVPN is enabled on a gateway, you cannot disable both suggester and partner roles on the gateway.
- As mentioned previously, you cannot create a shortcut between partners that are both behind NAT devices. The suggester can initiate a shortcut exchange if only one of the partners is behind a NAT device or if no partners are behind NAT devices.
- Only the OSPF dynamic routing protocol is supported with ADVPN; RIP and BGP are not supported.

The following configurations are not supported with ADVPN:

- IKEv1
- Policy-based VPN
- IKEv2 configuration payload
- Traffic selectors
- Preshared key
- Point-to-point secure tunnel interfaces

## Understanding Traffic Routing with Shortcut Tunnels

Tunnel flaps or catastrophic changes can cause both static tunnels and shortcut tunnels to go down. When this happens, traffic to a specific destination might be routed through an unexpected shortcut tunnel instead of through an expected static tunnel.

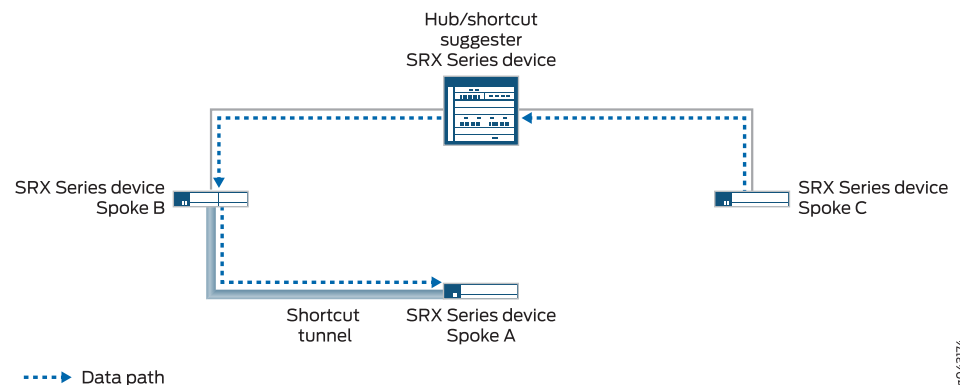

In Figure 304, static tunnels exist between the hub and each of the spokes. OSPF adjacencies are established between the hub and spokes. Spoke A also has a shortcut tunnel with Spoke B and OSPF adjacencies are established between the spokes. The hub (the shortcut suggester) recognizes that if connectivity between the hub and Spoke A goes down, Spoke A's network can be reached through the shortcut tunnel between Spoke B and Spoke A.

**Figure 304: Static Tunnels and Shortcut Tunnel Established in Hub-and-Spoke Network**

In Figure 305, the static tunnel between the hub and Spoke A is down. If there is new traffic from Spoke C to Spoke A, Spoke C forwards the traffic to the hub because it does not have a shortcut tunnel with Spoke A. The hub does not have an active static tunnel with Spoke A but it recognizes that there is a shortcut tunnel between Spoke A and Spoke B, so it forwards the traffic from Spoke C to Spoke B.

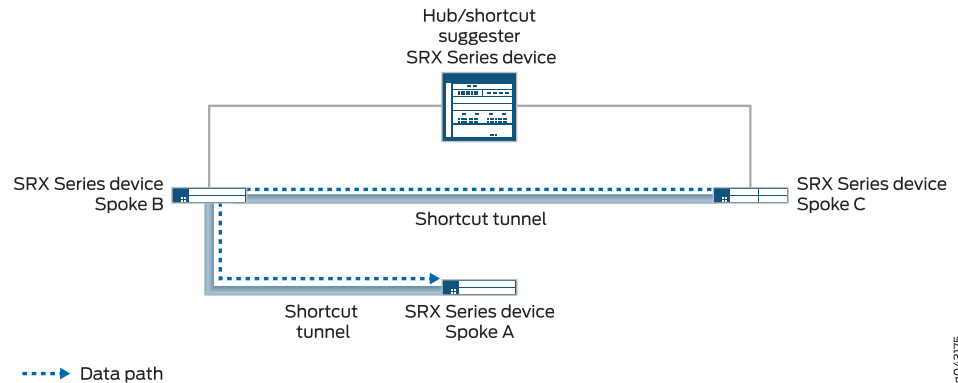

**Figure 305: Traffic Path from Spoke C to Spoke A**

As long as both Spoke B and Spoke C support Auto Discovery VPN (ADVPN) partner capability, the hub can suggest that the spokes establish a direct shortcut between each other. This occurs even though there is no direct traffic between the two spokes. Traffic from Spoke C to Spoke A travels through the shortcut tunnel between Spoke C and Spoke B, and then through the shortcut tunnel between Spoke B and Spoke A (see [Figure 306](#)).

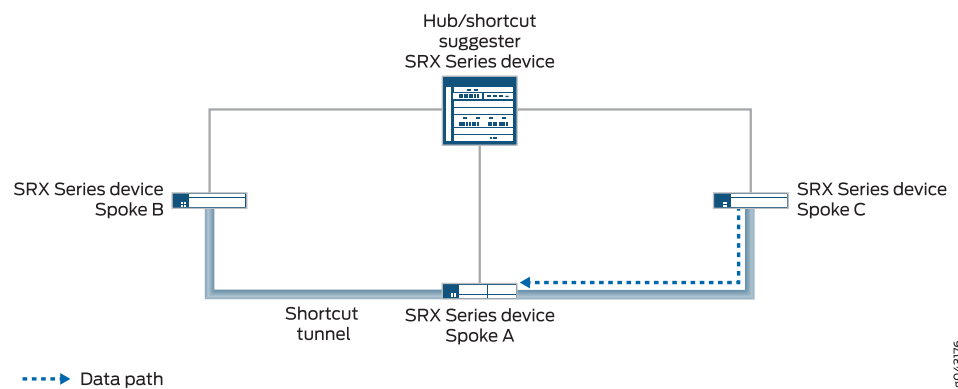

**Figure 306: Traffic Path from Spoke C to Spoke A Through Shortcut Tunnels**

g04375

When the static tunnel between the hub and Spoke A is reestablished, the tunnel is advertised to all spokes. Spoke C learns that there is a better route to reach Spoke A; instead of passing traffic through Spoke B, it forwards traffic for Spoke A to the hub. The hub suggests that a shortcut tunnel be established between Spoke C and Spoke A. When the shortcut tunnel is established between Spoke C and Spoke A, traffic flows through the shortcut tunnel (see [Figure 307](#)). Traffic between Spoke C and Spoke A no longer travels through Spoke B, and the shortcut tunnel between Spoke B and Spoke C eventually disappears.

**Figure 307: Traffic Path from Spoke C to Spoke A Through Shortcut Tunnel**

g04376

**NOTE:** You can use the `connection-limit` option at the `[edit security ike gateway gateway-name advpn partner]` hierarchy level to set the maximum number of shortcut tunnels that can be created with different shortcut partners using a particular gateway. The maximum number, which is also the default, is platform-dependent.

## Example: Improving Network Resource Utilization with Auto Discovery VPN Dynamic Tunnels

---

If you are deploying an AutoVPN network, you might be able to increase your network resource utilization by configuring Auto Discovery VPN (ADVPN). In AutoVPN networks, VPN traffic flows through the hub even when the traffic is travelling from one spoke to another. ADVPN allows VPN tunnels to be established dynamically between spokes, which can result in better network resource utilization. Use this example to configure ADVPN to enable dynamic spoke-to-spoke VPN tunnels in your AutoVPN network.

- [Requirements on page 6860](#)
- [Overview on page 6861](#)
- [Configuration on page 6863](#)
- [Verification on page 6882](#)

### Requirements

This example uses the following hardware and software components:

- Three supported SRX Series devices as AutoVPN hub and spokes.
- Junos OS Release 12.3X48-D10 or later releases that support ADVPN.
- Digital certificates enrolled in the hub and spokes that allow the devices to authenticate each other.

Before you begin:

1. Obtain the address of the certificate authority (CA) and the information they require (such as the challenge password) when you submit requests for local certificates. See [“Understanding Local Certificate Requests” on page 6665](#).
2. Enroll the digital certificates in each device. See [“Understanding Certificate Loading” on page 6671](#).

**NOTE:** This example uses the OSPF dynamic routing protocol as well as static route configurations to forward packets through VPN tunnels. You should be familiar with the OSPF dynamic routing protocol that is used to forward packets through the VPN tunnels. For more information about specific requirements for using dynamic routing protocols, see the *Routing Protocols Overview for Security Devices*.

## Overview

This example shows the configurations of an AutoVPN hub and two spokes for ADVPN. The spokes establish IPsec VPN connections to the hub, which allows them to communicate with each other as well as to access resources on the hub. While traffic is initially passed from one spoke to the other through the hub, ADVPN allows the spokes to establish a direct security association between each other. The hub acts as the shortcut suggester. On the hub, the ADVPN configuration disables the **partner** role. On the spokes, ADVPN configuration disables the **suggester** role.

Certain Phase 1 and Phase 2 IKE tunnel options configured on the AutoVPN hub and spokes must have the same values. [Table 594](#) shows the values used in this example.

**Table 594: Phase 1 and Phase 2 Options for AutoVPN Hub and Spokes for ADVPN Example**

Option	Value
<i>IKE proposal:</i>	
Authentication method	rsa-signatures
Diffie-Hellman (DH) group	group5
Authentication algorithm	sha1
Encryption algorithm	aes-256-cbc
<i>IKE policy:</i>	
Certificate	local-certificate
<i>IKE gateway:</i>	
Version	v2-only
<i>IPsec proposal:</i>	
Protocol	esp
Authentication algorithm	hmac-sha1-96
Encryption algorithm	aes-256-cbc

**Table 594: Phase 1 and Phase 2 Options for AutoVPN Hub and Spokes for ADVPN Example** (*continued*)

Option	Value
<i>IPsec policy:</i>	
Perfect Forward Secrecy (PFS) group	group5

The IKE gateway configuration on the hub and spokes include remote and local values that identify VPN peers. [Table 595](#) shows the IKE gateway configuration for the hub and spokes in this example.

**Table 595: IKE Gateway Configuration for ADVPN Example**

Option	Hub	Spokes
Remote IP address	Dynamic	Spoke 1: 11.1.1.1 Spoke 2: 11.1.1.1
Local IP address	11.1.1.1	Spoke 1: 21.1.1.2 Spoke 2: 31.1.1.2
Remote IKE ID	Distinguished name (DN) with the string “XYZ” in the organization (O) field and “Sales” in the organization unit (OU) field in the spokes’ certificates	DN with the string “Sales” in the OU field in the hub’s certificate
Local IKE ID	DN on the hub’s certificate	DN on the spokes’ certificate

The hub authenticates the spokes’ IKE ID if the subject fields of the spokes’ certificates contain the string “XYZ” in the O field and “Sales” in the OU field.

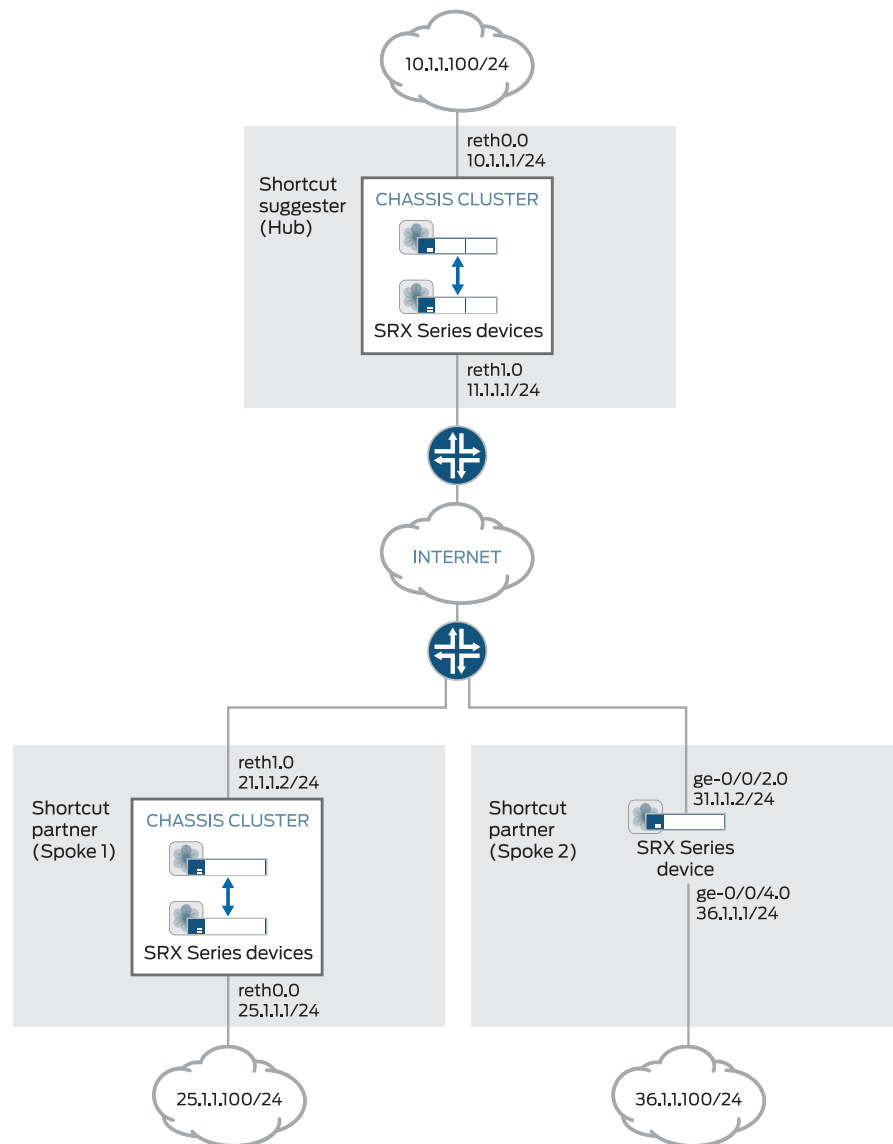

**NOTE:** In this example, the default security policy that permits all traffic is used for all devices. More restrictive security policies should be configured for production environments. See [“Security Policies Overview” on page 1065](#).

### Topology

### Configuring the Suggester (Hub)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the suggester:

1. Configure interfaces.

```

[edit interfaces]
user@host# set ge-0/0/3 gigether-options redundant-parent reth0
user@host# set ge-0/0/4 gigether-options redundant-parent reth1
user@host# set ge-7/0/3 gigether-options redundant-parent reth0
user@host# set ge-7/0/4 gigether-options redundant-parent reth1
user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth0 unit 0 family inet address 10.1.1.1/24
user@host# set reth1 redundant-ether-options redundancy-group 1
user@host# set reth1 unit 0 family inet address 11.1.1.1/24
user@host# set st0 unit 1 multipoint
user@host# set st0 unit 1 family inet address 172.16.1.1/24

```

2. Configure the routing protocol and static routes.

```

[edit protocols ospf]
user@host# set graceful-restart restart-duration 300
user@host# set graceful-restart notify-duration 300
user@host# set graceful-restart no-strict-lsa-checking
user@host# set area 0.0.0.0 interface st0.1 interface-type p2mp
user@host# set area 0.0.0.0 interface st0.1 metric 10
user@host# set area 0.0.0.0 interface st0.1 retransmit-interval 1
user@host# set area 0.0.0.0 interface st0.1 dead-interval 40
user@host# set area 0.0.0.0 interface st0.1 demand-circuit
user@host# set area 0.0.0.0 interface st0.1 dynamic-neighbors
user@host# set area 0.0.0.0 interface reth0.0

```

```

[edit routing-options]
user@host# set graceful-restart
user@host# set static route 21.1.1.0/24 next-hop 11.1.1.2
user@host# set static route 31.1.1.0/24 next-hop 11.1.1.2
user@host# set router-id 172.16.1.1

```

3. Configure Phase 1 options.

```

[edit security ike proposal IKE_PROP]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group5
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-256-cbc

```

```

[edit security ike policy IKE_POL]

```

```
user@host# set proposals IKE_PROP
user@host# set certificate local-certificate Suggester_Certificate_ID
```

```
[edit security ike gateway SUGGESTER_GW]
user@host# set ike-policy IKE_POL
user@host# set dynamic distinguished-name wildcard O=XYZ,OU=Sales
user@host# set dynamic ike-user-type group-ike-id
user@host# set dead-peer-detection
user@host# set local-identity distinguished-name
user@host# set external-interface reth1.0
user@host# set local-address 11.1.1.1
user@host# set advpn partner disable
user@host# set version v2-only
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal IPSEC_PROP]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm aes-256-cbc
```

```
[edit security ipsec policy IPSEC_POL]
user@host# set perfect-forward-secrecy keys group5
user@host# set proposals IPSEC_PROP
```

```
[edit security isec vpn SUGGESTER_VPN]
user@host# set bind-interface st0.1
user@host# set ike gateway SUGGESTER_GW
user@host# set ike ipsec-policy IPSEC_POL
```

5. Configure certificate information.

```
[edit security pki]
user@host# set ca-profile advpn ca-identity advpn
user@host# set ca-profile advpn enrollment url
 http://10.157.92.176:8080/scep/advpn/
```

6. Configure zones.

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces st0.1
user@host# set interfaces reth0.0
```

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces reth1.0
```

7. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security pki**, **show security zones**, and **show security policies** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure spoke 1:

1. Configure interfaces.

```

[edit interfaces]
user@host# set ge-0/0/3 gigether-options redundant-parent reth0
user@host# set ge-0/0/4 gigether-options redundant-parent reth1
user@host# set ge-7/0/3 gigether-options redundant-parent reth0
user@host# set ge-7/0/4 gigether-options redundant-parent reth1
user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth0 unit 0 family inet address 25.1.1.1/24
user@host# set reth1 redundant-ether-options redundancy-group 1
user@host# set reth1 unit 0 family inet address 21.1.1.2/24
user@host# set st0 unit 1 multipoint
user@host# set st0 unit 1 family inet address 172.16.1.2/24

```

2. Configure the routing protocol and static routes.

```

[edit protocols ospf]
user@host# set graceful-restart restart-duration 300
user@host# set graceful-restart notify-duration 300
user@host# set graceful-restart no-strict-lsa-checking
user@host# set area 0.0.0.0 interface st0.1 interface-type p2mp
user@host# set area 0.0.0.0 interface st0.1 metric 15

```

```
user@host# set area 0.0.0.0 interface st0.1 retransmit-interval 1
user@host# set area 0.0.0.0 interface st0.1 dead-interval 40
user@host# set area 0.0.0.0 interface st0.1 demand-circuit
user@host# set area 0.0.0.0 interface st0.1 dynamic-neighbors
user@host# set protocols ospf area 0.0.0.0 interface reth0.0
```

```
[edit routing-options]
user@host# set graceful-restart
user@host# set static route 11.1.1.0/24 next-hop 21.1.1.1
user@host# set static route 31.1.1.0/24 next-hop 21.1.1.1
user@host# set router-id 172.16.1.2
```

3. Configure Phase 1 options.

```
[edit security ike proposal IKE_PROP]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group5
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-256-cbc
```

```
[edit security ike policy IKE_POL]
user@host# set proposals IKE_PROP
user@host# set certificate local-certificate Partner1_Certificate_ID
```

```
[edit security ike gateway PARTNER_GW]
user@host# set ike-policy IKE_POL
user@host# set address 11.1.1.1
user@host# set local-identity distinguished-name
user@host# set remote-identity distinguished-name container OU=Sales
user@host# set external-interface reth1
user@host# set local-address 21.1.1.2
user@host# set advpn suggerter disable
user@host# set advpn partner
user@host# set version v2-only
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal IPSEC_PROP]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm aes-256-cbc
```

```
[edit security ipsec policy IPSEC_POL]
user@host# set perfect-forward-secrecy keys group5
user@host# set proposals IPSEC_PROP
```

```
[edit security isec vpn PARTNER_VPN]
user@host# set bind-interface st0.1
user@host# set ike gateway PARTNER_GW
user@host# set ike ipsec-policy IPSEC_POL
user@host# set establish-tunnels immediately
```

5. Configure certificate information.

```
[edit security pki]
user@host# set ca-profile advpn ca-identity advpn
```

```
user@host# set ca-profile advpn enrollment url
http://10.157.92.176:8080/scep/advpn/
```

6. Configure zones.

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces st0.1
user@host# set interfaces reth0.0
```

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces reth1.0
```

7. Configure the default security policy.

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security pki**, **show security zones**, and **show security policies** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure spoke 2:

1. Configure interfaces.

```

[edit interfaces]
user@host# set ge-0/0/2 unit 0 family inet address 31.1.1.2/24
user@host# set ge-0/0/4 unit 0 family inet address 36.1.1.1/24
user@host# set st0 unit 1 multipoint
user@host# set st0 unit 1 family inet address 172.16.1.3/24

```

2. Configure the routing protocol and static routes.

```
[edit protocols ospf]
user@host# set graceful-restart restart-duration 300
user@host# set graceful-restart notify-duration 300
user@host# set graceful-restart no-strict-lsa-checking
user@host# set area 0.0.0.0 interface st0.1 interface-type p2mp
user@host# set area 0.0.0.0 interface st0.1 metric 15
user@host# set area 0.0.0.0 interface st0.1 retransmit-interval 1
user@host# set area 0.0.0.0 interface st0.1 dead-interval 40
user@host# set area 0.0.0.0 interface st0.1 demand-circuit
user@host# set area 0.0.0.0 interface st0.1 dynamic-neighbors
user@host# set area 0.0.0.0 interface ge-0/0/4.0
```

```
[edit routing-options]
user@host# set graceful-restart
user@host# set static route 11.1.1.0/24 next-hop 31.1.1.1
user@host# set static route 21.1.1.0/24 next-hop 31.1.1.1
user@host# set router-id 172.16.1.3
```

3. Configure Phase 1 options.

```
[edit security ike proposal IKE_PROP]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group5
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-256-cbc
```

```
[edit security ike policy IKE_POL]
user@host# set proposals IKE_PROP
user@host# set certificate local-certificate Partner2_Certificate_ID
```

```
[edit security ike gateway PARTNER_GW]
user@host# set ike-policy IKE_POL
user@host# set address 11.1.1.1
user@host# set local-identity distinguished-name
user@host# set remote-identity distinguished-name container OU=Sales
user@host# set external-interface ge-0/0/2.0
user@host# set local-address 31.1.1.2
user@host# set advpn suggester disable
user@host# set advpn partner
user@host# set version v2-only
```

4. Configure Phase 2 options.

```
[edit security ipsec proposal IPSEC_PROP]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm aes-256-cbc
```

```
[edit security ipsec policy IPSEC_POL]
user@host# set perfect-forward-secrecy keys group5
user@host# set proposals IPSEC_PROP
```

```
[edit security isec vpn PARTNER_VPN]
user@host# set bind-interface st0.1
user@host# set ike gateway PARTNER_GW
```

```

user@host# set ike ipsec-policy IPSEC_POL
user@host# set establish-tunnels immediately

```

5. Configure certificate information.

```

[edit security pki]
user@host# set ca-profile advpn ca-identity advpn
user@host# set ca-profile advpn enrollment url
http://10.157.92.176:8080/scep/advpn/

```

6. Configure zones.

```

[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/4.0
user@host# set interfaces st0.1

```

```

[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces ge-0/0/2.0

```

7. Configure the default security policy.

```

[edit security policies]
user@host# set default-policy permit-all

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show routing-options**, **show security ike**, **show security ipsec**, **show security pki**, **show security zones**, and **show security policies** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly. First, verify that tunnels are established between the AutoVPN hub and spokes. When traffic is passed from one spoke to another through the hub, a shortcut can be established between the spokes. Verify that the shortcut partners have established a tunnel between them and that a route to the peer is installed on the partners.

- [Verifying Tunnels Between the Hub and Spokes on page 6882](#)
- [Verifying the Shortcut Tunnel Between Partners on page 6889](#)

### Verifying Tunnels Between the Hub and Spokes

**Purpose** Verify that tunnels are established between the AutoVPN hub and spokes. Initial traffic from one spoke to another must travel through the hub.

**Action** From operational mode, enter the **show security ike security-associations** and **show security ipsec security-associations** commands on the hub and spokes.

The following commands are entered on the hub:

```

user@host> show security ike security-associations
node1:

```

Index	State	Initiator cookie	Responder cookie	Mode	Remote Address

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. The **show security ipsec security-associations** command lists all active IKE Phase 2 SAs. The hub shows two active tunnels, one to each spoke. Each spoke shows an active tunnel to the hub.

If no SAs are listed for IKE Phase 1, then there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 1 proposal parameters must match on the hub and spokes.

If no SAs are listed for IKE Phase 2, then there was a problem with Phase 2 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 2 proposal parameters must match on the hub and spokes.

The **show route protocol ospf** command displays entries in the routing table that were learned from the OSPF protocol. The **show ospf neighbor** command displays information about OSPF neighbors.

### Verifying the Shortcut Tunnel Between Partners

**Purpose** The AutoVPN hub can act as a shortcut suggester when it notices that traffic is exiting a tunnel with one of its spokes and entering a tunnel with another spoke. A new IPsec SA, or shortcut, is established between the two shortcut partners. On each partner, the route to the network behind its partner now points to the shortcut tunnel instead of to the tunnel between the partner and the suggester (hub).

**Action** From operational mode, enter the **show security ike security-associations**, **show security ipsec security-associations**, **show route protocol ospf**, and **show ospf neighbor** commands on the spokes.

The following commands are entered on the hub:

```

user@host> show security ike security-associations
node0:

```

Index	State	Initiator cookie	Responder cookie	Mode	Remote Address
10957048	UP	2d58d8fbc396762d	46145be580c68be0	IKEv2	31.1.1.2
10957049	UP	fa05ee6d0f2cfb22	16f5ca836b118c0e	IKEv2	21.1.1.2

```

```

```

user@host> show ospf neighbor

```

Address	Interface	State	ID	Pri	Dead
172.16.1.2	st0.1	Full	172.16.1.2	128	-
172.16.1.1	st0.1	Full	172.16.1.1	128	-

**Meaning** The `show security ike security-associations` command lists all active IKE Phase 1 SAs. The `show security ipsec security-associations` command lists all active IKE Phase 2 SAs. The hub still shows two active tunnels, one to each spoke. Each spoke shows two active tunnels, one to the hub and one to its shortcut partner.

The `show route protocol ospf` command shows the addition of routes to the partner and to the hub.

## Enabling OSPF to Update Routes Quickly After ADVPN Shortcut Tunnels Are Established

**Problem** **Description:** OSPF can take up to 9 seconds to update a shortcut route in the routing table. It can take up to 10 seconds before traffic is forwarded to the shortcut tunnel.

**Symptoms:** When a shortcut tunnel is established between two shortcut partners, OSPF initiates an OSPF hello packet. Because of the timing of the shortcut tunnel establishment and the OSPF neighbor installation, the first packet in the tunnel might be dropped. This can cause OSPF to try again to establish an OSPF adjacency.

By default, the interval at which the OSPF retries to establish an adjacency is 10 seconds. After a shortcut tunnel is established, it can take more than 10 seconds for OSPF to establish an adjacency between the partners.

**Solution** Configuring a smaller retry interval, such as 1 or 2 seconds, can enable OSPF to establish adjacencies faster over the shortcut tunnel. For example, use the following configurations:

```
[edit]
set protocols ospf area 0.0.0.0 interface st0.1 retransmit-interval 1
set protocols ospf area 0.0.0.0 interface st0.1 dead-interval 40
```

## Understanding AutoVPN with Traffic Selectors

---

AutoVPN hubs can be configured with multiple traffic selectors to protect traffic to spokes. This feature provides the following benefits:

- A single VPN configuration can support many different peers.
- VPN peers can be non-SRX Series devices.
- A single peer can establish multiple tunnels with the same VPN.
- A larger number of tunnels can be supported than with AutoVPN with dynamic routing protocols.

When the hub-to-spoke tunnel is established, the hub uses auto route insertion (ARI), known in previous releases as *reverse route insertion (RRI)*, to insert the route to the spoke prefix in its routing table. The ARI route can then be imported to routing protocols and distributed to the core network.

AutoVPN with traffic selectors can be configured with the secure tunnel (st0) interface in point-to-point mode for both IKEv1 and IKEv2.

**NOTE:** Dynamic routing protocols are not supported on st0 interfaces when traffic selectors are configured.

Note the following caveats when configuring AutoVPN with traffic selectors:

- Dynamic routing protocols are not supported with traffic selectors with st0 interfaces in point-to-point mode.
- IPv6 addresses cannot be configured for traffic selectors on AutoVPN hubs. Only IPv4-in-IPv4 tunnel encapsulation is supported for traffic selectors on AutoVPN hubs; IPv4-in-IPv6, IPv6-in-IPv4, and IPv6-in-IPv6 tunnels are not supported.
- Auto Discovery VPN and IKEv2 configuration payload cannot be configured with AutoVPN with traffic selectors.
- Spokes can be non-SRX Series devices; however, note the following differences:
  - In IKEv2, a non-SRX Series spoke can propose multiple traffic selectors in a single SA negotiation. This is not supported on SRX Series devices and the negotiation is rejected.
  - A non-SRX Series spoke can identify specific ports or protocols for traffic selector use. Ports and protocols are not supported with traffic selectors on SRX Series devices and the negotiation is rejected.

## Example: Forwarding Traffic Through an AutoVPN Tunnel with Traffic Selectors

This example shows how to configure traffic selectors, instead of dynamic routing protocols, to forward packets through a VPN tunnel in an AutoVPN deployment. When traffic selectors are configured, the secure tunnel (st0) interface must be in point-to-point mode. Traffic selectors are configured on both the hub and spoke devices.

- [Requirements on page 6902](#)
- [Overview on page 6903](#)
- [Configuration on page 6905](#)
- [Verification on page 6915](#)

### Requirements

This example uses the following hardware and software components:

- Two SRX Series devices connected and configured in a chassis cluster. The chassis cluster is the AutoVPN hub.
- An SRX Series device configured as an AutoVPN spoke.

- Junos OS Release 12.3X48-D10 or later.
- Digital certificates enrolled in the hub and the spoke devices that allow the devices to authenticate each other.

Before you begin:

- Obtain the address of the certificate authority (CA) and the information they require (such as the challenge password) when you submit requests for local certificates. See [“Understanding Local Certificate Requests” on page 6665](#).
- Enroll the digital certificates in each device. See [“Understanding Certificate Loading” on page 6671](#).

## Overview

In this example, traffic selectors are configured on the AutoVPN hub and spoke. Only traffic that conforms to the configured traffic selector is forwarded through the tunnel. On the hub, the traffic selector is configured with the local IP address 80.0.0.0/8 and the remote IP address 172.0.0.0/8. On the spoke, the traffic selector is configured with the local IP address 172.0.0.0/8 and the remote IP address 80.0.0.0/8.

**NOTE:** The traffic selector IP addresses configured on the spoke can be a subset of the traffic selector IP addresses configured on the hub. This is known as traffic selector flexible match.

Certain Phase 1 and Phase 2 IKE tunnel options configured on the AutoVPN hubs and spokes must have the same values. [Table 596](#) shows the values used in this example:

**Table 596: Phase 1 and Phase 2 Options for AutoVPN Hubs and Spokes with Traffic Selectors**

Option	Value
<i>IKE proposal:</i>	
Authentication method	rsa-signatures
Diffie-Hellman (DH) group	group5
Authentication algorithm	sha-1
Encryption algorithm	aes-256-cbc
<i>IKE policy:</i>	
Mode	main
Certificate	local-certificate
<i>IKE gateway:</i>	

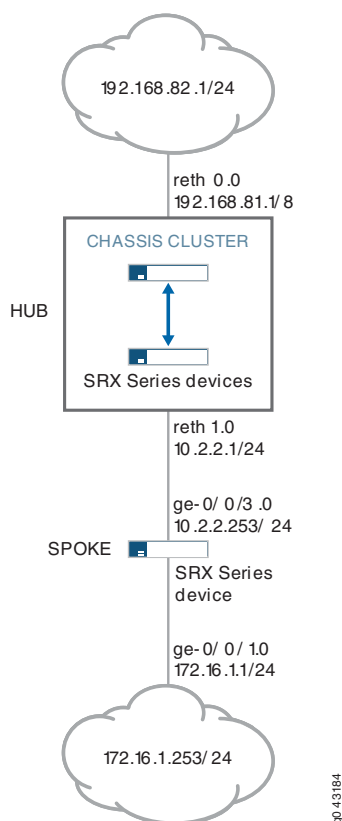

**Table 596: Phase 1 and Phase 2 Options for AutoVPN Hubs and Spokes with Traffic Selectors** (*continued*)

Option	Value
Dynamic	distinguished name wildcard DC=Common_component
IKE user type	group IKE id
Local identity	distinguished name
Version	v1-only
<i>IPsec proposal:</i>	
Protocol	esp
Authentication algorithm	hmac-sha1-96
Encryption algorithm	aes-192-cbc
Lifetime	3600 seconds
	150,000 kilobytes
<i>IPsec policy:</i>	
Perfect Forward Secrecy (PFS) group	group5

### Topology

Figure 309 shows the SRX Series devices to be configured for this example.

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the hub:

1. Configure interfaces.

