 Link type : Full-Duplex
 Link flags : None
 Last flapped : Never
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)

Logical interface pp0.0 (Index 1) (SNMP ifIndex 330)
 Flags: Point-To-Point SNMP-Traps 16384 Encapsulation: PPPoE
 PPPoE:
 State: SessionUp, Session ID: 3304,
 Session AC name: isp1.com, AC MAC address: 00:90:1a:40:f6:4c,
 Service name: video@isp1.com, Configured AC name: isp1.com,
 Auto-reconnect timeout: 60 seconds
 Underlying interface: ge-5/0/0.0 (Index 71)
 Input packets : 23
 Output packets: 22
 Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
 Keepalive: Input: 16 (00:00:26 ago), Output: 0 (never)
 LCP state: Opened
 NCP state: inet: Opened, inet6: Not-configured, iso: Not-configured, mpls:
 Not-configured
 CHAP state: Success
 Protocol inet, MTU: 1492
 Flags: Negotiate-Address
 Addresses, Flags: Kernel Is-Preferred Is-Primary
 Destination: 211.211.211.2, Local: 211.211.211.1
```

The output shows information about the physical and the logical interfaces. Verify the following information:

- The physical interface is enabled and the link is up.
- The PPPoE session is running on the correct logical interface.
- For state, the state is active (up).
- For underlying interface, the physical interface on which the PPPoE session is running is correct:
  - For an Ethernet connection, the underlying interface is Fast Ethernet or Gigabit Ethernet—for example, ge-5/0/0.0.
  - For an ATM-over-ADSL or ATM-over-SHDSL connection, the underlying interface is ATM—for example, at-2/0/0.0.

### **Verifying PPPoE Sessions**

**Purpose** Verify that a PPPoE session is running properly on the logical interface.

**Action** From operational mode, enter the **show pppoe interfaces** command.

```
user@host> show pppoe interfaces
pp0.0 Index 67
 State: Session up, Session ID: 31,
 Service name: video@isp1.com, Configured AC name: isp1.com,
 Session AC name: belur, AC MAC address: 00:90:1a:40:f6:4e,
 Auto-reconnect timeout: 1 seconds,
 Underlying interface: ge-0/0/1.0 Index 69
```

The output shows information about the PPPoE sessions. Verify the following information:

- The PPPoE session is running on the correct logical interface.
- For state, the session is active (up).
- For underlying interface, the physical interface on which the PPPoE session is running is correct:
  - For an Ethernet connection, the underlying interface is Fast Ethernet or Gigabit Ethernet—for example, ge-0/0/1.0.
  - For an ATM-over-ADSL or ATM-over-SHDSL connection, the underlying interface is ATM—for example, at-2/0/0.0.

**NOTE:** To clear a PPPoE session on the pp0.0 interface, use the **clear pppoe sessions pp0.0** command. To clear all sessions on the interface, use the **clear pppoe sessions** command.

### *Verifying the PPPoE Version*

**Purpose** Verify the version information of the PPPoE protocol configured on the device interfaces.

**Action** From operational mode, enter the **show pppoe version** command.

```
user@host> show pppoe version
Point-to-Point Protocol Over Ethernet, version 1. rfc2516
 PPPoE protocol = Enabled
 Maximum Sessions = 256
 PADI resend timeout = 2 seconds
 PADR resend timeout = 16 seconds
 Max resend timeout = 64 seconds
 Max Configured AC timeout = 4 seconds
```

The output shows PPPoE protocol information. Verify the following information:

- The correct version of the PPPoE protocol is configured on the interface.
- For PPPoE protocol, the PPPoE protocol is enabled.

### *Verifying PPPoE Statistics*

**Purpose** Verify the statistics information about PPPoE interfaces.

**Action** From operational mode, enter the **show pppoe statistics** command.

```
user@host> show pppoe statistics
Active PPPoE sessions: 4
```

| PacketType         | Sent | Received |
|--------------------|------|----------|
| PADI               | 502  | 0        |
| PADO               | 0    | 219      |
| PADR               | 219  | 0        |
| PADS               | 0    | 219      |
| PADT               | 0    | 161      |
| Service name error | 0    | 0        |
| AC system error    | 0    | 13       |
| Generic error      | 0    | 0        |
| Malformed packets  | 0    | 41       |
| Unknown packets    | 0    | 0        |
| Timeout            |      |          |
| PADI               | 42   |          |
| PADO               | 0    |          |
| PADR               | 0    |          |

The output shows information about active sessions on PPPoE interfaces. Verify the following information:

- Total number of active PPPoE sessions running on the interface
- For packet type, the number of packets of each type sent and received during the PPPoE session

## Disabling the End-of-List Tag

During the PPPoE discovery stage, any access concentrator that can provide the service requested by the client in the PADI packet replies with a PADO packet that contains its own name, the unicast address of the client, and the service requested. An access concentrator can also use the PADO packet to offer other services to the client. When a client receives a PADO packet, and if it encounters the **End-of-List** tag in the PADO packet, tags after the **End-of-List** tag are ignored and the complete information is not processed correctly. As a result, the PPPoE connection is not established correctly.

You can configure the **ignore-eol-tag** option to disable the **End-of-List** tag in the PADO packet.

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To disable the **End-of-List** tag:

1. Create a PPPoE interface.  

```
[edit]
user@host# set interfaces pp0 unit 0
```
2. Configure PPPoE options.  

```
[edit interfaces pp0 unit 0]
user@host# set pppoe-options ignore-eol-tag
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces pp0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces pp0
unit 0 {
 pppoe-options {
 ignore-eol-tag;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verifying That the End-of-List Tag Is Disabled

**Purpose** Verify the status of the **End-of-List** tag in the PPPoE configuration.

**Action** From operational mode, enter the **show interfaces pp0.0** command.

```
user@host> show pppoe interfaces pp0.0
Logical interface pp0.0 (Index 78) (SNMP ifIndex 541)
 Flags: Point-To-Point SNMP-Traps 0x0 Encapsulation: PPPoE
 PPPoE:
 State: SessionUp, Session ID: 3,
 Session AC name: cell, Remote MAC address: 00:26:88:f7:77:83,
 Configured AC name: None, Service name: None,
 Auto-reconnect timeout: Never, Idle timeout: Never,
 Underlying interface: ge-0/0/3.0 (Index 77)
 Ignore End-Of-List tag: Enable
```

```
user@host> show pppoe interfaces pp0.0 extensive
pp0.0 Index 74
 State: Session up, Session ID: 1,
 Service name: None,
 Session AC name: cell, Configured AC name: None,
 Remote MAC address: 00:26:88:f7:77:83,
 Session uptime: 00:02:03 ago,
 Auto-reconnect timeout: 10 seconds, Idle timeout: Never,
 Underlying interface: ge-0/0/3.0 Index 73
 Ignore End-of-List tag: Enable
 PacketType Sent Received
 PADI 23 0
 PADO 0 5
 PADR 11 0
 PADS 0 2
 PADT 2 0
 Service name error 0 0
 AC system error 0 0
 Generic error 0 0
 Malformed packets 0 0
 Unknown packets 0 0
 Timeout
 PADI 3
 PADO 0
 PADR 3
 Receive Error Counters
 PADI 0
 PADO 0
```

|      |   |
|------|---|
| PADR | 0 |
| PADS | 0 |

The output shows information about active sessions on PPPoE interfaces. Verify that the **Ignore End-of-List tag: Enable** option is set.

## Understanding PPPoE Ethernet Interfaces

During a Point-to-Point Protocol over Ethernet (PPPoE) session, the device encapsulates each PPP frame in an Ethernet frame and transports the frames over an Ethernet loop. [Figure 130](#) shows a typical PPPoE session between a device and an access concentrator on the Ethernet loop.

Figure 130: PPPoE Session on the Ethernet Loop

To configure PPPoE on an Ethernet interface, you configure encapsulation on the logical interface.

- Related Documentation
- [Understanding Point-to-Point Protocol over Ethernet on page 2731](#)
  - [Example: Configuring PPPoE Encapsulation on an Ethernet Interface on page 2741](#)

## Example: Configuring PPPoE Encapsulation on an Ethernet Interface

This example shows how to configure PPPoE encapsulation on an Ethernet interface.

- [Requirements on page 2741](#)
- [Overview on page 2742](#)
- [Configuration on page 2742](#)
- [Verification on page 2742](#)

### Requirements

Before you begin:

- Configure an Ethernet interface. See [“Example: Creating an Ethernet Interface”](#) on page 2634.
- Configure a PPPoE encapsulation interface. See [“Example: Configuring PPPoE Interfaces”](#) on page 2735.

## Overview

In this example, you configure PPPoE encapsulation on the ge-0/0/1 interface.

## Configuration

### Step-by-Step Procedure

To configure PPPoE encapsulation:

1. Enable PPPoE encapsulation on the interface.

```
[edit]
user@host# set interfaces ge-0/0/1 unit 0 encapsulation ppp-over-ether
```

2. Commit the configuration if you are done configuring the device.

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show interfaces ge-0/0/1** command.

## Understanding PPPoE ATM-over-ADSL and ATM-over-SHDSL Interfaces

When an ATM network is configured with a point-to-point connection, Point-to-Point Protocol over Ethernet (PPPoE) can use ATM Adaptation Layer 5 (AAL5) for framing PPPoE-encapsulated packets. The AAL5 protocol provides a virtual connection between the client and the server within the same network. The device encapsulates each PPPoE frame in an ATM frame and transports each frame over an asymmetric digital subscriber line (ADSL) or symmetric high-speed DSL (SHDSL) loop and a digital subscriber line access multiplexer (DSLAM). For example, [Figure 131](#) shows a typical PPPoE over ATM session between a device and an access concentrator on an ADSL loop.

**Figure 131: PPPoE Session on an ADSL Loop**

For PPPoE on an ATM-over-ADSL or ATM-over-SHDSL interface, you must configure encapsulation on both the physical and logical interfaces. To configure encapsulation on an ATM-over-ADSL or ATM-over-SHDSL physical interface, use Ethernet over ATM encapsulation. To configure encapsulation on an ATM-over-ADSL or ATM-over-SHDSL logical interface, use PPPoE over AAL5 logical link control (LLC) encapsulation. LLC encapsulation allows a single ATM virtual connection to transport multiple protocols.

## Example: Configuring PPPoE Encapsulation on an ATM-over-ADSL Interface

This example shows how to configure a physical interface for Ethernet over ATM encapsulation and how to create a logical interface for PPPoE over LLC encapsulation.

- [Requirements on page 2743](#)
- [Overview on page 2743](#)
- [Configuration on page 2743](#)
- [Verification on page 2744](#)

### Requirements

Before you begin:

- Configure network interfaces. See [“Example: Creating an Ethernet Interface” on page 2634](#).
- Configure PPPoE interfaces. See [“Example: Configuring PPPoE Interfaces” on page 2735](#).
- Configure PPPoE encapsulation on an Ethernet interface. See [“Example: Configuring PPPoE Encapsulation on an Ethernet Interface” on page 2741](#).

### Overview

In this example, you configure the physical interface at-2/0/0 for Ethernet over ATM encapsulation. As part of the configuration, you set the virtual path identifier (VPI) on an ATM-over-ADSL physical interface to 0, you set the ADSL operating mode to auto, and you set the encapsulation type to ATM-over-ADSL. Then you create a logical interface for PPPoE over LLC encapsulation.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces at-2/0/0 atm-options vpi 0
set interfaces at-2/0/0 dsl-options operating-mode auto
set interfaces at-2/0/0 encapsulation ethernet-over-atm
set interfaces at-2/0/0 unit 0 encapsulation ppp-over-ether-over-atm-llc vci 0.120
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure PPPoE encapsulation on an ATM-over-ADSL interface:

1. Configure the physical interface.  

```
[edit]
user@host# edit interfaces at-2/0/0
```
2. Set the VPI on the interface.  

```
[edit interfaces at-2/0/0]
user@host# set atm-options vpi 0
```
3. Configure the ADSL operating mode.  

```
[edit interfaces at-2/0/0]
user@host# set dsl-options operating-mode auto
```
4. Configure PPPoE encapsulation.  

```
[edit interfaces at-2/0/0]
user@host# set encapsulation ethernet-over-atm
```
5. Create a logical interface and configure LLC encapsulation.  

```
[edit interfaces at-2/0/0]
user@host# set unit 0 encapsulation ppp-over-ether-over-atm-llc vci 0.120
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces at-2/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces at-2/0/0 {
 encapsulation ethernet-over-atm;
 atm-options {
 vpi 0;
 }
 dsl-options {
 operating-mode auto;
 }
 unit 0 {
 encapsulation ppp-over-ether-over-atm-llc;
 vci 0.120;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying a PPPoE Configuration for an ATM-over-ADSL or ATM-over-SHDSL Interface

---

**Purpose** Verify the PPPoE configuration for an ATM-over-ADSL or ATM-over-SHDSL interface.

**Action** From operational mode, enter the **show interfaces** command.

**Related Documentation**

- [Understanding PPPoE ATM-over-ADSL and ATM-over-SHDSL Interfaces on page 2742](#)

## Understanding CHAP Authentication on a PPPoE Interface

---

For interfaces with Point-to-Point Protocol over Ethernet (PPPoE) encapsulation, you can configure interfaces to support the PPP Challenge Handshake Authentication Protocol (CHAP). When you enable CHAP on an interface, the interface can authenticate its peer and be authenticated by its peer.

If you set the **passive** option to handle incoming CHAP packets only, the interface does not challenge its peer. However, if the interface is challenged, it responds to the challenge. If you do not set the **passive** option, the interface always challenges its peer.

You can configure Remote Authentication Dial-In User Service (RADIUS) authentication of PPP sessions using CHAP. CHAP enables you to send RADIUS messages through a routing instance to customer RADIUS servers in a private network.

**Related Documentation**

- [Understanding Point-to-Point Protocol over Ethernet on page 2731](#)
- [Example: Configuring CHAP Authentication on a PPPoE Interface on page 2745](#)

## Example: Configuring CHAP Authentication on a PPPoE Interface

---

This example shows how to configure CHAP authentication on a PPPoE interface.

- [Requirements on page 2745](#)
- [Overview on page 2746](#)
- [Configuration on page 2746](#)
- [Verification on page 2747](#)

### Requirements

Before you begin:

- Configure an Ethernet interface. See [“Example: Creating an Ethernet Interface”](#) on page 2634.
- Configure a PPPoE interface. See [“Example: Configuring PPPoE Interfaces”](#) on page 2735.
- Configure PPPoE encapsulation on an ATM-over-ADSL interface. See [“Example: Configuring PPPoE Encapsulation on an ATM-over-ADSL Interface”](#) on page 2743.

## Overview

In this example, you configure a CHAP access profile, and then apply it to the PPPoE interface pp0. You also configure the hostname to be used in CHAP challenge and response packets, and set the passive option for handling incoming CHAP packets.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set access profile A-ppp-client client client1 chap-secret my-secret
set interfaces pp0 unit 0 ppp-options chap access-profile A-ppp-client local-name
A-ge-0/0/1.0 passive
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure CHAP on a PPPoE interface:

1. Configure a CHAP access profile.  

```
[edit]
user@host# set access profile A-ppp-client client client1 chap-secret my-secret
```
2. Enable CHAP options on the interface.  

```
[edit]
user@host# edit interfaces pp0 unit 0 ppp-options chap
```
3. Configure the CHAP access profile on the interface.  

```
[edit interfaces pp0 unit 0 ppp-options chap]
user@host# set access-profile A-ppp-client
```
4. Configure a hostname for the CHAP challenge and response packets.  

```
[edit interfaces pp0 unit 0 ppp-options chap]
user@host# set local-name A-ge-0/0/1.0
```
5. Set the passive option to handle incoming CHAP packets only.  

```
[edit interfaces pp0 unit 0 ppp-options chap]
user@host# set passive
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces
pp0 {
 unit 0 {
 ppp-options {
 chap {
 access-profile A-ppp-client;
 local-name A-ge-0/0/1.0;
 passive;
 }
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying CHAP Authentication

**Purpose** Verify that CHAP is enabled on the interface.

**Action** From operational mode, enter the **show interfaces** command.

**Related Documentation**

## Setting Tracing Options for PPPoE

To trace the operations of the router's PPPoE process, include the `traceoptions` statement at the `[edit protocols pppoe]` hierarchy level:

```

[edit protocols pppoe]
traceoptions {
 file filename <files number> <match regular-expression> <size size> <world-readable |
 no-world-readable>;
 flag flag;
 level severity-level;
 no-remote-trace;
}

```

To specify more than one tracing operation, include multiple **flag** statements.

You can specify the following flags in the **traceoptions** statement:

- **all**—All areas of code
- **config**—Configuration code
- **events**—Event code
- **gres**—Gres code
- **init**—Initialization code
- **interface-db**—Interface database code

- **memory**—Memory management code
- **protocol**—PPPoE protocol processing code
- **rtsock**—Routing socket code
- **session-db**—Session management code
- **signal**—Signal handling code
- **state**—State handling code
- **timer**—Timer code
- **ui**—User interface code

## PPPoE-Based Radio-to-Router Protocols Overview

---

Support for PPPoE-based radio-to-router protocols includes the following extensions to the PPPoE protocol:

- Messages that define how an external device provides the router with timely information about the quality of a link connection
- A flow control mechanism that indicates how much data the router can forward

The router uses the information provided in these PPPoE messages to dynamically adjust the interface speed. When OSPF is notified of this change, it adjusts the cost of the link and updates the routing tables accordingly.

The radio provides ground-to-ground or ground-to-air communications with like devices. When the radio picks up a signal from another device, it initiates a PPPoE session with a directly connected router. The PPPoE session encapsulates the packets that are relayed over a PPP link between the local and remote routers. The remote radio then forwards traffic over an independent PPPoE session between the remote radio and the router to which it is connected. The two routers exchange LCP and IPCP messages to configure the link and exchange OSPF messages to establish the network topology.

The router and radio are deployed in highly dynamic environments, such as moving vehicles. The quality of the radio link between the routers can vary significantly as a vehicle moves behind an obstruction. Each radio monitors the link every 50 milliseconds for changes in the link bandwidth, quality, and utilization. If any changes are detected, the radios announce the new set of metrics to the respective routers through a PPPoE Active Discovery Quality (PADQ) message, which is a nonstandard extension to the

PPPoE Discovery Protocol [RFC2516]. The router transforms these metrics into a bandwidth value for the PPP link and compares it to the value currently in use. When the router detects that the difference exceeds a user-specified threshold, it adjusts the speed of the PPP link. An event message notifies OSPF of the change, which then triggers OSPF to announce any resulting routing topology changes to its neighbors.

The PPPoE-based radio-to-router protocol notifies the router about neighbors joining or leaving the network and to create and maintain OSPF adjacencies over the dynamic links established between them. The costs assigned to these links are based on network conditions and flow control information sent by the radios. The calculations and requests to update interface speeds are performed by routines in a common library.

When PPPoE is used for applications, such as mobile radio, the radio links have variable bandwidth. So a mobile radio can function in a PPPoE environment, PPPoE messaging includes PADQ messages, which enable a link cost to be propagated to OSPF through the evaluation of various link quality metrics. The router uses information from these notifications along with user-configured parameters to calculate interface link costs that are used by the routing protocols.

A radio can send an optional PADQ at any time to query or report link quality metrics. When transmitting PPP streams over radio links, the quality of the link directly affects the throughput. The PADQ packet is used by the radio modem to report link metrics.

To support the credit-based flow control extensions described in RFC4938, PPPoE peers can also grant each other forwarding credits. The grantee can forward traffic to the peer only when it has a sufficient number of credits to do so. Credit-based forwarding allows both sides of the session to agree to use a non-default credit scaling factor during the PADR and PADS message exchange. Although this is used on both sides of the session, this feature provides the radio client with a flow control mechanism that throttles traffic by limiting the number of credits it grants to the router.

## Understanding the PPPoE-Based Radio-to-Router Protocol

---

Point-to-Point Protocol over Ethernet (PPPoE)-based radio-to-router protocols include messages that define how an external system will provide the device with timely information about the quality of a link's connection. They also include a flow control mechanism to indicate how much data the device can forward. The device can then use the information provided in the PPPoE messages to dynamically adjust the interface speed of PPP links.

For example, a high-band networking waveform (HNW) radio provides ground-to-ground or ground-to-air communications with like devices. When the HNW picks up a signal from another device, it initiates a PPPoE session with a directly connected device (router). The PPPoE session encapsulates the packets that are relayed over a PPP link between the local and remote devices. The remote radio then forwards traffic to a remote device using an independent PPPoE session. The two devices exchange Link Control Protocol

(LCP) and Internet Protocol Control Protocol (IPCP) messages to configure the link and exchange OSPF messages to establish the network topology.

Each HNW radio monitors the link every 50 milliseconds for changes in the link bandwidth, quality, and utilization. If any changes are detected, the radios announce the new set of metrics to the respective devices through a PPPoE Active Discovery Quality (PADQ) message, which is a nonstandard extension to the PPPoE Discovery Protocol (RFC 2516). The device transforms these metrics into a bandwidth value for the PPP link and compares it to the value currently in use. When the device detects that the difference exceeds a user-specified threshold, it adjusts the speed of the PPP link. OSPF is notified of the change and announces any resulting routing topology changes to its neighbors.

The CLI statement, **radio-router**, indicates that metrics announcements received on the interface will be processed by the device. When a PPPoE logical interface refers to this as an underlying interface, the device then processes incoming PADQ messages and uses information from the host's messages to control the flow of traffic and manage the speed of the link, resulting in a corresponding adjustment of the OSPF cost. If this option is not specified, then PADQ messages received over the underlying interface are ignored.

The following options are available within the **radio-router** configuration statement:

- **bandwidth, resource, latency, and quality**—These statements provide control over the weights used when transforming PADQ link metrics into an interface speed for the virtual link:
  - **bandwidth**—Weight of current (vs. maximum) data rate
  - **resource**—Resource weight
  - **latency**—Latency weight
  - **quality**—Relative link quality weight

All four weights accept values from 0 through 100. The default value for all four weights is 100.

- **credit**—This statement supports the credit-based flow control extensions described in RFC 4938. The statement enables PPPoE peers to grant each other forwarding credits. The grantee is then allowed to forward traffic to the peer only when it has a sufficient number of credits to do so. The subsequent credit interval statement controls how frequently the device generates credit announcement messages. The **interval** sub-statement, which controls the grant rate interval, accepts values from 1 through 60 seconds.
- **threshold**—This statement specifies how much of a difference is required between the calculated and the current interface speeds. The **threshold** value, expressed as a percentage, defaults to 10.

The following hierarchy provides another view of the **radio-router** configuration statements.

```
interfaces{
 interface-name {
 radio-router {
 bandwidth;
```

```
 credit {
 interval;
 }
 latency;
 quality;
 resource;
 threshold;
 }
}
```

## Configuring PPPoE-Based Radio-to-Router Protocols

To configure the PPPoE-based radio-to-router protocol:

1. Configure PPPoE encapsulation for an Ethernet interface.
2. Configure radio-router on the logical Ethernet interface.
3. Specify the logical Ethernet interface as the underlying interface for the PPPoE session.
4. Configure the operational mode as server.
5. (Optional) Identify the access concentrator by a unique name.
6. Specify how many seconds to wait before attempting to reconnect.
7. Provide a name for the type of service provided by the access concentrator.
8. Configure the maximum transmission unit (MTU) of the interface.
9. Configure the MTU size for the protocol family.
10. Disable the sending of keepalive messages on the logical interface.

## Example: Configuring the PPPoE-Based Radio-to-Router Protocol

This example shows how to configure the PPPoE-based radio-to-router protocol.

- [Requirements on page 2757](#)
- [Overview on page 2757](#)
- [Configuration on page 2757](#)
- [Verification on page 2758](#)

## Requirements

Before you begin:

1. Configure network interfaces. See [“Example: Creating an Ethernet Interface” on page 2634](#).
2. Configure PPPoE interfaces. See [“Example: Configuring PPPoE Interfaces” on page 2735](#).
3. Configure PPPoE encapsulation on an Ethernet interface. See [“Example: Configuring PPPoE Encapsulation on an Ethernet Interface” on page 2741](#).
4. Configure PPPoE encapsulation on an ATM-over-ADSL interface.
5. Configure CHAP authentication on a PPPoE interface.

## Overview

In this example, you configure the ge-3/0/3 interface and set the bandwidth, resource, latency, and quality to **100**. You also set the threshold value to **10**, and then configure options on the logical interface.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
[edit]
set interfaces ge-3/0/3 unit 1 radio-router bandwidth 100 resource 100 latency 100 quality
 100 threshold 10
set interfaces pp0 unit 1 pppoe-options underlying-interface ge-3/0/3 server
set interfaces pp0 unit 1 family inet unnumbered-address lo0.0 destination 192.168.1.2
set interfaces pp0 unit 1 family inet6 address lo0.0 destination fec0::1::1::2
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the PPPoE-based radio-to-router protocol:

1. Enable the PPPoE-based radio-to-router protocol.

```
[edit]
user@host# edit interfaces ge-3/0/3 unit 1 radio-router
```

2. Set the interface speed for the virtual link.

```
[edit interfaces ge-3/0/3 unit 1 radio-router]
user@host# set bandwidth 100 resource 100 latency 100 quality 100
```

3. Set the calculated and current interface speeds, as a percentage.

```
[edit interfaces ge-3/0/3 unit 1 radio-router]
user@host# set threshold 10
```

4. Configure options on the logical interface.

```
[edit interfaces pp0 unit 1]
user@host# set pppoe-options underlying-interface ge-3/0/3
user@host# set pppoe-options server
user@host# set family inet unnumbered-address lo0.0 destination 192.168.1.2
user@host# set family inet6 address lo0.0 destination fec0:1:1::2
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show interfaces** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
user@host# show interfaces ge-3/0/3 {
 unit 1
 radio-router {
 bandwidth 100;
 resource 100;
 latency 100;
 quality 100;
 threshold 10;
 }
}
...
pp0 {
 unit 1 {
 pppoe-options {
 underlying-interface ge-3/0/3;
 server;
 }
 family inet {
 unnumbered-address lo0.0 destination 192.168.1.2;
 }
 family inet6;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying the PPPoE-based Radio-to-Router Protocol

**Purpose** Verify the PPPoE-Based radio-to-router protocol.

**Action** From operational mode, enter the **show interfaces** command.

- Related Documentation**
- [Understanding the PPPoE-Based Radio-to-Router Protocol on page 2754](#)

## Credit Flow Control for PPPoE

To support the credit-based flow control extensions described in RFC4938, PPPoE peers can grant each other forwarding credits. The grantee is allowed to forward traffic to the peer only when it has a sufficient number of credits to do so. When credit-based forwarding is used on both sides of the session, the radio client can throttle traffic by limiting the number of credits it grants to the router.

The **interfaces** statement includes the **radio-router** attribute, which contains the parameters used for rate-based scheduling and OSPF link cost calculations. It also includes the **credit** attribute to indicate that credit-based packet scheduling is supported on the PPPoE interfaces that reference this underlying interface. Interfaces that set the **encapsulation** attribute support the PPPoE Active Discovery Grant (PADG) and PPPoE Active Discovery Credit (PADC) messages in the same way that the **radio-router** attribute provides active support for the PPPoE Active Discovery Quality (PADQ) message.

The **credit interval** parameter controls how frequently the router generates credit announcement messages. For PPPoE this corresponds to the interval between PADG credit announcements for each session.

# Configuring R2CP Radio-to-Router Protocol

- [R2CP Radio-to-Router Protocol Overview on page 2761](#)
- [Configuring the R2CP Radio-to-Router Protocol on page 2762](#)

## R2CP Radio-to-Router Protocol Overview

---

The Network Centric Waveform (NCW) radio-specific radio-to-router control protocol (R2CP) is similar to the PPPoE radio-to-router protocol. Both of these protocols exchange dynamic metric changes in the network that the routers use to update the OSPF topologies.

In radio-router topologies, the router connects to the radio over a Gigabit Ethernet link and the radio transmits packets over the radio frequency (RF) link. The radio periodically sends metrics to the router, which uses RF link characteristics and other data to inform the router on the shaping and OSPF link capacity. The router uses this information to shape the data traffic and provide the OSPF link cost for its SPF calculations. The radio functions like a Layer 2 switch and can only identify remote radio-router pairs using the Layer 2 MAC addresses. With R2CP the router receives metrics for each neighboring router, identified by the MAC address of the remote router. The R2CP daemon translates the MAC addresses to link the local IPv6 address and sends the metrics for each neighbor to OSPF. Processing these metrics is similar to the handling of PPPoE PADQ metrics. Unlike PPPoE, which is a point-to-point link, these R2CP neighbors are treated as nodes in a broadcast LAN.

You must configure each neighbor node with a per unit scheduler for CoS. The scheduler context defines the attributes of Junos class-of-service. To define CoS for each radio, you can configure virtual channels to limit traffic. You need to configure virtual channels for as many remote radio-router pairs as there are in the network. You configure virtual channels on a logical interface. Each virtual channel can be configured to have a set of eight queues with a scheduler and an optional shaper. When the radio initiates the session with a peer radio-router pair, a new session is created with the remote MAC address of the router and the VLAN over which the traffic flows. Junos OS chooses from the list of free virtual channels and assigns the remote MAC and the eight CoS queues and the scheduler to this remote MAC address. All traffic destined to this remote MAC address is subjected to the CoS that is defined in the virtual channel.

A virtual channel group is a collection of virtual channels. Each radio can have only one virtual channel group assigned uniquely. If you have more than one radio connected to the router, you must have one virtual channel group for each local radio-to-router pair. Although a virtual channel group is assigned to a logical interface, a virtual channel is not the same as a logical interface. The only features supported on a virtual channel are queuing, packet scheduling, and accounting. Rewrite rules and routing protocols apply to the entire logical interface.

All nodes in the R2CP network are in a broadcast LAN. The point-to-multipoint over LAN protocol supports advertising different bandwidth information for neighbors on a broadcast link. The network link is a point-to-multipoint link in the OSPFv3 link state database, which uses existing OSPF neighbor discovery to provide automatic discovery without configuration. It enables each node to advertise a different metric to every other node in the network to accurately represent the cost of communication. The **p2mp-over-lan** interface type under the OSPFv3 interface configuration enables you to configure the interface. OSPFv3 then uses LAN procedures for neighbor discovery and flooding, but represents the interface as point-to-multipoint in the link state database.

The interface type and router LSA are available under the following hierarchies:

**[protocols ospf3 area *area-id* interface *interface-name*]**

**[routing-instances *routing-instances-name* protocols ospf3 area *area-id* interface *interface-name*]**

For example:

```
protocols {
 ospf3 {
 area 0.0.0.0 {
 interface ge-0/0/2.0 {
 interface-type p2mp-over-lan;
 }
 }
 }
}
```

**Related Documentation**

- [Configuring the R2CP Radio-to-Router Protocol on page 2762](#)

## Configuring the R2CP Radio-to-Router Protocol

To configure the R2CP protocol:

1. Configure the interfaces.

The following example creates four logical interfaces on ge-0/0/2, using unit 52 for R2CP control messages and units 101-193 for data traffic. The **per-unit-scheduler** statement is required for R2CP.

```
interfaces {
 ge-0/0/2 {
 per-unit-scheduler;
```

```

vlan-tagging;
unit 52 {
 vlan-id 52;
 family inet {
 address 52.1.1.1/24;
 }
}
unit 101 {
 vlan-id 101;
 family inet {
 address 101.1.1.1/24;
 }
}
unit 102 {
 vlan-id 102;
 family inet {
 address 102.1.1.1/24;
 }
}
unit 103 {
 vlan-id 103;
 family inet {
 address 103.1.1.1/24;
 }
}
}
}

```

## 2. Configure the R2CP protocol.

The following example configures ge-0/0/2.52 as the interface for R2CP control messages, vg1 as the virtual-channel group, and ge-0/0/2.101-103 as data interfaces using the radio-interface statement.

```

protocols {
 r2cp {
 radio myRadio {
 interface ge-0/0/2.52;
 virtual-channel-group vg1;
 radio-interface ge-0/0/2.101;
 radio-interface ge-0/0/2.102;
 radio-interface ge-0/0/2.103;
 }
 }
}

```

## 3. Configure class of service.

The following example defines virtual-channels, their initial shaping-rates, and the virtual-channel-group to which they belong. It also makes the association between radio-interface interfaces and virtual-channel-group. In the class of service configuration, the **vc-shared-scheduler** configuration statement is required for each interface configured as a radio interface in the R2CP protocol configuration.

```

class-of-service {
 virtual-channels {
 vc1;
 }
}

```

```
 vc2;
 vc3;
 vc4;
 }
 virtual-channel-groups {
 vg1 {
 vc1 {
 scheduler-map sm;
 shaping-rate 15m;
 default;
 }
 vc2 {
 scheduler-map sm;
 shaping-rate 20m;
 }
 vc3 {
 scheduler-map sm;
 shaping-rate 20m;
 }
 vc4 {
 scheduler-map sm;
 shaping-rate 20m;
 }
 }
 }
 forwarding-classes {
 queue 0 DATA-queue;
 }
 interfaces {
 ge-0/0/2 {
 unit 101 {
 virtual-channel-group vg1;
 vc-shared-scheduler;
 }
 unit 102 {
 virtual-channel-group vg1;
 vc-shared-scheduler;
 }
 unit 103 {
 virtual-channel-group vg1;
 vc-shared-scheduler;
 }
 }
 }
 scheduler-maps {
 sm {
 forwarding-class DATA-queue scheduler sm-scheduler;
 }
 }
 schedulers {
 sm-scheduler {
 transmit-rate percent 20;
 buffer-size percent 20;
 priority low;
 }
 }
}
```

```
}
```

## Link Services Interfaces Overview

---

Link services include the multilink services Multilink Point-to-Point Protocol (MLPPP), Multilink Frame Relay (MLFR), and Compressed Real-Time Transport Protocol (CRTP). Juniper Networks devices support link services on the **lsq-0/0/0** link services queuing interface.

You configure the link services queuing interface (**lsq-0/0/0**) on a Juniper Networks device to support multilink services and CRTP.

The link services queuing interface on SRX Series devices consists of services provided by the following interfaces on the Juniper Networks M Series and T Series routing platforms: multilink services interface (**ml-fpc/pic/port**), link services interface (**ls-fpc/pic/port**), and link services intelligent queuing interface (**lsq-fpc/pic/port**). Although the multilink services, link services, and link services intelligent queuing (IQ) interfaces on M Series and T Series routing platforms are installed on Physical Interface Cards (PICs), the link services queuing interface on SRX Series devices is an internal interface only and is not associated with a physical medium or Physical Interface Module (PIM).

**NOTE:** (**ls-fpc/pic/port**) is not supported on SRX Series devices.

## Link Services Exceptions

The link and multilink services implementation on SRX Series devices is similar to the implementation on the M Series and T Series routing platforms, with the following exceptions:

- Support for link and multilink services are on the **lsq-0/0/0** interface instead of the **ml-fpc/pic/port**, **lsq-fpc/pic/port**, and **ls-fpc/pic/port** interfaces.
- When LFI is enabled, fragmented packets are queued in a round-robin fashion on the constituent links to enable per-packet and per-fragment load balancing. See [“Queuing with LFI” on page 2772](#).
- Support for per-unit scheduling is on all types of constituent links (on all types of interfaces).
- Support for Compressed Real-Time Transport Protocol (CRTP) is for both MLPPP and PPP.

## Configuring Multiclass MLPPP

For **lsq-0/0/0** on Juniper Networks device, with MLPPP encapsulation, you can configure multiclass MLPPP. If you do not configure multiclass MLPPP, fragments from different classes cannot be interleaved. All fragments for a single packet must be sent before the fragments from another packet are sent. Non-fragmented packets can be interleaved between fragments of another packet to reduce latency seen by non-fragmented packets. In effect, latency-sensitive traffic is encapsulated as regular PPP traffic, and bulk traffic is encapsulated as multilink traffic. This model works as long as there is a single class of latency-sensitive traffic, and there is no high-priority traffic that takes precedence over latency-sensitive traffic. This approach to LFI, used on the Link Services PIC, supports only two levels of traffic priority, which is not sufficient to carry the four-to-eight forwarding classes that are supported by M series and T series routing platforms.

Multiclass MLPPP makes it possible to have multiple classes of latency-sensitive traffic that are carried over a single multilink bundle with bulk traffic. In effect, multiclass MLPPP allows different classes of traffic to have different latency guarantees. With multiclass MLPPP, you can map each forwarding class into a separate multilink class, thus preserving priority and latency guarantees.

**NOTE:** Configuring both LFI and multiclass MLPPP on the same bundle is not necessary, nor is it supported, because multiclass MLPPP represents a superset of functionality. When you configure multiclass MLPPP, LFI is automatically enabled.

The Junos OS PPP implementation does not support the negotiation of address field compression and protocol field compression PPP NCP options, which means that the software always sends a full 4-byte PPP header.

The Junos OS implementation of multiclass MLPPP does not support compression of common header bytes.

Multiclass MLPPP greatly simplifies packet ordering issues that occur when multiple links are used. Without multiclass MLPPP, all voice traffic belonging to a single flow is hashed to a single link to avoid packet ordering issues. With multiclass MLPPP, you can assign voice traffic to a high-priority class, and you can use multiple links.

To configure multiclass MLPPP on a link services IQ interface, you must specify how many multilink classes should be negotiated when a link joins the bundle, and you must specify the mapping of a forwarding class into an multiclass MLPPP class.

To specify how many multilink classes should be negotiated when a link joins the bundle, include the **multilink-max-classes** statement:

```
multilink-max-classes number;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-routers *logical-router-name* interfaces *interface-name* unit *logical-unit-number*]

The number of multilink classes can be 1 through 8. The number of multilink classes for each forwarding class must not exceed the number of multilink classes to be negotiated.

To specify the mapping of a forwarding class into a multiclass MLPPP class, include the **multilink-class** statement at the [edit class-of-service fragmentation-maps forwarding-class *class-name*] hierarchy level:

```
edit class-of-service fragmentation-maps forwarding-class class-namemultilink-class
number
```

The multilink class index number can be 0 through 7. The **multilink-class** statement and the **no-fragmentation** statement are mutually exclusive.

To view the number of multilink classes negotiated, issue the **show interfaces lsq-0/0/0.logical-unit-number detail** command.

## Queuing with LFI

LFI or non-LFI packets are placed into queues on constituent links based on the queues in which they arrive. No changes in the queue number occur while the fragmented, non-fragmented, or LFI packets are being queued.

For example, assume that Queue Q0 is configured with fragmentation threshold 128, Q1 is configured with no fragmentation, and Q2 is configured with fragmentation threshold 512. Q0 is receiving stream of traffic with packet size 512. Q1 is receiving voice traffic of 64 bytes, and Q2 is receiving stream of traffic with 128-byte packets. Next the stream on Q0 gets fragmented and queued up into Q0 of a constituent link. Also, all packets on Q2 are queued up on Q0 on constituent link. The stream on Q1 is considered to be LFI because no fragmentation is configured. All the packets from Q0 and Q2 are queued up on Q0 of constituent link. All the packets from Q1 are queued up on Q2 of constituent link.

Using **lsq-0/0/0**, CRTP can be applied on LFI and non-LFI packets. There will be no changes in their queue numbers because of CRTP.

---

### Queuing on Q2s of Constituent Links

When using class of service on a multilink bundle, all Q2 traffic from the multilink bundle is queued to Q2 of constituent links based on a hash computed from the source address,

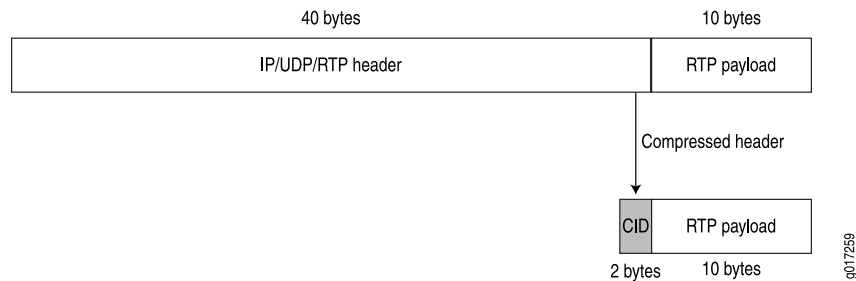

destination address, and the IP protocol of the packet. If the IP payload is TCP or UDP traffic, the hash also includes the source port and destination port. As a result of this hash algorithm, all traffic belonging to one traffic flow is queued to Q2 of one constituent link. This method of traffic delivery to the constituent link is applied at all times, including when the bundle has not been set up with LFI.

## Compressed Real-Time Transport Protocol Overview

Real-Time Transport Protocol (RTP) can help achieve interoperability among different implementations of network audio and video applications. However, in some cases, the header, which includes the IP, UDP, and RTP headers, can be too large (around 40 bytes) on networks using low-speed lines such as dial-up modems. Compressed Real-Time Transport Protocol (CRTP) can be configured to reduce network overhead on low-speed links. CRTP replaces the IP, UDP, and RTP headers with a 2-byte context ID (CID), reducing the header overhead considerably.

Figure 132 shows how CRTP compresses the RTP header in a voice packet by reducing a 40-byte header to a 2-byte header.

Figure 132: CRTP

You can configure CRTP with MLPPP or PPP logical interface encapsulation on link services interfaces. See [“Example: Configuring an MLPPP Bundle” on page 2808](#).

Real-time and non-real-time data frames are carried together on lower-speed links without causing excessive delays to the real-time traffic. See [“Understanding Link Fragmentation and Interleaving Configuration” on page 2791](#).

## Configuring Fragmentation by Forwarding Class

For **lsq-0/0/0**, you can specify fragmentation properties for specific forwarding classes. Traffic on each forwarding class can be either multilink encapsulated (fragmented and sequenced) or non-encapsulated (hashed with no fragmentation). By default, traffic in all forwarding classes is multilink encapsulated.

When you do not configure fragmentation properties for the queues on MLPPP interfaces, the fragmentation threshold you set at the **[edit interfaces interface-name unit logical-unit-number fragment-threshold]** hierarchy level is the fragmentation threshold for all forwarding classes within the MLPPP interface. For MLFR FRF.16 interfaces, the fragmentation threshold you set at the **[edit interfaces interface-name mlfr-uni-nni-bundle-options fragment-threshold]** hierarchy level is the fragmentation threshold for all forwarding classes within the MLFR FRF.16 interface.

If you do not set a maximum fragment size anywhere in the configuration, packets are still fragmented if they exceed the smallest maximum transmission unit (MTU) or maximum received reconstructed unit (MRRU) of all the links in the bundle. A non-encapsulated flow uses only one link. If the flow exceeds a single link, then the forwarding class must be multilink encapsulated, unless the packet size exceeds the MTU/MRRU.

Even if you do not set a maximum fragment size anywhere in the configuration, you can configure the MRRU by including the `mrru` statement at the **[edit interfaces *lsq-0/0/0* unit *logical-unit-number*]** or **[edit interfaces *interface-name* mlfr-uni-nni-bundle-options]** hierarchy level. The MRRU is similar to the MTU, but is specific to link services interfaces. By default the MRRU size is 1504 bytes, and you can configure it to be from 1500 through 4500 bytes.

To configure fragmentation properties on a queue, include the `fragmentation-maps` statement at the **[edit class-of-service]** hierarchy level:

```
[edit class-of-service]
fragmentation-maps {
 map-name {
 forwarding-class class-name {
 fragment-threshold bytes;
 multilink-class number;
 no-fragmentation;
 }
 }
}
```

To set a per-forwarding class fragmentation threshold, include the **fragment-threshold** statement in the fragmentation map. This statement sets the maximum size of each multilink fragment.

To set traffic on a queue to be non-encapsulated rather than multilink encapsulated, include the **no-fragmentation** statement in the fragmentation map. This statement specifies that an extra fragmentation header is not prepended to the packets received on this queue and that static link load balancing is used to ensure in-order packet delivery.

For a given forwarding class, you can include either the **fragment-threshold** or **no-fragmentation** statement; they are mutually exclusive.

You use the **multilink-class** statement to map a forwarding class into a multiclass MLPPP. For a given forwarding class, you can include either the **multilink-class** or **no-fragmentation** statement; they are mutually exclusive.

To associate a fragmentation map with a multilink PPP interface or MLFR FRF.16 DLCI, include the **fragmentation-map** statement at the **[edit class-of-service interfaces *interface-name* unit *logical-unit-number*]** hierarchy level:

```
[edit class-of-service interfaces]
lsq-0/0/0 {
 unit logical-unit-number { # Multilink PPP
 fragmentation-map map-name;
```

```

 }
 }
 lsq-0/0/0:channel { # MLFR FRF.16
 unit logical-unit-number
 fragmentation-map map-name;
 }
}

```

## Configuring Link-Layer Overhead

Link-layer overhead can cause packet drops on constituent links because of bit stuffing on serial links. Bit stuffing is used to prevent data from being interpreted as control information.

By default, 4 percent of the total bundle bandwidth is set aside for link-layer overhead. In most network environments, the average link-layer overhead is 1.6 percent. Therefore, we recommend 4 percent as a safeguard.

For **lsq-0/0/0** on Juniper Networks device, you can configure the percentage of bundle bandwidth to be set aside for link-layer overhead. To do this, include the `link-layer-overhead` statement:

**`link-layer-overhead percent;`**

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* mlfr-uni-nni-bundle-options]
- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-routers *logical-router-name* interfaces *interface-name* unit *logical-unit-number*]

You can configure the value to be from 0 percent through 50 percent.

## Link Services Configuration Overview

Before you begin:

- Install device hardware.
- Establish basic connectivity. See the Getting Started Guide for your device.
- Have a basic understanding of physical and logical interfaces and Juniper Networks interface conventions. See [“Understanding Interfaces” on page 2407](#)

Plan how you are going to use the link services interface on your network. See [“Link Services Interfaces Overview” on page 2769](#).

To configure link services on an interface, perform the following tasks:

1. Configure link fragmentation and interleaving (LFI). See [“Example: Configuring Link Fragmentation and Interleaving” on page 2792](#).
2. Configure classifiers and forwarding classes. See [“Example: Defining Classifiers and Forwarding Classes” on page 2796](#).
3. Configure scheduler maps. See [“Understanding How to Define and Apply Scheduler Maps” on page 2799](#).
4. Configure interface shaping rates. See [“Example: Configuring Interface Shaping Rates” on page 2804](#).
5. Configure an MLPPP bundle. See [“Example: Configuring an MLPPP Bundle” on page 2808](#).
6. To configure MLFR, see [“Example: Configuring Multilink Frame Relay FRF.15” on page 2813](#) or [“Example: Configuring Multilink Frame Relay FRF.16” on page 2817](#).
7. To configure CRTP, see [“Example: Configuring the Compressed Real-Time Transport Protocol” on page 2821](#).

## Verifying the Link Services Interface

Confirm that the configuration is working properly.

- [Verifying Link Services Interface Statistics on page 2776](#)
- [Verifying Link Services CoS Configuration on page 2779](#)

### Verifying Link Services Interface Statistics

**Purpose** Verify the link services interface statistics.

**Action** The sample output provided in this section is based on the configurations provided in [“Example: Configuring an MLPPP Bundle” on page 2808](#). To verify that the constituent links are added to the bundle correctly and the packets are fragmented and transmitted correctly, take the following actions:

1. On device R0 and device R1, the two devices used in this example, configure MLPPP and LFI as described in [“Example: Configuring an MLPPP Bundle” on page 2808](#).
2. From the CLI, enter the **ping** command to verify that a connection is established between R0 and R1.

3. Transmit 10 data packets, 200 bytes each, from R0 to R1.
4. On R0, from the CLI, enter the **show interfaces *interface-name* statistics** command.

```

user@R0> show interfaces lsq-0/0/0 statistics detail
Physical interface: lsq-0/0/0, Enabled, Physical link is Up
 Interface index: 134, SNMP ifIndex: 29, Generation: 135
 Link-level type: LinkService, MTU: 1504
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps
 Last flapped : 2006-06-23 11:36:23 PDT (03:38:43 ago)
 Statistics last cleared: 2006-06-23 15:13:12 PDT (00:01:54 ago)
 Traffic statistics:
 Input bytes : 0 0 bps
 Output bytes : 1820 0 bps
 Input packets: 0 0 pps
 Output packets: 10 0 pps
 ...
 Egress queues: 8 supported, 8 in use
 Queue counters:

This output shows a summary of interface information. Verify the following information:

- **Physical interface**—The physical interface is **Enabled**. If the interface is shown as **Disabled**, do either of the following:
  - In the CLI configuration editor, delete the **disable** statement at the **[edit interfaces interface-name]** level of the configuration hierarchy.
  - In the J-Web configuration editor, clear the **Disable** check box on the **Interfaces>interface-name** page.
- **Physical link**—The physical link is **Up**. A link state of **Down** indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- **Last flapped**—The **Last Flapped** time is an expected value. The **Last Flapped** time indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- **Traffic statistics**—Number and rate of bytes and packets received and transmitted on the interface. Verify that the number of inbound and outbound bytes and packets match the expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics interface-name** command.
- **Queue counters**—Name and number of queues are as configured. This sample output shows that 10 data packets were transmitted and no packets were dropped.
- **Logical interface**—Name of the multilink bundle you configured—**lsq-0/0/0.0**.
- **Bundle options**—Fragmentation threshold is correctly configured, and fragment interleaving is enabled.
- **Bundle errors**—Any packets and fragments dropped by the bundle.
- **Statistics**—The fragments and packets are received and transmitted correctly by the device. All references to traffic direction (input or output) are defined with respect to the device. Input fragments received by the device are assembled into input packets. Output packets are segmented into output fragments for transmission out of the device.

In this example, 10 data packets of 200 bytes were transmitted. Because the fragmentation threshold is set to 128 bytes, all data packets were fragmented into two fragments. The sample output shows that 10 packets and 20 fragments were transmitted correctly.

- **Link**—The constituent links are added to this bundle and are receiving and transmitting fragments and packets correctly. The combined number of fragments transmitted on the constituent links must be equal to the number of fragments transmitted from the bundle. This sample output shows that the bundle transmitted 20 fragments and the

two constituent links **se-1/0/0.0** and **se-1/0/1.0.0** correctly transmitted **10+10=20** fragments.

- **Destination** and **Local**—IP address of the remote side of the multilink bundle and the local side of the multilink bundle. This sample output shows that the destination address is the address on R1 and the local address is the address on R0.

## Verifying Link Services CoS Configuration

**Purpose** Verify CoS configurations on the link services interface.

**Action** From the CLI, enter the following commands:

- **show class-of-service interface *interface-name***
- **show class-of-service classifier name *classifier-name***
- **show class-of-service scheduler-map *scheduler-map-name***

The sample output provided in this section is based on the configurations provided in [“Example: Configuring an MLPPP Bundle” on page 2808](#).

```
user@R0> show class-of-service interface lsq-0/0/0
Physical interface: lsq-0/0/0, Index: 136
Queues supported: 8, Queues in use: 4
Scheduler map: [default], Index: 2
Input scheduler map: [default], Index: 3
Chassis scheduler map: [default-chassis], Index: 4
Logical interface: lsq-0/0/0.0, Index: 69
Object Name Type Index
Scheduler-map s_map Output 16206
Classifier ipprec-compatibility ip 12
```

```
user@R0> show class-of-service interface ge-0/0/1
Physical interface: ge-0/0/1, Index: 140
Queues supported: 8, Queues in use: 4
Scheduler map: [default], Index: 2
Input scheduler map: [default], Index: 3

Logical interface: ge-0/0/1.0, Index: 68
Object Name Type Index
Classifier classfy_input ip 4330
```

```
user@R0> show class-of-service classifier name classfy_input
Classifier: classfy_input, Code point type: inet-precedence, Index: 4330
```

| Code point | Forwarding class | Loss priority |
|------------|------------------|---------------|
| 000        | DATA             | low           |
| 010        | VOICE            | low           |

```
user@R0> show class-of-service scheduler-map s_map
Scheduler map: s_map, Index: 16206
```

```
Scheduler: DATA, Forwarding class: DATA, Index: 3810
Transmit rate: 49 percent, Rate Limit: none, Buffer size: 49 percent,
Priority:low
```

Drop profiles:

| Loss priority | Protocol | Index | Name |
|---------------|----------|-------|------|
|---------------|----------|-------|------|

|             |     |   |                        |
|-------------|-----|---|------------------------|
| Low         | any | 1 | [default-drop-profile] |
| Medium low  | any | 1 | [default-drop-profile] |
| Medium high | any | 1 | [default-drop-profile] |
| High        | any | 1 | [default-drop-profile] |

Scheduler: VOICE, Forwarding class: VOICE, Index: 43363  
 Transmit rate: 50 percent, Rate Limit: none, Buffer size: 5 percent,  
 Priority:high

## Drop profiles:

| Loss priority | Protocol | Index | Name                   |
|---------------|----------|-------|------------------------|
| Low           | any      | 1     | [default-drop-profile] |
| Medium low    | any      | 1     | [default-drop-profile] |
| Medium high   | any      | 1     | [default-drop-profile] |
| High          | any      | 1     | [default-drop-profile] |

Scheduler: NC, Forwarding class: NC, Index: 2435  
 Transmit rate: 1 percent, Rate Limit: none, Buffer size: 1 percent, Priority:high

## Drop profiles:

| Loss priority | Protocol | Index | Name                   |
|---------------|----------|-------|------------------------|
| Low           | any      | 1     | [default-drop-profile] |
| Medium low    | any      | 1     | [default-drop-profile] |
| Medium high   | any      | 1     | [default-drop-profile] |
| High          | any      | 1     | [default-drop-profile] |

These output examples show a summary of configured CoS components. Verify the following information:

- **Logical Interface**—Name of the multilink bundle and the CoS components applied to the bundle. The sample output shows that the multilink bundle is **lsq-0/0/0.0**, and the CoS scheduler-map **s\_map** is applied to it.
- **Classifier**—Code points, forwarding classes, and loss priorities assigned to the classifier. The sample output shows that a default classifier, **ipprec-compatibility**, was applied to the **lsq-0/0/0** interface and the classifier **classify\_input** was applied to the **ge-0/0/1** interface.
- **Scheduler**—Transmit rate, buffer size, priority, and loss priority assigned to each scheduler. The sample output displays the data, voice, and network control schedulers with all the configured values.

## Troubleshooting the Link Services Interface

To solve configuration problems on a link services interface:

- [Determine Which CoS Components Are Applied to the Constituent Links on page 2781](#)
- [Determine What Causes Jitter and Latency on the Multilink Bundle on page 2782](#)
- [Determine If LFI and Load Balancing Are Working Correctly on page 2783](#)
- [Determine Why Packets Are Dropped on a PVC Between a Juniper Networks Device and a Third-Party Device on page 2789](#)

### Determine Which CoS Components Are Applied to the Constituent Links

**Problem**    **Description:** You are configuring a multilink bundle, but you also have traffic without MLPPP encapsulation passing through constituent links of the multilink bundle. Do you apply all CoS components to the constituent links, or is applying them to the multilink bundle enough?

**Solution**    You can apply a scheduler map to the multilink bundle and its constituent links. Although you can apply several CoS components with the scheduler map, configure only the ones that are required. We recommend that you keep the configuration on the constituent links simple to avoid unnecessary delay in transmission.

[Table 284](#) shows the CoS components to be applied on a multilink bundle and its constituent links.

Table 284: CoS Components Applied on Multilink Bundles and Constituent Links

| Cos Component    | Multilink Bundle | Constituent Links | Explanation                                                                                                                                                                                                                                                                                                                                        |
|------------------|------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Classifier       | Yes              | No                | CoS classification takes place on the incoming side of the interface, not on the transmitting side, so no classifiers are needed on constituent links.                                                                                                                                                                                             |
| Forwarding class | Yes              | No                | Forwarding class is associated with a queue, and the queue is applied to the interface by a scheduler map. The queue assignment is predetermined on the constituent links. All packets from Q2 of the multilink bundle are assigned to Q2 of the constituent link, and packets from all the other queues are queued to Q0 of the constituent link. |

Table 284: CoS Components Applied on Multilink Bundles and Constituent Links (*continued*)

| Cos Component                                                         | Multilink Bundle | Constituent Links | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------------------------|------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scheduler map                                                         | Yes              | Yes               | <p>Apply scheduler maps on the multilink bundle and the constituent link as follows:</p> <ul style="list-style-type: none"> <li>Transmit rate—Make sure that the relative order of the transmit rate configured on Q0 and Q2 is the same on the constituent links as on the multilink bundle.</li> <li>Scheduler priority—Make sure that the relative order of the scheduler priority configured on Q0 and Q2 is the same on the constituent links as on the multilink bundle.</li> <li>Buffer size—Because all non-LFI packets from the multilink bundle transit on Q0 of the constituent links, make sure that the buffer size on Q0 of the constituent links is large enough.</li> <li>RED drop profile—Configure a RED drop profile on the multilink bundle only. Configuring the RED drop profile on the constituent links applies a back pressure mechanism that changes the buffer size and introduces variation. Because this behavior might cause fragment drops on the constituent links, make sure to leave the RED drop profile at the default settings on the constituent links.</li> </ul> |
| Shaping rate for a per-unit scheduler or an interface-level scheduler | No               | Yes               | Because per-unit scheduling is applied only at the end point, apply this shaping rate to the constituent links only. Any configuration applied earlier is overwritten by the constituent link configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Transmit-rate exact or queue-level shaping                            | Yes              | No                | The interface-level shaping applied on the constituent links overrides any shaping on the queue. Thus apply transmit-rate exact shaping on the multilink bundle only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Rewrite rules                                                         | Yes              | No                | Rewrite bits are copied from the packet into the fragments automatically during fragmentation. Thus what you configure on the multilink bundle is carried on the fragments to the constituent links.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Virtual channel group                                                 | Yes              | No                | Virtual channel groups are identified through firewall filter rules that are applied on packets only before the multilink bundle. Thus you do not need to apply the virtual channel group configuration to the constituent links.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Determine What Causes Jitter and Latency on the Multilink Bundle

**Problem**    **Description:** To test jitter and latency, you send three streams of IP packets. All packets have the same IP precedence settings. After configuring LFI and CRTP, the latency increased even over a noncongested link. How can you reduce jitter and latency?

**Solution**    To reduce jitter and latency, do the following:

1. Make sure that you have configured a shaping rate on each constituent link.
2. Make sure that you have not configured a shaping rate on the link services interface.
3. Make sure that the configured shaping rate value is equal to the physical interface bandwidth. See [“Example: Configuring Interface Shaping Rates” on page 2804](#).
4. If shaping rates are configured correctly, and jitter still persists, contact the Juniper Networks Technical Assistance Center (JTAC).

## Determine If LFI and Load Balancing Are Working Correctly

**Problem** **Description:** In this case, you have a single network that supports multiple services. The network transmits data and delay-sensitive voice traffic. After configuring MLPPP and LFI, make sure that voice packets are transmitted across the network with very little delay and jitter. How can you find out if voice packets are being treated as LFI packets and load balancing is performed correctly?

**Solution** When LFI is enabled, data (non-LFI) packets are encapsulated with an MLPPP header and fragmented to packets of a specified size. The delay-sensitive, voice (LFI) packets are PPP-encapsulated and interleaved between data packet fragments. Queuing and load balancing are performed differently for LFI and non-LFI packets.

To verify that LFI is performed correctly, determine that packets are fragmented and encapsulated as configured. After you know whether a packet is treated as an LFI packet or a non-LFI packet, you can confirm whether the load balancing is performed correctly.

**Solution Scenario**—Suppose two Juniper Networks devices, R0 and R1, are connected by a multilink bundle `lsq-0/0/0.0` that aggregates two serial links, `se-1/0/0` and `se-1/0/1`. On R0 and R1, MLPPP and LFI are enabled on the link services interface and the fragmentation threshold is set to 128 bytes.

In this example, we used a packet generator to generate voice and data streams. You can use the packet capture feature to capture and analyze the packets on the incoming interface.

The following two data streams were sent on the multilink bundle:

- 100 data packets of 200 bytes (larger than the fragmentation threshold)
- 500 data packets of 60 bytes (smaller than the fragmentation threshold)

The following two voice streams were sent on the multilink bundle:

- 100 voice packets of 200 bytes from source port 100
- 300 voice packets of 200 bytes from source port 200

To confirm that LFI and load balancing are performed correctly:

**NOTE:** Only the significant portions of command output are displayed and described in this example. For more information, see [“Verifying the Link Services Interface” on page 2776](#).

1. Verify packet fragmentation. From operational mode, enter the **show interfaces lsq-0/0/0** command to check that large packets are fragmented correctly.

```
user@R0#> show interfaces lsq-0/0/0
Physical interface: lsq-0/0/0, Enabled, Physical link is Up
Interface index: 136, SNMP ifIndex: 29
Link-level type: LinkService, MTU: 1504
Device flags : Present Running
Interface flags: Point-To-Point SNMP-Traps
Last flapped : 2006-08-01 10:45:13 PDT (2w0d 06:06 ago)
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)

Logical interface lsq-0/0/0.0 (Index 69) (SNMP ifIndex 42)
Flags: Point-To-Point SNMP-Traps 0x4000 Encapsulation: Multilink-PPP
Bandwidth: 16mbps
Statistics
Bundle:
Fragments:
 Input : 0 0 0 0
 Output: 1100 0 118800 0
Packets:
 Input : 0 0 0 0
 Output: 1000 0 112000 0
...
Protocol inet, MTU: 1500
Flags: None
Addresses, Flags: Is-Preferred Is-Primary
Destination: 9.9.9/24, Local: 9.9.9.10
```

**Meaning**—The output shows a summary of packets transiting the device on the multilink bundle. Verify the following information on the multilink bundle:

- The total number of transiting packets = 1000
- The total number of transiting fragments=1100
- The number of data packets that were fragmented =100

The total number of packets sent (600 + 400) on the multilink bundle match the number of transiting packets (1000), indicating that no packets were dropped.

The number of transiting fragments exceeds the number of transiting packets by 100, indicating that 100 large data packets were correctly fragmented.

**Corrective Action**—If the packets are not fragmented correctly, check your fragmentation threshold configuration. Packets smaller than the specified fragmentation threshold are not fragmented. See [“Example: Configuring Link Fragmentation and Interleaving” on page 2792](#).

2. Verify packet encapsulation. To find out whether a packet is treated as an LFI or non-LFI packet, determine its encapsulation type. LFI packets are PPP encapsulated, and non-LFI packets are encapsulated with both PPP and MLPPP. PPP and MLPPP encapsulations have different overheads resulting in different-sized packets. You can compare packet sizes to determine the encapsulation type.

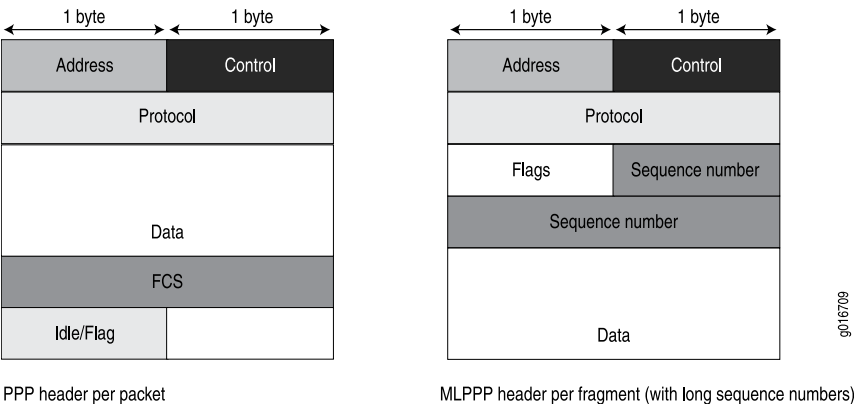

A small unfragmented data packet contains a PPP header and a single MLPPP header. In a large fragmented data packet, the first fragment contains a PPP header and an MLPPP header, but the consecutive fragments contain only an MLPPP header.

PPP and MLPPP encapsulations add the following number of bytes to a packet:

- PPP encapsulation adds 7 bytes:  
4 bytes of header+2 bytes of frame check sequence (FCS)+1 byte that is idle or contains a flag
- MLPPP encapsulation adds between 6 and 8 bytes:  
4 bytes of PPP header+2 to 4 bytes of multilink header

Figure 133 shows the overhead added to PPP and MLPPP headers.

Figure 133: PPP and MLPPP Headers

For CRTP packets, the encapsulation overhead and packet size are even smaller than for an LFI packet. For more information, see [“Example: Configuring the Compressed Real-Time Transport Protocol” on page 2821](#).

Table 285 shows the encapsulation overhead for a data packet and a voice packet of 70 bytes each. After encapsulation, the size of the data packet is larger than the size of the voice packet.

Table 285: PPP and MLPPP Encapsulation Overhead

| Packet Type                                 | Encapsulation | Initial Packet Size | Encapsulation Overhead       | Packet Size after Encapsulation |
|---------------------------------------------|---------------|---------------------|------------------------------|---------------------------------|
| Voice packet (LFI)                          | PPP           | 70 bytes            | 4 + 2 + 1 = 7 bytes          | 77 bytes                        |
| Data fragment (non-LFI) with short sequence | MLPPP         | 70 bytes            | 4 + 2 + 1 + 4 + 2 = 13 bytes | 83 bytes                        |

Table 285: PPP and MLPPP Encapsulation Overhead (*continued*)

| Packet Type                                | Encapsulation | Initial Packet Size | Encapsulation Overhead       | Packet Size after Encapsulation |
|--------------------------------------------|---------------|---------------------|------------------------------|---------------------------------|
| Data fragment (non-LFI) with long sequence | MLPPP         | 70 bytes            | 4 + 2 + 1 + 4 + 4 = 15 bytes | 85 bytes                        |

From operational mode, enter the **show interfaces queue** command to display the size of transmitted packet on each queue. Divide the number of bytes transmitted by the number of packets to obtain the size of the packets and determine the encapsulation type.

3. Verify load balancing. From operational mode, enter the **show interfaces queue** command on the multilink bundle and its constituent links to confirm whether load balancing is performed accordingly on the packets.

```

user@R0> show interfaces queue lsq-0/0/0

```

**Meaning**—The output from these commands shows the packets transmitted and queued on each queue of the link services interface and its constituent links. [Table 286](#) shows a summary of these values. (Because the number of transmitted packets equaled the number of queued packets on all the links, this table shows only the queued packets.)

**Table 286: Number of Packets Transmitted on a Queue**

| Packets Queued | Bundle<br>lsq-0/0/0.0 | Constituent Link<br>se-1/0/0 | Constituent Link<br>se-1/0/1 | Explanation                                                                                                                                                          |
|----------------|-----------------------|------------------------------|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Packets on Q0  | 600                   | 350                          | 350                          | The total number of packets transiting the constituent links (350+350 = 700) exceeded the number of packets queued (600) on the multilink bundle.                    |
| Packets on Q2  | 400                   | 100                          | 300                          | The total number of packets transiting the constituent links equaled the number of packets on the bundle.                                                            |
| Packets on Q3  | 0                     | 19                           | 18                           | The packets transiting Q3 of the constituent links are for keepalive messages exchanged between constituent links. Thus no packets were counted on Q3 of the bundle. |

On the multilink bundle, verify the following:

- The number of packets queued matches the number transmitted. If the numbers match, no packets were dropped. If more packets were queued than were transmitted, packets were dropped because the buffer was too small. The buffer size on the constituent links controls congestion at the output stage. To correct this problem, increase the buffer size on the constituent links. For more information, see [“Example: Configuring Scheduler Maps” on page 2800](#).
- The number of packets transiting Q0 (600) matches the number of large and small data packets received (100+500) on the multilink bundle. If the numbers match, all data packets correctly transited Q0.
- The number of packets transiting Q2 on the multilink bundle (400) matches the number of voice packets received on the multilink bundle. If the numbers match, all voice LFI packets correctly transited Q2.

On the constituent links, verify the following:

- The total number of packets transiting Q0 (350+350) matches the number of data packets and data fragments (500+200). If the numbers match, all the data packets after fragmentation correctly transited Q0 of the constituent links.

Packets transited both constituent links, indicating that load balancing was correctly performed on non-LFI packets.

- The total number of packets transiting Q2 (300+100) on constituent links matches the number of voice packets received (400) on the multilink bundle. If the numbers match, all voice LFI packets correctly transited Q2.

LFI packets from source port **100** transited **se-1/0/0**, and LFI packets from source port **200** transited **se-1/0/1**. Thus all LFI (Q2) packets were hashed based on the source port and correctly transited both constituent links.

**Corrective Action**—If the packets transited only one link, take the following steps to resolve the problem:

- a. Determine whether the physical link is **up** (operational) or **down** (unavailable). An unavailable link indicates a problem with the PIM, interface port, or physical connection (link-layer errors). If the link is operational, move to the next step.
  - b. Verify that the classifiers are correctly defined for non-LFI packets. Make sure that non-LFI packets are not configured to be queued to Q2. All packets queued to Q2 are treated as LFI packets.
  - c. Verify that at least one of the following values is different in the LFI packets: source address, destination address, IP protocol, source port, or destination port. If the same values are configured for all LFI packets, the packets are all hashed to the same flow and transit the same link.
4. Use the results to verify load balancing.

### Determine Why Packets Are Dropped on a PVC Between a Juniper Networks Device and a Third-Party Device

**Problem**    **Description:** You are configuring a permanent virtual circuit (PVC) between T1, E1, T3, or E3 interfaces on a Juniper Networks device and a third-party device, and packets are being dropped and ping fails.

**Solution**    If the third-party device does not have the same FRF.12 support as the Juniper Networks device or supports FRF.12 in a different way, the Juniper Networks device interface on the PVC might discard a fragmented packet containing FRF.12 headers and count it as a "Policed Discard."

As a workaround, configure multilink bundles on both peers, and configure fragmentation thresholds on the multilink bundles.

# Configuring Link Fragmentation and Interleaving

- [Understanding Link Fragmentation and Interleaving Configuration on page 2791](#)
- [Example: Configuring Link Fragmentation and Interleaving on page 2792](#)

## Understanding Link Fragmentation and Interleaving Configuration

---

As it does on any other interface, priority scheduling on a multilink bundle determines the order in which an output interface transmits traffic from an output queue. The queues are serviced in a weighted round-robin fashion. But when a queue containing large packets starts using the multilink bundle, small and delay-sensitive packets must wait their turn for transmission. Because of this delay, some slow links, such as T1 and E1, can become useless for delay-sensitive traffic.

Link fragmentation and interleaving (LFI) solves this problem. It reduces delay and jitter on links by fragmenting large packets and interleaving delay-sensitive packets with the resulting smaller packets for simultaneous transmission across multiple links of a multilink bundle.

[Figure 134](#) illustrates how LFI works. In this figure, device R0 and device R1 have LFI enabled. When device R0 receives large and small packets, such as data and voice packets, it divides them into two categories. All voice packets and any other packets configured to be treated as voice packets are categorized as LFI packets and transmitted without fragmentation or an MLPPP header. If CRTP is configured on the bundle, LFI packets are transmitted through CRTP processing. The remaining non-LFI (data) packets can be fragmented or unfragmented based on the configured fragmentation threshold. The packets larger than the fragmentation threshold are fragmented. An MLPPP header (containing a multilink sequence number) is added to all non-LFI packets, fragmented and unfragmented.

The fragmentation is performed according to the fragmentation threshold that you configure. For example, if you configure a fragmentation threshold of 128 bytes, all packets larger than 128 bytes are fragmented. When device R1 receives the packets, it sends the unfragmented voice packets immediately but buffers the packet fragments until it receives the last fragment for a packet. In this example, when device R1 receives fragment 5, it reassembles the fragments and transmits the whole packet.

The unfragmented data packets are treated as a single fragment. Thus device R1 does not buffer the unfragmented data packets and transmits them as it receives them.

**Figure 134: LFI on a Services Router**

To configure LFI, you define the MLPPP encapsulation type and enable fragmentation and interleaving of packets by specifying the fragmentation threshold and fragmentation maps, with a no-fragmentation knob mapped to the forwarding class of choice.

## Example: Configuring Link Fragmentation and Interleaving

This example shows how to configure LFI.

- [Requirements on page 2792](#)
- [Overview on page 2792](#)
- [Configuration on page 2793](#)
- [Verification on page 2793](#)

### Requirements

Before you begin, you should have two Juniper Networks devices configured with at least two serial interfaces that communicate over serial links. This example shows two devices.

### Overview

In this example, you create an interface called `lsq-0/0/0`. You specify the encapsulation type as `multilink-ppp` and set the fragmentation threshold value to 128. Set a fragmentation threshold of 128 bytes on the MLPPP bundle so that it applies to all traffic on both constituent links, enabling that any packet larger than 128 bytes transmitted on these links is fragmented. Any nonzero value must be a multiple of 64 bytes. The value can be between 128 and 16320. The default value is 0 bytes.

## Configuration

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure LFI:

1. Create an interface.  

```
[edit]
user@host# edit interfaces lsq-0/0/0
```
2. Specify the encapsulation type and fragmentation threshold value.  

```
[edit interfaces lsq-0/0/0]
user@host# set unit 0 encapsulation multilink-ppp fragment-threshold 128
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

---

### Verifying Link Fragmentation and Interleaving Configuration

---

**Purpose** Verify the LFI configuration.

**Action** From operational mode, enter the **show interfaces lsq-0/0/0** command.

## Understanding How to Define Classifiers and Forwarding Classes

---

By defining classifiers you associate incoming packets with a forwarding class and loss priority. Based on the associated forwarding class, you assign packets to output queues. To configure classifiers, you specify the bit pattern for the different types of traffic. The classifier takes this bit pattern and attempts to match it to the type of packet arriving on the interface. If the information in the packet's header matches the specified pattern, the packet is sent to the appropriate queue, defined by the forwarding class associated with the classifier.

On a Juniper Networks device, when LFI is enabled, all forwarding traffic assigned to queue 2 or member link is treated as LFI (voice) traffic. You do not need to assign network control traffic to a queue explicitly, because it is assigned to queue 3 by default.

### NOTE:

On member links:

- DATA is assigned to queue 0.
- VOICE is assigned to queue 2.
- NC (network control) is assigned to queue 3. By default NC is assigned to queue 3.

## Example: Defining Classifiers and Forwarding Classes

---

This example shows how to define classifiers for different types of traffic, such as voice, data, and network control packets, and to direct the traffic to different output queues to manage your throughput.

- [Requirements on page 2796](#)
- [Overview on page 2796](#)
- [Configuration on page 2796](#)
- [Verification on page 2798](#)

### Requirements

Before you begin:

- Configure two Juniper Networks devices with at least two serial interfaces that communicate over serial links.
- Configure CoS components.

### Overview

In this example, you configure class of service and set the default IP precedence classifier to `classify_input`, which is assigned to all incoming traffic. You then set the precedence bit value in the type of service field to 000 for all incoming data traffic and 010 for all incoming voice traffic. You set all outgoing data traffic to queue 0 and all voice traffic to queue 2, and fragmentation-map maps queue 2 to no fragmentation.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set class-of-service classifiers inet-precedence classify_input forwarding-class DATA
 loss-priority low code-points 000
set class-of-service classifiers inet-precedence classify_input forwarding-class VOICE
 loss-priority low code-points 010
set class-of-service forwarding-classes queue 0 DATA
set class-of-service forwarding-classes queue 2 VOICE
set class-of-service forwarding-classes queue 3 NC
set class-of-service interfaces ge-0/0/1 unit 0 classifiers inet-precedence classify_input
set class-of-service fragmentation-maps FM forwarding-class VOICE no-fragmentation
set class-of-service interfaces lsq-0/0/0 unit 0 fragmentation-map FM
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To define classifiers and forwarding classes:

1. Configure class of service.  

```
[edit]
user@host# edit class-of-service
```
2. Configure the behavior aggregate classifier for classifying packets.  

```
[edit class-of-service]
user@host# edit classifiers inet-precedence classify_input
```
3. Assign packets with IP precedence to the data forwarding class and specify a loss priority.  

```
[edit class-of-service classifiers inet-precedence classify_input]
user@host# set forwarding-class DATA loss-priority low code-points 000
```
4. Assign packets with IP precedence to the voice forwarding class and specify a loss priority.  

```
[edit class-of-service classifiers inet-precedence classify_input]
user@host# set forwarding-class VOICE loss-priority low code-points 010
```
5. Specify the forwarding class one-to-one with the output queues.  

```
[edit class-of-service]
user@host# edit forwarding-classes
user@host# set queue 0 DATA
user@host# set queue 2 VOICE
user@host# set queue 3 NC
```
6. Create an interface and apply the behavior aggregate classifier.  

```
[edit class-of-service]
user@host# edit interfaces ge-0/0/1
user@host# set unit 0 classifiers inet-precedence classify_input
```
7. Configure fragmentation map.  

```
[edit]
user@host# edit class-of-service
user@host# set fragmentation-maps FM forwarding-class VOICE no-fragmentation
```
8. Attach fragmentation map to the interface.  

```
[edit class-of-service]
user@host# set interfaces lsq-0/0/0 unit 0 fragmentation-map FM
```

**Results** From configuration mode, confirm your configuration by entering the **show class-of-service** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show class-of-service
classifiers {
```

```
inet-precedence classify_input {
 forwarding-class DATA {
 loss-priority low code-points 000;
 }
 forwarding-class VOICE {
 loss-priority low code-points 010;
 }
}
forwarding-classes {
 queue 0 DATA;
 queue 2 VOICE;
 queue 3 NC;
}
interfaces {
 lsq-0/0/0 {
 unit 0 {
 fragmentation-map FM;
 }
 }
 ge-0/0/1 {
 unit 0 {
 classifiers {
 inet-precedence classify_input;
 }
 }
 }
}
fragmentation-maps {
 FM {
 forwarding-class {
 VOICE {
 no-fragmentation;
 }
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying Classifiers and Forwarding Classes

## Understanding How to Define and Apply Scheduler Maps

Juniper Networks devices support per-unit scheduling **set class-of-service schedulers SO priority low g**, which allows you to configure scheduler maps on each MLPPP or MLFR multilink bundle. You can also configure scheduler maps on constituent links, but you must maintain the same relative priority on the constituent links and on the multilink bundle.

If you configure CoS components with LFI on a Juniper Networks device, we recommend that you follow certain recommendations for shaping rate, scheduling priority, and buffer size.

When you configure LFI, we recommend that you configure the shaping rate on each constituent link of the multilink bundle. Shaping rate configuration on the constituent links is required to limit the jitter on the LFI queue. If you anticipate no delay-sensitive or jitter-sensitive traffic on the LFI queue, or if there is no LFI traffic at all, shaping rate configuration is optional.

[Table 287](#) shows an example of correct and incorrect relative priorities on a multilink bundle and its constituent link. In this example, you have assigned a high priority to LFI packets and a low priority to data packets on the multilink bundle. To maintain the relative priority on the constituent links, you can assign a high priority to the LFI packets and a medium-high priority to the data packets, but you cannot assign a medium-high priority to LFI packets and a high priority to data packets.

**Table 287: Relative Priorities on Multilink Bundles and Constituent Links**

| Multilink Bundle          | Correct Constituent Link Priorities | Incorrect Constituent Link Priorities |
|---------------------------|-------------------------------------|---------------------------------------|
| LFI packets—High priority | LFI packets—High priority           | LFI packet—Medium-high priority       |
| Data packets—Low priority | Data packets—Medium-high priority   | Data packets—High priority            |

By defining schedulers you configure the properties of output queues that determine the transmission service level for each queue. These properties include the amount of interface bandwidth assigned to the queue, the size of the memory buffer allocated for storing packets, and the priority of the queue. After defining schedulers you associate them with forwarding classes by means of scheduler maps. You then associate each scheduler map with an interface, thereby configuring the hardware queues and packet schedulers that operate according to this mapping.

**NOTE:** When data and LFI streams are present, the following scheduler map configuration is recommended for constituent links. This gives less latency for LFI traffic and avoids out-of-order transmission of data traffic.

Configure the following schedulers:

- set class-of-service schedulers S0 buffer-size temporal 20k
- set class-of-service schedulers S0 priority low
- set class-of-service schedulers S2 priority high
- set class-of-service schedulers S3 priority high

Configure the following scheduler map:

- set class-of-service scheduler-maps lsqlink\_map forwarding-class best-effort scheduler S0
- set class-of-service scheduler-maps lsqlink\_map forwarding-class assured-forwarding scheduler S2
- set class-of-service scheduler-maps lsqlink\_map forwarding-class network-control scheduler S3

Attach scheduler map to all member links:

- set class-of-service interfaces t1-2/0/0 unit 0 scheduler-map lsqlink\_map

**NOTE:** Even after this configuration, if out-of-range sequence number drops are observed on the reassembly side, increase the drop-timeout of the bundle to 200 ms.

---

## Example: Configuring Scheduler Maps

This example shows how to configure scheduler maps to determine the transmission service level for each output queue.

- [Requirements on page 2801](#)
- [Overview on page 2801](#)

- [Configuration on page 2801](#)
- [Verification on page 2803](#)

## Requirements

Before you begin, you should have two Juniper Networks devices configured with at least two serial interfaces that communicate over serial links.

## Overview

In this example, you create interfaces called lsq-0/0/0, se-1/0/0, and se-1/0/1. You enable per-unit scheduling to allow the configuration of scheduler maps on the bundle. You configure a scheduler map as s\_map on lsq-0/0/0. You then apply the scheduler map to the constituent links, se-1/0/0 and se-1/0/1, of the multilink bundle. You associate the scheduler with each of the forwarding classes, DATA, VOICE and NC. You define the properties of output queues for the DATA scheduler by setting the transmit rate and the buffer size to 49 percent. You specify the properties of output queues for the VOICE scheduler by setting the transmit rate to 50 percent, the buffer size to 5 percent, and the priority to high. Finally, you define the properties of output queues for the NC scheduler by setting the transmit rate and the buffer size to 1 percent and the priority to high.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces lsq-0/0/0 per-unit-scheduler
set interfaces se-1/0/0 per-unit-scheduler
set interfaces se-1/0/1 per-unit-scheduler
set class-of-service interfaces lsq-0/0/0 unit 0 scheduler-map s_map
set class-of-service interfaces se-1/0/0 unit 0 scheduler-map s_map
set class-of-service interfaces se-1/0/1 unit 0 scheduler-map s_map
set class-of-service scheduler-maps s_map forwarding-class DATA scheduler DATA
set class-of-service scheduler-maps s_map forwarding-class VOICE scheduler VOICE
set class-of-service scheduler-maps s_map forwarding-class NC scheduler NC
set class-of-service schedulers DATA transmit-rate percent 49
set class-of-service schedulers DATA buffer-size percent 49
set class-of-service schedulers VOICE transmit-rate percent 50
set class-of-service schedulers VOICE buffer-size percent 5
set class-of-service schedulers VOICE priority high
set class-of-service schedulers NC transmit-rate percent 1
set class-of-service schedulers NC buffer-size percent 1
set class-of-service schedulers NC priority high
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure scheduler maps:

1. Create interfaces and enable per-unit scheduling.

```
[edit interfaces]
user@host# set lsq-0/0/0 per-unit-scheduler
user@host# set se-1/0/0 per-unit-scheduler
user@host# set se-1/0/1 per-unit-scheduler
```

2. Define a scheduler map and apply it to the constituent links in the multilink bundle.

```
[edit class-of-service interfaces]
user@host# set lsq-0/0/0 unit 0 scheduler-map s_map
user@host# set se-1/0/0 unit 0 scheduler-map s_map
user@host# set se-1/0/1 unit 0 scheduler-map s_map
```

3. Associate a scheduler with each forwarding class.

```
[edit class-of-service scheduler-maps]
user@host# set s_map forwarding-class DATA scheduler DATA
user@host# set s_map forwarding-class VOICE scheduler VOICE
user@host# set s_map forwarding-class NC scheduler NC
```

4. Define the properties of output queues for the DATA scheduler.

```
[edit class-of-service schedulers]
user@host# set DATA transmit-rate percent 49
user@host# set DATA buffer-size percent 49
```

5. Define the properties of output queues for the VOICE scheduler.

```
[edit class-of-service schedulers]
user@host# set VOICE transmit-rate percent 50
user@host# set VOICE buffer-size percent 5
user@host# set VOICE priority high
```

6. Define the properties of output queues for the NC scheduler.

```
[edit class-of-service schedulers]
user@host# set NC transmit-rate percent 1
user@host# set NC buffer-size percent 1
user@host# set NC priority high
```

**Results** From configuration mode, confirm your configuration by entering the **show class-of-service** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show class-of-service
interfaces {
 lsq-0/0/0 {
 unit 0 {
 scheduler-map s_map;
 }
 }
 se-1/0/0 {
 unit 0 {
 scheduler-map s_map;
 }
 }
 se-1/0/1 {
 unit 0 {
 scheduler-map s_map;
 }
 }
}
```

```

 }
 }
 scheduler-maps {
 s_map {
 forwarding-class DATA scheduler DATA;
 forwarding-class VOICE scheduler VOICE;
 forwarding-class NC scheduler NC;
 }
 }
 schedulers {
 DATA {
 transmit-rate percent 49;
 buffer-size percent 49;
 }
 VOICE {
 transmit-rate percent 50;
 buffer-size percent 5;
 priority high;
 }
 NC {
 transmit-rate percent 1;
 buffer-size percent 1;
 priority high;
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying the Configuration of scheduler maps.

## Understanding Interface Shaping Rates

When you configure LFI, we recommend that you configure the shaping rate on each constituent link of the multilink bundle. Shaping rate configuration on the constituent links is required to limit the jitter on the LFI queue. If you anticipate no delay-sensitive or

jitter-sensitive traffic on the LFI queue, or if there is no LFI traffic at all, shaping rate configuration is optional.

The shaping rate specifies the amount of bandwidth to be allocated for the multilink bundle. You must configure the shaping rate to be equal to the combined physical interface bandwidth for the constituent links. The combined bandwidth capacity of the two constituent links is 2 Mbps. Hence, configure a shaping rate of 2 Mbps on each constituent link.

- [Example: Configuring Interface Shaping Rates on page 2804](#)
- [Understanding How to Define and Apply Scheduler Maps on page 2799](#)

---

## Example: Configuring Interface Shaping Rates

This example shows how to configure interface shaping rates to control the maximum rate of traffic transmitted on an interface.

- [Requirements on page 2804](#)
- [Overview on page 2804](#)
- [Configuration on page 2804](#)
- [Verification on page 2805](#)

### Requirements

Before you begin:

- Configure two Juniper Networks devices configured with at least two serial interfaces that communicate over serial links. For more information about serial interfaces. See [“Serial Interfaces Overview” on page 2883](#).
- To apply shaping rates to interfaces, you have to first enable per-unit scheduling. For more information on per-unit scheduling. See [“Example: Configuring Scheduler Maps” on page 2800](#).

### Overview

In this example, you set the shaping rate to 2000000 for the constituent links of the multilink bundle, se-1/0/0 and se-1/0/1.

### Configuration

**Step-by-Step  
Procedure**

To configure the interface shaping rates:

1. Configure class of service.  
  
[edit]  
user@host# **edit class-of-service**
2. Apply the shaping rates to the constituent links of the multilink bundle.

```
[edit class-of-service]
user@host# set interfaces se-1/0/0 unit 0 shaping-rate 2000000
user@host# set interfaces se-1/0/1 unit 0 shaping-rate 2000000
```

## Verification

To verify the configuration is working properly, enter the **show class-of-service** command.

## Understanding MLPPP Bundles and Link Fragmentation and Interleaving (LFI) on Serial Links

---

Juniper Networks devices support MLPPP and MLFR multilink encapsulations. MLPPP multilink encapsulation enables you to bundle multiple PPP links into a single multilink bundle and MLFR multilink encapsulation enables you to bundle multiple Frame Relay data-link connection identifiers (DLCIs) into a single multilink bundle. Multilink bundles provide additional bandwidth, load balancing, and redundancy by aggregating low-speed links, such as T1, E1, and serial links.

You configure multilink bundles as logical units or channels on the link services interface **lsq-0/0/0**:

- With MLPPP and MLFR FRF.15, multilink bundles are configured as logical units on **lsq-0/0/0**—for example, **lsq-0/0/0.0** and **lsq-0/0/0.1**.
- With MLFR FRF.16, multilink bundles are configured as channels on **lsq-0/0/0**—for example, **lsq-0/0/0:0** and **lsq-0/0/0:1**.

After creating multilink bundles, you add constituent links to the bundle. The constituent links are the low-speed physical links that are to be aggregated. You can create 64 multilink bundles, and on each multilink bundle you can add up to 8 constituent links. The following rules apply when you add constituent links to a multilink bundle:

- On each multilink bundle, add only interfaces of the same type. For example, you can add either T1 or E1, but not both.
- Only interfaces with a PPP encapsulation can be added to an MLPPP bundle, and only interfaces with a Frame Relay encapsulation can be added to an MLFR bundle.

- If an interface is a member of an existing bundle and you add it to a new bundle, the interface is automatically deleted from the existing bundle and added to the new bundle.

Configuring a multilink bundle on the two serial links increases the bandwidth by 70 percent from approximately 1 Mbps to 1.7 Mbps and prepends each packet with a multilink header as specified in the FRF.12 standard. To increase the bandwidth further, you can add up to eight serial links to the bundle. In addition to a higher bandwidth, configuring the multilink bundle provides load balancing and redundancy. If one of the serial links fails, traffic continues to be transmitted on the other links without any interruption. In contrast, independent links require routing policies for load balancing and redundancy. Independent links also require IP addresses for each link as opposed to one IP address for the bundle. In the routing table, the multilink bundle is represented as a single interface.

## Example: Configuring an MLPPP Bundle

This example shows how to configure an MLPPP bundle to increase traffic bandwidth.

- [Requirements on page 2808](#)
- [Overview on page 2808](#)
- [Configuration on page 2809](#)
- [Verification on page 2811](#)

### Requirements

Before you begin, you should have two Juniper Networks devices configured with at least two serial interfaces that communicate over serial links.

### Overview

In this example, you create the MLPPP bundle lsq-0/0/0.0 at the logical unit level of the link services interface lsq-0/0/0 on Juniper Networks devices R0 and R1. You then add the two serial interfaces se-1/0/0 and se-1/0/1 as constituent links to the multilink bundle. In [Figure 135](#), your company's branch office is connected to its main branch using devices R0 and R1. You transmit data and voice traffic on two low-speed 1-Mbps serial links. To increase bandwidth, you configure MLPPP and join the two serial links se-1/0/0 and se-1/0/1 into the multilink bundle lsq-0/0/0.0. Then you configure LFI and CoS on R0 and R1 to enable them to transmit voice packets ahead of data packets.

Figure 135: Configuring MLPPP and LFI on Serial Links

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
For device R0
set interfaces lsq-0/0/0 unit 0 family inet address 10.0.0.10/24
set interfaces se-1/0/0 unit 0 family mlppp bundle lsq-0/0/0.0
set interfaces se-1/0/1 unit 0 family mlppp bundle lsq-0/0/0.0
set interfaces se-1/0/0 serial-options clocking-mode dce clock-rate 2.0mhz
set interfaces se-1/0/1 serial-options clocking-mode dce clock-rate 2.0mhz

For device R1
set interfaces lsq-0/0/0 unit 0 family inet address 10.0.0.9/24
set interfaces se-1/0/0 unit 0 family mlppp bundle lsq-0/0/0.0
set interfaces se-1/0/1 unit 0 family mlppp bundle lsq-0/0/0.0
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure MLPPP bundle:

1. Create an interface on both devices.  

```
[edit]
user@host# edit interfaces lsq-0/0/0 unit 0
```
2. Configure a family inet and define the IP address on device R0.  

```
[edit interfaces lsq-0/0/0 unit 0]
user@host# set family inet address 10.0.0.10/24
```
3. Configure a family inet and define the IP address on device R1.  

```
[edit interfaces lsq-0/0/0 unit 0]
user@host# set family inet address 10.0.0.9/24
```
4. Specify the names of the constituent links to be added to the multilink bundle on both devices.  

```
[edit interfaces]
user@host# edit se-1/0/0 unit 0
user@host# set family mlppp bundle lsq-0/0/0.0
[edit interfaces]
user@host# edit se-1/0/1 unit 0
user@host# set family mlppp bundle lsq-0/0/0.0
```

5. Set the serial options to the same values for both interfaces on R0.

**NOTE:** R0 is set as a DCE device. The serial options are not set for interfaces on R1. You can set the serial options according to your network setup.

```
[edit interfaces]
user@host# set se-1/0/0 serial-options clocking-mode dce clock-rate 2.0mhz
user@host# set se-1/0/1 serial-options clocking-mode dce clock-rate 2.0mhz
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces lsq-0/0/0**, **show interfaces se-1/0/0**, and **show interfaces se-1/0/1** commands for R0 and R1. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
For device R0
[edit]
user@host# show interfaces lsq-0/0/0
family inet {
 address 10.0.0.10/24;
}
}
[edit]
user@host# show interfaces se-1/0/0
clocking-mode dce;
clock-rate 2.0mhz;
}
unit 0 {
 family mlppp {
 bundle lsq-0/0/0.0;
 }
}
[edit]
user@host# show interfaces se-1/0/1
serial-options {
 clocking-mode dce;
 clock-rate 2.0mhz;
}
unit 0 {
 family mlppp {
 bundle lsq-0/0/0.0;
 }
}
}

For device R1
[edit]
user@host# show interfaces lsq-0/0/0
family inet {
 address 10.0.0.9/24;
}
}
[edit]
```

```
user@host# show interfaces se-1/0/0
unit 0 {
 family mlppp {
 bundle lsq-0/0/0.0;
 }
}
[edit]
user@host# show interfaces se-1/0/1
unit 0 {
 family mlppp {
 bundle lsq-0/0/0.0;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying the MLPPP Bundle

---

**Purpose** Verify that the constituent links are added to the bundle correctly.

**Action** From operational mode, enter the **show interfaces lsq-0/0/0 statistics** command.

## Understanding Multilink Frame Relay FRF.15

---

The link services intelligent queuing interface **lsq-0/0/0** supports Multilink Frame Relay end-to-end (MLFR FRF.15).

With MLFR FRF.15, multilink bundles are configured as logical units on the link services intelligent queuing interface, such as **lsq-0/0/0.0**. MLFR FRF.15 bundles combine multiple permanent virtual circuits (PVCs) into one aggregated virtual circuit (AVC). This process provides fragmentation over multiple PVCs on one end and reassembly of the AVC on the other end. You can configure LFI and CoS with MLFR in the same way that you configure them with MLPPP.

## Example: Configuring Multilink Frame Relay FRF.15

---

This example shows how to configure MLFR FRF.15 for additional bandwidth, load balancing, and redundancy by aggregating low-speed links such as T1, E1, and serial links.

- [Requirements on page 2814](#)
- [Overview on page 2814](#)
- [Configuration on page 2814](#)
- [Verification on page 2816](#)

## Requirements

Before you begin, you should have two Juniper Networks devices configured with at least two serial interfaces that communicate over serial links.

## Overview

In this example, you aggregate two T1 links to create the MLFR FRF.15 bundle on two Juniper Networks devices, R0 and R1, and set the interface to lsq-0/0/0. You configure a logical unit on the lsq-0/0/0 interface and set the family type to inet with address 10.0.0.4/24. Then you configure an IP address for the multilink bundle on the unit level of the interface.

You define the multilink bundle as an MLFR FRF.15 bundle by specifying the MLFR end-to-end encapsulation type. You specify the names of the constituent links to be added to the multilink bundle as t1-2/0/0 and t1-2/0/1 and set the encapsulation type to frame relay. You then define R0 as a DCE device and R1 as a DTE device. You set the DLCI value to 100 (range is 16 through 1022). Finally, you set the multilink bundle to lsq-0/0/0.0.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
For device R0
set interfaces lsq-0/0/0 unit 0 family inet address 10.0.0.4/24
set interfaces lsq-0/0/0 unit 0 encapsulation multilink-frame-relay-end-to-end
set interfaces t1-2/0/0 encapsulation frame-relay
set interfaces t1-2/0/1 encapsulation frame-relay
set interfaces lsq-0/0/0 dce
set interfaces lsq-0/0/0 unit 0 dlci 100 family mlfr-end-to-end bundle lsq-0/0/0.0

For device R1
set interfaces lsq-0/0/0 unit 0 family inet address 10.0.0.5/24
set interfaces lsq-0/0/0 unit 0 encapsulation multilink-frame-relay-end-to-end
set interfaces t1-2/0/0 encapsulation frame-relay
set interfaces t1-2/0/1 encapsulation frame-relay
set interfaces lsq-0/0/0 unit 0 dlci 100 family mlfr-end-to-end bundle lsq-0/0/0.0
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the MLFR FRF.15 bundle:

1. Create an interface on both devices.  

```
[edit]
user@host# edit interfaces lsq-0/0/0 unit 0
```
2. Set a logical unit on the interface and define the family type for devices R0 and R1.

- ```
[edit interfaces lsq-0/0/0 unit 0]
user@host# set family inet address 10.0.0.4/24
user@host# set family inet address 10.0.0.5/24
```
3. Define the multilink bundle as an MLFR FRF.15 bundle.

```
[edit interfaces lsq-0/0/0 unit 0]
user@host# set encapsulation multilink-frame-relay-end-to-end
```
 4. Specify the names of the constituent links to be added to the multilink bundle.

```
[edit interfaces]
user@host# set t1-2/0/0 encapsulation frame-relay
user@host# set t1-2/0/1 encapsulation frame-relay
```
 5. Define device R0 as a DCE device.

```
[edit interfaces]
user@host# edit lsq-0/0/0
user@host# set dce
```
 6. Specify the DLCI as well as the multilink bundle to which the interface is to be added.