```

[edit interfaces]
user@host# set ge-0/0/2 gigether-options redundant-parent reth1
user@host# set ge-0/0/3 gigether-options redundant-parent reth0
user@host# set ge-8/0/2 gigether-options redundant-parent reth1
user@host# set ge-8/0/3 gigether-options redundant-parent reth0
user@host# set lo0 unit 0 family inet address 100.100.1.100/24
user@host# set lo0 redundant-pseudo-interface-options redundancy-group 1
user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth0 unit 0 family inet address 80.1.1.1/8
user@host# set reth1 redundant-ether-options redundancy-group 1

```

```
user@host# set reth1 unit 0 family inet address 2.2.2.1/24
user@host# set st0 unit 1 family inet
```

2. Configure Phase 1 options.

```
[edit security ike proposal prop_ike]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group5
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-256-cbc
```

```
[edit security ike policy ikepol1]
user@host# set mode main
user@host# set proposals prop_ike
user@host# set certificate local-certificate Hub_ID
```

```
[edit security ike gateway HUB_GW]
user@host# set ike-policy ikepol1
user@host# set dynamic distinguished-name wildcard DC=Domain_component
user@host# set dynamic ike-user-type group-ike-id
user@host# set local-identity distinguished-name
user@host# set external-interface reth1
user@host# set version v1-only
```

3. Configure Phase 2 options.

```
[edit security ipsec proposal prop_ipsec]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm aes-192-cbc
user@host# set lifetime-seconds 3600
user@host# set lifetime-kilobytes 150000
```

```
[edit security ipsec policy ipsecpol1]
user@host# set perfect-forward-secrecy keys group5
user@host# set proposals prop_ipsec
```

```
[edit security ipsec HUB_VPN]
user@host# set bind-interface st0.1
user@host# set ike gateway HUB_GW
user@host# set ike ipsec-policy ipsecpol1
user@host# set traffic-selector ts1 local-ip 80.0.0.0/8
user@host# set traffic-selector ts1 remote-ip 172.0.0.0/8
```

4. Configure certificate information.

```
[edit security pki]
user@host# set ca-profile rsa ca-identity rsa
user@host# set ca-profile rsa revocation-check disable
```

5. Configure security zones.

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces st0.1
user@host# set interfaces reth0.0
```

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces lo0.0
user@host# set interfaces reth1.0
```

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security ike**, **show security ipsec**, **show security pki**, **show security zones**, and **show security policies** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

- [Verifying Traffic Selectors on page 6917](#)

### Verifying Tunnels

**Purpose** Verify that tunnels are established between the AutoVPN hub and spoke.

**Action** From operational mode, enter the **show security ike security-associations** and **show security ipsec security-associations** commands on the hub.

```

user@host> show security ike security-associations
node0:

```

Index	State	Initiator cookie	Responder cookie	Mode	Remote Address
1350248074	UP	d195bce6ccfcf9af	8f1569c6592c8408	Main	2.2.2.253

```

user@host> show security ipsec security-associations
node0:

```

```

Total active tunnels: 1
ID Algorithm SPI Life:sec/kb Mon 1sys Port Gateway
<77594650 ESP:aes-cbc-192/sha1 ac97cb1 2799/ 150000 - root 500 2.2.2.253
>77594650 ESP:aes-cbc-192/sha1 828dc013 2798/ 150000 - root 500 2.2.2.253

```

```

user@host> show security ipsec security-associations detail
node0:

```

```

Protocol: ESP, Authentication: hmac-sha1-96, Encryption: aes-cbc (192 bits)
Anti-replay service: counter-based enabled, Replay window size: 64
Location: FPC 1, PIC 0, KMD-Instance 1
Direction: outbound, SPI: ac97cb1, AUX-SPI: 0
Hard lifetime: Expires in 2991 seconds
Lifesize Remaining: 150000 kilobytes
Soft lifetime: Expires in 2369 seconds
Mode: Tunnel(0 0), Type: dynamic, State: installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: aes-cbc (192 bits)
Anti-replay service: counter-based enabled, Replay window size: 64

```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. The **show security ipsec security-associations** command lists all active IKE Phase 2 SAs. The hub shows one active tunnel to the spoke while the spoke shows one active tunnel to the hub.

If no SAs are listed for IKE Phase 1, then there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 1 proposal parameters must match on the hub and spoke.

If no SAs are listed for IKE Phase 2, then there was a problem with Phase 2 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 2 proposal parameters must match on the hub and spoke.

### Verifying Traffic Selectors

**Purpose** Verify the traffic selectors.

**Action** From operational mode, enter the **show security ipsec traffic-selector interface-name st0.1** command on the hub.

```

user@host> show security ipsec traffic-selector interface-name st0.1
node0:

```

```

Source IP Destination IP Interface
Tunnel-id IKE-ID
80.0.0.0-80.255.255.255 172.0.0.0-172.255.255.255 st0.1
77594650 DC=Domain_component, CN=Spoke1_ID, OU=Sales, O=XYZ, L=Sunnyvale,
ST=CA, C=US

```

From operational mode, enter the **show security ipsec traffic-selector interface-name st0.1** command on the spoke.

```

user@host> show security ipsec traffic-selector interface-name st0.1
Source IP Destination IP Interface
Tunnel-id IKE-ID
172.0.0.0-172.255.255.255 80.0.0.0-80.255.255.255 st0.1
69206018 DC=Domain_component, CN=Hub_ID, OU=Sales, O=XYZ, L=Sunnyvale,
ST=CA, C=US

```

**Meaning** A traffic selector (also known as a proxy ID in IKEv1) is an agreement between IKE peers to permit traffic through a tunnel if the traffic matches a specified pair of local and remote addresses. Only traffic that conforms to a traffic selector is permitted through an SA.

Traffic selectors are negotiated between the initiator and the responder (the SRX Series hub).

## Example: Ensuring VPN Tunnel Availability with AutoVPN and Traffic Selectors

Georedundancy is the deployment of multiple geographically distant sites so that traffic can continue to flow over a provider network even if there is a power outage, a natural disaster, or other catastrophic event that affects a site. In a mobile provider network, multiple Evolved Node B (eNodeB) devices can be connected to the core network through georedundant IPsec VPN gateways on SRX Series devices. The alternate routes to the eNodeB devices are distributed to the core network using a dynamic routing protocol.

This example configures AutoVPN hubs with multiple traffic selectors on SRX Series devices to ensure that there are georedundant IPsec VPN gateways to eNodeB devices. Auto route insertion (ARI) is used to automatically insert routes toward the eNodeB devices in the routing tables on the hubs. ARI routes are then distributed to the provider's core network through BGP.

- [Requirements on page 6918](#)
- [Overview on page 6919](#)
- [Configuration on page 6921](#)
- [Verification on page 6936](#)

## Requirements

This example uses the following hardware and software components:

- Two SRX Series devices connected and configured in a chassis cluster. The chassis cluster is AutoVPN hub A.
- An SRX Series device configured as AutoVPN hub B.
- Junos OS Release 12.3X48-D10 or later.
- eNodeB devices that can establish IPsec VPN tunnels with AutoVPN hubs. eNodeB devices are third-party network equipment providers that initiate a VPN tunnel with AutoVPN hubs.
- Digital certificates enrolled in the hubs and the eNodeB devices that allow the devices to authenticate each other.

Before you begin:

- Obtain the address of the certificate authority (CA) and the information they require (such as the challenge password) when you submit requests for local certificates. See [“Understanding Local Certificate Requests” on page 6665](#).

- Enroll the digital certificates in each device. See [“Understanding Certificate Loading” on page 6671](#).

**NOTE:** This example uses the BGP dynamic routing protocol to advertise routes toward the eNodeB devices to the core network. For more information about specific requirements for using dynamic routing protocols, see the *Routing Protocols Overview for Security Devices*.

## Overview

In this example, two AutoVPN hubs are configured with multiple traffic selectors on SRX Series devices to provide georedundant IPsec VPN gateways to eNodeB devices. ARI automatically inserts routes to the eNodeB devices in the routing tables on the hubs. ARI routes are then distributed to the provider's core network through BGP.

Certain Phase 1 and Phase 2 IKE tunnel options configured on the AutoVPN hubs and eNodeB devices must have the same values. [Table 597](#) shows the values used in this example:

**Table 597: Phase 1 and Phase 2 Options for Georedundant AutoVPN Hubs**

Option	Value
<i>IKE proposal:</i>	
Authentication method	rsa-signatures
Diffie-Hellman (DH) group	group5
Authentication algorithm	sha-1
Encryption algorithm	aes-256-cbc
<i>IKE policy:</i>	
Certificate	local-certificate
<i>IKE gateway:</i>	
Dynamic	distinguished name wildcard DC=Common_component
IKE user type	group IKE id
Dead peer detection	probe-idle-tunnel
Local identity	distinguished name
Version	v2-only

Table 597: Phase 1 and Phase 2 Options for Georedundant AutoVPN Hubs (*continued*)

Option	Value
<i>IPsec proposal:</i>	
Protocol	esp
Authentication algorithm	hmac-sha1-96
Encryption algorithm	aes-256-cbc
<i>IPsec policy:</i>	
Perfect Forward Secrecy (PFS) group	group5

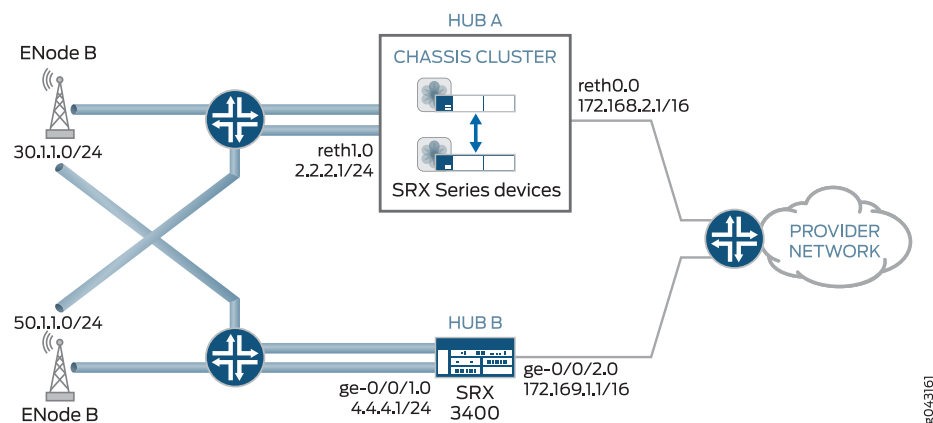

**NOTE:** In this example, the default security policy that permits all traffic is used for all devices. More restrictive security policies should be configured for production environments. See [“Security Policies Overview” on page 1065](#). For simplicity, the configuration on the SRX Series devices allows all types of inbound traffic; this configuration is not recommended for production deployments.

### Topology

Figure 310 shows the SRX Series devices to be configured for this example.

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure hub A:

1. Configure interfaces.

```

[edit interfaces]
user@host# set ge-0/0/2 gigether-options redundant-parent reth1
user@host# set ge-0/0/3 gigether-options redundant-parent reth0
user@host# set ge-8/0/2 gigether-options redundant-parent reth1
user@host# set ge-8/0/3 gigether-options redundant-parent reth0
user@host# set lo0 unit 0 family inet address 100.100.1.100/24
user@host# set lo0 redundant-pseudo-interface-options redundancy-group 1
user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth0 unit 0 family inet address 172.168.2.1/16
user@host# set reth1 redundant-ether-options redundancy-group 1
user@host# set reth1 unit 0 family inet address 2.2.2.1/24
user@host# set st0 unit 1 family inet

```

## 2. Configure Phase 1 options.

```
[edit security ike proposal prop_ike]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group5
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-256-cbc

[edit security ike policy ph1_ike_policy]
user@host# set proposals prop_ike
user@host# set certificate local-certificate HubA_certificate

[edit security ike gateway HUB_GW]
user@host# set ike-policy ph1_ike_policy
user@host# set dynamic distinguished-name wildcard DC=Common_component
user@host# set dynamic ike-user-type group-ike-id
user@host# set dead-peer-detection probe-idle-tunnel
user@host# set local-identity distinguished-name
user@host# set external-interface reth1
user@host# set version v2-only
```

## 3. Configure Phase 2 options.

```
[edit security ipsec proposal prop_ipsec]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm aes-256-cbc

[edit security ipsec policy ph2_ipsec_policy]
user@host# set perfect-forward-secrecy keys group5
user@host# set proposals prop_ipsec

[edit security ipsec vpn HUB_VPN]
user@host# set bind-interface st0.1
user@host# set ike gateway HUB_GW
user@host# set ike ipsec-policy ph2_ipsec_policy
user@host# set traffic-selector ts1 local-ip 172.0.0.0/8
user@host# set traffic-selector ts1 remote-ip 50.0.0.0/8
user@host# set traffic-selector ts2 local-ip 172.0.0.0/8
user@host# set traffic-selector ts2 remote-ip 30.0.0.0/8
```

## 4. Configure the BGP routing protocol.

```
[edit protocols bgp group internal-peers]
user@host# set type internal
user@host# set local-address 172.168.2.1
user@host# set export inject_ts1_routes
user@host# set export inject_ts2_routes
user@host# set export inject_up_routes
user@host# set neighbor 172.168.2.4
```

## 5. Configure routing options.

```
[edit policy-options policy-statement inject_ts1_routes]
user@host# set term cp_allow from protocol static
user@host# set term cp_allow from route-filter 30.1.2.0/24 orlonger
user@host# set term cp_allow from route-filter 30.1.1.0/24 orlonger
```

```

user@host# set term cp_allow then next-hop self
user@host# set term cp_allow then accept

```

```

[edit policy-options policy-statement inject_ts2_routes]
user@host# set term mp_allow from protocol static
user@host# set term mp_allow from route-filter 50.1.1.0/24 orlonger
user@host# set term mp_allow from route-filter 50.1.2.0/24 orlonger
user@host# set term mp_allow then next-hop self
user@host# set term mp_allow then accept

```

```

[edit policy-options policy-statement inject_up_routes]
user@host# set term up_allow from protocol static
user@host# set term up_allow from route-filter 172.168.1.0/24 orlonger
user@host# set term up_allow from route-filter 172.168.2.0/24 orlonger
user@host# set term up_allow then next-hop self
user@host# set term up_allow then accept

```

6. Configure certificate information.

```

[edit security pki]
user@host# set ca-profile csa ca-identity csa
user@host# set ca-profile csa revocation-check disable

```

7. Configure security zones.

```

[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces st0.1
user@host# set interfaces reth0.0

```

```

[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces lo0.0
user@host# set interfaces reth1.0

```

```

[edit security policies]
user@host# set default-policy permit-all

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security ike**, **show security ipsec**, **show protocols bgp**, **show policy-options**, **show security pki**, **show security zones**, and **show security policies** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

### Configuring Hub B

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/1 unit 0 family inet address 4.4.4.1/24
set interfaces ge-0/0/2 unit 0 family inet address 172.169.1.1/16
set interfaces lo0 unit 0 family inet address 100.100.1.101/24
set interfaces st0 unit 1 family inet
set security ike proposal prop_ike authentication-method rsa-signatures
set security ike proposal prop_ike dh-group group5
set security ike proposal prop_ike authentication-algorithm sha1
set security ike proposal prop_ike encryption-algorithm aes-256-cbc
set security ike policy ph1_ike_policy proposals prop_ike
set security ike policy ph1_ike_policy certificate local-certificate HubB_certificate
set security ike gateway HUB_GW ike-policy ph1_ike_policy
set security ike gateway HUB_GW dynamic distinguished-name wildcard
 DC=Common_component
set security ike gateway HUB_GW dynamic ike-user-type group-ike-id
set security ike gateway HUB_GW dead-peer-detection probe-idle-tunnel
set security ike gateway HUB_GW local-identity distinguished-name

```

```

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure hub B:

1. Configure interfaces.

```
[edit interfaces]
user@host# set ge-0/0/1 unit 0 family inet address 4.4.4.1/24
user@host# set ge-0/0/2 unit 0 family inet address 172.169.1.1/16
user@host# set lo0 unit 0 family inet address 100.100.1.101/24
user@host# set st0 unit 1 family inet
```

2. Configure Phase 1 options.

```
[edit security ike proposal prop_ike]
user@host# set authentication-method rsa-signatures
user@host# set dh-group group5
user@host# set authentication-algorithm sha1
user@host# set encryption-algorithm aes-256-cbc
```

```
[edit security ike policy ph1_ike_policy]
user@host# set proposals prop_ike
user@host# set certificate local-certificate HubB_certificate
```

```
[edit security ike gateway HUB_GW]
user@host# set ike-policy ph1_ike_policy
user@host# set dynamic distinguished-name wildcard DC=Common_component
user@host# set dynamic ike-user-type group-ike-id
user@host# set dead-peer-detection probe-idle-tunnel
user@host# set local-identity distinguished-name
user@host# set external-interface ge-0/0/1
user@host# set version v2-only
```

3. Configure Phase 2 options.

```
[edit security ipsec proposal prop_ipsec]
user@host# set protocol esp
user@host# set authentication-algorithm hmac-sha1-96
user@host# set encryption-algorithm aes-256-cbc
```

```
[edit security ipsec policy ph2_ipsec_policy]
user@host# set perfect-forward-secrecy keys group5
user@host# set proposals prop_ipsec
```

```
[edit security ipsec vpn HUB_VPN]
user@host# set bind-interface st0.1
user@host# set ike gateway HUB_GW
user@host# set ike ipsec-policy ph2_ipsec_policy
user@host# set traffic-selector ts1 local-ip 172.0.0.0/8
user@host# set traffic-selector ts1 remote-ip 50.0.0.0/8
user@host# set traffic-selector ts2 local-ip 172.0.0.0/8
user@host# set traffic-selector ts2 remote-ip 30.0.0.0/8
```

4. Configure the BGP routing protocol.

```
[edit protocols bgp group internal-peers]
user@host# set type internal
user@host# set local-address 172.169.1.1
user@host# set export inject_ts1_routes
user@host# set export inject_ts2_routes
user@host# set export inject_up_routes
user@host# set neighbor 172.169.1.2
```

5. Configure routing options.

```
[edit policy-options policy-statement inject_ts1_routes]
user@host# set term cp_allow from protocol static
user@host# set term cp_allow from route-filter 30.1.2.0/24 orlonger
user@host# set term cp_allow from route-filter 30.1.1.0/24 orlonger
user@host# set term cp_allow then next-hop self
user@host# set term cp_allow then accept
```

```
[edit policy-options policy-statement inject_ts2_routes]
user@host# set term mp_allow from protocol static
user@host# set term mp_allow from route-filter 50.1.1.0/24 orlonger
user@host# set term mp_allow from route-filter 50.1.2.0/24 orlonger
user@host# set term mp_allow then next-hop self
user@host# set term mp_allow then accept
```

```
[edit policy-options policy-statement inject_up_routes]
user@host# set term up_allow from protocol static
user@host# set term up_allow from route-filter 172.169.1.0/24 orlonger
user@host# set term up_allow from route-filter 172.169.2.0/24 orlonger
user@host# set term up_allow then next-hop self
user@host# set term up_allow then accept
```

6. Configure certificate information.

```
[edit security pki]
user@host# set ca-profile csa ca-identity csa
user@host# set ca-profile csa revocation-check disable
```

7. Configure security zones.

```
[edit security zones security-zone trust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces st0.1
user@host# set interfaces ge-0/0/2.0
```

```
[edit security zones security-zone untrust]
user@host# set host-inbound-traffic system-services all
user@host# set host-inbound-traffic protocols all
user@host# set interfaces lo0.0
user@host# set interfaces ge-0/0/1.0
```

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security ike**, **show security ipsec**, **show protocols bgp**, **show security pki**, **show security**

**zones**, and **show security policies** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring the eNodeB (Sample Configuration)

**Step-by-Step Procedure** The eNodeB configuration in this example is provided for reference. Detailed eNodeB configuration information is beyond the scope of this document. The eNodeB configuration must include the following information:

- Local certificate (X.509v3) and IKE identity information
- SRX Series IKE identity information and public IP address
- Phase 1 and Phase 2 proposals that match the configurations on the SRX Series hubs

**Results** The eNodeB devices in this example use strongSwan open source software for IPsec-based VPN connections:

```

config setup
 plutostart=yes
 plutodebug=all
 charondebug="ike 4, cfg 4, chd 4, enc 1"
 charonstart=yes #ikev2 daemon"
 nat_traversal=yes #<===== need to enable even no nat_t

conn %default
 ikelifetime=60m
 keylife=45m
 rekeymargin=2m
 keyingtries=4
 mobike=no

conn Hub_A
 keyexchange=ikev2
 authby=pubkey
 ike=aes256-sha-modp1536
 esp=aes256-sha1-modp1536
 leftcert=/usr/local/etc/ipsec.d/certs/fight02Req.pem.Email.crt
 left=5.5.5.1 # self if
 leftsubnet=30.1.1.0/24 # left subnet
 leftid="CN=fight02, DC=Common_component, OU=Dept, O=Company, L=City,
ST=CA, C=US " # self id
 right=2.2.2.1 # peer if

```

```

 rightsubnet=80.1.1.0/24 # peer net for proxy id
 rightid="DC=Domain_component, CN=HubA_certificate, OU=Dept, O=Company,
L=City, ST=CA, C=US " # peer id
 auto=add
 leftfirewall=yes
 dpdaction=restart
 dpddelay=10
 dpdtimeout=120
 rekeyfuzz=10%
 reauth=no

conn Hub_B
 keyexchange=ikev2
 authby=pubkey
 ike=aes256-sha-modp1536
 esp=aes192-sha1-modp1536
 leftcert=/usr/local/etc/ipsec.d/certs/fight02Req.pem.Email.crt
 left=5.5.5.1 # self if
 leftsubnet=30.1.1.0/24 # self net for proxy id
 leftid="CN=fight02, DC=Common_component, OU=Dept, O=Company, L=City,
ST=CA, C=US " # self id
 right=4.4.4.1 # peer if
 rightsubnet=80.1.1.0/24 # peer net for proxy id
 rightid="DC=Domain_component, CN=HubB_certificate, OU=Dept, O=Company,
L=City, ST=CA, C=US " # peer id
 auto=add
 leftfirewall=yes
 dpdaction=restart
 dpddelay=10
 dpdtimeout=120
 rekeyfuzz=10%
 reauth=no

```

## Verification

Confirm that the configuration is working properly.

- [Verifying Tunnels on the AutoVPN Hubs on page 6936](#)
- [Verifying Traffic Selectors on page 6937](#)
- [Verifying ARI Routes on page 6937](#)

### Verifying Tunnels on the AutoVPN Hubs

**Purpose** Verify that tunnels are established between the AutoVPN hub and eNodeB devices.

**Action** From operational mode, enter the **show security ike security-associations** and **show security ipsec security-associations** commands on the hub.

```

user@host> show security ike security-associations
node0:

```

```

Index State Initiator cookie Responder cookie Mode Remote Address
276505706 UP 16d6e53f0866b5cc ccd8ca944da7b63e IKEv2 5.5.5.1

```

```
1350247532 UP d5f0cb3a3b18cb92 91269f05527217a0 IKEv2 1.1.1.1
```

```
user@host> show security ipsec security-associations
node0:
```

```

Total active tunnels: 2
ID Algorithm SPI Life:sec/kb Mon lsys Port Gateway
<77594626 ESP:aes-cbc-192/sha1 a82bbc3 3600/ 64 - root 500 1.1.1.1
>77594626 ESP:aes-cbc-192/sha1 c930a858 3600/ 64 - root 500 1.1.1.1
<69206018 ESP:aes-cbc-192/sha1 2b437fc 3600/ 64 - root 500 5.5.5.1
>69206018 ESP:aes-cbc-192/sha1 c6e02755 3600/ 64 - root 500 5.5.5.1
```

**Meaning** The **show security ike security-associations** command lists all active IKE Phase 1 SAs. The **show security ipsec security-associations** command lists all active IKE Phase 2 SAs. The hub shows two active tunnels, one to each eNodeB device.

If no SAs are listed for IKE Phase 1, then there was a problem with Phase 1 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 1 proposal parameters must match on the hub and eNodeB devices.

If no SAs are listed for IKE Phase 2, then there was a problem with Phase 2 establishment. Check the IKE policy parameters and external interface settings in your configuration. Phase 2 proposal parameters must match on the hub and eNodeB devices.

### Verifying Traffic Selectors

**Purpose** Verify the traffic selectors.

**Action** From operational mode, enter the **show security ipsec traffic-selector interface-name st0.1** command.

```
user@host> show security ipsec traffic-selector interface-name st0.1
node0:
```

```

Source IP Destination IP Interface
Tunnel-id IKE-ID
80.1.1.0-80.1.1.255 30.1.1.0-30.1.1.255 st0.1
69206018 DC=Common_component, CN=enodebA, OU=Dept, O=Company, L=City, ST=CA, C=US
80.1.1.0-80.1.1.255 50.1.1.0-50.1.1.255 st0.1
77594626 DC=Common_component, CN=enodebB, OU=Dept, O=Company, L=City, ST=CA, C=US
```

**Meaning** A traffic selector (also known as a proxy ID in IKEv1) is an agreement between IKE peers to permit traffic through a tunnel if the traffic matches a specified pair of local and remote addresses. Only traffic that conforms to a traffic selector is permitted through an SA. Traffic selectors are negotiated between the initiator and the responder (the SRX Series hub).

### Verifying ARI Routes

**Purpose** Verify that the ARI routes are added to the routing table.

**Action** From operational mode, enter the **show route** command.

```

user@host> show route
inet.0: 23 destinations, 23 routes (22 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

1.1.0.0/16 *[Static/5] 02:57:57
 > to 2.2.2.253 via reth1.0
2.2.2.0/24 *[Direct/0] 02:58:43
 > via reth1.0
2.2.2.1/32 *[Local/0] 02:59:25
 Local via reth1.0
5.5.0.0/16 *[Static/5] 02:57:57
 > to 2.2.2.253 via reth1.0
10.0.0.0/8 *[Static/5] 21:54:52
 > to 10.157.64.1 via fxp0.0
10.157.64.0/19 *[Direct/0] 21:54:52
 > via fxp0.0
10.157.75.117/32 *[Local/0] 21:54:52
 Local via fxp0.0
10.254.75.117/32 *[Direct/0] 21:54:52
 > via lo0.0
30.1.1.0/24 *[Static/5] 02:28:10 [ARI route added based on TSi]
 > via st0.1
50.1.1.0/24 *[Static/5] 02:28:26
 > via st0.1
66.129.230.0/24 *[Static/5] 21:54:52
 > to 10.157.64.1 via fxp0.0
66.129.236.0/24 *[Static/5] 21:54:52
 > to 10.157.64.1 via fxp0.0
80.0.0.0/8 *[Direct/0] 02:57:57
 > via reth0.0
80.1.1.1/32 *[Local/0] 02:57:57
 Local via reth0.0
100.100.1.0/24 *[Direct/0] 02:57:57
 > via lo0.0
100.100.1.100/32 *[Local/0] 02:57:57
 Local via lo0.0
102.100.1.0/24 *[Static/5] 02:57:57
 > to 2.2.2.253 via reth1.0
104.100.1.0/24 *[Static/5] 02:57:57
 > to 2.2.2.253 via reth1.0
172.16.0.0/12 *[Static/5] 21:54:52
 > to 10.157.64.1 via fxp0.0
192.168.0.0/16 *[Static/5] 21:54:52
 > to 10.157.64.1 via fxp0.0
207.17.136.0/24 *[Static/5] 21:54:52
 > to 10.157.64.1 via fxp0.0
207.17.137.227/32 *[Static/5] 21:54:52
 > to 10.157.64.1 via fxp0.0

```

**Meaning** Auto route insertion (ARI) automatically inserts a static route for the remote network and hosts protected by a remote tunnel endpoint. A route is created based on the remote IP address configured in the traffic selector. In the case of traffic selectors, the configured remote address is inserted as a route in the routing instance associated with the st0 interface that is bound to the VPN.

Static routes to the eNodeB destinations 30.1.1.0/24 and 50.1.1.0/24 are added to the routing table on the SRX Series hub. These routes are reachable through the st0.1 interface.

### Understanding VPN Alarms and Auditing

---

Configure the following command to enable security event logging during the initial set up of the device.

#### **set security log cache**

The administrators (audit, cryptographic, IDS and security) cannot modify the security event logging configuration if the above command is configured and each administrator role is configured to have a distinct, unique set of privileges apart from all other administrative roles.

Alarms are triggered by a VPN failure. A VPN alarm is generated when the system monitors any of the following audited events:

- **Authentication failures**—You can configure the device to generate a system alarm when the packet authentication failures reaches a specified number.
- **Encryption and decryption failures**—You can configure the device to generate a system alarm when encryption or decryption failures exceed a specified number.
- **IKE Phase 1 and IKE Phase 2 failures**—Internet Key Exchange (IKE) Phase 1 negotiations are used to establish IKE security associations (SAs). These SAs protect the IKE Phase 2 negotiations. You can configure the device to generate a system alarm when IKE Phase 1 or IKE Phase 2 failures exceed a specified number.

- **Self-test failures**—Self tests are tests that a device runs upon power on or reboot to verify whether security software is implemented correctly on your device.

Self-tests ensure the correctness of cryptographic algorithms. The JUNOS-FIPS image performs self-tests automatically upon power-on, and continuously for key-pair generation. In either domestic or FIPS images, self-tests may be configured to be performed according to a defined schedule, upon demand or immediately after key generation.

You can configure the device to generate a system alarm when a self-test failure occurs.

- **IDP flow policy attacks**—An intrusion detection and prevention (IDP) policy allows you to enforce various attack detection and prevention techniques on network traffic. You can configure the device to generate a system alarm when IDP flow policy violations occur.
- **Replay attacks**—A replay attack is a network attack in which a valid data transmission is maliciously or fraudulently repeated or delayed. You can configure the device to generate a system alarm when a replay attack occurs.

The syslog messages are included in the following cases:

- Failed symmetric key generation
- Failed asymmetric key generation
- Failed manual key distribution
- Failed automated key distribution
- Failed key destruction
- Failed key handling and storage
- Failed data encryption or decryption
- Failed signature
- Failed key agreement
- Failed cryptographic hashing
- IKE failure
- Failed authentication of the received packets
- Decryption error due to invalid padding content
- Mismatch in the length specified in the alternative subject field of the certificate received from a remote VPN peer device.

Alarms are raised based on syslog messages. Every failure is logged, but an alarm is generated only when a threshold is reached.

To view the alarm information, run the **show security alarms** command. The violation count and the alarm do not persist across system reboots. After a reboot, the violation count resets to zero, and the alarm is cleared from the alarm queue.

After appropriate actions have been taken, you can clear the alarm. The alarm remains in the queue until you clear it (or until you reboot the device). To clear the alarm, run the **clear security alarms** command.

## Example: Setting an Audible Alert as Notification of a Security Alarm

This example shows how to configure a device to generate a system alert beep when a new security event occurs. By default, alarms are not audible.

- [Requirements on page 6945](#)
- [Overview on page 6945](#)
- [Configuration on page 6945](#)
- [Verification on page 6945](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you set an audible beep to be generated in response to a security alarm.

### Configuration

**Step-by-Step  
Procedure**

To set an audible alarm:

1. Enable security alarms.  
  
[edit]  
user@host# **edit security alarms**
2. Specify that you want to be notified of security alarms with an audible beep.  
  
[edit security alarms]  
user@host# **set audible**
3. If you are done configuring the device, commit the configuration.  
  
[edit security alarms]  
user@host# **commit**

### Verification

To verify the configuration is working properly, enter the **show security alarms detail** command.

**Related  
Documentation**

- [IPsec VPN Overview on page 6337](#)

## Example: Generating Security Alarms in Response to Potential Violations

---

This example shows how to configure the device to generate a system alarm when a potential violation occurs. By default, no alarm is raised when a potential violation occurs.

- [Requirements on page 6946](#)
- [Overview on page 6946](#)
- [Configuration on page 6946](#)
- [Verification on page 6948](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

In this example, you configure an alarm to be raised when:

- The number of authentication failures exceeds 6.
- The cryptographic self-test fails.
- The non-cryptographic self-test fails.
- The key generation self-test fails.
- The number of encryption failures exceeds 10.
- The number of decryption failures exceeds 1.
- The number of IKE Phase 1 failures exceeds 10.
- The number of IKE Phase 2 failure exceeds 1.
- A replay attack occurs.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security alarms potential-violation authentication 6
set security alarms potential-violation cryptographic-self-test
set security alarms potential-violation non-cryptographic-self-test
set security alarms potential-violation key-generation-self-test
set security alarms potential-violation encryption-failures threshold 10
set security alarms potential-violation decryption-failures threshold 1
set security alarms potential-violation ike-phase1-failures threshold 10
set security alarms potential-violation ike-phase2-failures threshold 1
set security alarms potential-violation replay-attacks
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure alarms in response to potential violations:

1. Enable security alarms.  

```
[edit]
user@host# edit security alarms
```
2. Specify that an alarm should be raised when an authentication failure occurs.  

```
[edit security alarms potential-violation]
user@host# set authentication 6
```
3. Specify that an alarm should be raised when a cryptographic self-test failure occurs.  

```
[edit security alarms potential-violation]
user@host# set cryptographic-self-test
```
4. Specify that an alarm should be raised when a non-cryptographic self-test failure occurs.  

```
[edit security alarms potential-violation]
user@host# set non-cryptographic-self-test
```
5. Specify that an alarm should be raised when a key generation self-test failure occurs.  

```
[edit security alarms potential-violation]
user@host# set key-generation-self-test
```
6. Specify that an alarm should be raised when an encryption failure occurs.  

```
[edit security alarms potential-violation]
user@host# set encryption-failures threshold 10
```
7. Specify that an alarm should be raised when a decryption failure occurs.  

```
[edit security alarms potential-violation]
user@host# set decryption-failures threshold 1
```
8. Specify that an alarm should be raised when an IKE Phase 1 failure occurs.  

```
[edit security alarms potential-violation]
user@host# set ike-phase1-failures threshold 10
```
9. Specify that an alarm should be raised when an IKE Phase 2 failure occurs.  

```
[edit security alarms potential-violation]
user@host# set ike-phase2-failures threshold 1
```
10. Specify that an alarm should be raised when a replay attack occurs.  

```
[edit security alarms potential-violation]
user@host# set replay-attacks
```

**Results** From configuration mode, confirm your configuration by entering the **show security alarms** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
```

```
user@host# show security alarms
potential-violation {
 authentication 6;
 cryptographic-self-test;
 decryption-failures {
 threshold 1;
 }
 encryption-failures {
 threshold 10;
 }
 ike-phase1-failures {
 threshold 10;
 }
 ike-phase2-failures {
 threshold 1;
 }
 key-generation-self-test;
 non-cryptographic-self-test;
 replay-attacks;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, from operational mode, enter the **show security alarms** command.

## Understanding VPN Monitoring and DPD

VPN monitoring and dead peer detection (DPD) are features available on SRX Series devices to verify the availability of VPN peer devices. This section compares the operation and configuration of these features.

**NOTE:** The SRX Series device responds to DPD messages sent by VPN peers even if DPD is not configured on the device. You can configure the SRX Series device to initiate DPD messages to VPN peers. You can also configure DPD and VPN monitoring to operate simultaneously on the same SRX Series device, although the number of peers that can be monitored with either method is reduced.

VPN monitoring is a Junos OS mechanism that monitors only Phase 2 security associations (SAs). VPN monitoring is enabled on a per-VPN basis with the **vpn-monitor** statement at the `[edit security ipsec vpn vpn-name]` hierarchy level. The destination IP and source interface must be specified. The **optimized** option enables the device to use traffic patterns as evidence of peer liveliness; ICMP requests are suppressed.

VPN monitoring options are configured with the **vpn-monitor-options** statement at the **[edit security ipsec]** hierarchy level. These options apply to all VPNs for which VPN monitoring is enabled. Options you can configure include the interval at which ICMP requests are sent to the peer (the default is 10 seconds) and the number of consecutive ICMP requests sent without receiving a response before the peer is considered unreachable (the default is 10 consecutive requests).

DPD is an implementation of RFC 3706, *A Traffic-Based Method of Detecting Dead Internet Key Exchange (IKE) Peers*. It operates at the IKE level and monitors the peer based on both IKE and IPsec traffic activity.

DPD is configured on an individual IKE gateway with the **dead-peer-detection** statement at the **[edit security ike gateway gateway-name]** hierarchy level. You can configure DPD modes of operation. The default (optimized) mode sends DPD messages to the peer if there is no incoming IKE or IPsec traffic within a configured interval after the local device sends outgoing packets to the peer. Other configurable options include the interval at which DPD messages are sent to the peer (the default is 10 seconds) and the number of consecutive DPD messages sent without receiving a response before the peer is considered unavailable (the default is five consecutive requests).

- Related Documentation**
- [Understanding Dead Peer Detection on page 6949](#)
  - [IPsec VPN Overview on page 6337](#)

## Understanding Dead Peer Detection

Dead peer detection (DPD) is a method that network devices use to verify the current existence and availability of other peer devices.

You can use DPD as an alternative to VPN monitoring. However, you cannot use both features simultaneously. VPN monitoring applies to an individual IPsec VPN, while DPD is configured only in an individual IKE gateway context.

A device performs DPD verification by sending encrypted IKE Phase 1 notification payloads (R-U-THERE messages) to a peer and waiting for DPD acknowledgements (R-U-THERE-ACK messages) from the peer. The device sends an R-U-THERE message only if it has not received any traffic from the peer during a specified DPD interval. If the device receives an R-U-THERE-ACK message from the peer during this interval, it considers the peer alive. If the device receives traffic on the tunnel from the peer, it resets its R-U-THERE message counter for that tunnel, thus starting a new interval. If the device does not receive an R-U-THERE-ACK message during the interval, it considers the peer dead. When the device changes the status of a peer device to be dead, the device removes the Phase 1 security association (SA) and all Phase 2 SAs for that peer.

The following DPD modes are supported on the SRX Series devices:

- **Optimized**—R-U-THERE messages are triggered if there is no incoming IKE or IPsec traffic within a configured interval after the device sends outgoing packets to the peer. This is the default mode.

- Probe idle tunnel—R-U-THERE messages are triggered if there is no incoming or outgoing IKE or IPsec traffic within a configured interval. R-U-THERE messages are sent periodically to the peer until there is traffic activity. This mode helps in early detection of a downed peer and makes the tunnel available for data traffic.
- Always send—R-U-THERE messages are sent at configured intervals regardless of traffic activity between the peers.

**NOTE:** We recommend that the probe idle tunnel mode be used instead of the always-send mode.

DPD timers are active as soon as the Phase 1 SA is established. The DPD behavior is the same for both IKEv1 and IKEv2 protocols.

You can configure the following DPD parameters:

- The interval parameter specifies the amount of time (expressed in seconds) the device waits for traffic from its peer before sending an R-U-THERE message. The default interval is 10 seconds, with a permissible range of 10 to 60 seconds.
- The threshold parameter specifies the maximum number of times to send the R-U-THERE message without a response from the peer before considering the peer dead. The default number of transmissions is five times, with a permissible range of 1 to 5 retries.

Note the following considerations before configuring DPD:

- When a DPD configuration is added to an existing gateway with active tunnels, R-U-THERE messages are started without clearing Phase 1 or Phase 2 SAs.
- When a DPD configuration is deleted from an existing gateway with active tunnels, R-U-THERE messages are stopped for the tunnels. IKE and IPsec SAs are not affected.
- Modifying any DPD configuration option such as the mode, interval, or threshold values updates the DPD operation without clearing Phase 1 or Phase 2 SAs.
- If the IKE gateway is configured with DPD and VPN but the option to establish tunnels immediately is not configured, DPD does not initiate Phase 1 negotiation.
- If the IKE gateway is configured with multiple peer IP addresses and DPD but Phase 1 SA fails to be established to the first peer IP address, a Phase 1 SA is attempted with the next peer IP address. DPD is active only after a Phase 1 SA is established.
- If the IKE gateway is configured with multiple peer IP addresses and DPD but DPD fails with the current peer's IP address, the Phase 1 and Phase 2 SAs are cleared and a failover to the next peer IP address is triggered.
- More than one Phase 1 or Phase 2 SA may exist with the same peer because of simultaneous negotiations. In this case, R-U-THERE messages are sent on all Phase 1 SAs. Failure to receive DPD responses for the configured number of consecutive times clears the Phase 1 SA and the associated Phase 2 SA (for IKEv2 only).

## Understanding VPN Monitoring

VPN monitoring uses ICMP echo requests (or pings) to determine if a VPN tunnel is up. When VPN monitoring is enabled, the security device sends pings through the VPN tunnel to the peer gateway or to a specified destination at the other end of the tunnel. Pings are sent by default at intervals of 10 seconds for up to 10 consecutive times. If no reply is received after 10 consecutive pings, the VPN is considered to be down and the IPsec security association (SA) is cleared.

VPN monitoring is enabled for a specified VPN by configuring the **vpn-monitor** option at the `[edit security ipsec vpn vpn-name]` hierarchy level. The peer gateway's IP address is the default destination; however, you can specify a different destination IP address (such as a server) at the other end of the tunnel. The local tunnel endpoint is the default source interface, but you can specify a different interface name.

The VPN monitoring **optimized** option sends pings only when there is outgoing traffic and no incoming traffic through the VPN tunnel. If there is incoming traffic through the VPN tunnel, the security device considers the tunnel to be active and does not send pings to the peer. Configuring the **optimized** option can save resources on the security device because pings are only sent when peer liveliness needs to be determined. Sending pings can also activate costly backup links that would otherwise not be used.

You can configure the interval at which pings are sent and the number of consecutive pings that are sent without a reply before the VPN is considered to be down. These are configured with the **interval** and **threshold** options, respectively, at the `[edit security ipsec vpn-monitor-options]` hierarchy level.

**NOTE:** VPN monitoring may cause tunnel flapping in some VPN environments if ping packets are not accepted by the peer based on the packet's source or destination IP address.

## Understanding Global SPI and VPN Monitoring Features

You can monitor and maintain the efficient operation of your VPN using the following global VPN features:

- **SPI—Peers** in a security association (SA) can become unsynchronized when one of the peers fails. For example, if one of the peers reboots, it might send an incorrect security parameter index (SPI). You can enable the device to detect such an event and resynchronize the peers by configuring the bad SPI response feature.

- VPN monitoring—You can use the global VPN monitoring feature to periodically send Internet Control Message Protocol (ICMP) requests to the peer to determine if the peer is reachable.

**Related  
Documentation**

- [IPsec VPN Overview on page 6337](#)
- [Example: Configuring Global SPI and VPN Monitoring Features on page 6952](#)

---

## Example: Configuring Global SPI and VPN Monitoring Features

- [Requirements on page 6952](#)
- [Overview on page 6952](#)
- [Configuration on page 6952](#)

### Requirements

Before you begin, understand global SPI and VPN monitoring features. See “[Understanding Global SPI and VPN Monitoring Features](#)” on page 6951.

### Overview

In this example, you configure the device to detect and respond five times to a bad IPsec SPI before deleting the SA and initiating a new one. You also configure the device to monitor the VPN by sending ICMP requests to the peer every 15 seconds, and to declare the peer unreachable after 15 unsuccessful pings.

### Configuration

**Step-by-Step  
Procedure**

To configure global VPN settings in the CLI editor:

1. Specify global VPN settings.

[edit]

user@host# **set security ike respond-bad-spi 5**

user@host# **set security ipsec vpn-monitor-options interval 15 threshold 15**

**Related  
Documentation**

## Understanding Tunnel Events

When there is a network problem related to a VPN, after the tunnel comes up only the tunnel status is tracked. Many issues can occur before the tunnel comes up. Hence, instead of tracking only the tunnel status, tunnel down issues, or negotiation failures, successful events such as successful IPsec SA negotiations, IPsec rekey, and IKE SA rekeys are now tracked. These events are called tunnel events.

For Phase 1 and Phase 2, negotiation events for a given tunnel are tracked along with the events that occur in external daemons like AUTHD or PKID. When a tunnel event occurs

multiple times, only one entry is maintained with the updated time and the number of times that event occurred.

Overall, 16 events are tracked: eight events for Phase 1 and eight events for Phase 2. Some events can reoccur and fill up the event memory, resulting in important events being removed. To avoid overwriting, an event is not stored unless a tunnel is down.

The following special events fall into this category:

- Lifetime in kilobytes expired for IPsec SA
- Hard lifetime of IPsec SA expired
- IPsec SA delete payload received from peer, corresponding IPsec SAs cleared
- Cleared unused redundant backup IPsec SA pairs
- IPsec SAs cleared as corresponding IKE SA deleted

AutoVPN tunnels are created and removed dynamically and consequently tunnel events corresponding to these tunnels are short lived. Sometimes these tunnel events cannot be associated with any tunnel so system logging is used for debugging instead.

# Improving IPsec VPN Traffic Performance

- [Understanding VPN Session Affinity on page 6955](#)
- [Enabling VPN Session Affinity on page 6957](#)
- [Accelerating the IPsec VPN Traffic Performance on page 6958](#)

## Understanding VPN Session Affinity

---

VPN session affinity occurs when a clear-text session is located in a Services Processing Unit (SPU) that is different from the SPU where the IPsec tunnel session is located. The goal of VPN session affinity is to locate the clear-text and IPsec tunnel session in the same SPU.

Without VPN session affinity, a clear-text session created by a flow might be located in one SPU and the tunnel session created by IPsec might be located in another SPU. An SPU to SPU forward or hop is needed to route clear-text packets to the IPsec tunnel.

By default, VPN session affinity is disabled on SRX Series devices. When VPN session affinity is enabled, a new clear-text session is placed on the same SPU as the IPsec tunnel session. Existing clear-text sessions are not affected.

Junos OS Release 15.1X49-D10 introduces the SRX5K-MPC3-100G10G (IOC3) and the SRX5K-MPC3-40G10G (IOC3) for SRX5400, SRX5600, and SRX5800 devices.

The SRX5K-MPC (IOC2) and the IOC3 support VPN session affinity through improved flow module and session cache. With IOCs, the flow module creates sessions for IPsec tunnel-based traffic before encryption and after decryption on its tunnel-anchored SPU and installs the session cache for the sessions so that the IOC can redirect the packets to the same SPU to minimize packet forwarding overhead. Express Path (previously known as services offloading) traffic and NP cache traffic share the same session cache table on the IOCs.

Enabling VPN session affinity can improve VPN throughput under the following traffic conditions:

- A number of IPsec tunnels are needed and they are distributed evenly among SPUs. If IPsec tunnels are already concentrated on several SPUs, then enabling VPN session affinity allows all clear-text SPUs to also use those SPUs. This can cause those SPUs to be overutilized while other SPUs might be underutilized.

To display active tunnel sessions on SPUs, use the **show security ipsec security-association** command and specify the Flexible PIC Concentrator (FPC) and Physical Interface Card (PIC) slots that contain the SPU. For example:

```
user@host> show security ipsec security-association fpc 3 pic 0
Total active tunnels: 1
ID Algorithm SPI Life:sec/kb Mon vsys Port Gateway
<131073 ESP:aes-128/sha1 18c4fd00 491/ 128000 - root 500 23.0.21.11
>131073 ESP:aes-128/sha1 188c0750 491/ 128000 - root 500 23.0.21.11
```

- Clear-text sessions passing through the tunnels should be at the highest volume for the longest periods of time as possible. Applying VPN session affinity to clear-text sessions of small volumes and short periods (for example, DNS sessions) will decrease the effect of session affinity and might even have a negative impact on VPN throughput under certain conditions.

**NOTE:** You need to evaluate the tunnel distribution and traffic patterns in your network to determine if VPN session affinity should be enabled.

The VPN session affinity limitations are as follows:

- Traffic across logical systems is not supported.
- If there is a route change, established clear-text sessions remain on an SPU and traffic is rerouted if possible. Sessions created after the route change may be set up on a different SPU.
- VPN session affinity only affects self traffic that terminates on the device (also known as host-inbound traffic); self traffic that originates from the device (also known as host-outbound traffic) is not affected.
- Multicast replication and forwarding performance is not affected.

## Enabling VPN Session Affinity

By default, VPN session affinity is disabled on SRX Series devices. Enabling VPN session affinity can improve VPN throughput under certain conditions. This section describes how to use the CLI to enable VPN session affinity.

Determine if clear-text sessions are being forwarded to IPsec tunnel sessions on a different SPU. Use the **show security flow session** command to display session information about clear-text sessions.

```
user@host> show security flow session
```

```
Flow Sessions on FPC3 PIC0:
```

```
Session ID: 600000001, Policy name: N/A, Timeout: N/A, Valid
```

```
In: 23.0.21.11/6204 --> 23.0.21.6/41264;esp, If: ge-0/0/2.0, Pkts: 0, Bytes: 0
```

```

```

```
Total sessions: 4
```

```
Flow Sessions on FPC6 PIC0:
```

```
Session ID: 1200000001, Policy name: N/A, Timeout: N/A, Valid
```

```
In: 23.0.21.11/0 --> 23.0.21.6/0;esp, If: ge-0/0/2.0, Pkts: 0, Bytes: 0
```

```
Session ID: 1200000002, Policy name: N/A, Timeout: N/A, Valid
```

```
In: 23.0.21.11/0 --> 23.0.21.6/0;esp, If: ge-0/0/2.0, Pkts: 0, Bytes: 0
```

```
Session ID: 120031730, Policy name: default-policy-00/2, Timeout: 1764, Valid
```

```
In: 22.0.20.155/53051 --> 26.0.20.156/23;tcp, If: ge-0/0/1.0, Pkts: 44, Bytes: 2399
```

```
Out: 26.0.20.156/23 --> 22.0.20.155/53051;tcp, If: st0.0, Pkts: 35, Bytes: 2449
```

```
Total sessions: 3
```

In the example, there is a tunnel session on FPC 3, PIC 0 and a clear-text session on FPC 6, PIC 0. A forwarding session (session ID 60017354) is set up on FPC 3, PIC 0.

**NOTE:** Junos OS Release 15.1X49-D10 introduces session affinity support on the IOC's (SRX5K-MPC [IOC2], SRX5K-MPC3-100G10G [IOC3], and SRX5K-MPC3-40G10G [IOC3]). You can enable session affinity for the IPsec tunnel session on the IOC FPCs.

To enable VPN session affinity:

1. In configuration mode, use the **set** command to enable VPN session affinity.

```
[edit]
user@host# set security flow load-distribution session-affinity ipsec
```

2. Check your changes to the configuration before committing.

```
[edit]
user@host# commit check
```

3. Commit the configuration.

```
[edit]
user@host# commit
```

After enabling VPN session affinity, use the **show security flow session** command to display session information about clear-text sessions.

```
user@host> show security flow session
Flow Sessions on FPC3 PIC0:

```

```
Session ID: 60017387, Policy name: default-policy-00/2, Timeout: 1796, Valid
In: 22.0.20.155/53053 --> 26.0.20.156/23;tcp, If: ge-0/0/1.0, Pkts: 10, Bytes: 610
Out: 26.0.20.156/23 --> 22.0.20.155/53053;tcp, If: st0.0, Pkts: 9, Bytes: 602
Total sessions: 4
```

```
Flow Sessions on FPC6 PIC0:
```

```
Session ID: 1200000001, Policy name: N/A, Timeout: N/A, Valid
In: 23.0.21.11/0 --> 23.0.21.6/0;esp, If: ge-0/0/2.0, Pkts: 0, Bytes: 0
```

```
Session ID: 1200000002, Policy name: N/A, Timeout: N/A, Valid
In: 23.0.21.11/0 --> 23.0.21.6/0;esp, If: ge-0/0/2.0, Pkts: 0, Bytes: 0
Total sessions: 2
```

After VPN session affinity is enabled, the clear-text session is always located on FPC 3, PIC 0.

## Accelerating the IPsec VPN Traffic Performance

You can accelerate the IPsec VPN performance by configuring the performance acceleration parameter. By default, VPN performance acceleration is disabled on SRX

Series devices. Enabling the VPN performance acceleration can improve the VPN throughput with VPN session affinity enabled.

This topic describes how to use the CLI to enable VPN performance acceleration.

**NOTE:** To enable performance acceleration, you must ensure that cleartext sessions and IPsec tunnel sessions are established on the same Services Processing Unit (SPU). For more information on enabling the session affinity, see [“Understanding VPN Session Affinity” on page 6955](#).

To enable IPsec VPN performance acceleration:

1. Enable VPN session affinity.

```
[edit]
user@host# set security flow load-distribution session-affinity ipsec
```

2. Enable IPsec performance acceleration.

```
[edit]
user@host# set security flow ipsec-performance-acceleration
```

3. Check your changes to the configuration before committing.

```
[edit]
user@host# commit check
```

4. Commit the configuration.

```
[edit]
user@host# commit
```

After enabling VPN performance acceleration, use the **show security flow status** command to display flow status.

```
Flow forwarding mode:
 Inet forwarding mode: flow based
 Inet6 forwarding mode: drop
 MPLS forwarding mode: drop
 ISO forwarding mode: drop
Flow trace status
 Flow tracing status: off
Flow session distribution
 Distribution mode: Hash-based
 Flow packet ordering
 Ordering mode: Hardware
Flow ipsec performance acceleration: on
```

## PART 90

# Troubleshooting

- [Tunnel Events on page 6963](#)

# Tunnel Events

- [Tunnel Events on page 6963](#)

## Tunnel Events

Tunnel events can include successful IPsec SA negotiations, IPsec and IKE SA rekeys, SA negotiation failures, and reasons for a tunnel going down. Tunnel events appear in the output for the **show security ipsec inactive-tunnel**, **show security ipsec inactive-tunnel detail**, and **show security ipsec security-association detail** commands. [Table 598](#) lists the tunnel events in alphabetical order. Each event includes a description and the action you can take.

**Table 598: IPsec VPN Tunnel Events**

Tunnel Event	Description	Action
Bind-interface's address deleted. Existing IPsec SAs cleared	A configuration commit removed the IP address from the st0 interface, which resulted in the clearing of the IPsec SA for VPNs bound to the interface.	Review the VPN setup to determine the need for the IP address on the st0 tunnel interface. Review system logs for the commit change.
Bind-interface's address received. Information updated	A configuration commit changed or added an IP address to the st0 tunnel interface.	No action required.
Bind-interface's family deleted. Existing IPsec SAs cleared	A configuration commit removed the family inet or inet6 from the st0 interface, which resulted in the clearing of the IPsec SA for VPNs bound to the interface.	Verify in the configuration that st0.x has the family inet or inet6 associated with the interface. Review system logs for the commit changes.
Bind-interface's family received. Information updated	A configuration commit added the family inet or inet6 on the st0 interface.	No action required.
Bind-interface's zone received. Information updated	A configuration commit changed or added a security zone on the st0 tunnel interface.	No action required.
Bind-interface's zone status changed. Existing IPsec SAs cleared	The st0.x interface status changed from Up, which cleared the IPsec SA for VPNs bound to the st0 interface where the status changed.	Review system logs for the the interface status change reason.

Table 598: IPsec VPN Tunnel Events (*continued*)

Tunnel Event	Description	Action
CA certificate for configured local certificate not found. Negotiation not initiated/successful	During VPN establishment using PKI certificates, the CA for the local certificate was not found on the device, which resulted in VPN establishment failure.	Verify the <b>ca-profile</b> configuration. Verify that the CA certificate is loaded on the device. Reload the CA certificate if necessary.
Certificate has expired. Refer to syslog for more information	An attempt to establish a VPN using PKI certificates failed because the CA or local certificate was expired.	Verify certificate validity dates. Verify the system date and time.
Cleared unused redundant backup IPsec SA pairs.	The IPsec SA count for a tunnel crossed two pairs.	No action required.
Configured local certificate has been revoked. Negotiation not initiated/successful	During a local certificate revocation check using the CRL, the local certificate was revoked or the CRL could not be downloaded to allow the revocation check, which resulted in VPN establishment failure or a failure to initiate the VPN tunnel.	Review system logs or PKI trace options for information about the CRL validation failure. Verify the downloaded CRL. Manually load an updated CRL. Consult the CA administrator about why the certificate is on the CRL. Disable the CRL revocation check.
CRL check failed as CA not reachable. Refer to syslog for more information	During a certificate revocation check using the CRL, the CA server could not be reached or did not respond, which resulted in VPN establishment failure.	Verify that the CA server and the CRL distribution point are reachable.
CRL check failed for a certificate. Refer to syslog for more information	During a certificate revocation check using the CRL, the received peer certificate was revoked or the CRL could not be downloaded to allow the revocation check, which resulted in VPN establishment failure.	Review system logs or PKI trace options for information about the CRL validation failure. Verify the downloaded CRL. Manually load an updated CRL. Consult the CA administrator about why the certificate is on the CRL. Disable the CRL revocation check.
Deactivated tunnel as interface information is not ready on new primary node	During a failover in a branch SRX Series chassis cluster, interface information was not available on the new primary node. This event is specific to branch SRX Series chassis clusters.	No action required.
DPD detected peer as down. Existing IKE/IPsec SAs cleared.	DPD is enabled and the peer was not reachable for the configured interval and threshold. When this happens, the corresponding IKE and IPsec SAs are cleared, causing the tunnel to flap.	Check peer connectivity. Verify peer gateway connectivity, increase DPD intervals or thresholds, or enable <b>probe-idle-tunnel</b> .
Duplicate IKE/IPsec session detected. Old session cleared	An established peer connected again with different information, such as IP address, username, or IKE ID. This event occurs for AutoVPN, dynamic endpoint, and dialup tunnels only.	No action required.

Table 598: IPsec VPN Tunnel Events (*continued*)

Tunnel Event	Description	Action
External-interface's address deleted. Existing IPsec SAs cleared	A configuration commit removed or adjusted the IP address on the IKE external interface, which resulted in the clearing of the IPsec SA for IKE gateways bound to the interface.	Verify that an IP address is assigned to the IKE external interface. Review system logs for the commit change.
External interface's address received. Information updated	A configuration commit changed or added a security zone on the IKE external interface.	No action required.
External-interface's device status changed. Existing IPsec SAs cleared	The IKE gateway external interface status changed from Up, which resulted in clearing of the IPsec SA for all IKE gateways associated with the external interface where the status changed.	Review system logs for the interface status change reason.
External-interface's primary address change triggered clearing of IPsec SA	A configuration commit adjusted the IP address on the IKE external interface, which resulted in clearing of the IPsec SA for IKE gateways bound to the adjusted interface.	Verify the IP address assigned to the external interface. Verify use of the primary setting on the external interface. Review system logs for the commit change.
External-interface's sub-unit status changed. Existing IPsec SAs cleared	The IKE gateway external interface status changed from Up, which resulted in clearing of the IPsec SA for all IKE gateways associated with the external interface where the status changed.	Review system logs for the interface status change reason.
External interface's zone received. Information updated	A configuration commit changed or added a security zone on the IKE external interface.	No action required.
External interface's zone status changed. Existing IPsec SAs cleared	A configuration commit changed the security zone for the IKE external interface, which resulted in the clearing of the IPsec SA for all IKE gateways associated with the changed external interface.	Review system logs for commit changes.
Gateway configuration deletion triggered clearing of IPsec SA	A configuration commit deleted or deactivated the IKE gateway, which resulted in clearing of the IPsec SA.	Review system logs for commit changes.
Group VPN configuration change triggered clearing of IPsec SA	A configuration commit changed the group VPN configuration, which resulted in clearing of the IPsec SA.	Review system logs for commit changes.

Table 598: IPsec VPN Tunnel Events (*continued*)

Tunnel Event	Description	Action
Hard lifetime of IPsec SA expired.	This event is tracked for a tunnel only if there are no more IPsec SAs. Otherwise, this event is tracked in statistics only to avoid multiple events being recorded during rekeys.	If the rekey fails or does not complete before the lifetime expires, this event is recorded and the statistics counter is incremented. If the hard lifetime expires before a rekey occurs, a higher lifetime value is recommended. If a rekey was triggered and failed, there might be some other issue noted in another tunnel event.
Idle timer triggered. Existing IPsec SAs cleared.	<b>idle-time</b> is configured at the <code>[edit security ipsec vpn vpn-name ike]</code> hierarchy level, and the tunnel was idle for the configured time.	Increase the idle tunnel interval.
IKE SA cleared as lifetime expired	The IKE configured lifetime seconds expired. The default setting is 28,800 seconds. This event does not impact current IPsec SAs.	No action required. You can use DPD to maintain IKE establishment.
IKE SA cleared on backup HA node as requested from primary HA node	The primary chassis cluster node requested that the IKE SA be cleared on the backup node.	Review system logs on the primary node for the IKE SA clear reason.
IKE SA negotiation successfully completed	IKE Phase 1 negotiations were successfully completed.	No action required.
IKE SA rekey successfully completed	When using IKEv2, the IKE SA expired with an established IPsec SA. IKEv2 requires an established IKE SA while an IPsec SA is active.	No action required.
IKE SA UDP port change detected with peer. Existing IPsec SAs cleared.	There was a NAT-T port change, possibly caused by changed ports on the NAT device after the tunnel was established. An IPsec layer UDP packet was received from the peer with a different port for the established tunnel. This event resulted in the clearing of the IPsec SA.	Verify the NAT device behavior that led to the port change.
IKE version mismatch detected	The SRX Series device and the VPN peer attempted to use different IKE versions, which resulted in tunnel establishment failure. The SRX Series device is configured for IKEv1 usage by default.	Adjust the VPN peer to use the same IKE version as the SRX Series; or configure the SRX Series to use the same IKE version in as the peer with <b>set security ike gateway gateway-name version v1-only</b> or <b>set security ike gateway gateway-name version v2-only</b> .
Initial-Contact received from peer. Stale IKE/IPsec SAs cleared.	Initial contact was received from the peer.	No action required.

Table 598: IPsec VPN Tunnel Events (*continued*)

Tunnel Event	Description	Action
IPSec SA delete payload received from peer, corresponding IPSec SAs cleared.	A peer or remote device sent a delete notification for a given IPSec SA, resulting in the deletion of that particular SA pair. If that SA is the last IPSec SA for that tunnel, the tunnel goes down. This event can occur for various reasons: for example, after a rekey the peer might send a delete for an old SA, or a configuration change triggered on a peer resulted in the clearing of the IPSec SA.	Review peer logs to locate the event that caused the SA deletion request to be sent.
IPSec SA negotiation successfully completed	IPsec Phase 2 negotiations were successfully completed.	No action required.
IPSec SA rekey successfully completed	The IPSec rekey was successfully completed.	No action required.
IPSec SA UDP port change detected with peer. Existing IPSec SAs cleared.	There was a NAT-T port change, possibly caused by changed ports on the NAT device after the tunnel was established. An IPSec layer UDP packet was received from the peer with a different port for the established tunnel. This event resulted in the clearing of the IPSec SA.	Verify the NAT device behavior that led to the port change.
IPSec SAs cleared as corresponding IKE SA deleted.	The IPSec SA was deleted.	No action required.
Key pair not found for configured local certificate. Negotiation failed	During VPN establishment using PKI certificates, a corrupt or missing key-pair file from the local device was detected, which resulted in VPN establishment failure.	Verify configuration of <b>local-certificate</b> in the IKE policy. Verify that the key-pair is located in <b>/var/db/certs/common/key-pair</b> . Generate a new key-pair and certificate-request, and load the new certificate.
Lifetime in kilobytes expired for IPSec SA.	The <b>lifetime-kilobytes</b> value has expired. Before this event, the soft lifetime triggered a rekey for the IPSec SA. The event is not captured and only a statistics counter is incremented.	If the rekey fails or does not complete before the lifetime expires, this event is recorded and the statistics counter is incremented. If the hard lifetime expires before a rekey occurs, a higher lifetime value is recommended. If a rekey was triggered and failed, there might be some other issue noted in another tunnel event.
Manual next-hop-tunnel configuration change triggered clearing of IPSec SA	A configuration commit changed the next-hop tunnel for the st0 interface, which resulted in the clearing of the IPSec SA for the VPN linked to the changed next-hop tunnel.	Review system logs for commit changes.

Table 598: IPsec VPN Tunnel Events (*continued*)

Tunnel Event	Description	Action
Negotiation failed with error code <code>INVALID_IKE_VERSION</code> received from peer	The peer device rejected an incoming VPN tunnel setup request from the SRX Series device because of mismatched IKE versions, resulting in tunnel establishment failure.	Verify the VPN configuration and VPN peer configuration for IKE version usage. Configure the SRX Series device to use IKEv1 or IKEv2 based on the peer setup by entering <b>set security ike gateway <i>gateway-name</i> version v1-only</b> or <b>set security ike gateway <i>gateway-name</i> version v2-only</b> .
Negotiation failed with error code <code>NO_PROPOSAL_CHOSEN</code> received from peer	The VPN peer informed the SRX Series device of VPN failure based on a mismatch of proposals, IKE version, peer gateway match, proxy ID/traffic-selectors, DH groups, or PSK usage.	Review peer logs for the failure reason. Review configurations on the SRX Series device and the peer to ensure that expected VPN attributes match.
Negotiation failed with error code <code>TS_UNACCEPTABLE</code> received from peer	The VPN peer rejected the proxy ID/traffic selector requested by the SRX Series device, which resulted in tunnel establishment failure.	Review peer logs for the rejection reason. For route-based VPNs, verify the configured proxy ID/traffic selector. For policy-based VPNs, verify the source, policy, or application defined in the security policy bound to the VPN.
OCSP revocation check failed as server not reachable. Refer to syslog for more information	During a certificate revocation check using OCSP, the OCSP server could not be contacted, which resulted in VPN establishment failure.	Verify that the OCSP server is reachable. Verify the configured IP address of the OCSP server.
OCSP revocation check failed for a certificate. Refer to syslog for more information	During a certificate revocation check using OCSP, a revoke response was received, which resulted in VPN establishment failure.	Review OCSP server logs for the revocation reason.
Peer proposed phase1 negotiation mode (main/aggressive) does not match with configuration	The IKE negotiation mode configured on the SRX Series device for IKEv1 does not match the peer's proposed mode.	Revise the peer or SRX Series device configuration to match the other device.
Peer proposed phase1 proposal conflicts with local configuration. Negotiation failed	The Phase 1 proposal configured on the SRX Series device does not match the peer's proposal.	Revise the peer or SRX Series device configuration to match the other device.
Peer proposed traffic-selectors are not in configured range	The traffic selector configured on the SRX Series device does not match the peer's proposed traffic selectors.	Revise the peer or SRX Series device configuration to match the other device.
Peer proposed unsupported multiple traffic-selector attributes for a single IPsec SA. Negotiation failed.	During IKEv2 negotiations, the peer device sent a proposal containing multiple traffic selectors for a single VPN tunnel, which resulted in the failure of the VPN tunnel setup.	Review the peer configuration of ACLs or traffic selectors.