```
[edit interfaces lsq-0/0/0]
user@host# set unit 0 dlci 100 family mlfr-end-to-end bundle lsq-0/0/0.0
```

Results From configuration mode, confirm your configuration by entering the **show interfaces lsq-0/0/0**, **show interfaces t1-2/0/0**, and **show interfaces t1-2/0/1** commands for R0 and R1. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
For device R0
[edit]
user@host# show interfaces lsq-0/0/0
dce;
unit 0 {
  encapsulation multilink-frame-relay-end-to-end;
  dlci 100;
  family inet {
    address 10.0.0.4/24;
  }
  family mlfr-end-to-end {
    bundle lsq-0/0/0.0;
  }
}
[edit]
user@host# show interfaces t1-2/0/0
encapsulation frame-relay;
[edit]
user@host# show interfaces t1-2/0/1
encapsulation frame-relay;

For device R1
[edit]
user@host# show interfaces lsq-0/0/0
unit 0 {
  encapsulation multilink-frame-relay-end-to-end;
  dlci 100;
```

```
family inet {
address 10.0.0.5/24;
}
family mlfr-end-to-end {
bundle lsq-0/0/0.0;
}
}
[edit]
user@host# show interfaces t1-2/0/0
encapsulation frame-relay;
[edit]
user@host# show interfaces t1-2/0/1
encapsulation frame-relay;
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying the MLFR FRF.15 Configuration

Purpose	Verify the MLFR FRF.15 configuration.
Action	From operational mode, enter the show interfaces command.

Understanding Multilink Frame Relay FRF.16

The link services intelligent queuing interface **lsq-0/0/0** supports the Multilink Frame Relay (MLFR) user-to-network interface (UNI) and network-to-network interface (NNI) (MLFR FRF.16).

MLFR FRF.16 configures multilink bundles as channels on the link services intelligent queuing interface, such as **lsq-0/0/0:0**. A multilink bundle carries Frame Relay permanent virtual circuits (PVCs), identified by their data-link connection identifiers (DLCIs). Each DLCI is configured at the logical unit level of the link services intelligent queuing interface and is also referred as a logical interface. Packet fragmentation and reassembly occur on each virtual circuit. You can configure LFI and CoS with MLFR in the same way that you configure them with MLPPP.

Related Documentation	<ul style="list-style-type: none">• Understanding MLPPP Bundles and Link Fragmentation and Interleaving (LFI) on Serial Links on page 2807• Example: Configuring an MLPPP Bundle on page 2808• Link Services Interfaces Overview on page 2769• Example: Configuring Multilink Frame Relay FRF.16 on page 2817
------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Example: Configuring Multilink Frame Relay FRF.16

This example shows how to configure MLFR FRF.16 for additional bandwidth, load balancing, and redundancy.

- [Requirements on page 2817](#)
- [Overview on page 2817](#)
- [Configuration on page 2817](#)
- [Verification on page 2820](#)

Requirements

Before you begin, you should have two Juniper Networks devices configured with at least two serial interfaces that communicate over serial links.

Overview

In this example, you aggregate two T1 interfaces to create an MLFR FRF.16 bundle on two Juniper Networks devices, R0 and R1. You configure the chassis interface and specify the number of MLFR FRF.16 bundles to be created on the interface. You then specify the channel to be configured as a multilink bundle and create interface lsq-0/0/0:0. You set the multilink bundle as an MLFR FRF.16 bundle by specifying the MLFR UNI NNI encapsulation type.

Then you define R0 as a DCE device and R1 as a DTE device. You configure a logical unit on the multilink bundle lsq-0/0/0:0, and set the family type to inet. You then assign a DLCI of 400 and an IP address of 10.0.0.10/24 to the multilink bundle. You create the T1 interfaces, t1-2/0/0 and t1-2/0/1, that are to be added as constituent links to the multilink bundle and define the Frame Relay encapsulation type. Finally, you set the multilink bundle to lsq-0/0/0:0.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
For device R0
set chassis fpc 0 pic 0 mlfr-uni-nni-bundles 1
set interfaces lsq-0/0/0:0 encapsulation multilink-frame-relay-uni-nni
set interfaces lsq-0/0/0:0 dce
set interfaces lsq-0/0/0 unit 0 dlci 400 family inet address 10.0.0.10/24
set interfaces t1-2/0/0 encapsulation multilink-frame-relay-uni-nni
set interfaces t1-2/0/1 encapsulation multilink-frame-relay-uni-nni
set interfaces t1-2/0/0 unit 0 family mlfr-uni-nni bundle lsq-0/0/0:0
set interfaces t1-2/0/1 unit 0 family mlfr-uni-nni bundle lsq-0/0/0:0
For device R1
set chassis fpc 0 pic 0 mlfr-uni-nni-bundles 1
set interfaces lsq-0/0/0:0 encapsulation multilink-frame-relay-uni-nni
set interfaces lsq-0/0/0 unit 0 dlci 400 family inet address 10.0.0.9/24
```

```

set interfaces t1-2/0/0 encapsulation multilink-frame-relay-uni-nni
set interfaces t1-2/0/1 encapsulation multilink-frame-relay-uni-nni
set interfaces t1-2/0/0 unit 0 family mlfr-uni-nni bundle lsq-0/0/0:0
set interfaces t1-2/0/1 unit 0 family mlfr-uni-nni bundle lsq-0/0/0:0

```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure an MLFR FRF.16 bundle:

1. Configure a chassis interface.

```

[edit]
user@host# edit chassis

```
2. Specify the number of MLFR bundles.

```

[edit chassis]
user@host# set fpc 0 pic 0 mlfr-uni-nni-bundles 1

```
3. Create an interface.

```

[edit]
user@host# edit interfaces lsq-0/0/0:0

```
4. Specify the MLFR encapsulation type.

```

[edit interfaces lsq-0/0/0:0]
user@host# set encapsulation multilink-frame-relay-uni-nni

```
5. Set device R0 as a DCE device.

```

[edit interfaces lsq-0/0/0:0]
user@host# set dce

```
6. Specify a logical unit on the multilink bundle and set the family type.

```

[edit interfaces lsq-0/0/0]
user@host# set unit 0 dlci 400 family inet address 10.0.0.10/24

```
7. Create the T1 interfaces and set the Frame Relay encapsulation.

```

[edit interfaces]
user@host# set t1-2/0/0 encapsulation multilink-frame-relay-uni-nni
user@host# set t1-2/0/1 encapsulation multilink-frame-relay-uni-nni

```
8. Specify the multilink bundle to which the interface is to be added as a constituent link on device R0.

```

[edit interfaces t1-2/0/0]
user@host# set unit 0 family mlfr-uni-nni bundle lsq-0/0/0:0

```
9. Specify the multilink bundle to which the interface is to be added as a constituent link on device R1.

```

[edit interfaces t1-2/0/1]
user@host# set unit 0 family mlfr-uni-nni bundle lsq-0/0/0:0

```

Results From configuration mode, confirm your configuration by entering the **show** commands for devices R0 and R1. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For device R0

```
[edit chassis]
user@host#show
fpc 0 {
  pic 0 {
    mlfr-uni-nni-bundles 1;
  }
}

[edit interfaces lsq-0/0/0:0]
user@host#show
dce;
encapsulation multilink-frame-relay-uni-nni;

[edit interfaces lsq-0/0/0]
user@host#show
unit 0 {
  dlci 400;
  family inet {
    address 10.0.0.10/24;
  }
}

[edit interfaces t1-2/0/0]
user@host#show
encapsulation multilink-frame-relay-uni-nni;
unit 0 {
  family mlfr-uni-nni {
    bundle lsq-0/0/0:0;
  }
}

[edit interfaces t1-2/0/1]
user@host#show
encapsulation multilink-frame-relay-uni-nni;
unit 0 {
  family mlfr-uni-nni {
    bundle lsq-0/0/0:0;
  }
}
```

For device R1

```
[edit chassis]
user@host#show
fpc 0 {
  pic 0 {
    mlfr-uni-nni-bundles 1;
  }
}

[edit interfaces lsq-0/0/0:0]
user@host#show
```

```
encapsulation multilink-frame-relay-uni-nni;

[edit interfaces t1-2/0/0]
user@host#show
encapsulation multilink-frame-relay-uni-nni;
unit 0 {
    family mlfr-uni-nni {
        bundle lsq-0/0/0:0;
    }
}

[edit interfaces t1-2/0/1]
user@host#show
encapsulation multilink-frame-relay-uni-nni;
unit 0 {
    family mlfr-uni-nni {
        bundle lsq-0/0/0:0;
    }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying the MLFR FRF.16 Configuration

Purpose	Verify the MLFR FRF.16 configuration.
Action	From operational mode, enter the show interfaces command.

Configuring Compressed Real-Time Transport Protocol

- [Understanding Compressed Real-Time Transport Protocol on page 2821](#)
- [Example: Configuring the Compressed Real-Time Transport Protocol on page 2821](#)

Understanding Compressed Real-Time Transport Protocol

Compressed Real-Time Transport Protocol (CRTP) is typically used for compressing voice and video packets. You can configure CRTP with LFI on a link services interface.

CRTP can be configured as a compression device on a T1 or E1 interface with PPP encapsulation, using the link services interface.

NOTE:

- **F-max period**—Maximum number of compressed packets allowed between transmission of full headers. It has a range from 1 to 65,535.
- **Maximum and Minimum**—UDP port values from 1 to 65,536 reserve these ports for RTP compression. CRTP is applied to network traffic on ports within this range. This feature is applicable only to voice services interfaces.

Related Documentation

- [Link Services Interfaces Overview on page 2769](#)
- [Example: Configuring the Compressed Real-Time Transport Protocol on page 2821](#)

Example: Configuring the Compressed Real-Time Transport Protocol

This example shows how to configure CRTP to improve packet transmission, especially for time-sensitive voice packets.

- [Requirements on page 2822](#)
- [Overview on page 2822](#)
- [Configuration on page 2822](#)
- [Verification on page 2823](#)

Requirements

Before you begin, you should have two Juniper Networks devices configured with at least two serial interfaces that communicate over serial links.

Overview

In this example, you create a T1 interface called t1-1/0/0 and set the type of encapsulation to PPP. You set the link services intelligent queuing interface to lsq-0/0/0.0. You then create an interface called lsq-0/0/0 and set the logical unit 0. Finally, you set the F-max period to 2500, the minimum UDP port value to 2000, and the maximum UDP port value to 64009.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces t1-1/0/0 encapsulation ppp
set interfaces t1-1/0/0 unit 0 compression-device lsq-0/0/0.0
set interfaces lsq-0/0/0 unit 0 compression rtp f-max-period 2500 port minimum 2000
maximum 64009
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure CRTP on a device:

1. Create the T1 interface.

```
[edit]
user@host# edit interfaces t1-1/0/0
```
2. Set the type of encapsulation.

```
[edit interfaces t1-1/0/0]
user@host# set encapsulation ppp
```
3. Add the link services intelligent queuing interface to the physical interface.

```
[edit interfaces t1-1/0/0]
user@host# edit unit 0
user@host# set compression-device lsq-0/0/0.0
```
4. Create an interface and set the logical unit.

```
[edit interfaces]
user@host# edit lsq-0/0/0 unit 0
```
5. Configure the link services intelligent queuing interface.

```
[edit interfaces lsq-0/0/0 unit 0]
user@host# set compression rtp f-max-period 2500 port minimum 2000 maximum
64009
```

Results From configuration mode, confirm your configuration by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces
lsq-0/0/0 {
  unit 0 {
    compression {
      rtp {
        f-max-period 2500;
        port minimum 2000 maximum 64009;
      }
    }
  }
}
tl-1/0/0 {
  encapsulation ppp;
  unit 0 {
    compression-device lsq-0/0/0.0;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying the CRTP Configuration

Purpose Verify the CRTP configuration.

Action From operational mode, enter the **show interfaces** command.

Understanding the Internal Interface LSQ-0/0/0 Configuration

The link services interface is an internal interface only. It is not associated with a physical medium or PIM. Within an SRX Series device, packets are routed to this interface for link bundling or compression.

It may be required that you upgrade your configuration to use the internal interface lsq-0/0/0 as the link services queuing interface instead of ls-0/0/0, which has been deprecated. You can also roll back your modified configuration to use ls-0/0/0.

Example: Upgrading from ls-0/0/0 to lsq-0/0/0 for Multilink Services

This example shows how to upgrade from ls-0/0/0 to lsq-0/0/0 (or to reverse the change) for multilink services.

- [Requirements on page 2825](#)
- [Overview on page 2826](#)
- [Configuration on page 2826](#)
- [Verification on page 2828](#)

Requirements

This procedure is only necessary if you are still using ls-0/0/0 instead of lsq-0/0/0 or if you need to revert to the old interface.

Overview

In this example, you rename the link services internal interface from ls-0/0/0 to lsq-0/0/0 or vice versa. You rename all occurrences of ls-0/0/0 in the configuration to lsq-0/0/0 and configure the fragmentation map by adding no fragmentation. You specify no fragmentation after the name of queue 2, if queue 2 is configured, or after assured forwarding. You then attach the fragmentation map configured in the preceding step to lsq-0/0/0 and specify the unit number as 6 of the multilink bundle for which interleave fragments is configured.

Then you roll back the configuration from lsq-0/0/0 to ls-0/0/0. You rename all occurrences in the configuration from lsq-0/0/0 to ls-0/0/0. You delete the fragmentation map if it is configured under the [class-of-service] hierarchy and delete the fragmentation map if it is assigned to lsq-0/0/0. You can delete multilink-max-classes if it is configured for lsq-0/0/0 under the [interfaces] hierarchy. You then delete link-layer-overhead if it is configured for lsq-0/0/0 under the [interfaces] hierarchy.

If no fragmentation is configured on any forwarding class and the fragmentation map is assigned to lsq-0/0/0, then you configure interleave fragments for the ls-0/0/0 interface. Finally, you configure the classifier for LFI packets to refer to queue 2. (The ls-0/0/0 interface treats queue 2 as the LFI queue.)

Configuration

CLI Quick Configuration

To quickly upgrade from ls-0/0/0 to lsq-0/0/0 (or reverse the change), copy the following commands and paste them into the CLI:

```
For interfaces ls-0/0/0 to lsq-0/0/0
[edit]
rename interfaces ls-0/0/0 to lsq-0/0/0
set class-of-service fragmentation-maps map6 forwarding-class assured-forwarding
  no-fragmentation
set class-of-service interfaces lsq-0/0/0 unit 6 fragmentation-map map6

For interfaces lsq-0/0/0 to ls-0/0/0
[edit]
rename interfaces lsq-0/0/0 to ls-0/0/0
delete class-of-service fragmentation-maps map6
delete class-of-service interfaces lsq-0/0/0 unit 6 fragmentation-map map6
delete interfaces lsq-0/0/0 unit 6 link-layer-overhead
delete interfaces lsq-0/0/0:0 mlfr-uni-nni-bundle-options link-layer-overhead
set interfaces ls-0/0/0 unit 6 interleave-fragments
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To upgrade from ls-0/0/0 to lsq-0/0/0 or to reverse that change:

1. Rename all the occurrences of ls-0/0/0 in the configuration.

```
[edit]
user@host# rename interfaces ls-0/0/0 to lsq-0/0/0
```

2. Configure the fragmentation map.

```
[edit class-of-service fragmentation-maps]
user@host# set map6 forwarding-class assured-forwarding no-fragmentation
```
3. Specify the unit number of the multilink bundle.

```
[edit class-of-service ]
user@host# set interfaces lsq-0/0/0 unit 6 fragmentation-map map6
```
4. Roll back the configuration for all occurrences in the configuration.

```
[edit]
user@host# rename interfaces lsq-0/0/0 to ls-0/0/0
```
5. Delete fragmentation map under class of service.

```
[edit]
user@host# delete class-of-service fragmentation-maps map6
```
6. Delete fragmentation map if it is assigned to the lsq-0/0/0 interface.

```
[edit class-of-service interfaces]
user@host# delete lsq-0/0/0 unit 6 fragmentation-map map6
```
7. Delete multilink max classes if it is configured for lsq-0/0/0.

NOTE: Multilink-max-classes is not supported and is most likely not configured.

8. Delete link-layer-overhead if it is configured for lsq-0/0/0.

```
[edit interfaces]
user@host# delete lsq-0/0/0 unit 6 link-layer-overhead
```
9. Delete link-layer-overhead if it is configured for lsq-0/0/0:0.

```
[edit interfaces]
user@host# delete lsq-0/0/0:0 mlfrr-uni-nni-bundle-options link-layer-overhead
```
10. Configure interleave fragments for the ls-0/0/0 interface.

```
[edit interfaces]
user@host# set ls-0/0/0 unit 6 interleave-fragments
```

Results From configuration mode, confirm your configuration by entering the **show class-of-service** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show class-of-service
interfaces {
  lsq-0/0/0 {
    unit 6 {
      fragmentation-map map6;
    }
  }
}
```

```
fragmentation-maps {  
  map6 {  
    forwarding-class {  
      assured-forwarding {  
        no-fragmentation;  
      }  
    }  
  }  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying Link Services Internal Interface ls-0/0/0 to lsq-0/0/0

Purpose Verify the link services internal interface ls-0/0/0 changed to lsq-0/0/0.

Action From operational mode, enter the **show class-of-service** command.

- [Configuring a Loopback Interface on page 2831](#)

Understanding Management Interfaces

Management interfaces are the primary interfaces for accessing the device remotely. Typically, a management interface is not connected to the in-band network, but is connected instead to the device's internal network. Through a management interface you can access the device over the network using utilities such as **ssh** and **telnet** and configure it from anywhere, regardless of its physical location. SNMP can use the management interface to gather statistics from the device.

Management interfaces vary based on device type:

- The SRX5600 and SRX5800 devices include a 10/100-Mbps Ethernet port on the Routing Engine (RE). This port, which is labeled ETHERNET, is a dedicated out-of-band management interface for the device. Junos OS automatically creates the device's management interface **fxp0**. To use **fxp0** as a management port, you must configure its logical port **fxp0.0** with a valid IP address. While you can use **fxp0** to connect to a management network, you cannot place it into the management zone.

NOTE: On the SRX5600 and SRX5800 devices, you must first connect to the device through the serial console port before assigning a unique IP address to the management interface.

As a security feature, users cannot log in as **root** through a management interface. To access the device as **root**, you must use the console port.

In an SRX Series device, the **fxp0** management interface is a dedicated port located on the Routing Engine. In an SRX Series chassis cluster configuration, the control link interface must be port **0** on an SPC. For each node in the chassis cluster, you must configure the SPC that is used for the control link interface.

- [Understanding Interfaces on page 2407](#)
 - [Understanding the Discard Interface on page 2830](#)
 - [Understanding the Loopback Interface on page 2830](#)

Understanding the Discard Interface

The discard (**dsc**) interface is not a physical interface, but a virtual interface that discards packets. You can configure one discard interface. This interface allows you to identify the ingress (inbound) point of a denial-of-service (DoS) attack. When your network is under attack, the target host IP address is identified, and the local policy forwards attacking packets to the discard interface. Traffic routed out the discard interface is silently discarded.

- Related Documentation**
- [Understanding Interfaces on page 2407](#)
 - [Understanding Management Interfaces on page 2829](#)
 - [Understanding the Loopback Interface on page 2830](#)

Understanding the Loopback Interface

The loopback address (**lo0**) has several uses, depending on the particular Junos feature being configured. It can perform the following functions:

- **Device identification**—The loopback interface is used to identify the device. While any interface address can be used to determine if the device is online, the loopback address is the preferred method. Whereas interfaces might be removed or addresses changed based on network topology changes, the loopback address never changes.

When you ping an individual interface address, the results do not always indicate the health of the device. For example, a subnet mismatch in the configuration of two endpoints on a point-to-point link makes the link appear to be inoperable. Pinging the interface to determine whether the device is online provides a misleading result. An interface might be unavailable because of a problem unrelated to the device's configuration or operation.

- **Routing information**—The loopback address is used by protocols such as OSPF to determine protocol-specific properties for the device or network. Further, some commands such as **ping mpls** require a loopback address to function correctly.
- **Packet filtering**—Stateless firewall filters can be applied to the loopback address to filter packets originating from, or destined for, the Routing Engine.

The Internet Protocol (IP) specifies a loopback network with the (IPv4) address **127.0.0.0/8**. Most IP implementations support a loopback interface (**lo0**) to represent the loopback facility. Any traffic that a computer program sends on the loopback network is addressed to the same computer. The most commonly used IP address on the loopback network is **127.0.0.1** for IPv4 and **::1** for IPv6. The standard domain name for the address is **localhost**.

The device also includes an internal loopback address (**lo0.16384**). The internal loopback address is a particular instance of the loopback address with the logical unit number 16384. Junos OS creates the loopback interface for the internal routing instance. This interface prevents any filter on **lo0.0** from disrupting internal traffic.

Configuring a Loopback Interface

The loopback interface supports many different network and operational functions and is an *always-up* interface. This means that the loopback interface ensures that the device is reachable, even if some of the physical interfaces are down or removed, or an IP address has changed. In most cases, you always define a loopback interface.

Junos OS follows the IP convention of using lo0 as the loopback interface's identifier name.

Junos OS requires that the loopback interface always be configured with a /32 network mask, thus avoiding any unnecessary allocation of address space.

If you are using routing instances, you can configure the loopback interface for the default routing instance or for a specific routing instance. The following procedure adds the loopback interface to the default routing instance.

Optionally, instead of configuring the root password at the **[edit interfaces]** hierarchy level, you can use a configuration group, as shown in this procedure. This is a recommended best practice for configuring the loopback interface. This procedure uses a group called **global** as an example.

To configure a loopback interface:

1. Using the proper IP address that has been allocated to this particular host, assign it to the loopback interface.

Each host in your network deployment should have a unique loopback interface address. The address used here is only an example.

```
[edit groups global interfaces lo0 unit 0 family inet]
user@host# set address 192.26.0.110/32
```

2. (Optional) Set the address to be preferred.

You can configure as many addresses as you need on the lo0 interface, so it is good practice to make one address preferred.

```
[edit groups global interfaces lo0 unit 0 family inet]
user@host# set address 192.26.0.110/32 preferred
```

3. (Optional) Configure additional addresses.

Only unit 0 is permitted as the master loopback interface. If you want to add more IP addresses to unit 0, you configure them in the normal way under unit 0, without the **preferred** option.

```
[edit groups global interfaces lo0 unit 0 family inet]
user@host# set address 192.168.1.1/32
user@host# set address 192.168.2.1/32
```

4. Configure the localhost address.

On the lo0.0 interface, it is useful to have the IP address 127.0.0.1 configured, as certain processes such as NTP and MPLS ping use this default host address. The 127.0.0.1/32 address is a Martian IP address (an address invalid for routing), so it is never advertised by the Juniper Networks device.

```
[edit groups global interfaces lo0 unit 0 family inet]
user@host# set address 127.0.0.1/32
```

5. (Optional) Configure an ISO address.

Depending on your network configuration, you might also need an ISO address for the IS-IS routing protocol.

```
[edit groups global interfaces lo0 unit 0 family iso]
user@host# address 49.0026.0000.0000.0110.00
```

6. If you used a configuration group, apply the configuration group, substituting **global** with the appropriate group name.

```
[edit]
user@host# set apply-groups global
```

7. Commit the configuration.

```
user@host# commit
```

3G Wireless Modem Overview

3G refers to the third generation of mobile phone standards and technology based on the International Telecommunication Union (ITU) International Mobile Telecommunications-2000 (IMT-2000) global standard. 3G networks are wide area cellular telephone networks that have evolved to include high-data rate services of up to 3 Mbps. This increased bandwidth makes 3G networks a viable option as primary or backup wide area network (WAN) links for a branch office.

Juniper Networks security devices supports 3G wireless interfaces (USB-based 3G modems). When used in a branch office, these devices can provide dial-out services to PC users and forward IP traffic through a service provider's cellular network.

[Figure 136](#) illustrates a basic setup for 3G wireless connectivity for two branch offices. Branch Office A has a T1 leased line as the primary wide area network (WAN) link and a 3G wireless modem connection as the failover link. Branch Office B uses the 3G wireless modem connection as the primary WAN link.

Figure 136: Wireless WAN Connections for Branch Offices

3G Wireless Modem Configuration Overview

Before you begin:

1. Install your SRX Series device and establish basic connectivity for your device. For more information, see the SRX Series Hardware Guide for your device.
2. Obtain a supported 3G wireless modem card for the device.
3. Establish an account with a cellular network service provider. Contact your service provider for more information.
4. With the services gateway powered off, insert the 3G wireless modem card into the ExpressCard slot (SRX210 devices) or 3G USB modems (SRX110 devices). Power on the device. The EXPCARD LED (for SRX210) and 3G LED (SRX110) on the front panel of the device indicates the status of the 3G wireless modem interface.

WARNING: The device must be powered off before you insert the 3G wireless modem card in the ExpressCard slot (SRX210) or integrated 3G USB modem (SRX110). Do not insert or remove the card when the device is powered on.

To configure and activate the 3G wireless modem card:

1. Configure a dialer interface. See [“Example: Configuring the Dialer Interface” on page 2840](#).
2. Configure the 3G wireless modem interface. See [“Example: Configuring the 3G Wireless Modem Interface” on page 2845](#).
3. Configure security zones and policies, as needed, to allow traffic through the WAN link. See [“Example: Creating Security Zones” on page 1031](#).

To use the 3G USB modems on the SRX210 device:

1. Upgrade the BIOS software packaged inside the Junos OS image. For detailed information about BIOS upgrade procedures, see the *Installation and Upgrade Guide for Security Devices*.

NOTE: You need the BIOS version of 2.1 or higher to use the 3G USB modems on the SRX210 device.

2. Configure the WAN port using the CLI command **set chassis routing-engine usb-wwan port 1** to enable the USB port to use the U319 USB modem.
3. Plug the 3G USB modem in to the appropriate USB slot (USB port 1) on the device.

NOTE: You can use the USB modem with a standard USB extension cable of 1.8288 meters (6 ft) or longer.

4. Reboot the device to start using the 3G USB modem.

Understanding the Dialer Interface

The *dialer interface*, **dln**, is a logical interface for configuring properties for modem connections. You can configure multiple dialer interfaces on an SRX Series device. A dialer interface and a dialer pool (which includes the physical interface) are bound together in a dialer profile.

This topic contains the following sections:

- [Dialer Interface Configuration Rules on page 2838](#)
- [Dialer Interface Authentication Support for GSM HSDPA 3G Wireless Modems on page 2838](#)
- [Dialer Interface Functions on page 2839](#)
- [Dialer Interface Operating Parameters on page 2839](#)

Dialer Interface Configuration Rules

The following rules apply when you configure dialer interfaces for 3G wireless modem connections:

- The dialer interface must be configured to use the default Point-to-Point Protocol (PPP) encapsulation. You cannot configure Cisco High-Level Data Link Control (HDLC) or Multilink PPP (MLPPP) encapsulation on dialer interfaces.
- You cannot configure the dialer interface as a constituent link in a multilink bundle.
- You cannot configure any dial-in options for the dialer interface.

You configure the following for a dialer interface:

- A dialer pool to which the physical interface belongs.
- Source IP address for the dialer interface.
- Dial string (optional) is the destination number to be dialed.
- Authentication, for GSM HSDPA 3G wireless modem cards.
- Watch list, if the dialer interface is a backup WAN link.

With GSM HSDPA 3G wireless modem cards, you might need to configure PAP or CHAP for authentication with the service provider network. The service provider must supply the username and password, which you configure in an access profile. You then specify the access profile in a dialer interface.

Next you set the dialer interface as a backup WAN link to a primary interface. Then you create a dialer watch to enable the device to monitor the route to a head office router and set a dialer pool. Finally, you create a dialer filter firewall rule for traffic from the branch office to the main office router and associate the dialer filter with a dialer interface.

Dialer Interface Authentication Support for GSM HSDPA 3G Wireless Modems

For GSM HSDPA 3G wireless modems, you configure a dialer interface to support authentication through Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP).

CHAP is a server-driven, three-step authentication method that depends on a shared secret password that resides on both the server and the client. When you enable CHAP on a dialer interface, the device can authenticate its peer and be authenticated by its peer.

PAP allows a simple method for a peer to establish its identity using a two-way handshake during initial link establishment. After the link is established, an identification and password pair is repeatedly sent by the peer to the authenticator until authentication is acknowledged or the connection is terminated.

Dialer Interface Functions

The dialer interface can perform backup, dialer filter, and dialer watch functions, but these operations are mutually exclusive. You can configure a single dialer interface to operate in only one of the following ways:

- As a backup interface for a single primary WAN connection. The dialer interfaces are activated only when the primary interface fails. The 3G wireless modem backup connectivity is supported on all interfaces except **lsq-0/0/0**.
- As a dialer filter. The Dialer filter enables the 3G wireless modem connection to be activated only when specific network traffic is sent on the backup WAN link. You configure a firewall rule with the dialer filter option, and then apply the dialer filter to the dialer interface.
- As a dialer watch interface. With dialer watch, the SRX Series device monitors the status of a specified route and if the route disappears, the dialer interface initiates the 3G wireless modem connection as a backup connection. To configure dialer watch, you first add the routes to be monitored to a watch list in a dialer interface; specify a dialer pool for this configuration. Then configure the 3G wireless modem interface to use the dialer pool.

Dialer Interface Operating Parameters

You can also specify optional operating parameters for the dialer interface:

- Activation delay—Number of seconds after the primary interface is down before the backup interface is activated. The default value is 0 seconds, and the maximum value is 60 seconds. Use this option only if dialer watch is configured.
- Deactivation delay—Number of seconds after the primary interface is up before the backup interface is deactivated. The default value is 0 seconds, and the maximum value is 60 seconds. Use this option only if dialer watch is configured.
- Idle timeout—Number of seconds the connection remains idle before disconnecting. The default value is 120 seconds, and the range is from 0 to 4,294,967,295 seconds.
- Initial route check—Number of seconds before the primary interface is checked to see if it is up. The default value is 120 seconds, and the range is from 1 to 300 seconds.

Example: Configuring the Dialer Interface

This example shows how to configure the dialer interface for 3G wireless modem connections.

- [Requirements on page 2840](#)
- [Overview on page 2840](#)
- [Configuration on page 2840](#)
- [Verification on page 2844](#)

Requirements

Before you begin, install your SRX Series device and establish basic connectivity for your device. See [“3G Wireless Modem Configuration Overview” on page 2836](#).

Overview

In this example, you first configure the dialer interface as dl0, specify the PPP encapsulation dialer pool as 1, specify the dial string as 14691, and negotiate the address option for the interface IP address.

Configuration

- [Configuring a Dialer Interface on page 2840](#)
- [Configuring PAP on the Dialer Interface on page 2841](#)
- [Configuring CHAP on the Dialer Interface on page 2842](#)
- [Configuring the Dialer Interface as a Backup WAN Connection on page 2842](#)

Configuring a Dialer Interface

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces dl0 description 3g-wireless encapsulation ppp unit 0 dialer-options pool 1
dial-string 14691
set interfaces dl0 unit 0 family inet negotiate-address
```

Step-by-Step Procedure

1. Set the interface and specify the PPP encapsulation, dialer pool, and dial string.
[edit]
user@host# **set interfaces dl0 description 3g-wireless encapsulation ppp unit 0 dialer-options pool 1 dial-string 14691**
2. Set the negotiate address option for the interface IP address.
[edit]
user@host# **set interfaces dl0 unit 0 family inet negotiate-address**

Results From configuration mode, confirm your configuration by entering the **show interfaces dl0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces dl0
description 3g-wireless;
encapsulation ppp;
unit 0 {
family inet {
negotiate-address;
}
dialer-options {
pool 1;
dial-string 14691;
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring PAP on the Dialer Interface

CLI Quick Configuration To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set access profile pap-1 client clientX pap-password 7a^6b%5c
set interfaces dl0 unit 0 ppp-options pap access-profile pap-1
```

Step-by-Step Procedure

1. Configure a PAP access profile.

```
[edit]
user@host# set access profile pap-1 client clientX pap-password 7a^6b%5c
```

2. Associate the PAP access profile with a dialer interface.

```
[edit]
user@host# set interfaces dl0 unit 0 ppp-options pap access-profile pap-1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces dl0** and **show access profile pap-1** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces dl0
unit 0 {
ppp-options {
pap {
access-profile pap-1;
}
}
}
[edit]
user@host# show access profile pap-1
```

```
client clientX pap-password "$9$jnqTz3nCBESu01hSrKvZUDkqf"; ## SECRET-DATA
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring CHAP on the Dialer Interface

CLI Quick Configuration

With GSM HSDPA 3G wireless modem cards, you may need to configure CHAP for authentication with the service provider network. The service provider must supply the username and password, which you configure in an access profile. You then specify this access profile in a dialer interface.

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set access profile chap-1 client clientX chap-secret 7a^6b%5c
set interfaces dl0 unit 0 ppp-options chap access-profile chap-1
```

Step-by-Step Procedure

1. Configure a CHAP access profile.

```
[edit]
user@host# set access profile chap-1 client clientX chap-secret 7a^6b%5c
```
2. Associate the CHAP access profile with a dialer interface.

```
[edit]
user@host# set interfaces dl0 unit 0 ppp-options chap access-profile chap-1
```

Results

From configuration mode, confirm your configuration by entering the **show access profile chap-1** and **show interfaces dl0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show access profile chap-1
client clientX chap-secret "$9$neYpCO1REyWx-Kv87-VsYQF39Cu"; ## SECRET-DATA
[edit]
user@host# show interfaces dl0
unit 0 {
  ppp-options {
    chap {
      access-profile chap-1;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring the Dialer Interface as a Backup WAN Connection

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/1 unit 0 backup-options interface dl0
```

Step-by-Step Procedure

1. Set interface back up option.

```
[edit]
user@host# set interfaces ge-0/0/1 unit 0 backup-options interface dl0
```

Results

From configuration mode, confirm your configuration by entering the **show interfaces ge-0/0/1** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces ge-0/0/1
unit 0 {
  backup-options {
    interface dl0.0;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Dialer Watch for the 3G Wireless Modem Interface

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces dl0 description dialer-watch unit 0 dialer-options watch-list
200.200.201.1/32
set interfaces dl0 description dialer-watch unit 0 dialer-options pool dw-pool
```

Step-by-Step Procedure

1. Create a dialer watch.

```
[edit]
user@host# set interfaces dl0 description dialer-watch unit 0 dialer-options
watch-list 200.200.201.1/32
```

2. Set a dialer pool.

```
[edit]
user@host# set interfaces dl0 description dialer-watch unit 0 dialer-options pool
dw-pool
```

Results

From configuration mode, confirm your configuration by entering the **show interfaces dl0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces dl0
description dialer-watch;
unit 0 {
  dialer-options {
    watch-list {
      200.200.201.1/32;
    }
  }
}
```

```

    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring a Dialer Filter for the 3G Wireless Modem Interface

CLI Quick Configuration To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set firewall family inet dialer-filter traffic-filter term term1 then note
```

Step-by-Step Procedure

1. Associate the dialer filter with a dialer interface.

```
[edit]
user@host# set firewall family inet dialer-filter traffic-filter term term1 then note
```
2. Check your other changes to the configuration before committing.

```
[edit]
user@host# commit check
```

Results From configuration mode, confirm your configuration by entering the **show firewall** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@host# show firewall
family inet {
  dialer-filter traffic-filter {
    term term-1 {
      then note;
    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying the Configuration

Purpose Verify the configuration output.

Action Verify the configuration output by entering the **show interfaces** command.

Understanding the 3G Wireless Modem Physical Interface

You configure two types of interfaces for 3G wireless modem connectivity—the physical interface and a logical dialer interface.

The physical interface for the 3G wireless modem uses the name **cl-0/0/8**. This interface is automatically created when a 3G wireless modem is installed in the device.

You configure the following properties for the physical interface:

- A dialer pool to which the physical interface belongs and the priority of the interface in the pool. A physical interface can belong to more than one dialer pool. The dialer pool priority has a range from 1 to **255**, with 1 designating the lowest-priority interfaces and **255** designating the highest-priority interfaces.
- Modem initialization string (optional). These strings begin with **AT** and execute Hayes modem commands that specify modem operation.
- GSM profile for establishing a data call with a GSM cellular network.

By default, the modem allows access to networks other than the home network.

Example: Configuring the 3G Wireless Modem Interface

This example shows how to configure the 3G wireless modem interface.

- [Requirements on page 2845](#)
- [Overview on page 2845](#)
- [Configuration on page 2846](#)
- [Verification on page 2846](#)

Requirements

Before you begin, configure a dialer interface. See “[Example: Configuring the Dialer Interface](#)” on page 2840.

Overview

In this example, you configure the physical interface as **cl-0/0/8** for the 3G wireless modem to use dialer pool 1 and set the priority for the dialer pool to 25. You also configure a modem initialization string to autoanswer after two rings.

Configuration

Step-by-Step Procedure

To configure the 3G wireless modem interface:

1. Specify the dialer pool.

```
[edit]  
user@host# set interfaces cl-0/0/8 dialer-options pool 1 priority 25
```
2. Specify the modem options.

```
[edit]  
user@host# set interfaces cl-0/0/8 modem-options init-command-string  
"ATSO=2\n"
```
3. If you are done configuring the device, commit the configuration.

```
[edit]  
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show interfaces cl-0/0/8 modem options** command.

Understanding the GSM Profile

To allow data calls to a Global System for Mobile Communications (GSM) network, you must obtain the following information from your service provider:

- Username and password
- Access point name (APN)
- Whether the authentication is Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP)

You configure this information in a GSM profile associated with the 3G wireless modem physical interface. You can configure up to 16 different GSM profiles, although only one profile can be active at a time.

NOTE: You also need to configure a CHAP or PAP profile with the specified username and password for the dialer interface.

Subscriber information is written to the Subscriber Identity Module (SIM) on the GSM HSDPA 3G wireless modem card. If the SIM is locked, you must unlock it before activation

by using the master subsidy lock (MSL) value given by the service provider when you purchase the cellular network service.

Some service providers may preload subscriber profile information on a SIM card. The assigned subscriber information is stored in profile 1, while profile 0 is a default profile created during manufacturing. If this is the case, specify profile 1 for the GSM profile associated with the 3G wireless modem physical interface.

Related Documentation

- [3G Wireless Modem Configuration Overview on page 2836](#)
- [Example: Configuring the GSM Profile on page 2847](#)

Example: Configuring the GSM Profile

This example shows how to configure the GSM profile for the 3G wireless modem interface with service provider networks such as AT&T and T-Mobile.

- [Requirements on page 2847](#)
- [Overview on page 2847](#)
- [Configuration on page 2848](#)
- [Verification on page 2848](#)

Requirements

Before you begin:

- Configure a dialer interface. See [“Example: Configuring the Dialer Interface” on page 2840](#)
- Configure the 3G wireless modem interface. See [“Example: Configuring the 3G Wireless Modem Interface” on page 2845](#).

Overview

In this example, you configure the following information provided by a service provider in a GSM profile called `juniper99` that is associated with the 3G wireless modem physical interface `cl-0/0/8`:

- Username—**juniper99**
- Password—**1@#6ahgfh**
- Access point name (APN)—**apn.service.com**
- Authentication method—**CHAP**

Then you activate the profile by specifying the profile ID as `profile-id 1`.

Configuration

Step-by-Step Procedure

To configure a GSM profile for the 3G wireless modem interface:

1. Create a GSM profile.

[edit]

```
user@host> request modem wireless gsm create-profile profile-id 1 sip-user-id  
juniper99 sip-password 16ahgfh access-point-name apn.service.com  
authentication-method chap
```

2. Activate the profile.

[edit]

```
user@host# set interface cl-0/0/8 cellular-options gsm-options select-profile  
profile-id 1
```

3. If you are done configuring the device, commit the configuration.

[edit]

```
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show interfaces cl-0/0/8** command.

Configuring CDMA EV-DO Modem Cards

- [Understanding Account Activation for CDMA EV-DO Modem Cards on page 2849](#)
- [Activating the CDMA EV-DO Modem Card with IOTA Provisioning on page 2851](#)
- [Activating the CDMA EV-DO Modem Card with OTASP Provisioning on page 2851](#)
- [Activating the CDMA EV-DO Modem Card Manually on page 2852](#)
- [Unlocking the GSM 3G Wireless Modem on page 2854](#)

Understanding Account Activation for CDMA EV-DO Modem Cards

Account activation is the process of enabling the CDMA EV-DO wireless modem card to connect to your service provider's cellular network. This is a one-time process where your subscriber information is saved in nonvolatile memory on the card. The procedure you use to perform account activation depends upon the service provider network.

Before activating an account, you can verify the signal strength on the 3G wireless modem interface by using the **show modem wireless interface cl-0/0/8 rssi** command. The signal strength should be at least -90 dB and preferably better than -80 dB (-125 dB indicates nil signal strength). If the signal strength is below -90 dB, activation may not be possible from that location. For example:

```
user@host> show modem wireless interface cl-0/0/8 rssi
Current Radio Signal Strength (RSSI) = -98 dBm
```

This topic contains the following sections:

- [Obtaining Electronic Serial Number \(ESN\) on page 2849](#)
- [Account Activation Modes on page 2850](#)

Obtaining Electronic Serial Number (ESN)

The service provider requires the electronic serial number (ESN) of the 3G wireless modem card to activate your account and to generate the necessary information you need to activate the card. You can obtain the ESN number of the modem card in the following ways:

- Inspect the modem card itself; the ESN is printed on the card.
- Use the CLI **show modem wireless interface cl-0/0/8 firmware** command, as shown in the following example, and note the value for the Electronic Serial Number (ESN) field:

```
user@host> show modem wireless interface cl-0/0/8 firmware
Modem Firmware Version : p2005600
Modem Firmware built date : 12-09-07
Card type : Aircard 597E - CDMA EV-DO revA
Manufacturer : Sierra Wireless, Inc.
Hardware Version : 1.0
Electronic Serial Number (ESN) : 0x6032688F
Preferred Roaming List (PRL) Version : 20224
Supported Mode : 1xev-do rev-a, 1x
Current Modem Temperature : 32 degrees Celsius
Modem Activated : YES
Activation Date: 2-06-08
Modem PIN Security : Unlocked
Power-up lock : Disabled
```

Account Activation Modes

For the CDMA EV-DO 3G wireless modem card, account activation can be done through one or more of the following modes:

- Over the air service provisioning (OTASP)—protocol for programming phones over the air using Interim Standard 95 (IS-95) Data Burst Messages.

To activate the 3G wireless modem card with OTASP, you need to obtain from the service provider the dial number that the modem will use to contact the network. Typically, OTASP dial numbers begin with the feature code *228 to indicate an activation call type to the cellular network's base transceiver station, followed by additional digits specified by the service provider.

- Internet-based over the air (IOTA) provisioning—method for programming phones for voice and data services
- Manually providing the required information by entering in a CLI operational mode command

Sprint uses manual and IOTA activation, whereas Verizon uses only OTASP.

NOTE: The 3G wireless modem is set into Single-Carrier Radio Transmission Technology (1xRTT) mode automatically when it is activated for Verizon networks.

Related Documentation

- [Example: Configuring the GSM Profile on page 2847](#)

Activating the CDMA EV-DO Modem Card with IOTA Provisioning

Manual activation stores the supplied values in the 3G wireless modem card's nonvolatile memory. If the modem card is reset or you need to update Mobile IP (MIP) parameters, use the CLI operational mode command to activate the modem card with IOTA.

Before you begin, activate the CDMA EV-DO 3G wireless modem card. See [“Understanding Account Activation for CDMA EV-DO Modem Cards” on page 2849](#).

To activate the CDMA EV-DO 3G wireless modem card with IOTA:

```
user@host> request modem wireless interface cl-0/0/8 activate iota
Beginning IOTA Activation. It can take up to 5 minutes
```

Please check the trace logs for details.

To check the trace log for account activation details:

```
user@host> tail -f /var/log/wwand.log
Jun 25 04:42:55: IOTA cl-0/0/8 Event: IOTA Start... Success
Jun 25 04:43:45: IOTA cl-0/0/8 OTA SPL unlock... Success
Jun 25 04:43:56: IOTA cl-0/0/8 Committing OTA Parameters to NVRAM... Success
Jun 25 04:44:02: IOTA cl-0/0/8 Over the air provisioning... Complete
Jun 25 04:44:04: IOTA cl-0/0/8 IOTA Event: IOTA End... Success
```

- [Activating the CDMA EV-DO Modem Card with OTASP Provisioning on page 2851](#)
- [Activating the CDMA EV-DO Modem Card Manually on page 2852](#)

Activating the CDMA EV-DO Modem Card with OTASP Provisioning

This topic describes the activation of the CDMA EV-DO 3G wireless modem card for use with service provider networks such as Verizon.

Before you begin:

- Obtain the dial number that the modem will use to contact the network from the service provider.
- The service provider must activate your account before OTASP provisioning can proceed.

Use the CLI operational mode command to activate the 3G wireless modem card.

In this example, the dial number from the service provider is ***22864**.

To activate the CDMA EV-DO 3G wireless modem card with OTASP provisioning:

```
user@host> request modem wireless interface cl-0/0/8 activate otasp dial-string *22864
OTASP number *2286*, Selecting NAM 0
```

Beginning OTASP Activation. It can take up to 5 minutes

Please check the trace logs for details.

To check the trace log for account activation details:

```
user@host> tail -f /var/log/wwand.log
Jun 25 04:42:55: OTASP c1-0/0/8 OTA SPL unlock... Success
Jun 25 04:43:42: OTASP c1-0/0/8 OTA PRL download... Success
Jun 25 04:43:55: OTASP c1-0/0/8 OTA Profile downloaded... Success
Jun 25 04:43:58: OTASP c1-0/0/8 OTA MDN download... Success
Jun 25 04:44:04: OTASP c1-0/0/8 Committing OTA Parameters to NVRAM... Success
Jun 25 04:44:45: Over the air provisioning... Complete
```

Activating the CDMA EV-DO Modem Card Manually

Manual activation stores the supplied values into the 3G wireless modem card's nonvolatile memory. This topic describes the activation of the CDMA EV-DO 3G wireless modem card for use with service provider networks such as Sprint.

Before you begin, the service provider must activate your account before you can activate the CDMA EV-DO 3G wireless modem card.

Using the electronic serial number (ESN) you provided and your account information, the service provider supplies you with the following information for manual activation of the 3G wireless modem card:

- Master subsidy lock (MSL)—activation code
- Mobile directory number (MDN)—10-digit user phone number
- International mobile station identify (IMSI)—Mobile subscriber information
- Simple IP user identification (SIP-ID)—Username
- Simple IP password (SIP-Password)—Password

You also need to obtain the following information from the 3G wireless modem card itself for the activation:

- System identification (SID)—Number between 0 and 32767
- Network identification (NID)—Number between 0 and 65535

Use the CLI **show modem wireless interface cl-0/0/8 network** command to display the SID and NID, as shown in the following example:

```
user@host> show modem wireless interface cl-0/0/8 network
```

Running Operating mode : 1xEV-DO (Rev A) and 1xRTT

Call Setup Mode : Mobile IP only

System Identifier (SID) : 3421

Network Identifier (NID) : 91

Roaming Status(1xRTT) : Home

Idle Digital Mode : HDR

System Time : Wed Jun6 15:16:9 2008

Use the CLI operational mode command to manually activate the 3G wireless modem card.

This example uses the following values for manual activation:

- MSL (from service provider)—**43210**
- MDN (from service provider)—**0123456789**
- IMSI (from service provider)—**0123456789**
- SIP-ID (from service provider)—**jnpr**
- SIP-Password (from service provider)—**jn9rl**
- SID (from modem card)—**12345**
- NID (from modem card)—**12345**

To activate the CDMA EV-DO 3G wireless modem card manually:

```
user@host> request modem wireless interface cl-0/0/8 activate manual msl 43210 mdn
0123456789 imsi 0123456789 sid 12345 nid 12345 sip-id jnpr sip-password jn9rl
Checking status...
```

Modem current activation status: Not Activated

Starting activation...

Performing account activation step 1/6 : [Unlock] Done

Performing account activation step 2/6 : [Set MDN] Done

Performing account activation step 3/6 : [Set SIP Info] Done

Performing account activation step 4/6 : [Set IMSI] Done

Performing account activation step 5/6 : [Set SID/NID] Done

Performing account activation step 6/6 : [Commit/Lock] Done

Configuration Commit Result: PASS

Resetting the modem ... Done

Account activation in progress. It can take up to 5 minutes

Please check the trace logs for details.

To check the trace log for account activation details:

```
user@host> tail -f /var/log/wwand.log
Jun 25 04:42:55: IOTA cl-0/0/8 Event: IOTA Start... Success
Jun 25 04:43:45: IOTA cl-0/0/8 OTA SPL unlock... Success
```

```

Jun 25 04:43:56: IOTA cl-0/0/8 Committing OTA Parameters to NVRAM... Success
Jun 25 04:44:02: IOTA cl-0/0/8 Over the air provisioning... Complete
Jun 25 04:44:04: IOTA cl-0/0/8 IOTA Event: IOTA End... Success

```

Unlocking the GSM 3G Wireless Modem

The subscriber identity module (SIM) in the GSM 3G wireless modem card is a detachable smart card. Swapping out the SIM allows you to change the service provider network, however some service providers lock the SIM to prevent unauthorized access to the service provider's network. If this is the case, you will need to unlock the SIM by using an personal identification number (PIN), a four-digit number provided by the service provider.

Before you begin, obtain the PIN from the service provider.

Use the CLI operational mode command to unlock the SIM on the GSM 3G wireless modem card.

This example uses the PIN **3210** from the service provider.

To unlock the SIM on the GSM 3G wireless modem card:

```
user@host> request modem wireless gsm sim-unlock cl-0/0/8 pin 3210
```

A SIM is blocked after three consecutive failed unlock attempts; this is a security feature to prevent brute force attempts to unlock the SIM. When the SIM is blocked, you need to unblock the SIM with an eight-digit PIN unlocking key (PUK) obtained from the service provider.

To unlock the SIM automatically on reboot:

```

user@host# set interfaces cl-0/0/8 cellular-options gsm-options sim-unlock-code
Enter PIN:
user@host#

```

NOTE: On SRX100, SRX110, and SRX210 devices, when you power on or reboot the device, the Subscriber Identity Module (SIM) will be locked. If the SIM Personal Identification Number (PIN) or the unlock code is configured in the `set interfaces cl-0/0/8 cellular-options gsm-options sim-unlock-code` configuration command, then Junos OS attempts to unlock the SIM only once. This is to keep the SIM from being blocked. If the SIM is blocked, you must provide a PIN Unblocking Key (PUK) obtained from the service provider. If the wrong SIM PIN is configured, the SIM will remain locked, and the administrator can unlock it by using the remaining two attempts.

Use the CLI operational mode command to unblock the SIM.

This example uses the PUK **76543210** from the service provider.

To unblock the SIM:

```
user@host> request modem wireless gsm sim-unblock cl-0/0/8 puk 76543210
```

NOTE: If you enter the PUK incorrectly ten times, you will need to return the SIM to the service provider for reactivation.

USB Modem Interface Overview

Juniper Networks devices support the use of USB modems for remote management. You can use Telnet or SSH to connect to the device from a remote location through two modems over a telephone network. The USB modem is connected to the USB port on the device, and a second modem is connected to a remote management device such as a PC or laptop computer.

You can configure your device to fail over to a USB modem connection when the primary Internet connection experiences interruption.

A USB modem connects to a device through modem interfaces that you configure. The device applies its own modem AT commands to initialize the attached modem. Modem setup requires that you connect and configure the USB modem at the device and the modem at the user end of the network.

You use either the J-Web configuration editor or CLI configuration editor to configure the USB modem and its supporting dialer interfaces.

NOTE: Low-latency traffic such as VoIP traffic is not supported over USB modem connections.

NOTE: We recommend using a US Robotics USB 56k V.92 Modem, model number USR Model 5637.

USB Modem Interfaces

You configure two types of interfaces for USB modem connectivity:

- A physical interface which uses the naming convention **umdn0**. The device creates this interface when a USB modem is connected to the USB port.
- A logical interface called the dialer interface. You use the dialer interface, **dln**, to configure dialing properties for USB modem connections. The dialer interface can be configured using Point-to-Point Protocol (PPP) encapsulation. You can also configure the dialer interface to support authentication protocols—PPP Challenge Handshake (CHAP) or Password Authentication Protocol (PAP). You can configure multiple dialer interfaces for different functions on the device. After configuring the dialer interface, you must configure a backup method such as a dialer backup, a dialer filter, or a dialer watch.

The USB modem provides a dial-in remote management interface, and supports dialer interface features by sharing the same dial pool as a dialer interface. The dial pool allows the logical dialer interface and the physical interface to be bound together dynamically on a per-call basis. You can configure the USB modem to operate either as a dial-in console for management or as a dial-in WAN backup interface. Dialer pool priority has a range from 1 to 255, with 1 designating the lowest priority interfaces and 255 designating the highest priority interfaces.

Dialer Interface Rules

The following rules apply when you configure dialer interfaces for USB modem connections:

- The dialer interface must be configured to use PPP encapsulation. You cannot configure Cisco High-Level Data Link Control (HDLC) or Multilink PPP (MLPPP) encapsulation on dialer interfaces.
- The dialer interface cannot be configured as a constituent link in a multilink bundle.
- The dialer interface can perform backup, dialer filter, and dialer watch functions, but these operations are mutually exclusive. You can configure a single dialer interface to operate in only one of the following ways:
 - As a backup interface—for one primary interface
 - As a dialer filter
 - As a dialer watch interface

The backup dialer interfaces are activated only when the primary interface fails. USB modem backup connectivity is supported on all interfaces except `lsq-0/0/0`.

The dial-on-demand routing backup method allows a USB modem connection to be activated only when network traffic configured as an “interesting packet” arrives on the network. Once the network traffic is sent, an inactivity timer is triggered and the connection is closed. You define an interesting packet using the dialer filter feature of the device. To

configure dial-on-demand routing backup using a dialer filter, you first configure the dialer filter and then apply the filter to the dialer interface.

Dialer watch is a backup method that integrates backup dialing with routing capabilities and provides reliable connectivity without relying on a dialer filter to trigger outgoing USB modem connections. With dialer watch, the device monitors the existence of a specified route. If the route disappears, the dialer interface initiates the USB modem connection as a backup connection.

How the Device Initializes USB Modems

When you connect the USB modem to the USB port on the device, the device applies the modem AT commands configured in the **init-command-string** command to the initialization commands on the modem.

If you do not configure modem AT commands for the **init-command-string** command, the device applies the following default sequence of initialization commands to the modem: **AT S7=45 S0=0 V1 X4 &C1 E0 Q0 &Q8 %C0**. [Table 288](#) describes the commands. For more information about these commands, see the documentation for your modem.

Table 288: Default Modem Initialization Commands

Modem Command	Description
AT	Attention. Informs the modem that a command follows.
S7=45	Instructs the modem to wait 45 seconds for a telecommunications service provider (carrier) signal before terminating the call.
S0=0	Disables the auto answer feature, whereby the modem automatically answers calls.
V1	Displays result codes as words.
&C1	Disables reset of the modem when it loses the carrier signal.
E0	Disables the display on the local terminal of commands issued to the modem from the local terminal.
Q0	Enables the display of result codes.
&Q8	Enables Microcom Networking Protocol (MNP) error control mode.
%C0	Disables data compression.

When the device applies the modem AT commands in the **init-command-string** command or the default sequence of initialization commands to the modem, it compares them to the initialization commands already configured on the modem and makes the following changes:

- If the commands are the same, the device overrides existing modem values that do not match. For example, if the initialization commands on the modem include **S0=0**

and the device's **init-command-string** command includes **S0=2**, the device applies **S0=2**.

- If the initialization commands on the modem do not include a command in the device's **init-command-string** command, the device adds it. For example, if the **init-command-string** command includes the command **L2**, but the modem commands do not include it, the device adds **L2** to the initialization commands configured on the modem.

NOTE: On SRX210 devices, the USB modem interface can handle bidirectional traffic of up to 19 Kbps. On oversubscription of this amount (that is, bidirectional traffic of 20 Kbps or above), keepalives do not get exchanged, and the interface goes down.

USB Modem Configuration Overview

Before you begin:

1. Install device hardware. For more information, see the Getting Started Guide for your device.
2. Establish basic connectivity. For more information, see the Getting Started Guide for your device.
3. Order a US Robotics USB 56k V.92 Modem, model number USR Model 5637 (<http://www.usr.com/>).
4. Order a public switched telephone network (PSTN) line from your telecommunications service provider. Contact your service provider for more information.
5. Connect the USB modem to the device's USB port.

NOTE: When you connect the USB modem to the USB port on the device, the USB modem is initialized with the modem initialization string configured for the USB modem interface on the device.

- a. Plug the modem into the USB port.
- b. Connect the modem to your telephone network.

Suppose you have a branch office router and a head office router each with a USB modem interface and a dialer interface. This example shows you how to establish a backup

connection between the branch office and head office routers. See [Table 289](#) for a summarized description of the procedure.

Table 289: Configuring Branch Office and Head Office Routers for USB Modem Backup Connectivity

Router Location	Configuration Requirement	Procedure
Branch Office	Configure the logical dialer interface on the branch office router for USB modem dial backup.	To configure the logical dialer interface, see “Example: Configuring a USB Modem Interface” on page 2862.
	Configure the dialer interface dl0 on the branch office router using one of the following backup methods: <ul style="list-style-type: none"> Configure the dialer interface dl0 as the backup interface on the branch office router's primary T1 interface t1-1/0/0. Configure a dialer filter on the branch office router's dialer interface. Configure a dialer watch on the branch office router's dialer interface. 	Configure the dialer interface using one of the following backup methods: <ul style="list-style-type: none"> To configure dl0 as a backup for t1-1/0/0 see “Example: Configuring Dialer Interfaces and Backup Methods for USB Modem Dial Backup” on page 2864. To configure a dialer filter on dl0, see “Example: Configuring Dialer Interfaces and Backup Methods for USB Modem Dial Backup” on page 2864. To configure a dialer watch on dl0, see “Example: Configuring Dialer Interfaces and Backup Methods for USB Modem Dial Backup” on page 2864.
Head Office	Configure dial-in on the dialer interface dl0 on the head office router.	To configure dial-in on the head office router, see “Example: Configuring a Dialer Interface for USB Modem Dial-In” on page 2870.

If the dialer interface is configured to accept only calls from a specific caller ID, the device matches the incoming call's caller ID against the caller IDs configured on its dialer interfaces. If an exact match is not found and the incoming call's caller ID has more digits than the configured caller IDs, the device performs a right-to-left match of the incoming call's caller ID with the configured caller IDs and accepts the incoming call if a match is found. For example, if the incoming call's caller ID is 4085321091 and the caller ID configured on a dialer interface is 5321091, the incoming call is accepted. Each dialer interface accepts calls from only callers whose caller IDs are configured on it.

See [Table 290](#) for a list of available incoming map options.

Table 290: Incoming Map Options

Option	Description
accept-all	Dialer interface accepts all incoming calls. You can configure the accept-all option for only one of the dialer interfaces associated with a USB modem physical interface. The dialer interface with the accept-all option configured is used only if the incoming call's caller ID does not match the caller IDs configured on other dialer interfaces.

Table 290: Incoming Map Options (*continued*)

Option	Description
caller	<p>Dialer interface accepts calls from a specific caller ID. You can configure a maximum of 15 caller IDs per dialer interface.</p> <p>The same caller ID must not be configured on different dialer interfaces. However, you can configure caller IDs with more or fewer digits on different dialer interfaces. For example, you can configure the caller IDs 14085551515, 4085551515, and 5551515 on different dialer interfaces.</p>

You configure dialer interfaces to support PAP. PAP allows a simple method for a peer to establish its identity using a two-way handshake during initial link establishment. After the link is established, an ID and password pair are repeatedly sent by the peer to the authenticator until authentication is acknowledged or the connection is terminated.

Example: Configuring a USB Modem Interface

This example shows how to configure a USB modem interface for dial backup.

- [Requirements on page 2862](#)
- [Overview on page 2862](#)
- [Configuration on page 2862](#)
- [Verification on page 2863](#)

Requirements

No special configuration beyond device initialization is required before configuring this feature.

Overview

In this example, you create an interface called as umd0 for USB modem connectivity and set the dialer pool priority to 25. You also configure a modem initialization string to autoanswer after a specified number of rings. The default modem initialization string is **AT S7=45 S0=0 V1 X4 &C1 E0 Q0 &Q8 %C0**. The modem command **S0=0** disables the modem from autoanswering the calls. Finally, you set the modem to act as a dial-in WAN backup interface.

Configuration

- CLI Quick Configuration**
- To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces umd0 dialer-options pool usb-modem-dialer-pool priority 25
```

```
set modem-options init-command-string "ATSO=2 \n" dialin routable
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a USB modem interface for dial backup:

1. Create an interface.

```
[edit]
user@host# edit interfaces umd0
```

2. Set the dialer options and priority.

```
[edit interfaces umd0]
user@host# set dialer-options pool usb-modem-dialer-pool priority 25
```

3. Specify the modem options.

```
[edit interfaces umd0]
user@host# set modem-options init-command-string "ATSO=2 \n"
```

4. Set the modem to act as a dial-in WAN backup interface.

```
[edit interfaces umd0]
user@host# set modem-options dialin routable
```

Results From configuration mode, confirm your configuration by entering the **show interface umd0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interface umd0
modem-options {
  init-command-string "ATSO=2 \n";
  dialin routable;
}
dialer-options {
  pool usb-modem-dialer-pool priority 25;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying the Configuration

Purpose Verify a USB modem interface for dial backup.

Action From configuration mode, enter the **show interfaces umd0 extensive** command. The output shows a summary of interface information and displays the modem status.

```
Physical interface:  umd0, Enabled, Physical link is Up
```

```

Example: Configuring Dialer Interfaces and Backup Methods for USB Modem Dial Backup

This example shows how to configure a dialer interfaces and backup methods for USB modem dial backup.

- [Requirements on page 2865](#)
- [Overview on page 2865](#)
- [Configuration on page 2865](#)
- [Verification on page 2870](#)

Requirements

Before you begin, configure a USB modem for the device. See [“Example: Configuring a USB Modem Interface” on page 2862](#).

Overview

In this example, you configure a logical dialer interface on the branch office router for the USB modem dial backup. You then configure dial backup to allow one or more dialer interfaces to be configured as the backup link for the primary serial interface. To configure dialer watch, you first add a dialer watch interface and then configure the USB modem interface to participate as a dialer watch interface. The USB modem interface must have the same pool identifier to participate in dialer watch. Dialer pool name dw-pool is used when configuring the USB modem interface.

Configuration

- [Configuring a Dialer Interface for USB Modem Dial Backup on page 2865](#)
- [Configuring a Dial Backup for a USB Modem Connection on page 2867](#)
- [Configuring a Dialer Filter for USB Modem Dial Backup on page 2867](#)

Configuring a Dialer Interface for USB Modem Dial Backup

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces dl0 description USB-modem-backup encapsulation ppp
set interfaces dl0 unit 0 dialer-options activation-delay 60 deactivation-delay 30
idle-timeout 30 initial-route-check 30 pool usb-modem-dialer-pool
set interfaces dl0 unit 0 dialer-options dial-string 5551212
set interfaces dl0 unit 0 family inet address 172.20.10.2 destination 172.20.10.1
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a logical dialer interface on the branch office router for the USB modem dial backup:

1. Create an interface.

```
[edit]
user@host# edit interfaces dl0
```
2. Specify a description.

```
[edit interfaces dl0]
user@host# set description USB-modem-backup
```
3. Configure PPP encapsulation.

```
[edit interfaces dl0]
user@host# set encapsulation ppp
```

NOTE: You cannot configure Cisco High-Level Data Link Control (HDLC) or Multilink PPP (MLPPP) encapsulation on dialer interfaces used in USB modem connections.

4. Create the logical unit.

```
[edit interfaces dl0]
user@host# set unit 0
```

NOTE: You can set the logical unit to 0 only.

5. Configure the dialer options.

```
[edit interfaces dl0]
user@host# edit unit 0 dialer-options
user@host# set activation-delay 60
user@host# set deactivation-delay 30
user@host# set idle-timeout 30 initial-route-check 30 pool usb-modem-dialer-pool
```

6. Configure the telephone number of the remote destination.

```
[edit interfaces dl0 unit 0 dialer-options]
user@host# set dial-string 5551212
```

7. Configure source and destination IP addresses.

```
[edit]
user@host# edit interfaces dl0 unit 0
user@host# set family inet address 172.20.10.2 destination 172.20.10.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces dl0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces dl0
description USB-modem-backup;
encapsulation ppp;
unit 0 {
family inet {
address 172.20.10.2/32 {
destination 172.20.10.1;
}
}
dialer-options {
pool usb-modem-dialer-pool;
dial-string 5551212;
idle-timeout 30;
activation-delay 60;
```

```

        deactivation-delay 30;
        initial-route-check 30;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring a Dial Backup for a USB Modem Connection

CLI Quick Configuration To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces t1-1/0/0 unit 0 backup-options interface dl0.0
```

Step-by-Step Procedure To configure a dial backup for a USB modem connection:

1. Select the physical interface.

```

[edit]
user@host# edit interfaces t1-1/0/0 unit 0

```

2. Configure the backup dialer interface.

```

[edit]
user@host# set backup-options interface dl0.0

```

Results From configuration mode, confirm your configuration by entering the **show interfaces t1-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@host# show interfaces t1-1/0/0
encapsulation ppp;
unit 0 {
    backup-options {
        interface dl0.0;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring a Dialer Filter for USB Modem Dial Backup

CLI Quick Configuration To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set firewall family inet dialer-filter interesting-traffic term term1 from source-address
20.20.90.4/32
set firewall family inet dialer-filter interesting-traffic term term1 from destination-address
200.200.201.1/32
set firewall family inet dialer-filter interesting-traffic term term1 then note

```

set interfaces dlo unit 0 family inet filter dialer interesting-traffic

Step-by-Step Procedure To configure a dialer filter for USB modem dial backup:

1. Create an interface.

```
[edit]
user@host# edit firewall
```
2. Configure the dialer filter name.

```
[edit]
user@host# edit family inet
user@host# edit dialer-filter interesting-traffic
```
3. Configure the dialer filter rule name and term behavior.

```
[edit]
user@host# edit term term1
user@host# set from source-address 20.20.90.4/32
user@host# set from destination-address 200.200.201.1/32
```
4. Configure the then part of the dialer filter.

```
[edit]
user@host# set then note
```
5. Select the dialer interface to apply the filter.

```
[edit]
user@host# edit interfaces dlo unit 0
```
6. Apply the dialer filter to the dialer interface.

```
[edit]
user@host# edit family inet filter
user@host# set dialer interesting-traffic
```

Results From configuration mode, confirm your configuration by entering the **show firewall family inet dialer-filter interesting-traffic** and **show interfaces dlo** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show firewall family inet dialer-filter interesting-traffic
term term1 {
  from {
    source-address {
      20.20.90.4/32;
    }
    destination-address {
      200.200.201.1/32;
    }
  }
  then note;
}
[edit]
user@host# show interfaces dlo
unit 0 {
```

```
family inet {
  filter {
    dialer interesting-traffic;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring a Dialer Watch for USB Modem Dial Backup

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces dl0 description dialer-watch unit 0 dialer-options watch-list
200.200.201.1/32
set interfaces dl0 unit 0 dialer-options pool dw-pool
set interfaces umd0 dialer-options pool dw-pool
```

Step-by-Step Procedure

To configure a dialer watch for USB modem dial backup:

1. Create an interface.

```
[edit]
user@host# edit interfaces
```
2. Specify a description.

```
[edit]
user@host# edit dl0
user@host# set description dialer-watch
```
3. Configure the route to the head office router for dialer watch.

```
[edit]
user@host# edit unit 0 dialer-options
user@host# set watch-list 200.200.201.1/32
```
4. Configure the name of the dialer pool.

```
[edit]
user@host# set pool dw-pool
```
5. Select the USB modem physical interface.

```
[edit]
user@host# edit interfaces umd0 dialer-options pool dw-pool
```

Results

From configuration mode, confirm your configuration by entering the **show interfaces dl0** and **show interfaces umd0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces dl0
dialer-options {
  pool dw-pool;
```

```
    }  
[edit]  
user@host# show interfaces umd0  
    description dialer-watch;  
    unit 0 {  
    dialer-options {  
        pool dw-pool;  
        watch-list {  
            200.200.201.1/32;  
        }  
    }  
    }
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying the Configuration

Purpose Verify the configuration output.

Action From operational mode, enter the **show interface terse** command.

Example: Configuring a Dialer Interface for USB Modem Dial-In

This example shows how to configure a dialer interface for USB modem dial-in.

- [Requirements on page 2870](#)
- [Overview on page 2870](#)
- [Configuration on page 2871](#)
- [Verification on page 2872](#)

Requirements

No special configuration beyond device initialization is required before configuring this feature.

Overview

To enable connections to the USB modem from a remote location, you must configure the dialer interfaces set up for USB modem use to accept incoming calls. You can

configure a dialer interface to accept all incoming calls or accept only calls from one or more caller IDs.

If the dialer interface is configured to accept only calls from a specific caller ID, the system matches the incoming call's caller ID against the caller IDs configured on its dialer interfaces. If an exact match is not found and the incoming call's caller ID has more digits than the configured caller IDs, the system performs a right-to-left match of the incoming call's caller ID with the configured caller IDs and accepts the incoming call if a match is found. For example, if the incoming call's caller ID is 4085550115 and the caller ID configured on a dialer interface is 5550115, the incoming call is accepted. Each dialer interface accepts calls from only callers whose caller IDs are configured on it.

You can configure the following incoming map options for the dialer interface:

- **accept-all**—Dialer interface accepts all incoming calls.

You can configure the **accept-all** option for only one of the dialer interfaces associated with a USB modem physical interface. The device uses the dialer interface with the **accept-all** option configured only if the incoming call's caller ID does not match the caller IDs configured on other dialer interfaces.

- **caller**—Dialer interface accepts calls from a specific caller ID—for example, **4085550115**. You can configure a maximum of 15 caller IDs per dialer interface.

The same caller ID must not be configured on different dialer interfaces. However, you can configure caller IDs with more or fewer digits on different dialer interfaces. For example, you can configure the caller IDs 14085550115, 4085550115, and 5550115 on different dialer interfaces.

In this example, you configure the incoming map option as caller 4085550115 for dialer interface d10.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter commit from configuration mode.

```
set interfaces d10 unit 0 dialer-options incoming-map caller 4085550115
```

Step-by-Step Procedure

To configure a dialer interface for USB modem dial-in:

1. Select a dialer interface.

```
[edit]  
user@host# edit interfaces d10
```
2. Configure the incoming map options.

```
[edit]  
user@host# edit unit 0 dialer-options incoming-map caller 4085551515
```
3. If you are done configuring the device, commit the configuration.

```
[edit]
```

```
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show interface dlo** command.

Related Documentation

- [USB Modem Configuration Overview on page 2860](#)
- [Example: Configuring a USB Modem Interface on page 2862](#)

Example: Configuring PAP on Dialer Interfaces

This example shows how to configure PAP on dialer interfaces.

- [Requirements on page 2872](#)
- [Overview on page 2872](#)
- [Configuration on page 2872](#)
- [Verification on page 2873](#)

Requirements

No special configuration beyond device initialization is required before configuring this feature.

Overview

In this example, you specify a PAP access profile with a client username and a PAP password and select a dialer interface. Finally, you configure PAP on the dialer interface and specify the local name and password.

Configuration

Step-by-Step Procedure

To configure PAP on the dialer interface:

1. Specify a PAP access profile.

```
[edit]  
user@host# set access profile pap-access-profile client pap-access-user  
pap-password my-pap
```
2. Select a dialer interface.

```
[edit]  
user@host# edit interfaces dlo unit 0
```
3. Configure PAP on the dialer interface.

```
[edit]  
user@host# set ppp-options pap local-name pap-access-user local-password  
my-pap
```
4. If you are done configuring the device, commit the configuration.

```
[edit]  
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show interface dlo** command.

Example: Configuring CHAP on Dialer Interfaces

This example shows how to configure CHAP on dialer interfaces for authentication.

- [Requirements on page 2873](#)
- [Overview on page 2873](#)
- [Configuration on page 2873](#)
- [Verification on page 2874](#)

Requirements

No special configuration beyond device initialization is required before configuring this feature.

Overview

In this example, you configure dialer interfaces to support CHAP for authentication. CHAP is a server-driven, three-step authentication method that depends on a shared secret password residing on both the server and the client. You specify a CHAP access profile with a client username and a password. You then specify a dialer interface as dlo. Finally, you enable CHAP on a dialer interface and specify a unique profile name containing a client list and access parameters.

Configuration

Step-by-Step Procedure

To configure CHAP on a dialer interface:

1. Specify a CHAP access profile.

```
[edit]  
user@host# set access profile usb-modem-access-profile client usb-modem-user chap-secret my-secret
```
2. Select a dialer interface.

```
[edit]  
user@host# edit interfaces dlo unit 0
```
3. Enable CHAP on the dialer interface.

```
[edit]
user@host# set ppp-options chap access-profile usb-modem-access-profile
```

4. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show interface dlo** command.

Configuring DOCSIS Mini-PIM Interfaces

- [DOCSIS Mini-PIM Interface Overview on page 2875](#)
- [Software Features Supported on DOCSIS Mini-PIMs on page 2876](#)
- [Example: Configuring the DOCSIS Mini-PIM Interfaces on page 2877](#)

DOCSIS Mini-PIM Interface Overview

Data over Cable Service Interface Specifications (DOCSIS) define the communications and operation support interface requirements for a data-over-cable system. Cable operators use DOCSIS to provide Internet access over their existing cable infrastructure for both residential and business customers. DOCSIS 3.0 is the latest interface standard, allowing channel bonding to deliver speeds higher than 100 Mbps throughput in either direction, far surpassing other WAN technologies such as T1/E1, ADSL2+, ISDN, and DS3.

NOTE: On SRX210 Services Gateway, the DOCSIS Mini-PIM delivers speeds up to a maximum of 100 Mbps throughput in each direction.

DOCSIS network architecture includes a cable modem on SRX Series Services Gateways with a DOCSIS Mini-Physical Interface Module (Mini-PIM) located at customer premises and a cable modem termination system (CMTS) located at the head-end or data center locations. Standards-based DOCSIS 3.0 Mini-PIM is interoperable with CMTS equipment. The DOCSIS Mini-PIM provides backward compatibility with CMTS equipment based on the following standards:

- DOCSIS 2.0
- DOCSIS 1.1
- DOCSIS 1.0

The cable modem interface of Mini-PIM is managed and monitored by CMTS through SNMP. This DOCSIS 3.0 Mini-PIM can be deployed in any multiple service operator (MSO) networks. The primary application is for distributed enterprise offices to connect to a CMTS network through the DOCSIS 3.0 (backward compatible to 2.0, 1.1, and 1.0) interface. The DOCSIS Mini-PIM uses PIM infrastructure developed for third-party PIMs.

The Mini-PIM can also be used with encapsulations other than GRE, PPPoE, and IP-in-IP.

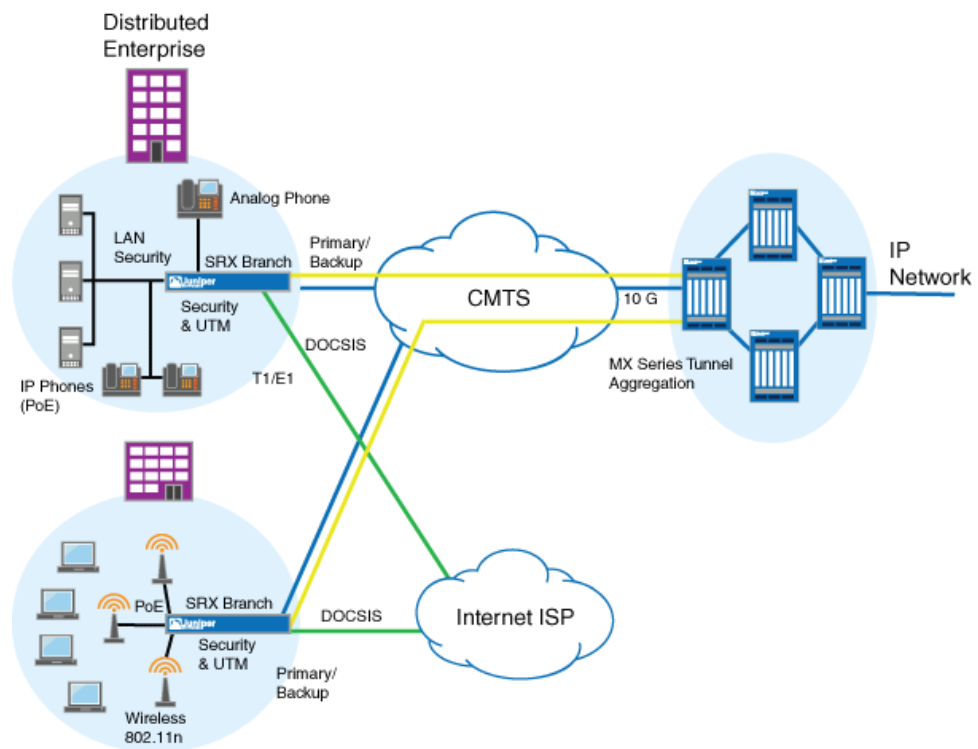

NOTE: The following interface trace options are supported:

- **all**—Enable all interface trace flags
- **event**—Trace interface events
- **ipc**—Trace interface IPC messages
- **media**—Trace interface media changes

CMTS manages and monitors the cable modem interface of then Mini-PIM through SNMP. This DOCSIS 3.0 Mini-PIM can be deployed in any multiple MSO network. [Figure 137](#) shows a typical use for this Mini-PIM in an MSO network.

Figure 137: Typical DOCSIS End-to-End Connectivity Diagram

Software Features Supported on DOCSIS Mini-PIMs

Table 291 lists the software features supported on DOCSIS Mini-PIMs.

Table 291: Software Features Supported on DOCSIS Mini-PIMs

Software Feature	Description
DHCP and DHCPv6 clients	<p>The DHCP and DHCPv6 clients are used to get the IP address from the CMTS using the DHCP protocol. DHCP is supported on IPv4 and IPv6. One of the main components of the configuration file is the static public IP address, which CMTS assigns to the cable modem. The management IP address is configured on the Mini-PIM's hybrid fiber coaxial (HFC) interface, which performs the following tasks:</p> <ul style="list-style-type: none"> • Allows CMTS to execute remote monitoring and management of the Mini-PIM's cable interface. • Downloads the configuration file from CMTS and uses it for configuring the cable interface.
QoS support	<p>The SRX Series device's Routing Engine is configured through the existing QoS CLI. Because the configuration on the SRX Series device's Routing Engine and Mini-PIM is done together, the QoS configuration has to be consistent between the Routing Engine and the cable modem interface. The QoS mechanisms on the Routing Engine are decoupled from the QoS mechanisms on the Mini-PIM.</p> <p>The configuration file downloaded from CMTS contains parameters for primary and secondary flows. These parameters are programmed in the DOCSIS Mini-PIM. The Mini-PIM sends these parameters to the Routing Engine through the PIM infrastructure. The secondary flows are prioritized over primary flows in the DOCSIS Mini-PIM.</p>
SNMP support	<p>CMTS issues the SNMP requests that go to the cable modem. The DOCSIS MIB on the SRX Series device's Routing Engine displays the Ethernet interface of the cable modem. The following features are supported on the DOCSIS Mini-PIM:</p> <ul style="list-style-type: none"> • NAT support • Dying gasp support • Back pressure information
MAC address	<p>The MAC address of the DOCSIS Mini-PIM is statically set at the factory and cannot be changed. The MAC address is retrieved from the Mini-PIM and assigned to the cable modem interface in Junos OS.</p>
Transparent bridging	<p>The DOCSIS Mini-PIM performs transparent bridging by sending the packets received on the Ethernet interface with the SRX Series device to the HFC interface and vice versa, without any modifications to the packet. All the other services such as webserver, DHCP server, and DNS server are disabled on the DOCSIS Mini-PIM during transparent bridging.</p>

 - [Example: Configuring the DOCSIS Mini-PIM Interfaces on page 2877](#)

Example: Configuring the DOCSIS Mini-PIM Interfaces

This example shows how to configure DOCSIS Mini-PIM network interfaces for SRX210, SRX220, and SRX240 devices.

- [Requirements on page 2878](#)
- [Overview on page 2878](#)

- [Configuration on page 2878](#)
- [Verification on page 2879](#)

Requirements

Before you begin:

- Establish basic connectivity. See the Quick Start for your device.
- Configure network interfaces as necessary. See “[Example: Creating an Ethernet Interface](#)” on page 2634.

Overview

In this example, you configure the DOCSIS Mini-PIM interface as cm-2/0/0. You specify the physical properties by setting the interface trace options and the flag option. You then set the logical interface to unit 0 and specify the family protocol type as inet. Finally, you configure the DHCP client.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces cm-2/0/0 traceoptions flag all
set interfaces cm-2/0/0 unit 0 family inet dhcp
```

Step-by-Step Procedure

To configure the DOCSIS Mini-PIM network interfaces:

1. Configure the interface.

```
[edit]
user@host# edit interfaces cm-2/0/0
```
2. Set the interface trace options.

```
[edit]
user@host# set interfaces cm-2/0/0 traceoptions
```
3. Specify the flag option.

```
[edit]
user@host# set interfaces cm-2/0/0 traceoptions flag all
```
4. Set the logical interface.

```
[edit]
user@host# set interfaces cm-2/0/0 unit 0
```
5. Specify the family protocol type.

```
[edit]
user@host# set interfaces cm-2/0/0 unit 0 family inet
```
6. Configure the DHCP client.

```
[edit]
```

```
user@host# set interfaces cm-2/0/0 unit 0 family inet dhcp
```

Results From configuration mode, confirm your configuration by entering the **show interfaces cm-2/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces cm-2/0/0
traceoptions {
  flag all;
}
unit 0 {
  family inet {
    dhcp;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying the DOCSIS Interface Properties on page 2879](#)

Verifying the DOCSIS Interface Properties

Purpose Verify that the DOCSIS interface properties are configured properly.

Action From operational mode, enter the **show interfaces cm-2/0/0** command.

```

The output shows a summary of DOCSIS interface properties. Verify the following information:

- The physical interface is **Enabled**. If the interface is shown as **Disabled**, do either of the following:
 - In the CLI configuration editor, delete the **disable** statement at the **[edit interfaces interface-name]** level of the configuration hierarchy.
 - In the J-Web configuration editor, clear the **Disable** check box on the **Interfaces>interface-name** page.
- The physical link is **Up**. A link state of **Down** indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- The **Last Flapped** time is an expected value. The **Last Flapped** time indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect the expected input and output rates. Verify that the number of inbound and outbound bytes and packets matches the expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics interface-name** command.

Serial Interfaces Overview

Serial links are simple, bidirectional links that require very few control signals. In a basic serial setup, data communications equipment (DCE) installed in a user's premises is responsible for establishing, maintaining, and terminating a connection. A modem is a typical DCE device.

A serial cable connects the DCE to a telephony network where, ultimately, a link is established with data terminal equipment (DTE). DTE is typically where a serial link terminates.

The distinction between DCE and DTE is important because it affects the cable pinouts on a serial cable. A DCE cable uses a female 9-pin or 25-pin connector, and a DTE cable uses a male 9-pin or 25-pin connector, and .

To form a serial link, the cables are connected to each other. However, if the pins are identical, each side's transmit and receive lines are connected, which makes data transport impossible. To address this problem, each cable is connected to a null modem cable, which crosses the transmit and receive lines in the cable.

This section includes the following topics:

- [Serial Transmissions on page 2884](#)
- [Signal Polarity on page 2885](#)
- [Serial Clocking Modes on page 2885](#)
- [Serial Line Protocols on page 2886](#)

Serial Transmissions

In basic serial communications, nine signals are critical to the transmission. Each signal is associated with a pin in either the 9-pin or 25-pin connector. [Table 292](#) lists and defines serial signals and their sources.

Table 292: Serial Transmission Signals

Signal Name	Definition	Signal Source
TD	Transmitted data	DTE
RD	Received data	DCE
RTS	Request to send	DTE
CTS	Clear to send	DCE
DSR	Data set ready	DCE
Signal Ground	Grounding signal	–
CD	Carrier detect	–
DTR	Data terminal ready	DTE
RI	Ring indicator	–

When a serial connection is made, a serial line protocol—such as EIA-530, X.21, RS-422/449, RS-232, or V.35—begins controlling the transmission of signals across the line as follows:

1. The DCE transmits a DSR signal to the DTE, which responds with a DTR signal. After this handshake, the link is established and traffic can pass.
2. When the DTE device is ready to receive data, it sets its RTS signal to a marked state (all 1s) to indicate to the DCE that it can transmit data. (If the DTE is not able to receive data—because of buffer conditions, for example—it sets the RTS signal to all 0s.)
3. When the DCE device is ready to receive data, it sets its CTS signal to a marked state to indicate to the DTE that it can transmit data. (If the DCE is not able to receive data, it sets the CTS signal to all 0s.)
4. When the negotiation to send information has taken place, data is transmitted across the transmitted data (TD) and received data (RD) lines:
 - TD line—Line through which data from a DTE device is transmitted to a DCE device
 - RD line—Line through which data from a DCE device is transmitted to a DTE device

The name of the wire does not indicate the direction of data flow.

The DTR and DSR signals were originally designed to operate as a handshake mechanism. When a serial port is opened, the DTE device sets its DTR signal to a marked state. Similarly, the DCE sets its DSR signal to a marked state. However, because of the negotiation that takes place with the RTS and CTS signals, the DTR and DSR signals are not commonly used.

The carrier detect and ring indicator signals are used to detect connections with remote modems. These signals are not commonly used.

Signal Polarity

Serial interfaces use a balanced (also called differential) protocol signaling technique. Two serial signals are associated with a circuit: the A signal and the B signal. The A signal is denoted with a plus sign (for example, DTR+), and the B signal is denoted with a minus sign (for example, DTR–). If DTR is low, then DTR+ is negative with respect to DTR–. If DTR is high, then DTR+ is positive with respect to DTR–.

By default, all signal polarities are positive, but sometimes they might be reversed. For example, signals might be miswired as a result of reversed polarities.

Serial Clocking Modes

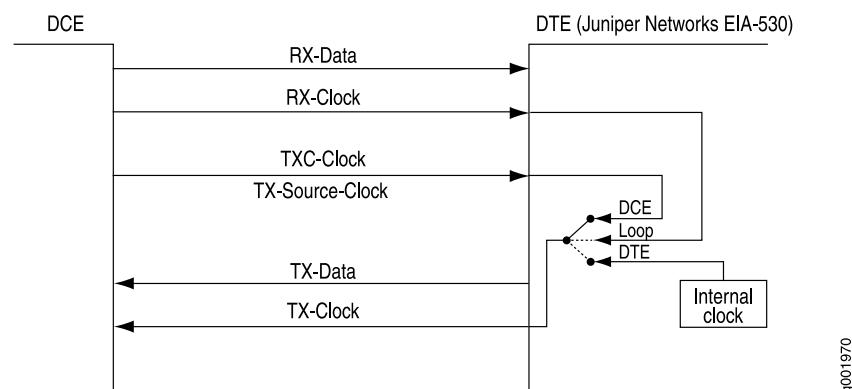

By default, a serial interface uses loop clocking to determine its timing source. For EIA-530 and V.35 interfaces, you can set each port independently to use one of the following clocking modes. X.21 interfaces can use only loop clocking mode.

- Loop clocking mode—Uses the DCE's receive (RX) clock to clock data from the DCE to the DTE.
- DCE clocking mode—Uses the transmit (TXC) clock, generated by the DCE specifically to be used by the DTE as the DTE's transmit clock.
- Internal clocking mode—Uses an internally generated clock. The speed of this clock is configured locally. Internal clocking mode is also known as line timing.

Both loop clocking mode and DCE clocking mode use external clocks generated by the DCE.

Figure 138 shows the clock sources for loop, DCE, and internal clocking modes.

Figure 138: Serial Interface Clocking Modes

Serial Interface Transmit Clock Inversion

When an externally timed clocking mode (DCE or loop) is used, long cables might introduce a phase shift of the DTE-transmitted clock and data. At high speeds, this phase shift might cause errors. Inverting the transmit clock corrects the phase shift, thereby reducing error rates.

DTE Clock Rate Reduction

Although the serial interface is intended for use at the default clock rate of 16.384 MHz, you might need to use a slower rate under any of the following conditions:

- The interconnecting cable is too long for effective operation.
- The interconnecting cable is exposed to an extraneous noise source that might cause an unwanted voltage in excess of +1 volt.

The voltage must be measured differentially between the signal conductor and the point in the circuit from which all voltages are measured ("circuit common") at the load end of the cable, with a 50-ohm resistor substituted for the generator.

- Interference with other signals must be minimized.
- Signals must be inverted.

Serial Line Protocols

Serial interfaces support the following line protocols:

- [EIA-530 on page 2886](#)
- [RS-232 on page 2887](#)
- [RS-422/449 on page 2887](#)
- [V.35 on page 2888](#)
- [X.21 on page 2888](#)

EIA-530

EIA-530 is an Electronic Industries Association (EIA) standard for the interconnection of DTE and DCE using serial binary data interchange with control information exchanged on separate control circuits. EIA-530 is also known as RS-530.

The EIA-530 line protocol is a specification for a serial interface that uses a DB-25 connector and balanced equivalents of the RS-232 signals—also called V.24. The EIA-530 line protocol is equivalent to the RS-422 and RS-423 interfaces implemented on a 25-pin connector.

The EIA-530 line protocol supports both balanced and unbalanced modes. In unbalanced transmissions, voltages are transmitted over a single wire. Because only a single signal is transmitted, differences in ground potential can cause fluctuations in the measured voltage across the link. For example, if a 3-V signal is sent from one endpoint to another, and the receiving endpoint has a ground potential 1 V higher than the transmitter, the signal on the receiving end is measured as a 2-V signal.

Balanced transmissions use two wires instead of one. Rather than sending a single signal across the wire and having the receiving end measure the voltage, the transmitting device sends two separate signals across two separate wires. The receiving device measures the difference in voltage of the two signals (balanced sampling) and uses that calculation to evaluate the signal. Any differences in ground potential affect both wires equally, and the difference in the signals is still the same.

The EIA-530 interface supports asynchronous and synchronous transmissions at rates ranging from 20 Kbps to 2 Mbps.

RS-232

RS-232 is a Recommended Standard (RS) describing the most widely used type of serial communication. The RS-232 protocol is used for asynchronous data transfer as well as synchronous transfers using HDLC, Frame Relay, and X.25. RS-232 is also known as EIA-232.

The RS-232 line protocol is very popular for low-speed data signals. RS-232 signals are carried as single voltages referred to a common ground signal. The voltage output level of these signals varies between -12 V and $+12$ V. Within this range, voltages between -3 V and $+3$ V are considered inoperative and are used to absorb line noise. Control signals are considered operative when the voltage ranges from $+3$ V to $+25$ V.

The RS-232 line protocol is an unbalanced protocol, because it uses only one wire and is susceptible to signal degradation. Degradation can be extremely disruptive, particularly when a difference in ground potential exists between the transmitting and receiving ends of a link.

The RS-232 interface is implemented in a 25-pin D-shell connector and supports line rates up to 200 Kbps over lines shorter than 98 feet (30 meters).

NOTE: RS-232 serial interfaces cannot function error-free with a clock rate greater than 200 KHz.

RS-422/449

RS-422 is a Recommended Standard (RS) describing the electrical characteristics of balanced voltage digital interface circuits that support higher bandwidths than traditional serial protocols like RS-232. RS-422 is also known as EIA-422.

The RS-449 standard (also known as EIA-449) is compatible with RS-422 signal levels. The EIA created RS-449 to detail the DB-37 connector pinout and define a set of modem control signals for regulating flow control and line status.

The RS-422/499 line protocol runs in balanced mode, allowing serial communications to extend over distances of up to 4,000 feet (1.2 km) and at very fast speeds of up to 10 Mbps.

In an RS-422/499-based system, a single master device can communicate with up to 10 slave devices in the system. To accommodate this configuration, RS-422/499 supports the following kinds of transmission:

- Half-duplex transmission—In half-duplex transmission mode, transmissions occur in only one direction at a time. Each transmission requires a proper handshake before it is sent. This operation is typical of a balanced system in which two devices are connected by a single connection.
- Full-duplex transmission—In full duplex transmission mode, multiple transmissions can occur simultaneously so that devices can transmit and receive at the same time. This operation is essential when a single master in a point-to-multipoint system must communicate with multiple receivers.
- Multipoint transmission—RS-422/499 allows only a single master in a multipoint system. The master can communicate to all points in a multipoint system, and the other points must communicate with each other through the master.

V.35

V.35 is an ITU-T standard describing a synchronous, Physical Layer protocol used for communications between a network access device and a packet network. V.35 is most commonly used in the United States and Europe.

The V.35 line protocol is a mixture of balanced (RS-422) and common ground (RS-232) signal interfaces. The V.35 control signals DTR, DSR, DCD, RTS, and CTS are single-wire common ground signals that are essentially identical to their RS-232 equivalents. Unbalanced signaling for these control signals is sufficient, because the control signals are mostly constant, varying at very low frequency, which makes single-wire transmission suitable. Higher frequency data and clock signals are sent over balanced wires.

V.35 interfaces operate at line rates of 20 Kbps and above.

X.21

X.21 is an ITU-T standard for serial communications over synchronous digital lines. The X.21 protocol is used primarily in Europe and Japan.

The X.21 line protocol is a state-driven protocol that sets up a circuit-switched network using call setup. X.21 interfaces use a 15-pin connector with the following eight signals:

- Signal ground (G)—Reference signal used to evaluate the logic states of the other signals. This signal can be connected to the protective earth (ground).
- DTE common return (Ga)—Reference ground signal for the DCE interface. This signal is used only in unbalanced mode.
- Transmit (T)—Binary signal that carries the data from the DTE to the DCE. This signal can be used for data transfer or in call-control phases such as Call Connect or Call Disconnect.
- Receive (R)—Binary signal that carries the data from the DCE to the DTE. This signal can be used for data transfer or in call-control phases such as Call Connect or Call Disconnect.

- Control (C)—DTE-controlled signal that controls the transmission on an X.21 link. This signal must be on during data transfer, and can be on or off during call-control phases.
- Indication (I)—DCE-controlled signal that controls the transmission on an X.21 link. This signal must be on during data transfer, and can be on or off during call-control phases.
- Signal Element Timing (S)—Clocking signal that is generated by the DCE. This signal specifies when sampling on the line must occur.
- Byte Timing (B)—Binary signal that is on when data or call-control information is being sampled. When an 8-byte transmission is over, this signal switches to off.

Transmissions across an X.21 link require both the DCE and DTE devices to be in a ready state, indicated by an all 1s transmission on the T and R signals.

Example: Configuring a Serial Interface

This example shows how to complete the initial configuration on a serial interface.

- [Requirements on page 2889](#)
- [Overview on page 2889](#)
- [Configuration on page 2889](#)
- [Verification on page 2890](#)

Requirements

Before you begin, install a serial PIM in the SRX Series device. See *SRX Series Services Gateways for the Branch Physical Interface Modules Hardware Guide*.

Overview

In this example, you create the interface se-1/0/0. You create the basic configuration for the new interface by setting the encapsulation type to ppp. Then you set the logical interface to 0. The logical unit number can range from 0 through 16,384. You can enter additional values for properties you need to configure on the logical interface, such as logical encapsulation or protocol family. Finally, you set IPv4 address 10.10.10.10/24 on the serial interface.

Configuration

**CLI Quick
Configuration**

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter commit from configuration mode.

```
set interfaces se-1/0/0 encapsulation ppp unit 0 family inet address 10.10.10.10/24
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a serial interface:

1. Create the interface.

```
[edit]  
user@host# edit interfaces se-1/0/0
```
2. Create the basic configuration for the new interface.

```
[edit interfaces se-1/0/0]  
user@host# set encapsulation ppp
```
3. Add logical interfaces.

```
[edit interfaces se-1/0/0]  
user@host# edit unit 0
```
4. Specify an IPv4 address for the interface.

```
[edit interfaces se-1/0/0 unit 0]  
user@host# set family inet address 10.10.10.10/24
```

Results From configuration mode, confirm your configuration by entering the **show interfaces se-1/0/0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]  
user@host# show interfaces se-1/0/0  
  
encapsulation ppp;  
unit 0 {  
  family inet {  
    address 10.10.10.10/24;  
  }  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying the Link State of All Interfaces on page 2890](#)
- [Verifying Interface Properties on page 2891](#)

Verifying the Link State of All Interfaces

Purpose Use the ping tool on each peer address in the network to verify that all interfaces on the device are operational.

Action For each interface on the device:

1. In the J-Web interface, select **Troubleshoot>Ping Host**.

2. In the Remote Host box, type the address of the interface for which you want to verify the link state.
3. Click **Start**. The output appears on a separate page.