Table 598: IPsec VPN Tunnel Events (*continued*)

Tunnel Event	Description	Action
Peer proposed unsupported port range in traffic-selector attribute. Phase 2 negotiation failed	During IPsec negotiation, the peer device sent a traffic selector that contained an unsupported port range, which resulted in the failure of the VPN tunnel setup.	Adjust the peer configuration for the port range setup for the ACLs or traffic selectors.
Peer proposed unsupported protocol in traffic-selector attribute. Phase 2 negotiation failed	During IPsec negotiation, the peer device sent a traffic selector that contained an unsupported protocol, which resulted in the failure of the VPN tunnel setup.	Adjust the peer configuration for the protocol setup for the ACLs or traffic selectors.
Peer's IKE-ID validation failed during negotiation	The received IKE ID did not match the expected IKE ID, which resulted in tunnel establishment failure. The default expected IKE ID is the IP address, peer, or <b>dynamic</b> setting configured for the IKE gateway.	Review the VPN peer configuration for the IKE ID the peer is sending. Configure the SRX Series device using <b>remote-identity</b> to adjust to the expected IKE ID of the peer.
Proposed peer's IKE-ID does not match with peer's certificate. Negotiation failed	When using PKI certificates, the peer IKE ID value was not in the SAN field of the received certificate, which resulted in VPN establishment failure.	Review the VPN peer and reissue a certificate with an updated SAN based on the IKE ID value. Adjust the VPN peer's IKE ID to match the SAN field of the certificate.
Received use IKEv1 message from peer	The peer device rejected an incoming VPN tunnel setup request from the SRX Series device to use IKEv2 when the peer is configured to use IKEv1, which resulted in tunnel establishment failure.	Adjust the VPN peer setup to use IKEv2, or adjust the SRX Series device's configuration to use IKEv1 by entering <b>set security ike gateway gateway-name version v1-only</b> .
Requested peer to use IKEv1 instead of IKEv2	The SRX Series device is configured to use IKEv1 by default, and the peer attempted to set up IKE using IKEv2, which resulted in tunnel establishment failure.	Adjust the VPN peer to use IKEv1, or configure the SRX Series device to use IKEv2 by entering <b>set security ike gateway gateway-name version v2-only</b> .
Security policy change triggered clearing of IPsec SA	A policy-based VPN configuration commit changed security policies bound to the IPsec VPN, which resulted in the clearing of the IPsec SA associated with the changed policies.	Review system logs for commit changes.
Shortcut Tunnel deleted because of inactivity	When using IKEv2 with ADVPN, the device received a shortcut suggestion. However, it did not receive a request from a partner to complete the setup of the shortcut tunnel.	Verify that shortcut tunnel peers can reach each other. Verify that the shortcut partners can exchange UDP500 IKEv2 traffic between them.

Table 598: IPsec VPN Tunnel Events (*continued*)

Tunnel Event	Description	Action
Shortcut Tunnel deleted when idle-time is reached	When using IKEv2 with ADVPN, traffic flowing over the shortcut tunnel fell below the <b>idle-threshold</b> for longer than the <b>idle-time</b> (default is 5 packets per second for 900 seconds). Traffic continues to flow through the IPsec tunnel to the hub.	If traffic is sporadic, decrease <b>idle-threshold</b> and increase <b>idle-time</b> . The shortcut tunnel should remain established during times of low traffic throughput.
Tunnel configuration changed. Corresponding IKE/IPsec SAs are deleted	A configuration commit adjusted the IKE/IPsec configuration, which resulted in clearing of the IPsec SA.	Review system logs for commit changes.
Tunnel configuration is deleted. Corresponding IKE/IPsec SAs are deleted	A configuration commit deleted or deactivated the IKE/IPsec configuration, which resulted in clearing of the IPsec SA.	Review system logs for commit changes.
Tunnel deleted on backup HA node as requested from primary HA node	This event is generated on the backup chassis cluster node when the tunnel on the primary node is deleted.	No action required.
Tunnel ID reused for other tunnel on primary node. Cleared stale tunnel	On high-end SRX Series chassis clusters, if the tunnel ID becomes out of sync for a given tunnel, the old tunnel is removed on the backup chassis cluster node.	No action required.
Tunnel is ready. Waiting for trigger event or peer to trigger negotiation.	The required configuration is available for peer negotiation. The device is awaiting traffic for tunnel establishment or a tunnel setup request from the peer.	No action required.
Unsupported AH and ESP bundle negotiation request denied	The peer proposed AH and ESP protocols on the same IPsec tunnel, but the SRX Series device does not support this configuration.	Reconfigure the peer for either AH or ESP protocol on the tunnel.
User cleared IKE SA from CLI, corresponding IPsec SAs cleared	The IKE SA was manually cleared using the CLI, which cleared the IKE SA but which does not affect current established IPsec SAs.	No action required.
User cleared IPsec SA from CLI.	A user or an administrator has cleared the IPsec SA manually in the CLI.	No action required.
VPN monitoring detected tunnel as down. Existing IPsec SAs cleared.	VPN monitor is configured for the tunnel and the peer did not respond to VPN monitor keepalive messages, or the peer was not reachable. The corresponding IPsec SAs were cleared.	Check peer connectivity and the VPN monitor destination address.

Table 598: IPsec VPN Tunnel Events (*continued*)

Tunnel Event	Description	Action
Zone change for all interface detected. Existing IPsec SAs cleared	A configuration commit changed the security zone for all interfaces, which resulted in clearing of all device IPsec SAs.	Review system logs for commit changes.

## Security Configuration Statement Hierarchy

Use the statements in the **security** configuration hierarchy to configure actions, certificates, dynamic virtual private networks (VPNs), firewall authentication, flow, forwarding options, group VPNs, Intrusion Detection Prevention (IDP), Internet Key Exchange (IKE), Internet Protocol Security (IPsec), logging, Network Address Translation (NAT), public key

infrastructure (PKI), policies, resource manager, rules, screens, secure shell known hosts, trace options, user identification, Unified Threat Management (UTM), and zones. Statements that are exclusive to the SRX Series devices running Junos OS are described in this section.

Each of the following topics lists the statements at a sub-hierarchy of the **[edit security]** hierarchy.

- [\[edit security address-book\] Hierarchy Level on page 634](#)
- [\[edit security analysis\] Hierarchy Level](#)
- [\[edit security alarms\] Hierarchy Level on page 6988](#)

## Access Configuration Statement Hierarchy

Use the statements in the **access** configuration hierarchy to configure access to the device and authentication methods, including address assignment and address pool, user and firewall authentication, a group profile, LDAP options and LDAP server configuration, an access profile, RADIUS options and RADIUS server configuration, and SecurID server configuration.

```
access {

## address (Security IKE Gateway)

---

<b>Syntax</b>	<code>address [<i>ip-address-or-hostname</i>];</code>
<b>Hierarchy Level</b>	<code>[edit security ike gateway <i>gateway-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for IPv6 addresses added in Junos OS Release 11.1.
<b>Description</b>	Specify the IPv4 or IPv6 address or the hostname of the primary Internet Key Exchange (IKE) gateway and up to four backup gateways.
<b>Options</b>	<i>ip-address-or-hostname</i> —IPv4 or IPv6 address or hostname of an IKE gateway.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

---

## administrator

---

<b>Syntax</b>	<code>administrator {     e-mail-address <i>e-mail-address</i> ; }</code>
<b>Hierarchy Level</b>	<code>[edit security pki ca-profile <i>ca-profile-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify an administrator e-mail address to which the certificate request is sent.
<b>Options</b>	<i>e-mail-address e-mail-address</i> —E-mail address where the certificate request is sent. By default, there is no preset e-mail address.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>

## advpn

```
Syntax advpn {
 suggester {
 disable;
 }
 partner {
 connection-limit <number>;
 idle-threshold <packets/sec>;
 idle-time <seconds>;
 disable;
 }
 }
```

**Hierarchy Level** [edit security ike gateway *gateway-name*]

**Release Information** Statement introduced in Junos OS Release 12.3X48-D10.

**Description** Enable Auto Discovery VPN (ADVPN) protocol on the specified gateway.

**Options** **suggester**—VPN peer that can initiate a shortcut exchange to allow shortcut partners to establish dynamic security associations (SAs) with each other. Specify **disable** to disable this role on the gateway.

**NOTE:** Both suggester and partner roles are enabled if **advpn** is configured without explicitly configuring **suggester** or **partner** keywords. In this release, we do not support suggester and partner roles on the same gateway. You must explicitly configure **disable** with the **suggester** or **partner** keyword to disable that particular role. You cannot disable both suggester and partner roles on the same gateway.

**partner**—VPN peer that can receive a shortcut exchange suggesting that it should establish dynamic SAs with another peer. Specify **disable** to disable this role on the gateway. The following options can be configured for the partner role:

**connection-limit**—Maximum number of shortcut tunnels that can be created with different shortcut partners using a particular gateway. The maximum number, which is also the default, is platform-dependent.

**idle-threshold**—Rate, in packets per second, below which the shortcut is brought down.

**Range:** 0 through 5000 packets per second.

**Default:** 5 packets per second.

**idle-time**—Duration, in seconds, after which the shortcut is deleted if the traffic remains below the **idle-threshold** value.

**Range:** 60 seconds through infinity (0).

**Default:** 900 seconds.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## algorithm (Security)

---

**Syntax** algorithm (3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | des-cbc);

**Hierarchy Level** [edit security ipsec vpn *vpn-name* manual encryption]

**Release Information** Statement modified in Junos OS Release 8.5.

**Description** Select the encryption algorithm for the internal Routing-Engine-to-Routing-Engine IPsec security association (SA) configuration.

**Options**

- **3des-cbc**—3DES-CBC encryption algorithm.
- **aes-128-cbc**—AES-CBC 128-bit encryption algorithm.
- **aes-192-cbc**—AES-CBC 192-bit encryption algorithm.
- **aes-256-cbc**—AES-CBC 256-bit encryption algorithm.
- **des-cbc**—DES-CBC encryption algorithm.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

---

## always-send

---

**Syntax** always-send;

**Hierarchy Level** [edit security ike gateway *gateway-name* dead-peer-detection]

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Instructs the device to send dead peer detection (DPD) requests regardless of whether there is outgoing IPsec traffic to the peer.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

## authentication (IPsec SA for OSPF)

<b>Syntax</b>	<pre>authentication {   algorithm (hmac-md5-96   hmac-sha1-96);   key {     ascii-text <i>key</i>;     hexadecimal <i>key</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit security ipsec security-association <i>sa-name</i> manual direction bidirectional]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D20.
<b>Description</b>	Configure authentication parameters for a manual IPsec security association (SA) to be applied to an OSPF or OSPFv3 interface or virtual link.
<b>Options</b>	<p><b>algorithm</b>—Hash algorithm that authenticates packet data. It can be one of the following:</p> <ul style="list-style-type: none"> <li><b>hmac-md5-96</b>—Produces a 128-bit digest. This is the default.</li> <li><b>hmac-sha1-96</b>—Produces a 160-bit digest.</li> </ul> <p><b>key</b>—Type of authentication key. It can be one of the following:</p> <ul style="list-style-type: none"> <li><b>ascii-text <i>key</i></b>—ASCII text key. For <b>hmac-md5-96</b>, the key is 16 ASCII characters; for <b>hmac-sha1-96</b>, the key is 20 ASCII characters.</li> <li><b>hexadecimal <i>key</i></b>—Hexadecimal key. For <b>hmac-md5-96</b>, the key is 32 hexadecimal characters; for <b>hmac-sha1-96</b>, the key is 40 hexadecimal characters.</li> </ul>
<b>Required Privilege Level</b>	<p>view-level—To view this statement in the configuration.</p> <p>control-level—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Understanding OSPF and OSPFv3 Authentication on SRX Series Devices</i></li> </ul>

## authentication (Security IPsec)

<b>Syntax</b>	<pre>authentication {   algorithm (hmac-md5-96   hmac-sha-256-128   hmac-sha-256-96   hmac-sha1-96);   key (ascii-text <i>key</i>   hexadecimal <i>key</i> ); }</pre>
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> manual]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for <b>hmac-sha-256-128</b> added to high-end SRX Series devices in Junos OS Release 12.1X46-D20.
<b>Description</b>	Configure IPsec authentication parameters for a manual security association.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>algorithm</b>—Hash algorithm that authenticates packet data. It can be one of the following:           <ul style="list-style-type: none"> <li>• <b>hmac-md5-96</b>—Produces a 128-bit digest.</li> <li>• <b>hmac-sha-256-128</b>—Produces a 256-bit digest, truncated to 128 bits.</li> <li>• <b>hmac-sha-256-96</b>—Produces a 256-bit digest, truncated to 96 bits. This option is not supported on high-end SRX Series devices.</li> <li>• <b>hmac-sha1-96</b>—Produces a 160-bit digest.</li> </ul> </li> <li>• <b>key</b>—Type of authentication key. It can be one of the following:           <ul style="list-style-type: none"> <li>• <b>ascii-text <i>key</i></b>—ASCII text key. For <b>hmac-md5-96</b>, the key is 16 ASCII characters; for <b>hmac-sha1-96</b>, the key is 20 ASCII characters.</li> <li>• <b>hexadecimal <i>key</i></b>—Hexadecimal key. For <b>hmac-md5-96</b>, the key is 32 hexadecimal characters; for <b>hmac-sha1-96</b>, the key is 40 hexadecimal characters.</li> </ul> </li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## authentication-algorithm (Security IKE)

<b>Syntax</b>	authentication-algorithm (md5   sha-256   sha-384   sha1);
<b>Hierarchy Level</b>	[edit security ike proposal <i>proposal-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for the <b>sha-384</b> option added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Configure the Internet Key Exchange (IKE) authentication algorithm.

**NOTE:** The device does not delete existing IPsec SAs when you update the **authentication-algorithm** configuration in the IKE proposal. The device deletes existing IPsec SAs when you update the **authentication-algorithm** configuration in the IPsec proposal.

<b>Options</b>	<p><b>authentication-algorithm</b>—Hash algorithm that authenticates packet data. It can be one of the following algorithms:</p> <ul style="list-style-type: none"> <li>• <b>md5</b>—Produces a 128-bit digest.</li> <li>• <b>sha-256</b>—Produces a 256-bit digest.</li> <li>• <b>sha-384</b>—Produces a 384-bit digest.</li> <li>• <b>sha1</b>—Produces a 160-bit digest.</li> </ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## authentication-algorithm (Security IPsec)

---

<b>Syntax</b>	authentication-algorithm (hmac-md5-96   hmac-sha-256-128   hmac-sha-256-96   hmac-sha1-96);
<b>Hierarchy Level</b>	[edit security ipsec proposal <i>proposal-name</i> ]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for <b>hmac-sha-256-128</b> added to high-end SRX Series devices in Junos OS Release 12.1X46-D20.
<b>Description</b>	Configure the IPsec authentication algorithm.
<b>Options</b>	<p>The hash algorithm to authenticate data can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>hmac-md5-96</b>—Produces a 128-bit digest.</li><li>• <b>hmac-sha-256-128</b>—Produces a 256-bit digest, truncated to 128 bits.</li><li>• <b>hmac-sha-256-96</b>—Produces a 256-bit digest, truncated to 96 bits. This option is not supported on high-end SRX Series devices.</li><li>• <b>hmac-sha1-96</b>—Produces a 160-bit digest.</li></ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## authentication-method

<b>Syntax</b>	authentication-method (dsa-signatures   ecdsa-signatures-256   ecdsa-signatures-384   pre-shared-keys   rsa-signatures);
<b>Hierarchy Level</b>	[edit security ike proposal <i>proposal-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for <b>ecdsa-signatures-256</b> and <b>ecdsa-signatures-384</b> options added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Specify the method the device uses to authenticate the source of Internet Key Exchange (IKE) messages. The <b>pre-shared-keys</b> option refers to a preshared key, which is a key for encryption and decryption that both participants must have before beginning tunnel negotiations. The other options refer to types of digital signatures, which are certificates that confirm the identity of the certificate holder.

**NOTE:** The device does not delete existing IPsec SAs when you update the **authentication-method** configuration in the IKE proposal.

<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>dsa-signatures</b>—Specify that the Digital Signature Algorithm (DSA) is used.</li> <li>• <b>ecdsa-signatures-256</b>—Specify that the Elliptic Curve DSA (ECDSA) using the 256-bit elliptic curve secp256r1, as specified in the <i>Federal Information Processing Standard (FIPS) Digital Signature Standard (DSS) 186-3</i>, is used.</li> <li>• <b>ecdsa-signatures-384</b>—Specify that the ECDSA using the 384-bit elliptic curve secp384r1, as specified in the <i>FIPS DSS 186-3</i>, is used.</li> <li>• <b>pre-shared-keys</b>—Specify that a preshared key, which is a secret key shared between the two peers, is used during authentication to identify the peers to each other. The same key must be configured for each peer. This is the default method.</li> <li>• <b>rsa-signatures</b>—Specify that a public key algorithm, which supports encryption and digital signatures, is used.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## auto-re-enrollment (Security)

---

<b>Syntax</b>	<pre>auto-re-enrollment {   certificate-id <i>certificate-id-name</i> {     ca-profile-name <i>ca-profile-name</i> ;     challenge-password <i>password</i> ;     re-enroll-trigger-time-percentage <i>percentage</i> ;     re-generate-keypair;   } }</pre>
<b>Hierarchy Level</b>	[edit security pki]
<b>Release Information</b>	Statement modified in Junos OS Release 9.0.
<b>Description</b>	Configure the automatic reenrollment of a local certificate.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>

## auxiliary-spi (IPsec SA for OSPF)

---

<b>Syntax</b>	<pre>auxiliary-spi <i>auxiliary-spi-value</i>;</pre>
<b>Hierarchy Level</b>	[edit security ipsec security-association <i>sa-name</i> mode transport manual direction bidirectional]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D20.
<b>Description</b>	Configure an auxiliary security parameter index (SPI) for a manual IPsec security association (SA) to be applied to an OSPF or OSPFv3 interface or virtual link.
<b>Options</b>	<b>auxiliary-spi</b> —Auxiliary SPI for the manual IPsec SA. The SPI uniquely identifies the SA to use at the receiving host (the destination address in the packet). <b>Range:</b> 256 through 16639
<b>Required Privilege Level</b>	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding OSPF and OSPFv3 Authentication on SRX Series Devices</a></li></ul>

## bind-interface

---

<b>Syntax</b>	<code>bind-interface <i>interface-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security ipsec vpn <i>vpn-name</i>]</code>
<b>Release Information</b>	Statement modified in Junos OS Release 8.5.
<b>Description</b>	Configure the tunnel interface to which the route-based virtual private network (VPN) is bound.
<b>Options</b>	<i>interface-name</i> —Tunnel interface.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## ca-identity (Security)

---

<b>Syntax</b>	<code>ca-identity <i>ca-identity</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security pki ca-profile <i>ca-profile-name</i>]</code>
<b>Release Information</b>	Statement modified in Junos OS Release 11.1.
<b>Description</b>	Specify the certificate authority (CA) identity to use in requesting digital certificates.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <i>ca-identity</i> —Name of CA identity. This name is typically the domain name of the CA.</li> <li>• <i>routing-instance-name</i> —Name of routing instance. The routing instance name is chosen from the list of configured routing instances.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>

## ca-profile (Security PKI)

<b>Syntax</b>	<pre> ca-profile <i>ca-profile-name</i> {   administrator {     e-mail-address <i>e-mail-address</i>;   }   ca-identity <i>ca-identity</i>;   enrollment {     retry <i>number</i>;     retry-interval <i>seconds</i>;     url <i>url-name</i>;   }   revocation-check {     crt {       disable {         on-download-failure;       }       refresh-interval <i>hours</i>;       url <i>url-name</i>;     }     disable;     ocsp {       connection-failure (disable   fallback-crt);       disable-responder-revocation-check;       nonce-payload (enable   disable);       url <i>ocsp-url</i>;     }     use-ocsp;   }   routing-instance <i>routing-instance-name</i>; } </pre>
<b>Hierarchy Level</b>	[edit security pki]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for <b>ocsp</b> and <b>use-ocsp</b> options added in Junos OS Release 12.1X46-D20.
<b>Description</b>	Configure certificate authority (CA) profile.
<b>Options</b>	<p><b>ca-profile-name</b> —Name of a trusted CA.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>

## ca-profile-name

---

<b>Syntax</b>	<code>ca-profile-name <i>ca-profile-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security pki auto-re-enrollment certificate-id <i>certificate-id-name</i>]</code>
<b>Release Information</b>	Statement modified in Junos OS Release 9.0.
<b>Description</b>	Specify the name of the certificate authority (CA) profile.
<b>Options</b>	<i>ca-profile-name</i> —Name of the specific CA profile.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>

## certificate

---

<b>Syntax</b>	<pre>certificate {   local-certificate <i>certificate-id</i>;   peer-certificate-type (pkcs7   x509-signature);   policy-oids [ <i>oid</i> ]; }</pre>
<b>Hierarchy Level</b>	<code>[edit security ike policy <i>policy-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. <b>policy-oids</b> option added in Junos OS Release 12.3X48-D10.
<b>Description</b>	Specify usage of a digital certificate to authenticate the virtual private network (VPN) initiator and recipient.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## certificate-id (Security)

---

<b>Syntax</b>	<code>certificate-id <i>certificate-id-name</i> {     ca-profile-name <i>ca-profile-name</i>;     challenge-password <i>password</i>;     re-enroll-trigger-time-percentage <i>percentage</i>;     re-generate-keypair; }</code>
<b>Hierarchy Level</b>	[edit security pki auto-re-enrollment]
<b>Release Information</b>	Statement modified in Junos OS Release 9.0.
<b>Description</b>	Specify the certificate authority (CA) certificate to use for automatic reenrollment.
<b>Options</b>	<b><i>certificate-id-name</i></b> —Identifier of the certificate that needs automatic reenrollment.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>

## challenge-password (Security)

---

<b>Syntax</b>	<code>challenge-password <i>password</i>;</code>
<b>Hierarchy Level</b>	[edit security pki auto-re-enrollment certificate-id <i>certificate-id-name</i> ]
<b>Release Information</b>	Statement modified in Junos OS Release 9.0.
<b>Description</b>	Specify the password used by the certificate authority (CA) for enrollment and revocation. If the CA does not provide the challenge password, choose your own password.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>

---

## connections-limit

---

<b>Syntax</b>	<code>connections-limit <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dynamic]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Configure the number of concurrent connections that the group profile supports. When the maximum number of connections is reached, no more dynamic virtual private network (VPN) endpoints dialup users attempting to access an IPsec VPN are allowed to begin Internet Key Exchange (IKE) negotiations.
<b>Options</b>	<i>number</i> —Maximum number of concurrent connections allowed.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li><li>• <i>Monitoring VPNs</i></li></ul>

## container

---

<b>Syntax</b>	<code>container <i>container-string</i>;</code>
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dynamic distinguished-name]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify that the value in the identity fields of a dynamic virtual private network (VPN) endpoint user's distinguished name exactly match the values in the group IKE user's distinguished name. The order of the identity fields in the fields of the distinguished name strings must be identical when matching.
<b>Options</b>	<i>container-string</i> —Distinguished name identity value to be matched. For example, <code>cn=admin, ou=eng, o=example, dc=net</code> .
<div style="display: flex; align-items: center;">  <div> <p><b>NOTE:</b> Add a space between each container string. For example, edit security ike gateway jsr_gateway dynamic distinguished-name container o=example, ou=eng;</p> </div> </div>	
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> <li>• <a href="#">Monitoring VPNs</a></li> </ul>

## crl (Security)

<b>Syntax</b>	<pre> crl {   disable {     on-download-failure;   }   refresh-interval <i>hours</i>;   url <i>url-name</i>; } </pre>
<b>Hierarchy Level</b>	[edit security pki ca-profile <i>ca-profile-name</i> revocation-check]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Configure the certificate revocation list (CRL). A CRL is a time-stamped list identifying revoked certificates, which is signed by a CA and made available to the participating IPsec peers on a regular periodic basis.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>disable on-download-failure</b>—(Optional) Override the default behavior and permit certificate verification even if the CRL fails to download.</li> <li>• <b>refresh-interval <i>hours</i></b>—Time interval, in hours, between CRL updates. Range — 0 through 8784 hours.</li> <li>• <b>url <i>url-name</i></b>—Name of the location from which to retrieve the CRL through HTTP or Lightweight Directory Access Protocol (LDAP). You can specify one URL for each configured CA profile. By default, no location is specified. Use a fully qualified domain name (FQDN) or an IP address and, optionally, a port number. If no port number is specified, port 80 is used for HTTP and port 443 is used for LDAP.</li> </ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>

## cryptographic-self-test

---

<b>Syntax</b>	cryptographic-self-test;
<b>Hierarchy Level</b>	[edit security alarms potential-violation ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	Raise a security alarm when the device or switch detects a cryptographic self-test failure. Cryptographic self-tests are a set of preoperational tests that are performed after the device or switch is powered on. The self-test run without operator intervention.
<b>Default</b>	No alarm is raised upon failure of a cryptographic self-test.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## dead-peer-detection

---

<b>Syntax</b>	dead-peer-detection { (always-send   optimized   probe-idle-tunnel); interval <i>seconds</i> ; threshold <i>number</i> ; }
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for the <b>optimized</b> and <b>probe-idle-tunnel</b> options added in Junos OS Release 12.1X46-D10.
<b>Description</b>	Enable the device to use dead peer detection (DPD). DPD is a method used by devices to verify the current existence and availability of IPsec peers. A device performs this verification by sending encrypted IKE Phase 1 notification payloads (R-U-THERE messages) to a peer and waiting for DPD acknowledgements (R-U-THERE-ACK messages) from the peer.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding AutoVPN on page 6745</a></li><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

---

## decryption-failures

---

<b>Syntax</b>	<code>decryption-failures {     threshold <i>value</i>; }</code>
<b>Hierarchy Level</b>	[edit security alarms potential-violation]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	Raise a security alarm after exceeding a specified number of decryption failures.
<b>Default</b>	Multiple decryption failures do not cause an alarm to be raised.
<b>Options</b>	<b>failures</b> —Number of decryption failures up to which an alarm is not raised. When the configured number is exceeded, an alarm is raised. <b>Range:</b> 0 through 1 through 1,000,000,000. <b>Default:</b> 1000
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## description (Security Policies)

<b>Syntax</b>	<code>description <i>description</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security group-vpn member ike policy <i>policy-name</i>]</code> <code>[edit security group-vpn member ike proposal <i>proposal-name</i>]</code> <code>[edit security group-vpn server ike policy <i>policy-name</i>]</code> <code>[edit security group-vpn server ipsec proposal <i>proposal-name</i>]</code> <code>[edit security group-vpn server ike proposal <i>proposal-name</i>]</code> <code>[edit security ike policy <i>policy-name</i>],</code> <code>[edit security ike proposal <i>proposal-name</i>],</code> <code>[edit security ipsec policy <i>policy-name</i>],</code> <code>[edit security ipsec proposal <i>proposal-name</i>]</code> <code>[edit security polices from-zone <i>zone-name</i> to-zone <i>zone-name</i> policy <i>policy-name</i>]</code>
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for <b>group-vpn</b> hierarchies added in Junos OS Release 10.2. Support for the <b>security policies</b> hierarchy added in Junos OS Release 12.1.
<b>Description</b>	Specify descriptive text for an IKE policy, an IPsec policy, an IKE proposal, an IPsec proposal, or a security policy.
<b>Options</b>	<b><i>description</i></b> —Descriptive text about an IKE policy, an IPsec policy, an IKE proposal, an IPsec proposal, or a security policy.
<b>Required Privilege Level</b>	<b>security</b> —To view this statement in the configuration. <b>security-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">[edit security policies] Hierarchy Level on page 320</a></li> </ul>

## destination-ip (Security IPsec)

<b>Syntax</b>	<code>destination-ip <i>ip-address</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security ipsec vpn <i>vpn-name</i> vpn-monitor]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the destination of the Internet Control Message Protocol (ICMP) pings. If this statement is used, the device uses the peer's gateway address by default.
<b>Options</b>	<b><i>ip-address</i></b> —Destination IP address.
<b>Required Privilege Level</b>	<b>security</b> —To view this statement in the configuration. <b>security-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## df-bit

---

<b>Syntax</b>	df-bit (clear   copy   set);
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify how the device handles the Don't Fragment (DF) bit in the outer header.

**NOTE:** On high-end SRX Series devices, the DF-bit configuration for VPN only works if the original packet size is smaller than the st0 interface MTU, and larger than the external interface-ipsec overhead.

<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>clear</b>—Clear (disable) the DF bit from the outer header. This is the default.</li> <li>• <b>copy</b>—Copy the DF bit to the outer header.</li> <li>• <b>set</b>—Set (enable) the DF bit in the outer header.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## dh-group (Security IKE)

<b>Syntax</b>	dh-group (group1   group14   group19   group2   group20   group24   group5);
<b>Hierarchy Level</b>	[edit security ike proposal <i>proposal-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for the <b>group14</b> option added in Junos OS Release 11.1. Support for <b>group19</b> , <b>group20</b> , and <b>group24</b> options added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Specify the IKE Diffie-Hellman group.

**NOTE:** The device does not delete existing IPsec SAs when you update the **dh-group** configuration in the IKE proposal.

<b>Options</b>	<p><b>dh-group</b>—Diffie-Hellman group for key establishment.</p> <ul style="list-style-type: none"> <li>• <b>group1</b>—768-bit Modular Exponential (MODP) algorithm.</li> <li>• <b>group14</b>—2048-bit MODP group.</li> <li>• <b>group19</b>—256-bit random Elliptic Curve Groups modulo a Prime (ECP groups) algorithm.</li> <li>• <b>group2</b>—1024-bit MODP algorithm.</li> <li>• <b>group20</b>—384-bit random ECP groups algorithm.</li> <li>• <b>group24</b>—2048-bit MODP Group with 256-bit prime order subgroup.</li> <li>• <b>group5</b>—1536-bit MODP algorithm.</li> </ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## disable (PKI)

---

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit security pki ca-profile <i>profile-name</i> revocation-check]
<b>Release Information</b>	Statement modified in Junos OS Release 9.0.
<b>Description</b>	Disable revocation checks.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>

## distinguished-name (Security)

---

<b>Syntax</b>	distinguished-name <container <i>container-string</i> > <wildcard <i>wildcard-string</i> >
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dynamic]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify a distinguished name as the identifier for the remote gateway with a dynamic IP address.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## dynamic (Security)

---

<b>Syntax</b>	<pre>dynamic {   connections-limit <i>number</i>;   (distinguished-name &lt;container <i>container-string</i>&gt; &lt;wildcard <i>wildcard-string</i>&gt;   hostname     <i>domain-name</i>   inet <i>ip-address</i>   inet6 <i>ipv6-address</i>   user-at-hostname <i>e-mail-address</i>);   ike-user-type (group-ike-id   shared-ike-id); }</pre>
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> ]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for the <b>inet6</b> option added in Junos OS Release 11.1.
<b>Description</b>	Specify the identifier for the remote gateway with a dynamic IPv4 or IPv6 address. Use this statement to set up a VPN with a gateway that has an unspecified IPv4 or IPv6 address.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## encryption (IPsec SA for OSPF)

<b>Syntax</b>	<pre> encryption {   algorithm (3des-cbc   des-cbc   null);   key {     ascii-text <i>key</i>;     hexadecimal <i>key</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit security ipsec security-association <i>sa-name</i> manual direction bidirectional]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D20.
<b>Description</b>	Configure encryption parameters for a manual IPsec security association (SA) to be applied to an OSPF or OSPFv3 interface or virtual link.
<b>Options</b>	<p><b>algorithm</b>—Type of encryption algorithm. It can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>3des-cbc</b>—Has block size of 8 bytes (64 bits); its key size is 192 bits long.</li> <li>• <b>des-cbc</b>—Has a block size of 8 bytes (64 bits); its key size is 48 bits long.</li> <li>• <b>null</b>—With null encryption, you are choosing not to provide encryption on OSPFv3 headers.</li> </ul> <p><b>key</b>—Type of encryption key. It can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>ascii-text <i>key</i></b>—ASCII text key. For the <b>des-cbc</b> option, the key contains 8 ASCII characters; for <b>3des-cbc</b>, the key contains 24 ASCII characters.</li> <li>• <b>hexadecimal <i>key</i></b>—Hexadecimal key. For the <b>des-cbc</b> option, the key contains 16 hexadecimal characters; for the <b>3des-cbc</b> option, the key contains 48 hexadecimal characters.</li> </ul>
<b>Required Privilege Level</b>	<p>view-level—To view this statement in the configuration.</p> <p>control-level—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding OSPF and OSPFv3 Authentication on SRX Series Devices</i></li> </ul>

## encryption (Security)

<b>Syntax</b>	<pre> encryption {   algorithm (3des-cbc   aes-128-cbc   aes-192-cbc   aes-256-cbc   des-cbc);   key (ascii-text key   hexadecimal key) ; } </pre>
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> manual]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5.
<b>Description</b>	Configure an encryption algorithm and key for a manual Security Association (SA).
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>algorithm</b>—Type of encryption algorithm. It can be one of the following: <ul style="list-style-type: none"> <li>• <b>des-cbc</b>—Has a block size of 8 bytes (64 bits); its key size is 48 bits long.</li> <li>• <b>3des-cbc</b>—Has block size of 8 bytes (64 bits); its key size is 192 bits long</li> </ul> </li> </ul> <p> <b>NOTE:</b> For <b>3des-cbc</b>, we recommend that the first 8 bytes be different from the second 8 bytes, and the second 8 bytes be the same as the third 8 bytes.</p> <ul style="list-style-type: none"> <li>• <b>aes-128-cbc</b>—Advanced Encryption Standard (AES) 128-bit encryption algorithm.</li> <li>• <b>aes-192-cbc</b>—Advanced Encryption Standard (AES) 192-bit encryption algorithm.</li> <li>• <b>aes-256-cbc</b>—Advanced Encryption Standard (AES) 256-bit encryption algorithm.</li> <li>• <b>key</b>—Type of encryption key. It can be one of the following: <ul style="list-style-type: none"> <li>• <b>ascii-text key</b>—ASCII text key. For the <b>des-cbc</b> option, the key contains 8 ASCII characters; for <b>3des-cbc</b>, the key contains 24 ASCII characters.</li> <li>• <b>hexadecimal key</b>—Hexadecimal key. For the <b>des-cbc</b> option, the key contains 16 hexadecimal characters; for the <b>3des-cbc</b> option, the key contains 48 hexadecimal characters.</li> </ul> </li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## encryption-algorithm (Security IKE)

<b>Syntax</b>	encryption-algorithm (3des-cbc   aes-128-cbc   aes-128-gcm   aes-192-cbc   aes-256-cbc   aes-256-gcm   des-cbc);
<b>Hierarchy Level</b>	[edit security ike proposal <i>proposal-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for <b>aes-128-gcm</b> and <b>aes-256-gcm</b> options added in Junos OS Release 12.3X48-D20.
<b>Description</b>	Configure an encryption algorithm for an IKE proposal.

**NOTE:** The device does not delete existing IPsec SAs when you update the **encryption-algorithm** configuration in the IKE proposal.

<b>Options</b>	<p><b>3des-cbc</b>—Has a block size of 24 bytes; the key size is 192 bits long.</p> <p><b>aes-128-cbc</b>—Advanced Encryption Standard (AES) 128-bit encryption algorithm.</p> <p><b>aes-128-gcm</b>—AES 128-bit authenticated encryption algorithm supported with IKEv2 only. When this option is used, <b>aes-128-gcm</b> must be configured at the [edit security ipsec proposal <i>proposal-name</i>] hierarchy level, and the <b>authentication-algorithm</b> option must not be configured at the [edit security ike proposal <i>proposal-name</i>] hierarchy level.</p> <p><b>aes-192-cbc</b>—AES 192-bit encryption algorithm.</p> <p><b>aes-256-cbc</b>—AES 256-bit encryption algorithm.</p> <p><b>aes-256-gcm</b>—AES 256-bit authenticated encryption algorithm supported with IKEv2 only. When this option is used, <b>aes-256-gcm</b> must be configured at the [edit security ipsec proposal <i>proposal-name</i>] hierarchy level, and the <b>authentication-algorithm</b> option must not be configured at the [edit security ike proposal <i>proposal-name</i>] hierarchy level.</p> <p><b>des-cbc</b>—Has a block size of 8 bytes; the key size is 48 bits long.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## encryption-algorithm (Security IPsec)

<b>Syntax</b>	encryption-algorithm (3des-cbc   aes-128-cbc   aes-128-gcm   aes-192-cbc   aes-192-gcm   aes-256-cbc   aes-256-gcm   des-cbc);
<b>Hierarchy Level</b>	[edit security ipsec proposal <i>proposal-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for <b>aes-128-gcm</b> , <b>aes-192-gcm</b> , and <b>aes-256-gcm</b> options added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Configure an encryption algorithm.

**NOTE:** The device deletes existing IPsec SAs when you update the encryption-algorithm configuration in the IPsec proposal.

<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>3des-cbc</b>—Has a block size of 24 bytes; the key size is 192 bits long.</li> <li>• <b>aes-128-cbc</b>—Advanced Encryption Standard (AES) 128-bit encryption algorithm.</li> <li>• <b>aes-128-gcm</b>—AES Galois/Counter Mode (GCM) 128-bit encryption algorithm. This option is for IPsec proposals only.</li> <li>• <b>aes-192-cbc</b>—AES 192-bit encryption algorithm.</li> <li>• <b>aes-192-gcm</b>—AES GCM 192-bit encryption algorithm. This option is for IPsec proposals only.</li> <li>• <b>aes-256-cbc</b>—AES 256-bit encryption algorithm.</li> <li>• <b>aes-256-gcm</b>—AES GCM 256-bit encryption algorithm. This option is for IPsec proposals only.</li> <li>• <b>des-cbc</b>—Has a block size of 8 bytes; the key size is 48 bits long.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> <li>• <i>Monitoring VPNs</i></li> </ul>

---

## encryption-failures

---

<b>Syntax</b>	encryption-failures { threshold <i>value</i> ; }
<b>Hierarchy Level</b>	[edit security alarms potential-violation]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	Raise a security alarm after exceeding a specified number of encryption failures.
<b>Default</b>	Multiple encryption failures do not cause an alarm to be raised.
<b>Options</b>	<b>failures</b> —Number of encryption failures up to which an alarm is not raised. When the configured number is exceeded, an alarm is raised. <b>Range:</b> 1 through 1,000,000,000. <b>Default:</b> 1000
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## enrollment (Security)

---

<b>Syntax</b>	<pre>enrollment {     retry <i>number</i>;     retry-interval <i>seconds</i>;     url <i>url-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit security pki ca-profile <i>ca-profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	Specify the enrollment parameters for a certificate authority (CA).
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>retry <i>number</i></b> —Number of automated attempts for online enrollment to be retried in case enrollment response is pending.  <b>Range:</b> 0 through 1080 <b>Default:</b> 10</li><li>• <b>retry-interval <i>seconds</i></b> —Time interval, in seconds, between the enrollment retries.  <b>Range:</b> 0 through 3600 <b>Default:</b> 900 seconds</li><li>• <b>url <i>url-name</i></b> —Enrollment URL where the Simple Certificate Enrollment Protocol (SCEP) request is sent to the certification authority (CA) as configured in this profile.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>

## establish-tunnels

---

<b>Syntax</b>	<code>establish-tunnels (immediately   on-traffic);</code>
<b>Hierarchy Level</b>	<code>[edit security ipsec vpn <i>vpn-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify when IKE is activated: immediately after VPN information is configured and configuration changes are committed, or only when data traffic flows. In the second case, IKE needs to be negotiated with the peer gateway.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>immediately</b>—IKE is activated immediately after VPN configuration and configuration changes are committed.</li> <li>• <b>on-traffic</b>—IKE is activated only when data traffic flows and must to be negotiated.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## external-interface (Security IKE Gateway)

---

<b>Syntax</b>	<code>external-interface <i>external-interface-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security ike gateway <i>gateway-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the outgoing interface for IKE SAs. This interface is associated with a zone that acts as its carrier, providing firewall security for it.
<b>Options</b>	<b><i>external-interface-name</i></b> —Name of the interface to be used to send traffic to the IPsec VPN.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## external-interface (Security Manual SA)

---

<b>Syntax</b>	<code>external-interface <i>external-interface-name</i>;</code>
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> manual]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the outgoing interface for the manual SA.
<b>Options</b>	<i>external-interface-name</i> —Name of the outgoing interface.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## gateway (Security IKE)

```

Syntax gateway gateway-name {
 address [ip-address-or-hostname];
 advpn {
 suggester {
 disable;
 }
 partner {
 connection-limit <number>;
 idle-threshold <packets/sec>;
 idle-time <seconds>;
 disable;
 }
 }
 dead-peer-detection {

## gateway (Security Manual SA)

---

**Syntax** *gateway ip-address;*

**Hierarchy Level** [edit security ipsec vpn *vpn-name* manual]

**Release Information** Statement introduced in Junos OS Release 8.5. Support for IPv6 addresses added in Junos OS Release 11.1.

**Description** For a manual security association, specify the IPv4 or IPv6 address of the peer.

**Options** *ip-address* —IPv4 or IPv6 address of the peer.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

- [IPsec VPN Overview on page 6337](#)

---

## general-ikeid

---

<b>Syntax</b>	<code>general-ikeid;</code>
<b>Hierarchy Level</b>	<code>[edit security ike gateway <i>gateway-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4.
<b>Description</b>	Accept general peer IKE ID.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

---

## hostname

---

<b>Syntax</b>	<code>hostname <i>domain-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security ike gateway <i>gateway-name</i> dynamic]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Unique name by which a network-attached device is known on a network.
<b>Options</b>	<i>domain-name</i> —A fully qualified domain name (FQDN).
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## idle-time

---

<b>Syntax</b>	<code>idle-time seconds;</code>
<b>Hierarchy Level</b>	<code>[edit security ipsec vpn <i>vpn-name</i> ike]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the maximum amount of idle time to delete a security association (SA).
<b>Options</b>	<b>seconds</b> —Maximum amount of idle time. <b>Range:</b> 60 through 999,999 seconds <b>Default:</b> To be disabled
<b>Required Privilege Level</b>	<b>security</b> —To view this statement in the configuration. <b>security-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## ike (Security)

```

Syntax ike {

Hierarchy Level	[edit security]
Release Information	Statement modified in Junos OS Release 8.5. Support for IPv6 addresses added in Junos OS Release 11.1. The <b>inet6</b> option added in Junos OS Release 11.1.
Description	Define Internet Key Exchange (IKE) configuration.
Options	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
Required Privilege Level	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> <li>• <a href="#">ALG Overview on page 3</a></li> <li>• <a href="#">Understanding Logical Systems for SRX Series Services Gateways on page 3527</a></li> </ul>

## ike (Security IPsec VPN)

**Syntax**   ike {  
               gateway *gateway-name*;  
               idle-time *seconds*;  
               install-interval *seconds*;  
               ipsec-policy *ipsec-policy-name*;  
               no-anti-replay;  
               proxy-identity {  
                   local *ip-prefix*;  
                   remote *ip-prefix*;  
                   service (any | *service-name*);  
               }  
           }

**Hierarchy Level**   [edit security ipsec vpn *vpn-name*]

**Release Information**   Statement introduced in Junos OS Release 8.5. Support for IPv6 addresses added in Junos OS Release 11.1.

**Description**   Define an IKE-keyed IPsec VPN.

**Options**   The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**   security—To view this statement in the configuration.  
                                   security-control—To add this statement to the configuration.

**Related Documentation**   • [IPsec VPN Overview on page 6337](#)

## ike-phase1-failures

---

<b>Syntax</b>	ike-phase1-failures { threshold <i>value</i> ; }
<b>Hierarchy Level</b>	[edit security alarms potential-violation]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	Raise a security alarm after exceeding a specified number of Internet Key Exchange (IKE) Phase 1 failures.
<b>Default</b>	Multiple IKE phase 1 failures do not cause an alarm to be raised.
<b>Options</b>	<b>failures</b> —Number of IKE phase 1 failures up to which an alarm is not raised. When the configured number is exceeded, an alarm is raised. <b>Range:</b> 1 through 1,000,000,000. <b>Default:</b> 20
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## ike-phase2-failures

---

<b>Syntax</b>	ike-phase2-failures { threshold <i>value</i> ; }
<b>Hierarchy Level</b>	[edit security alarms potential-violation]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	Raise a security alarm after exceeding a specified number of Internet Key Exchange (IKE) phase 2 failures.
<b>Default</b>	Multiple IKE phase 2 failures do not cause an alarm to be raised.
<b>Options</b>	<p><b>failures</b>—Number of IKE phase 2 failures up to which an alarm is not raised. When the configured number is exceeded, an alarm is raised.</p> <p><b>Range:</b> 1 through 1,000,000,000.</p> <p><b>Default:</b> 20</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## ike-policy (Security Gateway)

---

<b>Syntax</b>	ike-policy <i>policy-name</i> ;
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the IKE policy to be used for the gateway.
<b>Options</b>	<b>policy-name</b> —IKE policy name.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## ike-user-type

<b>Syntax</b>	ike-user-type (group-ike-id   shared-ike-id);
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dynamic]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Configure the type of IKE user for a remote access connection.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>group-ike-id</b>—E-mail address or fully qualified domain name (FQDN) shared by a group of remote access users so that each user does not need to configure a separate IKE profile. When group IKE IDs are configured, the IKE ID of each user is a concatenation of a user-specific part and a part that is common to all group IKE ID users. For example, the user Bob might use "Bob.example.net" as his full IKE ID, where ".example.net" is common to all users. The full IKE ID is used to uniquely identify each user connection. Group IKE IDs require the generation of a unique preshared key based on the username supplied during VPN connection, which can be viewed with the <b>show security ike pre-shared-key</b> command.</li> <li>• <b>shared-ike-id</b>—E-mail address shared by a large number of remote access users so that each user does not need to configure a separate IKE profile. When a shared IKE ID is configured, all users share a single IKE ID and a single IKE preshared key. Each user is authenticated through the mandatory XAuth phase, where the credentials of individual users are verified either with an external RADIUS server or with a local access database. XAuth is required for shared IKE IDs.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## inet (Security Dynamic Peer)

<b>Syntax</b>	inet <i>ip-address</i> ;
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dynamic]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify IP address to identify the dynamic peer.
<b>Options</b>	<i>ip-address</i> —IP address.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## inet6 (Security IKE Gateway)

---

<b>Syntax</b>	<code>inet6 <i>ipv6-address</i>;</code>
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dynamic]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1.
<b>Description</b>	Specify an IPv6 address to identify the dynamic peer.
<b>Options</b>	<i>ipv6-address</i> —IPv6 address.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## install-interval

---

<b>Syntax</b>	<code>install-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> ike]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the maximum number of seconds to allow for the installation of a rekeyed outbound security association (SA) on the device.
<b>Options</b>	<i>seconds</i> —Maximum amount of idle time. <b>Range:</b> 0 through 10 seconds
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## interval (Security IKE)

---

<b>Syntax</b>	interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dead-peer-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the amount of time that the peer waits for traffic from its destination peer before sending a dead-peer-detection (DPD) request packet.
<b>Options</b>	<b>seconds</b> —Number of seconds that the peer waits before sending a DPD request packet. <b>Range:</b> 10 through 60 seconds <b>Default:</b> 10 seconds
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## ipsec (Security)

```

Syntax ipsec {

**Hierarchy Level** [edit security]

**Release Information** Statement modified in Junos OS Release 8.5.

**Description** Define IPsec configuration.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation** • [IPsec VPN Overview on page 6337](#)

## ipsec-performance-acceleration (Security Flow)

---

**Syntax** `ipsec-performance-acceleration;`

**Hierarchy Level** [edit security flow]

**Release Information** Statement introduced in Junos OS Release 12.1X46-D10.

**Description** Enables IPsec VPN performance acceleration.

**Options** None.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation** • [IPsec VPN Overview on page 6337](#)  
• [show security flow status on page 2137](#)

## ipsec-policy (Security)

---

**Syntax** `ipsec-policy ipsec-policy-name;`

**Hierarchy Level** [edit security ipsec vpn *vpn-name* ike]

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Specify the IPsec policy name.

**Options** *ipsec-policy-name* —Name of the IPsec policy.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation** • [IPsec VPN Overview on page 6337](#)

## ipsec-vpn (Security Flow)

---

<b>Syntax</b>	ipsec-vpn { mss <i>value</i> ; }
<b>Hierarchy Level</b>	[edit security flow tcp-mss]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the TCP maximum segment size (TCP MSS) for the TCP packets that are about to go into an IPsec VPN tunnel. This value overrides the value specified in the <b>all-tcp-mss</b> statement.
<b>Options</b>	<b>mss <i>value</i></b> —TCP MSS value for TCP packets entering an IPsec VPN tunnel. Value is optional. <b>Range:</b> 64 through 65,535 bytes <b>Default:</b> 1320 bytes
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## key-generation-self-test

---

<b>Syntax</b>	key-generation-self-test;
<b>Hierarchy Level</b>	[edit security alarms potential-violation]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	Raise a security alarm when the device or switch detects a key generation self-test failure. Key generation is the process of generating keys for cryptography. A key is used to encrypt and decrypt data. The self-tests run without operator intervention.
<b>Default</b>	No alarm is raised upon failure of a key generation self-test.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## lifetime-kilobytes

---

<b>Syntax</b>	<code>lifetime-kilobytes <i>kilobytes</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security ipsec proposal <i>proposal-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the lifetime (in kilobytes) of an IPsec security association (SA).
<b>Options</b>	<p><b><i>kilobytes</i></b> —Lifetime of the IPsec security association (SA). If this statement is not configured, the number of kilobytes used for the SA lifetime is unlimited.</p> <p><b>Range:</b> 64 through 1,048,576 kilobytes</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## lifetime-seconds (Security IKE)

---

<b>Syntax</b>	<code>lifetime-seconds <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security ike proposal <i>proposal-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Default value modified in Junos OS Release 10.2.
<b>Description</b>	Specify the lifetime (in seconds) of an IKE security association (SA). When the SA expires, it is replaced by a new SA and security parameter index (SPI) or terminated.
<b>Options</b>	<p><b><i>seconds</i></b>—Lifetime of the IKE SA.</p> <p><b>Range:</b> 180 through 86,400 seconds</p> <p><b>Default:</b> 28,800 seconds</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> <li>• <a href="#">Understanding User Authentication Methods</a></li> </ul>

## lifetime-seconds (Security IPsec)

---

<b>Syntax</b>	lifetime-seconds <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit security ipsec proposal <i>proposal-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Default value modified in Junos OS Release 10.2.
<b>Description</b>	Specify the lifetime (in seconds) of an IPsec security association (SA). When the SA expires, it is replaced by a new SA and security parameter index (SPI) or terminated.
<b>Options</b>	<i>seconds</i> —Lifetime of the IPsec SA. <b>Range:</b> 180 through 86,400 seconds <b>Default:</b> 3600 seconds
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## load-distribution

---

<b>Syntax</b>	load distribution { session-affinity ipsec; }
<b>Hierarchy Level</b>	[edit security flow]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4R5.
<b>Description</b>	Enable load distribution for a data flow.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

---

## local (Security IPsec)

---

<b>Syntax</b>	local <i>ip-prefix</i> ;
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> ike proxy-identity]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for IPv6 addresses added in Junos OS Release 11.1.
<b>Description</b>	Specify the local IPv4 or IPv6 address and subnet mask for the proxy identity.
<b>Options</b>	<i>ip-prefix</i> —IPv4 or IPv6 address and subnet mask.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## local-address

<b>Syntax</b>	<code>local-address (<i>ipv4-address</i>   <i>ipv6-address</i>);</code>
<b>Hierarchy Level</b>	<code>[edit security ike gateway <i>gateway-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D10.
<b>Description</b>	Specify the local gateway address. Multiple addresses in the same address family can be configured on an external physical interface to a VPN peer. If this is the case, we recommend that <b>local-address</b> be configured. If there is only one IPv4 and one IPv6 address configured on an external physical interface, <b>local-address</b> configuration is not necessary.
<div>  <p><b>NOTE:</b> <b>local-address</b> must be an IP address that is configured on an interface on the SRX Series device. We recommend that <b>local-address</b> belong to the external interface of the IKE gateway. If <b>local-address</b> does not belong to the external interface of the IKE gateway, the interface must be in the same zone as the external interface of the IKE gateway and an intra-zone security policy must be configured to permit traffic.</p> <p><b>local-address</b> and the remote IKE gateway address must be in the same address family, either IPv4 or IPv6.</p> </div>	
<b>Options</b>	<p><i>ipv4-address</i>—IPv4 address for the local gateway.</p> <p><i>ipv6-address</i>—IPv6 address for the local gateway.</p>
<b>Required Privilege Level</b>	<p>view-level—To view this statement in the configuration.</p> <p>control-level—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

---

## local-certificate (Security)

---

<b>Syntax</b>	local-certificate <i>certificate-id</i> ;
<b>Hierarchy Level</b>	[edit security ike policy <i>policy-name</i> certificate]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5.
<b>Description</b>	Specify a particular certificate when the local device has multiple loaded certificates.

**NOTE:** The device deletes existing IKE and IPsec SAs when you update the **local-certificate** configuration in the IKE policy.

---

<b>Options</b>	<i>certificate-id</i> —Name of the specific certificate to be used.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## local-identity

<b>Syntax</b>	local-identity { (hostname <i>hostname</i>   inet <i>ip-address</i>   inet6 <i>ipv6-address</i>   user-at-hostname <i>e-mail-address</i> ); }
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. The <b>inet6</b> option added in Junos OS Release 11.1.
<b>Description</b>	Specify the local IKE identity to send in the exchange with the destination peer to establish communication. If you do not configure a local-identity, the device uses the IPv4 or IPv6 address corresponding to the local endpoint by default.
<div>  <b>NOTE:</b> For Network Address Translation Traversal (NAT-T), both local identity and remote identity must be configured. </div>	
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>hostname</b> <i>hostname</i>—Specify identity as a fully qualified domain name (FQDN).</li> <li>• <b>inet</b> <i>ip-address</i>—Specify identity as an IPv4 address.</li> <li>• <b>user-at-hostname</b> <i>e-mail-address</i>—Specify identity as an e-mail address.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## manual (Security IPsec)

<b>Syntax</b>	<pre> manual {   authentication {     algorithm (hmac-md5-96   hmac-sha-256-128   hmac-sha-256-96   hmac-sha1-96);     key (ascii-text <i>key</i>   hexadecimal <i>key</i> );   }   encryption {     algorithm (3des-cbc   aes-128-cbc   aes-192-cbc   aes-256-cbc   des-cbc);     key (ascii-text <i>key</i>   hexadecimal <i>key</i> );   }   external-interface <i>external-interface-name</i>;   gateway <i>ip-address</i>;   protocol (ah   esp);   spi <i>spi-value</i> ; } </pre>
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> ]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for IPv6 addresses added in Junos OS Release 11.1.
<b>Description</b>	Define a manual IPsec security association (SA).
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## mode (Security IKE Policy)

<b>Syntax</b>	mode (aggressive   main);
<b>Hierarchy Level</b>	[edit security ike policy <i>policy-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Define the mode used for Internet Key Exchange (IKE) Phase 1 negotiations. Use aggressive mode only when you need to initiate an IKE key exchange without ID protection, as when a peer unit has a dynamically assigned IP address.
<div>  <b>NOTE:</b> <ul style="list-style-type: none"> <li>• IKEv2 protocol does not negotiate using mode configuration.</li> <li>• The device deletes existing IKE and IPsec SAs when you update the mode configuration in the IKE policy.</li> </ul> </div>	
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>aggressive</b>—Aggressive mode.</li> <li>• <b>main</b>—Main mode. Main mode is the recommended key-exchange method because it conceals the identities of the parties during the key exchange.</li> </ul>
<div>  <b>NOTE:</b> Configuring mode main for group VPN servers or members is not supported when the remote gateway has a dynamic address and the authentication method is pre-shared-keys.         </div>	
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## nat-keepalive

---

<b>Syntax</b>	<code>nat-keepalive <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security ike gateway <i>gateway-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Default value changed from 5 seconds to 20 seconds in Junos OS Release 12.1X46-D10.
<b>Description</b>	Specify the interval at which NAT keepalive packets can be sent so that NAT translation continues.
<b>Options</b>	<p><b><i>seconds</i></b> —Maximum interval in seconds at which NAT keepalive packets can be sent.</p> <p><b>Range:</b> 1 through 300 seconds.</p> <p><b>Default:</b> 20 seconds.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## no-anti-replay (Security)

---

<b>Syntax</b>	<code>no-anti-replay;</code>
<b>Hierarchy Level</b>	<code>[edit security ipsec vpn <i>vpn-name</i> ike]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Disable the antireplay checking feature of IPsec. By default, antireplay checking is enabled.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## no-nat-traversal

---

<b>Syntax</b>	no-nat-traversal;
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Disables UDP encapsulation of IPsec Encapsulating Security Payload (ESP) packets, otherwise known as Network Address Translation Traversal (NAT-T). NAT-T is enabled by default.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## non-cryptographic-self-test

---

<b>Syntax</b>	non-cryptographic-self-test;
<b>Hierarchy Level</b>	[edit security alarms potential-violation]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	Raise a security alarm when the device or switch detects a noncryptographic self-test failure. The self-tests run without operator intervention.
<b>Default</b>	No alarm is raised upon failure of a noncryptographic self-test.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## ocsp (Security PKI)

<b>Syntax</b>	<pre>ocsp {   connection-failure (disable   fallback-crl);   disable-responder-revocation-check;   nonce-payload (enable   disable);   url <i>ocsp-url</i>; }</pre>
<b>Hierarchy Level</b>	[edit security pki ca-profile <i>ca-profile-name</i> revocation-check]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D20.
<b>Description</b>	Configure Online Certificate Status Protocol (OCSP) to check the revocation status of a certificate.
<b>Options</b>	<p><b>connection-failure</b>—(Optional) Specify action to take if there is a connection failure to the OCSP responder. If this option is not configured and there is no response from the OCSP responder, certificate validation will fail.</p> <p><b>disable</b>—Skip the revocation check if the OCSP responder is not reachable.</p> <p><b>fallback-crl</b>—Use CRL to check the revocation status of the certificate.</p> <p><b>disable-responder-revocation-check</b> —(Optional) Disable revocation check for the CA certificate received in an OCSP response. The certificates received in an OCSP response generally have shorter lifetimes and revocation check is not required.</p> <p><b>nonce-payload</b>—(Optional) Send a nonce payload to prevent replay attack. A nonce payload is sent by default unless it is explicitly disabled. If enabled, the SRX Series device expects OCSP responses to contain a nonce payload, otherwise the revocation check will fail. If OCSP responders are not capable of responding with a nonce payload, disable this option.</p> <p><b>disable</b>—Explicitly disable the sending of a nonce payload.</p> <p><b>enable</b>—Enable the sending of a nonce payload. This is the default.</p> <p><b>url <i>ocsp-url</i></b>—Specify HTTP addresses for OCSP responders. A maximum of two HTTP URL addresses can be configured. If the configured URLs are not reachable, or URLs are not configured, the URL from the certificate being verified is checked.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>

## optimized

---

<b>Syntax</b>	optimized;
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> vpn-monitor]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	<p>Specify that VPN monitoring optimization is enabled for the VPN object. When VPN monitoring optimization is enabled, the SRX Series device only sends ICMP echo requests (pings) when there is outgoing traffic and no incoming traffic from the configured peer through the VPN tunnel. If there is incoming traffic through the VPN tunnel, the SRX Series device considers the tunnel to be active and does not send pings to the peer.</p> <p>Because ICMP echo requests are only sent when needed to determine peer liveliness, VPN monitoring optimization can save resources on the SRX Series device. Also, ICMP echo requests can activate costly backup links that would otherwise not be used.</p> <p>This option is disabled by default.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## optimized (DPD)

---

<b>Syntax</b>	optimized;
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dead-peer-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D10.
<b>Description</b>	Send dead peer detection (DPD) messages if there is no incoming IKE or IPsec traffic within the configured interval after outgoing packets are sent to the peer. This is the default DPD mode.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## peer-certificate-type

---

<b>Syntax</b>	<code>peer-certificate-type (pkcs7   x509-signature);</code>
<b>Hierarchy Level</b>	[edit security ike policy <i>policy-name</i> certificate]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify a preferred type of certificate (PKCS7 or X509).
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>pkcs7</b>—Public-Key Cryptography Standard #7.</li><li>• <b>x509-signature</b>—X509 is an ITU-T standard for public key infrastructure. This is the default value.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## perfect-forward-secrecy (Security IPsec)

<b>Syntax</b>	<code>perfect-forward-secrecy keys (group1   group14   group19   group2   group20   group24   group5);</code>
<b>Hierarchy Level</b>	<code>[edit security ipsec policy <i>policy-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for <b>group14</b> options added in Junos OS Release 11.1. Support for <b>group19</b> , <b>group20</b> , and <b>group24</b> options added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Specify Perfect Forward Secrecy (PFS) as the method that the device uses to generate the encryption key. PFS generates each new encryption key independently from the previous key.

**NOTE:** The device deletes existing IPsec SAs when you update the **perfect-forward-secrecy** configuration in the IPsec policy.