```
PING 10.10.10.10 : 56 data bytes
64 bytes from 10.10.10.10: icmp_seq=0 ttl=255 time=0.382 ms
64 bytes from 10.10.10.10: icmp_seq=1 ttl=255 time=0.266 ms
```

If the interface is operational, it generates an ICMP response. If this response is received, the round-trip time, in milliseconds, is listed in the time field.

Verifying Interface Properties

Purpose Verify that the interface properties are correct.

Action From operational mode, enter the **show interfaces detail** command.

The output shows a summary of interface information. Verify the following information:

- The physical interface is Enabled. If the interface is shown as Disabled, do one of the following:
 - In the CLI configuration editor, delete the **disable** statement at the [edit interfaces se-1/0/0] level of the configuration hierarchy.
 - In the J-Web configuration editor, clear the **Disable** check box on the Interfaces> se-1/0/0 page.
- The physical link is Up. A link state of Down indicates a problem with the interface module, interface port, or physical connection (link-layer errors).
- The Last Flapped time is an expected value. It indicates the last time the physical interface became unavailable and then available again. Unexpected flapping indicates likely link-layer errors.
- The traffic statistics reflect expected input and output rates. Verify that the number of inbound and outbound bytes and packets matches expected throughput for the physical interface. To clear the statistics and see only new changes, use the **clear interfaces statistics se-1/0/0** command.

Example: Deleting a Serial Interface

This example shows how to delete a serial interface.

Requirements

No special configuration beyond device initialization is required before configuring an interface.

Overview

In this example, you delete the se-1/0/0 interface.

NOTE: Performing this action removes the interface from the software configuration and disables it. Network interfaces remain physically present, and their identifiers continue to appear on J-Web pages.

Configuration

Step-by-Step Procedure

To delete a serial interface:

1. Specify the interface you want to delete.

[edit]
user@host# **delete se-1/0/0**
2. If you are done configuring the device, commit the configuration.

[edit]
user@host# **commit**

Verification

To verify the configuration is working properly, enter the **show interfaces** command.

Understanding the 8-Port Synchronous Serial GPIM

A Gigabit-Backplane Physical Interface Module (GPIM) is a network interface card (NIC) that installs in the front slots of the SRX550 or SRX650 Services Gateway to provide physical connections to a LAN or a WAN.

The 8-port synchronous serial GPIM provides the physical connection to serial network media types, receiving incoming packets from the network and transmitting outgoing packets to the network. Besides forwarding packets for processing, the GPIM performs framing and line-speed signaling. This GPIM provides 8 ports that operate in sync mode and supports a line rate of 64 Mbps or 8 Mbps per port.

Supported Features

[Table 293](#) lists the features supported on the 8-port synchronous serial GPIM.

Table 293: Supported Features

Features	Description
Operation modes (autoselection based on cable, no configuration required)	<ul style="list-style-type: none"> • DTE (data terminal equipment) • DCE (data communication equipment)
Clocking	<ul style="list-style-type: none"> • Tx clock modes <ul style="list-style-type: none"> • DCE clock (only valid in DTE mode) • Baud clock (internally generated) • Loop clock (external) • Rx clock modes <ul style="list-style-type: none"> • Baud clock (internally generated) • Loop clock (external)
Clock rates (baud rates)	<p>1.2 KHz to 8.0 MHz</p> <p>NOTE: RS-232 serial interfaces might cause an error with a clock rate greater than 200 KHz.</p>
MTU	9192 bytes, default value is 1504 bytes
HDLC features	<ul style="list-style-type: none"> • Idle flag/fill (0x7e or all ones), default idle flag is (0x7e) • Counters—giants, runts, FCS error, abort error, align error
Line encoding	NRZ and NRZI
Invert data	Enabled
Line protocol	EIA530/EIA530A, X.21, RS-449, RS-232, V.35
Data cables	Separate cable for each line protocol (both DTE/DCE mode)
Error counters (conformance to ANSI specification)	Enabled
Alarms and defects	<ul style="list-style-type: none"> • Rx clock absent • Tx clock absent • DCD absent • RTS/CTS absent • DSR/DTR absent
Data signal	Rx clock
Control signals	<ul style="list-style-type: none"> • To DTE: CTS, DCD, DSR • From DTE: DTR, RTS
Serial autoresync	<ul style="list-style-type: none"> • Configurable resync duration • Configurable resync interval

Table 293: Supported Features (*continued*)

Features	Description
Diagnostic features	<ul style="list-style-type: none"> • Loopback modes—local, remote, and dce-local loopback • Ability to ignore control signals
Layer 2 features	Encapsulation <ul style="list-style-type: none"> • PPP • Cisco HDLC • Frame Relay • MLPPP • MLFR
SNMP features	SNMP information receivable at each port <ul style="list-style-type: none"> • IF-MIB - rfc2863a.mib • jnx-chassis.mib
Anticounterfeit check	Enabled

Example: Configuring an 8-Port Synchronous Serial GPIM in Back-to-Back SRX650 Services Gateways

This example shows how to perform a basic back-to-back device configuration with an 8-port synchronous serial GPIM. It describes the most common scenario in which a serial GPIM is deployed.

In this example, the SRX650 devices are shown as both data communication equipment (DCE) and data terminal equipment (DTE). In certain deployment scenarios, the DTE can be a serial modem or an encryptor or decryptor.

- [Requirements on page 2894](#)
- [Overview and Topology on page 2895](#)
- [Configuration on page 2896](#)
- [Verification on page 2904](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.1 R2 or later for SRX Series Services Gateways.
- Two SRX650 devices connected back-to-back.

- Two 8-port synchronous serial GPIMs.
- Four pairs of DCE and DTE cables. The cable can be any type as mentioned in *8-Port Serial GPIM Interface Cables*.

Before you begin:

- Establish basic connectivity. See the Getting Started Guide for your device.
- Configure network interfaces as necessary. See [“Example: Creating an Ethernet Interface” on page 2634](#).

Overview and Topology

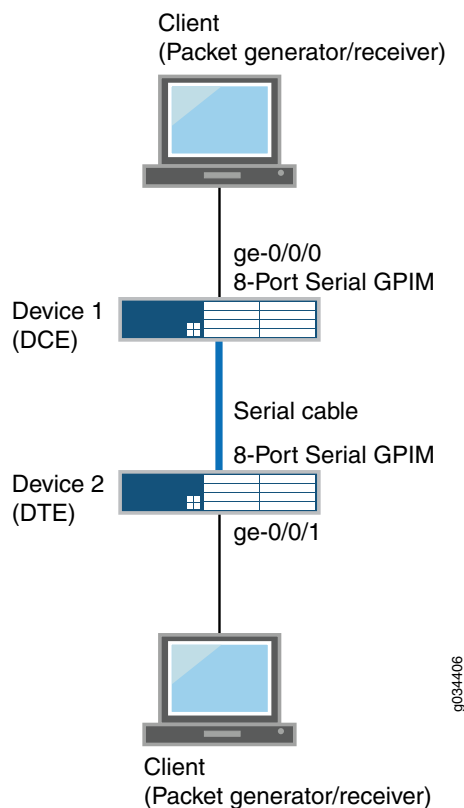

In this scenario, the configuration is done on two interfaces. All ports are configured with different encapsulations, such as Cisco High-Level Data Link Control (HDLC), Frame Relay, and Point-to-Point Protocol (PPP). When Frame Relay is set, then the data link connection identifier (in this example, 111) must also be set.

In this example, all eight ports on Device 1 (SRX650) are configured in DTE mode and their respective eight ports on Device 2 (SRX650) are configured in DCE mode.

For Device 1, you set the encapsulation type to **ppp**. Then you set the logical interface to **0**. The logical unit number can range from 0 through 16,384. You can enter additional values for properties you need to configure on the logical interface, such as logical encapsulation or protocol family. Finally, you set the IPv4 address to 10.10.10.1/24 on the serial port. For Device 2, you follow a procedure similar to Device 1, but you set the clocking mode to **dce**.

[Figure 139](#) shows the topology used in this example.

Figure 139: Basic Back-to-Back Device Configuration

Configuration

CLI Quick Configuration To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
Device 1  set interfaces se-7/0/0 mtu 9192
          set interfaces se-7/0/0 encapsulation ppp
          set interfaces se-7/0/0 serial-options clocking-mode internal
          set interfaces se-7/0/0 unit 0 family inet address 10.10.10.1/24
          set interfaces se-7/0/1 mtu 9192
          set interfaces se-7/0/1 encapsulation cisco-hdlc

set routing-options static route 34.34.34.0/24 next-hop 17.17.17.1

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the interfaces on Device 1:

1. Specify the maximum transmission unit (MTU) value for the interface.

```

[edit interfaces]
user@host# set se-7/0/0 mtu 9192

```

2. Configure the encapsulation type.

```

[edit interfaces]
user@host# set se-7/0/0 encapsulation ppp

```

3. Configure the serial options, such as the clocking mode.

```

[edit interfaces]
user@host# set se-7/0/0 serial-options clocking-mode internal

```

4. Set the IPv4 address on the serial port.

```

[edit interfaces]
user@host# set se-7/0/0 unit 0 family inet address 10.10.10.1/24

```

5. Configure the static route information.

```

[edit routing-options]
user@host# set static route 21.21.21.0/24 next-hop 10.10.10.2

```

NOTE: Repeat the same configuration for the other seven ports on Device 1.

6. If you are done configuring the device, commit the configuration.

```

[edit]
user@host# commit

```

Step-by-Step Procedure To configure the interfaces on Device 2:

1. Specify the MTU value for the interface.

```
[edit interfaces]
user@host# set se-3/0/0 mtu 9192
```
2. Configure the encapsulation type.

```
[edit interfaces]
user@host# set se-3/0/0 encapsulation ppp
```
3. Configure the serial options, such as the clocking mode.

```
[edit interfaces]
user@host# set se-3/0/0 serial-options clocking-mode dce
```
4. Set the IPv4 address on the serial port.

```
[edit interfaces]
user@host# set se-3/0/0 unit 0 family inet address 10.10.10.2/24
```
5. Configure the static route information.

```
[edit routing-options]
user@host# set static route 20.20.20.0/24 next-hop 10.10.10.1
```

NOTE: Repeat the same configuration for the other seven ports on Device 2.

6. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Results

From configuration mode, confirm your configuration by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

[edit]
user@host# show routing-options
static {
    route 20.20.20.0/24 next-hop 10.10.10.1;
    route 22.22.22.0/24 next-hop 11.11.11.1;
    route 24.24.24.0/24 next-hop 12.12.12.1;
    route 26.26.26.0/24 next-hop 13.13.13.1;
    route 28.28.28.0/24 next-hop 14.14.14.1;
    route 30.30.30.0/24 next-hop 15.15.15.1;
    route 32.32.32.0/24 next-hop 16.16.16.1;
    route 34.34.34.0/24 next-hop 17.17.17.1;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying Interface Link Status on page 2904](#)
- [Verifying Interface Statistics for DCE on page 2904](#)
- [Verifying Interface Statistics for DTE on page 2906](#)

Verifying Interface Link Status

Purpose Verify that the interface link status is up.

Action From operational mode, enter the **show interface terse se-7/0/*** command.

```
user@srx650-1> show interface terse se-7/0/*
```

Interface	Admin	Link	Proto	Local	Remote
se-7/0/0	up	up			
se-7/0/0.0	up	up	inet	10.10.10.1/24	
se-7/0/1	up	up			
se-7/0/1.0	up	up	inet	11.11.11.1/24	
se-7/0/2	up	up			
se-7/0/2.0	up	up	inet	12.12.12.1/24	
se-7/0/3	up	up			
se-7/0/3.0	up	up	inet	13.13.13.1/24	
se-7/0/4	up	up			
se-7/0/4.0	up	up	inet	14.14.14.1/24	
se-7/0/5	up	up			
se-7/0/5.0	up	up	inet	15.15.15.1/24	
se-7/0/6	up	up			
se-7/0/6.0	up	up	inet	16.16.16.1/24	
se-7/0/7	up	up			
se-7/0/7.0	up	up	inet	17.17.17.1/24	

Meaning The output displays a list of all interfaces configured. If the Link column displays **up** for all interfaces, the configuration is working properly. This verifies that the GPIM is up and end-to-end ping is working.

Verifying Interface Statistics for DCE

Purpose Verify that the interfaces are configured properly for DCE.

Action From operational mode, enter the **show interface se-7/0/0 extensive | no-more** command.

```
user@srx650-1> show interface se-7/0/0 extensive | no-more
```

```

Chassis Configuration Statement Hierarchy

Use the statements in the **chassis** configuration hierarchy to configure alarms, aggregated devices, clusters, the Routing Engine, and other chassis properties.

```
chassis {
  aggregated-devices {
    ethernet {
      device-count number;
      lacp {
        link-protection {
          non-revertive;
        }
        system-priority number;
      }
    }
    sonet {
      device-count number;
    }
  }
  alarm {
    ds1 {
      ais (ignore | red | yellow);
      ylw (ignore | red | yellow);
    }
    ethernet {
      link-down (ignore | red | yellow);
    }
    integrated-services {
      failure (ignore | red | yellow);
    }
    management-ethernet {
      link-down (ignore | red | yellow);
    }
    serial {
      cts-absent (ignore | red | yellow);
      dcd-absent (ignore | red | yellow);
      dsr-absent (ignore | red | yellow);
      loss-of-rx-clock (ignore | red | yellow);
      loss-of-tx-clock (ignore | red | yellow);
    }
    services {

Class-of-Service Configuration Statement Hierarchy

Use the statements in the **class-of-service** configuration hierarchy to configure class-of-services (CoS) features.

```

class-of-service {
    adaptive-shapers adaptive-shaper-name {
        trigger becn {
            shaping-rate (absolute-rate | percent percent);
        }
    }
    application-traffic-control {
        rate-limiters rate-limiter-name {
            bandwidth-limit kbps;
            burst-size-limit bytes;
        }
        rule-sets rule-set-name {
            rule rule-name {
                match {
                    application [application-name];
                    application-any;
                    application-group [application-group-name];
                    application-known;
                    application-unknown;
                }
                then {
                    dscp-code-point dscp-value;

Interfaces Configuration Statement Hierarchy

Use the statements in the **interfaces** configuration hierarchy to configure interfaces on the device.

NOTE: For a gigabit ethernet interface, the **gigether-options** and **ether-options** are identical, but only the **gigether-options** are documented.

```

interfaces {
  interface-name {
    accounting-profile name;
    clocking (external | internal);
    dce;
    description text;
    disable;
    e1-options {
      bert-algorithm algorithm;
      bert-error-rate rate;
      bert-period seconds;
      fcs (16 | 32);
      framing (g704 | g704-no-crc4 | unframed);
      idle-cycle-flag (flags | ones);
      invert-data data;
      loopback (local | remote);
      start-end-flag (shared | filler);
      timeslots time-slot-range;
    }
    e3-options {
      bert-algorithm algorithm;
      bert-error-rate rate;
      bert-period seconds;
    }
  }
}

```

```

compatibility-mode {
  digital-link {
    subrate value;
  }
  kentrox {
    subrate value;
  }

PoE Configuration Statement Hierarchy

To configure Power over Ethernet options, use the configuration statements in the **poe** configuration hierarchy. Statement descriptions that are exclusive to the SRX Series devices running Junos OS are described in this chapter.

```

poe {
    fpc slot-number {
        maximum-power watts;
        priority (high | low);
    }
    guard-band watts;
    interface (all | interface-name) {
        disable;
        maximum-power watts;
    }
}

```

```

    priority (high | low);
    telemetries {
        disable;
        duration hours;
        interval minutes;
    }
}
management (class | static);
}

```

accept-source-mac

Syntax

```

accept-source-mac {
    mac-address mac-address;
}

```

Hierarchy Level [edit interfaces *interface-name* unit logical-unit-number]

Release Information Statement introduced in Junos OS Release 11.4.

Description For Gigabit Ethernet (GE), Fast Ethernet (FE), or 10 Gigabit Ethernet (XE) interfaces, specify the MAC addresses from which the interface can receive packets. Ensure that you update the MAC address if the remote Ethernet card is replaced. Replacing the interface card changes the MAC address. If you do not update the MAC address, the interface cannot receive packets from the new card.

NOTE:

- Software-based MAC limiting is supported on SRX100, SRX210, SRX220, SRX240, and SRX650 devices. A maximum of 32 MAC addresses is supported per device.

Options *mac-address* —MAC address filter. You can specify the MAC address as six hexadecimal bytes in one of the following formats: *nn:nn:nn:nn:nn:nn* (for example, 00:11:22:33:44:55) or *nnnn:nnnn:nnnn* (for example, 0011.2233.4455). You can configure up to 32 source addresses. To specify more than one address, include multiple *mac-addresses* in the **source-address-filter** statement.

Required Privilege Level

interface—To view this statement in the configuration..

interface-control—To add this statement to the configuration.

Related Documentation

access-point-name

Syntax	<code>access-point-name <i>apn</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> cellular-options gsm-options profiles <i>profile-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Configure the access point name (APN) provided by the service provider for connection to a Global System for Mobile Communications (GSM) cellular network.
Options	<i>apn</i> —Access point name.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • 3G Wireless Modem Overview on page 2835

annex (Interfaces)

Syntax	<code>annex <i>annex-type</i></code>
Hierarchy Level	<code>[edit interfaces <i>interfaces-name</i> shdsl-options]</code>
Release Information	Command introduced in Junos OS Release 10.0
Description	Select an annex type that suits your requirements for configuring G.SHDSL interface.
Options	<ul style="list-style-type: none"> • Annex A • Annex-auto • Annex B • Annex F • Annex G

NOTE: The default configuration is annex-auto instead of annex-b.

Required Privilege Level	<ul style="list-style-type: none"> • interface—To view this statement in the configuration. • interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Example: Configuring the G.SHDSL Interface on SRX Series Devices on page 2537

apply-groups

Syntax	apply-groups;
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> radio-router]
Release Information	Statement introduced in Junos OS Release 9.6. Statement modified in Junos OS Release 15.1.
Description	Apply the groups from which to inherit configuration data. If radio-router is set without any other attributes specified, the first four values become 100 and threshold stays at 10, and capacity, margin, and delay are deprecated. If radio-router is set, do not change the OSPF reference-bandwidth value because this generates an incorrect link cost.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring PPPoE-Based Radio-to-Router Protocols on page 2756

arp-resp

Syntax	arp-resp (restricted unrestricted);
Hierarchy Level	[edit interfaces <i>interfaces-name</i> unit <i>logical-unit-number</i>]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	Configure Address Resolution Protocol (ARP) response on the interface.
Options	<ul style="list-style-type: none"> • restricted—Enable restricted proxy ARP response on the interface. This is the default. • unrestricted—Enable unrestricted ARP response on the interface.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Static ARP Entries on Ethernet Interfaces on page 2633

authentication-method (Interfaces)

Syntax	<code>authentication-method (pap chap none);</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> cellular-options gsm-options profiles <i>profile-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Specify the authentication method for connection to a Global System for Mobile Communications (GSM) cellular network.
Options	<ul style="list-style-type: none">• pap—Password Authentication Protocol.• chap—Challenge Handshake Authentication Protocol.• none—No authentication method is used.
Required Privilege Level	<code>interface</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• 3G Wireless Modem Overview on page 2835

bandwidth (Interfaces)

Syntax	<code>bandwidth <i>bandwidth</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> radio-router]</code>
Release Information	Statement introduced in Junos OS Release 10.1.
Description	This option controls the weight of the current (vs. maximum) data rate (value 0–100).
Required Privilege Level	<code>interface</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• PPPoE-Based Radio-to-Router Protocols Overview on page 2753

bundle (Interfaces)

Syntax	<code>bundle <i>bundle-name</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mlppp]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Specify the logical interface name the link joins.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

cbr rate

Syntax	<code>cbr rate;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> atm-options vpi <i>vpi-identifier</i> shaping]</code>
Release Information	Command introduced in Junos OS Release 9.5.
Description	For ATM encapsulation only, define a constant bit rate bandwidth utilization in the traffic-shaping profile.
Options	<ul style="list-style-type: none"> • CBR Value—Constant bandwidth utilization (range: 33,000 through 1,199,920) • CDVT—Cell delay variation tolerance in microseconds (range: 1 through 9999)
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

cellular-options

Syntax

```
cellular-options {  
  roaming-mode (home only | automatic)  
  gsm-options {  
    select-profile profile-name;  
    profiles {  
      profile-name {

classifiers (CoS)

Syntax	<pre> classifiers { (dscp dscp-ipv6 exp ieee-802.1 ieee-802.1ad inet-precedence) <i>classifier-name</i> { forwarding-class <i>forwarding-class-name</i> { loss-priority (high low medium-high medium-low) { code-point <i>alias-or-bit-string</i> ; } import (default <i>user-defined</i>); } } } </pre>
Hierarchy Level	[edit class-of-service]
Release Information	Statement introduced in Junos OS Release 9.2
Description	Configure a user-defined behavior aggregate (BA) classifier.
Options	<ul style="list-style-type: none"> • <i>classifier-name</i>—User-defined name for the classifier. • import (default <i>user-defined</i>)—Specify the template to use to map any code points not explicitly mapped in this configuration. For example, if the classifier is of type dscp and you specify import default, code points you do not map in your configuration will use the predefined DSCP default mapping; if you specify import mymap, for example, code points not mapped in the forwarding-class configuration would use the mappings in a user-defined classifier named mymap. • forwarding-class <i>class-name</i>—Specify the name of the forwarding class. You can use the default forwarding class names or define new ones. • loss-priority <i>level</i>—Specify a loss priority for this forwarding class: high, low, medium-high, medium-low. • code-points (<i>alias</i> <i>bits</i>)—Specify a code-point alias or the code points that map to this forwarding class.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

client-identifier (Interfaces)

Syntax	client-identifier { (ascii <i>string</i> hexadecimal <i>string</i>); }
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family-name</i> dhcp]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Specify an ASCII or hexadecimal identifier for the Dynamic Host Configuration Protocol (DHCP) client. The DHCP server identifies a client by a client-identifier value.
Options	<ul style="list-style-type: none"> • ascii <i>ascii</i>—Identifier consisting of ASCII characters. • hexadecimal <i>hexadecimal</i>—Identifier consisting of hexadecimal characters.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

code-points (CoS)

Syntax	code-points [<i>aliases</i>] [<i>bit-patterns</i>];
Hierarchy Level	[edit class-of-service classifiers (dscp ieee-802.1) <i>classifier-name</i> forwarding-class <i>class-name</i> loss-priority <i>level</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure one or more code-point aliases or bit sets to apply to a forwarding class.

NOTE: OCX Series switches do not support MPLS, so they do not support EXP code points or code point aliases.

Options	<i>aliases</i> —Name of the alias or aliases. <i>bit-patterns</i> —Value of the code-point bits, in decimal form.
Required Privilege Level	interfaces—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407 • Example: Configuring BA Classifiers on Transparent Mode Devices on page 3209

compression-device (Interfaces)

Syntax	<code>compression-device <i>name</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit (Interfaces) <i>logical-unit-number</i>]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Specify the compression interface for voice services traffic.
Options	<i>name</i> —Name of the AC.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

credit (Interfaces)

Syntax	<pre>credit { interval <i>number</i>; }</pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> radio—router]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	This parameter controls credit-based scheduling parameters and includes an interval option to set the grant rate interval to a value between 1–60 seconds.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

data-rate

Syntax	<code>data-rate <i>number</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> radio-router]
Release Information	Statement introduced in Junos OS Release 10.2.
Description	Configure the weight of the resource factor when calculating an effective data rate.
Options	weight —Factor used to calculate data rate. Range: 0 through 100 Default: 100
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Interfaces on page 2407

disable (PoE)

Syntax	<code>disable;</code>
Hierarchy Level	[edit poe interface (all <i>interface-name</i>)] [edit poe interface (all <i>interface-name</i>) telemetries]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Disables the PoE capabilities of the port. If PoE capabilities are disabled for a port, the port operates as a standard network access port. If the disable statement is specified after the telemetries statement, logging of PoE power consumption for the port is disabled. To disable monitoring and retain the stored interval and duration values for possible future use, you can specify the disable sub statement in the sub stanza for telemetries. Similarly for retaining the port configuration but disabling the PoE feature on the port, disable can be used in sub stanza for interface.
Default	The PoE capabilities are automatically enabled when a PoE interface is set. Specifying the telemetries statement enables monitoring of PoE per-port power consumption.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

dhcp (Interfaces)

Syntax	<pre>dhcp { client-identifier { (ascii <i>string</i> hexadecimal <i>string</i>); } lease-time (<i>length</i> infinite); retransmission-attempt <i>value</i>; retransmission-interval <i>seconds</i>; server-address <i>server-address</i>; update-server; vendor-id <i>vendor-id</i>; }</pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Configure the Dynamic Host Configuration Protocol (DHCP) client.
Options	The statements are explained separately.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

duration (PoE)

Syntax	<code>duration <i>hours</i>;</code>
Hierarchy Level	[edit poe interface (all <i>interface-name</i>) telemetries]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Modifies the duration for which telemetry records are stored. If telemetry logging continues beyond the specified duration, the older records are discarded one by one as new records are collected.
Options	hours— Hours for which telemetry data should be retained. Range: 1 through 24 hours Default: 1 hour
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Example: Configuring PoE on All Interfaces on page 2714

encapsulation (Interfaces)

Syntax	encapsulation (ether-vpls-ppp ethernet-bridge ethernet-ccc ethernet-tcc ethernet-vpls extended-frame-relay-ccc extended-frame-relay-tcc extended-vlan-bridge extended-vlan-ccc extended-vlan-tcc extended-vlan-vpls frame-relay-port-ccc vlan-ccc vlan-vpls);
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Specify logical link layer encapsulation.
Options	<ul style="list-style-type: none"> • cisco-hdlc—For normal mode (when the device is using only one B-channel). Cisco-compatible High-Level Data Link Control is a group of protocols for transmitting data between network points • frame-relay—Configure a Frame Relay encapsulation when the physical interface has multiple logical units, and the units are either point to point or multipoint. • multilink-frame-relay-uni-nni—Link services interfaces functioning as FRF.16 bundles can use Multilink Frame Relay UNI NNI encapsulation. • ppp—For normal mode (when the device is using only one ISDN B-channel per call). Point-to-Point Protocol is for communication between two computers using a serial interface. • ppp-over-ether—This encapsulation is used for underlying interfaces of pp0 interfaces.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Hierarchy Level [edit interfaces *interface* unit *unit*]

Release Information Statement introduced in a prior release of Junos OS.

Description Assign an IP address to a logical interface.

Options *ipaddress*—Specifies the IP address for the interface.

NOTE: You use family inet to assign an IPv4 address. You use family inet6 to assign an IPv6 address. An interface can be configured with both an IPv4 and IPv6 address.

Required Privilege Level **interface**—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

flag (Interfaces)

Syntax flag

Hierarchy Level [edit interfaces interface-name traceoptions]

Release Information Statement introduced in Junos OS Release 10.1.

Description Define tracing operations for individual interfaces. To specify more than one tracing operation, include multiple flag statements.

Options • **all**—Enable all interface trace flags.
 • **event** —Trace interface events.
 • **cache**—Enable interface flags for Web filtering cache maintained on the routing table.
 • **enhanced**—Enable interface flags for processing through Enhanced Web Filtering.
 • **ipc**—Trace interface IPC messages.
 • **media**—Trace interface media changes.
 • **critical**—Trace critical events.
 • **major**—Trace major events.

NOTE:

- MTU is limited to 1518 on this interface.
 - Cache and enhanced options are applicable only to Enhanced Web Filtering.
-

Required Privilege Level **interface**—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

forwarding-classes (CoS)

Syntax	<pre> forwarding-classes { class <i>class-name</i> { priority (high low); queue-num <i>number</i>; spu-priority (high low); } queue <i>queue-number</i> { <i>class-name</i> { priority (high low); } } } </pre>
Hierarchy Level	[edit class-of-service]
Release Information	Statement introduced in Junos OS Release 8.5. Statement updated in Junos OS Release 11.4. The spu-priority option introduced in Junos OS Release 11.4R2.
Description	Configure forwarding classes and assign queue numbers.
Options	<ul style="list-style-type: none"> <i>class-name</i>—Display the forwarding class name assigned to the internal queue number.

NOTE: This option is supported only on high-end SRX Series devices, including the SRX1500, SRX5400, SRX5600, and SRX5800.

NOTE: AppQoS forwarding classes must be different from those defined for interface-based rewriters.

- **policing-priority**—Layer 2 policing. One forwarding class can be configured as **premium** and others are configured as **normal**.
- **priority**—Fabric priority value:
 - **high**—Forwarding class's fabric queuing has high priority.
 - **low**—Forwarding class's fabric queuing has low priority.
- *queue-number*—Specify the internal queue number to which a forwarding class is assigned.
- **spu-priority**—Services Processing Unit (SPU) priority queue, either **high** or **low**.

NOTE: The **spu-priority** option is only supported on SRX1500, SRX3000 line, and SRX5000 line devices.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Hierarchy Level [edit class-of-service interface *interface-name* unit *number*]

Release Information Statement introduced in Junos OS Release 9.2.

Description Associate the class-of-service configuration elements with an interface.

Options interface *interface-name* unit *number*—The user-specified interface name and unit number.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

Related Documentation • [Understanding Interfaces on page 2407](#)

interval (Interfaces)

Syntax	<code>interval <i>seconds</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> radio-router credit]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	Configure the frequency that the router generates credit announcement messages.
Options	<p><i>seconds</i>—Interval between PADG credit announcements for each session.</p> <p>Range: 0 through 60</p> <p>Default: 1</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

interval (PoE)

Syntax	<code>interval <i>minutes</i>;</code>
Hierarchy Level	[edit poe interface (all <i>interface-name</i>) telemetries]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Modifies the interval for logging telemetries if you are monitoring the per-port power consumption for PoE interfaces.
Options	<p><i>minutes</i>—Interval at which data is logged.</p> <p>Range: 1 through 30 minutes</p> <p>Default: 5 minutes</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

lACP (Interfaces)

Syntax	<code>lACP { port-priority <i>port-number</i>; }</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> redundant-ether-options]
Release Information	Statement introduced in Junos OS Release 10.2.
Description	For redundant Ethernet interfaces in a chassis cluster only, configure Link Aggregation Control Protocol (LACP).
Options	<ul style="list-style-type: none">• active—Initiate transmission of LACP packets.• passive—Respond to LACP packets. <p>Default: If you do not specify lACP as either active or passive, LACP remains off (the default).</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	<code>interface</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding LACP on Standalone Devices on page 2659

latency (Interfaces)

Syntax	<code>latency <i>number</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> radio—router]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	This option controls the latency weight (value 0–100).
Required Privilege Level	<code>interface</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• PPPoE-Based Radio-to-Router Protocols Overview on page 2753

lease-time

Syntax	lease-time (<i>length</i> infinite);
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Request a specific lease time for the IP address.
Default	If no lease time is requested by client, then the server sends the lease time. The default lease time on a Junos OS DHCP server is one day.
Options	<p>seconds—Request a lease time of a specific duration. Range: 60 through 2147483647 seconds</p> <p>infinite—Request that the lease never expire.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

line-rate (Interfaces)

Syntax	line-rate
Hierarchy Level	[edit interfaces <i>interfaces name</i> shdsl-options]
Release Information	Command introduced in Junos OS Release 10.0.
Description	Specify a line rate for an G.SHDSL interface.
Options	<ul style="list-style-type: none"> • auto— Automatically selects a line rate. • value — Select the values between 192 kbps and 22784 kbps for the speed of transmission of data on the G.SHDSL connection.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

link-speed (Interfaces)

Syntax	<code>link-speed <i>speed</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> redundant-ether-options]</code>
Release Information	Statement modified in Junos OS Release 9.2.
Description	For redundant Ethernet interfaces in a chassis cluster only, set the required link speed.
Options	<i>speed</i> —For redundant Ethernet links, you can specify <i>speed</i> in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

loopback (Interfaces)

Syntax	<code>(loopback no-loopback);</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> redundant-ether-options]</code>
Release Information	Statement modified in Junos OS Release 9.2.
Description	For Fast Ethernet, Gigabit Ethernet, and redundant Ethernet interfaces, enable or disable loopback mode.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Interfaces on page 2407

loss-priority (CoS Loss Priority)

Syntax	<code>loss-priority <i>level</i> code-points[<i>values</i>];</code>
Hierarchy Level	[edit class-of-service loss-priority-maps frame-relay-de <i>map-name</i>]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Map CoS values to a loss priority.
Options	<i>level</i> can be one of the following: <ul style="list-style-type: none">• high—Packet has high loss priority.• medium-high—Packet has medium-high loss priority.• medium-low—Packet has medium-low loss priority.• low—Packet has low loss priority.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Interfaces on page 2407

loss-priority (CoS Rewrite Rules)

Syntax	<code>loss-priority <i>level</i>;</code>
Hierarchy Level	<code>[edit class-of-service rewrite-rules <i>type rewrite-name</i> forwarding-class <i>class-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.2.
Description	<p>Specify a loss priority to which to apply a rewrite rule. The rewrite rule sets the code-point aliases and bit patterns for a specific forwarding class and packet loss priority (PLP). The inputs for the map are the forwarding class and the PLP. The output of the map is the code-point alias or bit pattern.</p>
Options	<p><i>level</i> can be one of the following:</p> <ul style="list-style-type: none">• high—The rewrite rule applies to packets with high loss priority.• low—The rewrite rule applies to packets with low loss priority.• medium-high—The rewrite rule applies to packets with medium-high loss priority.• medium-low—The rewrite rule applies to packets with medium-low loss priority.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Understanding Interfaces on page 2407

loss-priority-maps (CoS Interfaces)

Syntax	<pre>loss-priority-maps { frame-relay-de (<i>map-name</i> default); }</pre>
Hierarchy Level	[edit class-of-service interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Assign the loss priority map to a logical interface.
Options	<ul style="list-style-type: none"> • default—Apply default loss priority map. The default map contains the following: <pre>loss-priority low code-point 0; loss-priority high code-point 1;</pre> • map-name—Name of loss priority map to be applied.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

loss-priority-maps (CoS)

Syntax	<pre>loss-priority-maps { frame-relay-de <i>loss-priority-map-name</i> { loss-priority (high low medium-high medium-low) { code-points [<i>bit-string</i>]; } } }</pre>
Hierarchy Level	[edit class-of-service]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Map the loss priority of incoming packets based on CoS values.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

management (PoE)

Syntax	management (class static);
Hierarchy Level	[edit poe]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Designates how the SRX Series device allocates power to the PoE ports.
Default	static
Options	<ul style="list-style-type: none">• static—When a powered device is connected to a PoE port, the power allocated to it is equal to the maximum power configured for the port.• class—When a powered device is connected to a PoE port, the power allocated to it is equal to the maximum power for the class as defined by the IEEE 802.3 AF standard.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Example: Configuring PoE on All Interfaces on page 2714

maximum-power (PoE)

Syntax	maximum-power watts;
Hierarchy Level	[edit poe interface (all <i>interface-name</i>)]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Maximum amount of power that can be supplied to the port.
Default	15.4 W
Options	Watts —The maximum number of watts that can be supplied to the port. Range —0 through 15.4 Default —15.4 W
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Example: Configuring PoE on All Interfaces on page 2714

media-type (Interfaces)

Syntax	<code>media-type</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> media-type]
Release Information	Command introduced in Junos OS Release 10.2.
Description	Configure the operating modes for the 2-Port 10 Gigabit Ethernet XPIM.
Options	<ul style="list-style-type: none"> • copper • fiber
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

minimum-links (Interfaces)

Syntax	<code>minimum-links <i>number</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> redundant-ether-options]
Release Information	Statement added in Junos OS Release 10.1.
Description	<p>For redundant Ethernet interfaces configured as 802.3ad redundant Ethernet interface link aggregation groups (LAGs) in a chassis cluster only, set the required minimum number of physical child links on the primary node that must be working to prevent the interface from being down. Interfaces configured as redundant Ethernet interface LAGs typically have between 4 and 16 physical interfaces, but only half, those on the primary node, are relevant to the minimum-links setting.</p> <p>If the number of operating interfaces on the primary node falls below the configured value, it will cause the interface to be down even if some of the interfaces are still working.</p>
Options	<i>number</i> —For redundant Ethernet interface link aggregation group links, specify the number of physical child links on the primary node in the redundant Ethernet interface that must be working. The default minimum-links value is 1. The maximum value is half of the total number of physical child interfaces bound to the redundant Ethernet interface being configured or 8, whichever is smaller.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

native-vlan-id (Interfaces)

Syntax	<code>native-vlan-id <i>vlan-id</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Configure VLAN identifier for untagged packets received on the physical interface of a trunk mode interface.
Options	<i>vlan-id</i> —Configure a VLAN identifier for untagged packets. Enter a number from 0 through 4094.
Required Privilege Level	interface —To view this statement in the configuration. interface-control —To add this statement to the configuration
Related Documentation	<ul style="list-style-type: none">• Understanding Interfaces on page 2407

next-hop-tunnel

Syntax	<code>next-hop-tunnel <i>gateway-address</i> ipsec-vpn <i>vpn-name</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	For the secure tunnel (st) interface, create entries in the Next-Hop Tunnel Binding (NHTB) table, which is used to map the next-hop gateway IP address to a particular IP Security (IPsec) Virtual Private Network (VPN) tunnel. NHTB allows the binding of multiple IPsec VPN tunnels to a single IPsec tunnel interface.
Options	<ul style="list-style-type: none">• <i>gateway-address</i>—Next-hop gateway IP address.• <i>ipsec-vpn vpn-name</i> —VPN to which the next-hop gateway IP address is mapped.
Required Privilege Level	interface —To view this statement in the configuration. interface-control —To add this statement to the configuration.

pic-mode (Chassis T1 Mode)

Syntax	pic-mode (clear-channel);
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ethernet]
Release Information	Statement added in Junos OS Release 10.2.
Description	Configure normal T1 mode or channelized T1 mode.
Options	<ul style="list-style-type: none"> • clear-channel—(default) Normal T1 mode. • ct1—Channelized T1 mode.
<div style="display: flex; align-items: center;">  <div> <p>NOTE: When chassis clustering is enabled, it is necessary to indicate in the command which node is being configured. In such circumstances, the edit chassis fpc command becomes edit chassis node <i>node-id</i> fpc.</p> </div> </div>	
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

periodic (Interfaces)

Syntax	periodic (fast slow);
Hierarchy Level	[edit interfaces <i>interface-name</i> redundant-ether-options lacp]
Release Information	Statement introduced in Junos OS Release 10.2.
Description	For redundant Ethernet interfaces in a chassis cluster only, configure the interval at which the interfaces on the remote side of the link transmit link aggregation control protocol data units (PDUs) by configuring the periodic statement on the interfaces on the local side. It is the configuration on the local side that specifies the behavior of the remote side. That is, the remote side transmits link aggregation control PDUs at the specified interval.
Options	<ul style="list-style-type: none">• fast—Transmit link aggregation control PDUs every second.• slow—Transmit link aggregation control PDUs every 30 seconds. <p>Default: fast</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Ethernet Interfaces on page 2629

ppp-over-ether

Syntax	ppp-over-ether;
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> encapsulation]
Release Information	Statement introduced before Junos OS Release 11.2 This encapsulation is supported for Redundant Ethernet interface in Release 11.2 of Junos OS.
Description	This encapsulation is used for underlying interfaces of pp0 interfaces. This encapsulation is supported on Fast Ethernet interface, Gigabit Ethernet interface, and Redundant Ethernet interface. When Redundant Ethernet interface is used as underlying interface, an existing pppoe session can be continued in case of failover.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Ethernet Interfaces on page 2629

pppoe

Syntax	<pre>pppoe { command <i>binary-file-path</i>; disable; failover (alternate-media other-routing-engine); }</pre>
Hierarchy Level	[edit system processes]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Enable users to connect to a network of hosts over a bridge or access concentrator.
Options	<ul style="list-style-type: none"> • command <i>binary-file-path</i>—Path to the binary process. • disable—Disable the Point-to-Point Protocol over Ethernet process. • failover—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot. <ul style="list-style-type: none"> • alternate-media—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly. • other-routing-engine—Instruct the secondary Routing Engine to take mastership if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Ethernet Interfaces on page 2629

pppoe-options

Syntax	<pre>pppoe-options { access-concentrator <i>name</i> ; auto-reconnect <i>seconds</i>; (client server); service-name <i>name</i>; underlying-interface <i>interface-name</i>; }</pre>
Hierarchy Level	[edit interfaces pp0 unit <i>logical-unit-number</i>], [edit logical-systems <i>logical-system-name</i> interfaces pp0 unit <i>logical-unit-number</i>]
Release Information	Statement modified in Junos OS Release 12.3X48 to include ignore-eol-tag statement.
Description	Configure PPP over Ethernet-specific interface properties.
Options	<p>close-server <i>name</i>—(SRX Series devices with Point-to-Point Protocol over Ethernet (PPPoE) interfaces) Configure the name of the access concentrator. If you configure a specific access concentrator name on the client and the same access concentrator name server is available, then a PPPoE session is established. If there is a mismatch between the access concentrator names of the client and the server, the PPPoE session gets closed.</p> <p>auto-reconnect <i>seconds</i>—Configure the amount of time to wait before reconnecting after a session has terminated.</p> <p>client —Configure the device to operate in the PPPoE client mode.</p> <p>idle-timeout <i>seconds</i>—Configure the maximum time that a session can be idle.</p> <p>ignore-eol-tag—Disable the End-of-List tag to process the tags after the End-of-List tag in a PPPoE Active Discovery Offer (PADO) packet.</p> <p>service-name <i>name</i>—Configure the service to be requested from the PPP over Ethernet server; that is, the access concentrator. For example, you can use this statement to indicate an Internet service provider (ISP) name or a class of service.</p> <p>server—Configure the device to operate in the PPPoE server mode.</p> <p>underlying-interface <i>interface-name</i>—Configure the interface on which PPP over Ethernet is running.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> Configuring a PPPoE Interface

priority (PoE)

Syntax	priority (high low);
Hierarchy Level	[edit poe interface (all <i>interface-name</i>)]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	<p>Sets the priority of individual ports. When it is not possible to maintain power to all connected ports, lower-priority ports are powered off before higher priority ports. When a new device is connected on a higher-priority port, a lower-priority port will be powered off automatically if available power is insufficient to power on the higher-priority port. Note that for ports with the same priority configuration, ports on the left are given higher priority than the ports on the right.</p>
Default	low
Options	<p>value—high or low:</p> <ul style="list-style-type: none">• high—Specify that this port is to be treated as high priority in terms of power allocation• low—Specify that this port is to be treated as low priority in terms of power allocation.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

Hierarchy Level [edit access]

Release Information Statement introduced in Junos OS Release 10.4.

Description	Create a profile containing a set of attributes that define device management access.
Required Privilege Level	access—To view this statement in the configuration. access-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407 • Understanding User Authentication for Security Devices on page 5499 • Layer 2 Bridging and Switching Overview on page 3159

profiles

Syntax	<pre> profiles { profile-name { sip-user-id simple-ip-user-id; sip-password simple-ip-password; access-point-name apn; authentication-method (pap chap none); } } </pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> cellular-options gsm-options]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Configure a profile to establish a data call with a Global System for Mobile Communications (GSM) cellular network. You can configure up to 16 profiles.
Options	<p><i>profile-name</i>—Name of the profile.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Ethernet Interfaces on page 2629

promiscuous-mode (Interfaces)

Syntax	<code>promiscuous-mode;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 10.1.
Description	<p>Enable promiscuous mode on Layer 3 Ethernet interfaces. When promiscuous mode is enabled on an interface, all packets received on the interface are sent to the central point or Services Processing Unit regardless of the destination MAC address of the packet.</p> <p>You can also enable promiscuous mode on chassis cluster redundant Ethernet interfaces and on aggregated Ethernet interfaces. If you enable promiscuous mode on a redundant Ethernet interface, promiscuous mode is then enabled on any child physical interfaces. If you enable promiscuous mode on an aggregated Ethernet interface, promiscuous mode is then enabled on all member interfaces.</p>
Required Privilege Level	<code>interface</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Enabling and Disabling Promiscuous Mode on Ethernet Interfaces (CLI Procedure) on page 2639

quality (Interfaces)

Syntax	<code>quality <value>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> radio—router]</code>
Release Information	Statement introduced in Junos OS Release 10.1.
Description	This option controls relative link quality weight (value 0–100).
Required Privilege Level	<code>interface</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• PPPoE-Based Radio-to-Router Protocols Overview on page 2753

r2cp

Syntax	<pre>r2cp { command <i>binary-file-path</i>; disable; }</pre>
Hierarchy Level	[edit system processes]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Specify the Radio-to-Router Control Protocol (R2CP) used to exchange dynamic metric changes in the network that routers use to update the OSPF topologies.
Options	<ul style="list-style-type: none">• command <i>binary-file-path</i>—Path to the binary process.• disable—Disable the Radio-to-Router Control Protocol process.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• PPPoE-Based Radio-to-Router Protocols Overview on page 2753

radio-router (Interfaces)

Syntax	<pre>radio-router { bandwidth <i>number</i>; credit { interval <i>number</i>; } data-rate <i>number</i>; latency <i>number</i>; quality <i>number</i>; resource <i>number</i>; threshold <i>number</i>; }</pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	Point-to-Point Protocol over Ethernet (PPPoE)-based radio-to-router protocols include messages that define how an external system will provide the device with timely information about the quality of a link's connection. They also include a flow control mechanism to indicate how much data the device can forward. The device can then use the information provided in the PPPoE messages to dynamically adjust the interface speed of PPP links.
Options	The remaining statements are explained separately. See CLI Explorer .
Required Privilege Level	interface —To view this statement in the configuration. interface-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• PPPoE-Based Radio-to-Router Protocols Overview on page 2753

redundancy-group (Interfaces)

Syntax	<code>redundancy-group <i>number</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> redundant-ether-options]</code>
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Specify the redundancy group that a redundant Ethernet interface belongs to.
Options	<p><i>number</i> —Number of the redundancy group that the redundant interface belongs to. Failover properties of the interface are inherited from the redundancy group.</p> <p>Range: 1 through 255</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407

redundant-ether-options

Syntax	<pre> redundant-ether-options { (flow-control no-flow-control); lacp { (active passive); periodic (fast slow); } link-speed <i>speed</i>; (loopback no-loopback); minimum-links <i>number</i>; redundancy-group <i>number</i>; source-address-filter <i>mac-address</i>; (source-filtering no-source-filtering); } </pre>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Configure Ethernet redundancy options for a chassis cluster.
Options	The remaining statements are explained separately. See CLI Explorer .
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Understanding Ethernet Interfaces on page 2629

redundant-parent (Interfaces Fast Ethernet)

Syntax	<code>redundant-parent <i>interface-name</i> ;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> fastether-options]</code>
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Configure Fast Ethernet-specific interface properties for Ethernet redundancy in a chassis cluster.
Options	<i>interface</i> —Parent redundant interface of the Fast Ethernet interface.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Ethernet Interfaces on page 2629

redundant-parent (Interfaces Gigabit Ethernet)

Syntax	<code>redundant-parent <i>interface-name</i> ;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> gigether-options]</code>
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Configure Gigabit Ethernet-specific interface properties for Ethernet redundancy in a chassis cluster.
Options	<i>interface</i> —Parent redundant interface of the Gigabit Ethernet interface.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Ethernet Interfaces on page 2629

resource (Interfaces)

Syntax	<code>resource <i>number</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> radio—router]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	This option controls the resource weight (value 1–100).
Required Privilege Level	interface —To view this statement in the configuration. interface-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • PPPoE-Based Radio-to-Router Protocols Overview on page 2753

retransmission-attempt

Syntax	<code>retransmission-attempt <i>number</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify the number of times the device retransmits a Dynamic Host Control Protocol (DHCP) packet if a DHCP server fails to respond. After the specified number of attempts, no further attempts at reaching a server are made.
Options	<p><i>number</i>—Number of retransmit attempts..</p> <p>Range: 0 through 6</p> <p>Default: 4</p>
Required Privilege Level	interface —To view this statement in the configuration. interface-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • PPPoE-Based Radio-to-Router Protocols Overview on page 2753

retransmission-interval (Interfaces)

Syntax	retransmission-interval <i>seconds</i> ;
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family-name</i> dhcp]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Specify the time between successive retransmission attempts.
Options	<i>seconds</i> —Number of seconds between successive retransmission. Range: 4 through 64 seconds Default: 4 seconds
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• PPPoE-Based Radio-to-Router Protocols Overview on page 2753

roaming-mode

Syntax	roaming-mode (home-only automatic)
Hierarchy Level	[edit interfaces <i>interface-name</i> cellular-options]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Specify whether the 3G wireless modem interface can access networks other than the home network.
Options	<ul style="list-style-type: none">• home-only—No roaming is allowed.• automatic—Allows access to networks other than the home network. This is the default.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Ethernet Interfaces on page 2629

scheduler-map (CoS Virtual Channels)

Syntax	<code>scheduler-map <i>map-name</i>;</code>
Hierarchy Level	<code>[edit class-of-service virtual-channel-groups <i>group-name</i> <i>virtual-channel-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Apply a scheduler map to this virtual channel.
Options	<p><i>map-name</i>—Name of the scheduler map.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • default (CoS) on page 1606 • virtual-channel-group (CoS Interfaces) on page 1625

select-profile

Syntax	<code>select-profile <i>profile-name</i></code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> cellular-options gsm-options]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Select the active profile to establish a data call with a Global System for Mobile Communications (GSM) cellular network.
Options	<i>profile-name</i> —Name of a configured profile that is to be used to establish a data call.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Understanding Ethernet Interfaces on page 2629

server-address

Syntax	<code>server-address <i>ip-address</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Specify the address of the DHCP server that the client should accept DHCP offers from. If this option is included in the DHCP configuration, the client accepts offers only from this server and ignores all other offers.
Default	The client accepts the first offer it receives from any DHCP server.
Options	<i>ip-address</i> —DHCP server address.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Ethernet Interfaces on page 2629

shaping-rate (CoS Interfaces)

Syntax	<code>shaping-rate rate;</code>
Hierarchy Level	[edit class-of-service interfaces <i>interface-name</i>], [edit class-of-service interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	<p>For logical interfaces on which you configure packet scheduling, configure traffic shaping by specifying the amount of bandwidth to be allocated to the logical interface.</p> <p>Logical and physical interface traffic shaping is mutually exclusive. This means you can include the shaping-rate statement at the [edit class-of-service interfaces <i>interface-name</i>] hierarchy level or the [edit class-of-service interfaces <i>interface-name</i> unit <i>logical-unit-number</i>] hierarchy level, but not both.</p> <p>Alternatively, you can configure a shaping rate for a logical interface and oversubscribe the physical interface by including the shaping-rate statement at the [edit class-of-service traffic-control-profiles] hierarchy level. With this configuration approach, you can independently control the delay-buffer rate.</p>
Default	<p>If you do not include this statement at the [edit class-of-service interfaces <i>interface-name</i> unit <i>logical-unit-number</i>] hierarchy level, the default logical interface bandwidth is the average of unused bandwidth for the number of logical interfaces that require default bandwidth treatment. If you do not include this statement at the [edit class-of-service interfaces <i>interface-name</i>] hierarchy level, the default physical interface bandwidth is the average of unused bandwidth for the number of physical interfaces that require default bandwidth treatment.</p>
Options	<p>rate—Peak rate, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).</p> <p>Range: For logical interfaces, 1000 through 32,000,000,000 bps.</p> <p>For physical interfaces, 1000 through 160,000,000,000 bps.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Example: Configuring a Large Delay Buffer on a Channelized T1 Interface on page 1465 • Understanding Ethernet Interfaces on page 2629

simple-filter (Interfaces)

Syntax	<code>simple-filter;</code>
Hierarchy Level	<code>[edit interfaces <i>interfaces-name</i> unit <i>logical-unit-number</i> family <i>family-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Apply a simple filter to an interface. You can apply simple filters on ingress interfaces only.
Options	input <i>filter-name</i> : Name of one filter to evaluate when packets are received on the interface.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Ethernet Interfaces on page 2629

sip-password

Syntax	<code>sip-password <i>simple-ip-password</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> cellular-options gsm-options profiles <i>profile-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Configure the password provided by the service provider for connection to a Global System for Mobile Communications (GSM) cellular network.
Options	<i>simple-ip-password</i> —Password.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Ethernet Interfaces on page 2629• 3G Wireless Modem Overview on page 2835

sip-user-id

Syntax	<code>sip-user-id <i>simple-ip-user-id</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> cellular-options gsm-options profiles <i>profile-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Configure the username provided by the service provider for connection to a Global System for Mobile Communications (GSM) cellular network.
Options	<i>simple-ip-user-id</i> —Username.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• 3G Wireless Modem Overview on page 2835

source-address-filter (Interfaces)

Syntax	<code>source-address-filter <i>mac-address</i> ;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> redundant-ether-options]</code>
Release Information	Statement modified in Junos OS Release 9.2.
Description	<p>For redundant Ethernet interfaces, specify the MAC addresses from which the interface can receive packets. For this statement to have any effect, you must include the source-filtering statement in the configuration to enable source address filtering.</p> <p>Be sure to update the MAC address if the remote Ethernet card is replaced. Replacing the interface card changes the MAC address. Otherwise, the interface cannot receive packets from the new card.</p>
	<div>  <p>NOTE:</p> <ul style="list-style-type: none"> Software based MAC limiting is supported on SRX100, SRX210, SRX220, SRX240, and SRX650 devices. <p>A maximum of 32 devices are supported per device.</p> </div>
Options	<p><i>mac-address</i> —MAC address filter. You can specify the MAC address as six hexadecimal bytes in one of the following formats: <i>nn:nn:nn:nn:nn:nn</i> (for example, 00:11:22:33:44:55) or <i>nnnn:nnnn:nnnn</i> (for example, 0011.2233.4455). You can configure up to 64 source addresses. To specify more than one address, include multiple <i>mac-address</i> options in the source-address-filter statement.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Understanding Ethernet Interfaces on page 2629

source-filtering (Interfaces)

Syntax	<code>(source-filtering no-source-filtering);</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> redundant-ether-options]</code>
Release Information	Statement modified in Junos OS Release 9.2.
Description	<p>For redundant Ethernet interfaces, enable the filtering of MAC source addresses, which blocks all incoming packets to that interface. To allow the interface to receive packets from specific MAC addresses, include the source-address-filter statement.</p> <p>If the remote Ethernet card is changed, the interface cannot receive packets from the new card because it has a different MAC address.</p> <p>By default, source address filtering is disabled.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

Syntax	vendor-id <i>vendor-id</i> ;
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family-name</i> dhcp]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Configure a vendor class ID for the Dynamic Host Configuration Protocol (DHCP) client.
Options	<i>vendor-id</i> —vendor class ID.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding Interfaces on page 2407

vlan-tagging (Interfaces)

Syntax	<code>vlan-tagging native-vlan-id <i>vlan-id</i>;</code>
Hierarchy Level	[edit interfaces <i>interface</i>]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Configure VLAN identifier for untagged packets received on the physical interface of a trunk mode interface.
Options	native-vlan-id —Configures a VLAN identifier for untagged packets. Enter a number from 0 through 4094.
<div> NOTE: The <code>native-vlan-id</code> can be configured only when either <code>flexible-vlan-tagging</code> mode or <code>interface-mode trunk</code> is configured.</div>	
Required Privilege Level	interface —To view this statement in the configuration. interface-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring VLAN Tagging on page 2457

web-authentication (Interfaces)

Syntax	<pre>web-authentication { http; https; redirect-to-https; }</pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family-name</i> address <i>address</i>]
Release Information	Statement introduced in Junos OS Release 9.2. Support for https and redirect-to-https options added in Junos OS Release 12.1x44-D10.
Description	Enable the Web authentication process for firewall user authentication.
Options	<p>http—Enable HTTP service.</p> <p>https—Enable authentication through HTTPS.</p> <p>redirect-to-https—Redirect Web authentication to HTTPS.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

```

clear lacp statistics interfaces

Syntax	clear lacp statistics interfaces < <i>interface-name</i> >
Release Information	Command modified in Junos OS Release 10.2.
Description	Clear the LACP statistics. If you do not specify an interface name, LACP statistics for all interfaces are cleared.
Options	<i>interface-name</i> —(Optional) Name of an interface.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show lacp statistics interfaces (View) on page 3127• Verifying LACP on Redundant Ethernet Interfaces on page 2667
Output Fields	This command produces no output.

request modem wireless activate iota

Syntax	<code>request modem wireless activate iota <i>interface-name</i></code>
Release Information	Command introduced in Junos OS Release 9.5.
Description	For CDMA EV-DO 3G wireless modem interfaces, enable modem card to connect to service provider's cellular network using Internet-based over the air (IOTA) provisioning.
Options	<i>interface-name</i> —The 3G wireless modem interface on the SRX210 device is <code>cl-0/0/8</code> .
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• Understanding the 3G Wireless Modem Physical Interface on page 2845
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request modem wireless activate iota cl-0/0/8

```
user@host> request modem wireless activate iota cl-0/0/8
Beginning IOTA Activation. It can take up to 5 minutes
Please check the trace logs for details.
```

request modem wireless activate manual

Syntax	<code>request modem wireless activate manual <i>interface-name</i> msl <i>msl-number</i> mdn <i>mdn-number</i> imsi <i>imsi-number</i> sid <i>sid-number</i> nid <i>nid-number</i> sip-user-id <i>sip-id</i> sip-password <i>sip-password</i></code>
Release Information	Command introduced in Junos OS Release 9.5.
Description	For CDMA EV-DO 3G wireless modem interfaces, enable modem card to connect to service provider's cellular network.
Options	<ul style="list-style-type: none"> • <i>interface-name</i>—The 3G wireless modem interface on the SRX210 device is cl-0/0/8. • <i>msl msl-number</i>—Master subsidy lock (MSL) number required to unlock the modem card. Obtain the number from the service provider. • <i>mdn mdn-number</i>—Mobile directory number (MDN) 10-digit phone number. Obtain the number from the service provider. • <i>imsi imsi-number</i>—International mobile station identity (IMSI) subscriber identification number. Obtain the number from the service provider. • <i>sid sid-number</i>—System identification (SID) number. Use the show modem wireless interface network command to display the SID. • <i>nid nid-number</i>—Network identification (NID) number. Use the show modem wireless interface network command to display the NID. • <i>sip-user-id sip-id</i>—Simple IP user identification. Obtain the username from the service provider. • <i>sip-password sip-password</i>—Simple IP password. Obtain the password from the service provider.
Required Privilege Level	maintenance

```

request modem wireless gsm sim-unblock

Syntax	<code>request modem wireless gsm sim-unblock <i>interface-name</i> puk <i>unlock-code</i></code>
Release Information	Command introduced in Junos OS Release 9.5.
Description	Unblock a blocked subscriber identity module (SIM) in the GSM 3G wireless modem card.
Options	<ul style="list-style-type: none"> • <i>interface-name</i>—The 3G wireless modem interface on the SRX210 device is <code>cl-0/0/8</code>. • <i>puk unlock-code</i>—Eight-digit PIN unblocking key (PUK). Obtain the PUK from the service provider.
<div>  <p>NOTE: If the PUK is entered incorrectly ten times, the SIM must be returned to the service provider for reactivation.</p> </div>	
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • request modem wireless gsm sim-unlock on page 3021 • Understanding the 3G Wireless Modem Physical Interface on page 2845 • Example: Configuring the 3G Wireless Modem Interface on page 2845
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

`request modem wireless gsm sim-unblock cl-0/0/8 puk 76543210`

```
user@host> request modem wireless gsm sim-unblock cl-0/0/8 puk 76543210
Issued SIM unblock request successfully.
Please verify SIM lock status under firmware stats
```

request modem wireless gsm sim-unlock

Syntax	<code>request modem wireless gsm sim-unlock <i>interface-name</i> pin <i>unlock-code</i></code>
Release Information	Command introduced in Junos OS Release 9.5.
Description	Unlock the subscriber identity module (SIM) in the GSM 3G wireless modem card.
Options	<ul style="list-style-type: none"> • <i>interface-name</i>—The 3G wireless modem interface on the SRX210 device is <code>cl-0/0/8</code>. • <i>pin unlock-code</i>—Four-digit personal identification number (PIN). Obtain the PIN from the service provider.
<div>  <p>NOTE: If the PIN is entered incorrectly three consecutive times, the SIM is blocked. Obtain a PIN unblocking key (PUK) from the service provider.</p> </div>	
Required Privilege Level	maintenance

Release Information Command introduced before Junos OS Release 9.2

Description Restart a Junos OS process.

CAUTION: Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router to drop calls and interrupt transmission, resulting in possible loss of data.

- Options**
- application-identification—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
 - application-security—(Optional) Restart the application security process.
 - audit-process—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, for analyzing and tracking usage patterns, and for billing a user based upon the amount of time used or the type of services accessed.
 - chassis-control—(Optional) Restart the chassis management process.
 - class-of-service—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.
 - commitd-service—(Optional) Restart the committed services.
 - database-replication—(Optional) Restart the database replication process.
 - datapath-trace-service—(Optional) Restart the Restart the packet path tracing process.
 - ddns—(Optional) Restart the dynamic domain name system, which dynamically updates IP addresses for registered domain names.

- `dhcp`—(Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.
- `dhcp-service`—(Optional) Restart the Dynamic Host Configuration Protocol process.
- `disk-monitoring`—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.
- `dynamic-flow-capture`—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on PIC3 monitoring services cards.
- `ethernet-connectivity-fault-management`—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Maintenance (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.
- `ethernet-link-fault-management`—(Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.
- `event-processing`—(Optional) Restart the event process (`eventd`).
- `extensible-subscriber-services`—(Optional) Restart the extensible subscriber services process.
- `fipsd`—(Optional) Restart the `fipsd` services.
- `firewall`—(Optional) Restart the firewall management process, which manages the firewall configuration and accepts or rejects packets that are transiting an interface on a router or switch.
- `firewall-authentication-service`—(Optional) Restart the firewall authentication service process.
- `general-authentication-service`—(Optional) Restart the general authentication process.
- `gprs-process`—(Optional) Restart the General Packet Radio Service (GPRS) process.
- `gracefully`—(Optional) Restart the software process.
- `idp-policy`—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.
- `immediately`—(Optional) Immediately restart the software process.
- `interface-control`—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.
- `ipmi`—(Optional) Restart the intelligent platform management interface process.
- `ipsec-key-management`—(Optional) Restart the IPsec key management process.
- `jflow-service`—(Optional) Restart `jflow` service process.
- `jnu-management`—(Optional) Restart `jnu` management process.
- `jnx-wmicd-service`—(Optional) Restart `jnx wmicd` service process.
- `jsrp-service`—(Optional) Restart the Juniper Services Redundancy Protocol (`jsrdp`) process, which controls chassis clustering.

- **kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.
- **lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link. The LACP process allows link aggregation control instances to reach agreement on the identity of the LAG to which a link belongs, moves the link to that LAG, and enables the transmission and reception processes for the link to function in an orderly manner.
- **l2cpd-service**—(High-end SRX Series only) (Optional) Restart the Layer 2 Control Protocol (L2CP) process, which enables features such as L2 protocol tunneling and nonstop bridging.
- **l2-learning**—(Optional) Restart the Layer 2 (L2) address flooding and learning process.
- **license-service**—(Optional) Restart the feature license management process.
- **logical-system-service**—(Optional) Restart the logical system service process.
- **mib-process**—(Optional) Restart the MIB version II process, which provides the router's MIB II agent.
- **mountd-service**—(Optional) Restart the service for Network File System (NFS) mount requests.
- **named-service**—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.
- **network-security**—(Optional) Restart the network security process.
- **network-security-trace**—(Optional) Restart the network security trace process.
- **nfsd-service**—(Optional) Restart the remote NFS server process, which provides remote file access for applications that need NFS-based transport.
- **ntpd-service**—(Optional) Restart the Network Time Protocol (NTP) process.
- **pgm**—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.
- **pic-services-logging**—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.
- **pki-service**—(Optional) Restart the public key infrastructure (PKI) service process.
- **profillerd**—(Optional) Restart the profiler process.
- **remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.
- **rest-api**—(Optional) Restart the rest api process.
- **routing**—(Optional) Restart the routing protocol process (rpd).
- **sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

- `sampling-route-record`—(Optional) Restart the sampling route record process.
- `scc-chassisd`—(Optional) Restart the scc chassisd process.
- `secure-neighbor-discovery`—(Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.
- `security-intelligence`—(Optional) Restart security intelligence process.
- `security-log`—(Optional) Restart the security log process.
- `service-deployment`—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.
- `services`—(Optional) Restart a service.
- `simple-mail-client-service`—(Optional) Restart the simple mail client service process.
- `snmp`—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.
- `static-routed`—(Optional) Restart the static routed process.
- `soft`—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.
- `statistics-service`—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.
- `subscriber-management`—(Optional) Restart the subscriber management process.
- `subscriber-management-helper`—(Optional) Restart the subscriber management helper process.
- `system-log-vital`—(Optional) Restart system log vital process.
- `tunnel-oamd`—(Optional) Restart the tunnel OAM process for L2 tunneled networks.
- `uac-service`—(Optional) Restart the Unified Access Control (UAC) process.
- `user-ad-authentication`—(Optional) Restart User ad Authentication process
- `vrrp`—(Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.
- `web-management`—(Optional) Restart the Web management process.

Required Privilege Level reset

List of Sample Output [restart interfaces on page 3026](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

show chassis fpc (View)

Syntax `show chassis fpc`
`<detail < fpc-slot >| <node (node-id | local | primary)>> |`
`<node (node-id | local | primary)> |`
`<pic-status < fpc-slot >| <node (node-id | local | primary)>>`

Release Information Command modified in Junos OS Release 9.2.
 Starting with Junos OS Release 15.1X49-D10, the SRX5K-MPC3-100G10G (IOC3) and the SRX5K-MPC3-40G10G (IOC3) are introduced.

NOTE: On SRX5K-MPC3-40G10G (IOC3), all four PICs cannot be powered on. A maximum of two PICs can be powered on at the same time. By default, PIC0 and PIC1 are online.

Use the **set chassis fpc <slot> pic <pic> power off** command to choose the PICs you want to power on.

When you use the **set chassis fpc <slot> pic <pic> power off** command to power off PIC0 and PIC1, PIC2 and PIC3 are automatically turned on.

When you switch from one set of PICs to another set of PICs using the **set chassis fpc <slot> pic <pic> power off** command again, ensure that there is 60 seconds duration between the two actions, otherwise core files are seen during the configuration.

The [Table 186](#) summarizes the SRX5K-MPC3-40G10G (IOC3) PICs selected for various configuration scenarios.

Table 294: SRX5K-MPC3-40G10G (IOC3) PIC Selection Summary

CLI Configuration	PIC Selection
Default (i.e. no CLI configuration)	Online: PIC-0, PIC-1 Offline: PIC-2, PIC-3
PIC-1, PIC-2 and PIC-3 powered OFF	Online: PIC-0 Offline: PIC-1, PIC-2, PIC-3
PIC-0, PIC-2 and PIC-3 powered OFF	Online: PIC-1 Offline: PIC-0, PIC-2, PIC-3
PIC-0, PIC-1 and PIC-3 powered OFF	Online: PIC-2 Offline: PIC-0, PIC-1, PIC-3
PIC-0, PIC-1 and PIC-2 powered OFF	Online: PIC-3 Offline: PIC-0, PIC-1, PIC-2

Table 294: SRX5K-MPC3-40G10G (IOC3) PIC Selection Summary (*continued*)

CLI Configuration	PIC Selection
PIC-2 and PIC-3 powered OFF	Online: PIC-0, PIC-1 Offline: PIC-2, PIC-3
PIC-2 and PIC-3 powered OFF	Online: PIC-0, PIC-1 Offline: PIC-2, PIC-3
PIC-1 and PIC-2 powered OFF	Online: PIC-0, PIC-3 Offline: PIC-1, PIC-2
PIC-0 and PIC-3 powered OFF	Online: PIC-2, PIC-1 Offline: PIC-0, PIC-3
PIC-0 and PIC-1 powered OFF	Online: PIC-2, PIC-3 Offline: PIC-0, PIC-1
All other combinations of PICs being powered OFF (Invalid)	Online: PIC-0, PIC-1 Offline: PIC-2, PIC-3 Default PICs will be selected for the invalid combinations. Also, a system log message will be displayed to indicate the invalid combination PIC selection.

Description Display status information about the installed Flexible PIC Concentrators (FPCs) and PICs.

- Options**
- **none**—Display status information for all FPCs.
 - **detail**—(Optional) Display detailed FPC status information.
 - **fpc-slot** —(Optional) Display information about the FPC in this slot.
 - **node**—(Optional) For chassis cluster configurations, display status information for all FPCs or for the specified FPC on a specific node (device) in the cluster.
 - **node-id** —Identification number of the node. It can be 0 or 1.
 - **local**—Display information about the local node.
 - **primary**—Display information about the primary node.

- **pic-status**—(Optional) Display status information for all FPCs or for the FPC in the specified slot (see *fpc-slot*).

Output Fields [Table 187](#) lists the output fields for the **show chassis fpc** command. Output fields are listed in the approximate order in which they appear.

Table 295: show chassis fpc Output Fields

Field Name	Field Description
Slot or Slot State	<p>Slot number and state. The state can be one of the following conditions:</p> <ul style="list-style-type: none"> • Dead—Held in reset because of errors. • Diag—Slot is being ignored while the device is running diagnostics. • Dormant—Held in reset. • Empty—No FPC is present. • Online—FPC is online and running. • Present—FPC is detected by the device, but is either not supported by the current version of Junos OS or inserted in the wrong slot. The output also states either Hardware Not Supported or Hardware Not In Right Slot. FPC is coming up but not yet online. • Probed—Probe is complete; awaiting restart of the Packet Forwarding Engine (PFE). • Probe-wait—Waiting to be probed.

Table 295: show chassis fpc Output Fields (*continued*)

Field Name	Field Description
Temp (C) or Temperature	Temperature of the air passing by the FPC, in degrees Celsius or in both Celsius and Fahrenheit.
Total CPU Utilization (%)	Total percentage of CPU being used by the FPC's processor.
Interrupt CPU Utilization (%)	Of the total CPU being used by the FPC's processor, the percentage being used for interrupts.
Memory DRAM (MB)	Total DRAM, in megabytes, available to the FPC's processor.
Heap Utilization (%)	Percentage of heap space (dynamic memory) being used by the FPC's processor. If this number exceeds 80 percent, there may be a software problem (memory leak).
Buffer Utilization (%)	Percentage of buffer space being used by the FPC's processor for buffering internal messages.
Start Time	Time when the Routing Engine detected that the FPC was running.
Uptime	How long the Routing Engine has been connected to the FPC and, therefore, how long the FPC has been up and running.
PIC type	(pic-status output only) Type of FPC.

show chassis hardware (View)

Syntax	show chassis hardware <clei-models detail extensive models node (<i>node-id</i> all local primary)>
Release Information	Command introduced in Junos OS Release 9.2. Command modified in Junos OS Release 9.2 to include node option.
Description	Display chassis hardware information.
Options	<ul style="list-style-type: none"> • clei-models—(Optional) Display Common Language Equipment Identifier Code (CLEI) barcode and model number for orderable field-replaceable units (FRUs). • detail extensive—(Optional) Display the specified level of output. • models—(Optional) Display model numbers and part numbers for orderable FRUs. • node—(Optional) For chassis cluster configurations, display chassis hardware information on a specific node (device) in the cluster. <ul style="list-style-type: none"> • node-id—Identification number of the node. It can be 0 or 1. • local—Display information about the local node. • primary—Display information about the primary node.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Juniper Networks Devices Processing Overview on page 1641 • Interface Naming Conventions on page 2411
Output Fields	Table 188 lists the output fields for the show chassis hardware command. Output fields are listed in the approximate order in which they appear.

Table 296: show chassis hardware Output Fields

Field Name	Field Description
Item	Chassis component—Information about the backplane; power supplies; fan trays; Routing Engine; each Physical Interface Module (PIM)—reported as FPC and PIC—and each fan, blower, and impeller.
Version	Revision level of the chassis component.
Part Number	Part number for the chassis component.
Serial Number	Serial number of the chassis component. The serial number of the backplane is also the serial number of the device chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the device chassis.
Assb ID or Assembly ID	Identification number that describes the FRU hardware.

Table 296: show chassis hardware Output Fields (*continued*)

Field Name	Field Description
FRU model number	Model number of FRU hardware component.
CLEI code	Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.
EEPROM Version	ID EEPROM version used by hardware component: 0x01 (version 1) or 0x02 (version 2).

Table 296: show chassis hardware Output Fields (*continued*)

Field Name	Field Description
Description	<p>Brief description of the hardware item:</p> <ul style="list-style-type: none"> Type of power supply. Switch Control Board (SCB) <p>Starting with Junos OS Release 12.1X47-D15, the SRX5K-SCBE (SCB2) is introduced.</p> <ul style="list-style-type: none"> There are three SCB slots in SRX5800 devices. The third slot can be used for an SCB or an FPC. When an SRX5K-SCB was used, the third SCB slot was used as an FPC. SCB redundancy is provided in chassis cluster mode. With an SCB2, a third SCB is supported. If a third SCB is plugged in, it provides intra-chassis fabric redundancy. The Ethernet switch in the SCB2 provides the Ethernet connectivity among all the FPCs and the Routing Engine. The Routing Engine uses this connectivity to distribute forwarding and routing tables to the FPCs. The FPCs use this connectivity to send exception packets to the Routing Engine. Fabric connects all FPCs in the data plane. The Fabric Manager executes on the Routing Engine and controls the fabric system in the chassis. Packet Forwarding Engines on the FPC and fabric planes on the SCB are connected through HSL2 channels. SCB2 supports HSL2 with both 3.11 Gbps and 6.22 Gbps (SerDes) link speed and various HSL2 modes. When an FPC is brought online, the link speed and HSL2 mode are determined by the type of FPC. <p>Starting with Junos OS Release 15.1X49-D10, the SRX5K-SCB3 (SCB3) with enhanced midplanes is introduced.</p> <ul style="list-style-type: none"> All existing SCB software that is supported by SCB2 is supported on SCB3. SRX5K-RE-1800X4 (RE2). Mixed Routing Engine use is not supported. SCB3 works with the SRX5K-MPC (IOC2), SRX5K-MPC3-100G10G (IOC3), SRX5K-MPC3-40G10G (IOC3), and SRX5K-SPC-4-15-320 (SPC2) with current midplanes and the new enhanced midplanes. Mixed SCB use is not supported. If an SCB2 and an SCB3 are used, the system will only power on the master Routing Engine's SCB and will power off the other SCBs. Only the SCB in slot 0 will be powered on and a system log is generated. SCB3 supports up to 400 Gbps per slot with old midplanes and up to 500 Gbps per slot with new midplanes. SCB3 supports fabric intra-chassis redundancy. SCB3 supports the same chassis cluster function as the SRX5K-SCB (SCB1) and the SRX5K-SCBE (SCB2), except for in-service software upgrade (ISSU) and in-service hardware upgrade (ISHU). SCB3 has a second external Ethernet port. Fabric bandwidth increasing mode is not supported.

Table 296: show chassis hardware Output Fields (*continued*)

Field Name	Field Description
	<ul style="list-style-type: none"> Type of Flexible PIC Concentrator (FPC), Physical Interface Card (PIC), Modular Interface Cards (MICs), and PIMs. IOC3 <p>Starting with Junos OS Release 15.1X49-D10, the SRX5K-MPC3-100G10G (IOC3) and the SRX5K-MPC3-40G10G (IOC3) are introduced.</p> <ul style="list-style-type: none"> IOC3 has two types of IOC3 MPCs, which have different built-in MICs: the 24x10GE + 6x40GE MPC and the 2x100GE + 4x10GE MPC. IOC3 supports SCB3 and SRX5000 line backplane and enhanced backplane. IOC3 can only work with SRX5000 line SCB2 and SCB3. If an SRX5000 line SCB is detected, IOC3 will be offline, an FPC misconfiguration alarm will be raised, and a system log message is generated. IOC3 interoperates with SCB2 and SCB3. IOC3 interoperates with the SRX5K-SPC-4-15-320 (SPC2) and the SRX5K-MPC (IOC2). The maximum power consumption for one IOC3 is 645W. An enhanced power module must be used. The IOC3 does not support the following command to set a PIC to go offline or online: request chassis pic fpc-slot <fpc-slot> pic-slot <pic-slot> <offline online> . IOC3 supports 240 Gbps of throughput with the enhanced SRX5000 line backplane. Chassis cluster functions the same as for the SRX5000 line IOC2. IOC3 supports intra-chassis and inter-chassis fabric redundancy mode. IOC3 supports ISSU and ISHU in chassis cluster mode. IOC3 supports intra-FPC and Inter-FPC Express Path (previously known as <i>services offloading</i>) with IPv4. NAT of IPv4 and IPv6 in normal mode and IPv4 for Express Path mode. All four PICs on the 24x10GE + 6x40GE cannot be powered on. A maximum of two PICs can be powered on at the same time. Use the set chassis fpc <slot> pic <pic> power off command to choose the PICs you want to power on. <p>NOTE: Fabric bandwidth increasing mode is not supported on IOC3.</p> SRX Clustering Module (SCM) Fan tray For hosts, the Routing Engine type. <ul style="list-style-type: none"> Starting with Junos OS Release 12.1X47-D15, the SRX5K-RE-1800X4 (RE2) Routing Engine is introduced. The RE2 has an Intel Quad core Xeon processor, 16 GB of DRAM, and a 128-GB solid-state drive (SSD). The number 1800 refers to the speed of the processor (1.8 GHz). The maximum required power for this Routing Engine is 90W. <p>NOTE: The RE2 provides significantly better performance than the previously used Routing Engine, even with a single core.</p>

show ethernet-switching mac-learning-log (View)

Syntax	show ethernet-switching mac-learning-log
Release Information	Command introduced in Junos OS Release 9.5.
Description	Displays the event log of learned MAC addresses.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Understanding MAC Limiting on page 3295
Output Fields	Table 297 lists the output fields for the show ethernet-switching mac-learning-log command. Output fields are listed in the approximate order in which they appear.

Table 297: show interfaces Output Fields

Field Name	Field Description
Date and Time	Timestamp when the MAC address was added or deleted from the log.
VLAN-IDX	VLAN index. An internal value assigned by Junos OS for each VLAN.
MAC	Learned MAC address.
Deleted Added	MAC address deleted or added to the MAC learning log.
Blocking	<p>The forwarding state of the interface:</p> <ul style="list-style-type: none"> • blocked—Traffic is not being forwarded on the interface. • unblocked—Traffic is forwarded on the interface.

Sample Output

show ethernet-switching mac-learning-log

```

user@host> show ethernet-switching mac-learning-log
Wed Mar 18 08:07:05 2009
vlan_idx 7 mac 00:00:00:00:00:00 was deleted

show ethernet-switching table (View)

Syntax	<code>show ethernet-switching table (brief detail extensive) interface <i>interface-name</i></code>
Release Information	Command introduced in Junos OS Release 9.5.
Description	Displays the Ethernet switching table.
Options	<ul style="list-style-type: none"> • none—(Optional) Display brief information about the Ethernet switching table. • brief detail extensive—(Optional) Display the specified level of output. • interface-name—(Optional) Display the Ethernet switching table for a specific interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Port Security Overview on page 3295 • Understanding MAC Limiting on page 3295
Output Fields	Table 298 lists the output fields for the show ethernet-switching table command. Output fields are listed in the approximate order in which they appear.

Table 298: show ethernet-switching table Output Fields

Field Name	Field Description
VLAN	The name of a VLAN.
MAC address	The MAC address associated with the VLAN.
Type	<p>The type of MAC address. Values are:</p> <ul style="list-style-type: none"> • static—The MAC address is manually created. • learn—The MAC address is learned dynamically from a packet's source MAC address. • flood—The MAC address is unknown and flooded to all members.
Age	The time remaining before the entry ages out and is removed from the Ethernet switching table.
Interfaces	Interface associated with learned MAC addresses or All-members (flood entry).
Learned	For learned entries, the time which the entry was added to the Ethernet switching table.

Sample Output

show ethernet-switching table

```
user@host> show ethernet-switching table
Ethernet-switching table: 57 entries, 17 learned
VLAN MAC address Type Age Interfaces
```

```

Release Information Command modified in Junos OS Release 9.5.

Description Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

On SRX Series appliance, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

- Options**
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
 - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
 - **ce1-*pim*/0/ *port***—Channelized E1 interface.
 - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
 - **ct1-*pim*/0/*port***—Channelized T1 interface.
 - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
 - **e1-*pim*/0/*port***—E1 interface.
 - **e3-*pim*/0/*port***—E3 interface.

- **fe-pim/0/port**—Fast Ethernet interface.
- **ge-pim/0/port**—Gigabit Ethernet interface.
- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

- **brief | detail | extensive | terse**—(Optional) Display the specified level of output.
- **controller**—(Optional) Show controller information.
- **descriptions**—(Optional) Display interface description strings.
- **destination-class**—(Optional) Show statistics for destination class.
- **diagnostics**—(Optional) Show interface diagnostics information.
- **far-end-interval**—(Optional) Show far end interval statistics.
- **filters**—(Optional) Show interface filters information.
- **flow-statistics**—(Optional) Show security flow counters and errors.
- **interval**—(Optional) Show interval statistics.
- **load-balancing**—(Optional) Show load-balancing status.
- **mac-database**—(Optional) Show media access control database information.
- **mc-ae**—(Optional) Show MC-AE configured interface information.
- **media**—(Optional) Display media information.
- **policers**—(Optional) Show interface policers information.
- **queue**—(Optional) Show queue statistics for this interface.
- **redundancy**—(Optional) Show redundancy status.
- **routing**—(Optional) Show routing status.
- **routing-instance**—(Optional) Name of routing instance.
- **snmp-index**—(Optional) SNMP index of interface.
- **source-class**—(Optional) Show statistics for source class.
- **statistics**—(Optional) Display statistics and detailed output.
- **switch-port**—(Optional) Front end port number (0..15).
- **transport**—(Optional) Show interface transport information.
- **zone**—(Optional) Interface's zone.

Output Fields	<p>Table 194 lists the output fields for the show interfaces command. Output fields are listed in the approximate order in which they appear.</p>

Table 300: show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Link-level type	Encapsulation being used on the physical interface.	All levels
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
MTU	Maximum transmission unit size on the physical interface.	All levels
Link mode	Link mode: Full-duplex or Half-duplex.	
Speed	Speed at which the interface is running.	All levels
BPDU error	Bridge protocol data unit (BPDU) error: Detected or None	
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device.	All levels
Interface flags	Information about the interface.	All levels
Link flags	Information about the physical link.	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Current address	Configured MAC address.	detail extensive none

Table 300: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None
Output Rate	Output rate in bps and pps.	None
Active alarms and Active defects	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Table 300: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Input errors	<p>Input errors on the interface.</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<p>Output errors on the interface.</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive

Table 300: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface.	extensive
Queue counters and queue number	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> • Packet length exceeds 1518 octets, or • Packet length exceeds MRU • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive

Table 300: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0. 	extensive
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. 	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 300: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Interface transmit statistics	Status of the interface-transmit-statistics configuration: Enabled or Disabled.	detail extensive
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive

Table 300: show interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Local statistics	Number and rate of bytes and packets destined to the device.	extensive
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	extensive
Security	Security zones that interface belongs to.	extensive
Flow Input statistics	Statistics on packets received by flow module.	extensive
Flow Output statistics	Statistics on packets sent by flow module.	extensive
Flow error statistics (Packets dropped due to)	Statistics on errors in the flow module.	extensive
Protocol	Protocol family.	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. .	detail extensive
Addresses, Flags	Information about the address flags..	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Sample Output

show interfaces diagnostics optics

Syntax	<code>show interfaces diagnostics optics <i>interface-name</i></code>
Release Information	Command introduced in Junos OS Release 10.1.
Description	<p>Display diagnostics data and alarms for Gigabit Ethernet optical transceivers (SFP) installed in SRX Series Services Gateways. The information provided by this command is known as digital optical monitoring (DOM) information.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.</p>
Options	<i>interface-name</i> —Name of the interface associated with the port in which the transceiver is installed: <code>ge-fpc/pic/port</code> .
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Understanding Interfaces on page 2407
List of Sample Output	show interfaces diagnostics optics on page 3109
Output Fields	Table 195 lists the output fields for the show interfaces diagnostics optics command. Output fields are listed in the general order in which they appear.

Table 301: show interfaces diagnostics optics Output Fields

Field Name	Field Description
Physical interface	Displays the name of the physical interface.
Laser bias current	Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Module temperature	Displays the temperature, in Celsius and Fahrenheit.
Module voltage	Displays the voltage, in Volts.
Receiver signal average optical power	Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Laser bias current high alarm	Displays whether the laser bias power setting high alarm is On or Off .

Table 301: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser bias current low alarm	Displays whether the laser bias power setting low alarm is On or Off .
Laser bias current high warning	Displays whether the laser bias power setting high warning is On or Off .
Laser bias current low warning	Displays whether the laser bias power setting low warning is On or Off .
Laser output power high alarm	Displays whether the laser output power high alarm is On or Off .
Laser output power low alarm	Displays whether the laser output power low alarm is On or Off .
Laser output power high warning	Displays whether the laser output power high warning is On or Off .
Laser output power low warning	Displays whether the laser output power low warning is On or Off .
Module temperature high alarm	Displays whether the module temperature high alarm is On or Off .
Module temperature low alarm	Displays whether the module temperature low alarm is On or Off .
Module temperature high warning	Displays whether the module temperature high warning is On or Off .
Module temperature low warning	Displays whether the module temperature low warning is On or Off .
Module voltage high alarm	Displays whether the module voltage high alarm is On or Off .
Module voltage low alarm	Displays whether the module voltage low alarm is On or Off .
Module voltage high warning	Displays whether the module voltage high warning is On or Off .
Module voltage low warning	Displays whether the module voltage low warning is On or Off .
Laser rx power high alarm	Displays whether the receive laser power high alarm is On or Off .
Laser rx power low alarm	Displays whether the receive laser power low alarm is On or Off .

Table 301: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser rx power high warning	Displays whether the receive laser power high warning is On or Off .
Laser rx power low warning	Displays whether the receive laser power low warning is On or Off .
Laser bias current high alarm threshold	Displays the vendor-specified threshold for the laser bias current high alarm.
Laser bias current low alarm threshold	Displays the vendor-specified threshold for the laser bias current low alarm.
Laser bias current high warning threshold	Displays the vendor-specified threshold for the laser bias current high warning.
Laser bias current low warning threshold	Displays the vendor-specified threshold for the laser bias current low warning.
Laser output power high alarm threshold	Displays the vendor-specified threshold for the laser output power high alarm.
Laser output power low alarm threshold	Displays the vendor-specified threshold for the laser output power low alarm.
Laser output power high warning threshold	Displays the vendor-specified threshold for the laser output power high warning.
Laser output power low warning threshold	Displays the vendor-specified threshold for the laser output power low warning.
Module temperature high alarm threshold	Displays the vendor-specified threshold for the module temperature high alarm.
Module temperature low alarm threshold	Displays the vendor-specified threshold for the module temperature low alarm.
Module temperature high warning threshold	Displays the vendor-specified threshold for the module temperature high warning.
Module temperature low warning threshold	Displays the vendor-specified threshold for the module temperature low warning.
Module voltage high alarm threshold	Displays the vendor-specified threshold for the module voltage high alarm.
Module voltage low alarm threshold	Displays the vendor-specified threshold for the module voltage low alarm.
Module voltage high warning threshold	Displays the vendor-specified threshold for the module voltage high warning.

Table 301: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Module voltage low warning threshold	Displays the vendor-specified threshold for the module voltage low warning.
Laser rx power high alarm threshold	Displays the vendor-specified threshold for the laser rx power high alarm.
Laser rx power low alarm threshold	Displays the vendor-specified threshold for the laser rx power low alarm.
Laser rx power high warning threshold	Displays the vendor-specified threshold for the laser rx power high warning.
Laser rx power low warning threshold	Displays the vendor-specified threshold for the laser rx power low warning.

show interfaces flow-statistics

Syntax	show interfaces flow-statistics <i><interface-name></i>
Release Information	Command introduced in Junos OS Release 9.2.
Description	Display interfaces flow statistics.
Options	<p>Interface-name — (Optional) Display flow statistics about the specified interface. Following is a list of typical interface names. Replace <i>pim</i> with the PIM slot and <i>port</i> with the port number. For a complete list, see the "Interface Naming Conventions" on page 2411.</p> <ul style="list-style-type: none"> • at-pim/0/port—ATM-over-ADSL or ATM-over-SHDSL interface. • br-pim/0/port—Basic Rate Interface for establishing ISDN connections. • ce1-pim/0/port—Channelized E1 interface. • ct1-pim/0/port—Channelized T1 interface. • dl0—Dialer Interface for initiating ISDN and USB modem connections. • e1-pim/0/port—E1 interface. • e3-pim/0/port—E3 interface. • fe-pim/0/port—Fast Ethernet interface. • ge-pim/0/port—Gigabit Ethernet interface. • se-pim/0/port—Serial interface. • t1-pim/0/port—T1 (also called DS1) interface. • t3-pim/0/port—T3 (also called DS3) interface. • wx-slot/0/0—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

List of Sample Output	show interfaces flow-statistics (Gigabit Ethernet) on page 3114
Output Fields	Table 196 lists the output fields for the show interfaces flow-statistics command. Output fields are listed in the approximate order in which they appear.

Table 302: show interfaces flow-statistics Output Fields

Field Name	Field Description
Traffic statistics	Number of packets and bytes transmitted and received on the physical interface.

Table 302: show interfaces flow-statistics Output Fields (*continued*)

Field Name	Field Description
Local statistics	Number of packets and bytes transmitted and received on the physical interface.
Transit statistics	Number of packets and bytes transiting the physical interface.
Flow input statistics	Statistics on packets received by flow module.
Flow output statistics	Statistics on packets sent by flow module.
Flow error statistics	Packet drop statistics for the flow module. For further details, see Table 197 .

Table 303: Flow Error Statistics (Packet Drop Statistics for the Flow Module)

Error	Error Description
Screen:	
Address spoofing	The packet was dropped when the screen module detected address spoofing.
Syn-attack protection	The packet was dropped because of SYN attack protection or SYN cookie protection.
VPN:	
Authentication failed	The packet was dropped because the IPsec Encapsulating Security Payload (ESP) or Authentication Header (AH) authentication failed.
No SA for incoming SPI	The packet was dropped because the incoming IPsec packet's security parameter index (SPI) does not match any known SPI.
Security association not active	The packet was dropped because an IPsec packet was received for an inactive SA.
NAT:	
Incoming NAT errors	The source NAT rule search failed, an invalid source NAT binding was found, or the NAT allocation failed.
Multiple incoming NAT	Sometimes packets are looped through the system more than once; if source NAT is specified more than once, the packet will be dropped.
Auth:	
Multiple user authentications	Sometimes packets are looped through the system more than once. Each time a packet passes through the system, that packet must be permitted by a policy. If the packet matches more than one policy that specifies user authentication, then it will be dropped.
User authentication errors	Packet was dropped because policy requires authentication; however: <ul style="list-style-type: none"> Only Telnet, FTP, and HTTP traffic can be authenticated. The corresponding authentication entry could not be found, if web-auth is specified. The maximum number of authenticated sessions per user was exceeded.

Table 303: Flow Error Statistics (Packet Drop Statistics for the Flow Module) (*continued*)

Flow:	
No one interested in self packets	<p>This counter is incremented for one of the following reasons:</p> <ul style="list-style-type: none"> • The outbound interface is a self interface, but the packet is not marked as a to-self packet and the destination address is in a source NAT pool. • No service is interested in the to-self packet • When a zone has ident-reset service enabled, the TCP RST to IDENT request for port 113 is sent back and this counter is incremented.
No minor session	The packet was dropped because no minor sessions are available and a minor session was requested. Minor sessions are allocated for storing additional TCP state information.
No more sessions	The packet was dropped because there were no more free sessions available.
No route present	<p>The packet was dropped because a valid route was not available to forward the packet.</p> <p>For new sessions, the counter is incremented for one of the following reasons:</p> <ul style="list-style-type: none"> • No valid route was found to forward the packet. • A discard or reject route was found. • The route could not be added due to lack of memory. • The reverse path forwarding check failed for an incoming multicast packet. <p>For existing sessions, the prior route was changed or deleted, or a more specific route was added. The session is rerouted, and this reroute could fail because:</p> <ul style="list-style-type: none"> • A new route could not be found; either the previous route was removed, or the route was changed to discard or reject. • Multiple packets may concurrently force rerouting to occur, and only one packet can successfully complete the rerouting process. Other packets will be dropped. • The route table was locked for updates by the Routing Engine. Packets that match a new session are retried, whereas packets that match an existing session are not.
No tunnel found	The packet was dropped because a valid tunnel could not be found
No session for a gate	This counter is incremented when a packet is destined for an ALG, and the ALG decides to drop this packet.
No zone or NULL zone binding	The packet was dropped because its incoming interface was not bound to any zone.
Policy denied	<p>The error counter is incremented for one of the following reasons:</p> <ul style="list-style-type: none"> • Source and/or destination NAT has occurred and policy says to drop the packet. • Policy specifies user authentication, which failed. • Policy was configured to deny this packet.
TCP sequence number out of window	A TCP packet with a sequence number failed the TCP sequence number check that was received.
Counters Not Currently in Use	
No parent for a gate	-

Table 303: Flow Error Statistics (Packet Drop Statistics for the Flow Module) (*continued*)

Invalid zone received packet	-
No NAT gate	-

show interfaces queue

Syntax	<pre>show interfaces queue <both-ingress-egress> <egress> <forwarding-class forwarding-class> <ingress> <interface-name interface-name> <l2-statistics></pre>
Release Information	Command introduced in Junos OS Release 15.1X49-D30 for vSRX.
Description	Display class-of-service (CoS) queue information for physical interfaces.
Options	<p>none—Show detailed CoS queue statistics for all physical interfaces.</p> <p>both-ingress-egress—Display both ingress and egress queue statistics.</p> <p>egress—Display egress queue statistics.</p> <p>forwarding-class forwarding-class—(Optional) Forwarding class name for this queue. Show detailed CoS statistics for the queue that is associated with the specified forwarding class.</p> <p>ingress—Display ingress queue statistics.</p> <p>interface-name interface-name—(Optional) Show detailed CoS queue statistics for the specified interface.</p> <p>l2-statistics—(Optional) Display Layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> Understanding Class of Service
List of Sample Output	show interfaces queue (vSRX) on page 3118
Output Fields	Table 166 lists the output fields for the show interfaces queue command. Output fields are listed in the approximate order in which they appear.

Table 304: show interfaces queue Output Fields

Field Name	Field Description
Physical interface	Name of the physical interface.
Enabled	State of the interface.
Interface index	Index number of the physical interface. The number reflects the interface's initialization sequence.
SNMP ifIndex	SNMP index number for the interface.

Table 304: show interfaces queue Output Fields (*continued*)

Field Name	Field Description
Forwarding classes supported	Total number of forwarding classes supported on the specified interface.
Forwarding classes in use	Total number of forwarding classes in use on the specified interface.
Egress queues supported	Total number of egress queues supported on the specified interface.
Egress queues in use	Total number of egress queues in use on the specified interface.
The following output fields are applicable to both the interface component and Packet Forwarding Engine component in the <code>show interfaces queue</code> command:	
Queue	Queue number.
Forwarding classes	Forwarding class name.
Queued Packets	Number of packets in this queue.
Queued Bytes	Number of bytes in this queue.
Transmitted Packets	Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the Packet Forwarding Engine Chassis Queues field) shows the prefragmentation values.
Transmitted Bytes	Number of bytes transmitted by this queue.
Tail-dropped packets	Number of packets dropped because of tail drop.
RL-dropped bytes	Number of bytes dropped because of rate limiting.
RED-dropped packets	Number of packets dropped because of random early detection (RED).
RED-dropped bytes	Number of bytes dropped because of RED. <ul style="list-style-type: none"> • Low, non-TCP—Number of low-loss priority, non-TCP bytes dropped because of RED. • Low, TCP—Number of low-loss priority, TCP bytes dropped because of RED. • High, non-TCP—Number of high-loss priority, non-TCP bytes dropped because of RED. • High, TCP—Number of high-loss priority, TCP bytes dropped because of RED.
Queue Buffer Usage:	<ul style="list-style-type: none"> • Reserved buffer—The size of the memory buffer that is allocated for storing packets • Current—The amount of buffer memory that is currently in use on this queue.