<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>group1</b>—Diffie-Hellman Group 1.</li> <li>• <b>group14</b>—Diffie-Hellman Group 14.</li> <li>• <b>group19</b>—Diffie-Hellman Group 19.</li> <li>• <b>group2</b>—Diffie-Hellman Group 2.</li> <li>• <b>group20</b>—Diffie-Hellman Group 20.</li> <li>• <b>group24</b>—Diffie-Hellman Group 24.</li> <li>• <b>group5</b>—Diffie-Hellman Group 5.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

```

Hierarchy Level [edit security]

<b>Release Information</b>	Statement modified in Junos OS Release 8.5.
<b>Description</b>	Configure an IPsec profile to request digital certificates.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>

---

## pki-local-certificate

---

<b>Syntax</b>	pki-local-certificate <i>name</i> ;
<b>Hierarchy Level</b>	[edit system services web-management https]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1.
<b>Description</b>	Specify the name of the certificate that is generated by public key infrastructure (PKI) and authenticated by certificate authority (CA).
<b>Options</b>	<i>name</i> —Name of certificate.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>

## policy (Security IKE)

<b>Syntax</b>	<pre> policy <i>policy-name</i> {   certificate {     local-certificate <i>certificate-id</i>;     peer-certificate-type (pkcs7   x509-signature);     policy-oids [ <i>oid</i> ];   }   description <i>description</i>;   mode (aggressive   main);   pre-shared-key (ascii-text <i>key</i>   hexadecimal <i>key</i>);   proposal-set (basic   compatible   standard } suiteb-gcm-128   suiteb-gcm-256);   proposals [<i>proposal-name</i>]; } </pre>
<b>Hierarchy Level</b>	[edit security ike]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for <b>suiteb-gcm-128</b> and <b>suiteb-gcm-256</b> options added in Junos OS Release 12.1X45-D10. Support for <b>policy-oids</b> option added in Junos OS Release 12.3X48-D10.
<b>Description</b>	Configure an IKE policy.
<b>Options</b>	<p><b><i>policy-name</i></b>—Name of the IKE policy. The policy name can be up to 32 alphanumeric characters long.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## policy (Security IPsec)

---

<b>Syntax</b>	<pre>policy <i>policy-name</i> {   description <i>description</i>;   perfect-forward-secrecy keys (group1   group14   group19   group2   group20   group24       group5);   proposal-set (basic   compatible   standard   suiteb-gcm-128   suiteb-gcm-256);   proposals [<i>proposal-name</i>]; }</pre>
<b>Hierarchy Level</b>	[edit security ipsec]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for group 14 is added in Junos OS Release 11.1.
<b>Description</b>	Define an IPsec policy.
<b>Options</b>	<p><i>policy-name</i> —Name of the IPsec policy.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## policy-oids

---

<b>Syntax</b>	<code>policy-oids [ <i>oid</i> ];</code>
<b>Hierarchy Level</b>	[edit security ike policy <i>policy-name</i> certificate]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3X48-D10.
<b>Description</b>	Configure policy object identifiers (OIDs). This configuration is optional.
<b>Options</b>	<i>oid</i> —Policy OID contained in a peer's certificate or certificate chain. Up to five policy OIDs can be configured. Each OID can be up to 63 bytes long.
<div style="display: flex; align-items: center; margin-top: 20px;">  <div> <p><b>NOTE:</b> You must ensure that at least one of the configured policy OIDs is included in a peer's certificate or certificate chain. Note that the <code>policy-oids</code> field in a peer's certificate is optional. If you configure policy OIDs in an IKE policy and the peer's certificate chain does not contain any policy OIDs, certificate validation for the peer fails.</p> </div> </div>	
<b>Required Privilege Level</b>	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Digital Certificate Validation on page 6651</a></li> </ul>

## pre-shared-key (Security IKE Policy)

<b>Syntax</b>	<code>pre-shared-key (ascii-text <i>key</i>   hexadecimal <i>key</i>);</code>
<b>Hierarchy Level</b>	<code>[edit security ike policy <i>policy-name</i>]</code>
<b>Release Information</b>	Statement modified in Junos OS Release 8.5.
<b>Description</b>	Define a preshared key for an IKE policy.

**NOTE:** The device deletes existing IKE and IPsec SAs when you update the `pre-shared-key` configuration in the IKE policy.

<b>Options</b>	<p><b>ascii-text <i>key</i></b>—Specify a string of 1 to 255 ASCII text characters for the key. Characters @ + - or = are not allowed. To include the special characters ( ) [ ] { } , ; , enclose either the entire key string or the special character in quotation marks; for example “<b>str</b>)ng” or <b>str</b>)”ng. Other use of quotation marks within the string is not allowed. With <b>des-cbc</b> encryption, the key contains 8 ASCII characters. With <b>3des-cbc</b> encryption, the key contains 24 ASCII characters.</p> <p><b>hexadecimal <i>key</i></b>—Specify a string of 1 to 255 hexadecimal characters for the key. Characters must be hexadecimal digits 0 through 9, or letters a through f or A through F. With <b>des-cbc</b> encryption, the key contains 16 hexadecimal characters. With <b>3des-cbc</b> encryption, the key contains 48 hexadecimal characters.</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## probe-idle-tunnel

<b>Syntax</b>	<code>probe-idle-tunnel;</code>
<b>Hierarchy Level</b>	<code>[edit security ike gateway <i>gateway-name</i> dead-peer-detection]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D10.
<b>Description</b>	Send dead peer detection (DPD) messages during idle traffic time between peers.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## proposals (Security IKE)

<b>Syntax</b>	proposals [ <i>proposal-name</i> ];
<b>Hierarchy Level</b>	[edit security ike policy <i>policy-name</i> ]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for <b>group-vpn</b> hierarchies added in Junos OS Release 10.2.
<b>Description</b>	Specify up to four Phase 1 proposals for an IKE policy. If you include multiple proposals, use the same Diffie-Hellman group in all of the proposals.
<b>Options</b>	<i>proposal-name</i> —Names of up to four configured Phase 1 proposals.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## proposals (Security IPsec)

---

<b>Syntax</b>	<code>proposals [<i>proposal-name</i>];</code>
<b>Hierarchy Level</b>	<code>[edit security ipsec policy <i>policy-name</i>]</code>
<b>Release Information</b>	Statement modified in Junos OS Release 8.5.
<b>Description</b>	Specify one or more proposals for an IPsec policy.
<b>Options</b>	<i>proposal-name</i> —Name of a configured proposal.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## proposal-set (Security IKE)

<b>Syntax</b>	<code>proposal-set (basic   compatible   standard   suiteb-gcm-128   suiteb-gcm-256);</code>
<b>Hierarchy Level</b>	<code>[edit security ike policy <i>policy-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for <b>suiteb-gcm-128</b> and <b>suiteb-gcm-256</b> options added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Specify a set of default Internet Key Exchange (IKE) proposals.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>basic</b>—Basic set of two IKE proposals:           <ul style="list-style-type: none"> <li>• Proposal 1—Preshared key, Data Encryption Standard (DES) encryption, and Diffie-Hellman (DH) group 1 and Secure Hash Algorithm 1 (SHA-1) authentication.</li> <li>• Proposal 2—Preshared key, DES encryption, and DH group 1 and Message Digest 5 (MD5) authentication.</li> </ul> </li> <li>• <b>compatible</b>—Set of four commonly used IKE proposals:           <ul style="list-style-type: none"> <li>• Proposal 1—Preshared key, triple DES (3DES) encryption, and Gnutella2 (G2) and SHA-1 authentication.</li> <li>• Proposal 2—Preshared key, 3DES encryption, and DH group 2 and MD5 authentication.</li> <li>• Proposal 3—Preshared key, DES encryption, and DH group 2 and SHA-1 authentication.</li> <li>• Proposal 4—Preshared key, DES encryption, and DH group 2 and MD5 authentication.</li> </ul> </li> <li>• <b>standard</b>—Standard set of two IKE proposals:           <ul style="list-style-type: none"> <li>• Proposal 1—Preshared key, 3DES encryption, and DH group 2 and SHA-1 authentication.</li> <li>• Proposal 2—Preshared key, Advanced Encryption Standard (AES) 128-bit encryption, and DH group 2 and SHA-1 authentication.</li> </ul> </li> <li>• <b>suiteb-gcm-128</b>—Provides the following Suite B proposal:           <ul style="list-style-type: none"> <li>• Authentication method—Elliptic Curve Digital Signature Algorithm (ECDSA) 256-bit signatures</li> <li>• Diffie-Hellman Group—19</li> <li>• Encryption algorithm—Advanced Encryption Standard (AES) 128-bit cipher block chaining (CBC)</li> </ul> </li> </ul>

**NOTE:** CBC mode is used instead of Galois/Counter Mode (GCM).

- Authentication algorithm—SHA-256
- **suiteb-gcm-256**—Provides the following Suite B proposal:

- Authentication method—ECDSA 384-bit signatures
- Diffie-Hellman Group—20
- Encryption algorithm—AES 256-bit CBC

**NOTE:** CBC mode is used instead of GCM.

---

- Authentication algorithm—SHA-384

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## proposal-set (Security IPsec)

<b>Syntax</b>	<code>proposal-set (basic   compatible   standard   suiteb-gcm-128   suiteb-gcm-256);</code>
<b>Hierarchy Level</b>	[edit security ipsec policy <i>policy-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4. Support for <b>suiteb-gcm-128</b> and <b>suiteb-gcm-256</b> options added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Define a set of default IPsec proposals.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>basic</b>—nopfs-esp-des-sha and nopfs-esp-des-md5</li> <li>• <b>compatible</b>—nopfs-esp-3des-sha, nopfs-esp-3des-md5, nopfs-esp-des-sha, and nopfs-esp-des-md5</li> <li>• <b>standard</b>—g2-esp-3des-sha and g2-esp-aes128-sha</li> <li>• <b>suiteb-gcm-128</b>—Provides the following Suite B proposal: <ul style="list-style-type: none"> <li>• Encapsulating Security Payload (ESP) protocol</li> <li>• Encryption algorithm—Advanced Encryption Standard Galois/Counter mode (AES-GCM)128-bit</li> <li>• Authentication algorithm—None (AES-GCM provides both encryption and authentication)</li> </ul> </li> <li>• <b>suiteb-gcm-256</b>—Provides the following Suite B proposal: <ul style="list-style-type: none"> <li>• ESP protocol</li> <li>• Encryption algorithm—AES-GCM 256-bit</li> <li>• Authentication algorithm—None (AES-GCM provides both encryption and authentication)</li> </ul> </li> </ul>

**NOTE:** Perfect Forward Secrecy setting in IPsec policy will override the settings in proposal-sets in Release 10.4 and later.

<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## protocol (IPsec SA for OSPF)

<b>Syntax</b>	protocol (ah   esp);
<b>Hierarchy Level</b>	[edit security ipsec security-association <i>sa-name</i> mode transport manual direction bidirectional ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D20.
<b>Description</b>	Configure the IPsec protocol for a manual IPsec security association (SA) to be applied to an OSPF or OSPFv3 interface or virtual link.
<b>Options</b>	<p><b>protocol</b>—Define the IPsec protocol for the manual SA. The protocol can be one of the following:</p> <ul style="list-style-type: none"> <li><b>ah</b>—Authentication Header (AH) protocol.</li> <li><b>esp</b>—Encapsulating Security Payload (ESP) protocol. This is the default.</li> </ul>
<b>Required Privilege Level</b>	<p>view-level—To view this statement in the configuration.</p> <p>control-level—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Understanding OSPF and OSPFv3 Authentication on SRX Series Devices</i></li> </ul>

## protocol (Security IPsec)

<b>Syntax</b>	protocol (ah   esp);
<b>Hierarchy Level</b>	[edit security ipsec proposal <i>proposal-name</i> ]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5.
<b>Description</b>	Define the IPsec protocol for a manual or dynamic security association (SA).

**NOTE:** The device deletes existing IPsec SAs when you update the encryption-algorithm configuration in the IPsec proposal.

<b>Options</b>	<ul style="list-style-type: none"> <li><b>ah</b>—Authentication Header protocol.</li> <li><b>esp</b>—Encapsulating Security Payload (ESP) protocol.</li> </ul>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## protocol (Security IPsec Manual SA)

<b>Syntax</b>	protocol (ah   esp)
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> manual]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5.
<b>Description</b>	Define the IPsec protocol for the manual security association.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>ah</b>—Authentication Header protocol.</li> <li>• <b>esp</b>—ESP protocol (To use the ESP protocol, you must also use the <b>tunnel</b> statement at the [edit security ipsec security-association <i>sa-name</i> mode] hierarchy level.)</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## proxy-identity

<b>Syntax</b>	<pre> proxy-identity {   local <i>ip-prefix</i>;   remote <i>ip-prefix</i>;   service (all   <i>service-name</i>); } </pre>
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> ike]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for IPv6 added in Junos OS Release 12.1X46-D10.
<b>Description</b>	Optionally specify the IPsec proxy ID to use in negotiations. The default is the identity based on the IKE gateway. If the IKE gateway is an IPv6 site-to-site gateway, the default proxy ID is ::/0. If the IKE gateway is an IPv4 gateway or a dynamic endpoint or dialup gateway, the default proxy ID is 0.0.0.0/0.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## re-enroll-trigger-time-percentage (Security PKI)

---

<b>Syntax</b>	re-enroll-trigger-time-percentage <i>percentage</i> ;
<b>Hierarchy Level</b>	[edit security pki auto-re-enrollment certificate-id <i>certificate-id-name</i> ]
<b>Release Information</b>	Statement modified in Junos OS Release 9.0.
<b>Description</b>	Specify the certificate reenrollment trigger as a percentage of the certificate's lifetime that remains before expiration. For example, if the renewal request is to be sent when the certificate's remaining lifetime is 10 percent, then configure 10 for <b>re-enroll-trigger-time-percentage</b> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>

## re-generate-keypair

---

<b>Syntax</b>	<re-generate-keypair>;
<b>Hierarchy Level</b>	[edit security pki auto-re-enrollment certificate-id]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	(Optional) Automatically generate a new key pair when auto-reenrolling a router certificate. If this statement is not configured, the current key pair is used.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Using SCEP to Automatically Renew a Local Certificate on page 6669</a></li></ul>

## refresh-interval

---

<b>Syntax</b>	<code>refresh-interval <i>hours</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security pki ca-profile <i>ca-profile-name</i> revocation-check <i>crl</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the amount of time between certificate revocation list (CRL) updates.
<b>Options</b>	<p><i>number-of-hours</i>—Time interval, in hours, between CRL updates.</p> <p><b>Range:</b> 0 through 8784</p> <p><b>Default:</b> 6</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Security Configuration Statement Hierarchy on page 595</a></li> <li>• <a href="#">[edit security pki] Hierarchy Level on page 637</a></li> <li>• <a href="#">crl (Security) on page 7009</a></li> </ul>

## remote (Security IPsec)

---

<b>Syntax</b>	<code>remote <i>ip-prefix</i>;</code>
<b>Hierarchy Level</b>	<code>[edit security ipsec vpn <i>vpn-name</i> ike proxy-identity]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Support for IPv6 addresses added in Junos OS Release 11.1.
<b>Description</b>	Specify the remote IPv4 or IPv6 address and subnet mask for the proxy identity.
<b>Options</b>	<i>ip-prefix</i> —IPv4 or IPv6 address and subnet mask.
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## remote-identity

<b>Syntax</b>	remote-identity { (distinguished-name <container <i>container-string</i> > <wildcard <i>wildcard-string</i> >   hostname <i>hostname</i>   inet <i>ip-address</i>   inet6 <i>ipv6-address</i>   user-at-hostname <i>e-mail-address</i> ); }
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4.
<b>Description</b>	Specify the remote IKE identity to exchange with the destination peer to establish communication. If you do not configure a remote-identity, the device uses the IPv4 or IPv6 address corresponding to the remote endpoint by default.
<div>  <b>NOTE:</b> For Network Address Translation Traversal (NAT-T), both remote identity and local identity must be configured.         </div>	
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>distinguished-name</b>—Specify identity as the distinguished name (DN) from the certificate. If there is more than one certificate on the device, use the <b>security ike gateway <i>gateway-name</i> policy <i>policy-name</i> certificate local-certificate <i>certificate-id</i></b>.              Optional container and wildcard strings may be specified:             <ul style="list-style-type: none"> <li>• <b>container <i>container-string</i></b>—Specify a string for the container.</li> <li>• <b>wildcard <i>wildcard-string</i></b>—Specify a string for the wildcard.</li> </ul> </li> <li>• <b>hostname <i>hostname</i></b>—Specify identity as a fully qualified domain name (FQDN).</li> <li>• <b>inet <i>ip-address</i></b>—Specify identity as an IPv4 address.</li> <li>• <b>inet6 <i>ipv6-address</i></b>—Specify identity as an IPv6 address.</li> <li>• <b>user-at-hostname <i>e-mail-address</i></b>—Specify identity as an e-mail address.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## replay-attacks

---

<b>Syntax</b>	replay-attacks { threshold <i>value</i> ; }
<b>Hierarchy Level</b>	[edit security alarms potential-violation]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2.
<b>Description</b>	Raise a security alarm when the device detects a replay attack. A replay attack is a form of network attack in which a valid data transmission is maliciously or fraudulently repeated or delayed.
<b>Default</b>	Replay attacks do not raise security alarms.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>threshold <i>value</i></b>—Number of reply attacks up to which an alarm is not raised. When the configured number is exceeded, an alarm is raised.</li> </ul> <p><b>Range:</b> Range: 0 through 100,00,00,000.</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## respond-bad-spi

---

<b>Syntax</b>	respond-bad-spi <i>max-responses</i> ;
<b>Hierarchy Level</b>	[edit security ike]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Enable response to invalid IPsec Security Parameter Index (SPI) values. If the security associations (SAs) between two peers of an IPsec VPN become unsynchronized, the device resets the state of a peer so that the two peers are synchronized.
<b>Options</b>	<p><b><i>max-responses</i></b>—Number of times to respond to invalid SPI values per gateway.</p> <p><b>Range:</b> 1 through 30</p> <p><b>Default:</b> 5</p>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## revocation-check (Security PKI)

---

<b>Syntax</b>	<pre>revocation-check {   crl {     disable {       on-download-failure;     }     refresh-interval <i>hours</i>;     url <i>url-name</i>;   }   disable;   ocsp {     connection-failure (disable   fallback-crl);     disable-responder-revocation-check;     nonce-payload (enable   disable);     url <i>ocsp-url</i>;   }   use-ocsp; }</pre>
<b>Hierarchy Level</b>	[edit security pki ca-profile <i>ca-profile-name</i> ]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5. Support for <b>ocsp</b> and <b>use-ocsp</b> options added in Junos OS Release 12.1X46-D20.
<b>Description</b>	Specify the method the device uses to verify the revocation status of digital certificates.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>

## routing-instance (Security PKI)

---

<b>Syntax</b>	<code>routing-instance <i>routing-instance-name</i></code>
<b>Hierarchy Level</b>	<code>[edit security pki ca-profile <i>ca-profile-name</i>]</code>
<b>Release Information</b>	Statement modified in Junos OS Release 9.0.
<b>Description</b>	Specify the routing-instance to be used.
<b>Options</b>	<ul style="list-style-type: none"><li>• <i>routing-instance-name</i>—Name of the routing instance.</li></ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>

## security-association

<b>Syntax</b>	<pre> security-association <i>sa-name</i> {   manual {     direction bidirectional {       authentication {         algorithm (hmac-md5-96   hmac-sha1-96);         key {           ascii-text <i>key</i>;           hexadecimal <i>key</i>;         }       }       auxiliary-spi <i>auxiliary-spi-value</i>;       encryption {         algorithm (3des-cbc   des-cbc   null);         key {           ascii-text <i>key</i>;           hexadecimal <i>key</i>;         }       }       protocol (ah   esp);       spi <i>spi-value</i>;     }   }   mode transport; } </pre>
<b>Hierarchy Level</b>	[edit security ipsec]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D20.
<b>Description</b>	Configure a manual IPsec security association (SA) to be applied to an OSPF or OSPFv3 interface or virtual link. IPsec can provide authentication and confidentiality to OSPF or OSPFv3 routing packets.
<b>Options</b>	<p><b><i>sa-name</i></b>—Name of the SA.</p> <p><b>mode</b>—SA mode. For this feature, the mode must be <b>transport</b>.</p> <p><b>direction</b>—Direction of the manual SA. For this feature, the direction must be <b>bidirectional</b>.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>view-level—To view this statement in the configuration.</p> <p>control-level—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Understanding OSPF and OSPFv3 Authentication on SRX Series Devices</i></li> </ul>

## service (Security IPsec)

---

<b>Syntax</b>	<code>service (all   <i>service-name</i>);</code>
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> ike proxy-identity]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the service (port and protocol combination) to protect.
<b>Options</b>	<b><i>service-name</i></b> —Name of the service, as defined with <b>system-services (Interface Host-Inbound Traffic)</b> and <b>system-services (Zone Host-Inbound Traffic)</b> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## session-affinity

---

<b>Syntax</b>	<code>session-affinity ipsec</code>
<b>Hierarchy Level</b>	[edit security flow load-distribution]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4R5. Starting with Junos OS Release 15.1X49-D10, IPsec session affinity is supported for IPsec tunnel-based traffic by the SRX5K-MPC3-100G10G (IOC3) and the SRX5K-MPC3-40G10G (IOC3) for SRX5400, SRX5600, and SRX5800 devices through improved flow module and session cache.
<b>Description</b>	Enable VPN session affinity.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## source-interface (Security)

---

<b>Syntax</b>	source-interface <i>interface-name</i> ;
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> vpn-monitor]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the source interface for ICMP requests (VPN monitoring “hellos” ). If no source interface is specified, the device automatically uses the local tunnel endpoint interface.
<b>Options</b>	<i>interface-name</i> —Name of the interface for the ICMP requests.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## spi (IPsec SA for OSPF)

---

<b>Syntax</b>	spi <i>spi-value</i> ;
<b>Hierarchy Level</b>	[edit security ipsec security-association <i>sa-name</i> mode transport manual direction bidirectional]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D20.
<b>Description</b>	Configure a security parameter index (SPI) for a manual IPsec security association (SA) to be applied to an OSPF or OSPFv3 interface or virtual link.
<b>Options</b>	<b>spi</b> —SPI for the manual SA. The SPI uniquely identifies the SA to use at the receiving host (the destination address in the packet). <b>Range:</b> 256 through 16,639
<b>Required Privilege Level</b>	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding OSPF and OSPFv3 Authentication on SRX Series Devices</a></li></ul>

## spi (Security IPsec)

<b>Syntax</b>	<code>spi spi-value;</code>
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> manual]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5.
<b>Description</b>	Configure a security parameter index (SPI) for a security association (SA).
<b>Options</b>	<p><b>spi-value</b> —An arbitrary value that uniquely identifies which security association (SA) to use at the receiving host (the destination address in the packet).</p> <p><b>Range:</b> 256 through 16,639</p>
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## threshold (Security IKE Gateway)

<b>Syntax</b>	<code>threshold number;</code>
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dead-peer-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the maximum number of unsuccessful dead peer detection (DPD) requests to be sent before the peer is considered unavailable.
<b>Options</b>	<p><b>number</b> —Maximum number of unsuccessful DPD requests to be sent.</p> <p><b>Range:</b> 1 through 5</p> <p><i>Output:</i> 5</p>
<div style="display: flex; align-items: center;">  <div> <p><b>NOTE:</b> The threshold number for the IKEv2 protocol is predefined as 5.</p> </div> </div>	
<b>Required Privilege Level</b>	<p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## traceoptions (Security IKE)

<b>Syntax</b>	<pre> traceoptions {   file {     filename;     files number;     match regular-expression;     size maximum-file-size;     (world-readable   no-world-readable);   }   flag flag;   no-remote-trace;   rate-limit messages-per-second; } </pre>
<b>Hierarchy Level</b>	[edit security ike]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Configure IKE tracing options.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>file</b>—Configure the trace file options. <ul style="list-style-type: none"> <li>• <b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</li> <li>• <b>files number</b>—Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed to <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.</li> </ul> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p>Range: 2 through 1000 files</p> <p>Default: 10 files</p> </li> <li>• <b>match regular-expression</b>—Refine the output to include lines that contain the regular expression.</li> <li>• <b>size maximum-file-size</b>—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When the <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</li> </ul> <p>If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option and filename.</p> <p>Syntax: <b>x k</b> to specify KB, <b>x m</b> to specify MB, or <b>x g</b> to specify GB</p> <p>Range: 10 KB through 1 GB</p>

Default: 128 KB

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag**—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.
  - **all**—Trace all ike process modules activity
  - **certificates**—Trace certificate-related activity
  - **config**—Trace configuration download processing
  - **database**—Trace VPN-related database activity
  - **general**—Trace general activity
  - **high-availability**—Trace high-availability operations
  - **ike**—Trace IKE protocol activity
  - **next-hop-tunnels**—Trace next-hop tunnels operations
  - **parse**—Trace VPN parsing activity
  - **policy-manager**—Trace ike callback activity
  - **routing-socket**—Trace routing socket activity
  - **thread**—Trace thread processing
  - **timer**—Trace timer activity
- **no-remote-trace**—Set remote tracing as disabled.
- **rate-limit *messages-per-second***—Configure the incoming rate of trace messages.

Range: 0 through 4,294,967,295

**Required Privilege Level** trace—To view this statement in the configuration.  
 trace-control—To add this statement to the configuration.

**Related Documentation** • [IPsec VPN Overview on page 6337](#)

## traceoptions (Security IPsec)

---

<b>Syntax</b>	traceoptions { flag <i>flag</i> ; }
<b>Hierarchy Level</b>	[edit security ipsec]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Configure IPsec tracing options.

**NOTE:** Configure IPsec tracing options only when instructed to do so by your Juniper support representative.

---

Trace operations are written to the trace file `/var/log/kmd`.

<b>Options</b>	<ul style="list-style-type: none"><li>• <b>flag</b>—To specify more than one trace operation, include multiple <b>flag</b> statements.<ul style="list-style-type: none"><li>• <b>all</b>—Trace with all flags enabled</li><li>• <b>next-hop-tunnel-binding</b>—Trace next-hop tunnel binding events</li><li>• <b>packet-drops</b>—Trace packet drop activity</li><li>• <b>packet-processing</b>—Trace data packet processing events</li><li>• <b>security-associations</b>—Trace security association (SA) management events</li></ul></li></ul>
<b>Required Privilege Level</b>	trace—To view this statement in the configuration. trace-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## traceoptions (Security PKI)

<b>Syntax</b>	<pre> traceoptions {   file {     filename;     files number;     match regular-expression;     size maximum-file-size;     (world-readable   no-world-readable);   }   flag flag;   no-remote-trace; } </pre>
<b>Hierarchy Level</b>	[edit security pki]
<b>Release Information</b>	Statement modified in Junos OS Release 8.5.
<b>Description</b>	Configure public key infrastructure (PKI) tracing options.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>file</b>—Configure the trace file options. <ul style="list-style-type: none"> <li>• <b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>. By default, the name of the file is the name of the process being traced.</li> <li>• <b>files number</b>—Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed to <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.</li> </ul> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p>Range: 2 through 1000 files</p> <p>Default: 10 files</p> </li> <li>• <b>match regular-expression</b>—Refine the output to include lines that contain the regular expression.</li> <li>• <b>size maximum-file-size</b>—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When the <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</li> </ul> <p>If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option and a filename.</p> <p>Syntax: <b>x K</b> to specify KB, <b>x m</b> to specify MB, or <b>x g</b> to specify GB</p> <p>Range: 10 KB through 1 GB</p>

Default: 128 KB

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag**—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.
  - **all**—Trace with all flags enabled
  - **certificate-verification**—Trace PKI certificate verification events
  - **online-crl-check**—Trace PKI online certificate revocation list (CRL) events
- **no-remote-trace**—Set remote tracing as disabled.

**Required Privilege Level** trace—To view this statement in the configuration.  
trace-control—To add this statement to the configuration.

**Related Documentation** [• Understanding Certificates and PKI on page 6643](#)

## traffic-selector

**Syntax** `traffic-selector traffic-selector-name {  
    local-ip ip-address/netmask;  
    remote-ip ip-address/netmask;  
}`

**Hierarchy Level** [edit security ipsec vpn *vpn-name*]

**Release Information** Statement introduced in Junos OS Release 12.1X46-D10.

**Description** Configure local and remote IP addresses for a traffic selector.

**Options** **local-ip *ip-address/netmask***—A local IP address or a local subnetwork protected by the local VPN device.

**remote-ip *ip-address/netmask***—A remote IP address or a remote subnetwork protected by the peer VPN device.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation** [• IPsec VPN Overview on page 6337](#)

## trusted-ca (Security IKE Policy)

---

<b>Syntax</b>	trusted-ca ( <i>ca-index</i>   use-all);
<b>Hierarchy Level</b>	[edit security ike policy <i>policy-name</i> certificate]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the preferred certificate authority (CA) to use when requesting a certificate from the peer. If no value is specified, then no certificate request is sent (although incoming certificates are still accepted).
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>ca-index</b>—Preferred certificate authority ID for the device to use.</li> <li>• <b>use-all</b>—Device uses all configured certificate authorities.</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## use-ocsp (Security PKI)

---

<b>Syntax</b>	use-ocsp;
<b>Hierarchy Level</b>	[edit security pki ca-profile <i>ca-profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X46-D20.
<b>Description</b>	Specify the Online Certificate Status Protocol (OCSP) as the method to check the revocation status of a certificate. CRL is the default method.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>

## user-at-hostname

---

<b>Syntax</b>	<code>user-at-hostname <i>e-mail-address</i>;</code>
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dynamic]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Configure an e-mail address.
<b>Options</b>	<i>e-mail-address</i> —Valid e-mail address.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## version (Security IKE Gateway)

---

<b>Syntax</b>	<code>version (v1-only   v2-only);</code>
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3.
<b>Description</b>	Specify the IKE version to use to initiate the connection.
<b>Options</b>	<i>v1-only</i> —The connection must be initiated using IKE version 1. This is the default. <i>v2-only</i> —The connection must be initiated using IKE version 2.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## vpn (Security)

```

Syntax vpn vpn-name {
 bind-interface interface-name;
 copy-outer-dscp;
 ike {
 gateway gateway-name;
 ipsec-policy ipsec-phase2-policy;
 }
 establish-tunnels (immediately | on-traffic);
 }
 ike {
 gateway gateway-name;
 idle-time seconds;
 install-interval seconds;
 ipsec-policy ipsec-policy-name;
 no-anti-replay;
 proxy-identity {
 local ip-prefix;
 remote ip-prefix;
 service (any | service-name);
 }
 }
 manual {
 authentication {
 algorithm (hmac-md5-96 | hmac-sha-256-128 | hmac-sha-256-96 | hmac-sha1-96);
 key (ascii-text key | hexadecimal key);
 }
 encryption {
 algorithm (3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | des-cbc);
 key (ascii-text key | hexadecimal key);
 }
 external-interface external-interface-name;
 gateway ip-address;
 protocol (ah | esp);

 remote-ip ip-address/netmask;
 }
 vpn-monitor {
 destination-ip ip-address;
 optimized;
 source-interface interface-name;
 }
}

```

**Hierarchy Level** [edit security ipsec]

**Release Information** Statement introduced in Junos OS Release 8.5. Support for IPv6 addresses added in Junos OS Release 11.1. Support for **copy-outer-dscp** added in Junos OS Release 15.1X49-D30.

<b>Description</b>	Configure an IPsec VPN.
<b>Options</b>	<b><i>vpn-name</i></b> —Name of the VPN.  The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

---

## vpn-monitor

---

<b>Syntax</b>	<pre>vpn-monitor {     destination-ip <i>ip-address</i>;     optimized;     source-interface <i>interface-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit security ipsec vpn <i>vpn-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Configure settings for VPN monitoring. This feature cannot be configured simultaneously with the <a href="#">dead-peer-detection</a> statement.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## vpn-monitor-options

<b>Syntax</b>	vpn-monitor-options { interval <i>seconds</i> ; threshold <i>number</i> ; }
<b>Hierarchy Level</b>	[edit security ipsec]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Configure VPN monitoring options.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>interval <i>seconds</i></b>—Interval at which to send ICMP requests to the peer.   <b>Range:</b> 2 through 3600 seconds  <b>Default:</b> 10 seconds</li> <li>• <b>threshold <i>number</i></b>—Number of consecutive unsuccessful pings before the peer is declared unreachable.   <b>Range:</b> 1 through 65,536 pings  <b>Default:</b> 10 pings</li> </ul>
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## wildcard

<b>Syntax</b>	wildcard <i>string</i> ;
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> dynamic distinguished-name]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify that the values of a dynamic virtual private network (VPN) endpoint user's distinguished name's identity fields match the values in the group IKE user's distinguished name's fields. The order of the identity fields in the distinguished name strings does not matter during a match.
<b>Options</b>	<b><i>string</i></b> —Distinguished name identity values to be matched.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## xauth

---

<b>Syntax</b>	<pre>xauth {     access-profile <i>profile-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit security ike gateway <i>gateway-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify that Extended authentication (XAuth) is performed in addition to IKE authentication for remote users trying to access a VPN tunnel. Include a previously created access profile, created with the <b>edit access profile</b> statement, to specify the access profile to be used for authentication information.
<b>Options</b>	<b>access-profile <i>profile-name</i></b> —Name of previously created access profile to reference for authentication information.
<b>Required Privilege Level</b>	security—To view this statement in the configuration. security-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IPsec VPN Overview on page 6337</a></li></ul>

## CHAPTER 300

# Operational Commands

- clear security ike respond-bad-spi-count
- clear security ike security-associations
- clear security ipsec security-associations
- clear security ipsec statistics
- clear security ipsec tunnel-events-statistics
- clear security pki key-pair (Local Certificate)
- clear security pki local-certificate (Device)
- request security pki ca-certificate ca-profile-group load
- request security pki ca-certificate enroll (Security)
- request security pki ca-certificate load (Security)
- request security pki ca-certificate verify (Security)
- request security pki crl load (Security)
- request security pki generate-certificate-request (Security)
- request security pki generate-key-pair (Security)
- request security pki local-certificate enroll (Security)
- request security pki local-certificate export
- request security pki local-certificate generate-self-signed (Security)
- request security pki local-certificate load
- request security pki local-certificate verify (Security)
- request security pki verify-integrity-status
- show security ike active-peer

- [show security pki local-certificate \(View\)](#)

## clear security ike respond-bad-spi-count

---

<b>Syntax</b>	clear security ike respond-bad-spi-count < <i>gateway-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	Clear information about invalid Internet Key Exchange (IKE) security parameter index (SPI) counters.
<b>Options</b>	<ul style="list-style-type: none"><li>• none—Clear all invalid SPI counters.</li><li>• <i>gateway-name</i> —(Optional) Clear the invalid SPI counters for the given gateway.</li></ul>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">respond-bad-spi on page 7075</a></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security ike security-associations

<b>Syntax</b>	<pre>clear security ike security-associations   &lt; peer-address &gt;   &lt; port &gt;   &lt; fpc slot-number &gt;   &lt; index SA-index-number &gt;   &lt; kmd-instance (all   kmd-instance-name) &gt;   &lt; pic slot-number &gt;   port   &lt; family (inet   inet6) &gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5. The <b>fpc</b> , <b>pic</b> , and <b>kmd-instance</b> options added in Junos OS Release 9.3. The <b>port</b> option added in Junos OS Release 10.0. The <b>family</b> option added in Junos OS Release 11.1.
<b>Description</b>	Clear information about the current Internet Key Exchange security associations (IKE SAs). For IKEv2, the device clears the information about the IKE SAs and the associated IPSec SA.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>none</b>—Clear all IKE SAs.</li> <li>• <b>peer-address</b> —(Optional) Clear IKE SAs for the destination peer at this IP address.</li> <li>• <b>fpc slot-number</b> —Specific to SRX Series devices. Clear information about existing IKE SAs in this Flexible PIC Concentrator (FPC) slot.</li> <li>• <b>index SA-index-number</b> —(Optional) Clear the IKE SA with this index number.</li> <li>• <b>port</b>—(Optional) Port number of SA (1 through 65,535).</li> <li>• <b>kmd-instance</b>—Specific to SRX Series devices. Clear information about existing IKE SAs in the key management process (the daemon, which in this case is KMD) identified by FPC <b>slot-number</b> and PIC <b>slot-number</b>.             <ul style="list-style-type: none"> <li>• <b>all</b>—All KMD instances running on the Services Processing Unit (SPU).</li> <li>• <b>kmd-instance-name</b>—Name of the KMD instance running on the SPU.</li> </ul> </li> <li>• <b>pic slot-number</b> —Specific to SRX Series devices. Clear information about existing IKE SAs in this PIC slot.</li> <li>• <b>family</b>—(Optional) Clear IKE SAs by family.             <ul style="list-style-type: none"> <li>• <b>inet</b>—IPv4 address family.</li> <li>• <b>inet6</b>—IPv6 address family.</li> </ul> </li> </ul>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show security ike security-associations on page 3993</a></li> </ul>

**Output Fields** This command produces no output.

## clear security ipsec security-associations

<b>Syntax</b>	clear security ipsec security-associations <b>fpc</b> <i>slot-number</i> <index <i>SA-index-number</i> > <b>kmd-instance</b> (all   <i>kmd-instance-name</i> ) <b>pic</b> <i>slot-number</i> <family (inet   inet6)>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5. The <b>fpc</b> , <b>pic</b> , and <b>kmd-instance</b> options added in Junos OS Release 9.3. The <b>family</b> option added in Junos OS Release 11.1.
<b>Description</b>	Clear information about IPsec security associations (SAs).
<b>Options</b>	<ul style="list-style-type: none"> <li>• none—Clear all IPsec SAs.</li> <li>• <b>fpc</b> <i>slot-number</i>—Specific to SRX Series devices. Clear information about existing IPsec SAs in this Flexible PIC Concentrator (FPC) slot.</li> <li>• <b>index</b> <i>SA-index-number</i> —(Optional) Clear the IPsec SA with this index number.</li> <li>• <b>kmd-instance</b>—Specific to SRX Series devices. Clear information about existing IPsec SAs in the key management process (the daemon, which in this case is KMD) identified by FPC <i>slot-number</i> and PIC <i>slot-number</i> .             <ul style="list-style-type: none"> <li>• all—All KMD instances running on the Services Processing Unit (SPU).</li> <li>• <i>kmd-instance-name</i>—Name of the KMD instance running on the SPU.</li> </ul> </li> </ul> <p><b>pic</b> <i>slot-number</i> —Specific to SRX Series devices. Clear information about existing IPsec SAs in this PIC slot.</p> <p><b>family</b>—(Optional) Clear SAs by family.</p> <ul style="list-style-type: none"> <li>• <b>inet</b>—IPv4 address family.</li> <li>• <b>inet6</b>—IPv6 address family.</li> </ul>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show security ipsec security-associations on page 4001</a></li> </ul>
<b>Output Fields</b>	This command produces no output.

## clear security ipsec statistics

<b>Syntax</b>	clear security ike statistics <fpc <i>slot-number</i> > <index <i>SA-index-number</i> > <kmd-instance (all   <i>kmd-instance-name</i> )> <pic <i>slot-number</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 8.5. <b>fpc</b> and <b>pic</b> options added in Junos OS Release 9.3. <b>kmd-instance</b> option added in Junos OS Release 10.4.
<b>Description</b>	Clear IPsec statistics on the device.
<b>Options</b>	<ul style="list-style-type: none"> <li>• none—Clear all IPsec statistics.</li> <li>• <b>fpc <i>slot-number</i></b>—Specific to SRX Series devices. Clear statistics about existing IPsec security associations (SAs) in this Flexible PIC Concentrator (FPC) slot.</li> <li>• <b>index <i>SA-index-number</i></b>—(Optional) Clear the IPsec statistics for the SA with this index number.</li> <li>• <b>kmd-instance</b>—Specific to SRX Series devices. Clear information about existing IKE SAs in the key management process (the daemon, which in this case is KMD) identified by FPC <i>slot-number</i> and PIC <i>slot-number</i>. <ul style="list-style-type: none"> <li>• <b>all</b>—All KMD instances running on the Services Processing Unit (SPU).</li> <li>• <b><i>kmd-instance-name</i></b>—Name of the KMD instance running on the SPU.</li> </ul> </li> <li>• <b>pic <i>slot-number</i></b>—Specific to SRX Series devices. Clear statistics about existing IPsec SAs in this PIC slot.</li> </ul>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show security ipsec statistics on page 4331</a></li> </ul>
<b>Output Fields</b>	This command produces no output.

## clear security ipsec tunnel-events-statistics

---

<b>Syntax</b>	clear security ipsec tunnel-events-statistics
<b>Release Information</b>	Command introduced in Junos OS Release 12.3X48-D10.
<b>Description</b>	Clear IPsec tunnel event statistics.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>show security ipsec tunnel-events-statistics</i></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security pki key-pair (Local Certificate)

---

<b>Syntax</b>	clear security pki key-pair (all   certificate-id <i>certificate-id</i> )
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	Clear public key infrastructure (PKI) key pair information for local digital certificates on the device.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>all</b>—Clear key pair information for all local certificates.</li><li>• <b>certificate-id <i>certificate-id</i></b>—Clear key pair information for the local certificate with this certificate ID.</li></ul>
<b>Required Privilege Level</b>	clear and security
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security pki certificate-request (View) on page 7164</a></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear security pki local-certificate (Device)

<b>Syntax</b>	clear security pki local-certificate (all   certificate-id <i>certificate-id</i>   system-generated)
<b>Release Information</b>	Command modified in Junos OS Release 9.1.
<b>Description</b>	Clear public key infrastructure (PKI) information for local digital certificates on the device.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>all</b>—Clear information for all the local digital certificates on the device.</li> </ul>
	<p> <b>NOTE:</b> You cannot clear the automatically generated self-signed certificate using <code>clear security pki local-certificate all</code> command. To clear the self-signed certificate you need to use <code>system-generated</code> as an option.</p>
	<ul style="list-style-type: none"> <li><b>certificate-id <i>certificate-id</i></b>—Clear the specified local digital certificate with this certificate ID.</li> <li><b>system-generated</b>—Clear the existing automatically generated self-signed certificate and generate a new self-signed certificate.</li> </ul>
<b>Required Privilege Level</b>	clear and security
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">show security pki local-certificate (View) on page 775</a></li> <li><a href="#">request security pki local-certificate generate-self-signed (Security) on page 7115</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear security pki local-certificate all on page 7102</a> <a href="#">clear security pki local-certificate system-generated on page 7102</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

clear security pki local-certificate all

```
user@host> clear security pki local-certificate all
```

### Sample Output

clear security pki local-certificate system-generated

```
user@host> clear security pki local-certificate system-generated
```

## request security pki ca-certificate ca-profile-group load

<b>Syntax</b>	<code>request security pki ca-certificate ca-profile-group load ca-group-name <i>ca-group-name</i> filename [<i>path/filename</i>   default]</code>
<b>Release Information</b>	Command introduced in Junos OS Release 12.1; <b>default</b> option added in Junos OS Release 12.1X47-D10.
<b>Description</b>	<p>For SSL forward proxy, you need to load trusted CA certificates on your system. By default, Junos OS provides a list of trusted CA certificates that include default certificates used by common browsers. Alternatively, you can define your own list of trusted CA certificates and import them on to your system.</p> <p>Use this command to load the default certificates or to specify a path and filename of trusted CA certificates that you define.</p>
<b>Options</b>	<p><b>ca-group-name <i>ca-group-name</i></b>—Load the specified CA group profile.</p> <p><b>filename <i>path/filename</i></b>—Directory location and filename of the trusted CA certificates defined by you.</p> <p><b>filename default</b>—Load the trusted CA certificates available by default.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show security pki ca-certificate on page 771</a></li> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security pki ca-certificate ca-profile-group load (default) on page 7103</a> <a href="#">request security pki ca-certificate ca-profile-group load (path/filename) on page 7104</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request security pki ca-certificate ca-profile-group load (default)

```
user@host> request security pki ca-certificate ca-profile-group load ca-group-name ca-default
filename default
```

```

```

## request security pki ca-certificate enroll (Security)

<b>Syntax</b>	<code>request security pki ca-certificate enroll ca-profile <i>ca-profile-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 7.5.
<b>Description</b>	Request a digital certificate from a certificate authority (CA) online by using the Simple Certificate Enrollment Protocol (SCEP).
<b>Options</b>	<code>ca-profile <i>ca-profile-name</i></code> —CA profile name.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show security pki ca-certificate (View) on page 7160</a></li> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security pki ca-certificate enroll on page 7105</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request security pki ca-certificate enroll

```

user@host> request security pki ca-certificate enroll ca-profile entrust
Received following certificates:
Certificate: C=us, O=example, CN=First Officer
Fingerprint: 46:71:15:34:f0:a6:41:76:65:81:33:4f:68:47:c4:df:78:b8:e3:3f
Certificate: C=us, O=example, CN=First Officer
Fingerprint: bc:78:87:9b:a7:91:13:20:71:db:ac:b5:56:71:42:ad:1a:b6:46:17
Certificate: C=us, O=example
Fingerprint: 00:8e:6f:58:dd:68:bf:25:0a:e3:f9:17:70:d6:61:f3:53:a7:79:10
Do you want to load the above CA certificate ? [yes,no] (no) yes

```

## request security pki ca-certificate load (Security)

---

<b>Syntax</b>	<code>request security pki ca-certificate load ca-profile <i>ca-profile-name</i> filename <i>path/filename</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 7.5.
<b>Description</b>	Manually load a certificate authority (CA) digital certificate from a specified location.
<b>Options</b>	<code>ca-profile <i>ca-profile-name</i></code> —Load the specified CA profile. <code>filename <i>path/filename</i></code> —Directory location and filename of the CA digital certificate.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security pki ca-certificate on page 771</a></li><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request security pki ca-certificate load on page 7106</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request security pki ca-certificate load

```
user@host> request security pki ca-certificate load ca-profile 2Kkey filename /var/tmp/2Kkey.pem

Fingerprint:
 a0:08:bb:1f:75:96:76:cd:ee:db:36:10:b6:c6:d8:df:5e:02:05:05 (sha1)
 f5:58:6b:de:7c:d6:cd:90:5a:18:c3:0e:3d:95:da:25 (md5)
Do you want to load this CA certificate ? [yes,no] (no) yes

CA certificate for profile 2Kkey loaded successfully
```

## request security pki ca-certificate verify (Security)

<b>Syntax</b>	<code>request security pki ca-certificate verify ca-profile <i>ca-profile-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	Verify the digital certificate installed for the specified certificate authority (CA).
<b>Options</b>	<code>ca-profile <i>ca-profile-name</i></code> —Display the specified CA profile.
<b>Required Privilege Level</b>	maintenance and security
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">ca-profile (Security PKI) on page 7004</a></li> <li>• <a href="#">show security pki ca-certificate (View) on page 7160</a></li> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security pki ca-certificate verify ca-profile ca1 (CRL downloaded) on page 7107</a> <a href="#">request security pki ca-certificate verify ca-profile ca1 (CRL not downloaded) on page 7107</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

This user has downloaded the certificate revocation list (CRL).

#### request security pki ca-certificate verify ca-profile ca1 (CRL downloaded)

```
user@host> request security pki ca-certificate verify ca-profile ca1
CA certificate ca1 verified successfully
```

### Sample Output

This user has not downloaded the certificate revocation list (CRL).

#### request security pki ca-certificate verify ca-profile ca1 (CRL not downloaded)

```
user@host> request security pki ca-certificate verify ca-profile ca1
CA certificate ca1: CRL verification in progress. Please check the PKId debug
logs for completion status
```

## request security pki crt load (Security)

---

<b>Syntax</b>	<code>request security pki crt load ca-profile <i>ca-profile-name</i> filename <i>path/filename</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 8.1.
<b>Description</b>	Manually install a certificate revocation list (CRL) on the device from a specified location.
<b>Options</b>	<code>ca-profile <i>ca-profile-name</i></code> —Load the specified certificate authority (CA) profile. <code>filename <i>path/filename</i></code> —Directory location and filename of the CRL.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request security pki crt load on page 7108</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request security pki crt load

```
user@host> request security pki crt load ca-profile ca-test filename example-inter-ca.crl
CRL for CA profile ca-test loaded successfully
```

## request security pki generate-certificate-request (Security)

<b>Syntax</b>	<pre>request security pki generate-certificate-request certificate-id <i>certificate-id-name</i>   domain-name <i>domain-name</i> subject <i>subject-distinguished-name</i>   &lt;add-ca-constraint&gt;   &lt;digest (sha1   sha256)&gt;   &lt;email <i>email-address</i>&gt;   &lt;filename (<i>path</i>   terminal)&gt;   &lt;ip-address <i>ip-address</i>&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 7.5. Support for <b>digest</b> option added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Manually generate a local digital certificate request in the Public-Key Cryptography Standards #10 (PKCS-10) format.
<b>Options</b>	<p><b>certificate-id</b> <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p><b>domain-name</b> <i>domain-name</i>—Fully qualified domain name (FQDN) provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p><b>subject</b> <i>subject-distinguished-name</i>—Distinguished name format contains the following information:</p> <ul style="list-style-type: none"> <li>• <b>DC</b>—Domain component</li> <li>• <b>CN</b>—Common name</li> <li>• <b>OU</b>—Organizational unit name</li> <li>• <b>O</b>—Organization name</li> <li>• <b>L</b>—Locality</li> <li>• <b>ST</b>—State</li> <li>• <b>C</b>—Country</li> </ul> <p><b>digest</b>—(Optional) Hash algorithm used to sign the certificate request.</p> <ul style="list-style-type: none"> <li>• <b>sha1</b>—SHA-1 digests (default value for RSA or DSA only).</li> <li>• <b>sha256</b>—SHA-256 digests for RSA or ECDSA only (default value for ECDSA).</li> <li>• <b>sha-384</b>—SHA-384 digests for ECDSA only.</li> </ul> <p><b>email</b> <i>email-address</i>—(Optional) E-mail address of the certificate holder.</p> <p><b>filename</b> (<i>path</i>   <i>terminal</i>)—(Optional) Location where the local digital certificate request should be placed or the login terminal.</p> <p><b>ip-address</b> <i>ip-address</i>—(Optional) IP address of the router.</p>

<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show security pki certificate-request (View) on page 7164</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security pki generate-certificate-request on page 7110</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security pki generate-certificate-request

```
user@host> request security pki generate-certificate-request certificate-id local-entrust2
domain-name router2.example.net filename entrust-req2 subject cn=router2.example.net
```

```

## request security pki generate-key-pair (Security)

<b>Syntax</b>	<code>request security pki generate-key-pair certificate-id <i>certificate-id-name</i></code> <code>&lt;size (256   384   512   1024   2048   4096)&gt;</code> <code>&lt;type (dsa   ecdsa   rsa)&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1. Options to support Elliptic Curve Digital Signature Algorithm (ECDSA) added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Generate a public key infrastructure (PKI) public/private key pair for a local digital certificate.
<b>Options</b>	<p><b>certificate-id</b> <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p><b>size</b>—Key pair size. The key pair size can be 256, 384, 512, 1024, 2048, or 4096 bits. Key pair sizes of 256 and 384 bits are compatible with ECDSA. If a key pair size is not specified, the default value, <b>1024</b> bits, is applied.</p> <p><b>type</b>—The algorithm to be used for encrypting the public/private key pair:</p> <ul style="list-style-type: none"> <li>• <b>ecdsa</b>—ECDSA encryption</li> <li>• <b>dsa</b>—Digital Signal Algorithm (DSA) encryption</li> <li>• <b>rsa</b>—Rivest Shamir Adleman (RSA) encryption (default)</li> </ul>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security pki generate-key-pair on page 7111</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security pki generate-key-pair

```
user@switch> request security pki generate-key-pair type rsa size 1024 certificate-id test
Generated key pair test, key size 1024 bits
```

## request security pki local-certificate enroll (Security)

<b>Syntax</b>	request security pki local-certificate enroll <i>ca-profile ca-profile-name</i> <i>certificate-id certificate-id-name</i> challenge-password <i>password</i> domain-name <i>domain-name</i> subject <i>subject-distinguished-name</i> <email <i>email-address</i> > <ip-address <i>ip-address</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 7.5. Serial number (SN) option added to the subject string output field in Junos OS Release 12.1X45.
<b>Description</b>	Request that a certificate authority (CA) enroll and install a local digital certificate online by using the Simple Certificate Enrollment Protocol (SCEP).
<div>  <b>NOTE:</b> SCEP supports RSA certificates only.         </div>	
<b>Options</b>	<p><b>ca-profile</b> <i>ca-profile-name</i>—CA profile name.</p> <p><b>certificate-id</b> <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p><b>challenge-password</b> <i>password</i>—Password set by the administrator and normally obtained from the SCEP enrollment webpage of the CA. The password is 16 characters in length.</p> <p><b>domain-name</b> <i>domain-name</i>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p><b>subject</b> <i>subject-distinguished-name</i>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none"> <li>• <b>CN</b>—Common name</li> <li>• <b>OU</b>—Organizational unit name</li> <li>• <b>O</b>—Organization name</li> <li>• <b>ST</b>—State</li> <li>• <b>C</b>—Country</li> </ul> <p><b>email</b> <i>email-address</i>—(Optional) E-mail address of the certificate holder.</p> <p><b>ip-address</b> <i>ip-address</i>—(Optional) IP address of the router.</p>
<b>Required Privilege Level</b>	maintenance

- Related Documentation**
- [show security pki local-certificate \(View\) on page 775](#)
  - [Understanding Certificates and PKI on page 6643](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

### Sample Output

```
user@host> request security pki local-certificate enroll certificate-id r3-entrust-scep ca-profile
entrust domain-name router3.example.net subject
"CN=router3,OU=Engineering,O=example,C=US" challenge-password 123
```

Certificate enrollment has started. To view the status of your enrollment, check the public key infrastructure log (pkid) log file at /var/log/pkid. Please save the challenge-password for revoking this certificate in future. Note that this password is not stored on the router.

## request security pki local-certificate export

---

<b>Syntax</b>	<code>request security pki local-certificate export</code>
<b>Release Information</b>	Command introduced in Junos OS Release 12.1.
<b>Description</b>	Export a generated self-signed certificate from the default location ( <code>var/db/certs/common/local</code> ) to a specific location within the device.
<b>Options</b>	<p><b>certificate id</b> <i>certificate-id-name</i>—Name of the local digital certificate.</p> <p><b>filename</b> <i>path/filename</i>—Target directory location and filename of the CA digital certificate.</p> <p><b>type</b> (<code>der</code>   <code>pem</code>)—Certificate format: DER (distinguished encoding rules) or PEM (privacy-enhanced mail).</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request security pki local-certificate export on page 7114</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security pki local-certificate export

```
user@host> request security pki local-certificate export filename /var/tmp/my-cert.pem
certificate-id nss-cert type pem
certificate exported successfully
```

## request security pki local-certificate generate-self-signed (Security)

<b>Syntax</b>	<pre>request security pki local-certificate generate-self-signed certificate-id     <i>certificate-id-namedomain-name domain-name</i> subject <i>subject-distinguished-name</i>     &lt;add-ca-constraint&gt;     &lt;digest (sha1   sha256)&gt;     &lt;email <i>email-address</i>&gt;     &lt;ip-address <i>ip-address</i>&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1. Support for <b>digest</b> option added in Junos OS Release 12.1X45-D10.
<b>Description</b>	Manually generate a self-signed certificate for the given distinguished name.
<b>Options</b>	<p><b>certificate-id</b> <i>certificate-id-name</i>—Name of the certificate and the public/private key pair.</p> <p><b>domain-name</b> <i>domain-name</i>—Fully qualified domain name (FQDN) provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p><b>subject</b> <i>subject-distinguished-name</i>—Distinguished name format contains the following information:</p> <ul style="list-style-type: none"> <li>• <b>DC</b>—Domain component</li> <li>• <b>CN</b>—Common name</li> <li>• <b>OU</b>—Organizational unit name</li> <li>• <b>O</b>—Organization name</li> <li>• <b>L</b>—Locality</li> <li>• <b>ST</b>—State</li> <li>• <b>C</b>—Country</li> </ul> <p><b>add-ca-constraint</b>—(Optional) Specifies that the certificate can be used to sign other certificates.</p> <p><b>digest</b>—(Optional) Hash algorithm used to sign the certificate.</p> <ul style="list-style-type: none"> <li>• <b>sha1</b>—SHA-1 digest (default)</li> <li>• <b>sha256</b>—SHA-256 digest</li> </ul> <p><b>email</b> <i>email-address</i>—(Optional) E-mail address of the certificate holder.</p>
<b>Required Privilege Level</b>	maintenance and security
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security pki local-certificate (Device) on page 7102</a></li> <li>• <a href="#">show security pki local-certificate (View) on page 775</a></li> </ul>

**List of Sample Output**    [request security pki local-certificate generate-self-signed certificate-id self-cert subject cn=abc domain-name example.net email user1@example.net on page 7116](#)

**Output Fields**    When you enter this command, you are provided feedback on the status of your request.

### Sample Output

[request security pki local-certificate generate-self-signed certificate-id self-cert subject cn=abc domain-name example.net email user1@example.net](#)

```
user@host> request security pki local-certificate generate-self-signed certificate-id self-cert
subject cn=abc domain-name example.net email user1@example.net
Self-signed certificate generated and loaded successfully
```

## request security pki local-certificate load

<b>Syntax</b>	<code>request security pki local-certificate load filename <i>ssl_proxy_ca.crt</i> key <i>ssl_proxy_ca.key</i> certificate-id <i>certificate id</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.4.
<b>Description</b>	Manually load a local digital certificate from a specified location.
<b>Options</b>	<p><b>filename</b> — Filename that contains the certificate to load</p> <p><b>key</b>— File pathname that contains the private key/key-pair to loaded</p> <p><b>certificate-id</b> —Name of the certificate identifier</p>
<b>Required Privilege Level</b>	maintenance and security
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show security pki local-certificate (View) on page 775</a></li> <li>• <a href="#">clear security pki local-certificate (Device) on page 7102</a></li> <li>• <a href="#">request security pki local-certificate verify (Security) on page 7118</a></li> <li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security pki local-certificate load on page 7117</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security pki local-certificate load

```
user@host> request security pki local-certificate load filename cert_name.crt key key_name.key
certificate-id test
Local certificate cert_name.crt loaded successfully
```

## request security pki local-certificate verify (Security)

---

<b>Syntax</b>	request security pki local-certificate verify certificate-id <i>certificate-id-name</i>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	Verify the validity of the local digital certificate identifier.
<b>Options</b>	<b>certificate-id</b> <i>certificate-id-name</i> — Name of the local digital certificate identifier.
<b>Required Privilege Level</b>	maintenance and security
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request security pki local-certificate load on page 7117</a></li><li>• <a href="#">show security pki local-certificate (View) on page 775</a></li><li>• <a href="#">clear security pki local-certificate (Device) on page 7102</a></li><li>• <a href="#">Understanding Certificates and PKI on page 6643</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request security pki local-certificate verify certificate-id bme1 (not downloaded) on page 7118</a> <a href="#">request security pki local-certificate verify certificate bme1 (downloaded) on page 7118</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

You receive the following response before the certificate revocation list (CRL) is downloaded:

#### [request security pki local-certificate verify certificate-id bme1 \(not downloaded\)](#)

```
user@host> request security pki local-certificate verify certificate-id bme1
Local certificate bme1: CRL verification in progress. Please check the PKId debug
logs for completion status
```

### Sample Output

You receive the following response after the certificate revocation list (CRL) is downloaded:

#### [request security pki local-certificate verify certificate bme1 \(downloaded\)](#)

```
user@host> request security pki local-certificate verify certificate-id bme1
Local certificate bme1 verification success
```

## request security pki verify-integrity-status

---

<b>Syntax</b>	request security pki verify-integrity-status
<b>Release Information</b>	Command introduced in Junos OS Release 11.2.
<b>Description</b>	Verify the integrity of public key infrastructure (PKI) files.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">[edit security pki] Hierarchy Level on page 637</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request security pki verify-integrity-status on page 7119</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request security pki verify-integrity-status

```
user@host> request security pki verify-integrity-status
All PKI objects: verification success
```

## show security ike active-peer

<b>Syntax</b>	show security ike active-peer
<b>Release Information</b>	Command introduced in Junos OS Release 10.4. Support to display dead peer detection (DPD) statistics added in Junos OS Release 12.3X48-D10.
<b>Description</b>	Display the list of connected active users with details about the peer addresses and ports they are using.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show security ike security-associations on page 3993</a></li> <li>• <a href="#">show security ipsec security-associations on page 4001</a></li> </ul>

## show security ike debug-status

---

<b>Syntax</b>	show security ike debug-status
<b>Release Information</b>	Command introduced in Junos OS Release 11.4R3.
<b>Description</b>	Display debug information for currently enabled Internet Key Exchange (IKE).
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>request security ike debug-disable</i></li><li>• <i>request security ike debug-enable</i></li></ul>
<b>List of Sample Output</b>	<a href="#">show security ike debug-status on page 7122</a>

### Sample Output

#### show security ike debug-status

```
user@host> show security ike debug-status
Enabled
flag: all
level: 15
```

## show security ike pre-shared-key

---

<b>Syntax</b>	<code>show security ike pre-shared key</code> <code>&lt;master-key <i>master-key</i> &gt;</code> <code>&lt;user-id <i>user-id</i> &gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	Display the Internet Key Exchange (IKE) preshared key used by the Virtual Private network (VPN) gateway to authenticate the remote access user.
<b>Options</b>	<ul style="list-style-type: none"> <li><code>master-key <i>master-key</i></code> —(Optional) Master preshared key.</li> <li><code>user-id <i>user-id</i></code> —(Optional) IKE user ID value.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">pre-shared-key (Security IKE Policy) on page 7060</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security ike pre-shared-key on page 7123</a>

### Sample Output

#### show security ike pre-shared-key

```
user@host> show security ike pre-shared-key user-id a@example.net master-key example
Preshared Key:aabbccdde31a561ec5a710f5d02f208033b108bb4
```

## show security ike security-associations

**Syntax**    **show security ike security-associations**  
               *peer-address*  
               **brief** | **detail**  
               **family** (inet | inet6)  
               *fpc slot-number*  
               *index SA-index-number*  
               **kmd-instance** (all | *kmd-instance-name*)  
               *pic slot-number*  
               **sa-type shortcut** <detail>

**Release Information**    Command introduced in Junos OS Release 8.5. Support for the **fpc**, **pic**, and **kmd-instance** options added in Junos OS Release 9.3. Support for the **family** option added in Junos OS Release 11.1. Support for Auto Discovery VPN added in Junos OS Release 12.3X48-D10.

**Description**    Display information about Internet Key Exchange security associations (IKE SAs).

- Options**
- **none**—Display standard information about existing IKE SAs, including index numbers.
  - **peer-address**—(Optional) Display details about a particular SA based on the IPv4 or IPv6 address of the destination peer. This option and **index** provide the same level of output.
  - **brief**—(Optional) Display standard information about all existing IKE SAs. (Default)
  - **detail**—(Optional) Display detailed information about all existing IKE SAs.
  - **family**—(Optional) Display IKE SAs by family. This option is used to filter the output.
    - **inet**—IPv4 address family.
    - **inet6**—IPv6 address family.
  - **fpc slot-number**—(Optional) Display information about existing IKE SAs in this Flexible PIC Concentrator (FPC) slot. This option is used to filter the output.
  - **index SA-index-number**—(Optional) Display information for a particular SA based on the index number of the SA. For a particular SA, display the list of existing SAs by using the command with no options. This option and **peer-address** provide the same level of output.
  - **kmd-instance** —(Optional) Display information about existing IKE SAs in the key management process (in this case, it is KMD) identified by FPC *slot-number* and PIC *slot-number*. This option is used to filter the output.
    - **all**—All KMD instances running on the Services Processing Unit (SPU).
    - **kmd-instance-name**—Name of the KMD instance running on the SPU.
  - **pic slot-number** —(Optional) Display information about existing IKE SAs in this PIC slot. This option is used to filter the output.
  - **sa-type**—(Optional for ADVPN) Type of SA. **shortcut** is the only option for this release.

<b>Output Fields</b>	<p><a href="#">Table 397</a> lists the output fields for the <b>show security ike security-associations</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 599: show security ike security-associations Output Fields

Field Name	Field Description
<b>IKE Peer or Remote Address</b>	IP address of the destination peer with which the local peer communicates.
<b>Index</b>	Index number of an SA. This number is an internally generated number you can use to display information about a single SA.
<b>Gateway Name</b>	Name of the IKE gateway.
<b>Location</b>	<ul style="list-style-type: none"> <li>• <b>FPC</b>—Flexible PIC Concentrator (FPC) slot number.</li> <li>• <b>PIC</b>—PIC slot number.</li> <li>• <b>KMD-Instance</b>—The name of the KMD instance running on the SPU, identified by <i>FPC slot-number</i> and <i>PIC slot-number</i>. Currently, 4 KMD instances are running on each SPU, and any particular IKE negotiation is carried out by a single KMD instance.</li> </ul>
<b>Role</b>	Part played in the IKE session. The device triggering the IKE negotiation is the initiator, and the device accepting the first IKE exchange packets is the responder.
<b>State</b>	State of the IKE SAs: <ul style="list-style-type: none"> <li>• <b>DOWN</b>—SA has not been negotiated with the peer.</li> <li>• <b>UP</b>—SA has been negotiated with the peer.</li> </ul>
<b>Initiator cookie</b>	Random number, called a cookie, which is sent to the remote node when the IKE negotiation is triggered.

Table 599: show security ike security-associations Output Fields (*continued*)

Field Name	Field Description
<b>Responder cookie</b>	<p>Random number generated by the remote node and sent back to the initiator as a verification that the packets were received.</p> <p>A cookie is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity.</p>
<b>Mode or Exchange type</b>	<p>Negotiation method agreed on by the two IPsec endpoints, or peers, used to exchange information between one another. Each exchange type determines the number of messages and the payload types that are contained in each message. The modes, or exchange types, are:</p> <ul style="list-style-type: none"> <li>• <b>main</b>—The exchange is done with six messages. This mode or exchange type encrypts the payload, protecting the identity of the neighbor. The authentication method used is displayed: preshared keys or certificate.</li> <li>• <b>aggressive</b>—The exchange is done with three messages. This mode or exchange type does not encrypt the payload, leaving the identity of the neighbor unprotected.</li> </ul> <p><b>NOTE:</b> IKEv2 protocol does not use the mode configuration for negotiation. Therefore, mode displays the version number of the security association.</p>
<b>Local</b>	Address of the local peer.
<b>Remote</b>	Address of the remote peer.
<b>Lifetime</b>	Number of seconds remaining until the IKE SA expires.
<b>Algorithms</b>	<p>IKE algorithms used to encrypt and secure exchanges between the peers during the IPsec Phase 2 process:</p> <ul style="list-style-type: none"> <li>• <b>Authentication</b>—Type of authentication algorithm used: <ul style="list-style-type: none"> <li>• <b>sha1</b>—Secure Hash Algorithm 1 authentication.</li> <li>• <b>md5</b>—MD5 authentication.</li> </ul> </li> <li>• <b>Encryption</b>—Type of encryption algorithm used: <ul style="list-style-type: none"> <li>• <b>aes-256-cbc</b>—Advanced Encryption Standard (AES) 256-bit encryption.</li> <li>• <b>aes-192-cbc</b>—AES 192-bit encryption.</li> <li>• <b>aes-128-cbc</b>—AES 128-bit encryption.</li> <li>• <b>3des-cbc</b>—3 Data Encryption Standard (DES) encryption.</li> <li>• <b>des-cbc</b>—DES encryption.</li> </ul> </li> </ul>
<b>Diffie-Hellman group</b>	Specifies the IKE Diffie-Hellman group.
<b>Traffic statistics</b>	<ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted.</li> <li>• <b>Input packets</b>—Number of packets received.</li> <li>• <b>Output packets</b>—Number of packets transmitted.</li> </ul>

Table 599: show security ike security-associations Output Fields (*continued*)

Field Name	Field Description
Flags	<p>Notification to the key management process of the status of the IKE negotiation:</p> <ul style="list-style-type: none"> <li>• <b>caller notification sent</b>—Caller program notified about the completion of the IKE negotiation.</li> <li>• <b>waiting for done</b>—Negotiation is done. The library is waiting for the remote end retransmission timers to expire.</li> <li>• <b>waiting for remove</b>—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation.</li> <li>• <b>waiting for policy manager</b>—Negotiation is waiting for a response from the policy manager.</li> </ul>
IPSec security associations	<ul style="list-style-type: none"> <li>• <b>number created</b>: The number of SAs created.</li> <li>• <b>number deleted</b>: The number of SAs deleted.</li> </ul>
Phase 2 negotiations in progress	<p>Number of Phase 2 IKE negotiations in progress and status information:</p> <ul style="list-style-type: none"> <li>• <b>Negotiation type</b>—Type of Phase 2 negotiation. Junos OS currently supports quick mode.</li> <li>• <b>Message ID</b>—Unique identifier for a Phase 2 negotiation.</li> <li>• <b>Local identity</b>—Identity of the local Phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation)</i>.</li> <li>• <b>Remote identity</b>—Identity of the remote Phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation)</i>.</li> <li>• <b>Flags</b>—Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> <li>• <b>caller notification sent</b>—Caller program notified about the completion of the IKE negotiation.</li> <li>• <b>waiting for done</b>—Negotiation is done. The library is waiting for the remote end retransmission timers to expire.</li> <li>• <b>waiting for remove</b>—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation.</li> <li>• <b>waiting for policy manager</b>—Negotiation is waiting for a response from the policy manager.</li> </ul> </li> </ul>

## show security ike tunnel-map

<b>Syntax</b>	<b>show security ike tunnel-map</b> <brief> <fpc slot-number> <kmd-instance (all   kmd-instance-name)> <pic slot-number> <summary>
<b>Release Information</b>	Command introduced in Junos OS Release 12.1X44-D10.
<b>Description</b>	Display the tunnel mapping on different Services Processing Units (SPUs) for site-to-site and manual VPNs. You can insert an SPC on a device in a chassis cluster without disrupting traffic on the existing VPN tunnels. After inserting the SPC, you can view the tunnel mapping using this command.
<b>Options</b>	<p><b>brief</b>—Display standard information about all existing IKE SAs. This is the default.</p> <p><b>fpc slot-number</b>—Display information about existing IKE SAs in the specified Flexible PIC Concentrator (FPC) slot.</p> <p><b>kmd-instance (all   kmd-instance-name)</b>—Display information about existing IKE SAs in the KMD key management process. You can specify one of the following options:</p> <ul style="list-style-type: none"> <li><b>all</b>—All KMD instances running on the SPU.</li> <li><b>kmd-instance-name</b>—Name of the KMD instance running on the SPU.</li> </ul> <p><b>pic slot-number</b>—Display information about existing IKE SAs in the specified PIC slot.</p> <p><b>summary</b>—Display the tunnel-mapping load on each SPU. The load is the number of times an SPU has been chosen as an anchor SPU. For site-to-site VPNs, the load should be equal to the number of gateways mapped to an SPU.</p>
<b>Required Privilege Level</b>	view

## show security ipsec control-plane-security-associations

<b>Syntax</b>	show security ipsec control-plane-security-associations <brief   detail> <sa-name <i>sa-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 12.1X46-D20.
<b>Description</b>	Display information about manual IPsec security associations (SAs) applied to OSPF or OSPFv3 interfaces or virtual links.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>brief   detail</b>—(Optional) Display the specified level of output.</li> <li><b>sa-name <i>sa-name</i></b>—Name of the manual SA.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Understanding OSPF and OSPFv3 Authentication on SRX Series Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security ipsec control-plane-security-associations on page 7135</a> <a href="#">show security ipsec control-plane-security-associations sa-name on page 7136</a> <a href="#">show security ipsec control-plane-security-associations detail on page 7136</a>
<b>Output Fields</b>	Table 601 lists the output fields for the <b>show security ipsec control-plane-security-associations</b> command. Output fields are listed in the approximate order in which they appear.