Sample Output

show interfaces queue (vSRX)

The following truncated example shows the CoS queue sizes for queues 0, 1, and 3. Queue 1 has a queue buffer size (guaranteed allocated memory) of 9192 bytes.

```

user@host> show interfaces queue
Physical interface: ge-0/0/0, Enabled, Physical link is Up
  Interface index: 134, SNMP ifIndex: 509
  Forwarding classes: 8 supported, 8 in use
  Egress queues: 8 supported, 8 in use
Queue: 0, Forwarding classes: class0
  Queued:
    Packets      :                0                0 pps
    Bytes        :                0                0 bps
  Transmitted:
    Packets      :                0                0 pps
    Bytes        :                0                0 bps
    Tail-dropped packets :                0                0 pps
    RL-dropped packets  :                0                0 pps
    RL-dropped bytes    :                0                0 bps

show lacp interfaces (View)

Syntax	show lacp interfaces <i>interface-name</i>
Release Information	Command modified in Junos OS Release 10.2.
Description	Display Link Aggregation Control Protocol (LACP) information about the specified aggregated Ethernet interface, redundant Ethernet interface, Gigabit Ethernet interface, or 10-Gigabit Ethernet interface. If you do not specify an interface name, LACP information for all interfaces is displayed.
Options	<i>interface-name</i> —(Optional) Display LACP information for the specified interface: <ul style="list-style-type: none"> • Aggregated Ethernet—<i>aenumber</i> • Redundant Ethernet—<i>rethnumber</i> • Gigabit Ethernet—<i>ge-fpc/pic/port</i> • 10-Gigabit Ethernet—<i>xe-fpc/pic/port</i>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Verifying LACP on Redundant Ethernet Interfaces on page 2667
List of Sample Output	show lacp interfaces (Aggregated Ethernet) on page 3125 show lacp interfaces (Redundant Ethernet) on page 3126 show lacp interfaces (Gigabit Ethernet) on page 3126
Output Fields	Table 306 lists the output fields for the show lacp interfaces command. Output fields are listed in the approximate order in which they appear.

Table 306: show lacp interfaces Output Fields

Field Name	Field Description
Aggregated interface	Aggregated interface value.

Table 306: show lacp interfaces Output Fields (*continued*)

Field Name	Field Description
LACP State	<p>LACP state information for each aggregated interface:</p> <ul style="list-style-type: none"> • Role—Role played by the interface. It can be one of the following: <ul style="list-style-type: none"> • Actor—Local device participating in LACP negotiation. • Partner—Remote device participating in LACP negotiation. • Exp—Expired state. Yes indicates the actor or partner is in an expired state. No indicates the actor or partner is not in an expired state. • Def—Default. Yes indicates that the actor's receive machine is using the default operational partner information, administratively configured for the partner. No indicates the operational partner information in use has been received in a link aggregation control protocol data unit (PDU). • Dist—Distribution of outgoing frames. No indicates distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is Yes. • Col—Collection of incoming frames. Yes indicates collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is No. • Syn—Synchronization. If the value is Yes, the link is considered synchronized. It has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is No, the link is not synchronized. It is currently not in the right aggregation. • Aggr—Ability of aggregation port to aggregate (Yes) or to operate only as an individual link (No). • Timeout—LACP timeout preference. Periodic transmissions of link aggregation control PDUs occur at either a slow or fast transmission rate, depending upon the expressed LACP timeout preference (Long Timeout or Short Timeout). • Activity—Actor or partner's port activity. Passive indicates the port's preference for not transmitting link aggregation control PDUs unless its partner's control value is Active. Active indicates the port's preference to participate in the protocol regardless of the partner's control value.

Table 306: show lacp interfaces Output Fields (*continued*)

Field Name	Field Description
LACP Protocol	<p>LACP protocol information for each aggregated interface:</p> <ul style="list-style-type: none"> Link state (active or standby) indicated in parentheses next to the interface when link protection is configured. Receive State—One of the following values: <ul style="list-style-type: none"> Current—The state machine receives a link aggregation control PDU and enters the Current state. Defaulted—If no link aggregation control PDU is received before the timer for the Current state expires a second time, the state machine enters the Defaulted state. Expired—If no link aggregation control PDU is received before the timer for the Current state expires once, the state machine enters the Expired state. Initialize—When the physical connectivity of a link changes or a Begin event occurs, the state machine enters the Initialize state. LACP Disabled—If the port is operating in half duplex, the operation of LACP is disabled on the port, forcing the state to LACP Disabled. This state is similar to the Defaulted state, except that the port is forced to operate as an individual port. Port Disabled—If the port becomes inoperable and a Begin event has not occurred, the state machine enters the Port Disabled state. Transmit State—Transmit state of state machine. One of the following values: <ul style="list-style-type: none"> Fast Periodic—Periodic transmissions are enabled at a fast transmission rate. No Periodic—Periodic transmissions are disabled. Periodic Timer—Transitory state entered when the periodic timer expires. Slow Periodic—Periodic transmissions are enabled at a slow transmission rate. Mux State—State of the multiplexer state machine for the aggregation port. The state is one of the following values: <ul style="list-style-type: none"> Attached—Multiplexer state machine initiates the process of attaching the port to the selected aggregator. Collecting Distributing—Collecting and distributing states are merged together to form a combined state (coupled control). Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution. Detached—Process of detaching the port from the aggregator is in progress. Waiting—Multiplexer state machine is in a holding process, awaiting an outcome.

show lacp statistics interfaces (View)

Syntax	<code>show lacp statistics interfaces <i>interface-name</i></code>
Release Information	Command modified in Junos OS Release 10.2.
Description	Display Link Aggregation Control Protocol (LACP) statistics about the specified aggregated Ethernet interface or redundant Ethernet interface. If you do not specify an interface name, LACP statistics for all interfaces are displayed.
Options	<i>interface-name</i> —(Optional) Name of an interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Verifying the Status of a LAG Interface • Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets • Verifying LACP on Redundant Ethernet Interfaces on page 2667
List of Sample Output	show lacp statistics interfaces on page 3127
Output Fields	Table 307 lists the output fields for the <code>show lacp statistics interfaces</code> command. Output fields are listed in the approximate order in which they appear.

Table 307: show lacp statistics interfaces Output Fields

Field Name	Field Description
Aggregated interface	Aggregated interface value.
LACP Statistics	<p>LACP statistics provide the following information:</p> <ul style="list-style-type: none"> • LACP Rx—LACP received counter that increments for each normal hello. • LACP Tx—Number of LACP transmit packet errors logged. • Unknown Rx—Number of unrecognized packet errors logged. • Illegal Rx—Number of invalid packets received.

Sample Output

show lacp statistics interfaces

```

user@host> show lacp statistics interfaces ae0
Aggregated interface: ae0
  LACP Statistics:      LACP Rx      LACP Tx      Unknown Rx      Illegal Rx

show modem wireless interface firmware

Syntax	show modem wireless interface <i>interface-name</i> firmware
Release Information	Command introduced in Junos OS Release 9.5.
Description	Display firmware details for 3G wireless modem interface.
Options	interface <i>interface-name</i> —The 3G wireless modem interface on the SRX210 device is cl-0/0/8 .
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Example: Configuring the 3G Wireless Modem Interface on page 2845
List of Sample Output	show modem wireless interface firmware (CDMA EV-DO modem) on page 3131 show modem wireless interface firmware (GSM modem) on page 3131
Output Fields	Table 309 lists some of the output fields for the show modem wireless interface firmware command. Output fields are listed in the approximate order in which they appear.

Table 309: show modem wireless interface firmware Output Fields

Field Name	Field Description
SIM Status	<p>Status of the subscriber identity module (SIM) in the GSM 3G wireless modem card. The status can be one of the following states:</p> <ul style="list-style-type: none"> • SIM Okay • SIM not inserted • SIM removed • SIM init failure—There is a problem with the SIM; the SIM may need to be replaced. • SIM locked • PIN1 blocked—Obtain a PIN unblocking key (PUK) to unblock the SIM. • PIN1 rejected—The wrong PIN was entered. • PIN2 rejected—The wrong PIN was entered. • Network rejected
SIM lock	Whether the SIM is locked or unlocked. See SIM user operation needed to determine if any action is required.
SIM user operation needed	<p>Action required by the user. This can be one of the following:</p> <ul style="list-style-type: none"> • No op—No user operation required. • Enter PIN—Enter the personal identification number (PIN) to unlock the SIM. See request modem wireless gsm sim-unlock. • Enter PUK—Enter the PIN unblocking key (PUK) to unblock the SIM. See request modem wireless gsm sim-unblock.

Table 309: show modem wireless interface firmware Output Fields (*continued*)

Field Name	Field Description
Retries remaining	<p>If the value of SIM user operation needed is Enter PIN, the number of PIN unlock attempts remaining before the modem is blocked. If the PIN is entered incorrectly three consecutive times, the SIM is blocked.</p> <p>If the value of SIM user operation needed is Enter PUK, the number of unblock attempts remaining before the modem is unusable. If the PUK is entered incorrectly ten times, the SIM must be returned to the service provider for reactivation.</p>

Sample Output

  SIM status: Low Power
  SIM lock: Unlocked
  SIM user operation needed: No Op
  Retries remaining: 3
  Current modem temperature: 25 degrees Celsius

```

show modem wireless interface network

Syntax	show modem wireless interface <i>interface-name</i> network
Release Information	Command introduced in Junos OS Release 9.5.
Description	Display wireless network statistics for 3G wireless modem interface.
Options	interface <i>interface-name</i> —The 3G wireless modem interface on the SRX210 device is cl-0/0/8.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Example: Configuring the 3G Wireless Modem Interface on page 2845
List of Sample Output	show modem wireless interface network (CDMA EV-DO modem) on page 3133 show modem wireless interface network (GSM modem) on page 3133
Output Fields	Table 310 lists some of the output fields for the show modem wireless interface network command.

Table 310: show modem wireless interface network Output Fields

Field Name	Field Description
System Identifier (SID)	Current SID of the network providing service.
Network Identifier (SID)	Current NID of the station providing service.
Roaming Status	Roaming state.
Current Modem Status	Status of the 3G wireless modem card. The status can be one of the following states: <ul style="list-style-type: none"> • Offline—Modem is not usable • Online—Modem booted properly • Low Power—Modem booted and in low power mode
Current Service Status	Status of the 3G wireless modem connection. The status can be one of the following states: <ul style="list-style-type: none"> • Offline—Modem is not connected • Online—Modem is connected
Current Service Type	One of the following: <ul style="list-style-type: none"> • Circuit switched (CS) • Packet switched (PS) • Combo (CS,PS)

Table 310: show modem wireless interface network Output Fields (*continued*)

Field Name	Field Description
Current Service Mode	One of the following: <ul style="list-style-type: none"> High-Speed Packet Access (HSPA) High-Speed Downlink Packet Access (HSDPA) High-Speed Uplink Packet Access (HSUPA)
Current Band	Current radio band in use.
Mobile country Code (MCC)	Number that uniquely identifies the country.
Mobile Network Code	Number that uniquely identifies a network within a country.
System Identifier (SID)	Current SID of the network providing service.

Sample Output

show modem wireless interface network (CDMA EV-DO modem)

```

user@host> show modem wireless interface cl-0/0/8 network
Running Operating mode : 1xEV-DO (Rev A) and 1xRTT
Call Setup Mode : Mobile IP only
System Identifier (SID) : 3421
Network Identifier (NID) : 91
Roaming Status(1xRTT) : Home
Idle Digital Mode : HDR
System Time : Wed Jun6 15:16:9 2008

```

Output Fields	Table 311 lists the output fields for the <code>show modem wireless interface rssi</code> command.

Table 311: show modem wireless interface rssi Output Fields

Field Name	Field Description
<code>rssi</code>	Current RSSI, in decibels (dB).

Sample Output

`show modem wireless interface cl-0/0/8 rssi`

```
user@host> show modem wireless interface cl-0/0/8 rssi
Radio statistics
  Current radio signal strength: -95 dB
```

show oam ethernet link-fault-management

Syntax	show oam ethernet link-fault-management <brief detail> <interface-name>
Release Information	Statement for branch SRX Series devices introduced in Junos OS Release 9.5.
Description	Display Operation, Administration, and Maintenance (OAM) link fault management (LFM) information for Ethernet interfaces.
Options	brief detail —(Optional) Display the specified level of output. interface-name —(Optional) Display link fault management information for the specified Ethernet interface only.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear oam ethernet connectivity-fault-management path-database on page 3418 • clear oam ethernet connectivity-fault-management statistics on page 3419 • Understanding Ethernet OAM Link Fault Management for SRX Series Services Gateways on page 2703 • Example: Configuring Ethernet OAM Link Fault Management on page 2705
List of Sample Output	show oam ethernet link-fault-management brief on page 3139 show oam ethernet link-fault-management detail on page 3139
Output Fields	Table 312 lists the output fields for the show oam ethernet link-fault-management command. Output fields are listed in the approximate order in which they appear.

Table 312: show oam ethernet link-fault-management Output Fields

Field Name	Field Description	Level of Output
Status	Status of the established link. <ul style="list-style-type: none"> • Fail—A link fault condition exists. • Running—A link fault condition does not exist. 	All levels
Discovery state	State of the discovery mechanism: <ul style="list-style-type: none"> • Passive Wait • Send Any • Send Local Remote • Send Local Remote Ok 	All levels
Peer address	Address of the OAM peer.	All levels

Table 312: show oam ethernet link-fault-management Output Fields (*continued*)

Field Name	Field Description	Level of Output
Flags	Information about the interface. <ul style="list-style-type: none"> Remote-Stable—Indicates remote OAM client acknowledgment of, and satisfaction with, local OAM state information. False indicates that remote DTE has either not seen or is unsatisfied with local state information. True indicates that remote DTE has seen and is satisfied with local state information. Local-Stable—Indicates local OAM client acknowledgment of, and satisfaction with, remote OAM state information. False indicates that local DTE either has not seen or is unsatisfied with remote state information. True indicates that local DTE has seen and is satisfied with remote state information. Remote-State-Valid—Indicates the OAM client has received remote state information found within local information TLVs (type, length, values) of received Information OAM PDUs. False indicates that the OAM client has not seen remote state information. True indicates that the OAM client has seen remote state information. 	All levels
Remote loopback status	An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).	All levels
Remote entity information	Remote entity information. <ul style="list-style-type: none"> Remote MUX action—Indicates the state of the multiplexer functions of the OAM sublayer. Device is forwarding non-OAM PDUs to the lower sublayer or discarding non-OAM PDUs. Remote parser action—Indicates the state of the parser function of the OAM sublayer. Device is forwarding non-OAM PDUs to the higher sublayer, looping back non-OAM PDUs to the lower sublayer, or discarding non-OAM PDUs. Discovery mode—Indicates whether discovery mode is active or inactive. Unidirectional mode—Indicates the ability to operate a link in unidirectional mode for diagnostic purposes. Remote loopback mode—Indicates whether remote loopback is supported or not supported. Link events—Indicates whether interpreting link events is supported or not supported on the remote peer. Variable requests—Indicates whether variable requests are supported or not supported. The Variable Request OAM PDU, is used to request one or more MIB variables from the remote peer. 	All levels
OAM Receive Statistics		
Information	Number of information PDUs received.	detail
Event	Number of loopback control PDUs received.	detail
Variable request	Number of variable request PDUs received.	detail
Variable response	Number of variable response PDUs received.	detail
Loopback control	Number of loopback control PDUs received.	detail

Table 312: show oam ethernet link-fault-management Output Fields (*continued*)

Field Name	Field Description	Level of Output
Organization specific	Number of vendor organization specific PDUs received.	detail
OAM Transmit Statistics		
Information	Number of information PDUs transmitted.	detail
Event	Number of event notification PDUs transmitted.	detail
Variable request	Number of variable request PDUs transmitted.	detail
Variable response	Number of variable response PDUs transmitted.	detail
Loopback control	Number of loopback control PDUs transmitted.	detail
Organization specific	Number of vendor organization specific PDUs transmitted.	detail
OAM Received Symbol Error Event information		
Events	Number of symbol error event TLVs that have been received after the OAM sublayer was reset.	detail
Window	Symbol error event window in the received PDU. The protocol default value is the number of symbols that can be received in one second on the underlying physical layer.	detail
Threshold	Number of errored symbols in the period required for the event to be generated.	detail
Errors in period	Number of symbol errors in the period reported in the received event PDU.	detail
Total errors	Number of errored symbols that have been reported in received event TLVs after the OAM sublayer was reset. Symbol errors are coding symbol errors.	detail
OAM Received Frame Error Event Information		
Events	Number of errored frame event TLVs that have been received after the OAM sublayer was reset.	detail
Window	Duration of the window in terms of the number of 100 ms period intervals.	detail
Threshold	Number of detected errored frames required for the event to be generated.	detail
Errors in period	Number of detected errored frames in the period.	detail

Table 312: show oam ethernet link-fault-management Output Fields (*continued*)

Field Name	Field Description	Level of Output
Total errors	Number of errored frames that have been reported in received event TLVs after the OAM sublayer was reset. A frame error is any frame error on the underlying physical layer.	detail
OAM Received Frame Period Error Event Information		
Events	Number of frame seconds errors event TLVs that have been received after the OAM sublayer was reset.	detail
Window	Duration of the frame seconds window.	detail
Threshold	Number of frame seconds errors in the period.	detail
Errors in period	Number of frame seconds errors in the period.	detail
Total errors	Number of frame seconds errors that have been reported in received event TLVs after the OAM sublayer was reset.	detail
OAM Transmitted Symbol Error Event Information		
Events	Number of symbol error event TLVs that have been transmitted after the OAM sublayer was reset.	detail
Window	The symbol error event window in the transmitted PDU.	detail
Threshold	Number of errored symbols in the period required for the event to be generated.	detail
Errors in period	Number of symbol errors in the period reported in the transmitted event PDU.	detail
Total errors	Number of errored symbols reported in event TLVs that have been transmitted after the OAM sublayer was reset.	detail
OAM Transmitted Frame Error Event Information		
Events	Number of errored frame event TLVs that have been transmitted after the OAM sublayer was reset.	detail
Window	Duration of the window in terms of the number of 100-ms period intervals.	detail
Threshold	Number of detected errored frames required for the event to be generated.	detail
Errors in period	Number of detected errored frames in the period.	detail
Total errors	Number of errored frames that have been detected after the OAM sublayer was reset.	detail

show poe controller (View)

Syntax show poe controller

Release Information Command introduced in Junos OS Release 9.5.

Description Display the status of the Power over Ethernet (PoE) controller.

Options none—Display general parameters of the PoE software module controller.

Required Privilege Level View

Related Documentation

- [Example: Configuring PoE on All Interfaces on page 2714](#)

Output Fields [Table 313](#) lists the output fields for the **show poe controller** command. Output fields are listed in the approximate order in which they appear.

Table 313: show poe controller Output Fields

Field name	Field Description
Controller-index	Identifies the controller.
Maximum-power	Specifies the maximum power that can be provided by the SRX Series device to PoE ports.
Power-consumption	Specifies the total amount of power allocated to the PoE ports.
Guard-band	Shows the guard band configured on the controller.
Management	Shows the power management mode.

Sample Output

show poe controller

```
user@host>show poe controller
```

Controller index	Maximum power	Power consumption	Guard band	Management
0	150.0 W	0.0 W	0 W	Static

show pppoe interfaces

Syntax	show pppoe interfaces <brief detail extensive> <pp0.logical>
Release Information	Command introduced in Junos OS Release 9.5.
Description	Display session-specific information about PPPoE interfaces.
Options	<p>none—Display interface information for all PPPoE interfaces.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>extensive—(Optional) Display information about the number of packets sent and received and the number of timeouts during a PPPoE session.</p> <p>pp0.logical—(Optional) Name of an interface. The logical unit number for static interfaces can be a value from 0 through 16,385. The logical unit number for dynamic interfaces can be a value from 1,073,741,824 through the maximum number of logical interfaces supported on your SRX100, SRX110, SRX210, SRX220, SRX240, and SRX550 devices.</p>
Required Privilege Level	view

Output Fields	Table 314 lists the output fields for the show pppoe interfaces command. Output fields are listed in the approximate order in which they appear.

Table 314: show pppoe interfaces Output Fields

Field Name	Field Description
Index	Index number of the logical interface, which reflects its initialization sequence.
State	State of the logical interface: up or down .
Session ID	Session ID.
Service name	Type of service required (can be used to indicate an ISP name, a class, or quality of service).
Configured AC name	Configured access concentrator name.
Session AC name	Name of the access concentrator.

Table 314: show pppoe interfaces Output Fields (*continued*)

Field Name	Field Description
Remote MAC address or Remote MAC	MAC address of the remote side of the connection, either the access concentrator or the PPPoE client.
Auto-reconnect timeout	Timeout value for reconnecting after a PPPoE session is terminated (in seconds).
Idle timeout	Length of time (in seconds) that a connection can be idle before disconnecting.
Session uptime	Length of time the session has been up, in <i>hh:mm:ss</i> .
Ignore End-Of-List tag	Disables the End-of-List tag to continue processing of other tags after the End-of-List tag in a PPPoE Active Discovery Offer (PADO) packet.
Underlying interface	Interface on which PPPoE is running.
Packet Type	<p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> • PADI—PPPoE Active Discovery Initiation packets. • PADO—PPPoE Active Discovery Offer packets. • PADR—PPPoE Active Discovery Request packets. • PADS—PPPoE Active Discovery Session-Confirmation packets. • PADT—PPPoE Active Discovery Termination packets. • Service name error—Packets for which the Service-Name request could not be honored. • AC system error—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit. • Generic error—Packets that indicate an unrecoverable error occurred. • Malformed packets—Malformed or short packets that caused the packet handler to discard the frame as unreadable. • Unknown packets—Unrecognized packets.
Timeout	<p>Timeouts that occur during the PPPoE session:</p> <ul style="list-style-type: none"> • PADI—No PADI packets received within the timeout period. • PADO—No PADO packets received within the timeout period. (This value is always zero and is not supported.) • PADR—No PADR packets received within the timeout period.
Receive Error Counters	<p>Error counters received during the PPPoE session:</p> <ul style="list-style-type: none"> • PADI—No PADI error counters received during the session. • PADO—No PADO error counters received during the session. • PADR—No PADR error counters received during the session. • PADS—No PADS error counters received during the session.

Layer 2 Bridging and Switching Overview

Ethernet frames can be forwarded from one LAN segment or VLAN to another by the bridging or switching functions on Juniper Networks devices. Bridging and switching functions are performed in Layer 2 of the Open Systems Interconnection (OSI) model—the Data Link Layer. Although the terms bridging and switching are often used interchangeably, switching functions are typically performed in hardware in application-specific integrated circuits (ASICs) while bridging functions are usually performed in software.

Layer 2 Bridging and Transparent Mode Overview

For SRX Series devices, transparent mode provides full security services for Layer 2 bridging capabilities. On these SRX Series devices, you can configure one or more bridge domains to perform Layer 2 bridging. A bridge domain is a set of logical interfaces that share the same flooding or broadcast characteristics. Like a virtual LAN (VLAN), a bridge domain spans one or more ports of multiple devices. Thus, the SRX Series device can function as a Layer 2 switch with multiple bridge domains that participate in the same Layer 2 network.

In transparent mode, the SRX Series device filters packets that traverse the device without modifying any of the source or destination information in the IP packet headers. Transparent mode is useful for protecting servers that mainly receive traffic from untrusted sources because there is no need to reconfigure the IP settings of routers or protected servers.

In transparent mode, all physical ports on the device are assigned to Layer 2 interfaces. Do not route Layer 3 traffic through the device. Layer 2 zones can be configured to host Layer 2 interfaces, and security policies can be defined between Layer 2 zones. When packets travel between Layer 2 zones, security policies can be enforced on these packets.

[Table 317](#) lists the security features that are supported and are not supported in transparent mode for Layer 2 bridging.

Table 317: Security Features Supported in Transparent Mode

Mode Type	Supported	Not Supported
Transparent mode	<ul style="list-style-type: none"> • Application Layer Gateways (ALGs) • Firewall User Authentication (FWAUTH) • Intrusion Detection and Prevention (IDP) • Screen • AppSecure 	<ul style="list-style-type: none"> • Network Address Translation (NAT) • VPN • Unified Threat Management (UTM)

**NOTE:**

- On all SRX Series devices, bridging and transparent mode are not supported on mPIMs.
- On all branch SRX Series devices, the DHCP server propagation is not supported in Layer 2 transparent mode.

Layer 2 Bridging Exceptions on SRX Series Devices

The bridging functions on the SRX Series devices are similar to the bridging features on Juniper Networks MX Series routers. However, the following Layer 2 networking features on MX Series routers are not supported on SRX Series devices:

- Layer 2 control protocols—These protocols are used on MX Series routers for Rapid Spanning Tree Protocol (RSTP) or Multiple Spanning Tree Protocol (MSTP) in customer edge interfaces of a VPLS routing instance.
- Virtual switch routing instance—The virtual switching routing instance is used on MX Series routers to group one or more VLANs.
- Virtual private LAN services (VPLS) routing instance—The VPLS routing instance is used on MX Series routers for point-to-multipoint LAN implementations between a set of sites in a VPN.

In addition, the SRX Series devices do not support the following Layer 2 features:

- Spanning Tree Protocol (STP), RSTP, or MSTP—It is the user's responsibility to ensure that no flooding loops exist in the network topology.
- Internet Group Management Protocol (IGMP) snooping—Host-to-router signaling protocol for IPv4 used to report their multicast group memberships to neighboring routers and determine whether group members are present during IP multicasting.

- Double-tagged VLANs or IEEE 802.1Q VLAN identifiers encapsulated within 802.1Q packets (also called “Q in Q” VLAN tagging)—Only untagged or single-tagged VLAN identifiers are supported on SRX Series devices.
- Nonqualified VLAN learning, where only the MAC address is used for learning within the VLAN—VLAN learning on SRX Series devices is qualified; that is, both the VLAN identifier and MAC address are used.

Also, on SRX100, SRX210, SRX220, SRX240, and SRX650 devices, the following features are not supported for Layer 2 transparent mode:

- G-ARP on the Layer 2 interface
- IP address monitoring on any interface
- Transit traffic through IRB
- IRB interface in a routing instance
- IRB interface handling of Layer 3 traffic

NOTE: The IRB interface is a pseudointerface and does not belong to the reth interface and redundancy group.

Layer 2 Transparent Mode on the SRX5000 Line Module Port Concentrator

The SRX5000 line Module Port Concentrator (SRX5K-MPC) supports Layer 2 transparent mode and processes the traffic when the SRX Series device is configured in Layer 2 transparent mode.

When the SRX5K-MPC is operating in Layer 2 mode, you can configure all interfaces on the SRX5K-MPC as Layer 2 bridging ports to support Layer 2 traffic.

The security processing unit (SPU) supports all security services for Layer 2 bridging functions, and the MPC delivers the ingress packets to the SPU and forwards the egress packets that are encapsulated by the SPU to the outgoing interfaces.

When the SRX Series device is configured in Layer 2 transparent mode, you can enable the interfaces on the MPC to work in Layer 2 mode by defining one or more logical units on a physical interface with the family address type as **bridge**. Later you can proceed with configuring Layer 2 security zones and configuring security policies in transparent mode. Once this is done, next-hop topologies are set up to process ingress and egress packets.

Understanding VLANs

The packets that are forwarded within a VLAN are determined by the VLAN ID of the packets and the VLAN ID of the VLAN. Only the packets with VLAN IDs that match the VLAN ID configured for a VLAN are forwarded within the VLAN.

When configuring VLANs, you can specify either a single VLAN ID or a list of specific VLAN IDs. If you specify a list of VLAN IDs, a VLAN is created for each VLAN ID in the list. Certain VLAN properties, such as the integrated routing and bridging interface (IRB), are not configurable if VLANs are created in this manner.

Each Layer 2 logical interface configured on the device is implicitly assigned to a VLAN based on the VLAN ID of the packets accepted by the interface. You do not need to explicitly define the logical interfaces when configuring a VLAN.

You can configure one or more static MAC addresses for a logical interface in a VLAN; this is only applicable if you specified a single VLAN ID when creating the VLAN.

NOTE: If a static MAC address you configure for a logical interface appears on a different logical interface, packets sent to that interface are dropped.

You can configure the following properties that apply to all VLANs on the SRX Series device:

- **Layer 2 address learning**—Layer 2 address learning is enabled by default. A bridge domain learns unicast media access control (MAC) addresses to avoid flooding packets to all interfaces in the bridge domain. Each bridge domain creates a source MAC entry in its forwarding tables for each source MAC address learned from packets received on interfaces that belong to the bridge domain. When you disable MAC learning, source MAC addresses are not dynamically learned, and any packets sent to these source addresses are flooded into a bridge domain.
- **Maximum number of MAC addresses learned from all logical interfaces on the SRX Series device**—After the MAC address limit is reached, the default is for any incoming packets with a new source MAC address to be forwarded. You can specify that the packets be dropped instead. The default limits of MAC addresses for the SRX Series devices are shown in [Table 318](#).

Table 318: MAC Addresses Default Limits

SRX Series Devices	Default Limit for MAC Addresses
SRX100	1024
SRX210	
SRX220	2048
SRX240	4096

Table 318: MAC Addresses Default Limits (*continued*)

SRX Series Devices	Default Limit for MAC Addresses
SRX650	16,384
SRX5600	131,071
SRX5800	

- Timeout interval for MAC table entries. By default, the timeout interval for MAC table entries is 300 seconds. The minimum you can configure is 10 seconds and the maximum is 64,000 seconds. The timeout interval applies only to dynamically learned MAC addresses. This value does not apply to configured static MAC addresses, which never time out.

NOTE: SRX100, SRX210, SRX220, SRX240, and SRX650 devices support only 16,000 MAC entries.

- [Understanding Layer 2 Forwarding Tables on page 3195](#)

Example: Configuring VLANs

This example shows how to configure VLANs.

- [Requirements on page 3167](#)
- [Overview on page 3167](#)
- [Configuration on page 3168](#)
- [Verification on page 3168](#)

Requirements

Before you begin, determine the properties you want to configure for the VLAN. See “Understanding VLANs” on page 3166.

Overview

In this example, you configure bridge domain vlan-a for VLANs 1 and 10, and bridge domain vlan-b for VLAN 2. You then limit the number of MAC addresses learned on all logical interfaces on the device to 64,000. When this limit is reached, incoming packets with a new source MAC address will be dropped.

Configuration

Step-by-Step Procedure

To configure VLANs:

1. Configure the domain type and VLANs.

```
[edit]
user@host# set vlans vlan-a vlan members 1-10
user@host# set vlans vlan-b vlan-id 2
```
2. Limit the number of MAC addresses.

```
[edit]
user@host# set protocols l2-learning global-mac-limit 64000 packet-action drop
```
3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show vlans** and **show protocols l2-learning** commands.

Understanding Transparent Mode Conditions

A device operates in Layer 2 transparent mode when all physical interfaces on the device are configured as Layer 2 interfaces. A physical interface is a Layer 2 interface if its logical interface is configured with the **bridge** family.

There is no command to define or enable transparent mode on the device. The device operates in transparent mode when there are interfaces defined as Layer 2 interfaces. The device operates in route mode (the default mode) if there are no physical interfaces configured as Layer 2 interfaces.

NOTE: In mixed mode, which is the default mode, you can configure an SRX Series device using both transparent mode (Layer 2) and route mode (Layer 3) simultaneously, with no reboot required.

You can configure the **fxp0** out-of-band management interface on the SRX Series device as a Layer 3 interface, even if Layer 2 interfaces are defined on the device. With the exception of the **fxp0** interface, you can define Layer 2 and Layer 3 interfaces on the device's network ports.

NOTE: There is no fxp0 out-of-band management interface on the SRX100, SRX210, SRX220, SRX240, and SRX650 devices.

Understanding Layer 2 Interfaces

Layer 2 logical interfaces are created by defining one or more logical units on a physical interface with the family address type **bridge**. If a physical interface has a **bridge** family logical interface, it cannot have any other family type in its logical interfaces. A logical interface can be configured in one of the following modes:

- Access mode—Interface accepts untagged packets, assigns the specified VLAN identifier to the packet, and forwards the packet within the bridge domain that is configured with the matching VLAN identifier.
- Trunk mode—Interface accepts any packet tagged with a VLAN identifier that matches a specified list of VLAN identifiers. Trunk mode interfaces are generally used to interconnect switches. To configure a VLAN identifier for untagged packets received on the physical interface, use the **native-vlan-id** option. If the **native-vlan-id** option is not configured, untagged packets are dropped.

Tagged packets arriving on a trunk mode interface can be rewritten or “retagged” with a different VLAN identifier. This allows incoming packets to be selectively redirected to a firewall or other security device.

NOTE: Multiple trunk mode logical interfaces can be defined, as long as the VLAN identifiers of a trunk interface do not overlap with those of another trunk interface. The **native-vlan-id** must belong to a VLAN identifier list configured for a trunk interface.

Example: Configuring Layer 2 Logical Interfaces

This example shows how to configure a Layer 2 logical interface as a trunk port so that the incoming packets can be selectively redirected to a firewall or other security device.

- [Requirements on page 3173](#)
- [Overview on page 3173](#)
- [Configuration on page 3173](#)
- [Verification on page 3173](#)

Requirements

Before you begin, configure the VLANs. See [“Example: Configuring VLANs” on page 3167](#).

Overview

In this example, you configure logical interface ge-3/0/0.0 as a trunk port that carries traffic for packets tagged with VLAN identifiers 1 through 10; this interface is implicitly assigned to the previously configured VLANs vlan-a and vlan-b. Then you assign a VLAN ID of 10 to any untagged packets received on physical interface ge-3/0/0.

Configuration

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the [jJunos OS CLI User Guide](#).

To configure a Layer 2 logical interface as a trunk port:

1. Configure the logical interface.

```
[edit interfaces ge-3/0/0]
user@host# set unit 0 family ethernet-switching interface-mode trunk vlan members 1-10
```
2. Specify a VLAN ID for untagged packets.

```
[edit interfaces ge-3/0/0]
user@host# set vlan-tagging native-vlan-id 10
```
3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show interfaces ge-3/0/0** and **show interfaces ge-3/0/0.0** commands.

Understanding VLAN Retagging

The VLAN identifier in packets arriving on a Layer 2 trunk port can be rewritten or “retagged” with a different internal VLAN identifier. VLAN retagging is a symmetric operation; upon exiting the same trunk port, the retagged VLAN identifier is replaced with the original VLAN identifier. VLAN retagging provides a way to selectively screen incoming packets and redirect them to a firewall or other security device without affecting other VLAN traffic.

VLAN retagging can be applied only to interfaces configured as Layer 2 trunk interfaces. These interfaces can include redundant Ethernet interfaces in a Layer 2 transparent mode chassis cluster configuration.

NOTE: If a trunk port is configured for VLAN retagging, untagged packets received on the port cannot be assigned a VLAN identifier with the VLAN retagging configuration. To configure a VLAN identifier for untagged packets received on the physical interface, use the **native-vlan-id** statement.

To configure VLAN retagging for a Layer 2 trunk interface, specify a one-to-one mapping of the following:

- Incoming VLAN identifier—VLAN identifier of the incoming packet that is to be retagged. This VLAN identifier must not be the same VLAN identifier configured with the **native-vlan-id** statement for the trunk port.
- Internal VLAN identifier—VLAN identifier for the retagged packet. This VLAN identifier must be in the VLAN identifier list for the trunk port and must not be the same VLAN identifier configured with the **native-vlan-id** statement for the trunk port.

Related Documentation

- [Example: Configuring Layer 2 Logical Interfaces on page 3173](#)

Example: Configuring VLAN Retagging for Layer 2 Transparent Mode

This example shows how to configure VLAN retagging on a Layer 2 trunk interface to selectively screen incoming packets and redirect them to a security device without affecting other VLAN traffic.

- [Requirements on page 3175](#)
- [Overview on page 3175](#)

- [Configuration on page 3175](#)
- [Verification on page 3175](#)

Requirements

Before you begin, determine the mapping you want to include for the VLAN retagging. See “[Understanding VLAN Retagging](#)” on page 3174.

Overview

In this example, you create a Layer 2 trunk interface called `ge-3/0/0` and configure it to receive packets with VLAN identifiers 1 through 10. Packets that arrive on the interface with VLAN identifier 11 are retagged with VLAN identifier 2. Before exiting the trunk interface, VLAN identifier 2 in the retagged packets is replaced with VLAN identifier 11. All VLAN identifiers in the retagged packets change back when you exit the trunk interface.

Configuration

Step-by-Step Procedure

To configure VLAN retagging on a Layer 2 trunk interface:

1. Create a Layer 2 trunk interface.

```
[edit]
user@host#set interfaces ge-3/0/0 unit 0 family ethernet-switching interface-mode trunk vlan members 1-10
```
2. Configure VLAN retagging.

```
[edit]
user@host#set interfaces ge-3/0/0 unit 0 family ethernet-switching vlan-rewrite translate 11 2
```
3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **`show interfaces ge-3/0/0`** command.

Understanding Integrated Routing and Bridging Interfaces

For VLANs configured with a single VLAN identifier, you can optionally configure an integrated routing and bridging (IRB) interface for management traffic in the bridge domain. An IRB interface acts as a Layer 3 routing interface for a bridge domain.

NOTE: If you specify a VLAN identifier list in the bridge domain configuration, you cannot configure an IRB interface for the bridge domain.

Currently the IRB interface on the SRX Series device does not support traffic forwarding or routing. In transparent mode, packets arriving on a Layer 2 interface that are destined for the device's MAC address are classified as Layer 3 traffic while packets that are not destined for the device's MAC address are classified as Layer 2 traffic. Packets destined for the device's MAC address are sent to the IRB interface. Packets from the device's routing engine are sent out the IRB interface.

You create an IRB logical interface in a similar manner as a Layer 3 interface, but the IRB interface does not support traffic forwarding or routing. The IRB interface cannot be assigned to a security zone; however, you can configure certain services on a per-zone basis to allow host-inbound traffic for management of the device. This allows you to control the type of traffic that can reach the device from interfaces bound to a specific zone.

NOTE:

- On SRX1500, SRX5600, and SRX5800 devices, we support an IRB interface that allows you to terminate management connections in transparent mode. However, you cannot route traffic on that interface or terminate IPsec VPNs.
- You can configure only one IRB logical interface for each bridge domain.
- On SRX100 devices, the multicast data traffic is not supported on IRB interfaces.
- On SRX210 devices, IGMPv2 JOINS messages are dropped on an IRB interface. As a workaround, enable IGMP snooping to use IGMP over IRB interfaces.

NOTE: On SRX100, SRX210, SRX240, and SRX650 devices, on the routed VLAN interface (RVI), the following features are not supported:

- IS-IS (family ISO)
- Encapsulations (Ether CCC, VLAN CCC, VPLS, PPPoE, and so on) on VLAN interfaces
- CLNS
- DVMRP
- VLAN interface MAC change
- G-ARP
- Change VLAN-Id for VLAN interface

- Related Documentation**

 - [Example: Configuring VLANs on page 3167](#)

Example: Configuring an IRB Interface

This example shows how to configure an IRB interface so it can act as a Layer 3 routing interface for a bridge domain.

- [Requirements on page 3177](#)
- [Overview on page 3177](#)
- [Configuration on page 3177](#)
- [Verification on page 3178](#)

Requirements

Before you begin, configure a bridge domain with a single VLAN identifier. See [“Example: Configuring VLANs” on page 3167](#).

Overview

In this example, you configure the IRB logical interface unit 0 with the family type inet and IP address 10.1.1.1/24, and then reference the IRB interface irb.0 in the vlan-2 bridge domain configuration. Then you enable Web authentication on the IRB interface and activate the webserver on the device.

NOTE: To complete the Web authentication configuration, you must perform the following tasks:

- Define the access profile and password for a Web authentication client.
- Define the security policy that enables Web authentication for the client.

Either a local database or an external authentication server can be used as the Web authentication server.

Configuration

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the [Junos OS CLI User Guide](#).

To configure an IRB interface:

1. Create a Layer 2 trunk interface.

[edit]

```
user@host# set interfaces ge-1/0/0 unit 0 family ethernet-switching port-mode trunk
```

2. Create an IRB logical interface.

```
[edit]
user@host# set interface irb unit 0 family inet address 10.1.1.1/24 web-authentication http
```

3. Create a Layer 2 VLAN.

```
[edit]
user@host# set vlans vlan-2 vlan-id 1
```

4. Associate the IRB interface with the VLAN.

```
[edit]
user@host# set vlans vlan-2 l3-interface irb.0
```

5. Activate the webserver.

```
[edit]
user@host# set system services web-management http
```

6. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show interface irb** , and **show vlans** commands.

Understanding Mixed Mode (Layer 2 and Layer 3)

Mixed mode supports both Layer 2 and Layer 3 interfaces; it is the default mode. You can configure both Layer 2 and Layer 3 interfaces simultaneously using separate security zones.

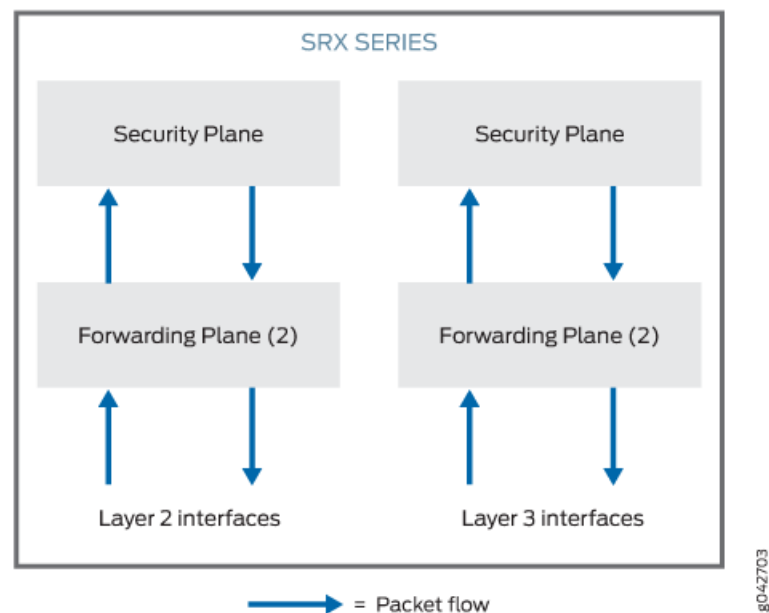

NOTE: For the mixed mode configuration, you must reboot the device after you commit the changes. However, for SRX5000 line devices, reboot is not required.

In mixed mode (Layer 2 and Layer 3):

- There is no routing among IRB interfaces and between IRB interfaces and Layer 3 interfaces.
- The user logical system is not supported for Layer 2 traffic. However, you can configure Layer 2 traffic using the root logical system.
- You can configure Layer 3 interfaces using both the user logical system and the root logical system.

The device in [Figure 140](#) looks like two separate devices. One device runs in Layer 2 mode and the other device runs in Layer 3 mode. But both devices run independently. Packets cannot be transferred between the Layer 2 and Layer 3 interfaces, because there is no routing among IRB interfaces and between IRB interfaces and Layer 3 interfaces.

Figure 140: Architecture of Mixed Layer 2 and Layer 3 Mode

In mixed mode, the Ethernet physical interface can be either a Layer 2 interface or a Layer 3 interface, but the Ethernet physical interface cannot be both simultaneously. However, Layer 2 and Layer 3 families can exist on separate physical interfaces on the same device.

[Table 321](#) lists the Ethernet physical interface types and supported family types.

Table 321: Ethernet Physical Interface and Supported Family Types

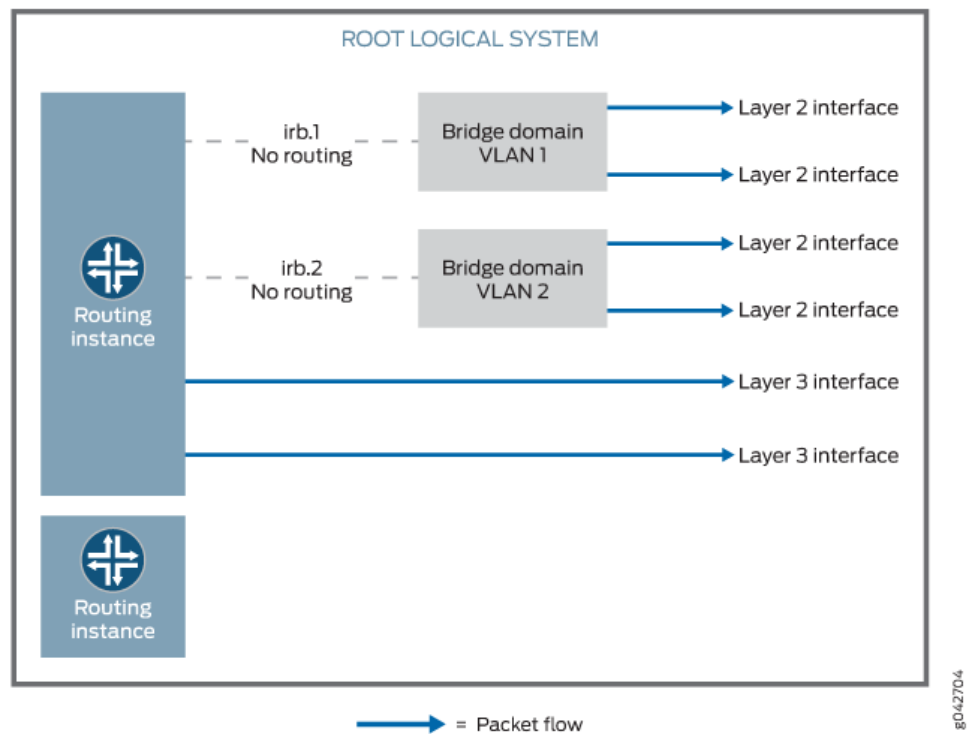

Ethernet Physical Interface Type	Supported Family Type
Layer 2 Interface	bridge
Layer 3 Interface	inet and inet6

NOTE: Multiple routing instances are supported.

You can configure both the pseudointerface **irb.x** and the Layer 3 interface under the same default routing instance using either a default routing instance or a user-defined routing instance. See [Figure 141](#).

Figure 141: Mixed Layer 2 and Layer 3 Mode

Packets from the Layer 2 interface are switched within the same bridge domain, or they connect to the host through the IRB interface. Packets cannot be routed to another IRB interface or a Layer 3 interface through their own IRB interface.

Packets from the Layer 3 interface are routed to another Layer 3 interface. Packets cannot be routed to a Layer 2 interface through an IRB interface.

[Table 322](#) lists the security features that are supported in mixed mode and the features that are not supported in transparent mode for Layer 2 bridging..

Table 322: Security Features Supported in Mixed Mode (Layer 2 and Layer 3)

Mode Type	Supported	Not Supported
Mixed mode	<ul style="list-style-type: none"> Application Layer Gateways (ALGs) Firewall User Authentication (FWAUTH) Intrusion Detection and Prevention (IDP) Screen AppSecure 	—
Layer 3 interface of mixed mode	<ul style="list-style-type: none"> Network Address Translation (NAT) VPN 	—
Layer 2 mode (transparent mode)		<ul style="list-style-type: none"> Network Address Translation (NAT) VPN

- On all branch SRX Series devices, you cannot configure Ethernet switching and virtual private LAN service (VPLS) using mixed mode (Layer 2 and Layer 3).
- On all branch SRX Series devices, you must reboot the device when you configure bridge domain if the bridge domain was not already configured on the device.
- On all high-end SRX Series devices, you do not have to reboot the device when you configure bridge domain.

Related Documentation

- [Example: Improving Security Services by Configuring an SRX Series Device Using Mixed Mode \(Layer 2 and Layer 3\) on page 3181](#)
- [Understanding Secure Wire on page 3223](#)

Example: Improving Security Services by Configuring an SRX Series Device Using Mixed Mode (Layer 2 and Layer 3)

You can configure an SRX Series device using both Layer 2 and Layer 3 interfaces simultaneously to simplify deployments and to improve security services.

This example shows how to pass the Layer 2 traffic from interface ge-0/0/1.0 to interface ge-0/0/0.0 and Layer 3 traffic from interface ge-0/0/2.0 to interface ge-0/0/3.0.

- [Requirements on page 3182](#)
- [Overview on page 3182](#)
- [Configuration on page 3184](#)
- [Verification on page 3187](#)

Requirements

This example uses the following hardware and software components:

- An SRX Series device
- Four PCs

Before you begin:

- Create a separate security zone for Layer 2 and Layer 3 interfaces. See [“Understanding Layer 2 Security Zones” on page 3189](#).

Overview

In enterprises where different business groups have either Layer 2 or Layer 3 based security solutions, using a single mixed mode configuration simplifies their deployments. In a mixed mode configuration, you can also provide security services with integrated switching and routing.

In addition, you can configure an SRX Series device in both standalone and chassis cluster mode using mixed mode.

In mixed mode (default mode), you can configure both Layer 2 and Layer 3 interfaces simultaneously using separate security zones.

NOTE: For the mixed mode configuration, you must reboot the device after you commit the changes. However, for SRX5000 line devices, reboot is not required.

In this example, first you configure a Layer 2 family type called bridge to identify Layer 2 interfaces. You set the IP address 10.10.10.1/24 to IRB interface. Then you create zone L2 and add Layer 2 interfaces ge-0/0/1.0 and ge-0/0/0.0 to it.

Next you configure a Layer 3 family type inet to identify Layer 3 interfaces. You set the IP address 192.0.2.1/24 to interface ge-0/0/2.0 and the IP address 192.0.2.3/24 to interface ge-0/0/3. Then you create zone L3 and add Layer 3 interfaces ge-0/0/2.0 and ge-0/0/3.0 to it.

Topology

Figure 142 shows a mixed mode topology.

Figure 142: Mixed Mode Topology

Table 323 shows the parameters configured in this example.

Table 323: Layer 2 and Layer 3 Parameters

Parameter	Description
L2	Layer 2 zone.
ge-0/0/1.0 and ge-0/0/0.0	Layer 2 interfaces added to the Layer 2 zone.
L3	Layer 3 zone.
ge-0/0/2.0 and ge-0/0/3.0	Layer 3 interfaces added to the Layer 3 zone.
10.10.10.1/24	IP address for the IRB interface.
192.0.2.1/24 and 192.0.2.3/24	IP addresses for the Layer 3 interface.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/0 unit 0 family ethernet-switching interface-mode access
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members 10
set interfaces ge-0/0/1 unit 0 family ethernet-switching interface-mode access
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members 10
set interfaces irb unit 10 family inet address 10.10.10.1/24
set security zones security-zone L2 interfaces ge-0/0/1.0
set security zones security-zone L2 interfaces ge-0/0/0.0
set vlans vlan-10 vlan-id 10
set vlans vlan-10 l3-interface irb.10
set interfaces ge-0/0/2 unit 0 family inet address 192.0.2.1/24
set interfaces ge-0/0/3 unit 0 family inet address 192.0.2.3/24
set security policies default-policy permit-all
set security zones security-zone L2 host-inbound-traffic system-services any-service
set security zones security-zone L2 host-inbound-traffic protocols all
set security zones security-zone L3 host-inbound-traffic system-services any-service
set security zones security-zone L3 host-inbound-traffic protocols all
set security zones security-zone L3 interfaces ge-0/0/2.0
set security zones security-zone L3 interfaces ge-0/0/3.0
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Layer 2 and Layer 3 interfaces:

1. Create a Layer 2 family type to configure Layer 2 interfaces.

```
[edit interfaces]
user@host#set ge-0/0/0 unit 0 family ethernet-switching interface-mode access
user@host#set ge-0/0/0 unit 0 family ethernet-switching vlan members 10
user@host#set ge-0/0/1 unit 0 family ethernet-switching interface-mode access
user@host#set ge-0/0/1 unit 0 family ethernet-switching vlan members 10
```
2. Configure an IP address for the IRB interface.

```
[edit interfaces]
user@host# set irb unit 10 family inet address 10.10.10.1/24
```
3. Configure Layer 2 interfaces.

```
[edit security zones security-zone L2 interfaces]
user@host# set ge-0/0/1.0
user@host# set ge-0/0/0.0
```
4. Configure bridge domain.

```
[edit vlans vlan-10]
user@host# set vlan-id 10
user@host# set l3-interface irb.10
```
5. Configure IP addresses for Layer 3 interfaces.

```
[edit interfaces]
user@host# set ge-0/0/2.0 unit 0 family inet address 192.0.2.1/24
user@host# set ge-0/0/3.0 unit 0 family inet address 192.0.2.3/24
```

6. Configure the policy to permit the traffic.

```
[edit security policies]
user@host# set default-policy permit-all
```

7. Configure Layer 3 interfaces.

```
[edit security zones security-zone]
user@host# set L2 host-inbound-traffic system-services any-service
user@host# set L2 host-inbound-traffic protocols all
user@host# set L3 host-inbound-traffic system-services any-service
user@host# set L3 host-inbound-traffic protocols all
user@host# set L3 interfaces ge-0/0/2.0
user@host# set L3 interfaces ge-0/0/3.0
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show security policies**, **show vlans**, and **show security zones** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
ge-0/0/0 {
  unit 0 {
    family ethernet-switching {
      interface-mode access;
      vlan-id 10;
    }
  }
}
ge-0/0/1 {
  unit 0 {
    family ethernet-switching {
      interface-mode access;
      vlan-id 10;
    }
  }
}
ge-0/0/2 {
  unit 0 {
    family inet {
      address 192.0.2.1/24;
    }
  }
}
ge-0/0/3 {
  unit 0 {
    family inet {
      address 192.0.2.2/24;
    }
  }
}
```

```
    irb {  
      unit 10 {  
        family inet {  
          address 10.10.10.1/24;  
        }  
      }  
    }  
  [edit]  
user@host# show security policies  
default-policy {  
  permit-all;  
}  
[edit]  
user@host# show vlans  
vlan-10 {  
  vlan-id 10;  
  l3-interface irb.10;  
}  
[edit]  
user@host# show security zones  
security-zone L2 {  
  host-inbound-traffic {  
    system-services {  
      any-service;  
    }  
    protocols {  
      all;  
    }  
  }  
  interfaces {  
    ge-0/0/1.0;  
    ge-0/0/0.0;  
  }  
}  
security-zone L3 {  
  host-inbound-traffic {  
    system-services {  
      any-service;  
    }  
    protocols {  
      all;  
    }  
  }  
  interfaces {  
    ge-0/0/2.0;  
    ge-0/0/3.0;  
  }  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying the Layer 2 and Layer 3 Interfaces and Zones on page 3187](#)
- [Verifying the Layer 2 and Layer 3 Session on page 3188](#)

Verifying the Layer 2 and Layer 3 Interfaces and Zones

Purpose Verify that the Layer 2 and Layer 3 interfaces and Layer 2 and Layer 3 zones are created.

Action From operational mode, enter the **show security zones** command.

```
user@host>show security zones
Security zone: HOST
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 0
  Interfaces:

Security zone: L2
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 2
  Interfaces:
    ge-0/0/0.0
    ge-0/0/1.0

Security zone: L3
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 2
  Interfaces:
    ge-0/0/2.0
    ge-0/0/3.0

Security zone: junos-host
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 0
  Interfaces:
```

Meaning The output shows the Layer 2 (L2) and Layer 3 (L3) zone names and the number and names of Layer 2 and Layer 3 interfaces bound to the L2 and L3 zones.

Verifying the Layer 2 and Layer 3 Session

Purpose Verify that the Layer 2 and Layer 3 sessions are established on the device.

Action From operational mode, enter the **show security flow session** command.

```
user@host>show security flow session
Session ID: 130000050, Policy name: default-policy-00/2, Timeout: 2, Valid
  In: 10.10.10.2/22 --> 10.10.10.3/28;icmp, If: ge-0/0/0.0, Pkts: 1, Bytes: 98
  Out: 10.10.10.3/245 --> 10.10.10.2/248;icmp, If: ge-0/0/1.0, Pkts: 1, Bytes:
98

Session ID: 130000051, Policy name: default-policy-02/2, Timeout: 4, Valid
  In: 192.0.2.1/17 --> 192.0.2.2/19;icmp, If: ge-0/0/2.0, Pkts: 1, Bytes: 84
  Out: 192.0.2.2/212 --> 192.0.2.1/218;icmp, If: ge-0/0/3.0, Pkts: 1, Bytes: 84
```

Meaning The output shows active sessions on the device and each session's associated security policy.

- **Session ID 130000050**—Number that identifies the Layer 2 session. Use this ID to get more information about the Layer 2 session such as policy name or number of packets in and out.
- **default-policy-00/2**—Default policy name that permitted the Layer 2 traffic.
- **In**—Incoming flow (source and destination Layer 2 IP addresses with their respective source and destination port numbers, session is ICMP, and the source interface for this session is ge-0/0/0.0).
- **Out**—Reverse flow (source and destination Layer 2 IP addresses with their respective source and destination port numbers, session is ICMP, and destination interface for this session is ge-0/0/1.0).
- **Session ID 130000051**—Number that identifies the Layer 3 session. Use this ID to get more information about the Layer 3 session such as policy name or number of packets in and out.
- **default-policy-02/2**—Default policy name that permitted the Layer 3 traffic.
- **In**—Incoming flow (source and destination Layer 3 IP addresses with their respective source and destination port numbers, session is ICMP, and the source interface for this session is ge-0/0/2.0).
- **Out**—Reverse flow (source and destination Layer 3 IP addresses with their respective source and destination port numbers, session is ICMP, and destination interface for this session is ge-0/0/3.0).

Understanding Layer 2 Security Zones

A Layer 2 security zone is a zone that hosts Layer 2 interfaces. A security zone can be either a Layer 2 or Layer 3 zone; it can host either all Layer 2 interfaces or all Layer 3 interfaces, but it cannot contain a mix of Layer 2 and Layer 3 interfaces.

The security zone type—Layer 2 or Layer 3—is implicitly set from the first interface configured for the security zone. Subsequent interfaces configured for the same security zone must be the same type as the first interface.

NOTE: You cannot configure a device with both Layer 2 and Layer 3 security zones.

You can configure the following properties for Layer 2 security zones:

- **Interfaces**—List of interfaces in the zone.
- **Policies**—Active security policies that enforce rules for the transit traffic, in terms of what traffic can pass through the firewall, and the actions that need to take place on the traffic as it passes through the firewall.
- **Screens**—A Juniper Networks stateful firewall secures a network by inspecting, and then allowing or denying, all connection attempts that require passage from one security zone to another. For every security zone, and the MGT zone, you can enable a set of predefined screen options that detect and block various kinds of traffic that the device determines as potentially harmful.

NOTE: You can configure the same screen options for a Layer 2 security zone as for a Layer 3 security zone.

- Address books—IP addresses and address sets that make up an address book to identify its members so that you can apply policies to them.
- TCP-RST—When this feature is enabled, the system sends a TCP segment with the reset flag set when traffic arrives that does not match an existing session and does not have the synchronize flag set.

In addition, you can configure a Layer 2 zone for host-inbound traffic. This allows you to specify the kinds of traffic that can reach the device from systems that are directly connected to the interfaces in the zone. You must specify all expected host-inbound traffic because inbound traffic from devices directly connected to the device's interfaces is dropped by default.

Example: Configuring Layer 2 Security Zones

This example shows how to configure Layer 2 security zones.

- [Requirements on page 3190](#)
- [Overview on page 3190](#)
- [Configuration on page 3191](#)
- [Verification on page 3191](#)

Requirements

Before you begin, determine the properties you want to configure for the Layer 2 security zone. See [“Understanding Layer 2 Security Zones” on page 3189](#).

Overview

In this example, you configure security zone l2-zone1 to include a Layer 2 logical interface called ge-3/0/0.0 and security zone l2-zone2 to include a Layer 2 logical interface called ge-3/0/1.0. Then you configure l2-zone2 to allow all supported application services (such as SSH, Telnet, and SNMP) as host-inbound traffic.

Configuration

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the [Junos OS CLI User Guide](#).

To configure Layer 2 security zones:

1. Create a Layer 2 security zone and assign interfaces to it.

```
[edit security zones]
user@host# set security-zone l2-zone1 interfaces ge-3/0/0.0
user@host# set security-zone l2-zone2 interfaces ge-3/0/1.0
```
2. Configure one of the Layer 2 security zones.

```
[edit security zones]
user@host# set security-zone l2-zone2 host-inbound-traffic system-services all
```
3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show security zones** command.

- Related Documentation**
- [Layer 2 Bridging and Transparent Mode Overview on page 3163](#)
 - [Example: Configuring Security Policies in Transparent Mode on page 3192](#)
 - [Example: Configuring Layer 2 Logical Interfaces on page 3173](#)

Understanding Security Policies in Transparent Mode

In transparent mode, security policies can be configured only between Layer 2 zones. When packets are forwarded through the bridge domain, the security policies are applied between security zones. A security policy for transparent mode is similar to a policy configured for Layer 3 zones, with the following exceptions:

- NAT is not supported.
- IPsec VPN is not supported.
- Application ANY is used.

Layer 2 forwarding does not permit any interzone traffic unless there is a policy explicitly configured on the device. By default, Layer 2 forwarding performs the following actions:

- Allows or denies traffic specified by the configured policy.
- Allows Address Resolution Protocol (ARP) and Layer 2 non-IP multicast and broadcast traffic. The device can receive and pass Layer 2 broadcast traffic for STP.
- Continues to block all non-IP and non-ARP unicast traffic.

This default behavior can be changed for bridge packet flow by using either J-Web or the CLI configuration editor:

- Configure the **block-non-ip-all** option to block all Layer 2 non-IP and non-ARP traffic, including multicast and broadcast traffic.
- Configure the **bypass-non-ip-unicast** option to allow all Layer 2 non-IP traffic to pass through the device.

NOTE: You cannot configure both options at the same time.

In mixed mode (default mode), you can create a separate security zone for Layer 2 and Layer 3 interfaces. However, there is no routing among IRB interfaces and between IRB interfaces and Layer 3 interfaces. Hence, you cannot configure security policies between Layer 2 and Layer 3 zones. You can only configure security policies between the Layer 2 zones or between Layer 3 zones.

- [Understanding Mixed Mode \(Layer 2 and Layer 3\) on page 3178](#)

Example: Configuring Security Policies in Transparent Mode

This example shows how to configure security policies in transparent mode between Layer 2 zones.

- [Requirements on page 3192](#)
- [Overview on page 3192](#)
- [Configuration on page 3193](#)
- [Verification on page 3194](#)

Requirements

Before you begin, determine the policy behavior you want to include in the Layer 2 security zone. See “[Understanding Security Policies in Transparent Mode](#)” on page 3191.

Overview

In this example, you configure a security policy to allow HTTP traffic from the 10.1.1.1/24 subnetwork in the l2-zone1 security zone to the server at 20.1.1.1/32 in the l2-zone2 security zone.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security policies from-zone l2-zone1 to-zone l2-zone2 policy p1 match source-address 10.1.1.1/24
set security policies from-zone l2-zone1 to-zone l2-zone2 policy p1 match destination-address 20.1.1.1/32
set security policies from-zone l2-zone1 to-zone l2-zone2 policy p1 match application http
set security policies from-zone l2-zone1 to-zone l2-zone2 policy p1 then permit
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the [Junos OS CLI User Guide](#).

To configure security policies in transparent mode:

1. Create policies and assign addresses to the interfaces for the zones.

```
[edit security policies]
user@host# set from-zone l2-zone1 to-zone l2-zone2 policy p1 match source-address 10.1.1.1/24
user@host# set from-zone l2-zone1 to-zone l2-zone2 policy p1 match destination-address 20.1.1.1/32
```

2. Set policies for the application.

```
[edit security policies]
user@host# set from-zone l2-zone1 to-zone l2-zone2 policy p1 match application http
user@host# set from-zone l2-zone1 to-zone l2-zone2 policy p1 then permit
```

Results From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security policies
from-zone l2-zone1 to-zone l2-zone2
{
  policy p1 {
    match {
      source-address 10.1.1.1/24;
      destination-address 20.1.1.1/32;
      application junos-http;
    }
    then {
      permit;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Verifying Layer 2 Security Policies

Purpose	Verify that the Layer 2 security policies are configured properly.
Action	From configuration mode, enter the show security policies command.

Understanding Firewall User Authentication in Transparent Mode

A firewall user is a network user who must provide a username and password for authentication when initiating a connection across the firewall. Firewall user authentication enables administrators to restrict and permit users accessing protected resources behind a firewall based on their source IP address and other credentials. Junos OS supports the following types of firewall user authentication for transparent mode on the SRX Series device:

- **Pass-through authentication**—A host or a user from one zone tries to access resources on another zone. You must use an FTP, Telnet, or HTTP client to access the IP address of the protected resource and be authenticated by the firewall. The device uses FTP, Telnet, or HTTP to collect username and password information, and subsequent traffic from the user or host is allowed or denied based on the result of this authentication.
- **Web authentication**—Users try to connect, by using HTTP, to an IP address on the IRB interface that is enabled for Web authentication. You are prompted for the username and password that are verified by the device. Subsequent traffic from the user or host to the protected resource is allowed or denied based on the result of this authentication.

Configuring Layer 2 Forwarding Tables

- [Understanding Layer 2 Forwarding Tables on page 3195](#)
- [Example: Configuring the Default Learning for Unknown MAC Addresses on page 3197](#)

Understanding Layer 2 Forwarding Tables

The SRX Series device maintains forwarding tables that contain MAC addresses and associated interfaces for each Layer 2 bridge domain. When a packet arrives with a new source MAC address in its frame header, the device adds the MAC address to its forwarding table and tracks the interface at which the packet arrived. The table also contains the corresponding interface through which the device can forward traffic for a particular MAC address.

If the destination MAC address of a packet is unknown to the device (that is, the destination MAC address in the packet does not have an entry in the forwarding table), the device duplicates the packet and floods it on all interfaces in the bridge domain other than the interface on which the packet arrived. This is known as *packet flooding* and is the default behavior for the device to determine the outgoing interface for an unknown destination MAC address. Packet flooding is performed at two levels: packets are flooded to different zones as permitted by configured Layer 2 security policies, and packets are also flooded to different interfaces with the same VLAN identifier within the same zone. The device learns the forwarding interface for the MAC address when a reply with that MAC address arrives at one of its interfaces.

You can specify that the SRX Series device use ARP queries and traceroute requests (which are ICMP echo requests with the time-to-live values set to 1) instead of packet flooding to locate an unknown destination MAC address. This method is considered more secure than packet flooding because the device floods ARP queries and traceroute packets—not the initial packet—on all interfaces. When ARP or traceroute flooding is used, the original packet is dropped. The device broadcasts an ARP or ICMP query to all other devices on the same subnetwork, requesting the device at the specified destination IP address to send back a reply. Only the device with the specified IP address replies, which provides the requestor with the MAC address of the responder.

ARP allows the device to discover the destination MAC address for a unicast packet if the destination IP address is in the same subnetwork as the ingress IP address. (The ingress IP address refers to the IP address of the last device to send the packet to the device. The device might be the source that sent the packet or a router forwarding the

packet.) Traceroute allows the device to discover the destination MAC address even if the destination IP address belongs to a device in a subnetwork beyond that of the ingress IP address.

When you enable ARP queries to locate an unknown destination MAC address, traceroute requests are also enabled. You can also optionally specify that traceroute requests not be used; however, the device can then discover destination MAC addresses for unicast packets only if the destination IP address is in the same subnetwork as the ingress IP address.

Whether you enable ARP queries and traceroute requests or ARP-only queries to locate unknown destination MAC addresses, the SRX Series device performs the following series of actions:

1. The device notes the destination MAC address in the initial packet. The device adds the source MAC address and its corresponding interface to its forwarding table, if they are not already there.
2. The device drops the initial packet.
3. The device generates an ARP query packet and optionally a traceroute packet and floods those packets out all interfaces except the interface on which the initial packet arrived.

ARP packets are sent out with the following field values:

- Source IP address set to the IP address of the IRB
- Destination IP address set to the destination IP address of the original packet
- Source MAC address set to the MAC address of the IRB
- Destination MAC address set to the broadcast MAC address (all **0xf**)

Traceroute (ICMP echo request or ping) packets are sent out with the following field values:

- Source IP address set to the IP address of the original packet
 - Destination IP address set to the destination IP address of the original packet
 - Source MAC address set to the source MAC address of the original packet
 - Destination MAC address set to the destination MAC address of the original packet
 - Time-to-live (TTL) set to 1
4. Combining the destination MAC address from the initial packet with the interface leading to that MAC address, the device adds a new entry to its forwarding table.
 5. The device forwards all subsequent packets it receives for the destination MAC address out the correct interface to the destination.

Example: Configuring the Default Learning for Unknown MAC Addresses

This example shows how to configure the device to use only ARP requests to learn the outgoing interfaces for unknown destination MAC addresses.

- [Requirements on page 3197](#)
- [Overview on page 3197](#)
- [Configuration on page 3197](#)
- [Verification on page 3197](#)

Requirements

Before you begin, determine the MAC addresses and associated interfaces of the forwarding table. See “[Understanding Layer 2 Forwarding Tables](#)” on page 3195.

Overview

In this example, you configure the device to use only ARP queries without traceroute requests.

Configuration

Step-by-Step Procedure

To configure the device to use only ARP requests to learn unknown destination MAC addresses:

1. Enable the device.

```
[edit]
user@host# set security flow ethernet-switching no-packet-flooding no-trace-route
```
2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show security flow** command.

Configuring Layer 2 Transparent Mode Chassis Clusters

- [Understanding Layer 2 Transparent Mode Chassis Clusters on page 3199](#)
- [Example: Configuring Redundant Ethernet Interfaces for Layer 2 Transparent Mode Chassis Clusters on page 3201](#)

Understanding Layer 2 Transparent Mode Chassis Clusters

A pair of SRX Series devices in Layer 2 transparent mode can be connected in a chassis cluster to provide network node redundancy. When configured in a chassis cluster, one node acts as the primary device and the other as the secondary device, ensuring stateful failover of processes and services in the event of system or hardware failure. If the primary device fails, the secondary device takes over processing of traffic.

NOTE: If the primary device fails in a Layer 2 transparent mode chassis cluster, the physical ports in the failed device become inactive (go down) for a few seconds before they become active (come up) again.

To form a chassis cluster, a pair of the same kind of supported SRX Series devices combines to act as a single system that enforces the same overall security.

Devices in Layer 2 transparent mode can be deployed in active/backup and active/active chassis cluster configurations.

The following chassis cluster features are not supported for devices in Layer 2 transparent mode:

- Gratuitous ARP—The newly elected master in a redundancy group cannot send gratuitous ARP requests to notify network devices of a change in mastership on the redundant Ethernet interface links.
- IP address monitoring—Failure of an upstream device cannot be detected.

A redundancy group is a construct that includes a collection of objects on both nodes. A redundancy group is primary on one node and backup on the other. When a redundancy group is primary on a node, its objects on that node are active. When a redundancy group fails over, all its objects fail over together.

You can create one or more redundancy groups numbered 1 through 128 for an active/active chassis cluster configuration. Each redundancy group contains one or more redundant Ethernet interfaces. A redundant Ethernet interface is a pseudointerface that contains physical interfaces from each node of the cluster. The physical interfaces in a redundant Ethernet interface must be the same kind—either Fast Ethernet or Gigabit Ethernet. If a redundancy group is active on node 0, then the child links of all associated redundant Ethernet interfaces on node 0 are active. If the redundancy group fails over to the node 1, then the child links of all redundant Ethernet interfaces on node 1 become active.

NOTE: In the active/active chassis cluster configuration, the maximum number of redundancy groups is equal to the number of redundant Ethernet interfaces that you configure. In the active/backup chassis cluster configuration, the maximum number of redundancy groups supported is two.

Configuring redundant Ethernet interfaces on a device in Layer 2 transparent mode is similar to configuring redundant Ethernet interfaces on a device in Layer 3 route mode, with the following difference: the redundant Ethernet interface on a device in Layer 2 transparent mode is configured as a Layer 2 logical interface.

The redundant Ethernet interface might be configured as either an access interface (with a single VLAN ID assigned to untagged packets received on the interface) or as a trunk interface (with a list of VLAN IDs accepted on the interface and, optionally, a native-vlan-id for untagged packets received on the interface). Physical interfaces (one from each node in the chassis cluster) are bound as child interfaces to the parent redundant Ethernet interface.

In Layer 2 transparent mode, MAC learning is based on the redundant Ethernet interface. The MAC table is synchronized across redundant Ethernet interfaces and Services Processing Units (SPUs) between the pair of chassis cluster devices.

The IRB interface is used only for management traffic, and it cannot be assigned to any redundant Ethernet interface or redundancy group.

All Junos OS screen options that are available for a single, nonclustered device are available for devices in Layer 2 transparent mode chassis clusters.

NOTE: Spanning-tree protocols are not supported for Layer 2 transparent mode. You should ensure that there are no loop connections in the deployment topology.

Example: Configuring Redundant Ethernet Interfaces for Layer 2 Transparent Mode Chassis Clusters

This example shows how to configure a redundant Ethernet interface on a device as a Layer 2 logical interface for a Layer 2 transparent mode chassis cluster.

- [Requirements on page 3201](#)
- [Overview on page 3201](#)
- [Configuration on page 3201](#)
- [Verification on page 3202](#)

Requirements

Before you begin, determine the devices you want to connect in a chassis cluster. See [“Understanding Layer 2 Transparent Mode Chassis Clusters” on page 3199](#).

Overview

This example shows you how to configure the redundant Ethernet interface as a Layer 2 logical interface and how to bind the physical interfaces (one from each node in the chassis cluster) to the redundant Ethernet interface. In this example, you create redundant Ethernet interface reth0 for redundancy group 1 and configure reth0 as an access interface with the VLAN identifier 1. Then you assign physical interface ge-2/0/2 on a chassis cluster node to the redundant Ethernet interface reth0.

Configuration

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the [Junos OS CLI User Guide](#).

To configure a redundant Ethernet interface as a Layer 2 logical interface:

1. Configure the interfaces and redundancy group.

```
[edit interfaces]
user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth0 unit 0 family ethernet-switching interface-mode access
vlan-id 1
```
2. Assign a physical interface on a chassis cluster node.

```
[edit interfaces]
user@host# set ge-2/0/2 gigether-options redundant-parent reth0
```
3. If you are done configuring the device, commit the configuration.

```
[edit]  
user@host# commit
```

Verification

To verify the configuration is working properly, enter the **show interfaces reth0** and **show interfaces ge-2/0/2** commands.

Configuring IP Spoofing in Layer 2 Transparent Mode

- [Understanding IP Spoofing in Layer 2 Transparent Mode on page 3203](#)
- [Configuring IP Spoofing in Layer 2 Transparent Mode on page 3204](#)

Understanding IP Spoofing in Layer 2 Transparent Mode

In an IP spoofing attack, the attacker gains access to a restricted area of the network and inserts a false source address in the packet header to make the packet appear to come from a trusted source. IP spoofing is most frequently used in denial-of-service (DoS) attacks. When SRX Series devices are operating in transparent mode, the IP spoof-checking mechanism makes use of address book entries. Address books only exist on the Routing Engine. IP spoofing in Layer 2 transparent mode is performed on the Packet Forwarding Engine. Address book information cannot be obtained from the Routing Engine each time a packet is received by the Packet Forwarding Engine. Therefore, address books attached to the Layer 2 zones must be pushed to the Packet Forwarding Engine.

NOTE: IP spoofing in Layer 2 transparent mode does not support DNS and wildcard addresses.

When a packet is received by the Packet Forwarding Engine, the packet's source IP address is checked to determine if it is in the incoming zone's address-book. If the packet's source IP address is in the incoming zone's address book, then this IP address is allowed on the interface, and traffic is passed.

If the source IP address is not present in the incoming zone's address-book, but exists in other zones, then the IP address is considered a spoofed IP. Accordingly, actions such as drop and logging can be taken depending on the screen configuration (alarm-without-drop).

NOTE: If the alarm-without-drop option is configured, the Layer 2 spoofing packet only triggers an alarm message, but the packet is not dropped.

If a packet's source IP address is not present in the incoming zone's address book or other zones', then you cannot determine if the IP is spoofed or not. In such instances, the packet is passed.

Junos OS takes into account the following match conditions while it searches for source IP addresses in the address book:

- **Host-match**—The IP address match found in the address-book is an address without a prefix.
- **Prefix-match**—The IP address match found in the address-book is an address with a prefix.
- **Any-match**—The IP address match found in the address-book is "any", "any-IPv4", or "any-IPv6".
- **No-match**—No IP address match is found.

**Related
Documentation**

- [Configuring IP Spoofing in Layer 2 Transparent Mode on page 932](#)

Configuring IP Spoofing in Layer 2 Transparent Mode

You can configure the IP spoof-checking mechanism to determine whether or not an IP is being spoofed.

To configure IP spoofing in Layer 2 transparent mode:

1. Set the interface in Layer 2 transparent mode.

```
[edit]
user@host# set interfaces ge-0/0/1 unit 0 family ethernet-switching
```

2. (Optional) Set the zone in Layer 2 transparent mode.

```
[edit]
user@host# set security zones security-zone untrust interfaces ge-0/0/1.0
```

3. Configure the address book.

```
[edit]
user@host# set security address-book my-book address myadd1 10.1.1.0/24
user@host# set security address-book my-book address myadd2 10.1.2.0/24
```

4. Apply the address book to the zone.

```
[edit]
user@host# set security address-book my-book attach zone untrust
```

5. Configure screen IP spoofing.

```
[edit]
user@host# set security screen ids-option my-screen ip spoofing
```

6. Apply the screen to the zone.

```
[edit]
user@host# set security zones security-zone untrust screen my-screen
```

7. (Optional) Configure the **alarm-without-drop** option.

[edit]

```
user@host# set security screen ids-option my-screen alarm-without-drop
```

NOTE: If the **alarm-without-drop** option is configured, the Layer 2 spoofing packet only triggers an alarm message, but the packet is not dropped.

- [Example: Configuring Rewrite Rules on Transparent Mode Devices on page 3212](#)

Class of Service Functions in Transparent Mode Overview

Devices operating in Layer 2 transparent mode support the following class-of-service (CoS) functions:

- IEEE 802.1p behavior aggregate (BA) classifiers to determine the forwarding treatment for packets entering the device

NOTE: Only IEEE 802.1p BA classifier types are supported on devices operating in transparent mode.

- Rewrite rules to redefine IEEE 802.1 CoS values in outgoing packets

NOTE: Rewrite rules that redefine IP precedence CoS values and Differentiated Services Code Point (DSCP) CoS values are not supported on devices operating in transparent mode.

- Shapers to apply rate limiting to an interface
- Schedulers that define the properties of an output queue

You configure BA classifiers and rewrite rules on transparent mode devices in the same way as on devices operating in Layer 3 mode. For transparent mode devices, however, you apply BA classifiers and rewrite rules only to logical interfaces configured with the **family ethernet-switching** configuration statement.

 - [Understanding Transparent Mode Conditions on page 3171](#)
 - [Understanding BA Traffic Classification on Transparent Mode Devices on page 3208](#)
 - [Example: Configuring BA Classifiers on Transparent Mode Devices on page 3209](#)

Understanding BA Traffic Classification on Transparent Mode Devices

A BA classifier checks the header information of an ingress packet. The resulting traffic classification consists of a forwarding class (FC) and packet loss priority (PLP). The FC and PLP associated with a packet specify the CoS behavior of a hop within the system. For example, a hop can place a packet into a priority queue according to its FC, and manage queues by checking the packet's PLP. Junos OS supports up to eight FCs and four PLPs.

NOTE: MPLS EXP bit-based traffic classification is not supported.

BA classification can be applied within one DiffServ domain. BA classification can also be applied between two domains, where each domain honors the CoS results generated by the other domain. Junos OS performs BA classification for a packet by examining its Layer 2 and Layer 3 CoS-related parameters. Those parameters include the following:

- Layer 2—IEEE 802.1p: User Priority
- Layer 3—IPv4 Precedence, IPv4 DSCP, IPv6 DSCP

On SRX Series devices in transparent mode, a BA classifier evaluates only Layer 2 parameters. On SRX Series devices in Layer 3 mode, a BA classifier can evaluate Layer 2 and Layer 3 parameters; in that case, classification resulting from Layer 3 parameters overrides that of Layer 2 parameters.

On SRX Series devices in transparent mode, you specify one of four PLP levels—high, medium-high, medium-low, or low—when configuring a BA classifier.

Example: Configuring BA Classifiers on Transparent Mode Devices

This example shows how to configure BA classifiers on transparent mode devices to determine the forwarding treatment of packets entering the devices.

- [Requirements on page 3209](#)
- [Overview on page 3209](#)
- [Configuration on page 3209](#)
- [Verification on page 3211](#)

Requirements

Before you begin, configure a Layer 2 logical interface. See [“Example: Configuring Layer 2 Logical Interfaces” on page 3173](#).

Overview

In this example, you configure logical interface ge-0/0/4.0 as a trunk port that carries traffic for packets tagged with VLAN identifiers 200 through 390. You then configure forwarding classes and create BA classifier c1 for IEEE 802.1 traffic where incoming packets with IEEE 802.1p priority bits 110 are assigned to the forwarding class fc1 with a low loss priority. Finally, you apply the BA classifier c1 to interface ge-0/0/4.0.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/4 vlan-tagging unit 0 family ethernet-switching interface-mode trunk vlan members 200-390
set class-of-service forwarding-classes queue 0 fc1
set class-of-service forwarding-classes queue 1 fc2
set class-of-service forwarding-classes queue 3 fc4
set class-of-service forwarding-classes queue 4 fc5
set class-of-service forwarding-classes queue 5 fc6
set class-of-service forwarding-classes queue 6 fc7
set class-of-service forwarding-classes queue 7 fc8
set class-of-service forwarding-classes queue 2 fc3
set class-of-service classifiers ieee-802.1 c1 forwarding-class fc1 loss-priority low code-point 110
set class-of-service interfaces ge-0/0/4 unit 0 classifiers ieee-802.1 c1
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BA classifiers on transparent mode devices:

1. Configure the logical interface as a Layer 2 trunk port.

```
[edit]
user@host# set interfaces ge-0/0/4 vlan-tagging unit 0 family ethernet-switching
interface-mode trunk vlan members 200-390
```

2. Configure the class of service.

```
[edit]
user@host# edit class-of-service
```

3. Configure the forwarding classes.

```
[edit class-of-service]
user@host# set forwarding-classes queue 0 fc1
user@host# set forwarding-classes queue 1 fc2
user@host# set forwarding-classes queue 3 fc4
user@host# set forwarding-classes queue 4 fc5
user@host# set forwarding-classes queue 5 fc6
user@host# set forwarding-classes queue 6 fc7
user@host# set forwarding-classes queue 7 fc8
user@host# set forwarding-classes queue 2 fc3
```

4. Configure a BA classifier.

```
[edit class-of-service]
user@host# set classifiers ieee-802.1 c1 forwarding-class fc1 loss-priority low
code-points 110
```

5. Apply the BA classifier to the interface.

```
[edit class-of-service]
user@host# set interfaces ge-0/0/4 unit 0 classifiers ieee-802.1 c1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces ge-0/0/4** and **show class-of-service** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces ge-0/0/4
vlan-tagging;
unit 0 {
  family ethernet-switching {
    interface-mode trunk;
    vlan members 200-390;
  }
}
[edit]
user@host# show class-of-service
classifiers {
  ieee-802.1 c1 {
    forwarding-class fc1 {
      loss-priority low code-points 110;
    }
  }
}
forwarding-classes {
  queue 0 fc1;
  queue 1 fc2;
```

```

queue 3 fc4;
queue 4 fc5;
queue 5 fc6;
queue 6 fc7;
queue 7 fc8;
queue 2 fc3;
}
interfaces {
  ge-0/0/4 {
    unit 0 {
      classifiers {
        ieee-802.1 c1;
      }
    }
  }
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Verifying BA Classifiers on Transparent Mode Devices

Purpose Verify that the BA classifier was configured on the transparent mode devices properly.

Action From configuration mode, enter the **show interfaces ge-0/0/4** and **show class-of-service** commands.

Understanding Rewrite of Packet Headers on Transparent Mode Devices

Before a packet is transmitted from an interface, the CoS fields in the packet's header can be rewritten for the forwarding class (FC) and packet loss priority (PLP) of the packet. The rewriting function converts a packet's FC and PLP into corresponding CoS fields in the packet header. In Layer 2 transparent mode, the CoS fields are the IEEE 802.1p priority bits.

Example: Configuring Rewrite Rules on Transparent Mode Devices

This example shows how to configure rewrite rules on transparent mode devices to redefine IEEE 802.1 CoS values in outgoing packets.

- [Requirements on page 3212](#)
- [Overview on page 3212](#)
- [Configuration on page 3212](#)
- [Verification on page 3214](#)

Requirements

Before you begin, configure a Layer 2 logical interface. See [“Example: Configuring Layer 2 Logical Interfaces” on page 3173](#).

Overview

In this example, you configure logical interface ge-1/0/3.0 as a trunk port that carries traffic for packets tagged with VLAN identifiers 200 through 390. You then configure the forwarding classes and create rewrite rule rw1 for IEEE 802.1 traffic. For outgoing packets in the forwarding class fc1 with low loss priority, the IEEE 802.1p priority bits are rewritten as 011. Finally, you apply the rewrite rule rw1 to interface ge-1/0/3.0.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-1/0/3 vlan-tagging unit 0 family ethernet-switching interface-mode trunk vlan members 200-390
set class-of-service forwarding-classes queue 0 fc1
set class-of-service forwarding-classes queue 1 fc2
set class-of-service forwarding-classes queue 3 fc4
set class-of-service forwarding-classes queue 4 fc5
set class-of-service forwarding-classes queue 5 fc6
set class-of-service forwarding-classes queue 6 fc7
set class-of-service forwarding-classes queue 7 fc8
set class-of-service forwarding-classes queue 2 fc3
set class-of-service rewrite-rules ieee-802.1 rw1 forwarding-class fc1 loss-priority low code-point 011
set class-of-service interfaces ge-1/0/3 unit 0 rewrite-rules ieee-802.1 rw1
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure rewrite rules on transparent mode devices:

1. Configure the logical interface as a Layer 2 trunk port.

- ```
[edit]
user@host# set interfaces ge-1/0/3 vlan-tagging unit 0 family ethernet-switching
interface-mode trunk vlan members 200-390
```
2. Configure the class of service.
 

```
[edit]
user@host# edit class-of-service
```
  3. Configure the forwarding classes.
 

```
[edit class-of-service]
user@host# set forwarding-classes queue 0 fc1
user@host# set forwarding-classes queue 1 fc2
user@host# set forwarding-classes queue 3 fc4
user@host# set forwarding-classes queue 4 fc5
user@host# set forwarding-classes queue 5 fc6
user@host# set forwarding-classes queue 6 fc7
user@host# set forwarding-classes queue 7 fc8
user@host# set forwarding-classes queue 2 fc3
```
  4. Configure a rewrite rule.
 

```
[edit class-of-service]
user@host# set rewrite-rules ieee-802.1 rw1 forwarding-class fc1 loss-priority low
code-point 011
```
  5. Apply the rewrite rule to the interface.
 

```
[edit class-of-service]
user@host# set interfaces ge-1/0/3 unit 0 rewrite-rules ieee-802.1 rw1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces ge-1/0/3** and **show class-of-service** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces ge-1/0/3
vlan-tagging;
unit 0 {
 family ethernet-switching {
 interface-mode trunk;
 vlan members 200-390;
 }
}
[edit]
user@host# show class-of-service
forwarding-classes {
 queue 0 fc1;
 queue 1 fc2;
 queue 3 fc4;
 queue 4 fc5;
 queue 5 fc6;
 queue 6 fc7;
 queue 7 fc8;
 queue 2 fc3;
}
interfaces {
```

```
ge-1/0/3 {
 unit 0 {
 rewrite-rules {
 ieee-802.1 rw1;
 }
 }
}
}
rewrite-rules {
 ieee-802.1 rw1 {
 forwarding-class fc1 {
 loss-priority low code-point 011;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

# Configuring IPv6 Flows

- [Understanding IPv6 Flows in Transparent Mode on page 3215](#)
- [Enabling Flow-Based Processing for IPv6 Traffic on page 3216](#)
- [Example: Configuring Transparent Mode for IPv6 Flows on page 3218](#)

## Understanding IPv6 Flows in Transparent Mode

---

In transparent mode, the SRX Series device filters packets that traverse the device without modifying any of the source or destination information in the packet MAC headers. Transparent mode is useful for protecting servers that mainly receive traffic from untrusted sources because there is no need to reconfigure the IP settings of routers or protected servers.

A device operates in transparent mode when all physical interfaces on the device are configured as Layer 2 interfaces. A physical interface is a Layer 2 interface if its logical interface is configured with the **bridge** option at the **[edit interfaces interface-name unit unit-number family]** hierarchy level. There is no command to define or enable transparent mode on the device. The device operates in transparent mode when there are interfaces defined as Layer 2 interfaces. The device operates in route mode (the default mode) if all physical interfaces are configured as Layer 3 interfaces.

By default, IPv6 flows are dropped on security devices. To enable processing by security features such as zones, screens, and firewall policies, you must enable flow-based forwarding for IPv6 traffic with the **mode flow-based** configuration option at the **[edit security forwarding-options family inet6]** hierarchy level. You must reboot the device when you change the mode.

In transparent mode, you can configure Layer 2 zones to host Layer 2 interfaces, and you can define security policies between Layer 2 zones. When packets travel between Layer 2 zones, security policies can be enforced on these packets. The following security features are supported for IPv6 traffic in transparent mode:

- Layer 2 security zones and security policies. See [“Understanding Layer 2 Security Zones” on page 3189](#) and [“Understanding Security Policies in Transparent Mode” on page 3191](#).
- Firewall user authentication. See [“Understanding Firewall User Authentication in Transparent Mode” on page 3194](#).

- Layer 2 transparent mode chassis clusters. See [“Understanding Layer 2 Transparent Mode Chassis Clusters” on page 3199](#).
- Class of service functions. See [“Class of Service Functions in Transparent Mode Overview” on page 3207](#).

The following security features are *not* supported for IPv6 flows in transparent mode:

- Logical systems
- IPv6 GTPv2
- J-Web interface
- NAT
- IPsec VPN
- With the exception of DNS, FTP, and TFTP ALGs, all other ALGs are not supported.

Configuring VLANs and Layer 2 logical interfaces for IPv6 flows is the same as configuring VLANs and Layer 2 logical interfaces for IPv4 flows. You can optionally configure an integrated routing and bridging (IRB) interface for management traffic in a bridge domain. The IRB interface is the only Layer 3 interface allowed in transparent mode. The IRB interface on the SRX Series device does not support traffic forwarding or routing. The IRB interface can be configured with both IPv4 and IPv6 addresses. You can assign an IPv6 address for the IRB interface with the **address** configuration statement at the **[edit interfaces irb unit *number* family inet6]** hierarchy level. You can assign an IPv4 address for the IRB interface with the **address** configuration statement at the **[edit interfaces irb unit *number* family inet]** hierarchy level.

The bridging functions on SRX Series devices are similar to the bridging features on Juniper Networks MX Series routers. However, not all Layer 2 networking features supported on MX Series routers are supported on SRX Series devices. See [“Layer 2 Bridging and Transparent Mode Overview” on page 3163](#).

The SRX Series device maintains forwarding tables that contain MAC addresses and associated interfaces for each Layer 2 bridge domain. The IPv6 flow processing is similar to IPv4 flows. See [“Understanding Layer 2 Forwarding Tables” on page 3195](#).

---

## Enabling Flow-Based Processing for IPv6 Traffic

---

By default, the SRX Series device drops IP version 6 (IPv6) traffic. To enable processing by security features such as zones, screens, and firewall policies, you must enable flow-based forwarding for IPv6 traffic.

To enable flow-based forwarding for IPv6 traffic, modify the **mode** statement at the **[edit security forwarding-options family inet6]** hierarchy level:

```
security {
```

```

forwarding-options {
 family {
 inet6 {
 mode flow-based;
 }
 }
}

```

The following example shows the CLI commands you use to configure forwarding for IPv6 traffic.

1. Use the **set** command to change the forwarding option mode for IPv6 to flow-based.

```

[edit]
user@host# set security forwarding-options family inet6 mode flow-based

```

2. Use the **show** command to review your configuration.

```

[edit]
user@host# show security forwarding-options
family {
 inet6 {
 mode flow-based;
 }
}

```

3. Check your changes to the configuration before committing.

```

[edit]
user@host# commit check
warning: You have enabled/disabled inet6 flow.
You must reboot the system for your change to take effect.
If you have deployed a cluster, be sure to reboot all nodes.
configuration check succeeds

```

4. Commit the configuration.

```

[edit]
user@host# commit
warning: You have enabled/disabled inet6 flow.
You must reboot the system for your change to take effect.
If you have deployed a cluster, be sure to reboot all nodes.
commit complete

```

5. At an appropriate time, reboot the device.

**NOTE:** SRX Series devices only process IPv6 Routing Header 0 (RH0) to-self packets, the segleft field of which is zero. Other packets will be dropped.

Table 173 summarizes device status upon forwarding option configuration change.

**Table 324: Device Status Upon Configuration Change**

| Configuration Change | Commit Warning | Reboot Required | Impact on Existing Traffic Before Reboot | Impact on New Traffic Before Reboot |
|----------------------|----------------|-----------------|------------------------------------------|-------------------------------------|
| Drop to flow-based   | Yes            | Yes             | Dropped                                  | Dropped                             |

Table 324: Device Status Upon Configuration Change (*continued*)

| Configuration Change       | Commit Warning | Reboot Required | Impact on Existing Traffic Before Reboot | Impact on New Traffic Before Reboot |
|----------------------------|----------------|-----------------|------------------------------------------|-------------------------------------|
| Drop to packet-based       | No             | No              | Packet-based                             | Packet-based                        |
| Flow-based to packet-based | Yes            | Yes             | None                                     | Flow sessions created               |
| Flow-based to drop         | Yes            | Yes             | None                                     | Flow sessions created               |
| Packet-based to flow-based | Yes            | Yes             | Packet-based                             | Packet-based                        |
| Packet-based to drop       | No             | No              | Dropped                                  | Dropped                             |

To process IPv6 traffic, you also need to configure IPv6 addresses for the transit interfaces that receive and forward the traffic. For information on the inet6 protocol family and procedures for configuring IPv6 addresses for interfaces, see the [Interfaces Feature Guide for Security Devices](#).

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set vlans vlan-a vlan-id 2
set vlans vlan-b vlan members 1-10
set interfaces ge-0/0/0 vlan-tagging native-vlan-id 30
set interfaces ge-0/0/0 unit 0 family ethernet-switching interface-mode trunk vlan
members 1-10
set interfaces irb unit 0 family inet address 10.1.1.1/24
set interfaces irb unit 0 family inet6 address 2:10::1/64
set vlans vlan-b l3-interface irb.0
set security flow ethernet-switching no-packet-flooding no-trace-route
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure transparent mode for IPv6 flows:

1. Configure VLANs.

```
[edit vlans]
user@host# set vlan-a vlan-id 2
user@host# set vlan-b vlan members 1-10
```
2. Configure the Layer 2 interface.

```
[edit interfaces ge-0/0/0]
user@host# set vlan-tagging native-vlan-id 30
```

```
user@host# set unit 0 family ethernet-switching interface-mode trunk vlan members
1-10
```

3. Configure the IRB interface.

```
[edit interfaces irb unit 0]
user@host# set family inet address 10.1.1.1/24
user@host# set family inet6 address 2:10::1/64
```

4. Configure the IRB interface for the bridge domain.

```
[edit vlans]
user@host# set vlan-b l3-interface irb.0
```

5. Configure learning for unknown destination MAC addresses.

```
[edit security flow ethernet-switching]
user@host# set no-packet-flooding no-trace-route
```

---

## Results

From configuration mode, confirm your configuration by entering the **show vlans**, **show interfaces**, and **show security flow ethernet-switching** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host# show vlans
vlan-a {
 vlan-id 2;
}
vlan-b {
 vlan members 1-10;
 l3-interface irb.0;
}
user@host# show interfaces
ge-0/0/0 {
 vlan-tagging;
 native-vlan-id 30;
 unit 0 {
 family ethernet-switching {
 interface-mode trunk;
 vlan members 1-10;
 }
 }
}
user@host# show security flow ethernet-switching
no-packet-flooding {
 no-trace-route;
}
```

## Verification

Confirm that the configuration is working properly.

## Understanding Secure Wire

---

Traffic that arrives on a specific interface can be forwarded unchanged through another interface. This mapping of interfaces, called secure wire, allows an SRX Series to be deployed in the path of network traffic without requiring a change to routing tables or a reconfiguration of neighboring devices. [Figure 143](#) shows a typical in-path deployment of an SRX Series with secure wire.

Figure 143: SRX Series In-Path Deployment with Secure Wire

Secure wire maps two peer interfaces. It differs from transparent and route modes in that there is no switching or routing lookup to forward traffic. As long as the traffic is permitted by a security policy, a packet arriving on one peer interface is immediately forwarded unchanged out of the other peer interface. There is no routing or switching decision made on the packet. Return traffic is also forwarded unchanged.

Secure wire mapping is configured with the **secure-wire** statement at the [edit security forwarding-options] hierarchy level; two Ethernet logical interfaces must be specified. The Ethernet logical interfaces must be configured with **family ethernet-switching** and each pair of interfaces must belong to the same bridge domain(s). The interfaces must be bound to security zones and a security policy configured to permit traffic between the zones.

This feature is available on Ethernet logical interfaces only; both IPv4 and IPv6 traffic are supported. You can configure interfaces for access or trunk mode. Secure wire supports chassis cluster redundant Ethernet interfaces. This feature does not support security features not supported in transparent mode, including NAT and IPsec VPN. Layer 7 features, including AppSecure, and IPS are supported.

Secure wire is a special case of Layer 2 transparent mode on SRX Series devices that provide point-to-point connections. This means that the two interfaces of a secure wire should ideally be directly connected to Layer 3 entities, such as routers or hosts. Secure wire interfaces can be connected to switches. However, note that a secure wire interface forwards all arriving traffic to the peer interface only if the traffic is permitted by a security policy.

Secure wire can coexist with Layer 3 mode. While you can configure Layer 2 and Layer 3 interfaces at the same time, traffic forwarding occurs independently on Layer 2 and Layer 3 interfaces.

Secure wire can coexist with Layer 2 transparent mode. If both features exist on the same SRX Series device, you need to configure them in different VLANs.

**NOTE:** Integrated routing and bridging (IRB) interfaces are not supported with secure wire.

## Example: Simplifying SRX Series Device Deployment with Secure Wire over Access Mode Interfaces

---

If you are connecting an SRX Series device to other network devices, you can use secure wire to simplify the device deployment in the network. No changes to routing or forwarding tables on the SRX Series device and no reconfiguration of neighboring devices is needed. Secure wire allows traffic to be forwarded unchanged between specified access mode interfaces on an SRX Series device as long as it is permitted by security policies or other security features. Follow this example if you are connecting an SRX Series device to other network devices through access mode interfaces.

This example shows how to configure a secure wire mapping for two access mode interfaces. This configuration applies to scenarios where user traffic is not VLAN tagged.

- [Overview on page 3226](#)
- [Configuration on page 3226](#)
- [Verification on page 3228](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

## Overview

This example configures the secure wire access-sw that maps interface ge-0/0/0.0 to interface ge-0/0/1.0. The two peer interfaces are configured for access mode. The VLAN ID 10 is configured for the bridge domain vlan-10 and the access mode interfaces.

**NOTE:** A specific VLAN ID must be configured for a bridge domain.

## Topology

Figure 144 shows the access mode interfaces that are mapped in secure wire access-sw.

**Figure 144: Secure Wire Access Mode Interfaces**

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set vlans vlan-10 domain-type bridge vlan-id 10
set interfaces ge-0/0/0 unit 0 family ethernet-switching interface-mode access vlan-id 10
set interfaces ge-0/0/1 unit 0 family ethernet-switching interface-mode access vlan-id 10
set security forwarding-options secure-wire access-sw interface [ge-0/0/0.0 ge-0/0/1.0]
set security zones security-zone trust interfaces ge-0/0/0.0
set security zones security-zone untrust interfaces ge-0/0/1.0
set security policies default-policy permit-all

```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a secure wire mapping for access mode interfaces:

1. Configure the bridge domain.

```

[edit vlans vlan-10]
user@host# set domain-type bridge vlan-id 10

```

2. Configure the access mode interfaces.

```

[edit interfaces]
user@host# set ge-0/0/0 unit 0 family ethernet-switching interface-mode access
vlan-id 10

```

```
user@host# set ge-0/0/1 unit 0 family ethernet-switching interface-mode access
vlan-id 10
```

3. Configure the secure wire mapping.

```
[edit security forwarding-options]
user@host# set secure-wire access-sw interface [ge-0/0/0.0 ge-0/0/1.0]
```

4. Configure security zones.

```
[edit security zones]
user@host# set security-zone trust interfaces ge-0/0/0.0
user@host# set security-zone untrust interfaces ge-0/0/1.0
```

5. Configure a security policy to permit traffic.

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show vlans**, **show interfaces**, **show security forwarding-options**, and **show security zones** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show vlans
vlan-10 {
 domain-type bridge;
 vlan-id 10;
}
user@host# show interfaces
ge-0/0/0 {
 unit 0 {
 family ethernet-switching {
 interface-mode access;
 vlan-id 10;
 }
 }
}
ge-0/0/1 {
 unit 0 {
 family ethernet-switching {
 interface-mode access;
 vlan-id 10;
 }
 }
}
user@host# show security forwarding-options
secure-wire access-sw {
 interfaces [ge-0/0/0.0 ge-0/0/1.0];
}
user@host# show security zones
security-zone trust {
 interfaces {
 ge-0/0/0.0;
 }
}
security-zone untrust {
```

```

 interfaces {
 ge-0/0/1.0;
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Configuration on page 3229](#)
- [Verification on page 3231](#)

## Requirements

No special configuration beyond device initialization is required before configuring this feature.

## Overview

This example configures the secure wire trunk-sw that maps interface ge-0/1/0.0 to interface ge-0/1/1.0. The two peer interfaces are configured for trunk mode and carry user traffic tagged with VLAN IDs from 100 to 102. The VLAN ID list 100-102 is configured for the bridge domain vlan-100 and the trunk mode interfaces.

**NOTE:** A specific VLAN ID must be configured for a bridge domain.

## Topology

Figure 145 shows the trunk mode interfaces that are mapped in secure wire trunk-sw.

**Figure 145: Secure Wire Trunk Mode Interfaces**

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set vlans vlan-100 vlan members 100-102
set interfaces ge-0/1/0 unit 0 family ethernet-switching interface-mode trunk vlan members 100-102
set interfaces ge-0/1/1 unit 0 family ethernet-switching interface-mode trunk vlan members 100-102
set security forwarding-options secure-wire trunk-sw interface [ge-0/1/0.0 ge-0/1/1.0]
set security zones security-zone trust interfaces ge-0/1/0.0
set security zones security-zone untrust interfaces ge-0/1/1.0
set security policies default-policy permit-all

```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a secure wire mapping for trunk mode interfaces:

1. Configure the bridge domain.

```
[edit vlans vlan-100]
user@host# set vlan members 100-102
```

2. Configure the trunk mode interfaces.

```
[edit interfaces]
user@host# set ge-0/1/0 unit 0 family ethernet-switching interface-mode trunk
vlan members 100-102
user@host# set ge-0/1/1 unit 0 family ethernet-switching interface-mode trunk
vlan members 100-102
```

3. Configure the secure wire mapping.

```
[edit security forwarding-options]
user@host# set secure-wire trunk-sw interface [ge-0/1/0.0 ge-0/1/1.0]
```

4. Configure security zones.

```
[edit security zones]
user@host# set security-zone trust interfaces ge-0/1/0.0
user@host# set security-zone untrust interfaces ge-0/1/1.0
```

5. Configure a security policy to permit traffic.

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show vlans**, **show interfaces**, **show security forwarding-options**, and **show security zones** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show vlans
vlan-100 {
 vlan members 100-102;
}
user@host# show interfaces
ge-0/1/0 {
 unit 0 {
 family ethernet-switching {
 interface-mode trunk;
 vlan members 100-102;
 }
 }
}
ge-0/1/1 {
 unit 0 {
 family ethernet-switching {
 interface-mode trunk;
 vlan members 100-102;
 }
 }
}
user@host# show security forwarding-options
secure-wire trunk-sw {
 interfaces [ge-0/1/0.0 ge-0/1/1.0];
}
user@host# show security zones
```

```

security-zone trust {
 interfaces {
 ge-0/1/0.0;
 }
}
security-zone untrust {
 interfaces {
 ge-0/1/1.0;
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying Secure Wire Mapping on page 3231](#)
- [Verifying the Bridge Domain on page 3231](#)

### Verifying Secure Wire Mapping

**Purpose** Verify the secure wire mapping.

**Action** From operational mode, enter the **show security forwarding-options secure-wire** command.

```

user@host> show security forwarding-options secure-wire
Secure wire Interface Link Interface Link
trunk-sw ge-0/1/0.0 up ge-0/1/1.0 up
Total secure wires: 1

```

### Verifying the Bridge Domain

**Purpose** Verify the bridge domain.

**Action** From operational mode, enter the **show vlans** command.

```

user@host> show vlans
Routing instance VLAN name VLAN ID Interfaces
default-switch vlan-100-vlan-0100 100 ge-0/1/0.0
 vlan-100-vlan-0101 101 ge-0/1/1.0
 vlan-100-vlan-0102 102 ge-0/1/0.0
 vlan-100-vlan-0103 103 ge-0/1/1.0

```

**NOTE:** VLANs are automatically expanded, with one bridge domain for each VLAN ID in the VLAN ID list.

**Related Documentation**

- [Understanding Secure Wire on page 3223](#)

## Example: Simplifying SRX Series Device Deployment with Secure Wire over Aggregated Interface Member Links

---

If you are connecting an SRX Series device to other network devices, you can use secure wire to simplify the device deployment in the network. No changes to routing or forwarding tables on the SRX Series device and no reconfiguration of neighboring devices is needed. Secure wire allows traffic to be forwarded unchanged between specified aggregated interface member links on an SRX Series device as long as it is permitted by security policies or other security features. Follow this example if you are connecting an SRX Series device to other network devices through aggregated interface member links.

**NOTE:** LACP is not supported. Secure wire mappings can be configured for member links of link bundles instead of directly mapping aggregated Ethernet interfaces.

## Requirements

No special configuration beyond device initialization is required before configuring this feature.

## Overview

This example configures secure wires for two aggregated Ethernet interface link bundles with two links each. Two separate secure wires ae-link1 and ae-link2 are configured using one link from each aggregated Ethernet link bundle. This static mapping requires that the two link bundles have the same number of links.

For link bundles, all logical interfaces of the secure wire mappings must belong to the same bridge domain. VLAN ID 10 is configured for the bridge domain vlan-10 and the logical interfaces. All logical interfaces of a link bundle must belong to the same security zone.

**NOTE:** A specific VLAN ID or VLAN ID list must be configured for a bridge domain.

## Topology

---

Figure 146 shows the aggregated interfaces that are mapped in secure wire configurations.

Figure 146: Secure Wire Aggregated Interfaces

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set vlans vlan-10 domain-type bridge vlan-id 10
set interfaces ge-0/0/0 unit 0 family ethernet-switching interface-mode access vlan-id 10
set interfaces ge-0/0/1 unit 0 family ethernet-switching interface-mode access vlan-id 10
set interfaces ge-0/1/0 unit 0 family ethernet-switching interface-mode access vlan-id 10
set interfaces ge-0/1/1 unit 0 family ethernet-switching interface-mode access vlan-id 10
set security forwarding-options secure-wire ae-link1-sw interface [ge-0/1/0.0 ge-0/1/1.0]
set security forwarding-options secure-wire ae-link2-sw interface [ge-0/0/0.0 ge-0/0/1.0]
set security zones security-zone trust interfaces ge-0/0/0.0
set security zones security-zone trust interfaces ge-0/1/0.0
set security zones security-zone untrust interfaces ge-0/0/1.0
set security zones security-zone untrust interfaces ge-0/1/1.0
set security policies default-policy permit-all
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a secure wire mapping for aggregated interface member links:

1. Configure the bridge domain.
 

```
[edit vlans vlan-10]
user@host# set domain-type bridge vlan-id10
```
2. Configure the interfaces.
 

```
[edit interfaces]
user@host# set ge-0/0/0 unit 0 family ethernet-switching interface-mode access
vlan-id 10
user@host# set ge-0/0/1 unit 0 family ethernet-switching interface-mode access
vlan-id 10
user@host# set ge-0/1/0 unit 0 family ethernet-switching interface-mode access
vlan-id 10
user@host# set ge-0/1/1 unit 0 family ethernet-switching interface-mode access
vlan-id 10
```
3. Configure the secure wire mappings.

```
[edit security forwarding-options]
user@host# set secure-wire ae-link1-sw interface [ge-0/1/0.0 ge-0/1/1.0]
user@host# set secure-wire ae-link2-sw interface [ge-0/0/0.0 ge-0/0/1.0]
```

4. Configure security zones.

```
[edit security zones]
user@host# set security-zone trust interfaces ge-0/0/0.0
user@host# set security-zone trust interfaces ge-0/1/0.0
user@host# set security-zone untrust interfaces ge-0/0/1.0
user@host# set security-zone untrust interfaces ge-0/1/1.0
```

5. Configure a security policy to permit traffic.

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show vlans**, **show interfaces**, **show security forwarding-options**, and **show security zones** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show vlans
vlan-10 {
 domain-type bridge;
 vlan-id 10;
}
user@host# show interfaces
ge-0/0/0 {
 unit 0 {
 family ethernet-switching {
 interface-mode access;
 vlan-id 10;
 }
 }
}
ge-0/0/1 {
 unit 0 {
 family ethernet-switching {
 interface-mode access;
 vlan-id 10;
 }
 }
}
ge-0/1/0 {
 unit 0 {
 family ethernet-switching {
 interface-mode access;
 vlan-id 10;
 }
 }
}
ge-0/1/1 {
 unit 0 {
 family ethernet-switching {
 interface-mode access;
```

```

 vlan-id 10;
 }
}
user@host# show security forwarding-options
secure-wire ae-link1-sw {
 interfaces [ge-0/1/0.0 ge-0/1/1.0];
}
secure-wire ae-link2-sw {
 interfaces [ge-0/0/0.0 ge-0/0/1.0];
}
user@host# show security zones
security-zone trust {
 interfaces {
 ge-0/0/0.0;
 ge-0/1/0.0;
 }
}
security-zone untrust {
 interfaces {
 ge-0/0/1.0;
 ge-0/1/1.0;
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

## Example: Simplifying Chassis Cluster Deployment with Secure Wire over Redundant Ethernet Interfaces

If you are connecting an SRX Series chassis cluster to other network devices, you can use secure wire to simplify the cluster deployment in the network. No changes to routing or forwarding tables on the cluster and no reconfiguration of neighboring devices is needed. Secure wire allows traffic to be forwarded unchanged between specified redundant Ethernet interfaces on the SRX Series chassis cluster as long as it is permitted by security policies or other security features. Follow this example if you are connecting an SRX Series chassis cluster to other network devices through redundant Ethernet interfaces.

- [Requirements on page 3236](#)
- [Overview on page 3236](#)
- [Configuration on page 3237](#)
- [Verification on page 3240](#)

### Requirements

Before you begin:

- Connect a pair of the same SRX Series devices in a chassis cluster.
- Configure the chassis cluster node ID and cluster ID.
- Set the number of redundant Ethernet interfaces in the chassis cluster.
- Configure the chassis cluster fabric.
- Configure chassis cluster redundancy group (in this example redundancy group 1 is used).

### Overview

Secure wire is supported over redundant Ethernet interfaces in a chassis cluster. The two redundant Ethernet interfaces must be configured in the same redundancy group. If failover occurs, both redundant Ethernet interfaces should fail over together.

**NOTE:** Secure wire mapping of redundant Ethernet link aggregation groups (LAGs) are not supported. LACP is not supported.

This example configures the secure wire reth-sw that maps ingress interface reth0.0 to egress interface reth1.0. Each redundant Ethernet interface consists of two child interfaces, one on each node of the chassis cluster. The two redundant Ethernet interfaces are configured for access mode. VLAN ID 10 is configured for the bridge domain vlan-10 and the redundant Ethernet interfaces.

**NOTE:** A specific VLAN ID or VLAN ID list must be configured for a bridge domain.

### Topology

Figure 147 shows the redundant Ethernet interfaces that are mapped in secure wire reth-sw.

Figure 147: Secure Wire Redundant Ethernet Interfaces

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set vlans vlan-10 domain-type bridge vlan-id 10
set interfaces ge-0/0/0 gigether-options redundant-parent reth0
set interfaces ge-0/0/1 gigether-options redundant-parent reth1
set interfaces ge-0/1/0 gigether-options redundant-parent reth0
set interfaces ge-0/1/1 gigether-options redundant-parent reth1
set interfaces reth0 unit 0 family ethernet-switching interface-mode access vlan-id 10
set interfaces reth1 unit 0 family ethernet-switching interface-mode access vlan-id 10
set interfaces reth0 redundant-ether-options redundancy-group 1
set interfaces reth1 redundant-ether-options redundancy-group 1
set security forwarding-options secure-wire reth-sw interface [reth0.0 reth1.0]
set security zones security-zone trust interfaces reth0.0
set security zones security-zone untrust interfaces reth1.0
set security policies default-policy permit-all
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a secure wire mapping for chassis cluster redundant Ethernet interfaces:

1. Configure the bridge domain.

```
[edit vlans vlan-10]
user@host# set domain-type bridge vlan-id 10
```

2. Configure the redundant Ethernet interfaces.

```
[edit interfaces]
user@host# set ge-0/0/0 gigether-options redundant-parent reth0
user@host# set ge-0/0/1 gigether-options redundant-parent reth1
user@host# set ge-0/1/0 gigether-options redundant-parent reth0
user@host# set ge-0/1/1 gigether-options redundant-parent reth1
```

```
user@host#set reth0 unit 0 family ethernet-switching interface-mode access vlan-id
10
user@host#set reth1 unit 0 family ethernet-switching interface-mode access vlan-id
10
```

```
user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth1 redundant-ether-options redundancy-group 1
```

3. Configure the secure wire mapping.

```
[edit security forwarding-options]
user@host# set secure-wire reth-sw interface [reth0.0 reth1.0]
```

4. Configure security zones.

```
[edit security zones]
user@host# set security-zone trust interfaces reth0.0
user@host# set security-zone untrust interfaces reth1.0
```

5. Configure a security policy to permit traffic.

```
[edit security policies]
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show vlans**, **show interfaces**, **show security forwarding-options**, and **show security zones** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show vlans
vlan-10 {
 domain-type bridge;
 vlan-id 10;
}
user@host# show interfaces
ge-0/0/0 {
 gigether-options {
 redundant-parent reth0;
```

```

 }
 }
 ge-0/0/1 {
 gigether-options {
 redundant-parent reth1;
 }
 }
 ge-0/1/0 {
 gigether-options {
 redundant-parent reth0;
 }
 }
 ge-0/1/1 {
 gigether-options {
 redundant-parent reth1;
 }
 }
 reth0 {
 redundant-ether-options {
 redundancy-group 1;
 }
 unit 0 {
 family ethernet-switching {
 interface-mode access;
 vlan-id 10;
 }
 }
 }
 reth1 {
 redundant-ether-options {
 redundancy-group 1;
 }
 unit 0 {
 family ethernet-switching {
 interface-mode access;
 vlan-id 10;
 }
 }
 }
}
user@host# show security forwarding-options
secure-wire reth-sw {
 interfaces [reth0.0 reth1.0];
}
user@host# show security zones
security-zone trust {
 interfaces {
 reth0.0;
 }
}
security-zone untrust {
 interfaces {
 reth1.0;
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying Secure Wire Mapping on page 3240](#)
- [Verifying the Bridge Domain on page 3240](#)

### Verifying Secure Wire Mapping

**Purpose** Verify the secure wire mapping.

**Action** From operational mode, enter the **show security forwarding-options secure-wire** command.

```
user@host> show security forwarding-options secure-wire
node0:
```

| Secure wire | Interface | Link | Interface | Link |
|-------------|-----------|------|-----------|------|
| reth-sw     | reth0.0   | up   | reth1.0   | up   |

Total secure wires: 1

```
node1:
```

| Secure wire | Interface | Link | Interface | Link |
|-------------|-----------|------|-----------|------|
| reth-sw     | reth0.0   | up   | reth1.0   | up   |

Total secure wires: 1

### Verifying the Bridge Domain

**Purpose** Verify the bridge domain.

**Action** From operational mode, enter the **show vlan vlan-10** command.

```
user@host> show vlan vlan-10
Routing instance VLAN Name VLAN ID Interfaces
default-switch vlan-10 10 reth0.0
 reth1.0
```

## Example: Simplifying Chassis Cluster Deployment with Secure Wire over Aggregated Redundant Ethernet Interfaces

If you are connecting an SRX Series chassis cluster to other network devices, you can use secure wire to simplify the cluster deployment in the network. No changes to routing or forwarding tables on the cluster and no reconfiguration of neighboring devices is needed. Secure wire allows traffic to be forwarded unchanged between specified

redundant Ethernet interfaces on the SRX Series chassis cluster as long as it is permitted by security policies or other security features. Follow this example if you are connecting an SRX Series chassis cluster to other network devices through aggregated redundant Ethernet interfaces.

**NOTE:** Secure wires cannot be configured for redundant Ethernet interface link aggregation groups (LAGs). For the secure wire mapping shown in this example, there is no LAG configuration on the SRX Series chassis cluster. Each redundant Ethernet interface consists of two child interfaces, one on each node of the chassis cluster. Users on upstream or downstream devices connected to the SRX Series cluster can configure the redundant Ethernet interface child links in LAGs.

- [Requirements on page 3241](#)
- [Overview on page 3241](#)
- [Configuration on page 3242](#)
- [Verification on page 3246](#)

## Requirements

Before you begin:

- Connect a pair of the same SRX Series devices in a chassis cluster.
- Configure the chassis cluster node ID and cluster ID.
- Set the number of redundant Ethernet interfaces in the chassis cluster.
- Configure the chassis cluster fabric.
- Configure the chassis cluster redundancy group (in this example, redundancy group 1 is used).

## Overview

This example configures secure wires for four redundant Ethernet interfaces: reth0, reth1, reth2, and reth3. Each redundant Ethernet interface consists of two child interfaces, one on each node of the chassis cluster. All four redundant Ethernet interfaces must be in the same bridge domain—in this example, the bridge domain is vlan-0. Two of the redundant Ethernet interfaces, reth0.0 and reth2.0, are assigned to the trust zone, while the other two interfaces, reth1.0 and reth3.0, are assigned to the untrust zone.

This example configures the following secure wires:

- reth-sw1 maps interface reth0.0 to interface reth1.0
- reth-sw2 maps interface reth2.0 to reth3.0

All redundant Ethernet interfaces are configured for access mode. VLAN ID 10 is configured for the bridge domain vlan-0 and the redundant Ethernet interfaces.

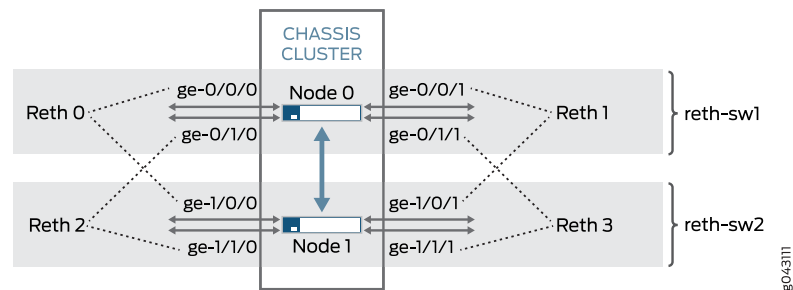

**NOTE:** A specific VLAN ID or VLAN ID list must be configured for a bridge domain.

## Topology

Figure 148 shows the redundant Ethernet interface child links that are mapped in secure wire configurations reth-sw1 and reth-sw2. Each redundant Ethernet interface consists of two child interfaces, one on each node of the chassis cluster.

Figure 148: Secure Wire Redundant Ethernet Interface Child Links

Users on upstream or downstream devices connected to the SRX Series cluster can configure redundant Ethernet interface child links in a LAG as long as the LAG does not span chassis cluster nodes. For example, ge-0/0/0 and ge-0/1/0 and ge-0/0/1 and ge-0/1/1 on node 0 can be configured as LAGs on connected devices. In the same way, ge-1/0/0 and ge-1/1/0 and ge-1/0/1 and ge-1/1/1 on node 1 can be configured as LAGs on connected devices.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set vlans vlan-0 domain-type bridge vlan-id 10
set interfaces ge-0/0/0 gigether-options redundant-parent reth0
set interfaces ge-0/0/1 gigether-options redundant-parent reth1
set interfaces ge-0/1/0 gigether-options redundant-parent reth2
set interfaces ge-0/1/1 gigether-options redundant-parent reth3
set interfaces ge-1/0/0 gigether-options redundant-parent reth0
set interfaces ge-1/0/1 gigether-options redundant-parent reth1
set interfaces ge-1/1/0 gigether-options redundant-parent reth2
set interfaces ge-1/1/1 gigether-options redundant-parent reth3
set interfaces reth0 unit 0 family ethernet-switching interface-mode access vlan-id 10
set interfaces reth1 unit 0 family ethernet-switching interface-mode access vlan-id 10
set interfaces reth2 unit 0 family ethernet-switching interface-mode access vlan-id 10
set interfaces reth3 unit 0 family ethernet-switching interface-mode access vlan-id 10
set interfaces reth0 redundant-ether-options redundancy-group 1
set interfaces reth1 redundant-ether-options redundancy-group 1
```

```

set interfaces reth2 redundant-ether-options redundancy-group 1
set interfaces reth3 redundant-ether-options redundancy-group 1
set security forwarding-options secure-wire reth-sw1 interface [reth0.0 reth1.0]
set security forwarding-options secure-wire reth-sw2 interface [reth2.0 reth3.0]
set security zones security-zone trust interfaces reth0.0
set security zones security-zone trust interfaces reth2.0
set security zones security-zone untrust interfaces reth1.0
set security zones security-zone untrust interfaces reth3.0
set security policies default-policy permit-all

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a secure wire mapping for aggregated interface member links:

1. Configure the bridge domain.

```

[edit vlans vlan-0]
user@host# set domain-type bridge vlan-id 10

```

2. Configure the redundant Ethernet interfaces.

```

[edit interfaces]
user@host# set ge-0/0/0 gigether-options redundant-parent reth0
user@host# set ge-0/0/1 gigether-options redundant-parent reth1
user@host# set ge-0/1/0 gigether-options redundant-parent reth2
user@host# set ge-0/1/1 gigether-options redundant-parent reth3
user@host# set ge-1/0/0 gigether-options redundant-parent reth0
user@host# set ge-1/0/1 gigether-options redundant-parent reth1
user@host# set ge-1/1/0 gigether-options redundant-parent reth2
user@host# set ge-1/1/1 gigether-options redundant-parent reth3

```

```

user@host# set reth0 unit 0 family ethernet-switching interface-mode access
vlan-id 10
user@host# set reth1 unit 0 family ethernet-switching interface-mode access vlan-id
10
user@host# set reth2 unit 0 family ethernet-switching interface-mode access vlan-id
10
user@host# set reth3 unit 0 family ethernet-switching interface-mode access vlan-id
10

```

```

user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth1 redundant-ether-options redundancy-group 1
user@host# set reth2 redundant-ether-options redundancy-group 1
user@host# set reth3 redundant-ether-options redundancy-group 1

```

3. Configure the secure wire mappings.

```

[edit security forwarding-options]
user@host# set secure-wire reth-sw1 interface [reth0.0 reth1.0]
user@host# set secure-wire reth-sw2 interface [reth2.0 reth3.0]

```

4. Configure security zones.

```

[edit security zones]
user@host# set security-zone trust interfaces reth0.0

```

```
user@host# set security-zone trust interfaces reth2.0
```

```
user@host# set security-zone untrust interfaces reth1.0
```

```
user@host# set security-zone untrust interfaces reth3.0
```

5. Configure a security policy to permit traffic.

```
[edit security policies]
```

```
user@host# set default-policy permit-all
```

**Results** From configuration mode, confirm your configuration by entering the **show vlans**, **show interfaces**, **show security forwarding-options**, and **show security zones** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show vlans

## Understanding Switching Modes

---

There are two types of switching modes:

- **Switching Mode**—The uPIM appears in the list of interfaces as a single interface, which is the first interface on the uPIM. For example, ge-2/0/0. You can optionally configure each uPIM port only for autonegotiation, speed, and duplex mode. A uPIM in switching mode can perform the following functions:
  - **Layer 3 forwarding**—Routes traffic destined for WAN interfaces and other PIMs present on the chassis.
  - **Layer 2 forwarding**—Switches intra-LAN traffic from one host on the LAN to another LAN host (one port of uPIM to another port of same uPIM).
- **Enhanced Switching Mode**—Each port can be configured for switching or routing mode. This usage differs from the routing and switching modes, in which all ports must be in either switching or routing mode. The uPIM in enhanced switching mode provides the following features:
  - Supports configuration of different types of VLANs and inter-VLAN routing.
  - Supports Layer 2 control plane protocols such as Spanning Tree Protocol (STP) and Link Aggregation Control Protocol (LACP).
  - Supports port-based Network Access Control (PNAC) by means of authentication servers.

You can set a multiport Gigabit Ethernet uPIM on a device to either switching or enhanced switching mode.

When you set a multiport uPIM to switching mode, the uPIM appears as a single entity for monitoring purposes. The only physical port settings that you can configure are

autonegotiation, speed, and duplex mode on each uPIM port, and these settings are optional.

## Ethernet Ports Switching Overview

Certain ports on Juniper Networks devices can function as Ethernet access switches that switch traffic at Layer 2 and route traffic at Layer 3.

You can deploy supported devices in branch offices as an access or desktop switch with integrated routing capability, thus eliminating intermediate access switch devices from your network topology. The Ethernet ports provide switching while the Routing Engine provides routing functionality, enabling you to use a single device to provide routing, access switching, and WAN interfaces.

## Supported Devices and Ports

Juniper Networks supports switching features on the following Ethernet ports and devices (see [Table 326](#)):

- Onboard Ethernet ports (Gigabit and Fast Ethernet built-in ports) on the SRX100, SRX210, and SRX240 devices
- Multiport Gigabit Ethernet XPIM on the SRX650 device

**Table 326: Supported Devices and Ports for Switching Features**

| Device         | Ports                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SRX100 devices | Onboard Fast Ethernet ports ( <b>fe-0/0/0</b> and <b>fe-0/0/7</b> )                                                                                                                          |
| SRX210 devices | Onboard Gigabit Ethernet ports ( <b>ge-0/0/0</b> and <b>ge-0/0/1</b> ) and 1-Port Gigabit Ethernet SFP Mini-PIM port.<br>Onboard Fast Ethernet ports ( <b>fe-0/0/2</b> and <b>fe-0/0/7</b> ) |
| SRX220 devices | Onboard Gigabit Ethernet ports ( <b>ge-0/0/0</b> through <b>ge-0/0/7</b> ) and 1-Port Gigabit Ethernet SFP Mini-PIM port.                                                                    |

Table 326: Supported Devices and Ports for Switching Features (*continued*)

| Device         | Ports                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SRX240 devices | Onboard Gigabit Ethernet ports ( <b>ge-0/0/0</b> through <b>ge-0/0/15</b> ) and 1-Port Gigabit Ethernet SFP Mini-PIM port.                                                                          |
| SRX550 devices | Onboard Gigabit Ethernet ports ( <b>ge-0/0/0</b> through <b>ge-0/0/9</b> , Multiport Gigabit Ethernet XPIM modules, and 1-Port Gigabit Ethernet SFP Mini-PIM port.                                  |
| SRX650 devices | Multiport Gigabit Ethernet XPIM modules<br><br><b>NOTE:</b> On SRX650 devices, Ethernet switching is not supported on Gigabit Ethernet interfaces ( <b>ge-0/0/0</b> through <b>ge-0/0/3</b> ports). |

On SRX650 devices, you can set multiport switch modules (uPIMs and XPIMs, respectively) to three modes of operation: routing (the default), switching, or enhanced switching. Routed traffic is forwarded from any port of the Gigabit Ethernet uPIM to the WAN interface. Switched traffic is forwarded from one port of the Gigabit Ethernet uPIM to another port on the same Gigabit Ethernet uPIM. Switched traffic is not forwarded from a port on one uPIM to a port on a different uPIM.

On the SRX100, SRX220, and SRX240 devices, you can set the onboard Gigabit Ethernet ports to operate as either switched ports or routed ports.

## Integrated Bridging and Routing

Integrated bridging and routing (IRB) provides support for simultaneous Layer 2 bridging and Layer 3 routing within the same bridge domain. Packets arriving on an interface of the bridge domain are switched or routed based on the destination MAC address of the packet. Packets with the router's MAC address as the destination are routed to other Layer 3 interfaces.

## Link Layer Discovery Protocol and LLDP-Media Endpoint Discovery

Devices use Link Layer Discovery Protocol (LLDP) and LLDP-Media Endpoint Discovery (MFD) to learn and distribute device information on network links. The information allows the device to quickly identify a variety of systems, resulting in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in Type Length Value (TLV) messages to neighbor devices. Device information can include specifics, such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in the Junos OS.

LLDP-MED goes one step further, exchanging IP-telephony messages between the device and the IP telephone. These TLV messages provide detailed information on Power over Ethernet (PoE) policy. The PoE Management TLVs let the device ports advertise the power level and power priority needed. For example, the device can compare the power needed by an IP telephone running on a PoE interface with available resources. If the

device cannot meet the resources required by the IP telephone, the device could negotiate with the telephone until a compromise on power is reached.

The following basic TLVs are supported:

- Chassis Identifier—The MAC address associated with the local system.
- Port identifier—The port identification for the specified port in the local system.
- Port Description—The user-configured port description. The port description can be a maximum of 256 characters.
- System Name—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- Switching Features Overview—This information is not configurable, but taken from the software.
- System Capabilities—The primary function performed by the system. The capabilities that system supports; for example, bridge or router. This information is not configurable, but based on the model of the product.
- Management Address—The IP management address of the local system.

The following LLDP-MED TLVs are supported:

- LLDP-MED Capabilities—A TLV that advertises the primary function of the port. The values range from 0 through 15:
  - 0—Capabilities
  - 1—Network policy
  - 2—Location identification
  - 3—Extended power through medium-dependent interface power-sourcing equipment (MDI-PSE)
  - 4—Inventory
  - 5–15—Reserved
- LLDP-MED Device Class Values:
  - 0—Class not defined
  - 1—Class 1 device
  - 2—Class 2 device
  - 3—Class 3 device
  - 4—Network connectivity device
  - 5–255— Reserved

**NOTE:** On SRX100, SRX210, SRX220, SRX240, and SRX650 devices, on VLAN-tagged routed interfaces, LLDP is not supported.

---

- **Network Policy**—A TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types, such as voice or streaming video, 802.1Q VLAN tagging, and 802.1p priority bits and Diffserv code points.
- **Endpoint Location**—A TLV that advertises the physical location of the endpoint.
- **Extended Power via MDI**—A TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.

LLDP and LLDP-MED must be explicitly configured on uPIMs (in enhanced switching mode) on base ports on SRX100, SRX210, and SRX240 devices, and Gigabit Backplane Physical Interface Modules (GPIMs) on SRX650 devices. To configure LLDP on all interfaces or on a specific interface, use the `lldp` statement at the `[set protocols]` hierarchy. To configure LLDP-MED on all interfaces or on a specific interface, use the `lldp-med` statement at the `[set protocols]` hierarchy.

## Types of Switch Ports

The ports, or interfaces, on a switch operate in either access mode or trunk mode.

An interface in access mode connects to a network device, such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The interface itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames.

Trunk interfaces handle traffic for multiple VLANs, multiplexing the traffic for all those VLANs over the same physical connection. Trunk interfaces are generally used to interconnect switches to one another.

## uPIM in a Daisy Chain

You cannot combine multiple uPIMs to act as a single integrated switch. However, you can connect uPIMs on the same chassis externally by physically connecting a port on one uPIM to a port on another uPIM in a daisy-chain fashion.

Two or more uPIMs daisy-chained together create a single switch with a higher port count than either individual uPIM. One port on each uPIM is used solely for the connection. For example, if you daisy-chain a 6-port uPIM and an 8-port uPIM, the result operates as a 12-port uPIM. Any port of a uPIM can be used for daisy chaining.

Configure the IP address for only one of the daisy-chained uPIMs, making it the primary uPIM. The secondary uPIM routes traffic to the primary uPIM, which forwards it to the Routing Engine. This results in some increase in latency and packet drops due to oversubscription of the external link.

Only one link between the two uPIMs is supported. Connecting more than one link between uPIMs creates a loop topology, which is not supported.

## Q-in-Q VLAN Tagging

Q-in-Q tunneling, defined by the IEEE 802.1ad standard, allows service providers on Ethernet access networks to extend a Layer 2 Ethernet connection between two customer sites.

In Q-in-Q tunneling, as a packet travels from a customer VLAN (C-VLAN) to a service provider's VLAN, a service provider-specific 802.1Q tag is added to the packet. This additional tag is used to segregate traffic into service-provider-defined service VLANs (S-VLANs). The original customer 802.1Q tag of the packet remains and is transmitted transparently, passing through the service provider's network. As the packet leaves the S-VLAN in the downstream direction, the extra 802.1Q tag is removed.

**NOTE:** When Q-in-Q tunneling is configured for a service provider's VLAN, all Routing Engine packets, including packets from the routed VLAN interface, that are transmitted from the customer-facing access port of that VLAN will always be untagged.

There are three ways to map C-VLANs to an S-VLAN:

- All-in-one bundling—Use the **dot1q-tunneling** statement at the **[edit vlans]** hierarchy to map without specifying customer VLANs. All packets from a specific access interface are mapped to the S-VLAN.
- Many-to-one bundling—Use the **customer-vlans** statement at the **[edit vlans]** hierarchy to specify which C-VLANs are mapped to the S-VLAN.
- Mapping C-VLAN on a specific interface—Use the **mapping** statement at the **[edit vlans]** hierarchy to map a specific C-VLAN on a specified access interface to the S-VLAN.

Table 327 lists the C-VLAN to S-VLAN mapping supported on SRX Series devices:

**Table 327: Supported Mapping Methods**

| Mapping                                | SRX210 | SRX240 | SRX650 |
|----------------------------------------|--------|--------|--------|
| All-in-one bundling                    | Yes    | Yes    | Yes    |
| Many-to-one bundling                   | No     | No     | Yes    |
| Mapping C-VLAN on a specific interface | No     | No     | Yes    |

**NOTE:** On SRX650 devices, in the dot1q-tunneling configuration options, customer VLANs range and VLAN push do not work together for the same S-VLAN, even when you commit the configuration. If both are configured, then VLAN push takes priority over customer VLANs range.

IRB interfaces are supported on Q-in-Q VLANs for SRX210, SRX240, SRX650, devices. Packets arriving on an IRB interface on a Q-in-Q VLAN are routed regardless of whether the packet is single or double tagged. The outgoing routed packets contain an S-VLAN tag only when exiting a trunk interface; the packets exit the interface untagged when exiting an access interface.

In a Q-in-Q deployment, customer packets from downstream interfaces are transported without any changes to source and destination MAC addresses. You can disable MAC address learning at both the interface level and the VLAN level. Disabling MAC address learning on an interface disables learning for all the VLANs of which that interface is a member. When you disable MAC address learning on a VLAN, MAC addresses that have already been learned are flushed.

On SRX100, SRX210, SRX240, and SRX650 devices, on the Layer 3 aggregated Ethernet , the following features are not supported:

- Encapsulations (such as CCC, VLAN CCC, VPLS, and PPPoE)
- J-Web
- On all SRX Series devices, the Link Layer Discovery Protocol (LLDP) is not supported on reth interfaces.
- On SRX550 and SRX650 devices, the aggregate Ethernet (ae) interface with XE member interface cannot be configured with the Ethernet switching family.
- On all branch SRX Series devices, the Q-in-Q support on a Layer 3 interface has the following limitations:
  - Double tagging is not supported on reth and ae interfaces.
  - Multitopology routing is not supported in flow mode and in chassis clusters.
  - Dual tagged frames are not supported on encapsulations (such as CCC, TCC, VPLS, and PPPoE)
  - On Layer 3 logical interfaces, input-vlan-map, output-vlan-map, inner-range, and inner-list are not applicable
  - Only TPIDs with 0x8100 are supported, and the maximum number of tags is 2.
  - Dual tagged frames are accepted only for logical interfaces with IPV4 and IPV6 families.
- On SRX100, SRX210, SRX240, and SRX650 devices, on the routed VLAN interface (RVI), the following features are not supported:
  - IS-IS (family ISO)
  - Encapsulations (Ether CCC, VLAN CCC, VPLS, PPPoE, and so on) on VLAN interfaces
  - CLNS
  - DVMRP
  - VLAN interface MAC change

- G-ARP
- Change VLAN-Id for VLAN interface

## Example: Configuring Switching Modes

This example shows how to configure a multiport Gigabit Ethernet uPIM to function in switching mode so the uPIM appears as a single entity for monitoring purposes.

- [Requirements on page 3258](#)
- [Overview on page 3258](#)
- [Configuration on page 3258](#)
- [Verification on page 3259](#)

### Requirements

Before you begin, see “[Understanding Switching Modes](#)” on page 3251.

### Overview

In this example, you configure **chassis** and set the uPIM mode of operation to switching. You then set the uPIM mode of operation to enhanced switching. Finally, you configure interface ge-2/0/0 and set the physical port parameter to auto-negotiation on switch port 1 on the uPIM.

### Configuration

**Step-by-Step  
Procedure**

To configure a uPIM to function in switching mode:

1. Set the uPIM mode of operation to switching.  

```
[edit chassis fpc 0 pic 0 ethernet]
user@host# set pic-mode switching
```
2. Set the uPIM mode of operation to enhanced switching.  

```
[edit chassis fpc 0 pic 0 ethernet]
user@host# set pic-mode enhanced-switching
```
3. Set a physical port parameter on the uPIM.  

```
[edit]
user@host# set interfaces ge-2/0/0 switch-options switch-port 1 auto-negotiation
```
4. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

## Verification

To verify the configuration is working properly, enter the **show interfaces ge-2/0/0 switch-options** and **show chassis fpc 0** commands.

- Related Documentation**
- [Ethernet Ports Switching Overview on page 3252](#)
  - [Verifying Switching Mode Configuration on page 3259](#)

## Verifying Switching Mode Configuration

**Purpose** The operational mode command for checking the status and statistics for multiport uPIMs in switching mode is different from that in routing mode. For uPIMs in routing mode, the operational commands are the same as for other Gigabit Ethernet interfaces, such as the 1-port Gigabit Ethernet ePIM and built-in Gigabit Ethernet ports.

However, not all operational mode commands are supported for ports of a uPIM in switching mode. For example, the operational mode command for monitoring port statistics is not supported.

**NOTE:** To clear the statistics for the individual switch ports, use the **clear interfaces statistics ge-pim/0/0 switch-port port-number** command.

To verify the status and view statistics for a port on a uPIM in switching mode:

```
user@host# show interfaces ge-slot/0/0 switch-port port-number
```

```
Port 0, Physical link is Up
Speed: 100mbps, Auto-negotiation: Enabled
Statistics:
 Receive Transmit
 Total bytes 28437086 21792250
 Total packets 409145 88008
 Unicast packets 9987 83817
 Multicast packets 145002 0
 Broadcast packets 254156 4191
 Multiple collisions 23 10
 FIFO/CRC/Align errors 0 0
 MAC pause frames 0 0
 Oversized frames 0
 Runt frames 0
 Jabber frames 0
 Fragment frames 0
 Discarded frames 0
Autonegotiation information:
Negotiation status: Complete
Link partner:
 Link mode: Full-duplex, Flow control: None, Remote fault: OK, Link
partner Speed: 100 Mbps
Local resolution:
 Flow control: None, Remote fault: Link OK
```

# Configuring VLANs

- [Understanding VLANs on page 3261](#)
- [Example: Configuring VLANs on page 3263](#)
- [Example: Configuring a Guest VLAN on page 3264](#)

## Understanding VLANs

Each VLAN is a collection of network nodes that are grouped together to form separate broadcast domains. On an Ethernet network that is a single LAN, all traffic is forwarded to all nodes on the LAN. On VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN. Frames that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within a VLAN and on the LAN as a whole.

On an Ethernet LAN, all network nodes must be physically connected to the same network. On VLANs, the physical location of the nodes is not important, so you can group network devices in any way that makes sense for your organization, such as by department or business function, by types of network nodes, or even by physical location. Each VLAN is identified by a single IP subnetwork and by standardized IEEE 802.1Q encapsulation.

To identify which VLAN the traffic belongs to, all frames on an Ethernet VLAN are identified by a tag, as defined in the IEEE 802.1Q standard. These frames are tagged and are encapsulated with 802.1Q tags.

For a simple network that has only a single VLAN, all traffic has the same 802.1Q tag. When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q tag. The tag is applied to all frames so that the network nodes receiving the frames know to which VLAN a frame belongs. Trunk ports, which multiplex traffic among a number of VLANs, use the tag to determine the origin of frames and where to forward them.

For VLAN configuration details, see [Table 328](#).

Table 328: VLAN Configuration Details

| Field   | Function | Action |
|---------|----------|--------|
| General |          |        |

Table 328: VLAN Configuration Details (*continued*)

| Field               | Function                                                                                                        | Action                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN Name           | Specifies a unique name for the VLAN.                                                                           | Enter a name.<br><br><b>NOTE:</b> VLAN text field is disabled when vlan-tagging is not enabled.                                                                                                                                                                                                                                                                 |
| VLAN ID/Range       | Specifies the identifier or range for the VLAN.                                                                 | Select one: <ul style="list-style-type: none"> <li>• <b>VLAN ID</b>—Type a unique identification number from 1 through 4094. If no value is specified, it defaults to 1.</li> <li>• <b>VLAN Range</b>—Type a number range to create VLANs with IDs corresponding to the range. For example, the range 2–3 will create two VLANs with the ID 2 and 3.</li> </ul> |
| Description         | Describes the VLAN.                                                                                             | Enter a brief description for the VLAN.                                                                                                                                                                                                                                                                                                                         |
| Input Filter        | Specifies the VLAN firewall filter that is applied to incoming packets.                                         | To apply an input firewall filter, select the firewall filter from the list.                                                                                                                                                                                                                                                                                    |
| Output Filter       | Specifies the VLAN firewall filter that is applied to outgoing packets.                                         | To apply an output firewall filter, select the firewall filter from the list.                                                                                                                                                                                                                                                                                   |
| <b>Ports</b>        |                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                 |
| Ports               | Specifies the ports to be associated with this VLAN for data traffic. You can also remove the port association. | Click one: <ul style="list-style-type: none"> <li>• <b>Add</b>—Select the ports from the available list.</li> <li>• <b>Remove</b>—Select the port that you do not want associated with the VLAN.</li> </ul>                                                                                                                                                     |
| <b>IP Address</b>   |                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                 |
| Layer 3 Information | Specifies IP address options for the VLAN.                                                                      | Select to enable the IP address options.                                                                                                                                                                                                                                                                                                                        |
| IP Address          | Specifies the IP address of the VLAN.                                                                           | Enter the IP address.                                                                                                                                                                                                                                                                                                                                           |
| Subnet Mask         | Specifies the range of logical addresses within the address space that is assigned to an organization.          | Enter the address, for example, 255.255.255.0. You can also specify the address prefix.                                                                                                                                                                                                                                                                         |
| Input Filter        | Specifies the VLAN interface firewall filter that is applied to incoming packets.                               | To apply an input firewall filter to an interface, select the firewall filter from the list.                                                                                                                                                                                                                                                                    |
| Output Filter       | Specifies the VLAN interface firewall filter that is applied to outgoing packets.                               | To apply an output firewall filter to an interface, select the firewall filter from the list.                                                                                                                                                                                                                                                                   |
| ARP/MAC Details     | Specifies the details for configuring the static IP address and MAC.                                            | Click the <b>ARP/MAC Details</b> button. Enter the static IP address and MAC address in the window that is displayed.                                                                                                                                                                                                                                           |
| <b>VoIP</b>         |                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                 |

Table 328: VLAN Configuration Details (*continued*)

| Field | Function                                                                                                         | Action                                                                                                                                                                                                      |
|-------|------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ports | Specifies the ports to be associated with this VLAN for voice traffic. You can also remove the port association. | Click one: <ul style="list-style-type: none"> <li>• <b>Add</b>—Select the ports from the available list.</li> <li>• <b>Remove</b>—Select the port that you do not want associated with the VLAN.</li> </ul> |

**NOTE:** On SRX100 devices, dynamic VLAN assignments and guest VLANs are not supported.

On SRX240 and SRX650 devices, the VLAN range from 3967 to 4094 falls under the reserved VLAN address range, and the user is not allowed any configured VLANs from this range.

## Example: Configuring VLANs

This example shows you how to configure a VLAN.

### Requirements

Before you begin:

- Determine which interfaces to use and verify that they are in switch mode. See [“Example: Configuring Switching Modes” on page 3258](#).
- Determine what ports to use on the device and how to segment your network. See [“Understanding Switching Modes” on page 3251](#).

### Overview

In this example, you create a new VLAN and then configure attributes.

### Configuration

#### GUI Step-by-Step Procedure

To access the VLAN:

1. In the J-Web user interface, select **Configure>Switching>VLAN**.

The VLAN configuration page displays a list of existing VLANs. If you select a specific VLAN, the specific VLAN details are displayed in the details section.

2. Click one:

- **Add**—Creates a VLAN.

- **Edit**—Edits an existing VLAN configuration.
- **Delete**—Deletes an existing VLAN.

**NOTE:** If you delete a VLAN, the VLAN configuration for all the associated interfaces is also deleted.

Add or edit VLAN information.

3. Click one:

- **OK**—Saves the configuration and returns to the main configuration page, then click **Commit Options>Commit**.
- **Cancel**—Cancels your entries and returns to the main configuration page.

## Example: Configuring a Guest VLAN

This example shows how to configure a guest VLAN for limited network access or for Internet-only access to avoid compromising a company's security.

- [Requirements on page 3264](#)
- [Overview on page 3264](#)
- [Configuration on page 3264](#)
- [Verification on page 3265](#)

### Requirements

Before you begin, verify that the interfaces that will be used are in switch mode. See “[Example: Configuring Switching Modes](#)” on page 3258 and “[Understanding Switching Modes](#)” on page 3251.

### Overview

In this example, you configure a VLAN called visitor-vlan with a VLAN ID of 300. Then you set protocols and configure visitor-vlan as the guest VLAN.

### Configuration

#### Step-by-Step Procedure

To configure a guest VLAN:

1. Configure a VLAN.  

```
[edit]
user@host# set vlans visitor-vlan vlan-id 300
```

2. Specify the guest VLAN.

[edit]

user@host# **set protocols dot1x authenticator interface all guest-vlan visitor-vlan**

3. If you are done configuring the device, commit the configuration.

[edit]

user@host# **commit**

## Verification

To verify the configuration is working properly, enter the **show vlans** and **show protocols dot1x** commands.

# Configuring GARP VLAN Registration Protocol

- [Understanding GARP VLAN Registration Protocol on page 3267](#)
- [Example: Configuring GARP VLAN Registration Protocol on page 3268](#)

## Understanding GARP VLAN Registration Protocol

As a network expands and the number of clients and VLANs increases, VLAN administration becomes complex, and the task of efficiently configuring VLANs becomes increasingly difficult. To automate VLAN administration, you can enable GARP VLAN Registration Protocol (GVRP) on the network.

The Generic VLAN Registration Protocol (GVRP) is an application protocol of the Generic Attribute Registration Protocol (GARP) and is defined in the IEEE 802.1Q standard. GVRP learns VLANs on a particular 802.1Q trunk port and adds the corresponding trunk port to the VLAN if the advertised VLAN is preconfigured on the switch.

The VLAN registration information sent by GVRP includes the current VLAN membership—that is, which switches are members of which VLANs—and which switch ports are in which VLAN. GVRP shares all VLAN information configured manually on a local switch.

As part of ensuring that VLAN membership information is current, GVRP removes switches and ports from the VLAN information when they become unavailable. Pruning VLAN information limits the network VLAN configuration to active participants only, reducing network overhead, and targets the scope of broadcast, unknown unicast, and multicast (BUM) traffic to interested devices only.

For GVRP global settings, see [Table 329](#).

**Table 329: GVRP Global Settings**

| Field        | Function                                                                                        | Action                                                   |
|--------------|-------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Disable GVRP | Disables GVRP on all the interfaces.                                                            | Click to select.                                         |
| Join Timer   | Specifies the number of milliseconds an interface must wait before sending VLAN advertisements. | Enter a value from 0 through 4,294,967,295 milliseconds. |

Table 329: GVRP Global Settings (*continued*)

| Field           | Function                                                                                                                                                                                | Action                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Leave Timer     | Specifies the number of milliseconds an interface must wait after receiving a leave message to remove itself from the VLAN specified in the message.                                    | Enter a value from 0 through 4,294,967,295 milliseconds. |
| Leave All Timer | Specifies the interval in milliseconds at which Leave All messages are sent on interfaces. Leave All messages help to maintain current GVRP VLAN membership information in the network. | Enter a value from 0 through 4,294,967,295 milliseconds. |

  - [Ethernet Ports Switching Overview on page 3252](#)
  - [Verifying Switching Mode Configuration on page 3259](#)

## Example: Configuring GARP VLAN Registration Protocol

This example shows you how to enable GVRP.

### Requirements

Before you begin:

- Ensure that the interfaces that will be used are in switch mode. See [“Example: Configuring Switching Modes” on page 3258](#).
- You should have a switched multicast network environment with VLANs configured. See [“Example: Configuring VLANs” on page 3263](#).

### Overview

In this example, you configure GVRP on an interface.

### Configuration

#### GUI Step-by-Step Procedure

To access the GVRP Quick Configuration:

1. In the J-Web user interface, select **Configure>Switching>GVRP**.

The GVRP Configuration page displays a list of interfaces on which GVRP is enabled.

2. Click one:

- **Global Settings**—Modifies GVRP timers. Enter the information.
- **Add**—Enables GVRP on an interface.
- **Disable Port**—Disables an interface.
- **Delete**—Deletes an interface.

3. Click one:

- Click **OK** to check your configuration and save it as a candidate configuration, then click **Commit Options>Commit**.
- Click **Cancel** to cancel the configuration without saving changes.

# Configuring Spanning Tree Protocol

- [Understanding the Spanning Tree Protocol on page 3271](#)
- [Configuring the Spanning Tree Protocol on page 3274](#)

## Understanding the Spanning Tree Protocol

Spanning Tree Protocol (STP), defined in IEEE 802.1D, creates a tree of links in the Ethernet switched network. Links that cause loops in the network are disabled, thereby providing a single active link between any two switches.

Rapid Spanning Tree Protocol (RSTP), originally defined in IEEE 802.1w and later merged into IEEE 802.1D, facilitates faster spanning tree convergence after a topology change.

Multiple Spanning Tree Protocol (MSTP), initially defined in IEEE 802.1s and later included in IEEE 802.1Q, supports mapping of multiple VLANs onto a single spanning tree instance. This reduces the number of spanning tree instances required in a switched network with many VLANs.

Juniper Networks devices provide Layer 2 loop prevention through STP, RSTP, and MSTP. You can configure bridge protocols data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could result in STP misconfigurations, which could lead to network outages.

For STP configuration parameters, see [Table 330](#).

**Table 330: STP Configuration Parameters**

| Field           | Function                                                                                                                                                                                                                                                          | Action                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| Protocol Name   | Displays the spanning-tree protocol.                                                                                                                                                                                                                              | View only.                                   |
| Disable         | Disables STP on the interface.                                                                                                                                                                                                                                    | To enable this option, select the check box. |
| BPDU Protect    | Specifies that BPDU blocks are to be processed.                                                                                                                                                                                                                   | To enable this option, select the check box. |
| Bridge Priority | Specifies the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment. | Select a value.                              |

**Table 330: STP Configuration Parameters** (*continued*)

| Field         | Function                                                                                                                                                                                                                      | Action                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| Forward Delay | Specifies the number of seconds an interface waits before changing from spanning-tree learning and listening states to the forwarding state.                                                                                  | Enter a value from 4 through 30 seconds. |
| Hello Time    | Specifies time interval in seconds at which the root bridge transmits configuration BPDUs.                                                                                                                                    | Enter a value from 1 through 10 seconds. |
| Max Age       | Specifies the maximum aging time in seconds for all MST instances. The maximum aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration. | Enter a value from 6 through 40 seconds. |

For RSTP configuration parameters, see [Table 331](#).

**Table 331: RSTP Configuration Parameters**

| Field           | Function                                                                                                                                                                                                                                                          | Action                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| Protocol Name   | Displays the spanning-tree protocol.                                                                                                                                                                                                                              | View only.                                   |
| Disable         | Specifies whether RSTP must be disabled on the interface.                                                                                                                                                                                                         | To enable this option, select the check box. |
| BPDU Protect    | Specifies that BPDU blocks are to be processed.                                                                                                                                                                                                                   | To enable this option, select the check box. |
| Bridge Priority | Specifies the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment. | Select a value.                              |
| Forward Delay   | Specifies the number of seconds a port waits before changing from its spanning-tree learning and listening states to the forwarding state.                                                                                                                        | Enter a value from 4 through 30 seconds.     |
| Hello Time      | Specifies the hello time in seconds for all MST instances.                                                                                                                                                                                                        | Enter a value from 1 through 10 seconds.     |
| Max Age         | Specifies the maximum aging time in seconds for all MST instances. The maximum aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration.                                     | Enter a value from 6 through 40 seconds.     |

For MSTP configuration parameters, see [Table 332](#).

**Table 332: MSTP Configuration Parameters**

| Field         | Function                             | Action     |
|---------------|--------------------------------------|------------|
| Protocol Name | Displays the spanning-tree protocol. | View only. |

Table 332: MSTP Configuration Parameters (*continued*)

| Field              | Function                                                                                                                                                                                                                                                          | Action                                                                                                                                                                                      |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disable            | Specifies whether MSTP must be disabled on the interface.                                                                                                                                                                                                         | To enable this option, select the check box.                                                                                                                                                |
| BPDU Protect       | Specifies that BPDU blocks are to be processed.                                                                                                                                                                                                                   | To enable this option, select the check box.                                                                                                                                                |
| Bridge Priority    | Specifies the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment. | Select a value.                                                                                                                                                                             |
| Forward Delay      | Specifies the number of seconds a port waits before changing from its spanning-tree learning and listening states to the forwarding state.                                                                                                                        | Enter a value from 4 through 30 seconds.                                                                                                                                                    |
| Hello Time         | Specifies the hello time in seconds for all MST instances.                                                                                                                                                                                                        | Enter a value from 1 through 10 seconds.                                                                                                                                                    |
| Max Age            | Specifies the maximum aging time for all MST instances. The maximum aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration.                                                | Enter a value from 6 through 40 seconds.                                                                                                                                                    |
| Configuration Name | MSTP region name carried in the MSTP bridge protocol data units (BPDUs).                                                                                                                                                                                          | Enter a name.                                                                                                                                                                               |
| Max Hops           | Maximum number of hops a BPDU can be forwarded in the MSTP region.                                                                                                                                                                                                | Enter a value from 1 through 255.                                                                                                                                                           |
| Revision Level     | Revision number of the MSTP region configuration.                                                                                                                                                                                                                 | Enter a value from 0 through 65,535.                                                                                                                                                        |
| <b>MSTI tab</b>    |                                                                                                                                                                                                                                                                   |                                                                                                                                                                                             |
| MSTI Id            | Specifies the multiple spanning-tree instance (MSTI) identifier. MSTI IDs are local to each region, so you can reuse the same MSTI ID in different regions.                                                                                                       | Click one: <ul style="list-style-type: none"> <li>• <b>Add</b>—Creates a MSTI.</li> <li>• <b>Edit</b>—Edits an existing MSTI.</li> <li>• <b>Delete</b>—Deletes an existing MSTI.</li> </ul> |
| Bridge Priority    | Specifies the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment. | Select a value.                                                                                                                                                                             |
| VLAN               | Specifies the VLANs for the MSTI.                                                                                                                                                                                                                                 | Click one: <ul style="list-style-type: none"> <li>• <b>Add</b>—Selects VLANs from the list.</li> <li>• <b>Remove</b>—Deletes the selected VLAN.</li> </ul>                                  |

Table 332: MSTP Configuration Parameters (*continued*)

| Field      | Function                                       | Action                                                                                                                                                                                                                    |
|------------|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces | Specifies the interface for the MSTP protocol. | Click one: <ul style="list-style-type: none"> <li>• <b>Add</b>—Selects interfaces from the list.</li> <li>• <b>Edit</b>—Edits the selected interface.</li> <li>• <b>Remove</b>—Deletes the selected interface.</li> </ul> |

For spanning-tree port configuration details, see [Table 333](#).

Table 333: Spanning-Tree Ports Configuration Details

| Field          | Function                                                                                                                  | Action                                                                                                                                                                                           |
|----------------|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | Specifies the interface for the spanning-tree protocol type.                                                              | Select an interface.                                                                                                                                                                             |
| Cost           | Specifies the link cost to control which bridge is the designated bridge and which interface is the designated interface. | Enter a value from 1 through 200,000,000.                                                                                                                                                        |
| Priority       | Specifies the interface priority to control which interface is elected as the root port.                                  | Select a value.                                                                                                                                                                                  |
| Edge           | Configures the interface as an edge interface. Edge interfaces immediately transition to a forwarding state.              | Select to configure the interface as an edge interface.                                                                                                                                          |
| Mode           | Specifies the link mode.                                                                                                  | Select one: <ul style="list-style-type: none"> <li>• <b>Point to Point</b>—For full-duplex links, select this mode.</li> <li>• <b>Shared</b>—For half-duplex links, select this mode.</li> </ul> |

## Configuring the Spanning Tree Protocol

This example shows you how to configure the Spanning Tree Protocol on a Ethernet switched network.

### Requirements

Before you begin:

- Determine which interfaces to use and verify that they are in switch mode. See [“Example: Configuring Switching Modes” on page 3258](#).
- Review information about switching modes. See [“Understanding Switching Modes” on page 3251](#).

## Overview

In this example, you enable the Spanning Tree Protocol on switched Ethernet ports.

## Configuration

### GUI Step-by-Step Procedure

To access the Spanning Tree Quick Configuration:

1. In the J-Web user interface, select **Configure>Switching>Spanning Tree**.

The Spanning Tree Configuration page displays a list of existing spanning-trees. If you select a specific spanning tree, the specific spanning tree details are displayed in the General and Interfaces tabs.

2. Click one of the following:

- **Add**—Creates a spanning tree.
- **Edit**—Edits an existing spanning-tree configuration.
- **Delete**—Deletes an existing spanning tree.

When you are adding a spanning tree, select a protocol name: STP, RSTP, or MSTP.

Select the **Ports** tab to configure the ports associated with this spanning tree. Click one of the following:

- **Add**—Creates a new spanning-tree interface configuration.
- **Edit**—Modifies an existing spanning-tree interface configuration.
- **Delete**—Deletes an existing spanning-tree interface configuration.

When you are adding or editing a spanning-tree port, enter information describing the port.

3. Click one:

- Click **OK** to check your configuration and save it as a candidate configuration, then click **Commit Options>Commit**.
- Click **Cancel** to cancel the configuration without saving changes.

# Configuring Link Aggregation Control Protocol

- [Understanding Link Aggregation Control Protocol on page 3277](#)
- [Example: Configuring Link Aggregation Control Protocol on page 3280](#)

## Understanding Link Aggregation Control Protocol

---

LACP, a subcomponent of IEEE 802.3ad, provides additional functionality for link aggregation groups (LAGs). Use the link aggregation feature to aggregate one or more Ethernet interfaces to form a logical point-to-point link, known as a LAG, virtual link, or bundle. The MAC client can treat this virtual link like a single link.

This topic contains the following sections:

- [Link Aggregation Benefits on page 3277](#)
- [Link Aggregation Configuration Guidelines on page 3278](#)

### Link Aggregation Benefits

Link aggregation increases bandwidth, provides graceful degradation as failure occurs, and increases availability. It provides network redundancy by load-balancing traffic across all available links. If one of the links should fail, the system automatically load-balances traffic across all remaining links.

When LACP is not enabled, a local LAG might attempt to transmit packets to a remote single interface, which causes the communication to fail. When LACP is enabled, a local LAG cannot transmit packets unless a LAG with LACP is also configured on the remote end of the link.

A typical LAG deployment includes aggregate trunk links between an access switch and a distribution switch or customer edge (CE) device.

## Link Aggregation Configuration Guidelines

When configuring link aggregation, note the following guidelines and restrictions:

- Link aggregation is supported only for Ethernet interfaces that are configured in switching mode (**family ethernet-switching**). Aggregating interfaces that are configured in routed mode (**family inet**) is not supported.
- You can configure a LAG by specifying the link number as a physical device and then associating a set of ports with the link. All the ports must have the same speed and be in full-duplex mode. Junos OS assigns a unique ID and port priority to each port. The ID and priority are not configurable.
- You can optionally configure LACP for link negotiation.
- You can optionally configure LACP for link protection.
- You can create up to eight Ethernet ports in each bundle.
- Each LAG must be configured on both sides of the link. The ports on either side of the link must be set to the same speed. At least one end of the LAG should be configured as active.
- LAGs are not supported on virtual chassis port links.
- By default, Ethernet links do not exchange protocol data units (PDUs), which contain information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. The transmitting link is known as the actor and the receiving link is known as the partner.
- LAGs can only be used for a point-to-point connection.

For LACP configuration details, see [Table 334](#) and [Table 335](#).

**Table 334: LACP (Link Aggregation Control Protocol) Configuration**

| Field                | Function                                                             |
|----------------------|----------------------------------------------------------------------|
| Aggregated Interface | Indicates the name of the aggregated interface.                      |
| Link Status          | Indicates whether the interface is linked (Up) or not linked (Down). |
| VLAN (VLAN ID)       | Virtual LAN identifier value for IEEE 802.1Q VLAN tags (0.4094).     |
| Description          | The description for the LAG.                                         |

**Table 335: Details of Aggregation**

| Field                 | Function                                                      |
|-----------------------|---------------------------------------------------------------|
| Administrative Status | Displays if the interface is enabled (Up) or disabled (Down). |

Table 335: Details of Aggregation (*continued*)

| Field                    | Function                                                                         |
|--------------------------|----------------------------------------------------------------------------------|
| Logical Interfaces       | Shows the logical interface of the aggregated interface.                         |
| Member Interfaces        | Member interfaces hold all the aggregated interfaces of the selected interfaces. |
| Port Mode                | Specifies the mode of operation for the port: trunk or access.                   |
| Native VLAN (VLAN ID)    | VLAN identifier to associate with untagged packets received on the interface.    |
| IP Address/Subnet Mask   | Specifies the address of the aggregated interfaces.                              |
| IPv6 Address/Subnet Mask | Specifies the IPv6 address of the aggregated interfaces.                         |

For aggregated Ethernet interface options, see [Table 336](#).

Table 336: Aggregated Ethernet Interface Options

| Field                | Function                                                                                                                                                                                                                                                                                                                                                    | Action                                                                                                                                                      |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Aggregated Interface | Indicates the name of the aggregated interface.                                                                                                                                                                                                                                                                                                             | Enter the aggregated interface name. If an aggregated interface already exists, then the field is displayed as read-only.                                   |
| LACP Mode            | Specifies the mode in which LACP packets are exchanged between the interfaces. The modes are: <ul style="list-style-type: none"> <li>None—Indicates that no mode is applicable.</li> <li>Active—Indicates that the interface initiates transmission of LACP packets</li> <li>Passive—Indicates that the interface only responds to LACP packets.</li> </ul> | Select from the list.                                                                                                                                       |
| Description          | The description for the LAG.                                                                                                                                                                                                                                                                                                                                | Enter the description.                                                                                                                                      |
| Interface            | Indicates that the interfaces available for aggregation.                                                                                                                                                                                                                                                                                                    | Click <b>Add</b> to select the interfaces.<br><br><b>NOTE:</b> Only interfaces that are configured with the same speeds can be selected together for a LAG. |
| Speed                | Indicates the speed of the interface.                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                             |
| Enable Log           | Specifies whether to enable generation of log entries for LAG.                                                                                                                                                                                                                                                                                              | Select to enable log generation.                                                                                                                            |

**NOTE:** On SRX100, SRX110, SRX210, SRX220, SRX240, and SRX650 devices, the speed mode and link mode configuration are available for member interfaces of ae.

For VLAN options, see [Table 337](#).

**Table 337: Edit VLAN Options**

| Field        | Function                                                                      | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Mode    | Specifies the mode of operation for the port: trunk or access.                | <p>If you select Trunk, you can:</p> <ol style="list-style-type: none"> <li>1. Click <b>Add</b> to add a VLAN member.</li> <li>2. Select the VLAN and click <b>OK</b>.</li> <li>3. (Optional) Associate a native VLAN ID with the port.</li> </ol> <p>If you select Access, you can:</p> <ol style="list-style-type: none"> <li>1. Select the VLAN member to be associated with the port.</li> <li>2. (Optional) Associate a VoIP VLAN with the interface. Only a VLAN with a VLAN ID can be associated as a VoIP VLAN.</li> <li>3. Click <b>OK</b>.</li> </ol> |
| VLAN Options | For trunk interfaces, the VLANs for which the interface can carry traffic.    | Click <b>Add</b> to select VLAN members.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Native VLAN  | VLAN identifier to associate with untagged packets received on the interface. | Select the VLAN identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Example: Configuring Link Aggregation Control Protocol

This example shows how to configure LACP.

### Requirements

Before you begin:

- Verify that the Ethernet interfaces are in switch mode. See [“Example: Configuring Switching Modes” on page 3258](#).

- Link aggregation of one or more interfaces must be set up to form a virtual link or link aggregation group (LAG) before you can apply LACP. See [“Understanding Switching Modes” on page 3251](#).

## Overview

In this example, you configure link aggregation for switched Ethernet interfaces then apply LACP.

## Configuration

### GUI Step-by-Step Procedure

To access the LACP Configuration:

1. In the J-Web user interface, select **Configure>Interfaces>Link Aggregation**.  
The Aggregated Interfaces list is displayed.
2. Click one of the following:
  - **Device Count**—Creates an aggregated Ethernet interface, or LAG. You can choose the number of device that you want to create.
  - **Add**—Adds a new aggregated Ethernet Interface, or LAG.
  - **Edit**—Modifies a selected LAG
    - **Aggregation**—Modifies an selected LAG.
    - **VLAN**—Specifies VLAN options for the selected LAG.
    - **IP Option**—Configuring IP address to LAG is not supported and when you try to configure the IP address an error message is displayed.
  - **Delete**—Deletes the selected LAG.
  - **Disable Port** or **Enable Port**—Disables or enables the administrative status on the selected interface.
3. Click one:
  - Click **OK** to check your configuration and save it as a candidate configuration, then click **Commit Options>Commit**.
  - Click **Cancel** to cancel the configuration without saving changes.

- [Example: Configuring 802.1x Interface Settings on page 3292](#)

## Understanding 802.1X Port-Based Network Authentication

IEEE 802.1X and MAC RADIUS authentication both provide network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from devices at the interface until the supplicant's credential or MAC address is presented and matched on the *authentication server* (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

A LAN network configured for 802.1X authentication contains three basic components:

- **Supplicant**—The IEEE term for a host that requests to join the network. The host can be responsive or nonresponsive. A responsive host is one on which 802.1X authentication is enabled and that provides authentication credentials (such as a user name and password). A nonresponsive host is one on which 802.1X authentication is not enabled.
- **Authenticator Port Access Entity**—The IEEE term for the authenticator. The SRX Series device is the authenticator and controls access by blocking all traffic to and from supplicants until they are authenticated.
- **Authentication server**—The server containing the back-end database that makes authentication decisions. (Junos OS supports RADIUS authentication servers.) The authentication server contains credential information for each supplicant that can connect to the network. The authenticator forwards credentials supplied by the supplicant to the authentication server. If the credentials forwarded by the authenticator match the credentials in the authentication server database, access is granted. If the credentials forwarded do not match, access is denied.

**NOTE:** Change of authorization (CoA) is not supported on SRX100, SRX210, SRX240, SRX650 devices.

The implementation of 802.1X authentication provides the following features for the specified devices. See [Table 338](#). The 802.1X implementation provides the following supplicant capacities. See [Table 339](#).

**Table 338: 802.1x Authentication Features**

| Feature                        | SRX100                    | SRX210 | SRX240 | SRX650 |
|--------------------------------|---------------------------|--------|--------|--------|
| Dynamic VLAN assignment        | No                        | Yes    | Yes    | Yes    |
| MAC RADIUS authentication      | Yes                       | Yes    | Yes    | Yes    |
| Static MAC bypass              | Yes (without VLAN option) | Yes    | Yes    | Yes    |
| Guest VLAN                     | No                        | Yes    | Yes    | Yes    |
| RADIUS server failure fallback | No                        | Yes    | Yes    | Yes    |
| VoIP VLAN support              | No                        | Yes    | Yes    | Yes    |
| RADIUS accounting              | Yes                       | Yes    | Yes    | Yes    |

**Table 339: 802.1x Supplicant Capacities**

|                                           | SRX100        | SRX210 | SRX240 | SRX650 |
|-------------------------------------------|---------------|--------|--------|--------|
| Supplicants per port                      | 64            | 64     | 64     | 64     |
| Supplicants per system                    | 2K            | 2K     | 2K     | 2K     |
| Supplicants with dynamic VLAN assignments | Not supported | 64     | 300    | 2K     |

This topic contains the following sections:

- [Dynamic VLAN Assignment on page 3284](#)
- [MAC RADIUS Authentication on page 3285](#)
- [Static MAC Bypass on page 3285](#)
- [Guest VLAN on page 3285](#)
- [RADIUS Server Failure Fallback on page 3286](#)
- [VoIP VLAN Support on page 3288](#)
- [RADIUS Accounting on page 3288](#)
- [Server Reject VLAN on page 3288](#)

## Dynamic VLAN Assignment

When a supplicant first connects to an SRX Series device, the authenticator sends a request to the supplicant to begin 802.1X authentication. If the supplicant is an

802.1X-enabled device, it responds, and the authenticator relays an authentication request to the RADIUS server.

As part of the reply to the authentication request, the RADIUS server returns information about the VLAN to which the port belongs. By configuring the VLAN information at the RADIUS server, you can control the VLAN assignment on the port.

## MAC RADIUS Authentication

If the authenticator sends three requests to a supplicant to begin 802.1X authentication and receives no response, the supplicant is considered nonresponsive. For a nonresponsive supplicant, the authenticator sends a request to the RADIUS server for authentication of the supplicant's MAC address. If the MAC address matches an entry in a predefined list of MAC addresses on the RADIUS server, authentication is granted and the authenticator opens LAN access on the interface where the supplicant is connected.

You can configure the number of times the authenticator attempts to receive a response and the time period between attempts.

## Static MAC Bypass

The authenticator can allow particular supplicants direct access to the LAN and bypass the authentication server by including the supplicants' MAC addresses in the static MAC bypass list configured on the SRX Series device. This list is checked first. If a match is found, the supplicant is considered successfully authenticated and the interface is opened up for it. No further authentication is done for that supplicant. If a match is not found and 802.1X authentication is enabled for the supplicant, the device continues with MAC RADIUS authentication on the authentication server.

For each MAC address in the list, you can configure the VLAN to which the supplicant is moved or the interfaces on which the supplicant can connect.

## Guest VLAN

You can specify a guest VLAN that provides limited network access for nonresponsive supplicants. If a guest-vlan is configured, the authenticator connects all nonresponsive supplicants to the predetermined VLAN, providing limited network access, often only to the Internet. This type of configuration can be used to provide Internet access to visitors without compromising company security.

**NOTE:** In 802.1x, mac-radius and guest-vlan should not be configured together, because guest-vlan does not work when mac-radius is configured.

IEEE 802.1X provides LAN access to nonresponsive hosts, which are hosts where 802.1X is not enabled. These hosts, referred to as guests, typically are provided access only to the Internet.

## RADIUS Server Failure Fallback

You can define one of four actions to be taken if no RADIUS authentication server is reachable (if, for example, a server failure or a timeout has occurred on the authentication server).

- **deny**—(default) Prevent traffic from flowing from the supplicant through the interface.
- **permit**—Allow traffic to flow from the supplicant through the interface as if the supplicant were successfully authenticated by the RADIUS server.
- **use-cache**—Force successful authentication if authentication was granted before the failure or timeout. This ensures that authenticated users are not adversely affected by a failure or timeout.
- **vlan *vlan-name* | *vlan-id***—Move the supplicant to a different VLAN specified by name or ID. This applies only to the first supplicant connecting to the interface.

**NOTE:** For **permit**, **use-cache**, and **vlan** fallback actions to work, 802.1X supplicants need to accept an out of sequence SUCCESS packet.

For RADIUS server settings, see [Table 340](#).

**Table 340: RADIUS Server Settings**

| Field              | Function                                                                                 | Your Action                                      |
|--------------------|------------------------------------------------------------------------------------------|--------------------------------------------------|
| IP Address         | Specifies the IP address of the server.                                                  | Enter the IP address in dotted decimal notation. |
| Password           | Specifies the login password.                                                            | Enter the password.                              |
| Confirm Password   | Verifies the login password for the server.                                              | Reenter the password.                            |
| Server Port Number | Specifies the port with which the server is associated.                                  | Type the port number.                            |
| Source Address     | Specifies the source address of the SRX Series device for communicating with the server. | Type the IP address in dotted decimal notation.  |
| Retry Attempts     | Specifies the number of login retries allowed after a login failure.                     | Type the number.                                 |
| Timeout            | Specifies the time interval to wait before the connection to the server is closed.       | Type the interval in seconds.                    |

For 802.1X exclusion list details, see [Table 341](#).

Table 341: 802.1X Exclusion List

| Field                                 | Function                                                                                                 | Your Action                                                                             |
|---------------------------------------|----------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| MAC Address                           | Specifies the MAC address to be excluded from 802.1X authentication.                                     | Enter the MAC address.                                                                  |
| Exclude if connected through the port | Specifies that a supplicant can bypass authentication if it is connected through a particular interface. | Select to enable the option. Select the port through which the supplicant is connected. |
| Move the host to the VLAN             | Moves the host to a specific VLAN once the host is authenticated.                                        | Select to enable the option. Select the VLAN from the list.                             |

For 802.1X port settings, see [Table 342](#).

Table 342: 802.1X Port Settings

| Field                          | Function                                                                                                                                                                                                                                                                                                                                                                                      | Your Action                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Supplicant Mode</b>         |                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                       |
| Supplicant Mode                | Specifies the mode to be adopted for supplicants: <ul style="list-style-type: none"> <li>• Single—allows only one host for authentication.</li> <li>• Multiple—allows multiple hosts for authentication. Each host is checked before being admitted to the network.</li> <li>• Single authentication for multiple hosts—allows multiple hosts but only the first is authenticated.</li> </ul> | Select the required mode.                                                             |
| <b>Authentication</b>          |                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                       |
| Enable re-authentication       | Specifies enabling reauthentication on the selected interface.                                                                                                                                                                                                                                                                                                                                | Select to enable reauthentication. Enter the timeout for reauthentication in seconds. |
| Action for nonresponsive hosts | Specifies the action to be taken in case a supplicant is nonresponsive: <ul style="list-style-type: none"> <li>• Move to the Guest VLAN—moves the supplicant to the specified Guest VLAN.</li> <li>• Deny—does not permit access to the supplicant.</li> </ul>                                                                                                                                | Select the desired action.                                                            |
| <b>Timeouts</b>                | Specifies timeout values for: <ul style="list-style-type: none"> <li>• Port waiting time after an authentication failure</li> <li>• EAPOL retransmitting interval</li> <li>• Maximum EAPOL requests</li> <li>• Maximum number of retries</li> <li>• Port timeout value for a response from the supplicant</li> <li>• Port timeout value for a response from the RADIUS server</li> </ul>      | Enter timeout values in seconds for the appropriate options.                          |

## VoIP VLAN Support

When VoIP is used with 802.1X, the RADIUS server authenticates the phone, and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) provides the class-of-service (CoS) parameters for the phone.

You can configure 802.1X authentication to work with VoIP in multiple-suppliant or single-suppliant mode:

- **Multiple-suppliant mode**—Allows multiple supplicants to connect to the interface. Each supplicant is authenticated individually.
- **Single-suppliant mode**—Authenticates only the first supplicant. All other supplicants who connect later to the interface are allowed to “piggyback” on the first supplicant’s authentication and gain full access.

## RADIUS Accounting

Configuring RADIUS accounting on a SRX Series device lets you collect statistical data about users logging on and off a LAN, and sends it to a RADIUS accounting server. The collected data can be used for general network monitoring, to analyze and track usage patterns, or to bill a user based on the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the device, and select the type of accounting data to be collected. To view the collected statistics, you can access the log file configured to receive them.

## Server Reject VLAN

By default, when authentication fails, the supplicant is denied access to the network. However, you can specify a VLAN to which the supplicant is moved if authentication fails. The server reject VLAN is similar to a guest VLAN. With a server reject VLAN, however, authentication is first attempted by credential, then by MAC address. If both authentication methods fail, the supplicant is given access to a predetermined VLAN with limited network access.

## Example: Configuring 802.1x Authentication

This example shows how to configure 802.1X authentication, configure RADIUS, and configure a guest VLAN.

- [Requirements on page 3289](#)
- [Overview on page 3289](#)
- [Configuration on page 3289](#)

## Requirements

Before you begin:

- Verify that the interfaces to use are in switch mode. See [“Example: Configuring Switching Modes” on page 3258](#).
- Review switching mode and VLAN information. See [“Understanding Switching Modes” on page 3251](#) and [“Understanding VLANs” on page 3261](#).

## Overview

In this example, you configure 802.1X authentication.

## Configuration

### GUI Step-by-Step Procedure

1. From the **Configure** menu, select **Security > 802.1X**.

The 802.1X screen displays a list of interfaces, whether 802.1X security has been enabled, and the assigned port role.

When you select a particular interface, the Details section displays 802.1X details for the selected interface.

**NOTE:** After you make changes to the configuration, click **OK** to check your configuration and save it as a candidate configuration, then click **Commit Options > Commit**.

2. Click one: **RADIUS Servers** or **Exclusion List**. Click **Add** or **Edit** to add or modify the settings.
  - **Edit**—specifies 802.1X settings for the selected interface.
    - **Apply 802.1X Profile**—applies a predefined 802.1X profile based on the port role. If a message appears asking if you want to configure a RADIUS server, click **Yes** and enter information.
    - **802.1X Configuration**—configures custom 802.1X settings for the selected interface. If a message appears asking if you want to configure a RADIUS server, click **Yes** and enter information.
  - **Delete**—deletes the existing 802.1X authentication configuration on the selected interface.

## Example: Specifying RADIUS Server Connections on the Device

---

This example shows how to specify a RADIUS server for 802.1X authentication to provide network edge security.

- [Requirements on page 3290](#)
- [Overview on page 3290](#)
- [Configuration on page 3290](#)
- [Verification on page 3292](#)

### Requirements

Before you begin, verify that the interfaces that will be used are in switch mode. See [“Example: Configuring Switching Modes” on page 3258](#).

- To use 802.1X or MAC RADIUS authentication, you must specify the connections on the SRX Series device for each RADIUS server to which you will connect.

### Overview

In this example, you set the RADIUS server IP address to 10.0.0.100 and the secret password to abc. The secret password on the device must match the secret password on the server. To define more than one RADIUS server, you need to enter separate radius-server commands.

You then specify the source address as 10.93.14.100. By default, the RADIUS server uses the address of the interface sending the RADIUS request to determine the source of the request. If the request has been diverted on an alternate route to the RADIUS server, the interface relaying the request might not be an interface on the device. To ensure that the source is identified correctly, specify its IP address explicitly.

Then you create a profile called profile1 and set the authentication order to radius. You can specify one or more RADIUS servers to be associated with profile1. Finally, you define profile1 as the authentication profile for 802.1X or MAC RADIUS authenticator.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set access radius-server 10.0.0.100 port 1812 secret abc
set access radius-server 10.0.0.100 source-address 10.93.14.100
set access profile profile1 authentication-order radius
set access profile profile1 radius authentication-server 10.0.0.100
set protocols dot1x authenticator authentication-profile-name profile1
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To specify a RADIUS server for 802.1X authentication:

1. Configure access.

```
[edit]
user@host# edit access
```

**NOTE:** For 802.1X authentication, the RADIUS server must be configured at the access hierarchy level.

2. Define the IP address and the secret password for the RADIUS server.

```
[edit access]
user@host# set radius-server 10.0.0.100 port 1812 secret abc
```

3. Specify the IP address and the source address.

```
[edit access]
user@host# set radius-server 10.0.0.100 source-address 10.93.14.100
```

4. Create the profile.

```
[edit access]
user@host# edit profile profile1
```

5. Configure the authentication order.

```
[edit access profile profile1]
user@host# set authentication-order radius
```

6. Specify one or more RADIUS servers to be associated with profile1.

```
[edit access profile profile1]
user@host# set radius authentication-server 10.0.0.100
```

7. Define authentication profile.

```
[edit]
user@host# set protocols dot1x authenticator authentication-profile-name profile1
```

**Results** From configuration mode, confirm your configuration by entering the **show access** and **show protocols dot1x** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show access
radius-server {
 10.0.0.100 {
 port 1812;
 secret "$ABC123"; ## SECRET-DATA
 source-address 10.93.14.100;
 }
}
```

```
}
profile profile1 {
 authentication-order radius;
 radius {
 authentication-server 10.0.0.100;
 }
}
[edit]
user@host# show protocols dot1x
authenticator {
 authentication-profile-name profile1;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform this task:

- [Verifying a RADIUS Server on page 3292](#)

---

### Verifying a RADIUS Server

**Purpose** Verify that the RADIUS server is configured properly.

**Action** From configuration mode, enter the **show access** and **show protocols dot1x** commands.

**Related Documentation**

---

## Example: Configuring 802.1x Interface Settings

This example shows how to configure 802.1X interface settings for network edge security.

- [Requirements on page 3292](#)
- [Overview on page 3293](#)
- [Configuration on page 3293](#)
- [Verification on page 3294](#)

## Requirements

Before you begin:

- Verify that the interfaces that will be used are in switch mode. See “[Example: Configuring Switching Modes](#)” on page 3258.

- Ensure that the interfaces are defined in the interfaces hierarchy with family ethernet-switching.

## Overview

In this example, you set the supplicant mode to multiple after configuring protocol dot1x and authenticator interface ge-0/0/5. You then enable reauthentication and set the reauthentication interval to 120. You configure the interface timeout value for the response from the supplicant as 5. You then configure the timeout for the interface before it resends an authentication request to the RADIUS server as 5. You specify the time, in seconds, the interface waits before retransmitting the initial EAPoL PDUs to the supplicant as 60. Finally, you configure the maximum number of times an EAPoL request packet is retransmitted to the supplicant before the authentication session times out as 5.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set protocols dot1x authenticator interface ge-0/0/5 supplicant multiple reauthentication
120
set protocols dot1x authenticator interface ge-0/0/5 supplicant-timeout 5 server-timeout
5 transmit-period 60
set protocols dot1x authenticator interface ge-0/0/5 maximum-requests 5
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure 802.1x interface settings:

1. Configure the protocol.  

```
[edit]
user@host# edit protocols dot1x
```
2. Configure an interface.  

```
[edit protocols dot1x]
user@host# edit authenticator interface ge-0/0/5
```
3. Configure the supplicant mode.  

```
[edit protocols dot1x authenticator interface ge-0/0/5.0]
user@host# set supplicant multiple
```
4. Enable reauthentication and specify the reauthentication interval.  

```
[edit protocols dot1x authenticator interface ge-0/0/5.0]
user@host# set reauthentication 120
```
5. Configure the interface timeout value for the response from the supplicant.  

```
[edit protocols dot1x authenticator interface ge-0/0/5.0]
user@host# set supplicant-timeout 5
```

6. Set the server timeout value.  

```
[edit protocols dot1x authenticator interface ge-0/0/5.0]
user@host# set server-timeout 5
```
7. Configure transmit period.  

```
[edit protocols dot1x authenticator interface ge-0/0/5.0]
user@host# set transmit-period 60
```
8. Specify the maximum request value.  

```
[edit protocols dot1x authenticator interface ge-0/0/5.0]
user@host# set maximum-requests 5
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols dot1x** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show protocols dot1x
authenticator {
 interface {
 ge-0/0/5.0 {
 suppliant multiple;
 transmit-period 60;
 reauthentication 120;
 suppliant-timeout 5;
 server-timeout 5;
 maximum-requests 5;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying 802.1X Interface Settings on page 3294](#)

---

### Verifying 802.1X Interface Settings

**Purpose** Verify that the 802.1X interface settings are working properly.

**Action** From configuration mode, enter the **show protocols dot1x** command.

# Configuring Port Security

- [Port Security Overview on page 3295](#)
- [Understanding MAC Limiting on page 3295](#)
- [Example: Configuring MAC Limiting on page 3296](#)

## Port Security Overview

---

Ethernet LANs are vulnerable to attacks such as address spoofing (forging) and Layer 2 denial of service (DoS) attacks on network devices. Port security features help protect the access ports on your services gateway against the losses of information and productivity that can result from such attacks.

Junos OS on SRX Series devices provides features to help secure ports on a switching port on the services gateway. The ports can be categorized as either trusted or untrusted. You apply policies appropriate to those categories to protect against various types of attacks.

The MAC limit port security feature can be turned on to obtain the most robust port security level. Basic port security features are enabled in the services gateway's default configuration. You can configure additional features with minimal configuration steps.

### Related Documentation

- [Ethernet Ports Switching Overview on page 3252](#)
- [Understanding MAC Limiting on page 3295](#)
- [Verifying Switching Mode Configuration on page 3259](#)

## Understanding MAC Limiting

---

MAC limiting protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You enable this feature on interfaces (ports). MAC move limiting detects MAC movement and MAC spoofing on access interfaces. You enable this feature on VLANs.

MAC limiting sets a limit on the number of MAC addresses that can be learned dynamically on a single Layer 2 access interface or on all the Layer 2 access interfaces on the services gateway.

You configure the maximum number of dynamic MAC addresses allowed per interface. When the limit is exceeded, incoming packets with new MAC addresses are treated as specified by the configuration.

You can choose to have one of the following actions performed when the MAC addresses limit is exceeded:

- **drop**—Drop the packet and generate an alarm, an SNMP trap, or a system log entry. This is the default.
- **log**—Do not drop the packet but generate an alarm, an SNMP trap, or a system log entry.
- **none**—Take no action.
- **shutdown**—Disable the interface and generate an alarm. If you have configured the services gateway with the **port-error-disable** statement, the disabled interface recovers automatically upon expiration of the specified disable timeout. If you have not configured the services gateway for autorecovery from port error disabled conditions, you can bring up the disabled interfaces with running the **clear ethernet-switching port-error** command.

**NOTE:** MAC limit is only applied to new MAC learning requests. If you already have 10 learned MAC addresses and you configure the limit as 5, all the MACs will remain in the forwarding database (FDB) table. Once the learned MAC addresses age out (or are cleared by the user with the **clear ethernet-switching** command), they are not relearned.

MAC limiting does not apply to static MAC addresses. Users can configure any number of static MAC addresses independent of MAC limiting and all of them are added to FDB.

**Related Documentation**

- [Example: Configuring MAC Limiting on page 3296](#)
- [Port Security Overview on page 3295](#)
- [Ethernet Ports Switching Overview on page 3252](#)
- [Verifying Switching Mode Configuration on page 3259](#)

---

## Example: Configuring MAC Limiting

- [Requirements on page 3297](#)
- [Overview on page 3297](#)
- [Configuration on page 3297](#)
- [Verification on page 3298](#)

## Requirements

Before you begin, verify that the interfaces that will be used are in switch mode. See [“Example: Configuring Switching Modes” on page 3258](#) and [“Understanding Switching Modes” on page 3251](#).

## Overview

MAC limiting protects against flooding of the Ethernet switching table on the SRX Series Services Gateways. MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface (port).

This example shows how to configure port security features by setting a MAC limit of 5.

## Configuration

**Step-by-Step Procedure** The action is not specified, so the switch performs the default action drop if the limit is exceeded:

1. On a single interface (here, the interface is ge-0/0/1):

```
[edit ethernet-switching-options secure-access-port]
user@host# set interface ge-0/0/1 mac-limit 5
```

2. On all interfaces:

```
[edit ethernet-switching-options secure-access-port]
user@host# set interface all mac-limit 5
```

**NOTE:** Do not set the mac-limit to 1. The first learned MAC address is often inserted into the FDB automatically (for example, for routed VLAN interfaces the first MAC address inserted into the forwarding database is the MAC address of the RVI; for Aggregated Ethernet bundles using LACP, the first MAC address inserted into the FDB in the forwarding table is the source address of the protocol packet). The services gateway will therefore not learn MAC addresses other than the automatic addresses when the mac-limit is set to 1, and this will cause problems with MAC learning and forwarding.

3. For specifying specific allowed MAC addresses:

- On a single interface (here, the interface is ge-0/0/2):

```
[edit ethernet-switching-options secure-access-port]
user@host# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
user@host# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
user@host# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
```

- On all interfaces:

```
[edit ethernet-switching-options secure-access-port]
user@host# set interface all allowed-mac 00:05:85:3A:82:80
user@host# set interface all allowed-mac 00:05:85:3A:82:81
user@host# set interface all allowed-mac 00:05:85:3A:82:83
```

## Verification

### Verifying That MAC Limiting Is Working Correctly on the Services Gateway

---

**Purpose** Verify that MAC limiting is working on the services gateway.

**Action** Display the learned MAC addresses. The following sample output shows the results when two packets were sent from hosts on ge-0/0/1 and five packets requests were sent from hosts on ge-0/0/2, with both interfaces set to a MAC limit of 4 with the action drop:

```
user@host> show ethernet-switching table
Ethernet-switching table: 7 entries, 6 learned
VLAN MAC address Type Age Interfaces
employee-vlan * Flood - ge-0/0/2.0
employee-vlan 00:05:85:3A:82:77 Learn 0 ge-0/0/1.0
employee-vlan 00:05:85:3A:82:79 Learn 0 ge-0/0/1.0
employee-vlan 00:05:85:3A:82:80 Learn 0 ge-0/0/2.0
employee-vlan 00:05:85:3A:82:81 Learn 0 ge-0/0/2.0
employee-vlan 00:05:85:3A:82:83 Learn 0 ge-0/0/2.0
employee-vlan 00:05:85:3A:82:85 Learn 0 ge-0/0/2.0
```

**Meaning** The sample output shows that with a MAC limit of 4 for each interface, the packet for a fifth MAC address on ge-0/0/2 was dropped because it exceeded the MAC limit. The address was not learned, and thus an asterisk (\*) rather than an address appears in the MAC address column in the first line of the sample output.

# Configuring IGMP Snooping

- [Understanding IGMP Snooping on page 3299](#)
- [Example: Configuring IGMP Snooping on page 3301](#)

## Understanding IGMP Snooping

Internet Group Management Protocol (IGMP) snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, the Juniper Networks device monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated member interfaces. The Juniper Networks device uses that information to make intelligent multicast-forwarding decisions and to forward traffic to its intended destination interfaces.

This topic contains the following sections:

- [How IGMP Snooping Works on page 3299](#)
- [How Hosts Join and Leave Multicast Groups on page 3300](#)

## How IGMP Snooping Works

IGMP snooping regulates multicast traffic on a VLAN to avoid flooding. When IGMP snooping is enabled, the switch intercepts IGMP packets and uses the content of the packets to build a multicast cache table. The cache table is a database of multicast groups and their corresponding member ports. The cache table is then used to regulate multicast traffic on the VLAN.

When the router receives multicast packets, it uses the cache table to selectively forward the packets only to the ports that are members of the destination multicast group.

For IGMP snooping configuration details, see [Table 343](#).

Table 343: IGMP Snooping Configuration Fields

| Field     | Function                                             | Action                         |
|-----------|------------------------------------------------------|--------------------------------|
| VLAN Name | Specifies the VLAN on which to enable IGMP snooping. | Select the VLAN from the list. |

Table 343: IGMP Snooping Configuration Fields (*continued*)

| Field                      | Function                                                                                                                                                                                                 | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Immediate Leave            | Immediately removes a multicast group membership from an interface when it receives a leave message from that interface and suppresses the sending of any group-specific queries for the multicast group | To enable the option, select the check box.<br><br>To disable the option, clear the check box.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Query Interval             | Configures how frequently the switch sends host-query timeout messages to a multicast group.                                                                                                             | Enter a value from 1 through 1024 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Query Last Member Interval | Configures the interval between group-specific query timeout messages sent by the switch.                                                                                                                | Enter a value from 1 through 1024 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Query Response Interval    | Configures the length of time the switch waits to receive a response to a specific query message from a host.                                                                                            | Enter a value from 1 through 25 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Robust Count               | Specifies the number of timeout intervals the switch waits before timing out a multicast group.                                                                                                          | Enter a value from 2 through 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Interfaces List            | Statically configures an interface as a switching interface toward a multicast router (the interface to receive multicast traffic).                                                                      | <ol style="list-style-type: none"> <li>1. Click <b>Add</b>.</li> <li>2. Select an interface from the list.</li> <li>3. Select <b>Multicast Router Interface</b>.</li> <li>4. Enter the maximum number of groups an interface can join in <b>Group Limit</b>.</li> <li>5. In <b>Static</b>, choose one: <ul style="list-style-type: none"> <li>• Click <b>Add</b>, type a group IP address, and click <b>OK</b>.</li> <li>• Select a group and click <b>Remove</b> to remove the group membership.</li> </ul> </li> </ol> |

## How Hosts Join and Leave Multicast Groups

Hosts can join multicast groups in either of two ways:

- By sending an unsolicited IGMP join message to a multicast router that specifies the IP multicast that the host is attempting to join.
- By sending an IGMP join message in response to a general query from a multicast router.

A multicast router continues to forward multicast traffic to a VLAN provided that at least one host on that VLAN responds to the periodic general IGMP queries. For a host to remain a member of a multicast group, therefore, it must continue to respond to the periodic general IGMP queries.

To leave a multicast group, a host can either not respond to the periodic general IGMP queries, which results in a “silent leave” (the only leave option for hosts connected to switches running IGMPv1), or send a group-specific IGMPv2 leave message.

## Example: Configuring IGMP Snooping

This example shows you how to configure IGMP snooping.

### Requirements

Before you begin:

- Ensure that the interfaces that will be used are in switch mode. See “[Example: Configuring Switching Modes](#)” on page 3258.
- You should have a switched multicast network environment with VLANs configured. See “[Example: Configuring VLANs](#)” on page 3263.

### Overview

In this example, you configure IGMP snooping.

### Configuration

#### GUI Step-by-Step Procedure

To access the IGMP Snooping Quick Configuration:

1. In the J-Web user interface, select **Configure>Switching>IGMP Snooping**.  
The VLAN Configuration page displays a list of existing IGMP snooping configurations.
2. Click one:
  - **Add**—Creates an IGMP snooping configuration for the VLAN.
  - **Edit**—Edits an existing IGMP snooping configuration for the VLAN.
  - **Delete**—Deletes member settings for the interface.

**NOTE:** If you delete a configuration, the VLAN configuration for all the associated interfaces is also deleted.

- **Disable Vlan**—Disables IGMP snooping on the selected VLAN.

When you are adding or editing a VLAN, enter information.

3. Click one:

- Click **OK** to check your configuration and save it as a candidate configuration, then click **Commit Options>Commit**.
- Click **Cancel** to cancel the configuration without saving changes.

## Understanding Ethernet OAM Connectivity Fault Management

Ethernet interfaces on branch SRX Series devices support the IEEE 802.1ag standard for Operation, Administration, and Management (OAM). The 802.1ag is an IEEE standard for connectivity fault management (CFM). The IEEE 802.1ag provides a specification for Ethernet CFM. The Ethernet network can consist of one or more service instances. A service instance could be a VLAN or a concatenation of VLANs. The goal of CFM is to provide a mechanism to monitor, locate, and isolate faulty links.

CFM support includes the following features:

- Fault monitoring using the Continuity Check Protocol. This is a neighbor discovery and health check protocol that discovers and maintains adjacencies at the VLAN or link level.
- Path discovery and fault verification using the Link Trace protocol.
- Fault isolation using the Loopback protocol.

The Loopback protocol is used to check access to maintenance association end points (MEPs) under the same maintenance association (MA). The Loopback messages are triggered by an administrator using the **ping ethernet** command.

**NOTE:** On all branch SRX Series devices, CFM is supported only on interfaces with the Ethernet switching family.

CFM partitions the service network into various administrative domains. For example, operators, providers, and customers might be part of different administrative domains. Each administrative domain is mapped into one maintenance domain providing enough information to perform its own management, thus avoiding security breaches and making end-to-end monitoring possible.

In a CFM maintenance domain, each service instance is called a maintenance association. A maintenance association can be thought of as a full mesh of maintenance association end points (MEPs) having similar characteristics. MEPs are active CFM entities generating and responding to CFM protocol messages. There is also a maintenance association intermediate point (MIP), which is a CFM entity similar to the MEP, but more passive (MIPs only respond to CFM messages).

Each maintenance domain is associated with a maintenance domain level from 0 through 7. Level allocation is based on the network hierarchy, where outer domains are assigned a higher level than the inner domains. You configure customer end points to have the highest maintenance domain level. The maintenance domain level is a mandatory parameter that indicates the nesting relationships between various maintenance domains. The level is embedded in each CFM frame. CFM messages within a given level are processed by MEPs at that same level.

To enable CFM on an Ethernet interface, you must configure maintenance domains, maintenance associations, and MEPs.

**NOTE:**

- You cannot configure MEP and MIP on the same VLAN.
- CFM and link fault management (LFM) cannot be configured on the same interface.
- CFM cannot be configured with Generic VLAN Registration Protocol (GVRP).
- CFM is not supported on VOIP VLAN ports.
- Lower level CFM frames are forwarded by a higher level down MEP.
- On all branch SRX Series devices, the CFM is not supported on the 2-Port 10-Gigabit Ethernet XPIM interface.

## Example: Configuring Ethernet OAM Connectivity Fault Management

Connectivity Fault Management (CFM) provides a mechanism to monitor, locate, and isolate faulty links.

This example describes how to enable and configure an end-to-end OAM CFM session on an Ethernet interface.

- [Requirements on page 3305](#)
- [Overview on page 3305](#)
- [Configuring Ethernet OAM Connectivity Fault Management on page 3306](#)
- [Verification on page 3311](#)

## Requirements

This example uses the following hardware and software components:

- Three SRX Series devices connected by a point-to-point Ethernet link.
- Junos OS Release 12.1X44-D10 or later for SRX Series devices.

## Overview

Ethernet interfaces on SRX Series devices support the IEEE 802.1ag standard for Operation, Administration, and Management (OAM). The IEEE 802.1ag specification provides a specification for Ethernet connectivity fault management (CFM). CFM can be used to detect faults in the network path between the customer premises devices. It also helps in detecting the device or node in the provider network, where the failure occurred.

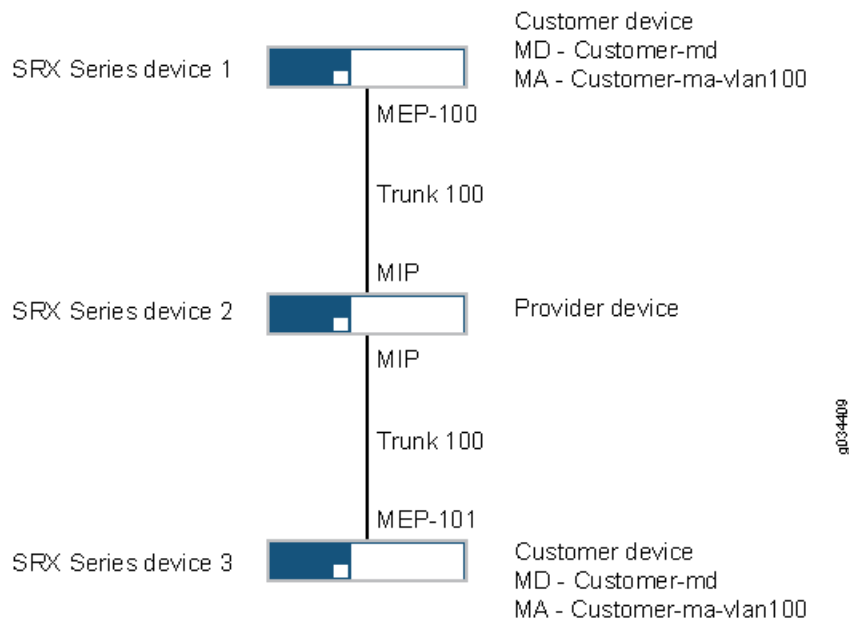

This example describes how to configure an end to end CFM session. In this example, three devices are connected by a point-to-point Ethernet link. The link between these devices is monitored using CFM. To check connectivity or fault through the provider network, maintenance intermediate point (MIP) is configured.

**Configuring Ethernet OAM Connectivity Fault Management on Device 1****CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces fe-0/0/4 unit 0 family ethernet-switching port-mode trunk
set interfaces fe-0/0/4 unit 0 family ethernet-switching vlan members v100
set vlans v100 vlan-id 100
set protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md level 5
set protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md maintenance-association Customer-ma mep 100 interface fe-0/0/4.0
set protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md maintenance-association Customer-ma mep 100 interface vlan-id 100
```

```

set protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md maintenance-association Customer-ma mep 100 auto-discovery
set protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md maintenance-association Customer-ma continuity-check interval 10s
set protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md maintenance-association Customer-ma continuity-check hold-interval
 20

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To enable and configure OAM CFM on device 1:

1. Define a VLAN and enable the interface for family Ethernet switching with port mode trunk or access.

```

[edit]
user@host# set interfaces fe-0/0/4 unit 0 family ethernet-switching port-mode
 trunk
user@host# set interfaces fe-0/0/4 unit 0 family ethernet-switching vlan members
 v100
user@host# set vlans v100 vlan-id 100

```

2. Specify the maintenance domain name and the maintenance domain level.

```

[edit protocols oam ethernet connectivity-fault-management]
user@host# set maintenance-domain Customer-md level 5

```

3. Create a maintenance association and configure MEP.

```

[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md]
user@host# set maintenance-association Customer-ma mep 100 interface
 fe-0/0/4.0
user@host# set maintenance-association Customer-ma mep 100 interface vlan-id
 100

```

4. Enable MEP automatic discovery.

```

[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md maintenance-association Customer-ma]
user@host# set mep 100 auto-discovery

```

5. Enable the Continuity Check Protocol and specify the continuity check interval and hold interval.

```

[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md maintenance-association Customer-ma]
user@host# set continuity-check interval 10s
user@host# set continuity-check hold-interval 20

```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show protocols** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
user@host# show protocols

oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain Customer-md {
 level 5;
 maintenance-association Customer-ma {
 continuity-check {
 interval 10s;
 hold-interval 20;
 }
 mep 100 {
 interface fe-0/0/4.0 vlan-id 100;
 auto-discovery;
 }
 }
 }
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Ethernet OAM CFM with MIP Half Function on Device 2

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/1 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members v100
set interfaces fe-0/0/4 unit 0 family ethernet-switching port-mode trunk
set interfaces fe-0/0/4 unit 0 family ethernet-switching vlan members v100
set vlans v100 vlan-id 100
set protocols oam ethernet connectivity-fault-management maintenance-domain
 default-5 vlan-name v100
set protocols oam ethernet connectivity-fault-management maintenance-domain
 default-5 mip-half-function default
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure MIP half function:

1. Define a VLAN and enable the interface for family Ethernet switching with port mode trunk or access.

```
[edit]
user@host# set interfaces ge-0/0/1 unit 0 family ethernet-switching port-mode
trunk
user@host# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members
v100
user@host# set interfaces fe-0/0/4 unit 0 family ethernet-switching port-mode
trunk
user@host# set interfaces fe-0/0/4 unit 0 family ethernet-switching vlan members
v100
user@host# set vlans v100 vlan-id 100
```

2. Create a maintenance domain and configure VLAN.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set maintenance-domain default-5 vlan-name v100
```

3. Create a MIP half function.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set maintenance-domain default-5 mip-half-function default
```

**NOTE:** If you want to configure traceoptions, run the following commands:

```
set protocols oam ethernet connectivity-fault-management traceoptions
file CFM_trace
set protocols oam ethernet connectivity-fault-management traceoptions
flag all
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
user@host# show protocols
oam {
 ethernet {
 connectivity-fault-management {
 traceoptions {
 file CFM_trace;
 flag all;
 }
 maintenance-domain default-5 {
 vlan-name v100;
 mip-half-function default;
 }
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Ethernet OAM Connectivity Fault Management on Device 3

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/1 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members v100
set vlans v100 vlan-id 100
set protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md level 5

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To enable and configure OAM CFM on Device 3:

1. Define a VLAN and enable the interface for family Ethernet switching with port mode trunk or access.

```
[edit]
user@host# set interfaces ge-0/0/1 unit 0 family ethernet-switching port-mode
 trunk
user@host# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members
 v100
user@host# set vlans v100 vlan-id 100
```

2. Specify the maintenance domain name and the maintenance domain level.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set maintenance-domain Customer-md level 5
```

3. Create a maintenance association and configure MEP.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 Customer-md]
user@host# set maintenance-association Customer-ma mep 101 interface
 ge-0/0/1.0
user@host# set maintenance-association Customer-ma mep 101 interface vlan-id
 100
```

4. Enable MEP automatic discovery.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
Customer-md]
user@host# set maintenance-association Customer-ma mep 101 auto-discovery
```

5. Enable the Continuity Check Protocol and specify the continuity check interval and hold interval.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
Customer-md maintenance-association Customer-ma]
user@host# set continuity-check interval 10s
user@host# set continuity-check hold-interval 20
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
user@host# show protocols
oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain Customer-md {
 level 5;
 maintenance-association Customer-ma {
 continuity-check {
 interval 10s;
 hold-interval 20;
 }
 mep 101 {
 interface ge-0/0/1.0 vlan-id 100;
 auto-discovery;
 }
 }
 }
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the OAM CFM Configuration on Device 1 on page 3312](#)
- [Verifying the OAM CFM Configuration with MIP Half Function on Device 2 on page 3313](#)
- [Verifying the OAM CFM Configuration on Device 3 on page 3313](#)

- [Verifying the Path Using the Link Trace Protocol on page 3314](#)
- [Verifying MEP Continuity Using Ping on page 3314](#)

### Verifying the OAM CFM Configuration on Device 1

**Purpose** Verify that OAM CFM has been configured properly.

**Action** From operational mode, enter the following commands:

- **show oam ethernet connectivity-fault-management adjacencies** to display connectivity-fault-management adjacencies.
- **show oam ethernet connectivity-fault-management interfaces** to display the Ethernet OAM information for the specified interface.

These commands produce the following sample output:

```
user@host# show oam ethernet connectivity-fault-management adjacencies
Mep-id Interface State Timer to Expire
 101 fe-0/0/4.0 ok 29

user@host# show oam ethernet connectivity-fault-management interfaces
Interface Link Status Level MEP Neighbours
 fe-0/0/4.0 Up Active 5 Identifier 100 1

user@host# show oam ethernet connectivity-fault-management interfaces detail
Interface name: fe-0/0/4.0, vlan 100, Interface status: Active, Link status: Up
Maintenance domain name: Customer-md, Format: string, Level: 5
Maintenance association name: Customer-ma, Format: string
Continuity-check status: enabled, Interval: 10s
MEP identifier: 100, Direction: down, MAC address: 2c:6b:f5:62:29:84
MEP status: running
Defects:
 Remote MEP not receiving CCM : no
 Erroneous CCM received : no
 Cross-connect CCM received : no
 RDI sent by some MEP : no
Statistics:
 CCMS sent : 7
 CCMS received out of sequence : 0
 LBMS sent : 0
 Valid in-order LBRs received : 0
 Valid out-of-order LBRs received : 0
 LBRs received with corrupted data : 0
 LBRs sent : 0
 LTMS sent : 0
 LTMS received : 0
 LTRs sent : 0
 LTRs received : 0
 Sequence number of next LTM request : 0
 1DMS sent : 0
 Valid 1DMS received : 0
 Invalid 1DMS received : 0
 DMMs sent : 0
 DMRs sent : 0
 Valid DMRs received : 0
 Invalid DMRs received : 0
Remote MEP count: 1
```

| Identifier | MAC address       | State | Interface  |
|------------|-------------------|-------|------------|
| 101        | 80:71:1f:ad:53:81 | ok    | fe-0/0/4.0 |

- Meaning**
- If the **show oam ethernet connectivity-fault-management interfaces detail** command output displays continuity-check status as **enabled** and displays details of the remote MEP, it means that connectivity fault management (CFM) was configured properly.
  - If the **show oam ethernet connectivity-fault-management adjacencies** command output displays the state as **ok**, it indicates that the Continuity Check Protocol is up.

### Verifying the OAM CFM Configuration with MIP Half Function on Device 2

**Purpose** Verify that OAM CFM has been configured properly.

**Action** From operational mode, run the **show oam ethernet connectivity-fault-management mip** command.

```
user@host# show oam ethernet connectivity-fault-management mip vlan 100
default maintenance-domain mhf : default
```

| Interface  | Level |
|------------|-------|
| ge-0/0/1.0 | 5     |
| fe-0/0/4.0 | 5     |

**Meaning** The **show oam ethernet connectivity-fault-management mip** command output displays the MIP information.

### Verifying the OAM CFM Configuration on Device 3

**Purpose** Verify that OAM CFM has been configured properly.

**Action** From operational mode, enter the following commands:

- **show oam ethernet connectivity-fault-management adjacencies** to display connectivity-fault-management adjacencies.
- **show oam ethernet connectivity-fault-management interfaces** to display the Ethernet OAM information for the specified interface.

```
user@host# show oam ethernet connectivity-fault-management adjacencies
Mep-id Interface State Timer to Expire
 100 ge-0/0/1.0 ok 27
```

```
user@host# show oam ethernet connectivity-fault-management interfaces detail
Interface name: ge-0/0/1.0, vlan 100, Interface status: Active, Link status: Up
Maintenance domain name: Customer-md, Format: string, Level: 5

100 2c:6b:f5:62:29:84 ok ge-0/0/1.0

```

- Meaning**
- If the **show oam ethernet connectivity-fault-management interfaces detail** command output displays continuity-check status as **enabled** and displays details of the remote MEP, it means that connectivity fault management (CFM) was configured properly.
  - If the **show oam ethernet connectivity-fault-management adjacencies** command output displays the state as **ok**, it indicates that the Continuity Check Protocol is up.

### Verifying the Path Using the Link Trace Protocol

**Purpose** Verify the path between maintenance endpoints.

**Action** From operational mode, enter the **traceroute ethernet** command.

```

user@host# traceroute ethernet maintenance-domain Customer-md maintenance-association
Customer-ma mep 101
Linktrace to 80:71:1f:ad:53:81, Interface : fe-0/0/4.0
Maintenance Domain: Customer-md, Level: 5
Maintenance Association: Customer-ma, Local Mep: 100
Transaction Identifier: 3
Hop TTL Source MAC address Next-hop MAC address
.
1 63 80:71:1f:ad:50:04 80:71:1f:ad:50:01
2 62 80:71:1f:ad:53:81 00:00:00:00:00:00

```

### Verifying MEP Continuity Using Ping

**Purpose** Verify access to MEPs under the same maintenance association.

**Action** From operational mode, enter the **ping ethernet** command.

```

user@host# ping ethernet maintenance-domain Customer-md maintenance-association
Customer-ma mep 101

```

```

PING to 80:71:1f:ad:53:81, Interface fe-0/0/4.0
60 bytes from 80:71:1f:ad:53:81: 1bm_seq=0
60 bytes from 80:71:1f:ad:53:81: 1bm_seq=1
60 bytes from 80:71:1f:ad:53:81: 1bm_seq=2
60 bytes from 80:71:1f:ad:53:81: 1bm_seq=3
--- ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss

```

## Creating the Maintenance Domain

A maintenance domain consist of network entities such as operators, providers, and customers. To enable CFM on an Ethernet interface, maintenance domains, maintenance associations, and MEPs must be created and configured.

To create a maintenance domain:

1. Specify a name for the maintenance domain.

```

[edit protocols oam ethernet connectivity-fault-management]
user@host# set maintenance-domain domain-name

```

2. Specify a format for the maintenance domain name. If you specify none, no name is configured.

- A plain ASCII character string
- A domain name service (DNS) format
- A media access control (MAC) address plus a two-octet identifier in the range 0 through 65,535
- none

```

[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name]
user@host# set name-format format

```

For example, to specify the name format as a MAC address plus a two-octet identifier:

```

[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name]

```

```

user@host# set name-format mac+2oct

```

3. Configure the maintenance domain level, which is used to indicate the nesting relationship between this domain and other domains. Use a value from 0 through 7.

```

[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name]

```

```

user@host# set level level-number

```

- [Creating a Maintenance Association on page 3316](#)
- [Configuring a Maintenance Association End Point on page 3316](#)
- [Configuring the Link Trace Protocol on page 3319](#)

---

## Creating a Maintenance Association

In a CFM maintenance domain, each service instance is called a maintenance association.

To create a maintenance association:

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name]
user@host# set maintenance-association ma-name
```

**NOTE:** On branch SRX Series devices, a maximum of seven maintenance associations are supported.

- [Configuring a Maintenance Association End Point on page 3316](#)
- [Configuring the Link Trace Protocol on page 3319](#)

---

## Configuring a Maintenance Association End Point

To configure a maintenance association end point (MEP):

1. Specify an ID for the MEP. The value can be from 1 through 8191.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name]
user@host# set mep mep-id
```

2. Enable maintenance endpoint automatic discovery if you want to have the MEP accept continuity check messages (CCMs) from all remote MEPs of the same maintenance association.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name mep mep-id]
user@host# set auto-discovery
```

3. Specify that CFM CCM packets be transmitted only in one direction for the MEP. That is, set the direction as down so that CCMs are transmitted only out of (not into) the interface configured on this MEP.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name mep mep-id]
user@host# set direction down
```

4. Specify the logical interface to which the MEP is attached. It can be either an access interface or a trunk interface. If you specify a trunk interface, the VLAN associated with that interface must have a VLAN ID.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name mep mep-id]
user@host# set interface interface-name
```

5. Configure a remote MEP from which CCMs are expected. If automatic discovery is not enabled, the remote MEP must be configured under the **mep** statement or the CCMs from the remote MEP are treated as errors.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name mep mep-id]
user@host# set remote-mep mep-id
```

**NOTE:** You cannot configure MEPs at different levels for the same VLANs.

## Configuring the Maintenance Domain MIP Half Function

MIP half function divides the maintenance association intermediate point (MIP) functionality into two unidirectional segments, improves visibility with minimal configuration, and improves network coverage by increasing the number of points that can be monitored. MHF extends monitoring capability by responding to loop back and link trace messages to help isolate faults. Whenever a MIP is configured, the MIP half function value for all maintenance domains and maintenance associations must be the same.

To configure the MIP half function:

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name]
user@host# set mip-half-function default
```

**NOTE:**

- If SRX240, SRX550, or SRX650 devices are configured as MIPs, ensure that a static MAC is configured in the Ethernet switching table with the next-hop interface to the MEP MAC.
- You cannot configure MIP in a non-default domain.
- In Q-in-Q mode, double tag packets are not retained by MIP.
- A maximum of 116 MIPs can be configured on a device.

## Configuring the Continuity Check Protocol

The Continuity Check Protocol is used for fault detection by a maintenance association end point (MEP) within a maintenance association. The MEP periodically sends continuity check multicast messages. The receiving MEPs use the continuity check messages (CCMs) to build a MEP database of all MEPs in the maintenance association.

To configure the Continuity Check Protocol:

1. Enable the Continuity Check Protocol.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name]
user@host# set continuity-check
```

2. Specify the continuity check hold interval. The hold interval is the number of minutes to wait before flushing the MEP database if no updates occur. The default value is 10 minutes.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name continuity-check]
user@host# set hold-interval number
```

3. Specify the CCM interval. The interval is the time between the transmission of CCMs. You can specify 10 minutes (10m), 1 minute (1m), 10 seconds (10s), 1 second (1s), or 100 milliseconds (100ms).

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name continuity-check]
user@host# set interval number
```

- Specify the number of CCMs (that is, protocol data units) that can be lost before the MEP is marked as down. The default number of protocol data units (PDUs) is 3.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name continuity-check]
user@host# set loss-threshold number
```

**NOTE:** If the CCM interval is 100 milliseconds, only four MEPs are supported on a device.

- [Creating a Maintenance Association on page 3316](#)
- [Configuring the Maintenance Domain MIP Half Function on page 3317](#)
- [Configuring the Link Trace Protocol on page 3319](#)

## Configuring the Link Trace Protocol

The Link Trace protocol is used for path discovery between a pair of maintenance points. Link Trace Messages (LTMs) are triggered by an administrator using the **traceroute ethernet** command to verify the path between a pair of MEPs under the same maintenance association. LTMs can also be used to verify the path between a MEP and a MIP under the same maintenance domain.

To configure the Link Trace protocol:

- Configure the Link Trace path age timer. If no response to a Link Trace request is received, the request and response entries are deleted after the age timer expires.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set linktrace age time
```

- Configure the number of Link Trace Reply(LTR) entries to be stored per Link Trace Request.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set linktrace path-database-size path-database-size
```

# Configuring Ethernet OAM Link Fault Management

- [Understanding Ethernet OAM Link Fault Management for SRX Series Services Gateways on page 3321](#)
- [Example: Configuring Ethernet OAM Link Fault Management on page 3323](#)

## Understanding Ethernet OAM Link Fault Management for SRX Series Services Gateways

The Ethernet interfaces on SRX Series devices support the IEEE 802.3ah standard for Operation, Administration, and Maintenance (OAM). The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters. The IEEE 802.3ah standard meets the requirement for OAM capabilities as Ethernet moves from being solely an enterprise technology to a WAN and access technology, and the standard remains backward-compatible with existing Ethernet technology.

**NOTE:** For SRX550 and SRX650 devices, LFM is supported only on devices that have 16-port or 24-port GPIMs.

The following OAM LFM features are supported:

- **Discovery and link monitoring**—The discovery process is triggered automatically when OAM is enabled on the interface. The discovery process permits Ethernet interfaces to discover and monitor the peer on the link if it also supports the IEEE 802.3ah standard. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. After the discovery process has been initiated, both sides participate in discovery. The device performs link monitoring by sending periodic OAM protocol data units (PDUs) to advertise OAM mode, configuration, and capabilities.

You can specify the number of OAM PDUs that an interface can miss before the link between peers is considered down.

- **Remote fault detection**—Remote fault detection uses flags and events. Flags convey Link Fault (a loss of signal), Dying Gasp (an unrecoverable condition such as a power failure), and Critical Event (an unspecified vendor-specific critical event). You can

specify the periodic OAM PDU sending interval for fault detection. SRX Series devices use the Event Notification OAM PDU to notify the remote OAM device when a problem is detected. You can specify the action to be taken by the system when the configured link-fault event occurs.

- Remote loopback—Remote loopback mode ensures link quality between the device and a remote peer during installation or troubleshooting. In this mode, when the interface receives a frame that is not an OAM PDU or a pause frame, it sends it back on the same interface on which it was received. The link appears to be in the active state. You can use the returned loopback acknowledgement to test delay, jitter, and throughput.

Junos OS can place a remote data terminal equipment (DTE) into loopback mode (if remote loopback mode is supported by the remote DTE). When you place a remote DTE into loopback mode, the interface receives the remote loopback request and puts the interface into remote loopback mode. When the interface is in remote loopback mode, all frames except OAM PDUs are looped back without any changes made to the frames. OAM PDUs continue to be sent and processed.

Table 280 lists the interfaces modes supported.

**Table 344: Supported Interface Modes**

| Interfaces                 | Mode                                                                                                                                                                                          |

## Example: Configuring Ethernet OAM Link Fault Management

The Ethernet interfaces on the SRX Series devices support the IEEE 802.3ah standard for Operation, Administration, and Maintenance (OAM). The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example describes how to enable and configure OAM LFM on a Gigabit Ethernet or Fast Ethernet interface:

- [Requirements on page 3323](#)
- [Overview on page 3324](#)
- [Configuration on page 3324](#)
- [Verification on page 3326](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.1 R2 or later for SRX Series Services Gateways
- Any two models of SRX Series devices connected directly

Before you begin:

- Establish basic connectivity. See the Getting Started Guide for your device.
- Configure network interfaces as necessary. See [“Example: Creating an Ethernet Interface” on page 2634](#).

- Ensure that you configure the interfaces as per the interface modules listed in [“Understanding Ethernet OAM Link Fault Management for SRX Series Services Gateways” on page 2703](#)

## Overview

The Ethernet interfaces on the SRX Series devices support the IEEE 802.3ah standard for Operation, Administration, and Maintenance (OAM). The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example uses two SRX Series devices connected directly. Before you begin configuring Ethernet OAM LFM on these two devices, connect the two devices directly through supported interfaces. See [“Understanding Ethernet OAM Link Fault Management for SRX Series Services Gateways” on page 2703](#).

Figure 128 shows the topology used in this example.

**Figure 150: Ethernet LFM with SRX Series Devices**

**NOTE:** For more information about configuring Ethernet OAM Link Fault Management, see [Junos® OS Ethernet Interfaces](#).

## Configuration

To configure Ethernet OAM LFM, perform these tasks:

- [Configuring Ethernet OAM Link Fault Management on Device 1 on page 3324](#)
- [Configuring Ethernet OAM Link Fault Management on Device 2 on page 3325](#)

### Configuring Ethernet OAM Link Fault Management on Device 1

#### CLI Quick Configuration

To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set protocols oam ethernet link-fault-management interface ge-0/0/0
set protocols oam ethernet link-fault-management interface ge-0/0/0 link-discovery
 active
set protocols oam ethernet link-fault-management interface ge-0/0/0 pdu-interval 800
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Ethernet OAM LFM on device 1:

1. Enable IEEE 802.3ah OAM support.  

```
[edit protocols oam ethernet link-fault-management]
user@device1# set interface ge-0/0/0
```
2. Specify that the interface initiates the discovery process.  

```
[edit protocols oam ethernet link-fault-management]
user@device1# set interface ge-0/0/0 link-discovery active
```
3. Set the periodic OAM PDU-sending interval (in milliseconds) for fault detection.  

```
[edit protocols oam ethernet link-fault-management]
user@device1# set interface pdu-interval 800
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@device1# show protocols
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ge-0/0/0 {
 pdu-interval 800;
 link-discovery active;
 }
 }
 }
 }
}
```

### Configuring Ethernet OAM Link Fault Management on Device 2

**CLI Quick Configuration** To quickly configure this example, copy the following command, paste it into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the command into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set protocols oam ethernet link-fault-management interface ge-0/0/1
set protocols oam ethernet link-fault-management interface ge-0/0/1 pdu-interval 800
set protocols oam ethernet link-fault-management interface ge-0/0/1 negotiation-options
allow-remote-loopback
```

**Step-by-Step Procedure** To configure Ethernet OAM LFM on device 2:

1. Enable OAM on the peer interface.  

```
[edit protocols oam ethernet link-fault-management]
```

```
user@device2# set interface ge-0/0/1
```

2. Set the periodic OAM PDU-sending interval (in milliseconds) for fault detection.

```
[edit protocols oam ethernet link-fault-management]
user@device2# set interface ge-0/0/1 pdu-interval 800
```

3. Enable remote loopback support for the local interface.

```
[edit protocols oam ethernet link-fault-management]
user@device2# set interface ge-0/0/1 negotiation-options allow-remote-loopback
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@device2# show protocols
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ge-0/0/1 {
 negotiation-options {
 allow-remote-loopback;
 }
 }
 }
 }
 }
}
```

## Verification

### Verify the OAM LFM Configuration

**Purpose** Verify that OAM LFM is configured properly.

**Action** From operational mode, enter the **show oam ethernet link-fault-management** command.

```
user@device1>show oam ethernet link-fault-management

Interface: ge-0/0/0.0
Status: Running, Discovery state: Send Any
Peer address: 00:19:e2:50:3b:e1
Flags:Remote-Stable Remote-State-Valid Local-Stable 0x50
Remote entity information:
Remote MUX action: forwarding, Remote parser action: forwarding
Discovery mode: active, Unidirectional mode: unsupported
Remote loopback mode: supported, Link events: supported
Variable requests: unsupported
```

**Meaning** The output displays the MAC address and the discovery state is **Send Any** if OAM LFM has been configured properly.

## Interfaces Configuration Statement Hierarchy

Use the statements in the **interfaces** configuration hierarchy to configure interfaces on the device.

**NOTE:** For a gigabit ethernet interface, the **gigether-options** and **ether-options** are identical, but only the **gigether-options** are documented.

```

interfaces {
 interface-name {
 accounting-profile name;
 clocking (external | internal);
 dce;
 description text;
 disable;
 e1-options {
 bert-algorithm algorithm;
 bert-error-rate rate;
 bert-period seconds;
 }
 }
}

```

```

 fcs (16 | 32);
 framing (g704 | g704-no-crc4 | unframed);
 idle-cycle-flag (flags | ones);
 invert-data data;
 loopback (local | remote);
 start-end-flag (shared | filler);
 timeslots time-slot-range;
}
e3-options {
 bert-algorithm algorithm;
 bert-error-rate rate;
 bert-period seconds;
 compatibility-mode {
 digital-link {
 substrate value;
 }
 kentrox {
 substrate value;
 }
 larscom;
 }
 fcs (16 | 32);
 framing (g.751 | g.832);
 idle-cycle-flag value;
 invert-data;
 loopback (local | remote);
 (no-payload-scrambler | payload-scrambler);
 (no-unframed | -unframed);
 start-end-flag (filler | shared);
}
encapsulation (ether-vpls-ppp | ethernet-bridge | ethernet-ccc | ethernet-tcc |

## authentication-order (Access Profile)

---

**Syntax** authentication-order [ldap | none | password | radius | securid];

**Hierarchy Level** [edit access profile *profile-name*]

**Release Information** Statement modified in Junos OS Release 9.1.

**Description** Set the order in which the Junos OS tries different authentication methods when verifying that a client can access the devices. For each login attempt, the software tries the authentication methods in order, from first to last.

- Options**
- **ldap**—Verify the client using LDAP.
  - **none**—Specify no authentication performed.
  - **password**—Verify the client using the information configured at the [edit access profile *profile-name* client *client-name*] hierarchy level.
  - **radius**—Verify the client using RADIUS authentication services.
  - **securid**—Verify the client using SecurID authentication services.

**Required Privilege Level** access—To view this statement in the configuration.  
access-control—To add this statement to the configuration.

## forwarding-classes (CoS)

|                            |                                                                                                                                                                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre> forwarding-classes {   class <i>class-name</i> {     priority (high   low);     queue-num <i>number</i>;     spu-priority (high   low);   }   queue <i>queue-number</i> {     <i>class-name</i> {       priority (high   low);     }   } } </pre> |
| <b>Hierarchy Level</b>     | [edit class-of-service]                                                                                                                                                                                                                                 |
| <b>Release Information</b> | Statement introduced in Junos OS Release 8.5. Statement updated in Junos OS Release 11.4. The <b>spu-priority</b> option introduced in Junos OS Release 11.4R2.                                                                                         |
| <b>Description</b>         | Configure forwarding classes and assign queue numbers.                                                                                                                                                                                                  |
| <b>Options</b>             | <ul style="list-style-type: none"> <li><i>class-name</i>—Display the forwarding class name assigned to the internal queue number.</li> </ul>                                                                                                            |

**NOTE:** This option is supported only on high-end SRX Series devices, including the SRX1500, SRX5400, SRX5600, and SRX5800.

**NOTE:** AppQoS forwarding classes must be different from those defined for interface-based rewriters.

- **policing-priority**—Layer 2 policing. One forwarding class can be configured as **premium** and others are configured as **normal**.
- **priority**—Fabric priority value:
  - **high**—Forwarding class's fabric queuing has high priority.
  - **low**—Forwarding class's fabric queuing has low priority.
- *queue-number*—Specify the internal queue number to which a forwarding class is assigned.
- **spu-priority**—Services Processing Unit (SPU) priority queue, either **high** or **low**.

**NOTE:** The **spu-priority** option is only supported on SRX1500, SRX3000 line, and SRX5000 line devices.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## match (Security Policies)

```
Syntax match {
 application {
 [application];
 any;
 }
 destination-address {
 [address];
 any;
 any-ipv4;
 any-ipv6;
 }
 source-address {
 [address];
 any;
 any-ipv4;
 any-ipv6;
 }
 source-identity {
 [role-name];
 any;
 authenticated-user;
 unauthenticated-user;
 unknown-user;
 }
}
```

**Hierarchy Level** [edit security policies from-zone *zone-name* to-zone *zone-name* policy *policy-name*]

**Release Information** Statement introduced in Junos OS Release 8.5. Statement updated with **source-identity** option in Junos OS Release 12.1.

**Description** Configure security policy match criteria.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Hierarchy Level** [edit security policies from-zone *zone-name* to-zone *zone-name*]

**Release Information** Statement introduced in Junos OS Release 8.5. The **services-offload** option added in Junos OS Release 11.4. Statement updated with the **source-identity** option and the **description** option added in Junos OS Release 12.1. Support for the **user-firewall** option added in Junos OS Release 12.1X45-D10. Support for the **initial-tcp-mss** and **reverse-tcp-mss** options added in Junos OS Release 12.3X48-D20.

**Description** Define a security policy.

```

**Hierarchy Level** [edit security zones]

**Release Information** Statement introduced in Junos OS Release 8.5. Support for wildcard addresses added in Junos OS Release 11.1. The **description** option added in Junos OS Release 12.1.

**Description** Define a security zone, which allows you to divide the network into different segments and apply different security options to each segment.

**Options**    *zone-name* —Name of the security zone.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege**    security—To view this statement in the configuration.  
**Level**                    security-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>For logical interfaces on which you configure packet scheduling, configure traffic shaping by specifying the amount of bandwidth to be allocated to the logical interface.</p> <p>Logical and physical interface traffic shaping is mutually exclusive. This means you can include the <b>shaping-rate</b> statement at the [edit class-of-service interfaces <i>interface-name</i>] hierarchy level or the [edit class-of-service interfaces <i>interface-name</i> unit <i>logical-unit-number</i>] hierarchy level, but not both.</p> <p>Alternatively, you can configure a shaping rate for a logical interface and oversubscribe the physical interface by including the <b>shaping-rate</b> statement at the [edit class-of-service traffic-control-profiles] hierarchy level. With this configuration approach, you can independently control the delay-buffer rate.</p> |
| <b>Default</b>                  | <p>If you do not include this statement at the [edit class-of-service interfaces <i>interface-name</i> unit <i>logical-unit-number</i>] hierarchy level, the default logical interface bandwidth is the average of unused bandwidth for the number of logical interfaces that require default bandwidth treatment. If you do not include this statement at the [edit class-of-service interfaces <i>interface-name</i>] hierarchy level, the default physical interface bandwidth is the average of unused bandwidth for the number of physical interfaces that require default bandwidth treatment.</p>                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>rate</b>—Peak rate, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p><b>Range:</b> For logical interfaces, 1000 through 32,000,000,000 bps.</p> <p>For physical interfaces, 1000 through 160,000,000,000 bps.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Hierarchy Level</b>          | <p>[edit security policies from-zone <i>zone-name</i> to-zone <i>zone-name</i> policy <i>policy-name</i> match]</p> <p>[edit security policies global policy <i>policy-name</i> match]</p>                                                                                                                                                                                |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.5. Support for IPv6 addresses added in Junos OS Release 10.2. Support for IPv6 addresses in active/active chassis cluster configurations (in addition to the existing support of active/passive chassis cluster configurations) added in Junos OS Release 10.4. Support for wildcard addresses added in Junos OS Release 11.1. |
| <b>Description</b>              | Define the matching criteria. You can specify one or more IP addresses, address sets, or wildcard addresses. You can specify wildcards <b>any</b> , <b>any-ipv4</b> , or <b>any-ipv6</b> .                                                                                                                                                                                |
| <b>Options</b>                  | <b>address</b> —IP addresses, address sets, or wildcard addresses (represented as A.B.C.D/wildcard-mask). You can configure multiple addresses or address prefixes separated by spaces and enclosed in square brackets.                                                                                                                                                   |
| <b>Required Privilege Level</b> | <p>security—To view this statement in the configuration.</p> <p>security-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                          |

## switch-options (VLANs)

---

**Syntax**    switch-options {  
              interface *interface-name* {  
                  encapsulation-type;  
                  ignore-encapsulation-mismatch;  
                  pseudowire-status-tlv;  
                  static-mac *mac-address* {  
                      vlan-id *vlan-id*;  
                  }  
              }  
              mac-table-aging-time *seconds*;  
              mac-table-size {  
                  *number*;  
                  packet-action drop;  
              }  
          }

**Hierarchy Level**    [edit vlans *vlans-name*]

**Release Information**    Statement modified in Junos OS Release 9.5.

**Description**    Configure Layer 2 learning and forwarding properties for a VLAN.  
  
The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

- **snmp-trap**—Enable incoming SNMP traps (UDP port 162).
- **ssh**—Enable incoming SSH traffic.
- **telnet**—Enable incoming Telnet traffic.
- **tftp**—Enable TFTP services.
- **traceroute**—Enable incoming traceroute traffic (UDP port 33434).
- **xnm-clear-text**—Enable incoming Junos XML protocol traffic for all specified interfaces.
- **xnm-ssl**— Enable incoming Junos XML protocol-over-SSL traffic for all specified interfaces.
- **except**—(Optional) except can only be used if all has been defined.

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## unframed | no-unframed (Interfaces)

**Syntax** (unframed | no-unframed);

**Hierarchy Level** [edit interfaces *interface-name* t3-options]

**Release Information** Statement introduced in Junos OS Release 11.1.

**Description** Enable or disable framing for the T3 interface on a 1-Port Clear Channel DS3/E3 GPIM on an SRX650 device. By default, unframed mode is enabled. Select no-unframed to enable framing. Select unframed to return to the default mode.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit]

**Release Information** Statement modified in Junos OS Release 9.5.

**Description** Configure a domain that includes a set of logical ports that share the same flooding or broadcast characteristics in order to perform Layer 2 bridging.

**Options** *vlans-name*—Name of the VLAN.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 8.4.</p> <p>Support for Layer 2 trunk ports added in Junos OS Release 9.2.</p> <p>Support for SRX 5600, and SRX 5800 devices added in Junos OS Release 9.6.</p> <p>Support for logical systems added in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>                              |
| <b>Description</b>         | Specify a VLAN identifier (VID) to include in the packets sent to and from the VLAN, or a VPLS routing instance.                                                                                                                                                                                                                                                                          |

**NOTE:** When configuring a VLAN identifier for provider backbone bridge (PBB) routing instances, dual-tagged VLANs and the `none` option are not permitted.

**Options** *number*—A valid VLAN identifier. If you configure multiple VLANs with a valid VLAN identifier, you must specify a unique VLAN identifier for each. However, you can use the same VLAN identifier for VLANs that belong to different virtual switches. Use this option to send single tagged frames with the specified VLAN identifier over VPLS VT interfaces.

**NOTE:** If you specify a VLAN identifier, you cannot also use the `all` option. They are mutually exclusive.

*all*—Specify that the VLAN spans all the VLAN identifiers configured on the member logical interfaces.

**NOTE:** You cannot specify the `all` option if you include a routing interface in the VLAN.

*none*—Specify to enable shared VLAN learning or to send untagged frames over VPLS VT interfaces.

**NOTE:** Multichassis link aggregation (MC-LAG) does not support the `none` option with the `vlan-id` statement with VLANs.

## CHAPTER 163

# Operational Commands

- clear oam ethernet connectivity-fault-management path-database
- clear oam ethernet connectivity-fault-management statistics
- clear security flow ip-action
- clear security flow session family
- show ethernet-switching mac-learning-log (View)
- show ethernet-switching table (View)
- show igmp-snooping route (View)
- show igmp-snooping vlans (View)
- show interfaces (SRX Series)
- show oam ethernet connectivity-fault-management adjacencies
- show oam ethernet connectivity-fault-management forwarding-state
- show oam ethernet connectivity-fault-management interfaces
- show oam ethernet connectivity-fault-management mep-database
- show oam ethernet connectivity-fault-management mep-statistics
- show oam ethernet connectivity-fault-management mip
- show oam ethernet connectivity-fault-management path-database
- show oam ethernet connectivity-fault-management routes
- show oam ethernet link-fault-management
- show security flow gate family
- show security flow ip-action
- show security flow session family
- show security flow statistics
- show security flow status
- show security forward-options secure-wire
- show security policies
- show security zones
- show vlans

## clear oam ethernet connectivity-fault-management path-database

---

|                                 |                                                                                                                                                                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | clear oam ethernet connectivity-fault-management path-database maintenance-domain <i>md-name</i> maintenance-association <i>ma-name</i> host < <i>mac-addr</i> >                                                              |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1X44-D10.                                                                                                                                                                         |
| <b>Description</b>              | Clear the relevant path information from the database for the specified remote host.                                                                                                                                          |

| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request.                                                           |

### Sample Output

#### clear oam ethernet connectivity-fault- management statistics

```
user@host> clear oam ethernet connectivity-fault-management statistics
Cleared statistics of all CFM sessions
```

## clear security flow ip-action

---

**Syntax** `clear security flow ip-action [filter]`

**Release Information** Command introduced in Junos OS Release 10.4. Logical systems option introduced in Junos OS Release 11.2.

**Description** Clear IP-action entries, based on filtered options, for IP sessions running on the device.

**Options** *filter*—Filter the display based on the specified criteria.

The following filters display those sessions that match the criteria specified by the filter. Refer to the sample output for filtered output examples.

**all** | [*filter*]  
—All active sessions on the device.

**destination-port** *destination-port*  
—Destination port number of the traffic. Range is 1 through 65,535.

**destination-prefix** *destination-prefix*  
—Destination IP prefix or address.

**family** (*inet* | *inet6*) [*filter*]  
—IPv4 traffic or IPv6-NATPT traffic and filtered options.

**logical-system** *logical-system-name* | **all** [*filter*]  
—Specified logical system or all logical systems.

**protocol** *protocol-name* | *protocol-number* [*filter*]  
—Protocol name or number and filtered options.

- **ah** or 51
- **egp** or 8
- **esp** or 50
- **gre** or 47
- **icmp** or 1
- **icmp6** or 58
- **igmp** or 2
- **ipip** or 4
- **ospf** or 89
- **pim** or 103
- **rsvp** or 46
- **sctp** or 132
- **tcp** or 6
- **udp** or 17

**root-logical-system** [*filter*]—Default logical system information and filtered options.

**source-port** *source-port*—Source port number of the traffic. Range is 1 through 65,535.

**source-prefix** *source-prefix*—Source IP prefix or address of the traffic.

|                          |                                                                                                                                                                                                                                                                                                      |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Required Privilege Level | clear                                                                                                                                                                                                                                                                                                |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                              |

Table 346: show ethernet-switching table Output Fields

| Field Name  | Field Description                                                                                                                                                                                                                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN        | The name of a VLAN.                                                                                                                                                                                                                                                                                       |
| MAC address | The MAC address associated with the VLAN.                                                                                                                                                                                                                                                                 |
| Type        | <p>The type of MAC address. Values are:</p> <ul style="list-style-type: none"> <li>static—The MAC address is manually created.</li> <li>learn—The MAC address is learned dynamically from a packet's source MAC address.</li> <li>flood—The MAC address is unknown and flooded to all members.</li> </ul> |
| Age         | The time remaining before the entry ages out and is removed from the Ethernet switching table.                                                                                                                                                                                                            |
| Interfaces  | Interface associated with learned MAC addresses or All-members (flood entry).                                                                                                                                                                                                                             |
| Learned     | For learned entries, the time which the entry was added to the Ethernet switching table.                                                                                                                                                                                                                  |

## Sample Output

### show ethernet-switching table

| Groups             | Number of groups in the VLAN.                                                                                                                                                                    |
| MRouters           | Number of multicast routers associated with the VLAN.                                                                                                                                            |
| Receivers          | Number of host receivers in the VLAN.                                                                                                                                                            |
| Tag                | Numerical identifier of the VLAN.                                                                                                                                                                |
| vlan-interface     | Internal VLAN interface identifier.                                                                                                                                                              |
| Membership timeout | Membership timeout value.                                                                                                                                                                        |
| Querier timeout    | Timeout value for interfaces dynamically marked as router interfaces (interfaces that receive queries). When the querier timeout is reached, the switch marks the interface as a host interface. |
| Interface          | Name of the interface.                                                                                                                                                                           |
| Reporters          | Number of dynamic groups on an interface.                                                                                                                                                        |

## Sample Output

### show igmp-snooping vlans

```
user@host> show igmp-snooping vlans
VLAN Interfaces Groups MRouters Receivers
default 0 0 0 0
v1 11 50 0 0
v10 1 0 0 0
v11 1 0 0 0
v180 3 0 1 0
v181 3 0 0 0
v182 3 0 0 0
```

## Sample Output

### show igmp-snooping vlans vlan v10

```
user@host> show igmp-snooping vlans vlan v10
VLAN Interfaces Groups MRouters Receivers
v10 1 0 0 0
```

## Sample Output

### show igmp-snooping vlans vlan v10 detail

```
user@host> sshow igmp-snooping vlans vlan v10 detail
VLAN: v10, Tag: 10, vlan-interface: vlan.10
Membership timeout: 260, Querier timeout: 255
Interface: ge-0/0/10.0, tagged, Groups: 0, Reporters: 0
```

## show interfaces (SRX Series)

**Syntax** show interfaces {  
 <brief | detail | extensive | terse>  
 controller *interface-name*  
 descriptions *interface-name*  
 destination-class (all | *destination-class-name logical-interface-name*)  
 diagnostics optics *interface-name*  
 far-end-interval *interface-fpc/pic/port*  
 filters *interface-name*  
 flow-statistics *interface-name*  
 interval *interface-name*  
 load-balancing (detail | *interface-name*)  
 mac-database mac-address *mac-address*  
 mc-ae id *identifier* unit *number* revertive-info  
 media *interface-name*  
 policers *interface-name*  
 queue both-ingress-egress egress forwarding-class *forwarding-class* ingress l2-statistics  
 redundancy (detail | *interface-name*)  
 routing brief detail summary *interface-name*  
 routing-instance (all | *instance-name*)  
 snmp-index *snmp-index*  
 source-class (all | *destination-class-name logical-interface-name*)  
 statistics *interface-name*  
 switch-port *switch-port number*  
 transport pm (all | optics | otn) (all | current | currentday | interval | previousday) (all |  
*interface-name*)  
 zone *interface-name*  
 }

**Release Information** Command modified in Junos OS Release 9.5.

**Description** Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

On SRX Series appliance, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

- Options**
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
    - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
    - **ce1-*pim*/0/ *port***—Channelized E1 interface.
    - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
    - **ct1-*pim*/0/*port***—Channelized T1 interface.
    - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
    - **e1-*pim*/0/*port***—E1 interface.
    - **e3-*pim*/0/*port***—E3 interface.

- **fe-pim/0/port**—Fast Ethernet interface.
- **ge-pim/0/port**—Gigabit Ethernet interface.
- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
- **brief | detail | extensive | terse**—(Optional) Display the specified level of output.
- **controller**—(Optional) Show controller information.
- **descriptions**—(Optional) Display interface description strings.
- **destination-class**—(Optional) Show statistics for destination class.
- **diagnostics**—(Optional) Show interface diagnostics information.
- **far-end-interval**—(Optional) Show far end interval statistics.
- **filters**—(Optional) Show interface filters information.
- **flow-statistics**—(Optional) Show security flow counters and errors.
- **interval**—(Optional) Show interval statistics.
- **load-balancing**—(Optional) Show load-balancing status.
- **mac-database**—(Optional) Show media access control database information.
- **mc-ae**—(Optional) Show MC-AE configured interface information.
- **media**—(Optional) Display media information.
- **policers**—(Optional) Show interface policers information.
- **queue**—(Optional) Show queue statistics for this interface.
- **redundancy**—(Optional) Show redundancy status.
- **routing**—(Optional) Show routing status.
- **routing-instance**—(Optional) Name of routing instance.
- **snmp-index**—(Optional) SNMP index of interface.
- **source-class**—(Optional) Show statistics for source class.
- **statistics**—(Optional) Display statistics and detailed output.
- **switch-port**—(Optional) Front end port number (0..15).
- **transport**—(Optional) Show interface transport information.
- **zone**—(Optional) Interface's zone.

**Required Privilege Level**    view

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Physical Interface</b> |                                                                                                                                                                                                                                                     |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                                                                                                                     | All levels                   |
| <b>Enabled</b>            | State of the interface.                                                                                                                                                                                                                             | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                                                                                                                                 | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                                                                                                                       | <b>detail extensive none</b> |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                                                                                                                                 | All levels                   |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                   | <b>detail extensive</b>      |
| <b>MTU</b>                | Maximum transmission unit size on the physical interface.                                                                                                                                                                                           | All levels                   |
| <b>Link mode</b>          | Link mode: Full-duplex or Half-duplex.                                                                                                                                                                                                              |                              |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                                                                                                                                            | All levels                   |
| <b>BPDU error</b>         | Bridge protocol data unit (BPDU) error: Detected or None                                                                                                                                                                                            |                              |
| <b>Loopback</b>           | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                                                                                                                      | All levels                   |
| <b>Source filtering</b>   | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                        | All levels                   |
| <b>Flow control</b>       | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                            | All levels                   |
| <b>Auto-negotiation</b>   | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                           | All levels                   |
| <b>Remote-fault</b>       | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul> | All levels                   |
| <b>Device flags</b>       | Information about the physical device.                                                                                                                                                                                                              | All levels                   |
| <b>Interface flags</b>    | Information about the interface.                                                                                                                                                                                                                    | All levels                   |

Table 349: show interfaces Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output              |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Last flapped</b>                     | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                          | <b>detail extensive none</b> |
| <b>Input Rate</b>                       | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                                                                                                                                                                                                                                                             | None                         |
| <b>Output Rate</b>                      | Output rate in bps and pps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | None                         |
| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul> | <b>detail extensive none</b> |
| <b>Statistics last cleared</b>          | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b>      |
| <b>Traffic statistics</b>               | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                  | <b>detail extensive</b>      |

Table 349: show interfaces Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output  |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b>  | <p>Input errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>                                                                                                                                                    | <b>extensive</b> |
| <b>Output errors</b> | <p>Output errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 349: show interfaces Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Ingress queues</b>                  | Total number of ingress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>extensive</b>        |

| <b>MAC statistics</b>                  | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> <li>• Packet length exceeds 1518 octets, or</li> <li>• Packet length exceeds MRU</li> </ul> </li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b>        |

Table 349: show interfaces Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Filter statistics                      | <p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul> | extensive       |
| Autonegotiation information            | <p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | extensive       |

| <b>Transit statistics</b>                             | Number and rate of bytes and packets transiting the switch.<br><br><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler. | <b>extensive</b>             |

## Sample Output

### show interfaces Gigabit Ethernet

```
user@host> show interfaces ge-0/0/1
```

```

Physical interface: ge-0/0/1, Enabled, Physical link is Down
 Interface index: 135, SNMP ifIndex: 510
 Link-level type: Ethernet, MTU: 1514, Link-mode: Full-duplex, Speed: 1000mbps,

 BPDU Error: None, MAC-REWRITE Error: None, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
 Remote fault: Online
 Device flags : Present Running Down
 Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
 Link flags : None
 CoS queues : 8 supported, 8 maximum usable queues
 Current address: 00:1f:12:e4:b1:01, Hardware address: 00:1f:12:e4:b1:01
 Last flapped : 2015-05-12 08:36:59 UTC (1w1d 22:42 ago)
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)
 Active alarms : LINK
 Active defects : LINK
 Interface transmit statistics: Disabled

Logical interface ge-0/0/1.0 (Index 71) (SNMP ifIndex 514)
 Flags: Device-Down SNMP-Traps 0x0 Encapsulation: ENET2
 Input packets : 0
 Output packets: 0
 Security: Zone: public
 Protocol inet, MTU: 1500
 Flags: Sendbroadcast-pkt-to-re
 Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
 Destination: 1.1.1/24, Local: 1.1.1.1, Broadcast: 1.1.1.255

```

## Sample Output

### show interfaces brief (Gigabit Ethernet)

```

user@host> show interfaces ge-3/0/2 brief
Physical interface: ge-3/0/2, Enabled, Physical link is Up
 Link-level type: 52, MTU: 1522, Speed: 1000mbps, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
 Remote fault: Online
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Link flags : None

Logical interface ge-3/0/2.0
 Flags: SNMP-Traps 0x4000
 VLAN-Tag [0x8100.512 0x8100.513] In(pop-swap 0x8100.530) Out(swap-push
 0x8100.512 0x8100.513)
 Encapsulation: VLAN-CCC
 ccc

Logical interface ge-3/0/2.32767
 Flags: SNMP-Traps 0x4000 VLAN-Tag [0x0000.0] Encapsulation: ENET2

```

## Sample Output

### show interfaces detail (Gigabit Ethernet)

```

user@host> show interfaces ge-0/0/1 detail
Physical interface: ge-0/0/1, Enabled, Physical link is Down
 Interface index: 135, SNMP ifIndex: 510, Generation: 138
 Link-level type: Ethernet, MTU: 1514, Link-mode: Full-duplex, Speed: 1000mbps,
 BPDU Error: None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering:

```

```

### show interfaces mac-database mac-address

```

user@host> show interfaces mac-database xe-0/3/3 mac-address 00:00:c8:01:01:09
Physical interface: xe-0/3/3, Enabled, Physical link is Up
 Interface index: 372, SNMP ifIndex: 788
 Link-level type: Ethernet, MTU: 1514, LAN-PHY mode, Speed: 10Gbps, Loopback:
None, Source filtering: Disabled, Flow control: Enabled
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Link flags : None

 Logical interface xe-0/3/3.0 (Index 364) (SNMP ifIndex 829)
 Flags: SNMP-Traps 0x4004000 Encapsulation: ENET2
 MAC address: 00:00:c8:01:01:09, Type: Configured,
 Input bytes : 202324652
 Output bytes : 202324560
 Input frames : 4398362
 Output frames : 4398360
 Policer statistics:
 Policer type Discarded frames Discarded bytes
 Output aggregate 3992386 183649756

```

## Sample Output

### show interfaces mc-ae

```

user@host> show interfaces mc-ae ae0 unit 512
Member Links : ae0
Local Status : active
Peer Status : active
Logical Interface : ae0.512
Core Facing Interface : Label Ethernet Interface
ICL-PL : Label Ethernet Interface

```

### show interfaces media (SONET/SDH)

The following example displays the output fields unique to the **show interfaces media** command for a SONET interface (with no level of output specified):

```

user@host> show interfaces media so-4/1/2
Physical interface: so-4/1/2, Enabled, Physical link is Up
 Interface index: 168, SNMP ifIndex: 495
 Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC48,
Loopback: None, FCS: 16, Payload scrambler: Enabled
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps 16384
 Link flags : Keepalives
 Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
 Keepalive: Input: 1783 (00:00:00 ago), Output: 1786 (00:00:08 ago)
 LCP state: Opened

```

```

NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
mpls: Not-configured
CHAP state: Not-configured
CoS queues : 8 supported
Last flapped : 2005-06-15 12:14:59 PDT (04:31:29 ago)
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)
SONET alarms : None
SONET defects : None
SONET errors:
 BIP-B1: 121, BIP-B2: 916, REI-L: 0, BIP-B3: 137, REI-P: 16747, BIP-BIP2: 0
Received path trace: routerb so-1/1/2
Transmitted path trace: routera so-4/1/2

```

## Sample Output

## Sample Output

### show interfaces queue

The following truncated example shows the CoS queue sizes for queues 0, 1, and 3. Queue 1 has a queue buffer size (guaranteed allocated memory) of 9192 bytes.

```

user@host> show interfaces queue
Physical interface: ge-0/0/0, Enabled, Physical link is Up
 Interface index: 134, SNMP ifIndex: 509
Forwarding classes: 8 supported, 8 in use
Egress queues: 8 supported, 8 in use
Queue: 0, Forwarding classes: class0
 Queued:
 Packets : 0 0 pps
 Bytes : 0 0 bps

```

```

Transmitted:
Packets : 0 0 pps
Bytes : 0 0 bps
Tail-dropped packets : 0 0 pps
RL-dropped packets : 0 0 pps
RL-dropped bytes : 0 0 bps
RED-dropped packets : 0 0 pps
 Low : 0 0 pps
 Medium-low : 0 0 pps
 Medium-high : 0 0 pps
 High : 0 0 pps
RED-dropped bytes : 0 0 bps
 Low : 0 0 bps
 Medium-low : 0 0 bps
 Medium-high : 0 0 bps
 High : 0 0 bps
Queue Buffer Usage:
 Reserved buffer : 118750000 bytes
 Queue-depth bytes :

| <b>Output Fields</b>            | <a href="#">Table 353</a> lists the output fields for the <b>show oam ethernet connectivity-fault-management mep-database</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                   |

**Table 353: show oam ethernet connectivity-fault-management mep-database Output Fields**

| Field Name                       | Field Description                                   |
|----------------------------------|-----------------------------------------------------|
| Maintenance domain name          | Maintenance domain name.                            |
| Format (Maintenance domain)      | Maintenance domain name format configured.          |
| Level                            | Maintenance domain level configured.                |
| Maintenance association name     | Maintenance association name.                       |
| Format (Maintenance association) | Maintenance association name format configured.     |
| Continuity-check status          | Continuity check status.                            |
| Interval                         | Continuity check message interval.                  |
| MEP identifier                   | Maintenance association end point (MEP) identifier. |
| Direction                        | MEP direction configured.                           |

**Table 353: show oam ethernet connectivity-fault-management mep-database Output Fields (*continued*)**

| Field Name                          | Field Description                                                                                                                                                                                                     |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC address                         | MAC address configured for the MEP.                                                                                                                                                                                   |
| Auto-discovery                      | Indicates whether automatic discovery is enabled or disabled.                                                                                                                                                         |
| Priority                            | Priority used for CCMs and Link Trace messages (LTMs) transmitted by the MEP.                                                                                                                                         |
| Interface name                      | Interface identifier.                                                                                                                                                                                                 |
| Interface status                    | Local interface status.                                                                                                                                                                                               |
| Link status                         | Local link status.                                                                                                                                                                                                    |
| Remote MEP not receiving CCM        | Indicates that the remote MEP is not receiving CCMs.                                                                                                                                                                  |
| Erroneous CCM received              | Indicates that erroneous CCMs have been received.                                                                                                                                                                     |
| Cross-connect CCM received          | Indicates that cross-connect CCMs have been received.                                                                                                                                                                 |
| RDI sent by some MEP                | Indicates that the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs. |
| CCMs sent                           | Number of CCMs transmitted.                                                                                                                                                                                           |
| CCMs received out of sequence       | Number of CCMs received out of sequence.                                                                                                                                                                              |
| LBMs sent                           | Number of loopback messages (LBMs) sent.                                                                                                                                                                              |
| Valid in-order LBRs received        | Number of loopback response messages (LBRs) received that were valid messages and in sequence.                                                                                                                        |
| Valid out-of-order LBRs received    | Number of LBRs received that were valid messages and not in sequence.                                                                                                                                                 |
| LBRs received with corrupted data   | Number of LBRs received that were corrupted.                                                                                                                                                                          |
| LBRs sent                           | Number of LBRs transmitted.                                                                                                                                                                                           |
| LTMs sent                           | Link Trace messages (LTMs) transmitted.                                                                                                                                                                               |
| LTMs received                       | LTMs received.                                                                                                                                                                                                        |
| LTRs sent                           | Link Trace Replies (LTRs) transmitted.                                                                                                                                                                                |
| LTRs received                       | LTRs received.                                                                                                                                                                                                        |
| Sequence number of next LTM request | Sequence number of the next Link Trace LTM request to be transmitted.                                                                                                                                                 |

**Table 353: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)**

| Field Name            | Field Description                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1DMs sent             | <p>If the MEP is an initiator for a one-way ETH-DM session, then this is the number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session.</p> <p>For all other cases, this field displays 0.</p> |
| Valid 1DMs received   | <p>If the MEP is a receiver for a one-way ETH-DM session, then this is the number of valid 1DM frames received.</p> <p>For all other cases, this field displays 0.</p>                                                         |
| Invalid 1DMs received | <p>If the MEP is a receiver for a one-way ETH-DM session, then this is the number of invalid 1DM frames received.</p> <p>For all other cases, this field displays 0.</p>                                                       |
| DMMs sent             | <p>If the MEP is an initiator for a two-way ETH-DM session, then this is the number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays 0.</p>        |
| DMRs sent             | <p>If the MEP is a responder for a ETH-DM session, then this is the number of Delay Measurement Reply (DMR) frames sent.</p> <p>For all other cases, this field displays 0.</p>                                                |

## show oam ethernet connectivity-fault-management mep-statistics

**Syntax** show oam ethernet connectivity-fault-management mep-statistics  
 count  
 local-mep  
 maintenance-association  
 maintenance-domain  
 remote-mep

**Release Information** Statement introduced in Junos OS Release 12.1X44-D10.

**Description** Display Ethernet OAM maintenance endpoint statistics.

**NOTE:** The delay measurement (DM) statistics are not valid for SRX Series devices, which supports only the IEEE 802.1ag standard.

**Options** **count** —Number of statistics per maintenance endpoint (1 through 100).

**local-mep** —Identifier for local maintenance endpoint (1 through 8191).

**maintenance-association**—Name of maintenance association.

**maintenance-domain**—Name of maintenance domain.

**remote-mep** —Identifier for remote maintenance endpoint (1 through 8191).

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet connectivity-fault- management mep-statistics on page 3476](#)

**Output Fields** [Table 354](#) lists the output fields for the **show oam ethernet connectivity-fault-management mep-statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 354: show oam ethernet connectivity-fault-management mep-statistics Output Fields**

| Field Name                    | Field Description                                   |
|-------------------------------|-----------------------------------------------------|
| MEP identifier                | Maintenance association end point (MEP) identifier. |
| CCMs sent                     | Number of CCMs transmitted.                         |
| CCMs received out of sequence | Number of CCMs received out of sequence.            |

**Table 354: show oam ethernet connectivity-fault-management mep-statistics Output Fields (*continued*)**

| Field Name                          | Field Description                                                                                                                                                                                                              |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LBM sent                            | Number of loopback messages (LBMs) sent.                                                                                                                                                                                       |
| Valid in-order LBRs received        | Number of loopback response messages (LBRs) received that were valid messages and in sequence.                                                                                                                                 |
| Valid out-of-order LBRs received    | Number of LBRs received that were valid messages and not in sequence.                                                                                                                                                          |
| LBRs received with corrupted data   | Number of LBRs received that were corrupted.                                                                                                                                                                                   |
| LBRs sent                           | Number of LBRs transmitted.                                                                                                                                                                                                    |
| LTM sent                            | Link Trace messages (LTMs) transmitted.                                                                                                                                                                                        |
| LTM received                        | Link Trace messages received.                                                                                                                                                                                                  |
| LTR sent                            | Link Trace responses (LTRs) transmitted.                                                                                                                                                                                       |
| LTR received                        | Link Trace responses received.                                                                                                                                                                                                 |
| Sequence number of next LTM request | Sequence number of the next Link Tracemessage request to be transmitted.                                                                                                                                                       |
| 1DMs sent                           | <p>If the MEP is an initiator in a one-way ETH-DM session, then this is the number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session.</p> <p>For all other cases, this field displays 0.</p>  |
| Valid 1DMs received                 | <p>If the MEP is a receiver for a one-way ETH-DM session, then this is the number of valid 1DM frames received.</p> <p>For all other cases, this field displays 0.</p>                                                         |
| Invalid 1DMs received               | <p>If the MEP is a receiver for a one-way ETH-DM session, then this is the number of invalid 1DM frames received.</p> <p>For all other cases, this field displays 0.</p>                                                       |
| DMMs sent                           | <p>If the MEP is an initiator for a two-way ETH-DM session, then this is the number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session.</p> <p>For all other cases, this field displays 0.</p> |
| DMRs sent                           | <p>If the MEP is a responder for a ETH-DM session, then this is the number of Delay Measurement Reply (DMR) frames sent. For all other cases, this field displays 0.</p>                                                       |
| Valid DMRs received                 | <p>If the MEP is an initiator for a two-way ETH-DM session, then this is the number of valid DMRs received.</p> <p>For all other cases, this field displays 0.</p>                                                             |

**Table 354: show oam ethernet connectivity-fault-management mep-statistics Output Fields (continued)**

| Field Name            | Field Description                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Invalid DMRs received | If the MEP is an initiator for a two-way ETH-DM session, then this is the number of invalid DMRs received.<br><br>For all other cases, this field displays 0. |

| <b>Output Fields</b>            | <a href="#">Table 356</a> lists the output fields for the <b>show oam ethernet connectivity-fault-management path-database</b> command. Output fields are listed in the approximate order in which they appear.                                     |

**Table 356: show oam ethernet connectivity-fault-management path-database Output Fields**

| Field Name              | Field Description                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------|
| Interface               | Interface Identifier.                                                                                        |
| Maintenance Domain      | Maintenance domain name.                                                                                     |
| Maintenance Association | Maintenance association name.                                                                                |
| Level                   | Maintenance domain level configured for the maintenance domain.                                              |
| Hop                     | Sequential hop count of the Link Trace path.                                                                 |
| TTL                     | Number of hops remaining in the Link Trace message (LTM). The time to live (TTL) is decremented at each hop. |
| Source MAC Address      | MAC address of the 802.1ag maintenance association intermediate point (MIP) that is forwarding the LTM.      |
| Next-hop MAC Address    | MAC address of the 802.1ag node that is the next hop in the LTM path.                                        |

**Table 356: show oam ethernet connectivity-fault-management path-database Output Fields (*continued*)**

| Field Name             | Field Description                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transaction Identifier | Identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all maintenance domains. Use the transaction identifier to match an incoming Link Trace Reply (LTR) with a previously sent LTM. |

## Sample Output

### show oam ethernet connectivity-fault- management path-database

```

user@host> show oam ethernet connectivity-fault-management path-database
Interface : fe-0/0/4
 Maintenance Domain: private, Level: 5
 Maintenance Association: private-ma, Local Mep: 100

Hop TTL Source MAC address Next-hop MAC address
Transaction Identifier:0
1 63 80:71:1f:ad:50:04 80:71:1f:ad:50:01

## show security flow gate family

|                                 |                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show security flow gate family (inet   inet6)                                                                                                                  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 10.4.                                                                                                                   |
| <b>Description</b>              | Display filtered summary of information about existing gates, types of gates, and the maximum allowed number of gates.                                         |
| <b>Options</b>                  | <ul style="list-style-type: none"> <li>• inet—Displays IPv4 information.</li> <li>• inet6—Displays IPv6 gate information.</li> </ul>                           |
| <b>Required Privilege Level</b> | view                                                                                                                                                           |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">show security flow gate on page 449</a></li> </ul>                                                        |
| <b>Output Fields</b>            | Table 1 lists the output fields for the <b>show security flow gate family</b> command. Output fields are listed in the approximate order in which they appear. |

Table 359: show security flow gate family Output Fields

| Field Name            | Field Description                |
|-----------------------|----------------------------------|
| Valid gates           | Number of valid gates.           |
| Pending gates         | Number of pending gates.         |
| Invalidated gates     | Number of invalid gates.         |
| Gates in other states | Number of gates in other states. |
| Total gates           | Total number of gates.           |

## Sample Output

```

user@host> show security flow gate family inet6

## show security flow ip-action

**Syntax** `show security flow ip-action [ <filter> ] [ summary family (inet | inet6) ]`

**Release Information** Command introduced in Junos OS Release 10.1. Logical systems option added in Junos OS Release 11.2 . Summary option introduced in Junos OS Release 12.1.

**Description** Display the current IP-action settings, based on filtered options, for IP sessions running on the device.

**Options** • *filter*—Filter the display based on the specified criteria.

The following filters display those sessions that match the criteria specified by the filter. Refer to the sample output for filtered output examples.

**all** | [*filter*]  
—All active sessions on the device.

**destination-port** *destination-port*  
—Destination port number of the traffic. Range is 1 through 65,535.

**destination-prefix** *destination-prefix*  
—Destination IP prefix or address.

**family** (inet | inet6) [*filter*]  
—IPv4 traffic or IPv6-NATPT traffic and filtered options.

**logical-system** *logical-system-name* | **all** [*filter*]  
—Specified logical system or all logical systems.

**protocol** *protocol-name* | *protocol-number* [*filter*]  
—Protocol name or number and filtered options.

- **ah** or 51
- **egp** or 8
- **esp** or 50
- **gre** or 47
- **icmp** or 1
- **icmp6** or 58
- **igmp** or 2
- **ipip** or 4
- **ospf** or 89
- **pim** or 103
- **rsvp** or 46
- **sctp** or 132
- **tcp** or 6
- **udp** or 17

**root-logical-system** [*filter*]  
—Default logical system information and filtered options.

**source-port** *source-port*—Source port number of the traffic. Range is 1 through 65,535.

**source-prefix** *source-prefix*—Source IP prefix or address of the traffic.

- **summary** —Summary information about IP-action entries.

**family**—Display summary of IP-action entries by family. This option is used to filter the output.

- **inet**—Display summary of IPv4 entries.
- **inet6**—Display summary of IPv6 entries.

**Required Privilege Level**

**Output Fields**

[Table 208](#) lists the output fields for the **show security flow ip-action** command. Output fields are listed in the approximate order in which they appear.

**Table 360: show security flow ip-action Output Fields**

| Field Name     | Field Description                                                |
|----------------|------------------------------------------------------------------|
| Src-Addr       | Source address of outbound IP traffic.                           |
| Src-Port       | Source port number of outbound IP traffic.                       |
| Dst-Addr       | Destination address of inbound IP traffic.                       |
| Dst-Port/Proto | Destination port number and protocol type of inbound IP traffic. |
| Timeout (sec)  | Configured timeouts and time remaining for an IP session.        |
| Zone           | Security zone associated with an IP session.                     |
| Action         | Configured action type, for example, block, close, and notify.   |

Table 360: show security flow ip-action Output Fields (*continued*)

| Field Name        | Field Description                                                                   |
|-------------------|-------------------------------------------------------------------------------------|
| State             | The active mode and passive mode describe the states of the <b>ip-action</b> entry. |
| IPv4 action count | The total number of IPv4 entries.                                                   |
| IPv6 action count | The total number of IPv6 entries.                                                   |

## Sample Output

### show security flow ip-action

```

user@host> show security flow ip-action

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                       |

**Table 361: show security flow session family Output Fields**

| Field Name     | Field Description                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Session ID     | Number that identifies the session. Use this ID to get more information about the session.                                                                                              |
| Policy name    | Policy that permitted the traffic.                                                                                                                                                      |
| Timeout        | Idle timeout after which the session expires.                                                                                                                                           |
| In             | Incoming flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes). |
| Out            | Reverse flow (source and destination IP addresses, application protocol, interface, session token, route, gateway, tunnel, port sequence, FIN sequence, FIN state, packets and bytes).  |
| Total sessions | Total number of sessions.                                                                                                                                                               |
| Status         | Session status.                                                                                                                                                                         |

Table 361: show security flow session family Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flag               | Internal flag depicting the state of the session, used for debugging purposes.                                                                                                        |
| Policy name        | Name and ID of the policy that the first packet of the session matched.                                                                                                               |
| Source NAT pool    | The name of the source pool where NAT is used.                                                                                                                                        |
| Application        | Name of the application.                                                                                                                                                              |
| Maximum timeout    | Maximum session timeout.                                                                                                                                                              |
| Current timeout    | Remaining time for the session unless traffic exists in the session.                                                                                                                  |
| Session State      | Session state.                                                                                                                                                                        |
| Start time         | Time when the session was created, offset from the system start time.                                                                                                                 |
| Unicast-sessions   | Number of unicast sessions.                                                                                                                                                           |
| Multicast-sessions | Number of multicast sessions.                                                                                                                                                         |
| Failed-sessions    | Number of failed sessions.                                                                                                                                                            |
| Sessions-in-use    | Number of sessions in use. <ul style="list-style-type: none"> <li>Valid sessions</li> <li>Pending sessions</li> <li>Invalidated sessions</li> <li>Sessions in other states</li> </ul> |
| Maximum-sessions   | Number of maximum sessions.                                                                                                                                                           |

## Sample Output

## show security flow statistics

**Syntax** `show security flow statistics`

**Release Information** Command introduced in Junos OS Release 10.2.  
Starting with Junos OS Release 15.1X49-D10, SRX5K-MPC3-100G10G (IOC3) and SRX5K-MPC3-40G10G (IOC3) are introduced for SRX5400, SRX5600, and SRX5800 devices that perform hash-based datapath packet forwarding to interconnect with all existing IOC and SPC cards using the XL chip (packet-processing chip). The IOC3 XL chip uses a hash-based method to distribute ingress traffic to a pool of SPUs by default. Selection of hash keys depends on application protocols.

**Description** Display flow-related system statistics.

**Required Privilege Level** view

**Related Documentation**

- [Juniper Networks Devices Processing Overview on page 1641](#)

**List of Sample Output** [show security flow statistics on page 3502](#)  
[show security flow statistics \(for hash-based datapath forwarding using SRX5K-MPC3-40G10G \(IOC3\) and SRX5K-MPC3-100G10G \(IOC3\) on page 3503](#)

**Output Fields** [Table 233](#) lists the output fields for the `show security flow statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 362: show security flow statistics Output Fields**

| Field Name        | Field Description            |
|-------------------|------------------------------|
| Current sessions  | Number of current sessions.  |
| Packets forwarded | Number of packets forwarded. |
| Packets dropped   | Number of Packets dropped.   |
| Fragment packets  | Number of fragment packets.  |

## Sample Output

### show security flow statistics

```

root> show security flow statistics
Flow Statistics of FPC4 PIC1:
 Current sessions: 63
 Packets forwarded: 3001
 Packets dropped: 1281
 Fragment packets: 0

Flow Statistics of FPC5 PIC0:
 Current sessions: 22
 Packets forwarded: 859

```

```
Packets dropped: 0
Fragment packets: 0
```

Flow Statistics of FPC5 PIC1:

```
Current sessions: 22
Packets forwarded: 858
Packets dropped: 0
Fragment packets: 0
```

Flow Statistics Summary:

```
System total valid sessions: 107
Packets forwarded: 4718
Packets dropped: 1281
Fragment packets: 0
```

**show security flow statistics (for hash-based datapath forwarding using SRX5K-MPC3-40G10G (IOC3) and SRX5K-MPC3-100G10G (IOC3))**

```
root> show security flow statistics
```

Flow Statistics of FPC0 PIC1:

```
Current sessions: 0
Packets forwarded: 0
Packets dropped: 0
Fragment packets: 0
```

Flow Statistics of FPC0 PIC2:

```
Current sessions: 0
Packets forwarded: 0
Packets dropped: 0
Fragment packets: 0
```

Flow Statistics of FPC0 PIC3:

```
Current sessions: 0
Packets forwarded: 0
Packets dropped: 0
Fragment packets: 0
```

Flow Statistics Summary:

```
System total valid sessions: 0
Packets forwarded: 0
Packets dropped: 0
Fragment packets: 0
```

## show security flow status

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | <p>Command introduced in Junos OS Release 10.2 ; session distribution mode option added in Junos OS Release 12.1X44-D10; enhanced route scaling mode option added in Junos OS Release 12.1X45-D10.</p> <p>Starting with Junos OS Release 15.1X49-D10, SRX5K-MPC3-100G10G (IOC3) and SRX5K-MPC3-40G10G (IOC3) are introduced for SRX5400, SRX5600, and SRX5800 devices that perform hash-based data path packet forwarding to interconnect with all existing IOC and SPC cards using the XL chip (packet-processing chip).</p> <p>The IOC3 XL chip uses a hash-based method to distribute ingress traffic to a pool of SPUs by default. Selection of hash keys depends on application protocols.</p> |
| <b>Description</b>              | Display the flow processing modes and logging status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Sample Output

### show security flow status

```

root> show security flow status
 Flow forwarding mode:
Inet forwarding mode: flow based
Inet6 forwarding mode: flow based
MPLS forwarding mode: drop
ISO forwarding mode: drop
+Enhanced route scaling mode: Enabled (reboot needed to disable)
Flow trace status
Flow tracing status: on
Flow tracing options: all
Flow session distribution
Distribution mode: Hash-based
Flow packet ordering
Ordering mode: Software (reboot needed to change to software)

```

### show security flow status (IPsec Performance Acceleration)

```

root> show security flow status
Flow forwarding mode:
 Inet forwarding mode: flow based
 Inet6 forwarding mode: drop
 MPLS forwarding mode: drop
 ISO forwarding mode: drop
Flow trace status
 Flow tracing status: off
Flow session distribution
 Distribution mode: RR-based
Flow packet ordering
Ordering mode: Software (reboot needed to change to software)
Flow ipsec performance acceleration: on

```

### show security flow status (for hash-based datapath forwarding using SRX5K-MPC3-40G10G (IOC3) and SRX5K-MPC3-100G10G (IOC3))

```

root> show security flow status
node0:

 Flow forwarding mode:
 Inet forwarding mode: flow based
 Inet6 forwarding mode: drop
 MPLS forwarding mode: drop
 ISO forwarding mode: drop
 Flow trace status
 Flow tracing status: off

```

Flow session distribution  
Distribution mode: Hash-based  
Flow ipsec performance acceleration: off  
Flow packet ordering  
Ordering mode: Hardware

node1:

-----  
Flow forwarding mode:  
Inet forwarding mode: flow based  
Inet6 forwarding mode: drop  
MPLS forwarding mode: drop  
ISO forwarding mode: drop  
Flow trace status  
Flow tracing status: off  
Flow session distribution  
Distribution mode: Hash-based  
Flow ipsec performance acceleration: off  
Flow packet ordering  
Ordering mode: Hardware

**Table 364: show security forward-options secure-wire Output Fields**

| Field Name  | Field Description                                      |
|-------------|--------------------------------------------------------|
| Secure wire | Name of the secure wire mapping.                       |
| Interface   | One of the peer interfaces in the secure wire mapping. |
| Link        | Operational status of the interface link.              |
| Interface   | The second peer interface in the secure wire mapping.  |
| Link        | Operational status of the interface link.              |

## Sample Output

### show security forward-options secure-wire

```

user@host> show security forward-options secure-wire
Secure wire Interface Link Interface Link

pw1 ge-11/1/0.0 up ge-11/1/1.0 up
pw2 ge-11/0/0.0 up ge-11/0/1.0 up
pw3 ge-11/1/2.0 down ge-11/1/3.0 down
Total secure wires: 3

```

## Sample Output

show security forward-options secure-wire pw1

```
user@host> show security forward-options secure-wire pw1
Secure wire Interface Link Interface Link
pw1 ge-11/1/0.0 up ge-11/1/1.0 up
```

| <b>Syntax</b>                   | <pre>show security policies &lt;detail&gt; &lt;none&gt; policy-name <i>policy-name</i> &lt;detail&gt; &lt;global&gt;</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Release Information</b>      | <p>Command modified in Junos OS Release 9.2. Support for IPv6 addresses added in Junos OS Release 10.2. Support for IPv6 addresses in active/active chassis cluster configurations in addition to the existing support of active/passive chassis cluster configurations added in Junos OS Release 10.4. Support for wildcard addresses added in Junos OS Release 11.1. Support for global policy added in Junos OS Release 11.4. Support for services offloading added in Junos OS Release 11.4. Support for source-identities added in Junos OS Release 12.1. The <b>Description</b> output field added in Junos OS Release 12.1. Support for negated address added in Junos OS Release 12.1X45-D10. The output fields for Policy Statistics expanded, and the output fields for the <b>global</b> and <b>policy-name</b> options expanded to include from-zone and to-zone global match criteria in Junos OS Release 12.1X47-D10. Support for the <b>initial-tcp-mss</b> and <b>reverse-tcp-mss</b> options added in Junos OS Release 12.3X48-D20.</p> |
| <b>Description</b>              | <p>Display a summary of all security policies configured on the device. If a particular policy is specified, display information particular to that policy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Output Fields** Table 51 lists the output fields for the **show security policies** command. Output fields are listed in the approximate order in which they appear.

**Table 365: show security policies Output Fields**

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>From zone</b>                        | Name of the source zone.                                                                                                                                                                                                                                                                                                                                                   |
| <b>To zone</b>                          | Name of the destination zone.                                                                                                                                                                                                                                                                                                                                              |
| <b>Policy</b>                           | Name of the applicable policy.                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>                      | Description of the applicable policy.                                                                                                                                                                                                                                                                                                                                      |
| <b>State</b>                            | Status of the policy: <ul style="list-style-type: none"> <li>• <b>enabled:</b> The policy can be used in the policy lookup process, which determines access rights for a packet and the action taken in regard to it.</li> <li>• <b>disabled:</b> The policy cannot be used in the policy lookup process, and therefore it is not available for access control.</li> </ul> |
| <b>Index</b>                            | Internal number associated with the policy.                                                                                                                                                                                                                                                                                                                                |
| <b>Sequence number</b>                  | Number of the policy within a given context. For example, three policies that are applicable in a from-zoneA-to-zoneB context might be ordered with sequence numbers 1, 2, 3. Also, in a from-zoneC-to-zoneD context, four policies might have sequence numbers 1, 2, 3, 4.                                                                                                |
| <b>Source addresses</b>                 | For standard display mode, the names of the source addresses for a policy. Address sets are resolved to their individual names.<br><br>For detail display mode, the names and corresponding IP addresses of the source addresses for a policy. Address sets are resolved to their individual address name-IP address pairs.                                                |
| <b>Destination addresses</b>            | Name of the destination address (or address set) as it was entered in the destination zone's address book. A packet's destination address must match this value for the policy to apply to it.                                                                                                                                                                             |
| <b>Source addresses (excluded)</b>      | Name of the source address excluded from the policy.                                                                                                                                                                                                                                                                                                                       |
| <b>Destination addresses (excluded)</b> | Name of the destination address excluded from the policy.                                                                                                                                                                                                                                                                                                                  |
| <b>Source identities</b>                | One or more user roles specified for a policy.                                                                                                                                                                                                                                                                                                                             |

**Table 366: show security zones Output Fields**

| Field Name          | Field Description                            |
|---------------------|----------------------------------------------|
| Security zone       | Name of the security zone.                   |
| Description         | Description of the security zone.            |
| Policy configurable | Whether the policy can be configured or not. |
| Interfaces bound    | Number of interfaces in the zone.            |
| Interfaces          | List of the interfaces in the zone.          |
| Zone                | Name of the zone.                            |
| Type                | Type of the zone.                            |

## Sample Output

### show security zones

```
user@host> show security zones
Functional zone: management
 Description: This is the management zone.
 Policy configurable: No
 Interfaces bound: 1
 Interfaces:
 ge-0/0/0.0
Security zone: Host
 Description: This is the host zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 fxp0.0
Security zone: abc
 Description: This is the abc zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 ge-0/0/1.0
Security zone: def
 Description: This is the def zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 ge-0/0/2.0
```

## Sample Output

### show security zones abc

```
user@host> show security zones abc
Security zone: abc
 Description: This is the abc zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 ge-0/0/1.0
```

## Sample Output

### show security zones abc detail

```
user@host> show security zones abc detail
Security zone: abc
 Description: This is the abc zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 ge-0/0/1.0
```

## Sample Output

show security zones terse

```
user@host> show security zones terse
Zone Type
my-internal Security
my-external Security
dmz Security
```

## show vlans

## Understanding Logical Systems for SRX Series Services Gateways

Logical systems for SRX Series devices enable you to partition a single device into secure contexts. Each logical system has its own discrete administrative domain, logical interfaces, routing instances, security firewall and other security features. By transforming an SRX Series device into a multitenant logical systems device, you can give various departments, organizations, customers, and partners—depending on your environment—private use of portions of its resources and a private view of the device. Using logical systems, you can share system and underlying physical machine resources among discrete user logical systems and the master logical system.

The top part of [Figure 151](#) shows the three main configuration components of a logical system. The lower part of the figure shows a single device with a master logical system and discrete user logical systems.

**Figure 151: Understanding Logical Systems**

Logical systems on SRX Series devices offer many benefits, allowing you to:

- Curtail costs. Using logical systems, you can reduce the number of physical devices required for your company. Because you can consolidate services for various groups of users on a single device, you reduce both hardware costs and power expenditure.
- Create many logical systems on a single device and provision resources and services for them quickly. Because services are converged, it is easier for the master, or root, administrator to manage a single device configured for logical systems than it is to manage many discrete devices.

You can deploy an SRX Series device running logical systems in many environments, in particular, in the enterprise and in the data center.

- In the enterprise, you can create and provision logical systems for various departments and groups.

You can configure logical systems to enable communication among groups sharing the device. When you create logical systems for various departments on the same device, users can communicate with one another without traffic leaving the device if you have configured an interconnect logical system to serve as an internal switch. For example, members of the product design group, the marketing department, and the accounting department sharing an SRX Series Services Gateway running logical systems can communicate with one another just as they could if separate devices were deployed for their departments. You can configure logical systems to interconnect through *logical tunnel* (*lt-0/0/0*) internal interfaces. The *lt-0/0/0* interfaces on the interconnect logical system connect to an *lt-0/0/0* interface that you configure for each logical system. The interconnect logical system switches traffic between logical systems. The SRX Series device running logical systems provides for high, fast interaction among all logical systems created on the device when an interconnect logical system is used.

Logical systems on the same device can also communicate with one another directly through ports on the device, as if they were separate devices. Although this method allows for direct connections between logical systems, it consumes more resources—you must configure interfaces and an external switch—and therefore it is more costly.

- In the data center, as a service provider, you can deploy an SRX Series device running logical systems to offer your customers secure and private user logical systems and discrete use of the device's resources.

For example, one corporation might require 10 user logical systems and another might require 20. Because logical systems are secure, private, and self-contained, data belonging to one logical system cannot be viewed by administrators or users of other logical systems. That is, employees of one corporation cannot view the logical systems of another corporation.

Logical systems include both master and user logical systems and their administrators. The roles and responsibilities of the master administrator and those of a user logical system administrator differ greatly. This differentiation of privileges and responsibilities is considered role-based administration and control.

**NOTE:** To use the internal switch, which is optional, you must also configure an interconnect logical system. The interconnect logical system does not require an administrator.

## Understanding the Fundamentals and Constraints of Logical Systems

---

This topic covers basic information about logical systems features and limitations.

- By default, logical systems delivers a master logical system, which exists at the root level. You can purchase licenses for logical systems that you intend to create with the total not exceeding 32.
- You can configure up to 32 security profiles, from 1 through 32, with ID 0 reserved for the internally configured default security profile. When the maximum number of security profiles is reached, if you want to add a new security profile, you must first delete one or more existing security profiles, commit the configuration, and then create the new security profile and commit it. You cannot add a new security profile and remove an existing one within a single configuration commit.

If you want to add more than one new security profile, the same rule is true. You must first delete the equivalent number of existing security profiles, commit the configuration, and then create the new security profiles and commit them.

- You can configure one or more master administrators to oversee administration of the device and the logical systems they configure.

As master administrator for an SRX Series Services Gateway running logical systems, you have root control over the device, its resources, and the logical systems that you create. You allocate security, networking, and routing resources to user logical systems. You can configure one logical system to serve as an interconnect logical system virtual private LAN service (VPLS) switch. The interconnect logical system, which is not mandatory, does not require security resources. However, if you configure an interconnect logical system, you must bind a dummy security profile to it. The master administrator configures it and all `lt-0/0/0` interfaces for it.

- A user logical system can have one or more administrators, referred to as user logical system administrators. The master administrator creates login accounts for these administrators and assigns them to a user logical system. Currently, the master administrator must configure all user logical system administrators. The first assigned user logical administrator cannot configure additional user logical system administrators for his logical system. As a user logical system administrator, you can configure the resources assigned to your user logical system, including logical interfaces assigned by the master administrator, routing instances and their routes, and security components. You can display configuration information only for your logical system.
- A logical system can include more than one routing instance based on available system resources.
- You cannot configure class of service on `lt-0/0/0` interfaces.
- The trace and debug features are supported at the root level only.
- Commit rollback is supported at the root level only.
- Quality of service (QoS) classification across interconnected logical systems does not work.

- The master administrator can configure Application Layer Gateways (ALGs) at the root level. The configuration is inherited by all user logical systems. It cannot be configured discretely for user logical systems.
- The master administrator can configure IDP policies at the root level and then apply an IDP policy to a user logical system.
- Only the master administrator can create user accounts and login IDs for users for all logical systems. The master administrator creates these user accounts at the root level and assigns them to the appropriate user logical systems.
- The same name cannot be used in two separate logical systems. For example, if logical-system1 includes a user with Bob configured as the username, then other logical systems on the device cannot include a user with the username Bob.
- Configuration for users for all logical systems and all user logical systems administrators must be performed at the root level by the master administrator. A user logical system administrator cannot create other user logical system administrators or user accounts for their logical systems.

## Understanding Licenses for Logical Systems on SRX Series Devices

---

This topic provides licensing information for SRX Series devices running logical systems. For general licensing information, such as how to install a license, see the [Junos OS Software Installation and Upgrade Guide](#).

By default, a device running logical systems delivers a master logical system at the root level. You can purchase licenses for other logical systems that you intend to create. If you intend to configure an interconnect logical system to use as a switch, it also requires a license.

Complications arise if the number of logical systems that you configure exceeds the number of licenses that you have purchased. The system will allow you to configure additional logical systems. However, when you attempt to commit their configurations, the system issues a warning message similar to the following: **Warning: 2 more license(s) are needed, logical system won't work without license!**. The message indicates the number of logical systems without licenses. We recommend that you do not configure more logical systems than the number of licenses you have purchased.

If you configure more logical systems than the number of licenses that you have purchased, the additional logical systems will not be activated until a license is available. The system will drop packets destined to them. They are inactive.

When a logical system is deleted, its license is freed up. That license is assigned to an inactive logical system, and the logical system is activated.

You can use the **show system license status logical-system all** command on the command-line interface (CLI) to determine which logical systems are active.

```
user@host> show system license status logical-system all
```

| logical system name | license status |
|---------------------|----------------|
| root-logical-system | enabled        |
| LSYS2               | enabled        |
| LSYS0               | enabled        |
| LSYS11              | enabled        |
| LSYS12              | enabled        |
| LSYS23              | enabled        |
| LSYS10              | enabled        |
| LSYS13              | enabled        |
| LSYS18              | enabled        |

When you use SRX Series devices running logical systems in a chassis cluster, you must purchase and install the same number of licenses for each node in the chassis cluster. Logical systems licenses pertain to a single chassis, or node, within a chassis cluster and not to the cluster collectively.

## Understanding the Interconnect Logical System and Logical Tunnel Interfaces

---

This topic covers the interconnect logical system that serves as an internal virtual private LAN service (VPLS) switch connecting one logical system on the device to another. The topic also explains how logical tunnel (lt-0/0/0) interfaces are used to connect logical systems through the interconnect logical system.

A device running logical systems can use an internal VPLS switch to pass traffic without it leaving the device. The interconnect logical system switches traffic across logical systems that use it. Although a virtual switch is used typically, it is not mandatory. If you choose to use a virtual switch, you must configure the interconnect logical system. There can be only one interconnect logical system on a device.

For communication between logical systems on the device to occur, you must configure an lt-0/0/0 interface on each logical system that will use the internal switch, and you must associate it with its peer lt-0/0/0 interface on the interconnect logical system, effectively creating a logical tunnel between them. You define a peer relationship at each end of the tunnel when you configure the logical system's lt-0/0/0 interfaces.

You might want all logical systems on the device to be able to communicate with one another without using an external switch. Alternatively, you might want some logical systems to connect across the internal switch but not all of them.

The interconnect logical system does not require security resources assigned to it through a security profile. However, you must assign a dummy security profile containing no resources to the interconnect logical system. Otherwise you will not be able to successfully commit the configuration for it.

**WARNING:** If you configure an `lt-0/0/0` interface in any user logical system or the master logical system and you do not configure an interconnect logical system containing a peer `lt-0/0/0` interface for it, the commit will fail.

An SRX Series device running logical systems can be used in a chassis cluster. Each node has the same configuration, including the interconnect logical system.

When you use SRX Series devices running logical systems within a chassis cluster, you must purchase and install the same number of licenses for each node in the chassis cluster. Logical systems licenses pertain to a single chassis, or node, within a chassis cluster and not to the cluster collectively.

## Understanding Flow in Logical Systems for SRX Series Devices

---

This topic explains how packets are processed in flow sessions on SRX Series devices running logical systems. It describes how an SRX Series device running logical systems handles pass-through traffic in a single logical system and between logical systems. It also covers self-traffic as self-initiated traffic within a logical system and self-traffic terminated on another logical system. Before addressing logical systems, the topic provides basic information about the SRX Series architecture in with respect to packet processing and sessions. Finally, it addresses sessions and how to change session characteristics.

The concepts explained in this example rely on the topology shown in [Figure 152](#).

- [About Configuring Sessions on page 3540](#)

## Understanding Junos OS SRX Series Services Gateways Architecture

Junos OS is a distributed parallel processing high throughput and high performance system. The distributed parallel processing architecture of the services gateways includes multiple processors to manage sessions and run security and other services processing. This architecture provides greater flexibility and allows for high throughput and fast performance.

The SRX5000 line devices include I/O cards (IOC) and Services Processing Cards (SPCs) that each contain processing units that process a packet as it traverses the device. A Network Processing Unit (NPU) runs on an IOC. An IOC has one or more NPUs. One or more Services Processing Units (SPUs) run on an SPC.

These processing units have different responsibilities. All flow-based services for a packet are executed on a single SPU. Otherwise, however, the lines are not clearly divided in regard to the kinds of services that run on these processors. (For details on flow-based processing, see ["Juniper Networks Devices Processing Overview" on page 1641.](#))

For example:

- An NPU processes packets discretely. It performs sanity checks and applies some screens that are configured for the interface, such as denial-of-service (DoS) screens, to the packet.
- An SPU manages the session for the packet flow and applies security features and other services to the packet. It also applies packet-based stateless firewall filters, classifiers, and traffic shapers to the packet.
- The system uses one processor as a central point to take care of arbitration and allocation of resources and distribute sessions in an intelligent way. The central point assigns an SPU to be used for a particular session when the first packet of its flow is processed.

These discrete, cooperating parts of the system, including the central point, each store the information identifying whether a session exists for a stream of packets and the information against which a packet is matched to determine if it belongs to an existing session.

This architecture allows the device to distribute processing of all sessions across multiple SPUs. It also allows an NPU to determine if a session exists for a packet, to check the packet, and to apply screens to it. How a packet is handled depends on whether it is the first packet of a flow.

Flow-based packet processing treats related packets, or a stream of packets, in the same way. Packet treatment depends on characteristics that are established for the first packet of the packet stream when the flow session is established. Most packet processing occurs within a flow. For the distributed processing architecture of the services gateway, some packet-based processing, such as traffic shaping, occurs on the NPU. Some packet-based processing, such as application of classifiers to a packet, occurs on the SPU.

Configuration settings that determine the fate of a packet—such as the security policy that applies to it, Application Layer Gateway (ALG)s configured for it, if NAT should be

applied to translate the packet's source and/or destination IP address—are assessed for the first packet of a flow.

## Session Creation for Devices Running Logical Systems

Session establishment for SRX Series devices running logical systems differs in minor ways from that of SRX series devices not running logical systems. Despite the complexities that logical systems introduce, traffic is handled in a manner similar to how it is handled on SRX Series devices not running logical systems. Flow-based packet processing, which is stateful, requires the creation of sessions. In considering flow based processing and session establishment for logical systems, it helps to think of each logical system on the device as a discrete device with respect to session establishment.

A session is created, based on routing and other classification information, to store information and allocate resources for a flow. Basically, a session is established when traffic enters a logical system interface, route lookup is performed to identify the next hop interface, and policy lookup is performed.

Optionally, logical systems enable you to configure an internal software switch. This virtual private LAN switch (VPLS) is implemented as an interconnect logical system. It enables both transit traffic and traffic terminated at a logical system to pass between logical systems. To enable traffic to pass between logical systems, logical tunnel (lt-0/0/0) interfaces across the interconnect logical system are used.

Communication between logical systems across the interconnect logical system requires establishment of two sessions: one for traffic that enters a logical system and exits its lt-0/0/0 interface, and one for traffic that enters the lt-0/0/0 interface of another logical system and either exits the device through one of its physical interface or is destined for it.

**NOTE:** Packet sequence occurs at the ingress and the egress interfaces. Packets traveling between logical systems might not be processed in the order in which they were received on the physical interface.

---

## Understanding Flow on Logical Systems

To understand how traffic is handled for logical systems, it is helpful to consider each logical system as a discrete device.

**NOTE:** Traffic is processed for the master logical system in the same way as it is for user logical systems on the device.

---

## Understanding Packet Classification

Packet classification is assessed the same way for SRX Series devices running with or without logical systems. Filters and class-of-service features are typically associated with an interface to influence which packets are allowed to transit the system and to

apply special actions to packets as needed. (Within a flow, some packet-based processing also takes place on an SPU.)

Packet classification is based on the incoming interface and performed at the ingress point. Traffic for a dedicated interface is classified to the logical system that contains that interface. Within the context of a flow, packet classification is based on both the physical interface and the logical interface.

## Handling Pass-Through Traffic for Logical Systems

For SRX Series devices not running logical systems, pass-through traffic is traffic that enters and exits a device. You can think of pass-through traffic for logical systems similarly, but as having a larger dimension as a result of the nature of a multitenant device. For SRX Series devices running logical systems, pass-through traffic can exist within a logical system or between logical systems.

- [Pass-Through Traffic Within a Logical System on page 3537](#)
- [Pass-Through Traffic Between Logical Systems on page 3537](#)

### Pass-Through Traffic Within a Logical System

---

For pass-through traffic within a logical system, traffic comes in on an interface belonging to one of the logical system's virtual routing instances, and it is sent to another of its virtual routing instances. To exit the device, the traffic is sent out an interface belonging to the second virtual routing instance. The traffic does not transit between logical systems but rather enters and exits the device in a single logical system. Pass-through traffic within a logical system is transmitted according to the routing tables in each of its routing instances.

Consider how pass-through traffic is handled within a logical system given the topology shown in [Figure 152](#).

- When a packet arrives on interface ge-0/0/5, it is identified as belonging to the ls-product-design logical system.
- Because ge-0/0/5 belongs to the pd-vr1 routing instance, route lookup is performed in pd-vr1 with pd-vr2 identified as the next hop.
- A second route lookup is performed in pd-vr2 to identify the egress interface to use—in this case— ge-0/0/8.
- The packet is sent out ge-0/0/8 to the network.
- The security policy lookup is performed in ls-product-design, and one session is established.

### Pass-Through Traffic Between Logical Systems

---

Pass-through traffic between logical systems is complicated by fact that each logical system has an ingress and an egress interface that the traffic must transit. It is as if traffic were coming into and going out from two devices.

Two sessions must be established for pass-through traffic between logical systems. (Note that policy lookup is performed in both logical systems).

- On the incoming logical system, one session is set up between the ingress interface (a physical interface) and its egress interface (an lt-0/0/0 interface).
- On the egress logical system, another session is set up between the ingress interface (the lt-0/0/0 interface of the second logical system) and its egress interface (a physical interface).

Consider how pass-through traffic is handled across logical systems in the topology shown in [Figure 152](#).

- A session is established in the incoming logical system.
  - When a packet arrives on interface ge-0/0/5, it is identified as belonging to the ls-product-design logical system.
  - Because ge-0/0/5 belongs to the pd-vr1 routing instance, route lookup is performed in pd-vr1.
  - As a result of the lookup, the egress interface for the packet is identified as lt-0/0/0.3 with the next hop identified as lt-0/0/0.5, which is the ingress interface in the ls-marketing-dept.
- A session is established between ge-0/0/5 and lt-0/0/0.3.
- A session is established in the outgoing logical system.
  - The packet is injected into the flow again from lt-0/0/0.5, and the logical system context identified as ls-marketing-dept is derived from the interface.
  - Packet processing continues in the ls-marketing-dept logical system.
  - To identify the egress interface, route lookup for the packet is performed in the mk-vr1 routing instances.
  - The outgoing interface is identified as ge-0/0/6, and the packet is transmitted from the interface to the network.

## Handling Self-Traffic

Self-traffic is traffic that originates in a logical system on the device and is either sent out to the network from that logical system or is terminated on another logical system on the device.

### Self-Initiated Traffic

---

Self-initiated traffic is generated from a source logical system context and forwarded directly to the network from the logical system interface.

The following process occurs:

- When a packet is generated in a logical system, a process for handling the traffic is started in the logical system.
- Route lookup is performed to identify the egress interface, and a session is established.
- The logical system performs a policy lookup and processes the traffic accordingly.
- If required, a management session is set up.

Consider how self-initiated traffic is handled across logical systems given the topology shown in [Figure 152](#).

- A packet is generated in the ls-product-design logical system, and a process for handling the traffic is started in the logical system.
- Route lookup performed in pd-vr2 to identifies the egress interface as ge-0/0/8.
- A session is established.
- The packet is transmitted to the network from ge-0/0/8.

---

### Traffic Terminated on a Logical System

When a packet enters the device on an interface belonging to a logical system and the packet is destined for another logical system on the device, the packet is forwarded between the logical systems in the same manner as is pass-through traffic. However, route lookup in the second logical system identifies the local egress interface as the packet destination. Consequently the packet is terminated on the second logical system as self-traffic.

- For terminated self-traffic, two policy lookups are performed, and two sessions are established.
  - On the incoming logical system, one session is set up between the ingress interface (a physical interface) and its egress interface (an lt-0/0/0 interface).
  - On the destination logical system, another session is set up between the ingress interface (the lt-0/0/0 interface of the second logical system) and the local interface.

Consider how terminated self-traffic is handled across logical systems in the topology shown in [Figure 152](#).

- A session is established in the incoming logical system.
  - When a packet arrives on interface ge-0/0/5, it is identified as belonging to the ls-product-design logical system.
  - Because ge-0/0/5 belongs to the pd-vr1 routing instance, route lookup is performed in pd-vr1.
  - As a result of the lookup, the egress interface for the packet is identified as lt-0/0/0.3 with the next hop identified as lt-0/0/0.5, the ingress interface in the ls-marketing-dept.
- A session is established between ge-0/0/5 and lt-0/0/0.3.

- A management session is established in the destination logical system.
  - The packet is injected into the flow again from lt-0/0/0.5, and the logical system context identified as ls-marketing-dept is derived from the interface.
  - Packet processing continues in the ls-marketing-dept logical system.
  - Route lookup for the packet is performed in the mk-vr1 routing instance. The packet is terminated in the destination logical system as self-traffic.
- A management session is established.

## Understanding Session and Gate Limitation Control

The logical systems flow module provides session and gate limitation to ensure that these resources are shared fairly among the logical systems. Resources allocation and limitations for each logical system are specified in the security profile bound to the logical system.

- For session limiting, the system checks the first packet of a session against the maximum number of sessions configured for the logical system. If the maximum is reached, the device drops the packet and logs the event.
- For gate limiting, the device checks the first packet of a session against the maximum number of gates configured for the logical system. If the maximum number of gates for a logical system is reached, the device rejects the gate open request and logs the event.

## Understanding Sessions

Sessions are created based on routing and other classification information to store information and allocate resources for a flow. You can change some characteristics of sessions, such as when a session is terminated. For example, you might want to ensure that a session table is never entirely full to protect against an attacker's attempt to flood the table and thereby prevent legitimate users from starting sessions.

## About Configuring Sessions

Depending on the protocol and service, a session is programmed with a timeout value. For example, the default timeout for TCP is 1800 seconds. The default timeout for UDP is 60 seconds. When a flow is terminated, it is marked as invalid, and its timeout is reduced to 10 seconds. If no traffic uses the session before the service timeout, the session is aged out and freed to a common resource pool for reuse.

You can affect the life of a session in the following ways:

- Age out sessions, based on how full the session table is.
- Set an explicit timeout for aging out TCP sessions.
- Configure a TCP session to be invalidated when it receives a TCP RST (reset) message.
- You can configure sessions to accommodate other systems as follows:
  - Disable TCP packet security checks.

- Change the maximum segment size.

**Related  
Documentation**

# Understanding Master Logical Systems

- [Understanding the Master Logical System and the Master Administrator Role on page 3543](#)
- [SRX Series Logical System Master Administrator Configuration Tasks Overview on page 3544](#)

## Understanding the Master Logical System and the Master Administrator Role

When, as a master administrator, you initialize an SRX Series device running logical systems, a master logical system is created at the root level. You can log in to the device as root and change the root password.

By default, all system resources are assigned to the master logical system, and the master administrator allocates them to the user logical systems.

As master administrator, you manage the device and all its logical systems. You also manage the master logical system and configure its assigned resources. There can be more than one master administrator managing a device running logical systems.

- The master administrator's role and main responsibilities include:
  - Creating user logical systems and configuring their administrators. You can create one or more user logical system administrators for each user logical system.
  - Creating login accounts for users for all logical systems and assigning them to the appropriate logical systems.
  - Configuring an interconnect logical system if you want to allow communication between logical systems on the device. The interconnect logical system acts as an internal switch. It does not require an administrator.

To configure an interconnect logical system, you configure `lt-0/0/0` interfaces between the interconnect logical system and each logical system. These peer interfaces effectively allow for establishment of tunnels.

- Configuring security profiles to provision portions of the system's security resources to user logical systems and the master logical system.

Only the master administrator can create, change, and delete security profiles and bind them to logical systems.

**NOTE:** A user logical system administrator can configure interface, routing, and security resources allocated to his logical system.

- Creating logical interfaces to assign to user logical systems. (The user logical system administrator configures logical interfaces assigned to his logical system.)
- Viewing and managing user logical systems, as required, and deleting user logical systems. When a user logical system is deleted, its allocated reserved resources are released for use by other logical systems.
- Configuring IDP, AppTrack, application identification, and application firewall features. The master administrator can also use trace and debug at the root level, and he can perform commit rollbacks. The master administrator manages the master logical system and configures all the features that a user logical system administrator can configure for his or her own logical systems including routing instances, static routes, dynamic routing protocols, zones, security policies, screens, and firewall authentication.

---

## SRX Series Logical System Master Administrator Configuration Tasks Overview

This topic identifies and describes the master administrator's tasks in the order in which they are performed.

An SRX Series device running logical systems is managed by a master administrator. The master administrator has the same capabilities as the root administrator of an SRX Series device not running logical systems. However, the master administrator's role and responsibilities extend beyond those of other SRX Series device administrators because an SRX Series device running logical systems is partitioned into discrete logical systems, each with its own resources, configuration, and management concerns. The master administrator is responsible for creating these user logical systems and provisioning them with resources.

For an overview of the master administrator's role and responsibilities, see "[Understanding the Master Logical System and the Master Administrator Role](#)" on page 3543.

As the master administrator, you perform the following tasks to configure an SRX Series device running logical systems:

1. Configure a root password. Initially the master administrator logs in to the device as the root user without needing to specify a password. After you log in to the device, you must define a root password for later use.

See [“Example: Configuring a Root Password for the Device \(Master Administrators Only\)” on page 3563](#) for configuration information.

2. Create user logical systems and their administrators and users. Optionally, create an interconnect logical system.

For each user logical system that you want to configure on the device, you must create a logical system, define one or more administrators for it, and add users to it.

The master administrator configures login accounts for user logical system administrators and users and associates them with the user logical system. A user logical system can have more than one administrator; the master administrator must define and add all user logical system administrators and add them to their user logical systems.

The master administrator adds users to user logical systems on behalf of the user logical system administrator. For example, if you have created a user logical system for the product design department, you must create user accounts for the users who belong to that department and associate them with the user logical system. The user logical system administrator does not have the ability to do this. Rather, the user logical administrator tells you the user accounts that you must create and add for his logical system.

If you intend to use an internal virtual private LAN service (VPLS) switch to allow logical systems to communicate with one another, you must create an interconnect logical system. An interconnect logical system does not require an administrator.

- For configuration information, see [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#)
  - For information on user logical system administrators, see [“Understanding User Logical Systems and the User Logical System Administrator Role” on page 3549](#).
  - For information on the interconnect logical system, see [“Understanding the Interconnect Logical System and Logical Tunnel Interfaces” on page 3532](#).
3. Configure one or more security profiles. Security profiles assign security resources to logical systems. You can assign a single security profile to more than one logical system if you intend to allocate the same kinds and amounts of resources to them.
    - For configuration information, see [“Example: Configuring Logical Systems Security Profiles \(Master Administrators Only\)” on page 3580](#).
    - For information on security profiles, see [“Understanding Logical System Security Profiles \(Master Administrators Only\)” on page 3575](#).
  4. Configure interfaces, routing instances, and static routes for logical systems, as appropriate.
    - If you plan to use an interconnect logical system, configure its logical tunnel interfaces and add them to its virtual routing instance.

- Configure interfaces for the master logical system. Optionally, create its logical tunnel interface to allow it to communicate with other logical systems on the device. Create a virtual routing instance for the master logical system and add its interfaces and static routes to it. Also configure logical interfaces for user logical systems with VLAN tagging.

**NOTE:** The master administrator tells the user logical system administrators which interfaces are assigned to their logical systems. It is the user logical system administrator's responsibility to configure their interfaces.

- Optionally, configure logical tunnel interfaces for any user logical systems that you want to allow to communicate with one another using the internal VPLS switch.
  - For configuration information, see [“Example: Configuring Interfaces, Routing Instances, and Static Routes for the Master and Interconnect Logical Systems and Logical Tunnel Interfaces for the User Logical Systems \(Master Administrators Only\)”](#) on page 3664.
  - For information about the interconnect logical system and logical tunnel (lt-0/0/0) interfaces, see [“Understanding the Interconnect Logical System and Logical Tunnel Interfaces”](#) on page 3532.
5. Enable CPU utilization control and configure the CPU control target and reserved CPU quotas for logical systems. See [“Example: Configuring CPU Utilization \(Master Administrators Only\)”](#) on page 3787.
  6. Optionally, configure dynamic routing protocols for the master logical system. See [“Example: Configuring OSPF Routing Protocol for the Master Logical System”](#) on page 3672.
  7. Configure zones, security policies, and security features for the master logical system. See [“Example: Configuring Security Features for the Master Logical System”](#) on page 3593.
  8. Configure IDP for the master logical system. See [“Example: Configuring an IDP Policy for the Master Logical System”](#) on page 3603.
  9. Configure application firewall services on the master logical system. See [“Understanding Logical System Application Firewall Services”](#) on page 3609 and [“Example: Configuring Application Firewall Services for a Master Logical System”](#) on page 3610.
  10. Configure a route-based VPN to secure traffic between a logical system and a remote site. See [“Example: Configuring IKE and IPsec SAs for a VPN Tunnel \(Master Administrators Only\)”](#) on page 3616.

## User Logical System Configuration Overview

---

When the master administrator creates a user logical system, he assigns a user logical system administrator to manage it. A user logical system can have multiple user logical system administrators.

As a user logical system administrator, you can access and view resources in your user logical system but not those of other user logical systems or the master logical system. You can configure resources allocated to your user logical system, but you cannot modify the numbers of allocated resources.

The following procedure lists the tasks that the user logical system administrator performs to configure resources in the user logical system:

1. Log in to the user logical system with the login and password configured by the master administrator:
  - a. Telnet or SSH to the management IP address configured on the device. Log in to the user logical system with the administrator login and password provided by the master administrator.

You enter a UNIX shell in the user logical system configured by the master administrator.
  - b. The presence of the > prompt indicates the CLI has started. The prompt is preceded by a string that contains your username, the hostname of the router, and the name of the user logical system. When the CLI starts, you are at the top level in operational mode. You enter configuration mode by entering the **configure** operational mode command. The CLI prompt changes from `user@host: logical-system>` to `user@host: logical-system#`.

To exit the CLI and return to the UNIX shell, enter the **quit** command.

2. Configure the logical interfaces assigned to the user logical system by the master administrator. Configure one or more routing instances and the routing protocols and options within each instance. See [“Example: Configuring Interfaces and Routing Instances for a User Logical System”](#) on page 3682.

3. Configure security resources for the user logical system:

- a. Create zones for the user logical system and bind the logical interfaces to the zones. Address books can be created that are attached to zones for use in policies. See [“Example: Configuring Zones for a User Logical System”](#) on page 3623.
- b. Configure screen options at the zone level. See [“Example: Configuring Screen Options for a User Logical System”](#) on page 3626.
- c. Configure security policies between zones in the user logical system. See [“Example: Configuring Security Policies in a User Logical System”](#) on page 3630.

Custom applications or application sets can be created for specific types of traffic. To create a custom application, use the **application** configuration statement at the [edit applications] hierarchy level. To create an application set, use the **application-set** configuration statement at the [edit applications] hierarchy level.

- d. Configure firewall authentication. The master administrator creates access profiles in the master logical system. See [“Example: Configuring Access Profiles \(Master Administrators Only\)”](#) on page 3591.

The user logical system administrator then configures a security policy that specifies firewall authentication for matching traffic and configures the type of authentication (pass-through or Web authentication), default access profile, and success banner. See [“Example: Configuring Firewall Authentication for a User Logical System”](#) on page 3635.

- e. Configure a route-based VPN tunnel to secure traffic between a user logical system and a remote site. The master administrator assigns a secure tunnel interface to the user logical system and configures IKE and IPsec SAs for the VPN tunnel. See [“Example: Configuring IKE and IPsec SAs for a VPN Tunnel \(Master Administrators Only\)”](#) on page 3616.

The user logical system administrator then configures a route-based VPN tunnel. See [“Example: Configuring a Route-Based VPN Tunnel in a User Logical System”](#) on page 3657.

- f. Configure Network Address Translation (NAT). See [“Example: Configuring Network Address Translation for a User Logical System”](#) on page 3678.
- g. Enable IDP. The master administrator configures IDP policies at the root level and specifies an IDP policy in the security profile that is bound to a logical system. See [“Example: Configuring an IDP Policy for a User Logical System”](#) on page 3643.

The user logical system administrator then enables IDP in a security policy. See [“Example: Enabling IDP in a User Logical System Security Policy”](#) on page 3645.

- h. Display or clear application system cache (ASC) entries. See [“Understanding Logical System Application Identification Services”](#) on page 3608.

- i. Configure application firewall services on a user logical system. See [“Understanding Logical System Application Firewall Services” on page 3609](#) and [“Example: Configuring Application Firewall Services for a User Logical System” on page 3648](#).
- j. Configure the AppTrack application tracking tool. See [“Example: Configuring AppTrack for a User Logical System” on page 3653](#).

## Understanding User Logical Systems and the User Logical System Administrator Role

Logical systems allow a master administrator to partition an SRX Series device into discrete contexts called user logical systems. User logical systems are self-contained, private contexts, separate both from one another and from the master logical system. A user logical system has its own security, networking, logical interfaces, routing configurations, and one or more user logical system administrators.

When the master administrator creates a user logical system, he assigns one or more user logical system administrators to manage it. A user logical system administrator has a view of the device that is limited to his logical system. Although a user logical system is managed by a user logical system administrator, the master administrator has a global view of the device and access to all user logical systems. If necessary, the master administrator can manage any user logical system on the device.

The role and responsibilities of a user logical system administrator differ from those of the master administrator. As a user logical system administrator, you can access, configure, and view the configuration for your user logical system resources, but not those of other user logical systems or the master logical system.

As a user logical system administrator, you can:

- Configure zones, address books, security policies, user lists, custom services, and so forth, for your user logical system environment, based on the resources allocated to it.

For example, if the master administrator allocates 40 zones to your user logical system, you can configure and administer those zones, but you cannot change the allocated number.

- Configure routing instances and assign allotted interfaces to them. Create static routes and add them to your routing instances. Configure routing protocols.
- Configure, enable, and monitor application firewall policy on your user logical system.
- Configure AppTrack.

- View all assigned logical interfaces and configure their attributes. The attributes that you configure for logical interfaces for your user logical system cannot be seen by other user logical system administrators.
- Run operational commands for your user logical system.

## Example: Configuring User Logical Systems

---

This example shows the configuration of interfaces, routing instances, zones, and security policies for user logical systems.

- [Requirements on page 3550](#)
- [Overview on page 3550](#)
- [Configuration on page 3552](#)
- [Verification on page 3560](#)

### Requirements

Before you begin:

- Log in to the user logical system as the logical system administrator. See [“User Logical System Configuration Overview” on page 3547](#).
- Be sure you know which logical interfaces and optionally, which logical tunnel interface (and its IP address) are allocated to your user logical system by the master administrator. See [“Understanding the Master Logical System and the Master Administrator Role” on page 3543](#).

### Overview

This example configures the ls-marketing-dept and ls-accounting-dept user logical systems shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#).

This example configures the parameters described in [Table 367](#) and [Table 368](#).

Table 367: ls-marketing-dept Logical System Configuration

| Feature          | Name                      | Configuration Parameters                                                                                                                                                                                                                                                                                                       |

| Zones            | ls-accounting-trust       | Bind to interface ge-0/0/7.1.                                                                                                                                                                                                                                                                                                  |
|                  | ls-accounting-untrust     | Bind to interface lt-0/0/0.7                                                                                                                                                                                                                                                                                                   |
| Address books    | accounting-internal       | <ul style="list-style-type: none"> <li>Address accounting: 14.1.1.0/24</li> <li>Attach to zone ls-accounting-trust</li> </ul>                                                                                                                                                                                                  |
|                  | accounting-external       | <ul style="list-style-type: none"> <li>Address design: 12.1.1.0/24</li> <li>Address marketing: 13.1.1.0/24</li> <li>Address others: 12.12.1.0/24</li> <li>Address set otherlsys: design, marketing</li> <li>Attach to zone ls-accounting-untrust</li> </ul>                                                                    |
| Policies         | permit-all-to-otherlsys   | Permit the following traffic: <ul style="list-style-type: none"> <li>From zone: ls-accounting-trust</li> <li>To zone: ls-accounting-untrust</li> <li>Source address: accounting</li> <li>Destination address: otherlsys</li> <li>Application: any</li> </ul>                                                                   |
|                  | permit-all-from-otherlsys | Permit the following traffic: <ul style="list-style-type: none"> <li>From zone: ls-accounting-untrust</li> <li>To zone: ls-accounting-trust</li> <li>Source address: otherlsys</li> <li>Destination address: accounting</li> <li>Application: any</li> </ul>                                                                   |

## Configuration

- [Configuring the ls-marketing-dept User Logical System on page 3552](#)
- [Configuring the ls-accounting-dept User Logical System on page 3556](#)

### Configuring the ls-marketing-dept User Logical System

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/6 unit 1 family inet address 13.1.1.1/24
set interfaces ge-0/0/6 unit 1 vlan-id 800
set routing-instances mk-vr1 instance-type virtual-router
set routing-instances mk-vr1 interface ge-0/0/6.1
set routing-instances mk-vr1 interface lt-0/0/0.5
set routing-instances mk-vr1 routing-options static route 12.1.1.0/24 next-hop 10.0.1.2

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a user logical system:

1. Log in to the user logical system as the logical system administrator and enter configuration mode.
 

```

lsmarketingadmin1@host:ls-marketing-dept> configure
lsmarketingadmin1@host:ls-marketing-dept#

```
2. Configure the logical interface for a user logical system.
 

```

[edit interfaces]
lsmarketingadmin1@host:ls-marketing-dept# set ge-0/0/6 unit 1 family inet address
13.1.1.1/24
lsmarketingadmin1@host:ls-marketing-dept# set ge-0/0/6 unit 1 vlan-id 800

```
3. Configure the routing instance and assign interfaces.
 

```

[edit routing-instances]

```

```
lsmarketingadmin1@host:ls-marketing-dept# set mk-vr1 instance-type virtual-router
lsmarketingadmin1@host:ls-marketing-dept# set mk-vr1 interface ge-0/0/6.1
lsmarketingadmin1@host:ls-marketing-dept# set mk-vr1 interface lt-0/0/0.5
```

4. Configure static routes.

```
[edit routing-instances]
lsmarketingadmin1@host:ls-marketing-dept# set mk-vr1 routing-options static route
12.1.1.0/24 next-hop 10.0.1.2
lsmarketingadmin1@host:ls-marketing-dept# set mk-vr1 routing-options static route
14.1.1.0/24 next-hop 10.0.1.4
lsmarketingadmin1@host:ls-marketing-dept# set mk-vr1 routing-options static route
12.12.1.0/24 next-hop 10.0.1.1
```

5. Configure security zones and assign interfaces to each zone.

```
[edit security zones]
lsmarketingadmin1@host:ls-marketing-dept# set security-zone ls-marketing-trust
interfaces ge-0/0/6.1
lsmarketingadmin1@host:ls-marketing-dept# set security-zone ls-marketing-untrust
interfaces lt-0/0/0.5
```

6. Create address book entries.

```
[edit security]
lsmarketingadmin1@host:ls-marketing-dept# set address-book marketing-internal
address marketers 13.1.1.0/24
lsmarketingadmin1@host:ls-marketing-dept# set address-book marketing-external
address design 12.1.1.0/24
lsmarketingadmin1@host:ls-marketing-dept# set address-book marketing-external
address accounting 14.1.1.0/24
lsmarketingadmin1@host:ls-marketing-dept# set address-book marketing-external
address others 12.12.1.0/24
lsmarketingadmin1@host:ls-marketing-dept# set address-book marketing-external
address-set otherlsys address design
lsmarketingadmin1@host:ls-marketing-dept# set address-book marketing-external
address-set otherlsys address accounting
```

7. Attach address books to zones.

```
[edit security]
lsmarketingadmin1@host:ls-marketing-dept# set address-book marketing-internal
attach zone ls-marketing-trust
lsmarketingadmin1@host:ls-marketing-dept# set address-book marketing-external
attach zone ls-marketing-untrust
```

8. Configure a security policy that permits traffic from the ls-marketing-trust zone to the ls-marketing-untrust zone.

```
[edit security policies from-zone ls-marketing-trust to-zone ls-marketing-untrust]
lsmarketingadmin1@host:ls-marketing-dept# set policy permit-all-to-otherlsys
match source-address marketers
lsmarketingadmin1@host:ls-marketing-dept# set policy permit-all-to-otherlsys
match destination-address otherlsys
lsmarketingadmin1@host:ls-marketing-dept# set policy permit-all-to-otherlsys
match application any
lsmarketingadmin1@host:ls-marketing-dept# set policy permit-all-to-otherlsys then
permit
```

9. Configure a security policy that permits traffic from the ls-marketing-untrust zone to the ls-marketing-trust zone.

```
[edit security policies from-zone ls-marketing-untrust to-zone ls-marketing-trust]
lsmarketingadmin1@host:ls-marketing-dept# set policy permit-all-from-otherlsys
match source-address otherlsys
lsmarketingadmin1@host:ls-marketing-dept# set policy permit-all-from-otherlsys
match destination-address marketers
lsmarketingadmin1@host:ls-marketing-dept# set policy permit-all-from-otherlsys
match application any
lsmarketingadmin1@host:ls-marketing-dept# set policy permit-all-from-otherlsys
then permit
```

**Results** From configuration mode, confirm your configuration by entering the **show routing-instances** and **show security** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
lsmarketingadmin1@host:ls-marketing-dept# show routing instances
mk-vr1 {
 instance-type virtual-router;
 interface ge-0/0/6.1;
 interface lt-0/0/0.5;
 routing-options {

 interfaces {
 ge-0/0/6.1;
 }
 }
 security-zone ls-marketing-untrust {
 interfaces {
 lt-0/0/0.5;
 }
 }
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring the ls-accounting-dept User Logical System

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/7 unit 1 family inet address 14.1.1.1/24
set interfaces ge-0/0/7 unit 1 vlan-id 900
set routing-instances acct-vr1 instance-type virtual-router
set routing-instances acct-vr1 interface ge-0/0/7.1
set routing-instances acct-vr1 interface lt-0/0/0.7
set routing-instances acct-vr1 routing-options static route 12.12.1.0/24 next-hop 10.0.1.1
set routing-instances acct-vr1 routing-options static route 12.1.1.0/24 next-hop 10.0.1.2
set routing-instances acct-vr1 routing-options static route 13.1.1.0/24 next-hop 10.0.1.3
set security address-book accounting-internal address accounting 14.1.1.0/24
set security address-book accounting-internal attach zone ls-accounting-trust
set security address-book accounting-external address design 12.1.1.0/24

```

```

set security address-book accounting-external address marketing 13.1.1.0/24
set security address-book accounting-external address others 12.12.1.0/24
set security address-book accounting-external address-set otherlsys address design
set security address-book accounting-external address-set otherlsys address marketing
set security address-book accounting-external attach zone ls-accounting-untrust
set security policies from-zone ls-accounting-trust to-zone ls-accounting-untrust policy

set security policies from-zone ls-accounting-trust to-zone ls-accounting-untrust policy
 permit-all-to-otherlsys then permit
set security policies from-zone ls-accounting-untrust to-zone ls-accounting-trust policy
 permit-all-from-otherlsys match source-address otherlsys
set security policies from-zone ls-accounting-untrust to-zone ls-accounting-trust policy
 permit-all-from-otherlsys match destination-address accounting
set security policies from-zone ls-accounting-untrust to-zone ls-accounting-trust policy
 permit-all-from-otherlsys match application any
set security policies from-zone ls-accounting-untrust to-zone ls-accounting-trust policy
 permit-all-from-otherlsys then permit
set security zones security-zone ls-accounting-trust interfaces ge-0/0/7.1
set security zones security-zone ls-accounting-untrust interfaces lt-0/0/0.7

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a user logical system:

1. Log in to the user logical system as the logical system administrator and enter configuration mode.
 

```

lsaccountingadmin1@host:ls-accounting-dept> configure
lsaccountingadmin1@host:ls-accounting-dept#

```
2. Configure the logical interface for a user logical system.
 

```

[edit interfaces]
lsaccountingadmin1@host:ls-accounting-dept# set ge-0/0/7 unit 1 family inet
 address 14.1.1.1/24
lsaccountingadmin1@host:ls-accounting-dept# set ge-0/0/7 unit 1 vlan-id 900

```
3. Configure the routing instance and assign interfaces.
 

```

[edit routing-instances]
lsaccountingadmin1@host:ls-accounting-dept# set acct-vr1 instance-type
 virtual-router
lsaccountingadmin1@host:ls-accounting-dept# set acct-vr1 interface ge-0/0/7.1
lsaccountingadmin1@host:ls-accounting-dept# set acct-vr1 interface lt-0/0/0.7

```
4. Configure static routes.
 

```

[edit routing-instances]
lsaccountingadmin1@host:ls-accounting-dept# set acct-vr1 routing-options static
 route 12.1.1.0/24 next-hop 10.0.1.2
lsaccountingadmin1@host:ls-accounting-dept# set acct-vr1 routing-options static
 route 13.1.1.0/24 next-hop 10.0.1.3

```

```
lsaccountingadmin1@host:ls-accounting-dept# set acct-vr1 routing-options static
route 12.12.1.0/24 next-hop 10.0.1.1
```

5. Configure security zones and assign interfaces to each zone.

```
[edit security zones]
lsaccountingadmin1@host:ls-accounting-dept# set security-zone ls-accounting-trust
interfaces ge-0/0/7.1
lsaccountingadmin1@host:ls-accounting-dept# set security-zone
ls-accounting-untrust interfaces lt-0/0/0.7
```

6. Create address book entries.

```
[edit security]
lsaccountingadmin1@host:ls-accounting-dept# set address-book accounting-internal
address accounting 14.1.1.0/24
lsaccountingadmin1@host:ls-accounting-dept# set address-book
accounting-external address design 12.1.1.0/24
lsaccountingadmin1@host:ls-accounting-dept# set address-book
accounting-external address marketing 13.1.1.0/24
lsaccountingadmin1@host:ls-accounting-dept# set address-book
accounting-external address others 12.12.1.0/24
lsaccountingadmin1@host:ls-accounting-dept# set address-book
accounting-external address-set otherlsys address design
lsaccountingadmin1@host:ls-accounting-dept# set address-book
accounting-external address-set otherlsys address marketing
```

7. Attach address books to zones.

```
[edit security]
lsaccountingadmin1@host:ls-accounting-dept# set address-book accounting-internal
attach zone ls-accounting-trust
lsaccountingadmin1@host:ls-accounting-dept# set address-book
accounting-external attach zone ls-accounting-untrust
```

8. Configure a security policy that permits traffic from the ls-accounting-trust zone to the ls-accounting-untrust zone.

```
[edit security policies from-zone ls-accounting-trust to-zone ls-accounting-untrust]
lsaccountingadmin1@host:ls-accounting-dept# set policy permit-all-to-otherlsys
match source-address accounting
lsaccountingadmin1@host:ls-accounting-dept# set policy permit-all-to-otherlsys
match destination-address otherlsys
lsaccountingadmin1@host:ls-accounting-dept# set policy permit-all-to-otherlsys
match application any
lsaccountingadmin1@host:ls-accounting-dept# set policy permit-all-to-otherlsys
then permit
```

9. Configure a security policy that permits traffic from the ls-accounting-untrust zone to the ls-accounting-trust zone.

```
[edit security policies from-zone ls-accounting-untrust to-zone ls-accounting-trust]
lsaccountingadmin1@host:ls-accounting-dept# set policy permit-all-from-otherlsys
match source-address otherlsys
lsaccountingadmin1@host:ls-accounting-dept# set policy permit-all-from-otherlsys
match destination-address accounting
lsaccountingadmin1@host:ls-accounting-dept# set policy permit-all-from-otherlsys
match application any
```

```
lsaccountingadmin1@host:ls-accounting-dept# set policy permit-all-from-otherlsys
then permit
```

**Results** From configuration mode, confirm your configuration by entering the **show routing-instances** and **show security** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
lsaccountingadmin1@host:ls-accounting-dept# show routing-instances
acct-vr1 {
 instance-type virtual-router;
 interface ge-0/0/7.1;
 interface lt-0/0/0.7;
 routing-options {
 static {
 route 12.12.1.0/24 next-hop 10.0.1.1;
 route 12.1.1.0/24 next-hop 10.0.1.2;
 route 13.1.1.0/24 next-hop 10.0.1.3;
 }
 }
}
lsaccountingadmin1@host:ls-accounting-dept# show security
address-book {
 accounting-internal {
 address accounting 14.1.1.0/24;

## PART 47

# Getting Started for Master Administrators

- [Configuring Device for Master Logical Systems on page 3563](#)

# Configuring Device for Master Logical Systems

- [Example: Configuring a Root Password for the Device \(Master Administrators Only\)](#) on page 3563
- [Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)](#) on page 3564

## Example: Configuring a Root Password for the Device (Master Administrators Only)

- [Requirements](#) on page 3563
- [Overview](#) on page 3563
- [Configuration](#) on page 3563

### Requirements

Before you begin, read "[SRX Series Logical System Master Administrator Configuration Tasks Overview](#)" on page 3544 to understand how this task fits into the overall configuration process.

The example uses an SRX5600 device running Junos OS with logical systems.

### Overview

The Junos OS software is installed on the router before it is delivered from the factory. When you power on your router, it is ready for you to configure. Initially you log in as *root* user without using a password.

After you log in, you can configure a password for the root user, or, in logical systems terms, the master administrator. The master administrator has root privileges over the device.

### Configuration

- [Configuring the Root Password](#) on page 3564

### Configuring the Root Password

#### Step-by-Step Procedure

- Configure a root password for the device.  
user@host# **set system root-authentication Talk22rt6**

#### Related Documentation

- [Understanding the Master Logical System and the Master Administrator Role on page 3543](#)
- [Understanding Logical Systems for SRX Series Services Gateways on page 3527](#)

## Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System (Master Administrators Only)

This example shows how to create user logical systems and assign administrators to them. It shows how to add users to a user logical system. And the example shows how to create an interconnect logical system, which is optional.

**NOTE:** Only the master administrator can create user login accounts for administrators and users. If a user logical system administrator wants to add users to his logical system, he must convey the information to the master administrator, who will add the users.

- [Requirements on page 3564](#)
- [Overview on page 3564](#)
- [Configuration on page 3566](#)
- [Verification on page 3570](#)

### Requirements

The example uses an SRX5600 device running Junos OS with logical systems.

### Overview

Before you begin, read “[SRX Series Logical System Master Administrator Configuration Tasks Overview](#)” on [page 3544](#) to understand how this task fits into the overall configuration process.

This example is for a company that includes product design, marketing, and accounting departments. The company wants to curtail hardware and energy costs, but not at the risk of exposing data across departments or to the Internet.

Each department has its own security requirements in regard both to other departments and to the Internet. To meet its requirements for cost control without forfeiting security, the company deploys the SRX5600 device. The master administrator configures three user logical systems giving each department a logical device that is private and fully secured.

This topic covers how to:

- Create user logical systems and an interconnect logical system that is used as an internal VPLS switch to allow traffic to pass from one logical system to another.
- Create administrators for user logical systems other than the interconnect logical system. A user logical system can have more than one administrator. The interconnect logical system does not require an administrator.
- Add users to a user logical system.

**NOTE:** This example shows how to configure only two users—`lsdesignuser1` and `lsdesignuser2`. In reality, every user logical system will include many users that would require configurations similar to those shown in this example.

Figure 153 shows an SRX5600 device deployed and configured for logical systems. The configuration examples reflect this deployment.

Figure 153: SRX Series Device Configured for Logical Systems

## Configuration

- [Configuring User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System on page 3566](#)

### Configuring User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set logical-systems ls-product-design
set system login class ls-design-admin logical-system ls-product-design
set system login class ls-design-admin permissions all
set system login user lsdesignadmin1 full-name lsdesignadmin1
set system login user lsdesignadmin1 class ls-design-admin
set system login user lsdesignadmin1 authentication encrypted-password "$ABC123"
set system login class ls-design-user logical-system ls-product-design
set system login class ls-design-user permissions view
set system login user lsdesignuser1 full-name lsdesignuser1
set system login user lsdesignuser1 class ls-design-user
set system login user lsdesignuser1 authentication encrypted-password "$ABC123"
set system login user lsdesignuser2 full-name lsdesignuser2
set system login user lsdesignuser2 class ls-design-user
set system login user lsdesignuser2 authentication encrypted-password "$ABC123"
set logical-systems ls-marketing-dept
set system login class ls-marketing-admin logical-system ls-marketing-dept
set system login class ls-marketing-admin permissions all
set system login user lsmarketingadmin1 class ls-marketing-admin
set system login user lsmarketingadmin1 full-name lsmarketingadmin1
set system login user lsmarketingadmin1 authentication encrypted-password "$ABC123"
set system login user lsmarketingadmin2 full-name lsmarketingadmin2
set system login user lsmarketingadmin2 class ls-marketing-admin
set system login user lsmarketingadmin2 authentication encrypted-password "$ABC123"
set logical-systems ls-accounting-dept
set system login class ls-accounting-admin logical-system ls-accounting-dept
set system login class ls-accounting-admin permissions all
set system login user lsaccountingadmin1 full-name lsaccountingadmin1
set system login user lsaccountingadmin1 class ls-accounting-admin
set system login user lsaccountingadmin1 authentication encrypted-password "$ABC123"
set logical-systems interconnect-logical-system
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Create the first user logical system and define its administrator.
  - a. Create the user logical system.

```
[edit]
user@host# set logical-systems ls-product-design
```

- b. Assign the user login class to the user logical system.

```
[edit system]
user@host# set login class ls-design-admin logical-system ls-product-design
```

- c. Create the login class to give the user logical system administrator full permission over the user logical system.

```
[edit system]
user@host# set login class ls-design-admin permissions all
```

- d. Assign a full name to the user logical system administrator.

```
[edit system]
user@host# set login user lsdesignadmin1 full-name lsdesignadmin1
```

- e. Associate the login class with the user logical system administrator to allow the administrator to log in to the user logical system.

```
[edit system]
user@host# set login user lsdesignadmin1 class ls-design-admin
```

- f. Create a user login password for the user logical system administrator.

```
[edit system]
user@host# set login user lsdesignadmin1 authentication plain-text-password
New password: Talk1234
Retype new password: Talk1234
```

2. Configure the first user for the logical system.

- a. Configure the user login class and assign it to the user logical system.

```
[edit system]
user@host# set login class ls-design-user logical-system ls-product-design
```

- b. To give the first user the ability to see the logical system's resources and settings but not change them, assign **view** as the permission to the login class.

```
[edit system]
user@host# set login class ls-design-user permissions view
```

- c. Assign a full name to the logical system user.

```
[edit system]
user@host# set login user lsdesignuser1 full-name lsdesignuser1
```

- d. Associate the login class with the user to allow the user to log in to the user logical system.

```
user@host# set login user lsdesignuser1 class ls-design-user
```

- e. Create a user login password for the user.

```
[edit system]
user@host# set login user lsdesignuser1 authentication plain-text-password
New password: Talk4234
```

Retype new password: Talk4234

3. Create the second user for logical system ls-product-design.

- a. Assign a full name to the user.

```
[edit system]
user@host# set login user lsdesignuser2 full-name lsdesignuser2
```

- b. Associate the user with the login class to allow the user to log in to the user logical system.

```
user@host# set login user lsdesignuser2 class ls-design-user
```

- c. Create a user login password.

```
[edit system]
user@host# set login user lsdesignuser2 authentication plain-text-password
New password: Talk9234
Retype new password: Talk9234
```

4. Create the second user logical system and define its administrator.

- a. Create the user logical system.

```
[edit]
user@host# set logical-systems ls-marketing-dept
```

- b. Configure the user login class and assign it to the user logical system.

```
[edit system]
user@host# set login class ls-marketing-admin logical-system ls-marketing-dept
```

- c. To give the user logical system administrator control over the user logical system, assign **all** as the permissions to the login class.

```
[edit system]
user@host# set login class ls-marketing-admin permissions all
```

- d. Assign a full name to the user logical system administrator.

```
[edit system]
user@host# set login user lsmarketingadmin1 full-name lsmarketingadmin1
```

- e. Associate the user logical system administrator with the login class to allow the administrator to log in to the user logical system.

```
[edit system]
user@host# set login user lsmarketingadmin1 class ls-marketing-admin
```

- f. Create a user login password for the user logical system administrator.

```
[edit system]
user@host# set login user lsmarketingadmin1 authentication plain-text-password
New password: Talk2345
Retype new password: Talk2345
```

5. Create a second user logical system administrator for the ls-marketing-dept logical system.

- a. Assign a full name to the user logical system administrator.

```
[edit system]
user@host# set login user lsmarketingadmin2 full-name lsmarketingadmin2
```

- b. Associate the user logical system administrator with the login class to allow the administrator to log in to the user logical system.

```
[edit system]
user@host# set login lsmarketingadmin2 class ls-marketing-admin
```

- c. Create a user login password for the user logical system administrator.

```
[edit system]
user@host# set login user lsmarketingadmin2 authentication plain-text-password
New password: Talk6345
Retype new password: Talk6345
```

6. Create the third user logical system and define its administrator.

- a. Create the user logical system.

```
[edit]
user@host# set logical-systems ls-accounting-dept
```

- b. Configure the user login class and assign it to the user logical system.

```
[edit system]
user@host# set login class ls-accounting-admin logical-system
ls-accounting-dept
```

- c. To give the user logical system administrator control over the user logical system, assign permissions to the login class.

```
[edit system]
user@host# set login class ls-accounting-admin permissions all
```

- d. Assign a full name to the user logical system administrator.

```
[edit system]
user@host# set login user lsaccountingadmin1 full-name lsaccountingadmin1
```

- e. Associate the user logical system administrator with the login class to allow the administrator to log in to the user logical system.

```
[edit system]
user@host# set login user lsaccountingadmin1 class ls-accounting-admin
```

- f. Create a login password for the user logical system administrator.

```
[edit system]
user@host# set login user lsaccountingadmin1 authentication
plain-text-password
New password: Talk5678
Retype new password: Talk5678
```

7. Configure an interconnect logical system to allow logical systems to pass traffic from one to another.

```
user@host# set logical-systems interconnect-logical-system
```

**Results** From configuration mode, confirm your configuration by entering the **show logical-systems** command to verify that the logical systems were created. Also enter the **show system login class** command for each class that you defined.

To ensure that the logical systems administrators were created, enter the **show system login user** command.

If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host# show logical-systems ?
interconnect-logical-system;
ls-accounting-dept;
ls-marketing-dept;
ls-product-design;

user@host# show system login class ls-design-admin
logical-system ls-product-design;
permissions all;

user@host# show system login class ls-design-user
logical-system ls-product-design
permissions view;

user@host show system login class ls-marketing-admin
logical-system ls-marketing-dept;
permissions all;

user@host show system login class ls-accounting-admin
logical-system ls-accounting-dept;
permissions all;

user@host show system login user ?
lsaccountingadmin1 lsaccountingadmin1
lsdesignadmin1 lsdesignadmin1
lsdesignuser2 lsdesignuser2
lsmarketingadmin1 lsmarketingadmin1
lsmarketingadmin2 lsmarketingadmin2
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying User Logical Systems and Login Configurations from the Master Logical System on page 3570](#)
- [Verifying User Logical Systems and Login Configurations Using Telnet on page 3571](#)

### Verifying User Logical Systems and Login Configurations from the Master Logical System

---

**Purpose** Verify that the user logical systems exist and that you, as the master administrator, can enter them from root. Return from a user logical system to the master logical system.

**Action** From operational mode, enter the following command:

```
root@host> set cli logical-system ls-product-design
```

```

Logical system:ls-product-design
root@host:ls-product-design>

root@host:ls-product-design> clear cli logical-system
Cleared default logical system
root@host>

root@host> set cli logical-system ls-marketing-dept
Logical system:ls-marketing-dept
root@host:ls-marketing-dept>

root@host:ls-marketing-dept> clear cli logical-system
Cleared default logical system
root@host>

root@host> set cli logical-system ls-accounting-dept
Logical system:ls-accounting-dept
root@host:ls-accounting-dept>

root@host:ls-accounting-dept> clear cli logical-system
Cleared default logical system
root@host>

```

### Verifying User Logical Systems and Login Configurations Using Telnet

**Purpose** Verify that the user logical systems you created exist and that the administrators' login IDs and passwords that you created are correct.

**Action** Use Telnet to log in to each user logical system as its user administrator would do.

1. Run Telnet specifying the IP address of your SRX Series device. For example:

```
telnet 10.11.11.19
```

2. Enter the login ID and password for the administrator for one of the user logical systems that you created. After you log in, the prompt shows the administrator name. Notice how this result differs from the result produced when you log in to the user logical system from the master logical system at root. Repeat this procedure for all of your user logical systems.

```

login: lsdesignadmin1
Password: Talk1234
lsdesignadmin1@host: ls-product-design>

```

## Understanding Logical System Security Profiles (Master Administrators Only)

---

Logical systems allow you to virtually divide a supported SRX Series device into multiple devices, isolating one from another, securing them from intrusion and attacks, and protecting them from faulty conditions outside their own contexts. To protect logical systems, security resources are configured in a manner similar to how they are configured for a discrete device. However, as the master administrator, you must allocate the kinds and amounts of security resources to logical systems. The logical system administrator allocates resources for his own logical system.

An SRX Series device running logical systems can be partitioned into user logical systems, an interconnect logical system, if desired, and the default master logical system. When the system is initialized, the master logical system is created at the root level. All system resources are assigned to it, effectively creating a default master logical system security profile. To distribute security resources across logical systems, the master administrator creates security profiles that specify the kinds and amounts of resources to be allocated to a logical system that the security profile is bound to. Only the master administrator can configure security profiles and bind them to logical systems. The user logical system administrator configures these resources for his or her logical system.

Logical systems are defined largely by the resources allocated to them, including security components, interfaces, routing instances, static routes, and dynamic routing protocols. When the master administrator configures a user logical system, he binds a security profile to it. Any attempt to commit a configuration for a user logical system without a security profile bound to it will fail.

This topic includes the following sections:

- [Logical Systems Security Profiles on page 3576](#)
- [How the System Assesses Resources Assignment and Use Across Logical Systems on page 3576](#)
- [Cases: Assessments of Reserved Resources Assigned Through Security Profiles on page 3578](#)

## Logical Systems Security Profiles

As master administrator, you can configure a single security profile to assign resources to a specific logical system, use the same security profile for more than one logical system, or use a mix of both methods. You can configure up to 32 security profiles on an SRX Series device running logical systems. When you reach the limit, you must delete a security profile and commit the configuration change before you can create and commit another security profile. In many cases fewer security profiles are needed because you might bind a single security profile to more than one logical system.

Security profiles allow you to:

- Share the device's resources, including policies, zones, addresses and address books, flow sessions, and various forms of NAT, among all logical systems appropriately. You can dedicate various amounts of a resource to the logical systems and allow them to compete for use of the free resources.

Security profiles protect against one logical system exhausting a resource that is required at the same time by other logical systems. Security profiles protect critical system resources and maintain a fair level of performance among user logical systems when the device is experiencing heavy traffic flow. They defend against one user logical system dominating the use of resources and depriving other user logical systems of them.

- Configure the device in a scalable way to allow for future creation of additional user logical systems.

You must delete a logical system's security profile before you delete that logical system.

## How the System Assesses Resources Assignment and Use Across Logical Systems

To provision a logical system with security resources, you, as a master administrator, configure a security profile that specifies for each resource:

- A reserved quota that guarantees that the specified resource amount is always available to the logical system.
- A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows, it can utilize resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems must compete for global resources.

If a reserved quota is not configured for a resource, the default value is 0. If a maximum allowed quota is not configured for a resource, the default value is the global system quota for the resource (global system quotas are platform-dependent). The master administrator must configure appropriate maximum allowed quota values in the security profiles so the maximum resource usage of a specific logical system does not negatively impact other logical systems configured on the device. The master administrator must configure the appropriate maximum-allowed quota values in the security profiles so that the maximum resource usage of a specific logical system does not negatively impact other logical systems configured on the device.

The system maintains a count of all allocated resources that are reserved, used, and made available again when a logical system is deleted. This count determines whether resources are available to use for new logical systems or to increase the amount of the resources allocated to existing logical systems through their security profiles.

When a user logical system is deleted, its reserved resource allocations are released for use by other logical systems.

Resources configured in security profiles are characterized as static modular resources or dynamic resources. For static resources, we recommend setting a maximum quota for a resource equal or close to the amount specified as its reserved quota, to allow for scalable configuration of logical systems. A high maximum quota for a resource might give a logical system greater flexibility through access to a larger amount of that resource, but it would constrain the amount available to allocate to a new user logical system.

The difference between reserved and maximum allowed amounts for a dynamic resource is not important because dynamic resources are aged out and do not deplete the pool available for assignment to other logical systems.

The following resources can be specified in a security profile:

- Security policies, including schedulers
- Security zones
- Addresses and address books for security policies
- Application firewall rule sets
- Application firewall rules
- Firewall authentication
- Flow sessions and gates
- NAT, including:
  - Cone NAT bindings
  - NAT destination rule
  - NAT destination pool
  - NAT IP address in source pool without Port Address Translation (PAT)

**NOTE:** IPv6 addresses in IPv6 source pools without PAT are not included in security profiles.

- NAT IP address in source pool with PAT
- NAT port overloading
- NAT source pool
- NAT source rule
- NAT static rule

**NOTE:** All resources except flow sessions are static.

You can modify a logical system security profile dynamically while the security profile is assigned to other logical systems. However, to ensure that the system resource quota is not exceeded, the system takes the following actions:

- If a static quota is changed, system daemons that maintain logical system counts for resources specified in security profiles revalidate the security profile. This check identifies the number of resources assigned across all logical systems to determine whether the allocated resources, including their increased amounts, are available.

These quota checks are the same quota checks that the system performs when you add a new user logical system and bind a security profile to it. The are also performed when you bind a different security profile from the security profile that is presently assigned to it to an existing user logical system (or the master logical system).

- If a dynamic quota is changed, no check is performed, but the new quota is imposed on future resource usage.

## Cases: Assessments of Reserved Resources Assigned Through Security Profiles

To understand how the system assesses allocation of reserved resources through security profiles, consider the following three cases that address allocation of one resource, zones. To keep the example simple, 10 zones are allocated in security-profile-1: 4 reserved zones and 6 maximum zones. This example assumes that the full maximum amount specified—six zones—is available for the user logical systems. The system maximum number of zones is 10.

These cases address configuration across logical systems. They test to see whether a configuration will succeed or fail when it is committed based on allocation of zones.

Table 369 shows the security profiles and their zone allocations.

**Table 369: Security Profiles Used for Reserved Resource Assessments****Two Security Profiles Used in the Configuration Cases**

security-profile-1

- zones reserved quota = 4
- zones maximum quota = 6

**NOTE:** Later the master administrator dynamically increases the reserved zone count specified in this profile.

master-logical-system-profile

- zones maximum quota = 10
- no reserved quota

**Table 370** shows three cases that illustrate how the system assesses reserved resources for zones across logical systems based on security profile configurations.

- The configuration for the first case succeeds because the cumulative reserved resource quota for zones configured in the security profiles bound to all logical systems is 8, which is less than the system maximum resource quota.
- The configuration for the second case fails because the cumulative reserved resource quota for zones configured in the security profiles bound to all logical systems is 12, which is greater than the system maximum resource quota.
- The configuration for the third case fails because the cumulative reserved resource quota for zones configured in the security profiles bound to all logical systems is 12, which is greater than the system maximum resource quota.

**Table 370: Reserved Resource Allocation Assessment Across Logical Systems****Reserved Resource Quota Checks Across Logical Systems**

Example 1: Succeeds

This configuration is within bounds:  $4+4+0=8$ , maximum capacity =10.

Security Profiles Used

- The security profile security-profile-1 is bound to two user logical systems: user-logical-system-1 and user-logical-system-2.
- The master-logical-system-profile profile is used exclusively for the master logical system.
- user-logical-system-1 = 4 reserved zones.
- user-logical-system-2 = 4 reserved zones.
- master-logical-system = 0 reserved zones.

**Table 370: Reserved Resource Allocation Assessment Across Logical Systems (*continued*)****Reserved Resource Quota Checks Across Logical Systems****Example 2: Fails**

This configuration is out of bounds:  $4+4+4=12$ , maximum capacity =10.

- user-logical-system-1 = 4 reserved zones.
- user-logical-system-2 = 4 reserved zones.
- master-logical-system = 0 reserved zones.
- new-user-logical-system = 4 reserved zones.

**Security Profiles**

- The security profile security-profile-1 is bound to two user logical systems: user-logical-system-1 and user-logical-system-2.
- The master-logical-system-profile is bound to the master logical system and used exclusively for it.
- The master administrator configures a new user logical system called new-user-logical-system and binds security-profile-1 to it.

**Example 3: Fails**

This configuration is out of bounds:  $6+6=12$ , maximum capacity =10.

The master administrator modifies the reserved zones quota in security-profile-1, increasing the count to 6.

- user-logical-system-1 = 6 reserved zones.
- user-logical-system-2 = 6 reserved zones.
- master-logical-system = 0 reserved zones.

- [Configuration on page 3581](#)
- [Verification on page 3587](#)

## Requirements

The example uses an SRX5600 device running Junos OS with logical systems.

Before you begin, read [“SRX Series Logical System Master Administrator Configuration Tasks Overview” on page 3544](#) to understand how this task fits into the overall configuration process.

## Overview

This example shows how to configure security profiles for the following logical systems:

- The root-logical-system logical system. The security profile master-profile is assigned to the master, or root, logical system.
- The ls-product-design logical system. The security profile ls-design-profile is assigned to the logical system.
- The ls-marketing-dept logical system. The security profile ls-accnt-mrkt-profile is assigned to the logical system.
- The ls-accounting-dept logical system. The security profile ls-accnt-mrkt-profile is assigned to the logical system.
- The interconnect-logical-system, if you use one. You must assign a dummy, or null, security profile to it.

This configuration relies on the deployment shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#).

## Configuration

- [Configuring Logical System Security Profiles on page 3581](#)

### Configuring Logical System Security Profiles

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set system security-profile master-profile policy maximum 65
set system security-profile master-profile policy reserved 60
set system security-profile master-profile zone maximum 22
set system security-profile master-profile zone reserved 17
set system security-profile master-profile flow-session maximum 3000
set system security-profile master-profile flow-session reserved 2100
set system security-profile master-profile nat-nopat-address maximum 115
set system security-profile master-profile nat-nopat-address reserved 100
set system security-profile master-profile nat-static-rule maximum 125
set system security-profile master-profile nat-static-rule reserved 100
set system security-profile master-profile idp
set system security-profile master-profile root-logical-system
set system security-profile ls-accnt-mrkt-profile policy maximum 65
```

```

set system security-profile ls-accnt-mrkt-profile policy reserved 60
set system security-profile ls-accnt-mrkt-profile zone maximum 22
set system security-profile ls-accnt-mrkt-profile zone reserved 17
set system security-profile ls-accnt-mrkt-profile flow-session maximum 2500
set system security-profile ls-accnt-mrkt-profile flow-session reserved 2000
set system security-profile ls-accnt-mrkt-profile nat-nopat-address maximum 125
set system security-profile ls-accnt-mrkt-profile nat-nopat-address reserved 100
set system security-profile ls-accnt-mrkt-profile nat-static-rule maximum 125
set system security-profile ls-accnt-mrkt-profile nat-static-rule reserved 100
set system security-profile ls-accnt-mrkt-profile logical-system ls-marketing-dept
set system security-profile ls-accnt-mrkt-profile logical-system ls-accounting-dept
set system security-profile ls-design-profile policy maximum 50
set system security-profile ls-design-profile policy reserved 40
set system security-profile ls-design-profile zone maximum 10
set system security-profile ls-design-profile zone reserved 5
set system security-profile ls-design-profile flow-session maximum 2500
set system security-profile ls-design-profile flow-session reserved 2000
set system security-profile ls-design-profile nat-nopat-address maximum 120
set system security-profile ls-design-profile nat-nopat-address reserved 100
set system security-profile ls-design-profile logical-system ls-product-design
set system security-profile interconnect-profile logical-system
interconnect-logical-system

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

Create three security profiles.

1. Create the first security profile.

- a. Specify the number of maximum and reserved policies.

```

[edit system security-profile]
user@host# set master-profile policy maximum 65 reserved 60

```

- b. Specify the number of maximum and reserved zones.

```

[edit system security-profile]
user@host# set master-profile zone maximum 22 reserved 17

```

- c. Specify the number of maximum and reserved sessions.

```

[edit system security-profile]
user@host# set master-profile flow-session maximum 3000 reserved 2100

```

- d. Specify the number of maximum and reserved source NAT no-PAT addresses and static NAT rules.

```

[edit system security-profile]
user@host# set master-profile nat-nopat-address maximum 115 reserved 100
user@host# set master-profile nat-static-rule maximum 125 reserved 100

```

- e. Enable intrusion detection and prevention (IDP). You can enable IDP only for the master (root) logical system.

```

[edit system security-profile]
user@host# set idp

```

- f. Bind the security profile to the logical system.

```
[edit system security-profile]
user@host# set master-profile logical-system root-logical-system
```

2. Create the second security profile.

- a. Specify the number of maximum and reserved policies.

```
[edit system security-profile]
user@host# set ls-accnt-mrkt-profile policy maximum 65 reserved 60
```

- b. Specify the number of maximum and reserved zones.

```
[edit system security-profile]
user@host# set ls-accnt-mrkt-profile zone maximum 22 reserved 17
```

- c. Specify the number of maximum and reserved sessions.

```
[edit system security-profile]
user@host# set ls-accnt-mrkt-profile flow-session maximum 2500 reserved
2000
```

- d. Specify the number of maximum and reserved source NAT no-PAT addresses.

```
[edit system security-profile]
user@host# set ls-accnt-mrkt-profile nat-nopat-address maximum 125 reserved
100
```

- e. Specify the number of maximum and reserved static NAT rules.

```
[edit system security-profile]
user@host# set ls-accnt-mrkt-profile nat-static-rule maximum 125 reserved 100
```

- f. Bind the security profile to two logical systems.

```
[edit system]
user@host# set security-profile ls-accnt-mrkt-profile logical-system
ls-marketing-dept
user@host# set security-profile ls-accnt-mrkt-profile logical-system
ls-accounting-dept
```

3. Create the third security profile.

- a. Specify the number of maximum and reserved policies.

```
[edit system security-profile]
user@host# set ls-design-profile policy maximum 50 reserved 40
```

- b. Specify the number of maximum and reserved zones.

```
[edit system security-profile]
user@host# set ls-design-profile zone maximum 10 reserved 5
```

- c. Specify the number of maximum and reserved sessions.

```
[edit system security-profile]
user@host# set ls-design-profile flow-session maximum 2500 reserved 2000
```

- d. Specify the number of maximum and reserved source NAT no-PAT addresses.

```
[edit system security-profile]
```

```
user@host# set ls-design-profile nat-nopat-address maximum 120 reserved 100
```

4. Bind the security profile to a logical system.

```
user@host# set system security-profile ls-design-profile logical-system
ls-product-design
```

5. Bind a null security profile to the interconnect logical system.

```
user@host# set system security-profile interconnect-profile logical-system
interconnect-logical-system
```

**Results** From configuration mode, confirm your configuration by entering the **show system security-profile** command to see all security profiles configured.

To see individual security profiles, enter the **show system security-profile master-profile**, the **show system security-profile ls-accnt-mrkt-profile** and, the **show system security-profile ls-design-profile** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host# show system security-profile
interconnect-profile {
 logical-system interconnect-logical-system;
}
ls-accnt-mrkt-profile {
 policy {

If you are done configuring the device, enter commit from configuration mode.

## Verification

To confirm that the security resources that you allocated for logical systems have been assigned to them, follow this procedure for each logical system and for all its resources.

- [Verifying That Security Profile Resources Are Effectively Allocated for Logical Systems on page 3587](#)

### Verifying That Security Profile Resources Are Effectively Allocated for Logical Systems

**Purpose** Verify security resources for each logical system. Follow this process for all configured logical systems.

**Action** 1. Use Telnet to log in to each user logical system as its user logical system administrator.

Run Telnet, specifying the IP address of your SRX Series device. For example:

```
telnet 10.11.11.19
```

2. Enter the login ID and password for one of the user logical systems that you created

```
login: lsmarketingadmin1
password: Talk2345
lsmarketingadmin1@host:ls-marketing-dept>
```

3. Enter the following statement to identify the resources configured for the profile.

```
lsmarketingadmin1@host:ls-marketing-dept> show system security-profile ?
```

4. Enter the following command at the resulting prompt. Do this for each feature configured for the profile.

```
lsmarketingadmin1@host:ls-marketing-dept> show system security-profile zone detail
logical system name : ls-marketing-dept
security profile name : ls-accnt-mrkt-profile
used amount : 0
reserved amount : 17
maximum quota : 22
```

## Understanding Logical System Firewall Authentication

A firewall user is a network user who must provide a username and password for authentication when initiating a connection across the firewall. Junos OS enables administrators to restrict and permit firewall users to access protected resources (different zones) behind a firewall based on their source IP address and other credentials.

The master administrator is responsible for configuring access profiles in the master logical system. Access profiles store usernames and passwords of users or point to external authentication servers where such information is stored. Access profiles configured at the master logical system are available to all user logical systems.

The master administrator configures the maximum and reserved numbers of firewall authentications for each user logical system. The user logical system administrator can then create firewall authentications in the user logical system. From a user logical system, the user logical system administrator can use the **show system security-profile auth-entry**

command to view the number of authentication resources allocated to the user logical system.

To configure the access profile, the master administrator uses the **profile** configuration statement at the **[edit access]** hierarchy level in the master logical system. The access profile can also include the order of authentication methods, LDAP or RADIUS server options, and session options.

The user logical system administrator can then associate the access profile with a security policy in the user logical system. The user logical system administrator also specifies the type of authentication:

- With pass-through authentication, a host or a user from one zone tries to access resources on another zone using an FTP, a Telnet, or an HTTP client. The device uses FTP, Telnet, or HTTP to collect username and password information, and subsequent traffic from the user or host is allowed or denied based on the result of this authentication.
- With Web authentication, users use HTTP to connect to an IP address on the device that is enabled for Web authentication and are prompted for the username and password. Subsequent traffic from the user or host to the protected resource is allowed or denied based on the result of this authentication.

The user logical system administrator configures the following properties for firewall authentication in the user logical system:

- Security policy that specifies firewall authentication for matching traffic. Firewall authentication is specified with the **firewall-authentication** configuration statement at the **[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit]** hierarchy level.

Users or user groups in an access profile who are allowed access by the policy can optionally be specified with the client-match configuration statement. (If no users or user groups are specified, any user who is successfully authenticated is allowed access.)

For pass-through authentication, the access profile can optionally be specified and Web redirect (redirecting the client system to a webpage for authentication) can be enabled.

- Type of authentication (pass-through or Web authentication), default access profile, and success banner for the FTP, Telnet, or HTTP session. These properties are configured with the **firewall-authentication** configuration statement at the **[edit access]** hierarchy level.
- Host inbound traffic. Protocols, services, or both are allowed to access the logical system. The types of traffic are configured with the **host-inbound-traffic** configuration statement at the **[edit security zones security-zone zone-name]** or **[edit security zones security-zone zone-name interfaces interface-name]** hierarchy levels.

From a user logical system, the user logical system administrator can use the **show security firewall-authentication users** or **show security firewall-authentication history** commands to view the information about firewall users and history for the user logical system. From the master logical system, the master administrator can use the same

commands to view information for the master logical system, a specific user logical system, or all logical systems.

## Example: Configuring Access Profiles (Master Administrators Only)

The master administrator is responsible for configuring access profiles in the master logical system. This example shows how to configure access profiles.

- [Requirements on page 3591](#)
- [Overview on page 3591](#)
- [Configuration on page 3592](#)

### Requirements

Before you begin:

- Log in to the master logical system as the master administrator. See [“Understanding the Master Logical System and the Master Administrator Role” on page 3543](#).
- Read [“Firewall User Authentication Overview” on page 5505](#).

### Overview

This example configures an access profile for LDAP authentication for logical system users. This example creates the access profile described in [Table 371](#).

**NOTE:** The master administrator creates the access profile.

**Table 371: Access Profile Configuration**

| Name  | Configuration Parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ldap1 | <ul style="list-style-type: none"> <li>• LDAP is used as the first (and only) authentication method.</li> <li>• Base distinguished name:             <ul style="list-style-type: none"> <li>• Organizational unit name (OU): people</li> <li>• Domain components (DC): example, com</li> </ul> </li> <li>• A user's LDAP distinguished name is assembled through the use of a common name identifier, username, and base distinguished name. The common name identifier is user ID (UID).</li> <li>• The LDAP server address is 10.155.26.104 and is reached through port 389.</li> </ul> |

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

**NOTE:** You must be logged in as the master administrator.

```
set access profile ldap1 authentication-order ldap
set access profile ldap1 ldap-options base-distinguished-name
 ou=people,dc=example,dc=com
set access profile ldap1 ldap-options assemble common-name uid
set access profile ldap1 ldap-server 10.155.26.104 port 389
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an access profile in the master logical system:

1. Log in to the master logical system as the master administrator and enter configuration mode.

```
admin@host> configure
admin@host#
```

2. Configure an access profile and set the authentication order.

```
[edit access profile ldap1]
admin@host# set authentication-order ldap
```

3. Configure LDAP options.

```
[edit access profile ldap1]
admin@host# set ldap-options base-distinguished-name
 ou=people,dc=example,dc=com
admin@host# set ldap-options assemble common-name uid
```

4. Configure the LDAP server.

```
[edit access profile ldap1]
admin@host# set ldap-server 10.155.26.104 port 389
```

**Results** From configuration mode, confirm your configuration by entering the **show access profile profile-name** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
admin@host# show access profile ldap1
authentication-order ldap;
ldap-options {
 base-distinguished-name ou=people,dc=example,dc=com;
 assemble {
```

```

 common-name uid;
 }
}
ldap-server {
 10.155.26.104 port 389;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Example: Configuring Security Features for the Master Logical System

This example shows how to configure security features, such as zones, policies, and firewall authentication, for the master logical system.

- [Requirements on page 3593](#)
- [Overview on page 3593](#)
- [Configuration on page 3594](#)
- [Verification on page 3598](#)

### Requirements

Before you begin:

- Log in to the master logical system as the master administrator. See [“Example: Configuring a Root Password for the Device \(Master Administrators Only\)” on page 3563](#).
- Use the **show system security-profile** command to see the resources allocated to the master logical system.
- Configure logical interfaces for the master logical system. See [“Example: Configuring Interfaces, Routing Instances, and Static Routes for the Master and Interconnect Logical Systems and Logical Tunnel Interfaces for the User Logical Systems \(Master Administrators Only\)” on page 3664](#).
- Configure the access profile `ldap1` in the master logical system. The `ldap1` access profile is used for Web authentication of firewall users. See [“Example: Configuring Access Profiles \(Master Administrators Only\)” on page 3591](#).

### Overview

In this example, you configure security features for the master logical system, called root-logical-system, shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#). This example configures the security features described in [Table 372](#).

Table 372: root-logical-system Security Feature Configuration

| Feature                 | Name                    | Configuration Parameter                                                                                                                                                                                                                                             |
|-------------------------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Zones                   | ls-root-trust           | Bind to interface ge-0/0/4.0.                                                                                                                                                                                                                                       |
|                         | ls-root-untrust         | Bind to interface lt-0/0/0.1                                                                                                                                                                                                                                        |

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security address-book root-internal address masters 12.12.1.0/24
set security address-book root-internal attach zone ls-root-trust
set security address-book root-external address design 12.1.1.0/24
set security address-book root-external address accounting 14.1.1.0/24
set security address-book root-external address marketing 13.1.1.0/24
set security address-book root-external address-set userlsys address design

```

```

set security address-book root-external address-set userlsys address accounting
set security address-book root-external address-set userlsys address marketing
set security address-book root-external attach zone ls-root-untrust
set security policies from-zone ls-root-trust to-zone ls-root-untrust policy
 permit-to-userlsys match source-address masters
set security policies from-zone ls-root-trust to-zone ls-root-untrust policy
 permit-to-userlsys match destination-address userlsys
set security policies from-zone ls-root-trust to-zone ls-root-untrust policy
 permit-to-userlsys match application any
set security policies from-zone ls-root-trust to-zone ls-root-untrust policy
 permit-to-userlsys then permit
set security policies from-zone ls-root-untrust to-zone ls-root-trust policy
 permit-authorized-users match source-address userlsys
set security policies from-zone ls-root-untrust to-zone ls-root-trust policy
 permit-authorized-users match destination-address masters
set security policies from-zone ls-root-untrust to-zone ls-root-trust policy
 permit-authorized-users match application junos-http
set security policies from-zone ls-root-untrust to-zone ls-root-trust policy
 permit-authorized-users match application junos-https
set security policies from-zone ls-root-untrust to-zone ls-root-trust policy
 permit-authorized-users then permit firewall-authentication web-authentication
set security zones security-zone ls-root-trust interfaces ge-0/0/4.0
set security zones security-zone ls-root-untrust interfaces lt-0/0/0.1
set system services web-management http interface ge-0/0/4.0
set access firewall-authentication web-authentication default-profile ldap1
set access firewall-authentication web-authentication banner success "WEB AUTH
LOGIN SUCCESS"

```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure zones and policies for the master logical system:

1. Log in to the master logical system as the master administrator and enter configuration mode.

```

admin@host> configure
admin@host#

```

2. Create security zones and assign interfaces to each zone.

```

[edit security zones]
admin@host# set security-zone ls-root-trust interfaces ge-0/0/4.0
admin@host# set security-zone ls-root-untrust interfaces lt-0/0/0.1

```

3. Create address book entries.

```

[edit security]
admin@host# set address-book root-internal address masters 12.12.1.0/24
admin@host# set address-book root-external address design 12.1.1.0/24
admin@host# set address-book root-external address accounting 14.1.1.0/24
admin@host# set address-book root-external address marketing 13.1.1.0/24
admin@host# set address-book root-external address-set userlsys address design
admin@host# set address-book root-external address-set userlsys address
 accounting

```

```
admin@host# set address-book root-external address-set userlsys address
marketing
```

4. Attach address books to zones.

```
[edit security]
admin@host# set address-book root-internal attach zone ls-root-trust
admin@host# set address-book root-external attach zone ls-root-untrust
```

5. Configure a security policy that permits traffic from the ls-root-trust zone to the ls-root-untrust zone.

```
[edit security policies from-zone ls-root-trust to-zone ls-root-untrust]
admin@host# set policy permit-to-userlsys match source-address masters
admin@host# set policy permit-to-userlsys match destination-address userlsys
admin@host# set policy permit-to-userlsys match application any
admin@host# set policy permit-to-userlsys then permit
```

6. Configure a security policy that authenticates traffic from the ls-root-untrust zone to the ls-root-trust zone.

```
[edit security policies from-zone ls-root-untrust to-zone ls-root-trust]
admin@host# set policy permit-authorized-users match source-address userlsys
admin@host# set policy permit-authorized-users match destination-address masters
admin@host# set policy permit-authorized-users match application junos-http
admin@host# set policy permit-authorized-users match application junos-https
admin@host# set policy permit-authorized-users then permit firewall-authentication
web-authentication
```

7. Configure the Web authentication access profile and define a success banner.

```
[edit access]
admin@host# set firewall-authentication web-authentication default-profile ldap1
admin@host# set firewall-authentication web-authentication banner success "WEB
AUTH LOGIN SUCCESS"
```

8. Activate the HTTP daemon on the device.

```
[edit system]
admin@host# set services web-management http interface ge-0/0/4.0
```

**Results** From configuration mode, confirm your configuration by entering the **show security**, **show access**, and **show system services** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```

## IDP in Logical Systems Overview

A Junos OS Intrusion Detection and Prevention (IDP) policy enables you to selectively enforce various attack detection and prevention techniques on network traffic passing through a logical system.

This topic includes the following sections:

- [IDP Policies on page 3599](#)
- [IDP Installation and Licensing for Logical Systems on page 3599](#)

## IDP Policies

The master administrator configures IDP policies at the root level. Configuring an IDP policy for logical systems is similar to configuring an IDP policy on a device that is not configured for logical systems. This can include the configuration of custom attack objects.

**NOTE:** User logical system administrators cannot create or modify IDP policies for their user logical systems. Only the master administrator can create IDP policies and bind them to user logical systems through a logical systems security profile.

**NOTE:** The user logical system administrator can create security zones in the user logical system and assign interfaces to each security zone. Zones that are specific to user logical systems cannot be referenced in IDP policies configured by the master administrator. The master administrator can reference zones in the master logical system in an IDP policy configured for the master logical system.

The master administrator then specifies an IDP policy in the security profile that is bound to a logical system. To enable IDP in a logical system, the master administrator or user logical system administrator configures a security policy that defines the traffic to be inspected and specifies the **permit application-services idp** action.

Although the master administrator can configure multiple IDP policies, a logical system can have only one active IDP policy at a time. For user logical systems, the master administrator can either bind the same IDP policy to multiple user logical systems or bind a unique IDP policy to each user logical system. To specify the active IDP policy for the master logical system, the master administrator can *either* reference the IDP policy in the security profile that is bound to the master logical system or use the **active-policy** configuration statement at the [edit security idp] hierarchy level.

**NOTE:** A commit error is generated if an IDP policy is both configured in the security profile that is bound to the master logical system and specified with the **active-policy** configuration statement. Use only one method to specify the active IDP policy for the master logical system.

## IDP Installation and Licensing for Logical Systems

A single IDP security package is installed for all logical systems on the device. The download and install options can only be executed at the root level. The same version of the IDP attack database is shared by all logical systems.

An idp-sig license must be installed at the root level. Once IDP is enabled at the root level, it can be used with any logical system on the device.

---

## Understanding IDP Features in Logical Systems

This topic includes the following sections:

- [Rulebases on page 3600](#)
- [Protocol Decoders on page 3600](#)
- [SSL Inspection on page 3601](#)
- [Inline Tap Mode on page 3601](#)
- [Multi-Detectors on page 3601](#)
- [Logging and Monitoring on page 3601](#)

### Rulebases

A single IDP policy can contain only one instance of any type of rulebase. The following IDP rulebases are supported for logical systems:

- The Intrusion prevention system (IPS) rulebase uses attack objects to detect known and unknown attacks. It detects attacks based on stateful signature and protocol anomalies.
- The application-level distributed denial-of-service (DDoS) rulebase defines parameters to protect servers such as DNS or HTTP. The application-level DDoS rulebase defines the source match condition for traffic that should be monitored and takes an action, such as drop the connection, drop the packet, or no action. It can also perform actions against future connections that use the same IP address.

**NOTE:** Status monitoring for IPS and application-level DDoS is global to the device and not on a per logical system basis.

---

### Protocol Decoders

The Junos IDP module ships with a set of preconfigured protocol decoders. These protocol decoders have default settings for various protocol-specific contextual checks that they perform. The IDP protocol decoder configuration is global and applies to all logical systems. Only the master administrator at the root level can modify the settings at the `[edit security idp sensor-configuration]` hierarchy level.

## SSL Inspection

IDP SSL inspection uses the Secure Sockets Layer (SSL) protocol suite to enable inspection of HTTP traffic encrypted in SSL.

SSL inspection configuration is global and applies to all logical systems on a device. SSL inspection can only be configured by the master administrator at the root level with the **ssl-inspection** configuration statement at the [edit security idp sensor-configuration] hierarchy level.

## Inline Tap Mode

The inline tap mode feature provides passive, inline detection of Application Layer threats for traffic matching security policies that have the IDP application service enabled. When a device is in inline tap mode, packets pass through firewall inspection and are also copied to the independent IDP module. This allows the packets to get to the next service module without waiting for IDP processing results.

Inline tap mode is enabled or disabled for all logical systems at the root level by the master administrator. To enable inline tap mode, use the **inline-tap** configuration statement at the [edit security forwarding-process application-services maximize-idp-sessions] hierarchy level. Delete the inline tap mode configuration to switch the device back to regular mode.

**NOTE:** The device must be restarted when switching to inline tap mode or back to regular mode.

## Multi-Detectors

When a new IDP security package is received, it contains attack definitions and a detector. After a new policy is loaded, it is also associated with a detector. If the policy being loaded has an associated detector that matches the detector already in use by the existing policy, the new detector is not loaded and both policies use a single associated detector. But if the new detector does not match the current detector, the new detector is loaded along with the new policy. In this case, each loaded policy will then use its own associated detector for attack detection.

The version of the detector is common to all logical systems.

## Logging and Monitoring

Status monitoring options are available to the master administrator only. All status monitoring options under the **show security idp** and **clear security idp** CLI operational commands present global information, but not on a per logical system basis.

**NOTE:** SNMP monitoring for IDP is not supported on logical systems.

IDP generates event logs when an event matches an IDP policy rule in which logging is enabled.

The logical systems identification is added to the following types of IDP traffic processing logs:

- Attack logs. The following example shows an attack log for the ls-product-design logical system:

```
Oct 12 17:33:32 8.0.0.254 RT_IDP: IDP_ATTACK_LOG_EVENT_LS: IDP: In
ls-product-design at 1286930013, SIG Attack log <4.0.0.1/34327->5.0.0.1/21> for TCP
protocol and service SERVICE_IDP application NONE by rule 1 of rulebase IPS in policy
Recommended. attack: repeat=0, action=IGNORE, threat-severity=MEDIUM,
name=FTP:USER:ROOT, NAT <0.0.0.0->0.0.0.0>, time-elapsed=0, inbytes=0,
outbytes=0, inpackets=0, outpackets=0,
intf:ls-product-design-untrust:ge-0/0/0.0->ls-product-design-trust:ge-0/0/1.0,
packet-log-id: 65535 and misc-message -
```

- IP action logs. The following example shows an IP action log for the ls-product-design logical system:

```
Oct 13 16:56:04 8.0.0.254 RT_IDP: IDP_ATTACK_LOG_EVENT_LS: IDP: In
ls-product-design at 1287014163, TRAFFIC Attack log <25.0.0.1/34802->15.0.0.1/21>
for TCP protocol and service SERVICE_NONE application NONE by rule 1 of rulebase
IPS in policy Recommended. attack: repeat=0, action=TRAFFIC_IPACTION_NOTIFY,
threat-severity=INFO, name=_, NAT <0.0.0.0->0.0.0.0>, time-elapsed=0,
inbytes=0, outbytes=0, inpackets=0, outpackets=0,
intf:ls-product-design-trust:ge-0/0/1.0->ls-product-design-untrust:plt0.3,
packet-log-id: 0 and misc-message -
```

- Application DDoS logs. The following example shows an application DDoS log for the ls-product-design logical system:

```
Oct 11 16:29:57 8.0.0.254 RT_IDP: IDP_APPDDOS_APP_ATTACK_EVENT_LS: DDOS
Attack in ls-product-design at 1286839797 on my-http,
<ls-product-design-untrust:ge-0/0/0.0:4.0.0.1:33738->ls-product-design-trust:ge-0/0/1.0:5.0.0.1:80>
for TCP protocol and service HTTP by rule 1 of rulebase DDOS in policy Recommended.
attack: repeats 0 action DROP threat-severity INFO, connection-hit-rate 0,
context-name http-url-parsed, hit-rate 6, value-hit-rate 6 time-scope PEER time-count

## Example: Configuring an IDP Policy for the Master Logical System

This example shows how to configure an IDP policy in a master logical system.

- [Requirements on page 3603](#)
- [Overview on page 3603](#)
- [Configuration on page 3604](#)
- [Verification on page 3608](#)

### Requirements

Before you begin:

- Log in to the master logical system as the master administrator. See [“Understanding the Master Logical System and the Master Administrator Role” on page 3543](#).
- Read [“IDP in Logical Systems Overview” on page 3598](#).
- Use the **show system security-profile** command to see the resources allocated to the master logical system.

### Overview

In this example you configure a custom attack that is used in an IDP policy. The IDP policy is specified in a security profile that is applied to the master logical system. IDP is then enabled in a security policy configured in the master logical system.

You configure the features described in [Table 373](#).

**Table 373: IDP Configuration for the Master Logical System**

| Feature             | Name            | Configuration Parameters                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Custom attack       | http-bf         | <ul style="list-style-type: none"> <li>• Severity critical</li> <li>• Detect three attacks between source and destination addresses of sessions.</li> <li>• Stateful signature attack type with the following characteristics:               <ul style="list-style-type: none"> <li>• location http-url-parsed</li> <li>• pattern .*juniper.*</li> <li>• client to server traffic</li> </ul> </li> </ul> |
| IPS rulebase policy | root-idp-policy | Match: <ul style="list-style-type: none"> <li>• application default</li> <li>• http-bf custom attacks</li> </ul> Action: <ul style="list-style-type: none"> <li>• drop-connection</li> <li>• notification log-attacks</li> </ul>                                                                                                                                                                         |

Table 373: IDP Configuration for the Master Logical System (*continued*)

| Feature                         | Name                                                                      | Configuration Parameters                                                                                              |
|---------------------------------|---------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Logical system security profile | master-profile (previously configured and applied to root-logical-system) | Add IDP policy root-idp-policy.                                                                                       |
| Security policy                 | enable-idp                                                                | Enable IDP in a security policy that matches any traffic from the lsys-root-untrust zone to the lsys-root-trust zone. |

**NOTE:** A logical system can have only one active IDP policy at a time. To specify the active IDP policy for the master logical system, the master administrator can reference the IDP policy in the security profile that is bound to the master logical system as shown in this example. Alternatively, the master administrator can use the `active-policy` configuration statement at the `[edit security idp]` hierarchy level.

A commit error is generated if an IDP policy is both configured in the security profile that is bound to the master logical system and specified with the `active-policy` configuration statement. Use only one method to specify the active IDP policy for the master logical system.

## Configuration

- [Configuring a Custom Attack on page 3604](#)
- [Configuring an IDP Policy for the Master Logical System on page 3606](#)
- [Enabling IDP in a Security Policy on page 3607](#)

### Configuring a Custom Attack

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter **commit** from configuration mode.

```
set security idp custom-attack http-bf severity critical
set security idp custom-attack http-bf time-binding count 3
set security idp custom-attack http-bf time-binding scope peer
set security idp custom-attack http-bf attack-type signature context http-url-parsed
set security idp custom-attack http-bf attack-type signature pattern .*juniper.*
set security idp custom-attack http-bf attack-type signature direction client-to-server
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a custom attack object:

1. Log in to the master logical system as the master administrator and enter configuration mode.

```
[edit]
admin@host> configure
admin@host#
```

2. Create the custom attack object and set the severity level.

```
[edit security idp]
admin@host# set custom-attack http-bf severity critical
```

3. Configure attack detection parameters.

```
[edit security idp]
admin@host# set custom-attack http-bf time-binding count 3
admin@host# set custom-attack http-bf time-binding scope peer
```

4. Configure stateful signature parameters.

```
[edit security idp]
admin@host# set custom-attack http-bf attack-type signature context
http-url-parsed
admin@host# set custom-attack http-bf attack-type signature pattern .*juniper.*
admin@host# set custom-attack http-bf attack-type signature direction
client-to-server
```

**Results** From configuration mode, confirm your configuration by entering the **show security idp custom-attack http-bf** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
admin@host# show security idp custom-attack http-bf
severity critical;
time-binding {
 count 3;
 scope peer;
}
attack-type {
 signature {
 context http-url-parsed;
 pattern .*juniper.*;
 direction client-to-server;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring an IDP Policy for the Master Logical System

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security idp idp-policy root-idp-policy rulebase-ips rule 1 match application default
set security idp idp-policy root-idp-policy rulebase-ips rule 1 match attacks custom-attacks
http-bf
set security idp idp-policy root-idp-policy rulebase-ips rule 1 then action drop-connection
set security idp idp-policy root-idp-policy rulebase-ips rule 1 then notification log-attacks
set system security-profile master-profile idp-policy lsys1-idp-policy
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure an IDP policy:

1. Create the IDP policy and configure match conditions.

```
[edit security idp]
admin@host# set idp-policy root-idp-policy rulebase-ips rule 1 match application
default
admin@host# set idp-policy root-idp-policy rulebase-ips rule 1 match attacks
custom-attacks http-bf
```

2. Configure actions for the IDP policy.

```
[edit security idp]
admin@host# set idp-policy root-idp-policy rulebase-ips rule 1 then action
drop-connection
admin@host# set idp-policy root-idp-policy rulebase-ips rule 1 then notification
log-attacks
```

3. Add the IDP policy to the security profile.

```
[edit system security-profile master-profile]
admin@host# set idp-policy lsys1-idp-policy
```

**Results** From configuration mode, confirm your configuration by entering the **show security idp idp-policy root-idp-policy** and **show system security-profile master-profile** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
admin@host# show security idp idp-policy root-idp-policy
rulebase-ips {
 rule 1 {
 match {
 application default;
 attacks {
 custom-attacks http-bf;
 }
 }
 }
}
```

```

 }
 then {
 action {
 drop-connection;
 }
 notification {
 log-attacks;
 }
 }
}
}
admin@host# show system security-profile master-profile
...
idp-policy lsys1-idp-policy;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Enabling IDP in a Security Policy

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security policies from-zone lsys-root-untrust to-zone lsys-root-trust policy enable-idp
match source-address any
set security policies from-zone lsys-root-untrust to-zone lsys-root-trust policy enable-idp
match destination-address any
set security policies from-zone lsys-root-untrust to-zone lsys-root-trust policy enable-idp
match application any
set security policies from-zone lsys-root-untrust to-zone lsys-root-trust policy enable-idp
then permit application-services idp

```

#### Step-by-Step Procedure

To enable IDP in a security policy:

1. Create the security policy and configure match conditions.
 

```

[edit security policies from-zone lsys-root-untrust to-zone lsys-root-trust]
admin@host# set policy enable-idp match source-address any
admin@host# set policy enable-idp match destination-address any
admin@host# set policy enable-idp match application any

```
2. Enable IDP.
 

```

[edit security policies from-zone lsys-root-untrust to-zone lsys-root-trust]
admin@host# set policy enable-idp then permit application-services idp

```

#### Results

From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
admin@host# show security policies
from-zone lsys-root-untrust to-zone lsys-root-trust {
 policy enable-idp {
 match {
 source-address any;
 destination-address any;
 application any;
 }
 then {
 permit {
 application-services {
 idp;
 }
 }
 }
 }
}
...
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

### Verifying Attack Matches

---

**Purpose** Verify that attacks are being matched in network traffic.

**Action** From operational mode, enter the **show security idp attack table** command.

```
admin@host> show security idp attack table
IDP attack statistics:
 Attack name #Hits
 http-bf 1
```

## Understanding Logical System Application Identification Services

---

Predefined and custom application signatures identify an application by matching patterns in the first few packets of a session. Identifying applications provides the following benefits:

- Allows Intrusion Detection and Prevention (IDP) to apply appropriate attack objects to applications running on nonstandard ports.
- Improves performance by narrowing the scope of attack signatures for applications without decoders.

- Enables you to create detailed reports using AppTrack on applications passing through the device.

With logical systems, predefined and custom application signatures are global resources that are shared by all logical systems. The master administrator is responsible for downloading and installing predefined Juniper Networks application signatures and creating custom application and nested application signatures to identify applications that are not part of the predefined database.

Application identification is enabled by default.

The application system cache (ASC) saves the mapping between an application type and the corresponding destination IP address, destination port, protocol type, and service. Each user logical system has its own ASC. A user logical system administrator can display the ASC entries for their logical system with the **show services application-identification application-system-cache** command. A user logical system administrator can use the **clear services application-identification application-system-cache** command to clear the ASC entries for their logical system.

The master administrator can display or clear ASC entries for any logical system. The master administrator can also display or clear global counters with the **show services application-identification counter** and **clear services application-identification counter** commands.

## Understanding Logical System Application Firewall Services

---

An application firewall enables administrators of logical systems to create security policies for traffic based on application identification defined by application signatures. The application firewall provides additional security protection against dynamic-application traffic that might not be adequately controlled by standard network firewall policies. The application firewall controls information transmission by allowing or blocking traffic originating from particular applications.

To configure an application firewall, you define a rule set that contains rules specifying the action to be taken on identified dynamic applications. The rule set is configured independently and assigned to a security policy. Each rule set contains at least two rules, a matched rule (consisting of match criteria and action) and a default rule.

- A matched rule defines the action to be taken on matching traffic. When traffic matches an application and other criteria specified in the rule, the traffic is allowed or blocked based on the action specified in the rule.
- A default rule is applied when traffic does not match any other rule in the rule set.

The master administrator can download a predefined application signature database from the Juniper Networks Security Engineering website or can define application signatures using the Junos OS configuration CLI. For more information about application identification and application signatures, see [AppSecure Services Feature Guide for Security Devices](#).

Configuring an application firewall on a logical system is the same process as configuring an application firewall on a device that is not configured with logical systems. However, the application firewall applies only to the logical system for which it is configured. The master administrator can configure, enable, and monitor application firewalls on the master logical system and all user logical systems on a device. User logical system administrators can configure, enable, and monitor application firewalls only on the user logical systems for which they have access.

---

## Example: Configuring Application Firewall Services for a Master Logical System

This example describes how to configure application firewall services on the master, or root, logical system by a master administrator. Only the master administrator can configure, manage, and view configuration of the master logical system, in addition to all user logical systems.

After configuring application firewall rule sets and rules, the master administrator adds the application firewall rule set information to the security policy on the master logical system.

For information about configuring an application firewall within a security policy, see [“Application Firewall Overview” on page 547](#).

- [Requirements on page 3610](#)
- [Overview on page 3611](#)
- [Configuration on page 3611](#)
- [Verification on page 3613](#)

### Requirements

Before you begin:

- Verify that all interfaces, routing instances, and security zones have been configured on the master logical system.

See [“Example: Configuring Security Features for the Master Logical System”](#) on page 3593.

- Verify that application firewall resources (appfw-rule-set and appfw-rule) have been allocated in a security profile and bound to the master logical system through the `[system security-profile]` command. For application firewall resources, a security profile configuration allows 0 to 10,000 rule sets and 0 to 10,000 rules.

**NOTE:** The master administrator allocates various global system resources through a security profile configuration which is then bound to the various logical systems on the device. The master administrator owns this function and configures the security profile for all user logical systems as well as the master logical system.

For more information, see [“Understanding Logical System Security Profiles \(Master Administrators Only\)”](#) on page 3575.

- Log in to the master logical system as the master administrator.

For information about master administrator role functions, see [“Understanding the Master Logical System and the Master Administrator Role”](#) on page 3543.

## Overview

In this example you create application firewall services on the master logical system, called root-logical-system shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)”](#) on page 3564.

This example creates the following application firewall configuration:

- Rule set, root-rs1, with rules r1 and r2. When r1 is matched, Telnet traffic is allowed through the firewall. When r2 is matched, web traffic is allowed through the firewall.
- Rule set, root-rs2, with rule r1. When r1 is matched, Facebook traffic is blocked by the firewall.

All rule sets require a default rule, which specifies whether to permit or deny traffic that is not specified in any rules of a rule set. The default-rule action (permit or deny) must be the opposite from the action that is specified for the other rule(s) in the rule set.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter **commit** from configuration mode.

```
set logical-systems root-logical-system security application-firewall rule-sets root-rs1
 rule r1 match dynamic-application junos:TELNET
set logical-systems root-logical-system security application-firewall rule-sets root-rs1
 rule r1 then permit
```

```

set logical-systems root-logical-system security application-firewall rule-sets root-rs1
rule r2 match dynamic-application-group junos:web
set logical-systems root-logical-system security application-firewall rule-sets root-rs1
rule r2 then permit
set logical-systems root-logical-system security application-firewall rule-sets root-rs1
default-rule deny
set logical-systems root-logical-system security application-firewall rule-sets root-rs2
rule r1 match dynamic-application junos:facebook
set logical-systems root-logical-system security application-firewall rule-sets root-rs2
rule r1 then deny
set logical-systems root-logical-system security application-firewall rule-sets root-rs2
default-rule permit

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure application firewall for a master logical system:

1. Log in to the master logical system as the master administrator. See [“Example: Configuring a Root Password for the Device \(Master Administrators Only\)” on page 3563](#) and enter configuration mode.
 

```

admin@host> configure
admin@host#

```
2. Configure an application firewall rule set for root-logical-system.
 

```

[edit]
admin@host# set logical-systems security application-firewall rule-sets root-rs1

```
3. Configure a rule for this rule set and specify which dynamic applications and dynamic application groups the rule should match.
 

```

[edit]
admin@host# set logical-systems security application-firewall rule-sets root-rs1
rule r1 match dynamic-application telnet then permit

```
4. Configure the default rule for this rule set and specify the action to take when the identified dynamic application is not specified in any rules of the rule set.
 

```

[edit]
admin@host# set logical-systems security application-firewall rule-sets root-rs1
default-rule deny

```
5. Repeat these steps to configure another rule set, root-rs2, if desired.

**Results** From configuration mode, confirm your configuration by entering the **show security application-firewall rule-sets** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```

[edit]
admin@host# show security application-firewall rule-sets all

```

```

...
application-firewall {
 rule-sets root-rs1 {
 rule r1 {
 match {
 dynamic-application [junos:TELNET];
 }
 then {
 permit;
 }
 }
 default-rule {
 deny;
 }
 }
 rule-sets root-rs1 {
 rule r2 {
 match {
 dynamic-application-group [junos:web];
 }
 then {
 permit;
 }
 }
 }
 rule-sets root-rs2 {
 rule r1 {
 match {
 dynamic-application [junos:FACEBOOK];
 }
 then {
 deny;
 }
 }
 default-rule {
 permit;
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying Application Firewall Configuration on page 3613](#)

### Verifying Application Firewall Configuration

**Purpose** View the application firewall configuration on the master logical system.

**Action** From operational mode, enter the **show security application-firewall rule-set logical-system root-logical-system rule-set all** command.

```

admin@host> show security application-firewall rule-set logical-system root-logical-system
rule-set all

```

```
Rule-set: root-rs1
 Logical system: root-logical-system
 Rule: r1
 Dynamic Applications: junos:TELNET
 Action:permit
 Number of sessions matched: 10
Default rule:deny
 Number of sessions matched: 100
Number of sessions with appid pending: 2
```

```
Rule-set: root-rs1
 Logical system: root-logical-system
 Rule: r2
 Dynamic Applications: junos:web
 Action:permit
 Number of sessions matched: 20
Default rule:deny
 Number of sessions matched: 200
Number of sessions with appid pending: 4
```

```
Rule-set: root-rs2
 Logical system: root-logical-system
 Rule: r1
 Dynamic Applications: junos:FACEBOOK
 Action:deny
 Number of sessions matched: 40
Default rule:permit
 Number of sessions matched: 400
Number of sessions with appid pending: 10
```

## Understanding Logical System Application Tracking Services

AppTrack is an application tracking tool that provides statistics for analyzing bandwidth usage of your network. When enabled, AppTrack collects byte, packet, and duration statistics for application flows in the specified zone. By default, when each session closes, AppTrack generates a message that provides the byte and packet counts and duration of the session, and sends it to the host device. The Security Threat Response Manager (STRM) retrieves the data and provides flow-based application visibility.

AppTrack can be enabled and configured within any logical system. Configuring AppTrack in a logical system is the same as configuring AppTrack on a device that is not configured for logical systems. An AppTrack configuration only applies to the logical system in which it is configured. The name of the logical system is added to AppTrack logs. The master administrator can configure AppTrack for any logical system while a user logical system

administrator can only configure AppTrack for the logical system that they are logged in to.

**NOTE:** The system log configuration is global on the device and must be configured by the master administrator. The user logical system administrator cannot configure system logging for a logical system.

Counters keep track of the number of log messages sent and logs that have failed. AppTrack counters are global to the device. The master administrator as well as user logical system administrators can view AppTrack counters with the **show security application-tracking counters** command.

## Understanding Route-Based VPN Tunnels in Logical Systems

A VPN connection can secure traffic that passes between a logical system and a remote site across a WAN. With route-based VPNs, you configure one or more security policies in a logical system to regulate the traffic flowing through a single IP Security (IPsec) tunnel. For each IPsec tunnel, there is one set of IKE and IPsec security associations (SAs) that must be configured at the root level by the master administrator.

**NOTE:** Only route-based VPNs are supported for logical systems. Policy-based VPNs are not supported.

In addition to configuring IKE and IPsec SAs for each VPN, the master administrator must also assign a secure tunnel (st0) interface to a user logical system. An st0 interface can only be assigned to a single user logical system. However, multiple user logical systems can each be assigned their own st0 interface.

**NOTE:** The st0 unit 0 interface should not be assigned to a logical system, as an SA cannot be set up for this interface.

The user logical system administrator can configure the IP address and other attributes of the st0 interface assigned to the user logical system. The user logical system administrator cannot delete an st0 interface assigned to their user logical system.

For route-based VPNs, a security policy refers to a destination address and not a specific VPN tunnel. For cleartext traffic in a user logical system to be sent to the VPN tunnel for encapsulation, the user logical system administrator must make the following configurations:

- Security policy that permits traffic to a specified destination.
- Static route to the destination with the st0 interface as the next hop.

When Junos OS looks up routes in the user logical system to find the interface to use to send traffic to the destination address, it finds a static route through the st0 interface. Traffic is routed to the VPN tunnel as long as the security policy action is permit.

The master logical system and a user logical system can share a route-based VPN tunnel. An st0 interface assigned to a user logical system can also be used by the master logical system. For the master logical system, the master administrator configures a security policy that permits traffic to the remote destination and a static route to the remote destination with the st0 interface as the next hop.

VPN monitoring is configured by the master administrator in the master logical system. For the VPN monitor source interface, the master administrator must specify the st0 interface; a physical interface for a user logical system cannot be specified.

## Example: Configuring IKE and IPsec SAs for a VPN Tunnel (Master Administrators Only)

---

The master administrator is responsible for assigning an st0 interface to a user logical system and configuring IKE and IPsec SAs at the root level for each VPN tunnel. This example shows how to assign an st0 interface to a user logical system and configure IKE and IPsec SA parameters.

- [Requirements on page 3616](#)
- [Overview on page 3617](#)
- [Configuration on page 3617](#)
- [Verification on page 3620](#)

### Requirements

Before you begin:

- Log in to the master logical system as the master administrator. See [“Understanding the Master Logical System and the Master Administrator Role” on page 3543](#).
- Read [“Understanding Route-Based IPsec VPNs” on page 6369](#).

## Overview

In this example you configure a VPN tunnel for the ls-product-design user logical system. This example configures the VPN tunnel parameters described in [Table 374](#).

**Table 374: Logical System VPN Tunnel Configuration**

| Feature          | Name                  | Configuration Parameters                                                                                                                                                                                 |

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set logical-systems ls-product-design interfaces st0 unit 1
set security ike proposal ike-phase1-proposal authentication-method pre-shared-keys
set security ike proposal ike-phase1-proposal dh-group group2
set security ike proposal ike-phase1-proposal authentication-algorithm sha1
set security ike proposal ike-phase1-proposal encryption-algorithm aes-128-cbc
```

```

set security ike policy ike-phase1-policy mode main
set security ike policy ike-phase1-policy proposals ike-phase1-proposal
set security ike policy ike-phase1-policy pre-shared-key ascii-text "$ABC123"
set security ike gateway ike-gw ike-policy ike-phase1-policy
set security ike gateway ike-gw address 2.2.2.2
set security ike gateway ike-gw external-interface ge-0/0/3.0
set security ipsec proposal ipsec-phase2-proposal protocol esp
set security ipsec proposal ipsec-phase2-proposal authentication-algorithm hmac-sha1-96
set security ipsec proposal ipsec-phase2-proposal encryption-algorithm aes-128-cbc
set security ipsec policy vpn-policy1 perfect-forward-secrecy keys group2
set security ipsec policy vpn-policy1 proposals ipsec-phase2-proposal
set security ipsec vpn ike-vpn bind-interface st0.1
set security ipsec vpn ike-vpn vpn-monitor source-interface st0.1
set security ipsec vpn ike-vpn vpn-monitor destination-ip 4.0.0.1
set security ipsec vpn ike-vpn ike gateway ike-gw
set security ipsec vpn ike-vpn ike ipsec-policy vpn-policy1

```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To assign a VPN tunnel interface to a user logical system and configure IKE and IPsec SAs:

1. Log in to the master logical system as the master administrator and enter configuration mode.

```

[edit]
admin@host> configure
admin@host#

```

2. Assign a VPN tunnel interface.

```

[edit logical-systems ls-product-design]
admin@host# set interfaces st0 unit 1

```

3. Configure an IKE proposal.

```

[edit security ike]
admin@host# set proposal ike-phase1-proposal authentication-method
pre-shared-keys
admin@host# set proposal ike-phase1-proposal dh-group group2
admin@host# set proposal ike-phase1-proposal authentication-algorithm sha1
admin@host# set proposal ike-phase1-proposal encryption-algorithm aes-128-cbc

```

4. Configure an IKE policy.

```

[edit security ike]
admin@host# set policy ike-phase1-policy mode main
admin@host# set policy ike-phase1-policy proposals ike-phase1-proposal
admin@host# set policy ike-phase1-policy pre-shared-key ascii-text 395psksecr3t

```

5. Configure an IKE gateway.

```

[edit security ike]
admin@host# set gateway ike-gw external-interface ge-0/0/3.0
admin@host# set gateway ike-gw ike-policy ike-phase1-policy
admin@host# set gateway ike-gw address 2.2.2.2

```

6. Configure an IPsec proposal.

```
[edit security ipsec]
admin@host# set proposal ipsec-phase2-proposal protocol esp
admin@host# set proposal ipsec-phase2-proposal authentication-algorithm
 hmac-sha1-96
admin@host# set proposal ipsec-phase2-proposal encryption-algorithm aes-128-cbc
```

7. Configure an IPsec policy.

```
[edit security ipsec]
admin@host# set policy vpn-policy1 proposals ipsec-phase2-proposal
admin@host# set policy vpn-policy1 perfect-forward-secrecy keys group2
```

8. Configure the VPN.

```
[edit security ipsec]
admin@host# set vpn ike-vpn bind-interface st0.1
admin@host# set vpn ike-vpn ike gateway ike-gw
admin@host# set vpn ike-vpn ike ipsec-policy vpn-policy1
```

9. Configure VPN monitoring.

```
[edit security ipsec]
admin@host# set vpn ike-vpn vpn-monitor source-interface st0.1
admin@host# set vpn ike-vpn vpn-monitor destination-ip 4.0.0.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show security ike**, and **show security ipsec** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
admin@host# show interfaces
 st0 {
 unit 1;
 }
[edit]
admin@host# show security ike
 proposal ike-phase1-proposal {
 authentication-method pre-shared-keys;
 dh-group group2;
 authentication-algorithm sha1;
 encryption-algorithm aes-128-cbc;
 }
 policy ike-phase1-policy {
 mode main;
 proposals ike-phase1-proposal;
 pre-shared-key ascii-text "$ABC123"; ## SECRET-DATA
 }
 gateway ike-gw {
 ike-policy ike-phase1-policy;
 address 2.2.2.2;
 external-interface ge-0/0/3.0;
 }
[edit]
admin@host# show security ipsec
 proposal ipsec-phase2-proposal {
 protocol esp;
```

```
authentication-algorithm hmac-sha1-96;
encryption-algorithm aes-128-cbc;
}
policy vpn-policy1 {
 perfect-forward-secrecy {
 keys group2;
 }
 proposals ipsec-phase2-proposal;
}
vpn ike-vpn {
 bind-interface st0.1;
 vpn-monitor {
 source-interface st0.1;
 destination-ip 4.0.0.1;
 }
 ike {
 gateway ike-gw;
 ipsec-policy vpn-policy1;
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying the Configuration

---

## Understanding Logical System Zones

---

Security zones are logical entities to which one or more interfaces are bound. Security zones can be configured on the master logical system by the master administrator or on user logical systems by the user logical system administrator. On a logical system, the administrator can configure multiple security zones, dividing the network into network segments to which various security options can be applied.

The master administrator configures the maximum and reserved numbers of security zones for each user logical system. The user logical system administrator can then create

security zones in the user logical system and assign interfaces to each security zone. From a user logical system, the user logical system administrator can use the **show system security-profile zones** command to view the number of security zones allocated to the user logical system and the **show interfaces** command to view the interfaces allocated to the user logical system.

**NOTE:** The master administrator can configure a security profile for the master logical system that specifies the maximum and reserved numbers of security zones applied to the master logical system. The number of zones configured in the master logical system count toward the maximum number of zones available on the device.

The master and user administrator can configure the following properties of a security zone in a logical system:

- Interfaces that are part of a security zone.
- Screen options—For every security zone, you can enable a set of predefined screen options that detect and block various kinds of traffic that the device determines as potentially harmful.
- TCP-Reset—When this feature is enabled, the system sends a TCP segment with the RESET flag set when traffic arrives that does not match an existing session and does not have the synchronize flag set.
- Host inbound traffic—This feature specifies the kinds of traffic that can reach the device from systems that are directly connected to its interfaces. You can configure these parameters at the zone level, in which case they affect all interfaces of the zone, or at the interface level. (Interface configuration overrides that of the zone.)

There are no preconfigured security zones in the master logical system or user logical system.

The management functional zone (MGT) can only be configured for the master logical system. There is only one management interface per device and that interface is allocated to the master logical system.

The **all** interface can only be assigned to a zone in the master logical system by the master administrator.

The user logical system administrator can configure and view all attributes for a security zone in a user logical system. All attributes of a security zone in a user logical system are also visible to the master administrator.

## Example: Configuring Zones for a User Logical System

This example shows how to configure zones for a user logical system.

- [Requirements on page 3623](#)
- [Overview on page 3623](#)
- [Configuration on page 3624](#)

### Requirements

Before you begin:

- Log in to the user logical system as the user logical system administrator. See [“User Logical System Configuration Overview” on page 3547](#).
- Use the **show system security-profile zones** command to see the zone resources allocated to the logical system.
- Logical interfaces for the user logical system must be configured. See [“Example: Configuring Interfaces and Routing Instances for a User Logical System” on page 3682](#).

### Overview

This example configures the ls-product-design user logical system shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#).

This example creates the zones and address books described in [Table 375](#).

**Table 375: User Logical System Zone and Address Book Configuration**

| Feature       | Name                      | Configuration Parameters                                                                                                                                                                                                                                                          |
|---------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Zones         | ls-product-design-trust   | <ul style="list-style-type: none"> <li>• Bind to interface ge-0/0/5.1.</li> <li>• TCP reset enabled.</li> </ul>                                                                                                                                                                   |
|               | ls-product-design-untrust | <ul style="list-style-type: none"> <li>• Bind to interface lt-0/0/0.3.</li> </ul>                                                                                                                                                                                                 |
| Address books | product-design-internal   | <ul style="list-style-type: none"> <li>• Address product-designers: 12.1.1.0/24</li> <li>• Attach to zone ls-product-design-trust</li> </ul>                                                                                                                                      |
|               | product-design-external   | <ul style="list-style-type: none"> <li>• Address marketing: 13.1.1.0/24</li> <li>• Address accounting: 14.1.1.0/24</li> <li>• Address others: 12.12.1.0/24</li> <li>• Address set otherlsys: marketing, accounting</li> <li>• Attach to zone ls-product-design-untrust</li> </ul> |

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security address-book product-design-internal address product-designers 12.1.1.0/24
set security address-book product-design-internal attach zone ls-product-design-trust
set security address-book product-design-external address marketing 13.1.1.0/24
set security address-book product-design-external address accounting 14.1.1.0/24
set security address-book product-design-external address others 12.1.1.0/24
set security address-book product-design-external address-set otherlsys address
 marketing
set security address-book product-design-external address-set otherlsys address
 accounting
set security address-book product-design-external attach zone ls-product-design-untrust
set security zones security-zone ls-product-design-trust tcp-rst
set security zones security-zone ls-product-design-trust interfaces ge-0/0/5.1
set security zones security-zone ls-product-design-untrust interfaces lt-0/0/0.3
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure zones in a user logical system:

1. Log in to the user logical system as the logical system administrator and enter configuration mode.  

```
lsdesignadmin1@host:ls-product-design> configure
lsdesignadmin1@host:ls-product-design#
```
2. Configure a security zone and assign it to an interface.  

```
[edit security zones]
lsdesignadmin1@host:ls-product-design# set security-zone ls-product-design-trust
 interfaces ge-0/0/5.1
```
3. Configure the TCP-Reset parameter for the zone.  

```
[edit security zones security-zone ls-product-design-trust]
lsdesignadmin1@host:ls-product-design# set tcp-rst
```
4. Configure a security zone and assign it to an interface.  

```
[edit security zones]
lsdesignadmin1@host:ls-product-design# set security-zone ls-product-design-untrust
 interfaces lt-0/0/0.3
```
5. Create global address book entries.  

```
[edit security]
lsdesignadmin1@host:ls-product-design# set address-book product-design-internal
 address product-designers 12.1.1.0/24
lsdesignadmin1@host:ls-product-design# set address-book product-design-external
 address marketing 13.1.1.0/24
```

```

lsdesignadmin1@host:ls-product-design# set address-book product-design-external
address accounting 14.1.1.0/24
lsdesignadmin1@host:ls-product-design# set address-book product-design-external
address others 12.12.1.0/24
lsdesignadmin1@host:ls-product-design# set address-book product-design-external
address-set otherlsys address marketing
lsdesignadmin1@host:ls-product-design# set address-book product-design-external
address-set otherlsys address accounting

```

6. Attach address books to zones.

```

[edit security]
lsdesignadmin1@host:ls-product-design# set address-book product-design-internal
attach zone ls-product-design-trust
lsdesignadmin1@host:ls-product-design# set address-book product-design-external
attach zone ls-product-design-untrust

```

**Results** From configuration mode, confirm your configuration by entering the **show security** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

lsdesignadmin1@host:ls-product-design# show security
address-book {
 product-design-internal {
 address product-designers 12.1.1.0/24;
 attach {
 zone ls-product-design-trust;
 }
 }
 product-design-external {
 address marketing 13.1.1.0/24;
 address accounting 14.1.1.0/24;
 address others 12.12.1.0/24;
 address-set otherlsys {
 address marketing;
 address accounting;
 }
 attach {
 zone ls-product-design-untrust;
 }
 }
}
zones {
 security-zone ls-product-design-trust {
 tcp-rst;
 interfaces {
 ge-0/0/5.1;
 }
 }
 security-zone ls-product-design-untrust {
 interfaces {
 lt-0/0/0.3;
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Understanding Logical System Screen Options

Junos OS screen options secure a zone by inspecting, then allowing or denying, all connection attempts that require crossing an interface bound to that zone. Junos OS then applies firewall policies, which can contain content filtering and IDP components, to the traffic that passes the screen filters.

All screen options available on the device are available in each logical system. Each user logical system administrator can configure screen options for their user logical system. The master administrator can configure screen options for the master logical system as well as all user logical systems.

The user logical system administrator can configure and view all screen options in a user logical system. All screen options in a user logical system are visible to the master administrator.

## Example: Configuring Screen Options for a User Logical System

This example shows how to configure screen options for a user logical system.

- [Requirements on page 3626](#)
- [Overview on page 3627](#)
- [Configuration on page 3627](#)

### Requirements

Before you begin:

- Log in to the user logical system as the user logical system administrator. See “[User Logical System Configuration Overview](#)” on page 3547.
- Configure zones for the user logical system. See “[Example: Configuring Zones for a User Logical System](#)” on page 3623.

## Overview

This example configures the ls-product-design user logical system shown in “[Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)](#)” on page 3564.

You can limit the number of concurrent sessions to the same destination IP address in a user logical system. Setting a destination-based session limit can ensure that Junos OS allows only an acceptable number of concurrent connection requests—no matter what the source—to reach any one host. When the number of concurrent connection requests to an IP address surpasses the limit, Junos OS blocks further connection attempts to that IP address. This example creates the screen options described in [Table 376](#).

**Table 376: User Logical System Screen Options Configuration**

| Name                       | Configuration Parameters                                                                                                                                              |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| limit-destination-sessions | <ul style="list-style-type: none"> <li>Limits concurrent connection requests to destination IPs to 80.</li> <li>Applied to ls-product-design-untrust zone.</li> </ul> |

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security screen ids-option limit-destination-sessions limit-session destination-ip-based 80
set security zones security-zone ls-product-design-untrust screen limit-destination-sessions
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure destination-based session limits in a user logical system:

1. Log in to the user logical system as the logical system administrator and enter configuration mode.

```
lsdesignadmin1@host:ls-product-design> configure
lsdesignadmin1@host:ls-product-design#
```

2. Configure a screen option for a destination-based session limit.

```
[edit security]
lsdesignadmin1@host:ls-product-design# set screen ids-option
limit-destination-sessions limit-session destination-ip-based 80
```

3. Set the security zone for the screen option.

```
[edit security]
lsdesignadmin1@host:ls-product-design# set zones security-zone
ls-product-design-untrust screen limit-destination-sessions
```

**Results** From configuration mode, confirm your configuration by entering the **show security screen** and **show security zone** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
lsdesignadmin1@host:ls-product-design# show security screen
ids-option limit-destination-sessions {
 limit-session {
 destination-ip-based 80;
 }
}
lsdesignadmin1@host:ls-product-design# show security zones
security-zone ls-product-design-trust {
 ...
}
security-zone ls-product-design-untrust {
 screen limit-destination-sessions;
 ...
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Understanding Logical System Security Policies

- [Security Policies in Logical Systems on page 3628](#)
- [Application Timeouts on page 3629](#)
- [Security Policy Allocation on page 3629](#)

### Security Policies in Logical Systems

Security policies enforce rules for what traffic can pass through the firewall and actions that need to take place on the traffic as it passes through the firewall. From the perspective of security policies, traffic enters one security zone and exits another security zone.

By default, a logical system denies all traffic in all directions, including intra-zone and inter-zone directions. Through the creation of security policies, the logical system administrator can control the traffic flow from zone to zone by defining the kinds of traffic permitted to pass from specified sources to specified destinations.

Security policies can be configured in the master logical system and in user logical systems. Configuring a security policy in a logical system is the same as configuring a security policy on a device that is not configured for logical systems. Any security policies, policy rules, address books, applications and application sets, and schedulers created

within a logical system are only applicable to that logical system. Only predefined applications and application sets, such as **junos-ftp**, can be shared between logical systems.

**NOTE:** In a logical system, you cannot specify **global** as either the **from-zone** or the **to-zone** in a security policy.

The user logical system administrator can configure and view all attributes for security policies in a user logical system. All attributes of a security policy in a user logical system are also visible to the master administrator.

## Application Timeouts

The application timeout value set for an application determines the session timeout. Application timeout behavior is the same in a logical system as at the root level. However, user logical system administrators can use predefined applications in security policies but cannot modify the timeout value of predefined applications. This is because the predefined applications are shared by the master logical system and all user logical systems, so the user logical system administrator is not allowed to change its behavior. Application timeout values are stored in the application entry database and in the corresponding logical system TCP and UDP port-based timeout tables.

If the application that is matched for the traffic has a timeout value, that timeout value is used. Otherwise, the lookup proceeds in the following order until an application timeout value is found:

1. The logical system TCP and UDP port-based timeout table is searched for a timeout value.
2. The root TCP and UDP port-based timeout table is searched for a timeout value.
3. The protocol-based default timeout table is searched for a timeout value.

## Security Policy Allocation

The master administrator configures the maximum and reserved numbers of security policies for each user logical system. The user logical system administrator can then create security policies in the user logical system. From a user logical system, the user logical system administrator can use the **show system security-profile policy** command to view the number of security policies allocated to the user logical system.

**NOTE:** The master administrator can configure a security profile for the master logical system that specifies the maximum and reserved numbers of security policies applied to the master logical system. The number of policies configured in the master logical system count toward the maximum number of policies available on the device.

## Example: Configuring Security Policies in a User Logical System

This example shows how to configure security policies for a user logical system.

- [Requirements on page 3630](#)
- [Overview on page 3630](#)
- [Configuration on page 3631](#)
- [Verification on page 3633](#)

### Requirements

Before you begin:

- Log in to the user logical system as the logical system administrator. See [“User Logical System Configuration Overview” on page 3547](#).
- Use the **show system security-profiles policy** command to see the security policy resources allocated to the logical system.
- Configure zones and address books. See [“Example: Configuring Zones for a User Logical System” on page 3623](#).

### Overview

This example configures the ls-product-design user logical system shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#).

This example configures the security policies described in [Table 377](#).

**Table 377: User Logical System Security Policies Configuration**

| Name                    | Configuration Parameters                                                                                                                                                                                                                                                              |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| permit-all-to-otherlsys | Permit the following traffic: <ul style="list-style-type: none"> <li>• From zone: ls-product-design-trust</li> <li>• To zone: ls-product-design-untrust</li> <li>• Source address: product-designers</li> <li>• Destination address: otherlsys</li> <li>• Application: any</li> </ul> |

Table 377: User Logical System Security Policies Configuration (*continued*)

| Name                      | Configuration Parameters                                                                                                                                                                                                                                                    |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| permit-all-from-otherlsys | Permit the following traffic: <ul style="list-style-type: none"> <li>From zone: ls-product-design-untrust</li> <li>To zone: ls-product-design-trust</li> <li>Source address: otherlsys</li> <li>Destination address: product-designers</li> <li>Application: any</li> </ul> |

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set security policies from-zone ls-product-design-trust to-zone ls-product-design-untrust
 policy permit-all-to-otherlsys match source-address product-designers
set security policies from-zone ls-product-design-trust to-zone ls-product-design-untrust
 policy permit-all-to-otherlsys match destination-address otherlsys
set security policies from-zone ls-product-design-trust to-zone ls-product-design-untrust
 policy permit-all-to-otherlsys match application any
set security policies from-zone ls-product-design-trust to-zone ls-product-design-untrust
 policy permit-all-to-otherlsys then permit
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
 policy permit-all-from-otherlsys match source-address otherlsys
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
 policy permit-all-from-otherlsys match destination-address product-designers
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
 policy permit-all-from-otherlsys match application any
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
 policy permit-all-from-otherlsys then permit

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure security policies in a user logical system:

- Log in to the user logical system as the logical system administrator and enter configuration mode.
 

```

lsdesignadmin1@host:ls-product-design> configure
lsdesignadmin1@host:ls-product-design#

```
- Configure a security policy that permits traffic from the ls-product-design-trust zone to the ls-product-design-untrust zone.
 

```

[edit security policies from-zone ls-product-design-trust to-zone
ls-product-design-untrust]
lsdesignadmin1@host:ls-product-design# set policy permit-all-to-otherlsys match
source-address product-designers

```

```

lsdesignadmin1@host:ls-product-design# set policy permit-all-to-otherlsys match
destination-address otherlsys
lsdesignadmin1@host:ls-product-design# set policy permit-all-to-otherlsys match
application any
lsdesignadmin1@host:ls-product-design# set policy permit-all-to-otherlsys then
permit

```

3. Configure a security policy that permits traffic from the ls-product-design-untrust zone to the ls-product-design-trust zone.

```

[edit security policies from-zone ls-product-design-untrust to-zone
ls-product-design-trust]
lsdesignadmin1@host:ls-product-design# set policy permit-all-from-otherlsys match
source-address otherlsys
lsdesignadmin1@host:ls-product-design# set policy permit-all-from-otherlsys match
destination-address product-designers
lsdesignadmin1@host:ls-product-design# set policy permit-all-from-otherlsys match
application any
lsdesignadmin1@host:ls-product-design# set policy permit-all-from-otherlsys then
permit

```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

lsdesignadmin1@host:ls-product-design# show security policies
from-zone ls-product-design-trust to-zone ls-product-design-untrust {
 policy permit-all-to-otherlsys {
 match {
 source-address product-designers;
 destination-address otherlsys;
 application any;
 }
 then {
 permit;
 }
 }
}
from-zone ls-product-design-untrust to-zone ls-product-design-trust {
 policy permit-all-from-otherlsys {
 match {
 source-address otherlsys;
 destination-address product-designers;
 application any;
 }
 then {
 permit;
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying Policy Configuration on page 3633](#)

### Verifying Policy Configuration

---

**Purpose** Verify information about policies and rules.

**Action** From operational mode, enter the **show security policies detail** command to display a summary of all policies configured on the logical system.

**Related Documentation**

## Understanding Logical System Firewall Authentication

---

A firewall user is a network user who must provide a username and password for authentication when initiating a connection across the firewall. Junos OS enables administrators to restrict and permit firewall users to access protected resources (different zones) behind a firewall based on their source IP address and other credentials.

The master administrator is responsible for configuring access profiles in the master logical system. Access profiles store usernames and passwords of users or point to external authentication servers where such information is stored. Access profiles configured at the master logical system are available to all user logical systems.

The master administrator configures the maximum and reserved numbers of firewall authentications for each user logical system. The user logical system administrator can then create firewall authentications in the user logical system. From a user logical system, the user logical system administrator can use the **show system security-profile auth-entry** command to view the number of authentication resources allocated to the user logical system.

To configure the access profile, the master administrator uses the **profile** configuration statement at the **[edit access]** hierarchy level in the master logical system. The access profile can also include the order of authentication methods, LDAP or RADIUS server options, and session options.

The user logical system administrator can then associate the access profile with a security policy in the user logical system. The user logical system administrator also specifies the type of authentication:

- With pass-through authentication, a host or a user from one zone tries to access resources on another zone using an FTP, a Telnet, or an HTTP client. The device uses FTP, Telnet, or HTTP to collect username and password information, and subsequent

traffic from the user or host is allowed or denied based on the result of this authentication.

- With Web authentication, users use HTTP to connect to an IP address on the device that is enabled for Web authentication and are prompted for the username and password. Subsequent traffic from the user or host to the protected resource is allowed or denied based on the result of this authentication.

The user logical system administrator configures the following properties for firewall authentication in the user logical system:

- Security policy that specifies firewall authentication for matching traffic. Firewall authentication is specified with the **firewall-authentication** configuration statement at the **[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit]** hierarchy level.

Users or user groups in an access profile who are allowed access by the policy can optionally be specified with the client-match configuration statement. (If no users or user groups are specified, any user who is successfully authenticated is allowed access.)

For pass-through authentication, the access profile can optionally be specified and Web redirect (redirecting the client system to a webpage for authentication) can be enabled.

- Type of authentication (pass-through or Web authentication), default access profile, and success banner for the FTP, Telnet, or HTTP session. These properties are configured with the **firewall-authentication** configuration statement at the **[edit access]** hierarchy level.
- Host inbound traffic. Protocols, services, or both are allowed to access the logical system. The types of traffic are configured with the **host-inbound-traffic** configuration statement at the **[edit security zones security-zone zone-name]** or **[edit security zones security-zone zone-name interfaces interface-name]** hierarchy levels.

From a user logical system, the user logical system administrator can use the **show security firewall-authentication users** or **show security firewall-authentication history** commands to view the information about firewall users and history for the user logical system. From the master logical system, the master administrator can use the same commands to view information for the master logical system, a specific user logical system, or all logical systems.

## Example: Configuring Firewall Authentication for a User Logical System

---

This example shows how to configure firewall authentication for a user logical system.

- [Requirements on page 3635](#)
- [Overview on page 3635](#)
- [Configuration on page 3636](#)
- [Verification on page 3638](#)

### Requirements

Before you begin:

- Log in to the user logical system as the logical system administrator. See [“User Logical System Configuration Overview” on page 3547](#).
- Use the **show system security-profiles auth-entry** command to see the firewall authentication entries allocated to the logical system.
- Access profiles must be configured in the master logical system by the master administrator. See [“Example: Configuring Access Profiles \(Master Administrators Only\)” on page 3591](#).

### Overview

This example configures the ls-product-design user logical system shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#).

In this example, users in the ls-marketing-dept and ls-accounting-dept logical systems are required to authenticate when initiating certain connections to the product designers subnet. This example configures the firewall authentication described in [Table 378](#).

NOTE: This example uses the access profile configured in [“Example: Configuring Access Profiles \(Master Administrators Only\)” on page 3591](#) and address book entries configured in [“Example: Configuring Zones for a User Logical System” on page 3623](#).

Table 378: User Logical System Firewall Authentication Configuration

| Feature                 | Name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Configuration Parameters                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security policy         | permit-authorized-users<br><br><b>NOTE:</b> Policy lookup is performed in the order that the policies are configured. The first policy that matches the traffic is used. If you have previously configured a policy that permits traffic for the same from-zone, to-zone, source address, and destination address but with application <b>any</b> , the policy configured in this example would never be matched. (See <a href="#">"Example: Configuring Security Policies in a User Logical System" on page 3630.</a> ) Therefore, this policy should be reordered so that it is checked first. | Permit firewall authentication for the following traffic: <ul style="list-style-type: none"> <li>From zone: ls-product-design-untrust</li> <li>To zone: ls-product-design-trust</li> <li>Source address: otherlsys</li> <li>Destination address: product-engineers</li> <li>Application: junos-h323</li> </ul> The ldap1 access profile is used for pass-through authentication. |
| Firewall authentication |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>Pass-through authentication</li> <li>HTTP login prompt "welcome"</li> <li>Default access profile ldap1</li> </ul>                                                                                                                                                                                                                         |

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
policy permit-authorized-users match source-address otherlsys
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
policy permit-authorized-users match destination-address product-designers
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
policy permit-authorized-users match application junos-h323
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
policy permit-authorized-users then permit firewall-authentication pass-through
access-profile ldap1
set access firewall-authentication pass-through default-profile ldap1
set access firewall-authentication pass-through http banner login "welcome"
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure firewall authentication in a user logical system:

- Log in to the user logical system as the logical system administrator and enter configuration mode.
 

```
lsdesignadmin1@host:ls-product-design> configure
lsdesignadmin1@host:ls-product-design#
```
- Configure a security policy that permits firewall authentication.
 

```
[edit security policies from-zone ls-product-design-untrust to-zone
ls-product-design-trust]
```

```

lsdesignadmin1@host:ls-product-design# set policy permit-authorized-users match
source-address otherlsys
lsdesignadmin1@host:ls-product-design# set policy permit-authorized-users match
destination -address product-designers
lsdesignadmin1@host:ls-product-design# set policy permit-authorized-users match
application junos-h323
lsdesignadmin1@host:ls-product-design# set policy permit-authorized-users then
permit firewall-authentication pass-through access-profile ldap1

```

3. Reorder the security policies.

```

[edit]
lsdesignadmin1@host:ls-product-design# insert security policies from-zone
ls-product-design-untrust to-zone ls-product-design-trust policy
permit-authorized-users before policy permit-all-from-otherlsys

```

4. Configure firewall authentication.

```

[edit access firewall-authentication]
lsdesignadmin1@host:ls-product-design# set pass-through http banner login
"welcome"
lsdesignadmin1@host:ls-product-design# set pass-through default-profile ldap1

```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** and **show access firewall-authentication** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

lsdesignadmin1@host:ls-product-design# show security policies
from-zone ls-product-design-trust to-zone ls-product-design-untrust {
 policy permit-all-to-otherlsys {
 match {
 source-address product-designers;
 destination-address otherlsys;
 application any;
 }
 then {
 permit;
 }
 }
}
from-zone ls-product-design-untrust to-zone ls-product-design-trust {
 policy permit-authorized-users {
 match {
 source-address otherlsys;
 destination-address product-designers;
 application junos-h323;
 }
 then {
 permit {
 firewall-authentication {
 pass-through {
 access-profile ldap1;
 }
 }
 }
 }
 }
}

```

```

 }
 }
 policy permit-all-from-otherlsys {
 match {
 source-address otherlsys;
 destination-address product-designers;
 application any;
 }
 then {
 permit;
 }
 }
}
lsdesignadmin1@host:ls-product-design# show access firewall-authentication
pass-through {
 default-profile ldap1;
 http {
 banner {
 login welcome;
 }
 }
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying Firewall User Authentication and Monitoring Users and IP Addresses on page 3638](#)

### Verifying Firewall User Authentication and Monitoring Users and IP Addresses

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## IDP in Logical Systems Overview

A Junos OS Intrusion Detection and Prevention (IDP) policy enables you to selectively enforce various attack detection and prevention techniques on network traffic passing through a logical system.

This topic includes the following sections:

- [IDP Policies on page 3639](#)
- [IDP Installation and Licensing for Logical Systems on page 3640](#)

### IDP Policies

The master administrator configures IDP policies at the root level. Configuring an IDP policy for logical systems is similar to configuring an IDP policy on a device that is not configured for logical systems. This can include the configuration of custom attack objects.

**NOTE:** User logical system administrators cannot create or modify IDP policies for their user logical systems. Only the master administrator can create IDP policies and bind them to user logical systems through a logical systems security profile.

**NOTE:** The user logical system administrator can create security zones in the user logical system and assign interfaces to each security zone. Zones that are specific to user logical systems cannot be referenced in IDP policies configured by the master administrator. The master administrator can reference zones in the master logical system in an IDP policy configured for the master logical system.

The master administrator then specifies an IDP policy in the security profile that is bound to a logical system. To enable IDP in a logical system, the master administrator or user logical system administrator configures a security policy that defines the traffic to be inspected and specifies the **permit application-services idp** action.

Although the master administrator can configure multiple IDP policies, a logical system can have only one active IDP policy at a time. For user logical systems, the master administrator can either bind the same IDP policy to multiple user logical systems or bind a unique IDP policy to each user logical system. To specify the active IDP policy for the master logical system, the master administrator can *either* reference the IDP policy in the security profile that is bound to the master logical system or use the **active-policy** configuration statement at the **[edit security idp]** hierarchy level.

**NOTE:** A commit error is generated if an IDP policy is both configured in the security profile that is bound to the master logical system and specified with the active-policy configuration statement. Use only one method to specify the active IDP policy for the master logical system.

---

## IDP Installation and Licensing for Logical Systems

A single IDP security package is installed for all logical systems on the device. The download and install options can only be executed at the root level. The same version of the IDP attack database is shared by all logical systems.

An idp-sig license must be installed at the root level. Once IDP is enabled at the root level, it can be used with any logical system on the device.

## Understanding IDP Features in Logical Systems

This topic includes the following sections:

- [Rulebases on page 3640](#)
- [Protocol Decoders on page 3641](#)
- [SSL Inspection on page 3641](#)
- [Inline Tap Mode on page 3641](#)
- [Multi-Detectors on page 3641](#)
- [Logging and Monitoring on page 3642](#)

### Rulebases

A single IDP policy can contain only one instance of any type of rulebase. The following IDP rulebases are supported for logical systems:

- The Intrusion prevention system (IPS) rulebase uses attack objects to detect known and unknown attacks. It detects attacks based on stateful signature and protocol anomalies.
- The application-level distributed denial-of-service (DDoS) rulebase defines parameters to protect servers such as DNS or HTTP. The application-level DDoS rulebase defines the source match condition for traffic that should be monitored and takes an action,

such as drop the connection, drop the packet, or no action. It can also perform actions against future connections that use the same IP address.

**NOTE:** Status monitoring for IPS and application-level DDoS is global to the device and not on a per logical system basis.

## Protocol Decoders

The Junos IDP module ships with a set of preconfigured protocol decoders. These protocol decoders have default settings for various protocol-specific contextual checks that they perform. The IDP protocol decoder configuration is global and applies to all logical systems. Only the master administrator at the root level can modify the settings at the `[edit security idp sensor-configuration]` hierarchy level.

## SSL Inspection

IDP SSL inspection uses the Secure Sockets Layer (SSL) protocol suite to enable inspection of HTTP traffic encrypted in SSL.

SSL inspection configuration is global and applies to all logical systems on a device. SSL inspection can only be configured by the master administrator at the root level with the `ssl-inspection` configuration statement at the `[edit security idp sensor-configuration]` hierarchy level.

## Inline Tap Mode

The inline tap mode feature provides passive, inline detection of Application Layer threats for traffic matching security policies that have the IDP application service enabled. When a device is in inline tap mode, packets pass through firewall inspection and are also copied to the independent IDP module. This allows the packets to get to the next service module without waiting for IDP processing results.

Inline tap mode is enabled or disabled for all logical systems at the root level by the master administrator. To enable inline tap mode, use the `inline-tap` configuration statement at the `[edit security forwarding-process application-services maximize-idp-sessions]` hierarchy level. Delete the inline tap mode configuration to switch the device back to regular mode.

**NOTE:** The device must be restarted when switching to inline tap mode or back to regular mode.

## Multi-Detectors

When a new IDP security package is received, it contains attack definitions and a detector. After a new policy is loaded, it is also associated with a detector. If the policy being loaded has an associated detector that matches the detector already in use by the existing policy, the new detector is not loaded and both policies use a single associated detector. But if the new detector does not match the current detector, the new detector is loaded

along with the new policy. In this case, each loaded policy will then use its own associated detector for attack detection.

The version of the detector is common to all logical systems.

## Logging and Monitoring

Status monitoring options are available to the master administrator only. All status monitoring options under the **show security idp** and **clear security idp** CLI operational commands present global information, but not on a per logical system basis.

**NOTE:** SNMP monitoring for IDP is not supported on logical systems.

IDP generates event logs when an event matches an IDP policy rule in which logging is enabled.

The logical systems identification is added to the following types of IDP traffic processing logs:

- Attack logs. The following example shows an attack log for the ls-product-design logical system:

```
Oct 12 17:33:32 8.0.0.254 RT_IDP: IDP_ATTACK_LOG_EVENT_LS: IDP: In
ls-product-design at 1286930013, SIG Attack log <4.0.0.1/34327->5.0.0.1/21> for TCP
protocol and service SERVICE_IDP application NONE by rule 1 of rulebase IPS in policy
Recommended. attack: repeat=0, action=IGNORE, threat-severity=MEDIUM,
name=FTP:USER:ROOT, NAT <0.0.0.0->0.0.0.0>, time-elapsed=0, inbytes=0,
outbytes=0, inpackets=0, outpackets=0,
intf:ls-product-design-untrust:ge-0/0/0.0->ls-product-design-trust:ge-0/0/1.0,
packet-log-id: 65535 and misc-message -
```

- IP action logs. The following example shows an IP action log for the ls-product-design logical system:

```
Oct 13 16:56:04 8.0.0.254 RT_IDP: IDP_ATTACK_LOG_EVENT_LS: IDP: In
ls-product-design at 1287014163, TRAFFIC Attack log <25.0.0.1/34802->15.0.0.1/21>
for TCP protocol and service SERVICE_NONE application NONE by rule 1 of rulebase
IPS in policy Recommended. attack: repeat=0, action=TRAFFIC_IPACTION_NOTIFY,
threat-severity=INFO, name=_, NAT <0.0.0.0->0.0.0.0>, time-elapsed=0,
inbytes=0, outbytes=0, inpackets=0, outpackets=0,
intf:ls-product-design-trust:ge-0/0/1.0->ls-product-design-untrust:plt0.3,
packet-log-id: 0 and misc-message -
```

- Application DDoS logs. The following example shows an application DDoS log for the ls-product-design logical system:

```
Oct 11 16:29:57 8.0.0.254 RT_IDP: IDP_APPDDOS_APP_ATTACK_EVENT_LS: DDOS
Attack in ls-product-design at 1286839797 on my-http,

## Example: Configuring an IDP Policy for a User Logical System

The master administrator can *either* download predefined IDP policies to the device or configure custom IDP policies at the root level using custom or predefined attack objects. The master administrator is responsible for assigning an IDP policy to a user logical system. This example shows how to assign a predefined IDP policy to a user logical system.

- [Requirements on page 3643](#)
- [Overview on page 3643](#)
- [Configuration on page 3644](#)
- [Verification on page 3645](#)

### Requirements

Before you begin:

- Log in to the master logical system as the master administrator. See [“Understanding the Master Logical System and the Master Administrator Role” on page 3543](#).
- Read *IDP Policies Overview*.
- Assign the ls-design-profile security policy to the ls-product-design user logical system. See [“Example: Configuring Logical Systems Security Profiles \(Master Administrators Only\)” on page 3580](#).
- Download predefined IDP policy templates to the device. See *Downloading and Using Predefined IDP Policy Templates (CLI Procedure)*.

**NOTE:** Activating a predefined IDP policy with the active-policy configuration statement at the [edit security idp] hierarchy level only applies to the master logical system. For a user logical system, the master administrator specifies the active IDP policy in the security profile that is bound to the user logical system.

### Overview

The predefined IDP policy named Recommended contains attack objects recommended by Juniper Networks. All rules in the policy have their actions set to take the recommended

action for each attack object. You add the Recommended IDP policy to the `ls-design-profile`, which is bound to the `ls-product-design` user logical system shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)”](#) on page 3564.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set system security-profile ls-design-profile idp-policy Recommended
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To add a predefined IDP policy to a security profile for a user logical system:

1. Log in to the master logical system as the master administrator and enter configuration mode.

```
[edit]
admin@host> configure
admin@host#
```

2. Add the IDP policy to the security profile.

```
[edit system security-profile]
admin@host# set ls-design-profile idp-policy Recommended
```

**Results** From configuration mode, confirm your configuration by entering the **show security idp** and **show system security-profile ls-design-profile** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
admin@host# show security idp
 idp-policy Recommended {
 ...
 }
[edit]
admin@host# show system security-profile ls-design-profile
 policy {
 ...
 }
 idp-policy Recommended;
logical-system ls-product-design;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

### Verifying the Configuration

## Example: Enabling IDP in a User Logical System Security Policy

This example shows how to enable IDP in a security policy in a user logical system.

- [Requirements on page 3645](#)
- [Overview on page 3645](#)
- [Configuration on page 3646](#)
- [Verification on page 3647](#)

## Requirements

Before you begin:

- Log in to the user logical system as the logical system administrator. See [“User Logical System Configuration Overview” on page 3547](#).
- Use the **show system security-profiles idp-policy** command to see the security policy resources allocated to the logical system.
- Configure an IDP security policy for the user logical system as the master administrator. See [“Example: Configuring an IDP Policy for a User Logical System” on page 3643](#).

## Overview

In this example, you configure the ls-product-design user logical system as shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#).

You enable IDP in a security policy that matches any traffic from the ls-product-design-untrust zone to the ls-product-design-trust zone. Enabling IDP in a security policy directs matching traffic to be checked against the IDP rulebases.

**NOTE:** This example uses the IDP policy configured and assigned to the ls-product-design user logical system by the master administrator in “[Example: Configuring an IDP Policy for a User Logical System](#)” on page 3643.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
 policy enable-idp match source-address any
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
 policy enable-idp match destination-address any
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
 policy enable-idp match application any
set security policies from-zone ls-product-design-untrust to-zone ls-product-design-trust
 policy enable-idp then permit application-services idp
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a security policy to enable IDP in a user logical system:

1. Log in to the logical system as the user logical system administrator and enter configuration mode.  
  

```
[edit]
lsdesignadmin1@host:ls-product-design>configure
lsdesignadmin1@host:ls-product-design#
```
2. Configure a security policy that matches traffic from the ls-product-design-untrust zone to the ls-product-design-trust zone.  
  

```
[edit security policies from-zone ls-product-design-untrust to-zone
 ls-product-design-trust]
lsdesignadmin1@host:ls-product-design# set policy enable-idp match source-address
 any
lsdesignadmin1@host:ls-product-design# set policy enable-idp match
 destination-address any
lsdesignadmin1@host:ls-product-design# set policy enable-idp match application
 any
```
3. Configure the security policy to enable IDP for matching traffic.  
  

```
[edit security policies from-zone ls-product-design-untrust to-zone
 ls-product-design-trust]
lsdesignadmin1@host:ls-product-design# set policy enable-idp then permit
 application-services idp
```

**Results** From configuration mode, confirm your configuration by entering the **show security policies** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
lsdesignadmin1@host:ls-product-design# show security policies
 from-zone ls-product-design-untrust to-zone ls-product-design-trust {
 policy enable-idp {
 match {
 source-address any;
 destination-address any;
 application any;
 }
 then {
 permit {
 application-services {
 idp;
 }
 }
 }
 }
 }
 ...
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

### Verifying Attack Matches

**Purpose** Verify that attacks are being matched in network traffic.

**Action** From operational mode, enter the **show security idp attack table** command.

```
admin@host> show security idp attack table
IDP attack statistics:
 Attack name #Hits
 FTP:USER:ROOT 1
```

**Related Documentation**

## Understanding Logical System Application Identification Services

---

Predefined and custom application signatures identify an application by matching patterns in the first few packets of a session. Identifying applications provides the following benefits:

- Allows Intrusion Detection and Prevention (IDP) to apply appropriate attack objects to applications running on nonstandard ports.
- Improves performance by narrowing the scope of attack signatures for applications without decoders.
- Enables you to create detailed reports using AppTrack on applications passing through the device.

With logical systems, predefined and custom application signatures are global resources that are shared by all logical systems. The master administrator is responsible for downloading and installing predefined Juniper Networks application signatures and creating custom application and nested application signatures to identify applications that are not part of the predefined database.

Application identification is enabled by default.

The application system cache (ASC) saves the mapping between an application type and the corresponding destination IP address, destination port, protocol type, and service. Each user logical system has its own ASC. A user logical system administrator can display the ASC entries for their logical system with the **show services application-identification application-system-cache** command. A user logical system administrator can use the **clear services application-identification application-system-cache** command to clear the ASC entries for their logical system.

The master administrator can display or clear ASC entries for any logical system. The master administrator can also display or clear global counters with the **show services application-identification counter** and **clear services application-identification counter** commands.

## Example: Configuring Application Firewall Services for a User Logical System

---

This example describes how to configure application firewall services on a user logical system by a user logical system administrator. User logical system administrators can

manage and monitor their own system application firewall rule sets and rules and manage the dynamic applications allowed or blocked on their respective logical systems.

After configuring application firewall rule sets and rules, user logical system administrators add the application firewall rule set information to the security policy on their individual logical systems.

For information about configuring an application firewall within a security policy, see [“Application Firewall Overview” on page 547](#).

- [Requirements on page 3649](#)
- [Overview on page 3649](#)
- [Configuration on page 3650](#)
- [Verification on page 3651](#)

## Requirements

Before you begin:

- Verify that the security zones are configured for the user logical system.
- Verify that the master administrator has allocated application firewall resources (appfw-rule-set and appfw-rule) in the security profile bound to the user logical system.

For more information, see [“Understanding Logical System Security Profiles \(Master Administrators Only\)” on page 3575](#).

- Log in to the logical system as the user logical system administrator.

For information about user logical system administrator role functions, see [“Understanding User Logical Systems and the User Logical System Administrator Role” on page 3549](#).

## Overview

In this example you configure application firewall services on the ls-product-design user logical system shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#).

This example creates the following application firewall configuration:

- Rule set, ls-product-design-rs1, with rules r1 and r2. When r1 is matched, Telnet traffic is allowed through the firewall. When r2 is matched, web traffic is allowed through the firewall.
- Rule set, ls-product-design-rs2, with rule r1. When r1 is matched, Facebook traffic is blocked by the firewall.

All rule sets require a default rule, which specifies whether to permit or deny traffic that is not specified in any rules of a rule set. The default-rule action (permit or deny) must be the opposite from the action that is specified for the other rule(s) in the rule set.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security application-firewall rule-sets ls-product-design-rs1 rule r1 match
dynamic-application junos:TELNET
set security application-firewall rule-sets ls-product-design-rs1 rule r1 then permit
set security application-firewall rule-sets ls-product-design-rs1 rule r2 match
dynamic-application-group junos:web
set security application-firewall rule-sets ls-product-design-rs1 rule r2 then permit
set security application-firewall rule-sets ls-product-design-rs1 default-rule deny
set security application-firewall rule-sets ls-product-design-rs2 rule r1 match
dynamic-application junos:facebook
set security application-firewall rule-sets ls-product-design-rs2 rule r1 then deny
set security application-firewall rule-sets ls-product-design-rs2 default-rule permit
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure application firewall for a user logical system:

1. Log in to the user logical system as the user logical system administrator and enter configuration mode.

```
lsdesignadmin1@host:ls-product-design> configure
lsdesignadmin1@host:ls-product-design#
```

2. Configure an application firewall rule set for this logical system.

```
[edit]
lsdesignadmin1@host:ls-product-design# set security application-firewall rule-sets
ls-product-design-rs1
```

3. Configure a rule for this rule set and specify which dynamic applications and dynamic application groups the rule should match.

```
[edit]
lsdesignadmin1@host:ls-product-design# set security application-firewall rule-sets
ls-product-design-rs1 rule r1 match dynamic-application telnet then permit
```

4. Configure the default rule for this rule set and specify the action to take when the identified dynamic application is not specified in any rules of the rule set.

```
[edit]
lsdesignadmin1@host:ls-product-design# set security application-firewall rule-sets
ls-product-design-rs1 default-rule deny
```

5. Repeat these steps to configure another rule set, ls-product-design-rs2, if desired.

**Results** From configuration mode, confirm your configuration by entering the **show security application-firewall rule-set all** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
lsdesignadmin1@host:ls-product-design# show security application-firewall rule-set all
...
application-firewall {
 rule-sets ls-product-design-rs1 {
 rule r1 {
 match {
 dynamic-application [junos:TELNET];
 }
 then {
 permit;
 }
 }
 default-rule {
 deny;
 }
 }
 rule-sets ls-product-design-rs1 {
 rule r2 {
 match {
 dynamic-application-group [junos:web];
 }
 then {
 permit;
 }
 }
 }
 rule-sets ls-product-design-rs2 {
 rule r1 {
 match {
 dynamic-application [junos:FACEBOOK];
 }
 then {
 deny;
 }
 }
 default-rule {
 permit;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying Application Firewall Configuration on page 3651](#)

### Verifying Application Firewall Configuration

**Purpose** View the application firewall configuration on the user logical system.

**Action** From operational mode, enter the **show security application-firewall rule-set all** command.

```
lsdesignadmin1@host:ls-product-design> show security application-firewall rule-set all
```

```
Rule-set: ls-product-design-rs1
 Logical system: ls-product-design
 Rule: r1
 Dynamic Applications: junos:TELNET
 Action:permit
 Number of sessions matched: 10
 Default rule:deny
 Number of sessions matched: 100
 Number of sessions with appid pending: 2
```

```
Rule-set: ls-product-design-rs1
 Logical system: ls-product-design
 Rule: r2
 Dynamic Applications: junos:web
 Action:permit
 Number of sessions matched: 20
 Default rule:deny
 Number of sessions matched: 200
 Number of sessions with appid pending: 4
```

```
Rule-set: ls-product-design-rs2
 Logical system: ls-product-design
 Rule: r1
 Dynamic Applications: junos:FACEBOOK
 Action:deny
 Number of sessions matched: 40
 Default rule:permit
 Number of sessions matched: 400
 Number of sessions with appid pending: 10
```

## Understanding Logical System Application Tracking Services

AppTrack is an application tracking tool that provides statistics for analyzing bandwidth usage of your network. When enabled, AppTrack collects byte, packet, and duration statistics for application flows in the specified zone. By default, when each session closes, AppTrack generates a message that provides the byte and packet counts and duration of the session, and sends it to the host device. The Security Threat Response Manager (STRM) retrieves the data and provides flow-based application visibility.

AppTrack can be enabled and configured within any logical system. Configuring AppTrack in a logical system is the same as configuring AppTrack on a device that is not configured for logical systems. An AppTrack configuration only applies to the logical system in which it is configured. The name of the logical system is added to AppTrack logs. The master administrator can configure AppTrack for any logical system while a user logical system administrator can only configure AppTrack for the logical system that they are logged in to.

**NOTE:** The system log configuration is global on the device and must be configured by the master administrator. The user logical system administrator cannot configure system logging for a logical system.

Counters keep track of the number of log messages sent and logs that have failed. AppTrack counters are global to the device. The master administrator as well as user logical system administrators can view AppTrack counters with the **show security application-tracking counters** command.

#### Related Documentation

- [Understanding AppTrack on page 565](#)
- [Example: Configuring AppTrack on page 566](#)
- [Example: Configuring AppTrack for a User Logical System on page 3653](#)

## Example: Configuring AppTrack for a User Logical System

This example shows how to configure the AppTrack tracking tool so you can analyze the bandwidth usage of your network.

- [Requirements on page 3653](#)
- [Overview on page 3653](#)
- [Configuration on page 3653](#)
- [Verification on page 3655](#)

### Requirements

Before you begin:

- Log in to the user logical system as the logical system administrator. See [User Logical System Configuration Overview](#).
- (Master administrator) Configure system logging in the master logical system. See *Network Monitoring and Troubleshooting Guide for Security Devices*.

### Overview

This example shows how to enable application tracking for the security zone ls-product-design-trust in the ls-product-design user logical system shown in “[Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)](#)” on page 3564.

The first message is generated at session start and update messages are sent every 5 minutes after that or until the session ends. A final message is sent at session end.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security zones security-zone ls-product-design-trust application-tracking
set security application-tracking first-update
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure AppTrack for a user logical system:

1. Log in to the user logical system as the logical system administrator and enter configuration mode.

```
lsdesignadmin1@host:ls-product-design> configure
lsdesignadmin1@host:ls-product-design#
```

2. Enable AppTrack for the security zone.

```
[edit security]
lsdesignadmin1@host:ls-product-design# set zones security-zone
ls-product-design-trust application-tracking
```

3. Generate update messages at session start and at 5-minute intervals.

```
[edit security]
lsdesignadmin1@host:ls-product-design# set application-tracking first-update
```

**Results** From configuration mode, confirm your configuration by entering the **show security** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
lsdesignadmin1@host:ls-product-design# show security
...
 application-tracking {
 first-update;
 }
...
 zones {
 security-zone ls-product-design-trust {
 ...
 application-tracking;
 }
 }
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying AppTrack Operation on page 3655](#)
- [Verifying Security Flow Session Statistics on page 3655](#)
- [Verifying Application System Cache Statistics on page 3655](#)
- [Verifying the Status of Application Identification Counter Values on page 3655](#)

---

### Verifying AppTrack Operation

- Purpose** View the AppTrack counters periodically to monitor tracking.
- Action** From operational mode, enter the **show application-tracking counters** command.

---

### Verifying Security Flow Session Statistics

- Purpose** Compare byte and packet counts in logged messages with the session statistics from the **show security flow session** command output.
- Action** From operational mode, enter the **show security flow session** command.

---

### Verifying Application System Cache Statistics

- Purpose** Compare cache statistics such as IP address, port, protocol, and service for an application from the **show services application-identification application-system-cache** command output.
- Action** From operational mode, enter the **show services application-identification application-system-cache** command.

---

### Verifying the Status of Application Identification Counter Values

- Purpose** Compare session statistics for application identification counter values from the **show services application-identification counter** command output.
- Action** From operational mode, enter the **show services application-identification counter** command.

## Understanding Route-Based VPN Tunnels in Logical Systems

A VPN connection can secure traffic that passes between a logical system and a remote site across a WAN. With route-based VPNs, you configure one or more security policies

in a logical system to regulate the traffic flowing through a single IP Security (IPsec) tunnel. For each IPsec tunnel, there is one set of IKE and IPsec security associations (SAs) that must be configured at the root level by the master administrator.

**NOTE:** Only route-based VPNs are supported for logical systems. Policy-based VPNs are not supported.

In addition to configuring IKE and IPsec SAs for each VPN, the master administrator must also assign a secure tunnel (st0) interface to a user logical system. An st0 interface can only be assigned to a single user logical system. However, multiple user logical systems can each be assigned their own st0 interface.

**NOTE:** The st0 unit 0 interface should not be assigned to a logical system, as an SA cannot be set up for this interface.

The user logical system administrator can configure the IP address and other attributes of the st0 interface assigned to the user logical system. The user logical system administrator cannot delete an st0 interface assigned to their user logical system.

For route-based VPNs, a security policy refers to a destination address and not a specific VPN tunnel. For cleartext traffic in a user logical system to be sent to the VPN tunnel for encapsulation, the user logical system administrator must make the following configurations:

- Security policy that permits traffic to a specified destination.
- Static route to the destination with the st0 interface as the next hop.

When Junos OS looks up routes in the user logical system to find the interface to use to send traffic to the destination address, it finds a static route through the st0 interface. Traffic is routed to the VPN tunnel as long as the security policy action is permit.

The master logical system and a user logical system can share a route-based VPN tunnel. An st0 interface assigned to a user logical system can also be used by the master logical system. For the master logical system, the master administrator configures a security policy that permits traffic to the remote destination and a static route to the remote destination with the st0 interface as the next hop.

VPN monitoring is configured by the master administrator in the master logical system. For the VPN monitor source interface, the master administrator must specify the st0 interface; a physical interface for a user logical system cannot be specified.

## Example: Configuring a Route-Based VPN Tunnel in a User Logical System

This example shows how to configure a route-based VPN tunnel in a user logical system.

- [Requirements on page 3657](#)
- [Overview on page 3657](#)
- [Configuration on page 3657](#)
- [Verification on page 3659](#)

### Requirements

Before you begin:

- Log in to the user logical system as the logical system administrator. See [“User Logical System Configuration Overview” on page 3547](#).
- Ensure that an st0 interface is assigned to the user logical system and IKE and IPsec SAs are configured at the root level by the master administrator. See [“Example: Configuring IKE and IPsec SAs for a VPN Tunnel \(Master Administrators Only\)” on page 3616](#).

### Overview

In this example, you configure the ls-product-design user logical system as shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#).

You configure the route-based VPN parameters described in [Table 379](#).

**Table 379: User Logical System Route-Based VPN Configuration**

| Feature          | Name        | Configuration Parameters                                                                                                                                                                                                                                                       |
|------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunnel interface | st0 unit 1  | <ul style="list-style-type: none"> <li>• IPv4 protocol family (inet)</li> <li>• IP address 10.11.11.150/24</li> </ul>                                                                                                                                                          |
| Static route     |             | <ul style="list-style-type: none"> <li>• Destination 192.168.168.0/24</li> <li>• Next hop st0.1</li> </ul>                                                                                                                                                                     |
| Security policy  | through-vpn | Permit the following traffic: <ul style="list-style-type: none"> <li>• From zone: ls-product-design-trust</li> <li>• To zone: ls-product-design-untrust</li> <li>• Source address: any</li> <li>• Destination address: 192.168.168.0/24</li> <li>• Application: any</li> </ul> |

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces st0 unit 1 family inet address 10.11.11.150/24
set routing-options static route 192.168.168.0/24 next-hop st0.1
set security policies from-zone ls-product-design-trust to-zone ls-product-design-untrust
 policy through-vpn match source-address any
set security policies from-zone ls-product-design-trust to-zone ls-product-design-untrust
 policy through-vpn match destination-address 192.168.168.0/24
set security policies from-zone ls-product-design-trust to-zone ls-product-design-untrust
 policy through-vpn match application any
set security policies from-zone ls-product-design-trust to-zone ls-product-design-untrust
 policy through-vpn then permit
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a route-based VPN tunnel in a user logical system:

1. Log in to the user logical system as the logical system administrator and enter configuration mode.

```
[edit]
lsdesignadmin1@host:ls-product-design>configure
lsdesignadmin1@host:ls-product-design#
```

2. Configure the VPN tunnel interface.

```
[edit interfaces]
lsdesignadmin1@host:ls-product-design# set st0 unit 1 family inet address
10.11.11.150/24
```

3. Create a static route to the remote destination.

```
[edit routing-options]
lsdesignadmin1@host:ls-product-design# set static route 192.168.168.0/24 next-hop
st0.1
```

4. Configure a security policy to permit traffic to the remote destination.

```
[edit security policies from-zone ls-product-design-trust to-zone
ls-product-design-untrust]
lsdesignadmin1@host:ls-product-design# set policy through-vpn match
source-address any
lsdesignadmin1@host:ls-product-design# set policy through-vpn match
destination-address 192.168.168.0/24
lsdesignadmin1@host:ls-product-design# set policy through-vpn match application
any
lsdesignadmin1@host:ls-product-design# set policy through-vpn then permit
```

#### Results

From configuration mode, confirm your configuration by entering the **show interfaces st0**, **show routing-options**, and **show security policies** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
```

```

lsdesignadmin1@host:ls-product-design# show interfaces st0
unit 1 {
 family inet {
 address 10.11.11.150/24;
 }
}
lsdesignadmin1@host:ls-product-design# show routing-options
static {
 route 192.168.168.0/24 next-hop st0.1;
}
[edit]
lsdesignadmin1@host:ls-product-design# show security policies
from-zone ls-product-design-trust to-zone ls-product-design-untrust {
 policy through-vpn {
 match {
 source-address any;
 destination-address 192.168.168.0/24;
 application any;
 }
 then {
 permit;
 }
 }
 ...
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

**NOTE:** Before starting the verification process, you need to send traffic from a host in the user logical system to a host in the 192.168.168.0/24 network. For example, initiate a ping from a host in the 12.1.1.1/24 subnet in the ls-product-design user logical system to the host 192.168.168.10.

- [Verifying the IKE Phase 1 Status on page 3659](#)
- [Verifying the IPsec Phase 2 Status on page 3660](#)

### Verifying the IKE Phase 1 Status

**Purpose** Verify the IKE Phase 1 status.

**Action** From operational mode, enter the **show security ike security-associations** command. After obtaining an index number from the command, use the **show security ike security-associations index *index\_number* detail** command.

For sample outputs and meanings, see the “Verification” section of [“Example: Configuring a Route-Based VPN” on page 6370](#).

### Verifying the IPsec Phase 2 Status

---

**Purpose** Verify the IPsec Phase 2 status.

**Action** From operational mode, enter the **show security ipsec security-associations** command. After obtaining an index number from the command, use the **show security ipsec security-associations index *index\_number* detail** command.

For sample outputs and meanings, see the “Verification” section of [“Example: Configuring a Route-Based VPN” on page 6370](#).

## Understanding Logical System Interfaces and Routing Instances

---

Logical interfaces on the device are allocated among the user logical systems by the master administrator. The user logical system administrator configures the attributes of the interfaces, including IP addresses, and assigns them to routing instances and zones.

A routing instance is a collection of routing tables, interfaces, and routing protocol parameters. There can be multiple routing tables for a single routing instance—for example, unicast IPv4, unicast IPv6, and multicast IPv4 routing tables can exist in a single routing instance. Routing protocol parameters and options control the information in the routing tables.

Interfaces and routing instances can be configured in the master logical system and in user logical systems. Configuring an interface or routing instance in a logical system is the same as configuring an interface or routing instance on a device that is not configured for logical systems. Any routing instance created within a logical system is only applicable to that logical system.

The default routing instance, master, refers to the main inet.0 routing table in the logical system. The master routing instance is reserved and cannot be specified as a routing instance. Routes are installed in the master routing instance by default, unless a routing instance is specified. Configure global routing options and protocols for the master routing instance by including statements at the **[edit protocols]** and **[edit routing-options]** hierarchy levels in the logical system.

You can configure only virtual router routing instance type in a user logical system. Only one virtual private LAN service (VPLS) routing instance type can be configured on the device and it must be in the interconnect logical system.

The user logical system administrator can configure and view all attributes for an interface or routing instance in a user logical system. All attributes of an interface or routing instance in a user logical system are also visible to the master administrator.

Multicast is a “one source, many destinations” method of traffic distribution, which means the destinations needing to receive the information from a particular source receive the traffic stream. The master and user logical system administrators can configure a logical system to support multicast applications. The same multicast configurations to configure a device as a node in a multicast network can be used in a logical system.

## **Example: Configuring Interfaces, Routing Instances, and Static Routes for the Master and Interconnect Logical Systems and Logical Tunnel Interfaces for the User Logical Systems (Master Administrators Only)**

---

This topic covers configuration of interfaces, static routes, and routing instances for the master and interconnect logical systems. It also covers configuration of logical tunnel interfaces for user logical systems.

- [Requirements on page 3664](#)
- [Overview on page 3665](#)
- [Configuration on page 3666](#)
- [Verification on page 3672](#)

### **Requirements**

The example uses an SRX5600 device running Junos operating system (Junos OS) with logical systems.

Before you begin:

- Read “[SRX Series Logical System Master Administrator Configuration Tasks Overview](#)” on page 3544 to understand how and where this procedure fits in the overall master administrator configuration process.
- Read “[Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)](#)” on page 3564
- [Understanding the Interconnect Logical System and Logical Tunnel Interfaces on page 3532](#)

## Overview

This scenario shows how to configure interfaces for the logical systems on the device, including an interconnect logical system.

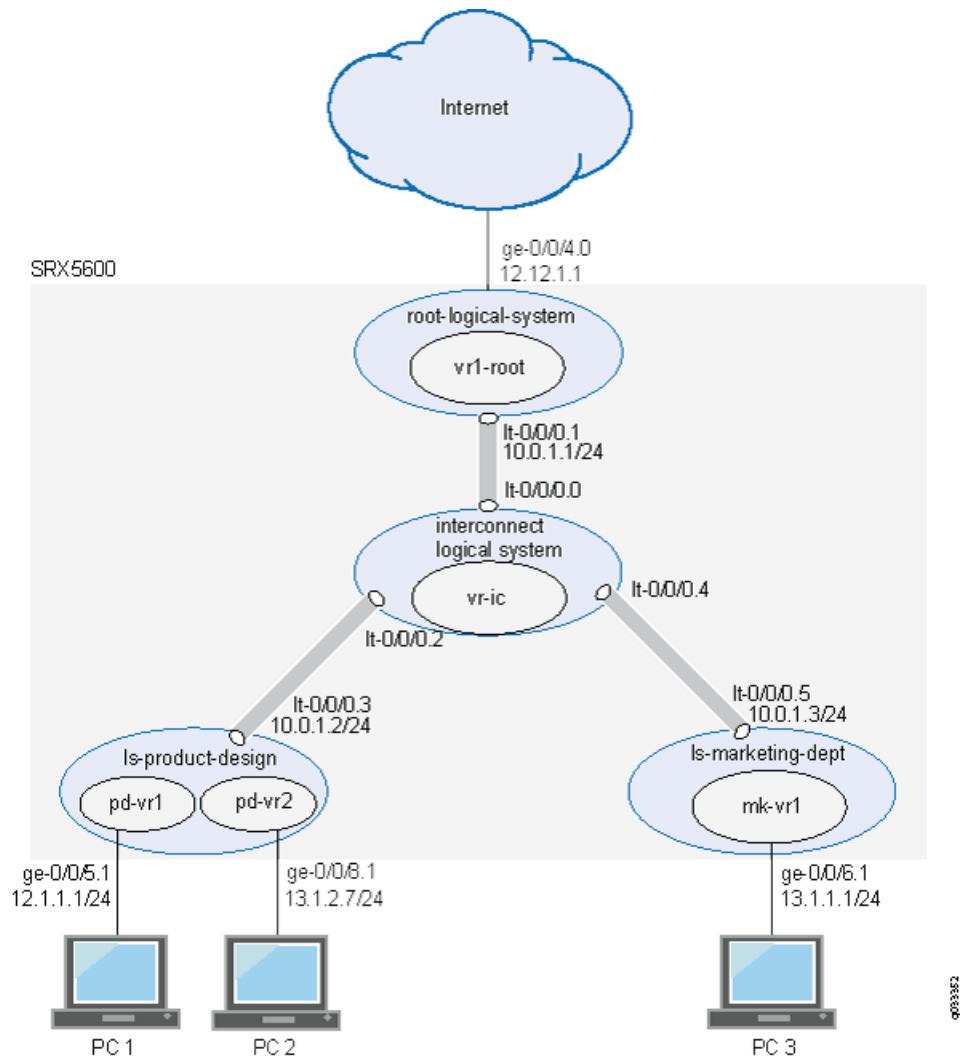

- For the interconnect logical system, the example configures logical tunnel interfaces lt-0/0/0.0, lt-0/0/0.2, lt-0/0/0.4, and lt-0/0/0.6. The example configures a routing instance called vr-ic and assigns the interfaces to it.

Because the interconnect logical system acts as a virtual switch, it is configured as a virtual private LAN service (VPLS) routing instance type. The interconnect logical system's lt-0/0/0 interfaces are configured with ethernet-vpls as the encapsulation type. The corresponding peer lt-0/0/0 interfaces in the master and user logical systems are configured with Ethernet as the encapsulation type.

- lt-0/0/0.0 connects to lt-0/0/0.1 on the root logical system.
- lt-0/0/0.2 connects to lt-0/0/0.3 on the ls-product-design logical system.
- lt-0/0/0.4 connects to lt-0/0/0.5 on the ls-marketing-dept logical system.
- lt-0/0/0.6 connects to lt-0/0/0.7 on the ls-accounting-dept logical system.
- For the master logical system, called root-logical-system, the example configures ge-0/0/4.0 and assigns it to the vr1-root routing instance. The example configures lt-0/0/0.1 to connect to lt-0/0/0.0 on the interconnect logical system and assigns it to the vr1-root routing instance. The example configures static routes to allow for communication with other logical systems and assigns them to the vr1-root routing instance.
- For the ls-product-design logical system, the example configures lt-0/0/0.3 to connect to lt-0/0/0.2 on the interconnect logical system.
- For the ls-marketing-dept logical system, the example configures lt-0/0/0.5 to connect to lt-0/0/0.4 on the interconnect logical system.
- For the ls-accounting-dept logical system, the example configures lt-0/0/0.7 to connect to lt-0/0/0.6 on the interconnect logical system.

Figure 154 shows the topology for this deployment including virtual routers and their interfaces for all logical systems.

**Figure 154: Configuring Logical Tunnel Interfaces, Logical Interfaces, and Virtual Routers**

## Configuration

This topic explains how to configure interfaces for logical systems.

- [Configuring Logical Tunnel Interfaces and a Routing Instance for the Interconnect Logical System on page 3666](#)
- [Configuring Interfaces, a Routing Instance, and Static Routes for the Master Logical System on page 3668](#)
- [Configuring Logical Tunnel Interfaces for the User Logical Systems on page 3670](#)

### Configuring Logical Tunnel Interfaces and a Routing Instance for the Interconnect Logical System

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set logical-systems interconnect-logical-system interfaces lt-0/0/0 unit 0 encapsulation
 ethernet-vpls
set logical-systems interconnect-logical-system interfaces lt-0/0/0 unit 0 peer-unit 1
set logical-systems interconnect-logical-system interfaces lt-0/0/0 unit 2 encapsulation
 ethernet-vpls
set logical-systems interconnect-logical-system interfaces lt-0/0/0 unit 2 peer-unit 3
set logical-systems interconnect-logical-system interfaces lt-0/0/0 unit 4 encapsulation
 ethernet-vpls
set logical-systems interconnect-logical-system interfaces lt-0/0/0 unit 4 peer-unit 5
set logical-systems interconnect-logical-system interfaces lt-0/0/0 unit 6 encapsulation
 ethernet-vpls
set logical-systems interconnect-logical-system interfaces lt-0/0/0 unit 6 peer-unit 7
set logical-systems interconnect-logical-system routing-instances vr-ic instance-type
 vpls
set logical-systems interconnect-logical-system routing-instances vr-ic interface
 lt-0/0/0.0
set logical-systems interconnect-logical-system routing-instances vr-ic interface
 lt-0/0/0.2
set logical-systems interconnect-logical-system routing-instances vr-ic interface
 lt-0/0/0.4
set logical-systems interconnect-logical-system routing-instances vr-ic interface
 lt-0/0/0.6
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the interconnect system lt-0/0/0 interfaces and routing instances:

1. Configure the lt-0/0/0 interfaces.

```
[edit logical-systems]
user@host# set interconnect-logical-system interfaces lt-0/0/0 unit 0 encapsulation
 ethernet-vpls
user@host# set interconnect-logical-system interfaces lt-0/0/0 unit 0 peer-unit 1
user@host# set interconnect-logical-system interfaces lt-0/0/0 unit 2 encapsulation
 ethernet-vpls
user@host# set interconnect-logical-system interfaces lt-0/0/0 unit 2 peer-unit 3
user@host# set interconnect-logical-system interfaces lt-0/0/0 unit 4 encapsulation
 ethernet-vpls
user@host# set interconnect-logical-system interfaces lt-0/0/0 unit 4 peer-unit 5
user@host# set interconnect-logical-system interfaces lt-0/0/0 unit 6 encapsulation
 ethernet-vpls
user@host# set interconnect-logical-system interfaces lt-0/0/0 unit 6 peer-unit 7
```

2. Configure the routing instance for the interconnect logical system and add its lt-0/0/0 interfaces to it.

```
[edit logical-systems]
user@host# set interconnect-logical-system routing-instances vr-ic instance-type
 vpls
user@host# set interconnect-logical-system routing-instances vr-ic interface
 lt-0/0/0.0
```

```

user@host# set interconnect-logical-system routing-instances vr-ic interface
lt-0/0/0.2
user@host# set interconnect-logical-system routing-instances vr-ic interface
lt-0/0/0.4
user@host# set interconnect-logical-system routing-instances vr-ic interface
lt-0/0/0.6

```

**Results** From configuration mode, confirm your configuration by entering the **show logical-systems interconnect-logical-system** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

If you are done configuring the device, enter **commit** from configuration mode.

```

user@host# show logical-systems interconnect-logical-system
interfaces {
 lt-0/0/0 {
 unit 0 {
 encapsulation ethernet-vpls;
 peer-unit 1;
 }
 unit 2 {
 encapsulation ethernet-vpls;
 peer-unit 3;
 }
 unit 4 {
 encapsulation ethernet-vpls;
 peer-unit 5;
 }
 unit 6 {
 encapsulation ethernet-vpls;
 peer-unit 7;
 }
 }
}
routing-instances {
 vr-ic {
 instance-type vpls;
 interface lt-0/0/0.0;
 interface lt-0/0/0.2;
 interface lt-0/0/0.4;
 interface lt-0/0/0.6;
 }
}

```

### Configuring Interfaces, a Routing Instance, and Static Routes for the Master Logical System

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set interfaces ge-0/0/4 vlan-tagging
set interfaces ge-0/0/4 unit 0 vlan-id 600

```

```

set interfaces ge-0/0/4 unit 0 family inet address 12.12.1.1/24
set interfaces ge-0/0/5 vlan-tagging
set interfaces ge-0/0/6 vlan-tagging
set interfaces ge-0/0/7 vlan-tagging
set interfaces lt-0/0/0 unit 1 encapsulation ethernet
set interfaces lt-0/0/0 unit 1 peer-unit 0
set interfaces lt-0/0/0 unit 1 family inet address 10.0.1.1/24
set routing-instances vr1-root instance-type virtual-router
set routing-instances vr1-root interface ge-0/0/4.0
set routing-instances vr1-root interface lt-0/0/0.1
set routing-instances vr1-root routing-options static route 12.1.1.0/24 next-hop 10.0.1.2
set routing-instances vr1-root routing-options static route 13.1.1.0/24 next-hop 10.0.1.3
set routing-instances vr1-root routing-options static route 14.1.1.0/24 next-hop 10.0.1.4

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the master logical system interfaces:

1. Configure the master (root) logical and lt-0/0/0.1 interfaces.

```

[edit interfaces]
user@host# set ge-0/0/4 vlan-tagging
user@host# set ge-0/0/4 unit 0 vlan-id 600
user@host# set ge-0/0/4 unit 0 family inet address 12.12.1.1/24
user@host# set lt-0/0/0 unit 1 encapsulation ethernet
user@host# set lt-0/0/0 unit 1 peer-unit 0
user@host# set lt-0/0/0 unit 1 family inet address 10.0.1.1/24

```

2. Configure the interfaces for other logical systems to support VLAN tagging.

```

[edit interfaces]
user@host# set ge-0/0/5 vlan-tagging
user@host# set ge-0/0/6 vlan-tagging
user@host# set ge-0/0/7 vlan-tagging

```

3. Configure a routing instance for the master logical system, assign its interfaces to it, and configure static routes for it.

```

[edit routing-instances]
user@host# set vr1-root instance-type virtual-router
user@host# set vr1-root interface ge-0/0/4.0
user@host# set vr1-root interface lt-0/0/0.1
user@host# set vr1-root routing-options static route 12.1.1.0/24 next-hop 10.0.1.2
user@host# set vr1-root routing-options static route 13.1.1.0/24 next-hop 10.0.1.3
user@host# set vr1-root routing-options static route 14.1.1.0/24 next-hop 10.0.1.4

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show routing-instances** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@host# show interfaces
 ge-0/0/4 {
 vlan-tagging;

```

```

 routing-options {
 static {
 route 14.1.1.0/24 next-hop 10.0.1.4;
 route 12.1.1.0/24 next-hop 10.0.1.2;
 route 13.1.1.0/24 next-hop 10.0.1.3;
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Logical Tunnel Interfaces for the User Logical Systems

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set logical-systems ls-product-design interfaces lt-0/0/0 unit 3 encapsulation ethernet
set logical-systems ls-product-design interfaces lt-0/0/0 unit 3 peer-unit 2
set logical-systems ls-product-design interfaces lt-0/0/0 unit 3 family inet address
 10.0.1.2/24
set logical-systems ls-marketing-dept interfaces lt-0/0/0 unit 5 encapsulation ethernet
set logical-systems ls-marketing-dept interfaces lt-0/0/0 unit 5 peer-unit 4

```

```

set logical-systems ls-marketing-dept interfaces lt-0/0/0 unit 5 family inet address
 10.0.1.3/24
set logical-systems ls-accounting-dept interfaces lt-0/0/0 unit 7 encapsulation ethernet
set logical-systems ls-accounting-dept interfaces lt-0/0/0 unit 7 peer-unit 6
set logical-systems ls-accounting-dept interfaces lt-0/0/0 unit 7 family inet address
 10.0.1.4/24

```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

1. Configure the lt-0/0/0 interface for the first user logical system:

```

[edit logical-systems]
user@host# set ls-product-design interfaces lt-0/0/0 unit 3 encapsulation ethernet
user@host# set ls-product-design interfaces lt-0/0/0 unit 3 peer-unit 2
user@host# set ls-product-design interfaces lt-0/0/0 unit 3 family inet address
 10.0.1.2/24

```

2. Configure the lt-0/0/0 interface for the second user logical system.

```

[edit logical-systems]
user@host# set ls-marketing-dept interfaces lt-0/0/0 unit 5 encapsulation ethernet
user@host# set ls-marketing-dept interfaces lt-0/0/0 unit 5 peer-unit 4
user@host# set ls-marketing-dept interfaces lt-0/0/0 unit 5 family inet address
 10.0.1.3/24 face

```

3. Configure the lt-0/0/0 interface for the third user logical system.

```

[edit logical-systems]
user@host# set ls-accounting-dept interfaces lt-0/0/0 unit 7 encapsulation ethernet
user@host# set ls-accounting-dept interfaces lt-0/0/0 unit 7 peer-unit 6
user@host# set ls-accounting-dept interfaces lt-0/0/0 unit 7 family inet address
 10.0.1.4/24

```

**Results** From configuration mode, confirm your configuration by entering the **show logical-systems ls-product-design interfaces lt-0/0/0**, **show logical-systems ls-marketing-dept interfaces lt-0/0/0**, and **show logical-systems ls-accounting-dept interfaces lt-0/0/0** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

user@host# show logical-systems ls-product-design interfaces lt-0/0/0
lt-0/0/0 {
 unit 3 {
 encapsulation ethernet;
 peer-unit 2;
 family inet {
 address 10.0.1.2/24;
 }
 }
}
user@host# show logical-systems ls-marketing-dept interfaces lt-0/0/0
lt-0/0/0 {
 unit 5 {
 encapsulation ethernet;
 peer-unit 4;
 }
}

```

```
 family inet {
 address 10.0.1.3/24;
 }
 }
}
user@host# show logical-systems ls-accounting-dept interfaces lt-0/0/0
lt-0/0/0 {
 unit 7 {
 encapsulation ethernet;
 peer-unit 6;
 family inet {
 address 10.0.1.4/24;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Static Routes Configured for the Master Administrator Are Correct on page 3672](#)

### Verifying That the Static Routes Configured for the Master Administrator Are Correct

---

**Purpose** Verify if you can send data from the master logical system to the other logical systems.

**Action** From operational mode, use the **ping** command.

**Related Documentation**

- [Understanding the Master Logical System and the Master Administrator Role on page 3543](#)
- [Understanding User Logical Systems and the User Logical System Administrator Role on page 3549](#)
- [Understanding the Interconnect Logical System and Logical Tunnel Interfaces on page 3532](#)

## Example: Configuring OSPF Routing Protocol for the Master Logical System

---

This example shows how to configure OSPF for the master logical system.

- [Requirements on page 3673](#)
- [Overview on page 3673](#)
- [Configuration on page 3673](#)
- [Verification on page 3675](#)

## Requirements

Before you begin:

- Log in to the master logical system as the master administrator. See [“Example: Configuring a Root Password for the Device \(Master Administrators Only\)”](#) on page 3563.
- Configure logical interfaces ge-0/0/4.0 and lt-0/0/0.1 for the master logical system and assign them to the vr1-root routing instance. See [“Example: Configuring Interfaces, Routing Instances, and Static Routes for the Master and Interconnect Logical Systems and Logical Tunnel Interfaces for the User Logical Systems \(Master Administrators Only\)”](#) on page 3664.

## Overview

In this example, you configure OSPF for the master logical system, called root-logical-system, shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)”](#) on page 3564.

This example enables OSPF routing on the ge-0/0/4.0 and lt-0/0/0.1 interfaces in the master logical system. You configure the following routing policies to export routes from the Junos OS routing table into OSPF in the vr1-root routing instance:

- ospf-redirect-direct—Routes learned from directly connected interfaces.
- ospf-redirect-static—Static routes.
- ospf-to-ospf—Routes learned from OSPF.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the [edit] hierarchy level, and then enter **commit** from configuration mode.

```
set policy-options policy-statement ospf-redirect-direct from protocol direct
set policy-options policy-statement ospf-redirect-direct then accept
set policy-options policy-statement ospf-redirect-static from protocol static
set policy-options policy-statement ospf-redirect-static then accept
set policy-options policy-statement ospf-to-ospf from protocol ospf
set policy-options policy-statement ospf-to-ospf then accept
set routing-instances vr1-root protocols ospf export ospf-redirect-direct
set routing-instances vr1-root protocols ospf export ospf-redirect-static
set routing-instances vr1-root protocols ospf export ospf-to-ospf
set routing-instances vr1-root protocols ospf area 0.0.0.1 interface ge-0/0/4.0
set routing-instances vr1-root protocols ospf area 0.0.0.1 interface lt-0/0/0.1
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure OSPF for the master logical system:

1. Log in to the master logical system as the master administrator and enter configuration mode.

```
admin@host> configure
admin@host#
```

2. Create routing policies that accept routes.

```
[edit policy-options]
admin@host# set policy-statement ospf-redirect-direct from protocol direct
admin@host# set policy-statement ospf-redirect-direct then accept
admin@host# set policy-statement ospf-redirect-static from protocol static
admin@host# set policy-statement ospf-redirect-static then accept
admin@host# set policy-statement ospf-to-ospf from protocol ospf
admin@host# set policy-statement ospf-to-ospf then accept
```

3. Apply the routing policies to routes exported from the Junos OS routing table into OSPF.

```
[edit routing-instances]
admin@host# set vr1-root protocols ospf export ospf-redirect-direct
admin@host# set vr1-root protocols ospf export ospf-redirect-static
admin@host# set vr1-root protocols ospf export ospf-to-ospf
```

4. Enable OSPF on the logical interfaces.

```
[edit routing-instances]
admin@host# set vr1-root protocols ospf area 0.0.0.1 interface ge-0/0/4.0
admin@host# set vr1-root protocols ospf area 0.0.0.1 interface lt-0/0/0.1
```

**Results** From configuration mode, confirm your configuration by entering the **show policy-options** and **show routing-instances** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```
[edit]
admin@host# show policy-options
policy-statement ospf-redirect-direct {
 from protocol direct;
 then accept;
}
policy-statement ospf-redirect-static {
 from protocol static;
 then accept;
}
policy-statement ospf-to-ospf {
 from protocol ospf;
 then accept;
```

```

}
[edit]
admin@host# show routing-instances
vr1-root {
 ...
 protocols {
 ospf {
 export [ospf-redist-direct ospf-to-ospf ospf-redist-static];
 area 0.0.0.1 {
 interface lt-0/0/0.1;
 interface ge-0/0/4.0;
 }
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying OSPF Interfaces on page 3675](#)
- [Verifying OSPF Neighbors on page 3675](#)
- [Verifying OSPF Routes on page 3675](#)

### Verifying OSPF Interfaces

**Purpose** Verify OSPF-enabled interfaces.

**Action** From the CLI, enter the **show ospf interface instance vr1-root** command.

```

admin@host> show ospf interface instance vr1-root

```

| Interface  | State | Area    | DR ID    | BDR ID  | Nbrs |
|------------|-------|---------|----------|---------|------|
| lt-0/0/0.1 | DR    | 0.0.0.0 | 10.0.1.1 | 0.0.0.0 | 0    |
| ge-0/0/4.0 | DR    | 0.0.0.1 | 10.0.1.1 | 0.0.0.0 | 0    |

### Verifying OSPF Neighbors

**Purpose** Verify OSPF neighbors.

**Action** From the CLI, enter the **show ospf neighbor instance vr1-root** command.

```

admin@host> show ospf neighbor instance vr1-root

```

| Address  | Interface | State | ID      | Pri | Dead |
|----------|-----------|-------|---------|-----|------|
| 10.0.1.2 | pl1t0.3   | Full  | 0.0.0.0 | 128 | 39   |

### Verifying OSPF Routes

**Purpose** Verify OSPF routes.

**Action** From the CLI, enter the **show ospf route instance vr1-root** command.

```

admin@host> show ospf route instance vr1-root

```

Topology default Route Table:

| Prefix       | Path<br>Type | Route<br>Type | NH<br>Type | Metric | NextHop<br>Interface | Nexthop<br>Address/LSP |
|--------------|--------------|---------------|------------|--------|----------------------|------------------------|
| 10.0.1.0/24  | Intra        | Network       | IP         | 1      | lt-0/0/0.1           |                        |
| 12.12.1.0/24 | Intra        | Network       | IP         | 1      | ge-0/0/4.0           |                        |

## Understanding Logical System Network Address Translation

---

Network Address Translation (NAT) is a method for modifying or translating network address information in packet headers. Either or both source and destination addresses in a packet may be translated. NAT can include the translation of port numbers as well as IP addresses.

Any combination of static, destination, or source NAT can be configured in the root or user logical systems. Configuring NAT in a logical system is the same as configuring NAT in a root system. The master administrator can configure and monitor NAT in the master logical system as well as any user logical system.

For each user logical system, the master administrator can configure the maximum and reserved numbers for the following NAT resources:

- Source NAT pools and destination NAT pools
- IP addresses in source NAT pools with and without port address translation
- Rules for source, destination, and static NAT
- Persistent NAT bindings
- IP addresses that support port overloading

From a user logical system, the user logical system administrator can use the operational command **show system security-profile** with a NAT option to view the number of NAT resources allocated to the user logical system.

**NOTE:** The master administrator can configure a security profile for the master logical system that specifies the maximum and reserved numbers of NAT resources applied to the master logical system. The number of resources configured in the master logical system count toward the maximum number of NAT resources available on the device.

From a user logical system, the user logical system administrator can use the **show security nat** command to view the information about NAT for the user logical system. From the master logical system, the master administrator can use the same command to view information for the master logical system, a specific user logical system, or all logical systems.

---

## Example: Configuring Network Address Translation for a User Logical System

---

This example shows how to configure static NAT for a user logical system.

- [Requirements on page 3678](#)
- [Overview on page 3678](#)
- [Configuration on page 3679](#)
- [Verification on page 3680](#)

### Requirements

Before you begin:

- Log in to the user logical system as the logical system administrator. See [“User Logical System Configuration Overview” on page 3547](#).
- Use the **show system security-profile nat-static-rule** command to see the static NAT resources allocated to the logical system.
- Configure security policies. See [“Example: Configuring Security Policies in a User Logical System” on page 3630](#).

### Overview

This example configures the ls-product-design user logical system shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#).

Devices in the ls-product-design-untrust zone access a specific host in the ls-product-design-trust zone by way of the address 12.1.1.200/32. For packets that enter the ls-product-design logical system from the ls-product-design-untrust zone with the destination IP address 12.1.1.200/32, the destination IP address is translated to the 12.1.1.100/32. This example configures the static NAT described in [Table 380](#).

**Table 380: User Logical System Static NAT Configuration**

| Feature             | Name | Configuration Parameters                                                                                                                                                                                                                       |
|---------------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static NAT rule set | rs1  | <ul style="list-style-type: none"> <li>Rule r1 to match packets from the ls-product-design-untrust zone with destination address 12.1.1.200/32.</li> <li>Destination IP address in matching packets is translated to 12.1.1.100/32.</li> </ul> |
| Proxy ARP           |      | Address 12.1.1.200 on interface lt-0/0/0.3.                                                                                                                                                                                                    |

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security nat static rule-set rs1 from zone ls-product-design-untrust
set security nat static rule-set rs1 rule r1 match destination-address 12.1.1.200/32
set security nat static rule-set rs1 rule r1 then static-nat prefix 12.1.1.100/32
set security nat proxy-arp interface lt-0/0/0.3 address 12.1.1.200/32
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure NAT in a user logical system:

- Log in to the user logical system as the logical system administrator and enter configuration mode.  

```
lsdesignadmin1@host:ls-product-design> configure
lsdesignadmin1@host:ls-product-design#
```
- Configure a static NAT rule set.  

```
[edit security nat static]
lsdesignadmin1@host:ls-product-design# set rule-set rs1 from zone
ls-product-design-untrust
```
- Configure a rule that matches packets and translates the destination address in the packets.  

```
[edit security nat static]
lsdesignadmin1@host:ls-product-design# set rule-set rs1 rule r1 match
destination-address 12.1.1.200/32
lsdesignadmin1@host:ls-product-design# set rule-set rs1 rule r1 then static-nat prefix
12.1.1.100/32
```
- Configure proxy ARP.

```
[edit security nat]
lsdesignadmin1@host:ls-product-design# set proxy-arp interface lt-0/0/0.3 address
12.1.1.200/32
```

**Results** From configuration mode, confirm your configuration by entering the **show security nat** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
lsdesignadmin1@host:ls-product-design# show security nat
static {
 rule-set rs1 {
 from zone ls-product-design-untrust;
 rule r1 {
 match {
 destination-address 12.1.1.200/32;
 }
 then {
 static-nat prefix 12.1.1.100/32;
 }
 }
 }
}
proxy-arp {
 interface lt-0/0/0.3 {
 address {
 12.1.1.200/32;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying Static NAT Configuration on page 3680](#)
- [Verifying NAT Application to Traffic on page 3680](#)

---

### Verifying Static NAT Configuration

**Purpose** Verify that there is traffic matching the static NAT rule set.

**Action** From operational mode, enter the **show security nat static rule** command. View the Translation hits field to check for traffic that matches the rule.

---

### Verifying NAT Application to Traffic

**Purpose** Verify that NAT is being applied to the specified traffic.

**Action** From operational mode, enter the **show security flow session** command.

## Understanding Logical System Interfaces and Routing Instances

---

Logical interfaces on the device are allocated among the user logical systems by the master administrator. The user logical system administrator configures the attributes of the interfaces, including IP addresses, and assigns them to routing instances and zones.

A routing instance is a collection of routing tables, interfaces, and routing protocol parameters. There can be multiple routing tables for a single routing instance—for example, unicast IPv4, unicast IPv6, and multicast IPv4 routing tables can exist in a single routing instance. Routing protocol parameters and options control the information in the routing tables.

Interfaces and routing instances can be configured in the master logical system and in user logical systems. Configuring an interface or routing instance in a logical system is the same as configuring an interface or routing instance on a device that is not configured for logical systems. Any routing instance created within a logical system is only applicable to that logical system.

The default routing instance, master, refers to the main inet.0 routing table in the logical system. The master routing instance is reserved and cannot be specified as a routing instance. Routes are installed in the master routing instance by default, unless a routing instance is specified. Configure global routing options and protocols for the master routing instance by including statements at the `[edit protocols]` and `[edit routing-options]` hierarchy levels in the logical system.

You can configure only virtual router routing instance type in a user logical system. Only one virtual private LAN service (VPLS) routing instance type can be configured on the device and it must be in the interconnect logical system.

The user logical system administrator can configure and view all attributes for an interface or routing instance in a user logical system. All attributes of an interface or routing instance in a user logical system are also visible to the master administrator.

Multicast is a “one source, many destinations” method of traffic distribution, which means the destinations needing to receive the information from a particular source receive the traffic stream. The master and user logical system administrators can configure a logical system to support multicast applications. The same multicast configurations to configure a device as a node in a multicast network can be used in a logical system.

- Related Documentation**
- [Example: Configuring Interfaces and Routing Instances for a User Logical System on page 3682](#)
  - [User Logical System Configuration Overview on page 3547](#)
  - [Understanding User Logical Systems and the User Logical System Administrator Role on page 3549](#)

## Example: Configuring Interfaces and Routing Instances for a User Logical System

This example shows how to configure interfaces and routing instances for a user logical system.

- [Requirements on page 3682](#)
- [Overview on page 3682](#)
- [Configuration on page 3682](#)

### Requirements

Before you begin:

- Log in to the user logical system as the user logical system administrator. See [“User Logical System Configuration Overview” on page 3547](#).
- Determine which logical interfaces and, optionally, which logical tunnel interfaces are allocated to your user logical system by the master administrator. The master administrator configures the logical tunnel interfaces. See [“Understanding the Master Logical System and the Master Administrator Role” on page 3543](#).

### Overview

This example configures the ls-product-design user logical system shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)” on page 3564](#).

This example configures the interfaces and routing instances described in [Table 381](#).

**Table 381: User Logical System Interface and Routing Instance Configuration**

| Feature          | Name       | Configuration Parameters                                                                                                                                                                                                                                                                                                                                 |
|------------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/5 unit 1 family inet address 12.1.1.1/24
```

```

set interfaces ge-0/0/5 unit 1 vlan-id 700
set routing-instances pd-vr1 instance-type virtual-router
set routing-instances pd-vr1 interface ge-0/0/5.1
set routing-instances pd-vr1 interface lt-0/0/0.3
set routing-instances pd-vr1 routing-options static route 13.1.1.0/24 next-hop 10.0.1.3
set routing-instances pd-vr1 routing-options static route 14.1.1.0/24 next-hop 10.0.1.4
set routing-instances pd-vr1 routing-options static route 12.12.1.0/24 next-hop 10.0.1.1

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an interface and a routing instance in a user logical system:

1. Log in to the user logical system as the logical system administrator and enter configuration mode.  

```

lsdesignadmin1@host:ls-product-design> configure
lsdesignadmin1@host:ls-product-design#

```
2. Configure the logical interface for a user logical system.  

```

[edit interfaces]
lsdesignadmin1@host:ls-product-design# set ge-0/0/5 unit 1 family inet address 12.1.1.1/24
lsdesignadmin1@host:ls-product-design# set ge-0/0/5 unit 1 vlan-id 700

```
3. Configure the routing instance and assign interfaces.  

```

[edit routing-instances]
lsdesignadmin1@host:ls-product-design# set pd-vr1 instance-type virtual-router
lsdesignadmin1@host:ls-product-design# set pd-vr1 interface ge-0/0/5.1
lsdesignadmin1@host:ls-product-design# set pd-vr1 interface lt-0/0/0.3

```
4. Configure static routes.  

```

[edit routing-instances]
lsdesignadmin1@host:ls-product-design# set pd-vr1 routing-options static route 13.1.1.0/24 next-hop 10.0.1.3
lsdesignadmin1@host:ls-product-design# set pd-vr1 routing-options static route 14.1.1.0/24 next-hop 10.0.1.4
lsdesignadmin1@host:ls-product-design# set pd-vr1 routing-options static route 12.12.1.0/24 next-hop 10.0.1.1

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show routing-instances** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

**NOTE:** The master administrator configures the lt-0/0/0.3 interface. Thus, the lt-0/0/0.3 configuration appears in the **show interfaces** output even though you did not configure this item.

```

lsdesignadmin1@host:ls-product-design# show interfaces
ge-0/0/5 {

```

```

unit 1 {
 vlan-id 700;
 family inet {
 address 12.1.1.1/24;
 }
}
lt-0/0/0 {
 unit 3 {
 encapsulation ethernet;
 peer-unit 2;
 family inet {
 address 10.0.1.2/24;
 }
 }
}
lsdesignadmin1@host:ls-product-design# show routing-instances
pd-vr1 {
 instance-type virtual-router;
 interface ge-0/0/5.1;
 interface lt-0/0/0.3;
 routing-options {
 static {
 route 13.1.1.0/24 next-hop 10.0.1.3;
 route 14.1.1.0/24 next-hop 10.0.1.4;
 route 12.12.1.0/24 next-hop 10.0.1.1;
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Example: Configuring OSPF Routing Protocol for a User Logical System

This example shows how to configure OSPF for a user logical system.

- [Requirements on page 3684](#)
- [Overview on page 3685](#)
- [Configuration on page 3685](#)
- [Verification on page 3687](#)

### Requirements

Before you begin:

- Log in to the user logical system as the user logical system administrator. See [“User Logical System Configuration Overview” on page 3547](#).

- Configure logical interface ge-0/0/5.1. Assign ge-0/0/5.1 and lt-0/0/0.3 to the pd-vr1 routing instance. See [“Example: Configuring Interfaces and Routing Instances for a User Logical System”](#) on page 3682.

## Overview

In this example, you configure OSPF for the ls-product-design user logical system, shown in [“Example: Creating User Logical Systems, Their Administrators, Their Users, and an Interconnect Logical System \(Master Administrators Only\)”](#) on page 3564.

This example enables OSPF routing on the ge-0/0/5.1 and lt-0/0/0.3 interfaces in the ls-product-design user logical system. You configure the following routing policies to export routes from the Junos OS routing table into OSPF in the pd-vr1 routing instance:

- ospf-redirect-direct—Routes learned from directly connected interfaces.
- ospf-redirect-static—Static routes.
- ospf-to-ospf—Routes learned from OSPF.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set policy-options policy-statement ospf-redirect-direct from protocol direct
set policy-options policy-statement ospf-redirect-direct then accept
set policy-options policy-statement ospf-redirect-static from protocol static
set policy-options policy-statement ospf-redirect-static then accept
set policy-options policy-statement ospf-to-ospf from protocol ospf
set policy-options policy-statement ospf-to-ospf then accept
set routing-instances pd-vr1 protocols ospf export ospf-redirect-direct
set routing-instances pd-vr1 protocols ospf export ospf-redirect-static
set routing-instances pd-vr1 protocols ospf export ospf-to-ospf
set routing-instances pd-vr1 protocols ospf area 0.0.0.1 interface ge-0/0/5.1
set routing-instances pd-vr1 protocols ospf area 0.0.0.1 interface lt-0/0/0.3
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure OSPF for the user logical system:

1. Log in to the user logical system as the user logical system administrator and enter configuration mode.  

```
lsdesignadmin1@host:ls-product-design> configure
lsdesignadmin1@host:ls-product-design#
```
2. Create routing policies that accept routes.  

```
[edit policy-options]
```

```

lsdesignadmin1@host:ls-product-design# set policy-statement ospf-redist-direct
from protocol direct
lsdesignadmin1@host:ls-product-design# set policy-statement ospf-redist-direct
then accept
lsdesignadmin1@host:ls-product-design# set policy-statement ospf-redist-static
from protocol static
lsdesignadmin1@host:ls-product-design# set policy-statement ospf-redist-static
then accept
lsdesignadmin1@host:ls-product-design# set policy-statement ospf-to-ospf from
protocol ospf
lsdesignadmin1@host:ls-product-design# set policy-statement ospf-to-ospf then
accept

```

3. Apply the routing policies to routes exported from the Junos OS routing table into OSPF.

```

[edit routing-instances]
lsdesignadmin1@host:ls-product-design# set pd-vr1 protocols ospf export
ospf-redist-direct
lsdesignadmin1@host:ls-product-design# set pd-vr1 protocols ospf export
ospf-redist-static
lsdesignadmin1@host:ls-product-design# set pd-vr1 protocols ospf export
ospf-to-ospf

```

4. Enable OSPF on the logical interfaces.

```

[edit routing-instances]
lsdesignadmin1@host:ls-product-design# set pd-vr1 protocols ospf area 0.0.0.1
interface ge-0/0/5.1
lsdesignadmin1@host:ls-product-design# set pd-vr1 protocols ospf area 0.0.0.1
interface lt-0/0/0.3

```

**Results** From configuration mode, confirm your configuration by entering the **show policy-options** and **show routing-instances** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

```

[edit]
lsdesignadmin1@host:ls-product-design# show policy-options
policy-statement ospf-redist-direct {
 from protocol direct;
 then accept;
}
policy-statement ospf-redist-static {
 from protocol static;
 then accept;
}
policy-statement ospf-to-ospf {
 from protocol ospf;
 then accept;
}
[edit]
lsdesignadmin1@host:ls-product-design# show routing-instances

```

```

pd-vr1 {
...
 protocols {
 ospf {
 export [ospf-redist-direct ospf-to-ospf ospf-redist-static];
 area 0.0.0.1 {
 interface lt-0/0/0.3;
 interface ge-0/0/5.1;
 }
 }
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying OSPF Interfaces on page 3687](#)
- [Verifying OSPF Neighbors on page 3687](#)
- [Verifying OSPF Routes on page 3687](#)

### Verifying OSPF Interfaces

**Purpose** Verify OSPF-enabled interfaces.

**Action** From the CLI, enter the **show ospf interface instance pd-vr1** command.

```

lsdesignadmin1@host:ls-product-design> show ospf interface instance pd-vr1
Interface State Area DR ID BDR ID Nbrs
lt-0/0/0.3 DR 0.0.0.0 10.0.1.2 0.0.0.0 0
ge-0/0/5.1 DR 0.0.0.1 10.0.1.2 0.0.0.0 0

```

### Verifying OSPF Neighbors

**Purpose** Verify OSPF neighbors.

**Action** From the CLI, enter the **show ospf neighbor instance pd-vr1** command.

```

lsdesignadmin1@host:ls-product-design> show ospf neighbor instance pd-vr1
Address Interface State ID Pri Dead
10.0.1.1 plt0.1 Full 0.0.0.0 128 39

```

### Verifying OSPF Routes

**Purpose** Verify OSPF routes.

**Action** From the CLI, enter the **show ospf route instance pd-vr1** command.

```

lsdesignadmin1@host:ls-product-design> show ospf route instance pd-vr1
Topology default Route Table:

```

| Prefix | Path<br>Type | Route<br>Type | NH<br>Type | Metric | NextHop<br>Interface | Nexthop<br>Address/LSP |
|--------|--------------|---------------|------------|--------|----------------------|------------------------|
|--------|--------------|---------------|------------|--------|----------------------|------------------------|

|              |               |    |              |
|--------------|---------------|----|--------------|
| 10.0.1.0/24  | Intra Network | IP | 1 lt-0/0/0.3 |
| 12.12.1.0/24 | Intra Network | IP | 1 ge-0/0/5.1 |

## Understanding Logical Systems in the Context of Chassis Cluster

---

The behavior of a chassis cluster whose nodes consist of SRX Series devices running logical systems is the same as that of a cluster whose SRX Series nodes in the cluster are not running logical systems. No difference exists between events that cause a node to fail over. In particular, if a link associated with a single logical system fails, then the device fails over to another node in the cluster.

The master administrator configures the chassis cluster (including both primary and secondary nodes) before he or she creates and configures the logical systems. Each node in the cluster has the same configuration, as is the case for nodes in a cluster not running logical systems. All logical system configurations are synchronized and replicated between both nodes in the cluster.

When you use SRX Series devices running logical systems within a chassis cluster, you must purchase and install the same number of licenses for each node in the chassis cluster. Logical systems licenses pertain to a single chassis, or node, within a chassis cluster and not to the cluster collectively.

## Example: Configuring Logical Systems in an Active/Passive Chassis Cluster (Master