Table 601: show security ipsec control-plane-security-associations Output Fields

Field Name	Field Description
Name	Name of the SA.
Algorithm	IPsec protocol followed by encryption algorithm and authentication algorithm.
SPI	SPI value.
Total active security-associations	Total number of active manual SAs for application to OSPF or OSPFv3 interfaces or virtual links.

## Sample Output

### show security ipsec control-plane-security-associations

```

user@host> show security ipsec control-plane-security-associations
Name Algorithm SPI
test_sa ESP:3des/md5 3e8
test_sa ESP:3des/md5 3e8
test_sa2 ESP:3des/sha1 7d1
test_sa2 ESP:3des/sha1 7d1
Total active security-associations: 2

```

**show security ipsec control-plane-security-associations sa-name**

```
user@host> show security ipsec control-plane-security-associations sa-name test_sa
Name Algorithm SPI
test_sa ESP:3des/md5 3e8
test_sa ESP:3des/md5 3e8
Total active security-associations: 1
```

**show security ipsec control-plane-security-associations detail**

```
user@host> show security ipsec control-plane-security-associations detail
Direction: inbound, SA Name: test_sa,
Protocol: ESP:, Authentication: md5
SPI: 3e8, AUX-SPI: 0,
Mode: transport, Type: manual,
ID: 1,

Direction: outbound, SA Name: test_sa,
Protocol: ESP:, Authentication: md5
SPI: 3e8, AUX-SPI: 0,
Mode: transport, Type: manual,
ID: 2,

Direction: inbound, SA Name: test_sa2,
Protocol: ESP:, Authentication: sha1
SPI: 7d1, AUX-SPI: 0,
Mode: transport, Type: manual,
ID: 3,

Direction: outbound, SA Name: test_sa2,
Protocol: ESP:, Authentication: sha1
SPI: 7d1, AUX-SPI: 0,
Mode: transport, Type: manual,
ID: 4,
```

## show security ipsec inactive-tunnels

**Syntax** `show security ipsec inactive-tunnels`  
`brief | detail`  
`family (inet | inet6)`  
`fpc slot-number`  
`index index-number`  
`kmd-instance (all | kmd-instance-name)`  
`pic slot-number`  
`sa-type shortcut`  
`vpn-name vpn-name`

**Release Information** Command introduced in Junos OS Release 11.4R3. Support for Auto Discovery VPN added in Junos OS Release 12.3X48-D10.

**Description** Display security information about the inactive tunnel.

- Options**
- **none**—Display information about all inactive tunnels.
  - **brief | detail**—(Optional) Display the specified level of output.
  - **family**—(Optional) Display the inactive tunnel by family. This option is used to filter the output.
    - **inet**—IPv4 address family.
    - **inet6**—IPv6 address family.
  - **fpc slot-number**—(Optional) Display information about inactive tunnels in the Flexible PIC Concentrator (FPC) slot.
  - **index index-number**—(Optional) Display detailed information about the specified inactive tunnel identified by this index number. For a list of all inactive tunnels with their index numbers, use the command with no options.
  - **kmd-instance** —(Optional) Display information about inactive tunnels in the key management process (in this case, it is KMD) identified by FPC *slot-number* and PIC *slot-number*.
    - **all**—All KMD instances running on the Services Processing Unit (SPU).
    - **kmd-instance-name**—Name of the KMD instance running on the SPU.
  - **pic slot-number**—Display information about inactive tunnels in the PIC slot.
  - **sa-type**—(Optional for ADVPN) Type of SA. **shortcut** is the only option for this release.
  - **vpn-name vpn-name**—(Optional) Name of the VPN.

**NOTE:** The **fpc slot-number**, **kmd-instance (all | kmd-instance-name)**, and **pic slot-number** parameters apply to SRX5600 and SRX5800 devices only.

**Required Privilege Level** view

[show security ipsec inactive-tunnels sa-type shortcut on page 7139](#)

**Output Fields** Table 602 lists the output fields for the **show security ipsec inactive-tunnels** command. Output fields are listed in the approximate order in which they appear.

**Table 602: show security ipsec inactive-tunnels Output Fields**

Field Name	Field Description
Total inactive tunnels	Total number of inactive IPsec tunnels.
Total inactive tunnels which establish immediately	Total number of inactive IPsec tunnels that can establish a session immediately.
ID	Identification number of the inactive tunnel. You can use this number to get more information about the inactive tunnel.
Gateway	IP address of the remote gateway.
Port	If Network Address Translation (NAT) is used, this value is 4500. Otherwise, it is the standard IKE port, 500.
Def-Del#	Number of deferred deletions of a dial-up IPsec VPN.
Virtual system	Virtual system to which the VPN belongs.
VPN name	Name of the IPsec VPN.
Local gateway	Gateway address of the local system.
Remote gateway	Gateway address of the remote system.
Local identity	Identity of the local peer so that its partner destination gateway can communicate with it. The value is specified as an IP address, fully qualified domain name, e-mail address, or distinguished name (DN).
Remote identity	IP address of the destination peer gateway.
Version	Version of IKE.
DF-bit	State of the don't fragment bit: <b>set</b> or <b>clear</b> .
Bind-interface	The tunnel interface to which the route-based VPN is bound.
Policy-name	Name of the applicable policy.

Table 602: show security ipsec inactive-tunnels Output Fields (*continued*)

Field Name	Field Description
Tunnel Down Reason	Reason for which the tunnel is inactive.
Tunnel events	Tunnel event and the number of times the event has occurred. See <a href="#">“Tunnel Events” on page 6963</a> for descriptions of tunnel events and the action you can take.

## Sample Output

## show security ipsec next-hop-tunnels

<b>Syntax</b>	<code>show security ipsec next-hop-tunnels</code> <code>&lt; interface-name <i>interface-name</i> &gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	Display security information about the secure tunnel interface.
<b>Options</b>	<ul style="list-style-type: none"> <li><code>none</code>—Display information about all secure tunnel interface.</li> <li><code>interface-name <i>interface-name</i></code>—(Optional) Name of the secure tunnel logical interface.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">show security ipsec security-associations on page 4001</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security ipsec next-hop-tunnels on page 7141</a>
<b>Output Fields</b>	Table 603 lists the output fields for the <code>show security ipsec next-hop-tunnels</code> command. Output fields are listed in the approximate order in which they appear.

Table 603: show security ipsec next-hop-tunnels Output Fields

Field Name	Field Description
Next-hop gateway	IP address of the next gateway.
Interface	Name of the secure tunnel logical interface.
IPsec VPN name	Name of the IPsec VPN tunnel.
Flag	<ul style="list-style-type: none"> <li><b>Static</b>—IP address manually configured.</li> <li><b>Auto</b>—IP address obtained from the remote peer automatically.</li> </ul>

## Sample Output

### show security ipsec next-hop-tunnels

```

user@host> show security ipsec next-hop-tunnels
Next-hop gateway interface IPsec VPN name Flag
11.1.1.2 st0.0 autokey Static
11.1.1.3 st0.0 pbd-4-6 Auto

```

## show security ipsec security-associations

**Syntax** `show security ipsec security-associations`  
`brief | detail`  
`family (inet | inet6)`  
`fpc slot-number`  
`index SA-index-number`  
`kmd-instance (all | kmd-instance-name)`  
`pic slot-number>`  
`sa-type shortcut`  
`vpn-name vpn-name <traffic-selector traffic-selector-name>`

**Release Information** Command introduced in Junos OS Release 8.5. Support for the **fpc**, **pic**, and **kmd-instance** options added in Junos OS Release 9.3. Support for the **family** option added in Junos OS Release 11.1. Support for the **vpn-name** option added in Junos OS Release 11.4R3. Support for the **traffic-selector** option and traffic selector field added in Junos OS Release 12.1X46-D10. Support for Auto Discovery VPN (ADVPN) added in Junos OS Release 12.3X48-D10.

**Description** Display information about the IPsec security associations (SAs).

- Options**
- **none**—Display information about all SAs.
  - **brief | detail**—(Optional) Display the specified level of output.
  - **family**—(Optional) Display SAs by family. This option is used to filter the output.
    - **inet**—IPv4 address family.
    - **inet6**—IPv6 address family.
  - **fpc slot-number**—(Optional) Display information about existing IPsec SAs in this Flexible PIC Concentrator (FPC) slot. This option is used to filter the output.
  - **index SA-index-number**—(Optional) Display detailed information about the specified SA identified by this index number. To obtain a list of all SAs that includes their index numbers, use the command with no options.
  - **kmd-instance**—(Optional) Display information about existing IPsec SAs in the key management process (in this case, it is KMD) identified by the FPC *slot-number* and PIC *slot-number*. This option is used to filter the output.
    - **all**—All KMD instances running on the Services Processing Unit (SPU).
    - **kmd-instance-name**—Name of the KMD instance running on the SPU.
  - **pic slot-number**—(Optional) Display information about existing IPsec SAs in this PIC slot. This option is used to filter the output.
  - **sa-type**—(Optional for ADVPN) Type of SA. **shortcut** is the only option for this release.
  - **vpn-name vpn-name**—Name of the VPN. If configured, **traffic-selector traffic-selector-name** can optionally be specified.

**Output Fields** [Table 398](#) lists the output fields for the **show security ipsec security-associations** command. Output fields are listed in the approximate order in which they appear.

**Table 604: show security ipsec security-associations**

Field Name	Field Description
<b>Total active tunnels</b>	Total number of active IPsec tunnels.
<b>ID</b>	Index number of the SA. You can use this number to get additional information about the SA.
<b>VPN name</b>	IPsec name for VPN.
<b>Gateway</b>	IP address of the remote gateway.
<b>Port</b>	If Network Address Translation (NAT) is used, this value is 4500. Otherwise, it is the standard IKE port, 500.
<b>Algorithm</b>	<p>Cryptography used to secure exchanges between peers during the IKE Phase 2 negotiations includes:</p> <ul style="list-style-type: none"> <li>• An authentication algorithm used to authenticate exchanges between the peers. Options are <b>hmac-md5-95</b>, <b>hmac-sha1-96</b>, or <b>ESP</b>.</li> <li>• An encryption algorithm used to encrypt data traffic. Options are <b>3des-cbc</b>, <b>aes-128-cbc</b>, <b>aes-192-cbc</b>, <b>aes-256-cbc</b>, or <b>des-cbc</b>.</li> </ul>

Table 604: show security ipsec security-associations (*continued*)

Field Name	Field Description
<b>SPI</b>	Security parameter index (SPI) identifier. An SA is uniquely identified by an SPI. Each entry includes the name of the VPN, the remote gateway address, the SPIs for each direction, the encryption and authentication algorithms, and keys. The peer gateways each have two SAs, one resulting from each of the two phases of negotiation: Phase 1 and Phase 2.
<b>Life: sec/kb</b>	The lifetime of the SA, after which it expires, expressed either in seconds or kilobytes.
<b>Sta</b>	State has two options, <b>Installed</b> and <b>Not Installed</b> . <ul style="list-style-type: none"> <li>• <b>Installed</b>—The SA is installed in the SA database.</li> <li>• <b>Not Installed</b>—The SA is not installed in the SA database.</li> </ul> For transport mode, the value of State is always <b>Installed</b> .
<b>Mon</b>	The Mon field refers to VPN monitoring status. If VPN monitoring is enabled, then this field displays <b>U</b> (up) or <b>D</b> (down). A hyphen (-) means VPN monitoring is not enabled for this SA.
<b>vsys or Virtual-system</b>	The root system.
<b>Tunnel index</b>	Numeric identifier of the specific IPsec tunnel for the SA.
<b>Local gateway</b>	Gateway address of the local system.
<b>Remote gateway</b>	Gateway address of the remote system.
<b>Traffic selector</b>	Name of the traffic selector.
<b>Local identity</b>	Identity of the local peer so that its partner destination gateway can communicate with it. The value is specified as an IP address, fully qualified domain name, e-mail address, or distinguished name (DN).
<b>Remote identity</b>	IP address of the destination peer gateway.
<b>DF-bit</b>	State of the don't fragment bit: <b>set</b> or <b>cleared</b> .
<b>Policy-name</b>	Name of the applicable policy.
<b>Location</b>	<b>FPC</b> —Flexible PIC Concentrator (FPC) slot number.  <b>PIC</b> —PIC slot number.  <b>KMD-Instance</b> —The name of the KMD instance running on the SPU, identified by FPC <i>slot-number</i> and PIC <i>slot-number</i> . Currently, 4 KMD instances running on each SPU, and any particular IPsec negotiation is carried out by a single KMD instance.
<b>Tunnel events</b>	Tunnel event and the number of times the event has occurred. See <a href="#">“Tunnel Events” on page 6963</a> for descriptions of tunnel events and the action you can take.
<b>Direction</b>	Direction of the SA; it can be inbound or outbound.

Table 604: show security ipsec security-associations (*continued*)

Field Name	Field Description
AUX-SPI	<p>Value of the auxiliary security parameter index(SPI).</p> <ul style="list-style-type: none"> <li>When the value is <b>AH</b> or <b>ESP</b>, <b>AUX-SPI</b> is always 0.</li> <li>When the value is <b>AH+ESP</b>, <b>AUX-SPI</b> is always a positive integer.</li> </ul>
Mode	<p>Mode of the SA:</p> <ul style="list-style-type: none"> <li><b>transport</b>—Protects host-to-host connections.</li> <li><b>tunnel</b>—Protects connections between security gateways.</li> </ul>
Type	<p>Type of the SA:</p> <ul style="list-style-type: none"> <li><b>manual</b>—Security parameters require no negotiation. They are static and are configured by the user.</li> <li><b>dynamic</b>—Security parameters are negotiated by the IKE protocol. Dynamic SAs are not supported in transport mode.</li> </ul>
State	<p>State of the SA:</p> <ul style="list-style-type: none"> <li><b>Installed</b>—The SA is installed in the SA database.</li> <li><b>Not Installed</b>—The SA is not installed in the SA database.</li> </ul> <p>For transport mode, the value of State is always <b>Installed</b>.</p>
Protocol	<p>Protocol supported.</p> <ul style="list-style-type: none"> <li>Transport mode supports Encapsulation Security Protocol (ESP) and Authentication Header (AH).</li> <li>Tunnel mode supports ESP and AH. <ul style="list-style-type: none"> <li><b>Authentication</b>—Type of authentication used.</li> <li><b>Encryption</b>—Type of encryption used.</li> </ul> </li> </ul>
Soft lifetime	<p>The soft lifetime informs the IPsec key management system that the SA is about to expire.</p> <p>Each lifetime of an SA has two display options, hard and soft, one of which must be present for a dynamic SA. This allows the key management system to negotiate a new SA before the hard lifetime expires.</p> <ul style="list-style-type: none"> <li><b>Expires in seconds</b>—Number of seconds left until the SA expires.</li> </ul>
Hard lifetime	<p>The hard lifetime specifies the lifetime of the SA.</p> <ul style="list-style-type: none"> <li><b>Expires in seconds</b>—Number of seconds left until the SA expires.</li> </ul>
Lifesize Remaining	<p>The lifesize remaining specifies the usage limits in kilobytes. If there is no lifesize specified, it shows unlimited.</p> <ul style="list-style-type: none"> <li><b>Expires in kilobytes</b>—Number of kilobytes left until the SA expires.</li> </ul>
Anti-replay service	<p>State of the service that prevents packets from being replayed. It can be <b>Enabled</b> or <b>Disabled</b>.</p>

Table 604: show security ipsec security-associations (*continued*)

Field Name	Field Description
<b>Replay window size</b>	Configured size of the antireplay service window. It can be 32 or 64 packets. If the replay window size is 0, the antireplay service is disabled.  The antireplay window size protects the receiver against replay attacks by rejecting old or duplicate packets.
<b>Bind-interface</b>	The tunnel interface to which the route-based VPN is bound.
<b>Copy-Outer-DSCP</b>	Indicates if copying outer IP header DSCP and ECN to inner IP header is enabled or disabled.

## Sample Output

## show security ipsec statistics

<b>Syntax</b>	<pre>show security ipsec statistics &lt;fpc slot-number &gt; &lt;index SA-index-number &gt; &lt;kmd-instance kmd-instance-name &gt; pic slot-number</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5. <b>fpc</b> and <b>pic</b> options added in Junos OS Release 9.3. <b>kmd-instance</b> option added in Junos OS Release 10.4.
<b>Description</b>	Display standard IPsec statistics.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>none</b>—Display statistics about all IPsec security associations (SAs).</li> <li>• <b>fpc slot-number</b>—Specific to SRX Series devices. Display statistics about existing IPsec SAs in this Flexible PIC Concentrator (FPC) slot. This option is used to filter the output.</li> <li>• <b>index SA-index-number</b>—(Optional) Display statistics for the SA with this index number.</li> <li>• <b>kmd-instance kmd-instance-name</b>—Specific to SRX Series devices. Display information about existing IKE SAs in the key management process (the daemon, which in this case is KMD) identified by FPC <i>slot-number</i> and PIC <i>slot-number</i>. This option is used to filter the output. <ul style="list-style-type: none"> <li>• <b>all</b>—All KMD instances running on the Services Processing Unit (SPU).</li> <li>• <b>kmd-instance-name</b>—Name of the KMD instance running on the SPU.</li> </ul> </li> <li>• <b>pic slot-number</b>—Specific to SRX Series devices. Display statistics about existing IPsec SAs in this PIC slot. This option is used to filter the output.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security ipsec statistics on page 7099</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security ipsec statistics on page 7155</a> <a href="#">show security ipsec statistics index 5 on page 7156</a> <a href="#">show security ipsec statistics fpc 6 pic 1 (SRX Series devices) on page 7156</a>
<b>Output Fields</b>	<a href="#">Table 414</a> lists the output fields for the <b>show security ipsec statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 605: show security ipsec statistics Output Fields

Field Name	Field Description
Virtual-system	The root system.

Table 605: show security ipsec statistics Output Fields (*continued*)

Field Name	Field Description
ESP Statistics	<ul style="list-style-type: none"> <li>• <b>Encrypted bytes</b>—Total number of bytes encrypted by the local system across the IPsec tunnel.</li> <li>• <b>Decrypted bytes</b>—Total number of bytes decrypted by the local system across the IPsec tunnel.</li> <li>• <b>Encrypted packets</b>—Total number of packets encrypted by the local system across the IPsec tunnel.</li> <li>• <b>Decrypted packets</b>—Total number of packets decrypted by the local system across the IPsec tunnel.</li> </ul>
AH Statistics	<ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Total number of bytes received by the local system across the IPsec tunnel.</li> <li>• <b>Output bytes</b>—Total number of bytes transmitted by the local system across the IPsec tunnel.</li> <li>• <b>Input packets</b>—Total number of packets received by the local system across the IPsec tunnel.</li> <li>• <b>Output packets</b>—Total number of packets transmitted by the local system across the IPsec tunnel.</li> </ul>
Errors	<ul style="list-style-type: none"> <li>• <b>AH authentication failures</b>—Total number of authentication header (AH) failures. An AH failure occurs when there is a mismatch of the authentication header in a packet transmitted across an IPsec tunnel.</li> <li>• <b>Replay errors</b>—Total number of replay errors. A replay error is generated when a duplicate packet is received within the replay window.</li> <li>• <b>ESP authentication failures</b>—Total number of Encapsulation Security Payload (ESP) failures. An ESP failure occurs when there is an authentication mismatch in ESP packets.</li> <li>• <b>ESP decryption failures</b>—total number of ESP decryption errors.</li> <li>• <b>Bad headers</b>—Total number of invalid headers detected.</li> <li>• <b>Bad trailers</b>—Total number of invalid trailers detected.</li> </ul>

## Sample Output

### show security ipsec statistics

```

user@host> show security ipsec statistics
Virtual-system: Root
ESP Statistics:
 Encrypted bytes: 0
 Decrypted bytes: 0
 Encrypted packets: 0
 Decrypted packets: 0
AH Statistics:
 Input bytes: 0
 Output bytes: 0
 Input packets: 0
 Output packets: 0
Errors:
 AH authentication failures: 0, Replay errors: 0
 ESP authentication failures: 0, ESP decryption failures: 0
 Bad headers: 0, Bad trailers: 0

```

## Sample Output

### show security ipsec statistics index 5

```
user@host> show security ipsec statistics index 5
Virtual-system: Root
SA index: 5
ESP Statistics:
 Encrypted bytes: 0
 Decrypted bytes: 0
 Encrypted packets: 0
 Decrypted packets: 0
AH Statistics:
 Input bytes: 0
 Output bytes: 0
 Input packets: 0
 Output packets: 0
Errors:
 AH authentication failures: 0, Replay errors: 0
 ESP authentication failures: 0, ESP decryption failures: 0
 Bad headers: 0, Bad trailers: 0
```

## Sample Output

### show security ipsec statistics fpc 6 pic 1 (SRX Series devices)

```
user@host> show security ipsec statistics fpc 6 pic 1
ESP Statistics:
 Encrypted bytes: 536408
 Decrypted bytes: 696696
 Encrypted packets: 1246
 Decrypted packets: 888
AH Statistics:
 Input bytes: 0
 Output bytes: 0
 Input packets: 0
 Output packets: 0
Errors:
 AH authentication failures: 0, Replay errors: 0
 ESP authentication failures: 0, ESP decryption failures: 0
 Bad headers: 0, Bad trailers: 0
```

## show security ipsec traffic-selector

<b>Syntax</b>	<pre>show security ipsec traffic-selector interface-name <i>interface-name</i> &lt;brief   detail&gt; &lt;destination-address <i>address</i>&gt; &lt;fpc <i>slot-number</i>&gt; &lt;kmd-instance (all   <i>kmd-instance-name</i>)&gt; &lt;pic <i>slot-number</i>&gt; &lt;source-address <i>address</i>&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 12.3X48-D10.
<b>Description</b>	Display information about the traffic selectors that have been negotiated between the initiator and responder.
<b>Options</b>	<p><b>interface-name <i>interface-name</i></b>—Name of the secure tunnel logical interface.</p> <p><b>brief   detail</b> —(Optional) Display the specified level of output.</p> <p><b>destination-address <i>address</i></b>—(Optional) Destination IP address.</p> <p><b>fpc <i>slot-number</i></b>—(Optional) Display information about existing IKE SAs in this Flexible PIC Concentrator (FPC) slot. This option is used to filter the output.</p> <p><b>kmd-instance</b>—(Optional) Display information about existing traffic selectors in the key management process (in this case, it is KMD) identified by FPC slot-number and PIC slot-number. This option is used to filter the output.</p> <ul style="list-style-type: none"> <li><b>all</b>—All KMD instances running on the Services Processing Unit (SPU).</li> <li><b><i>kmd-instance-name</i></b>—Name of the KMD instance running on the SPU.</li> </ul> <p><b>pic <i>slot-number</i></b>—(Optional) Display information about existing traffic selectors in this PIC slot. This option is used to filter the output.</p> <p><b>source-address <i>address</i></b>—(Optional) Source IP address.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">IPsec VPN Overview on page 6337</a></li> </ul>

## show security ipsec tunnel-events-statistics

<b>Syntax</b>	<code>show security ipsec tunnel-events-statistics</code>
<b>Release Information</b>	Command introduced in Junos OS Release 12.3X48-D10.
<b>Description</b>	Show tunnel event statistics.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>clear security ipsec tunnel-events-statistics</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security ipsec tunnel-events statistics on page 7159</a>

### Sample Output

#### show security ipsec tunnel-events statistics

```

user@host> show security ipsec tunnel-events statistics
IPSec SA delete payload received from peer : 153
Configuration change triggered clearing of IPSec SA : 1
Peer's remote IKE-ID validation failed during negotiation : 2
Phase1 proposal mismatch detected : 2
Phase2 proposal mismatch detected : 2
Peer proposed traffic-selectors are not in configured range : 8576
Negotiation failed as peer did not respond : 4
IKE SA negotiation successfully completed : 19
IPSec SA negotiation successfully completed : 154
Tunnel is ready. Waiting for trigger event or peer to trigger negotiation : 1

```

## show security pki ca-certificate (View)

**Syntax** show security pki ca-certificate  
<brief | detail>  
<ca-profile *ca-profile-name* >

**Release Information** Command modified in Junos OS Release 8.5. Subject string output field added in Junos OS Release 12.1X44-D10. Policy identifier output field added in Junos OS Release 12.3X48-D10.

**Description** Display information about the certificate authority (CA) public key infrastructure (PKI) digital certificates configured on the device.

**NOTE:** The FIPS image does not permit the use of MD5 fingerprints. Therefore, MD5 fingerprints are not included when a certificate is displayed using this command. The SHA-1 fingerprint that is currently displayed is retained in the FIPS image. The Simple Certificate Enrollment Protocol (SCEP) is disabled in the FIPS image.

- Options**
- none—Display basic information about all configured CA certificates.
  - brief | detail—(Optional) Display the specified level of output.
  - ca-profile *ca-profile-name*- (Optional) Display information about only the specified CA certificate.

**Required Privilege Level** view

- Related Documentation**
- [ca-profile \(Security PKI\) on page 7004](#)
  - [request security pki ca-certificate verify \(Security\)](#)

**List of Sample Output** [show security pki ca-certificate ca-profile RootCA brief on page 7161](#)  
[show security pki ca-certificate ca-profile RootCA detail on page 7162](#)  
[show security pki ca-certificate ca-profile ca-tmp detail on page 7162](#)

**Output Fields** [Table 607](#) lists the output fields for the **show security pki ca-certificate** command. Output fields are listed in the approximate order in which they appear.

**Table 607: show security pki ca-certificate Output Fields**

Field Name	Field Description
Certificate identifier	Name of the digital certificate.
Certificate version	Revision number of the digital certificate.
Serial number	Unique serial number of the digital certificate.

Table 607: show security pki ca-certificate Output Fields (*continued*)

Field Name	Field Description
<b>Issuer</b>	<p>Authority that issued the digital certificate, including details of the authority organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>Country</b>—Country of origin.</li> <li>• <b>Locality</b>—Locality of origin.</li> <li>• <b>Common name</b>—Name of the authority.</li> </ul>
<b>Subject</b>	<p>Details of the digital certificate holder organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>Country</b>—Country of origin.</li> <li>• <b>Locality</b>—Locality of origin.</li> <li>• <b>Common name</b>—Name of the authority.</li> </ul> <p>If the certificate contains multiple subfield entries, all entries are displayed.</p>
<b>Subject string</b>	Subject field as it appears in the certificate.
<b>Validity</b>	<p>Time period when the digital certificate is valid. Values are:</p> <ul style="list-style-type: none"> <li>• <b>Not before</b>—Start time when the digital certificate becomes valid.</li> <li>• <b>Not after</b>—End time when the digital certificate becomes invalid.</li> </ul>
<b>Public key algorithm</b>	Encryption algorithm used with the private key, such as <b>rsaEncryption(1024 bits)</b> .
<b>Signature algorithm</b>	Encryption algorithm that the CA used to sign the digital certificate, such as <b>sha1WithRSAEncryption</b> .
<b>Certificate Policy</b>	<b>Policy Identifier</b> —One or more policy object identifiers (OIDs).
<b>Use for key</b>	Use of the public key, such as <b>Certificate signing</b> , <b>CRL signing</b> , <b>Digital signature</b> , or <b>Data encipherment</b> .
<b>Fingerprint</b>	Secure Hash Algorithm ( <b>SHA1</b> ) and Message Digest 5 ( <b>MD5</b> ) hashes used to identify the digital certificate.
<b>Distribution CRL</b>	Distinguished name information and the URL for the certificate revocation list (CRL) server.

## show security pki certificate-request (View)

<b>Syntax</b>	show security pki certificate-request <brief   detail> <certificate-id <i>certificate-id-name</i> >
<b>Release Information</b>	Command modified in Junos OS Release 8.5.
<b>Description</b>	Display information about manually generated local digital certificate requests that are stored on the device.
<b>Options</b>	<ul style="list-style-type: none"> <li>• none—Display basic information about all local digital certificate requests.</li> <li>• brief   detail—(Optional) Display the specified level of output.</li> <li>• certificate-id <i>certificate-id-name</i> —(Optional) Display information about only the specified local digital certificate requests.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear security pki key-pair (Local Certificate) on page 7101</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security pki certificate-request certificate-id user1 brief on page 7165</a> <a href="#">show security pki certificate-request certificate-id user1 detail on page 7165</a>
<b>Output Fields</b>	Table 608 lists the output fields for the <b>show security pki certificate-request</b> command. Output fields are listed in the approximate order in which they appear.

**Table 608: show security pki certificate-request Output Fields**

Field Name	Field Description
Certificate identifier	Name of the digital certificate.
Certificate version	Revision number of the digital certificate.
Issued to	Device that was issued the digital certificate.
Subject	Details of the digital certificate holder organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>Country</b>—Country of origin.</li> <li>• <b>Locality</b>—Locality of origin.</li> <li>• <b>Common name</b>—Name of the authority.</li> </ul>
Alternate subject	Domain name or IP address of the device related to the digital certificate.
Public key algorithm	Encryption algorithm used with the private key, such as <b>rsaEncryption(1024 bits)</b> .

Table 608: show security pki certificate-request Output Fields (*continued*)

Field Name	Field Description
Public key verification status	Public key verification status: <b>Failed</b> or <b>Passed</b> . The <b>detail</b> output also provides the verification hash.
Fingerprint	Secure Hash Algorithm ( <b>SHA1</b> ) and Message Digest 5 ( <b>MD5</b> ) hashes used to identify the digital certificate.
Use for key	Use of the public key, such as <b>Certificate signing</b> , <b>CRL signing</b> , <b>Digital signature</b> , or <b>Data encipherment</b> .

## Sample Output

### show security pki certificate-request certificate-id user1 brief

```

Subject string	Subject field as it appears in the certificate.
Alternate subject	Domain name or IP address of the device related to the digital certificate.
Validity	<p>Time period when the digital certificate is valid. Values are:</p> <ul style="list-style-type: none"> <li>• <b>Not before</b>—Start time when the digital certificate becomes valid.</li> <li>• <b>Not after</b>—End time when the digital certificate becomes invalid.</li> </ul>
Public key algorithm	Encryption algorithm used with the private key, such as <b>rsaEncryption(1024 bits)</b> .
Public key verification status	Public key verification status: <b>Failed</b> or <b>Passed</b> . The <b>detail</b> output also provides the verification hash.
Signature algorithm	Encryption algorithm that the CA used to sign the digital certificate, such as <b>sha1WithRSAEncryption</b> .
Fingerprint	Secure Hash Algorithm ( <b>SHA1</b> ) and Message Digest 5 ( <b>MD5</b> ) hashes used to identify the digital certificate.
Distribution CRL	Distinguished name information and URL for the certificate revocation list ( <b>CRL</b> ) server.
Use for key	Use of the public key, such as <b>Certificate signing</b> , <b>CRL signing</b> , <b>Digital signature</b> , or <b>Data encipherment</b> .

## Sample Output

### show security pki local-certificate certificate-id hello

```
user@host> show security pki local-certificate certificate-id hello
Certificate identifier: hello
 Issued to: cn1, Issued by: DC = local, DC = demo, CN = example-CN1
 Validity:
 Not before: 08- 8-2012 17:02
 Not after: 08- 8-2014 17:02
 Public key algorithm: rsaEncryption(1024 bits)
```

## Sample Output

### show security pki local-certificate certificate-id hello detail

```
user@host> show security pki local-certificate certificate-id hello detail
Certificate identifier: hello
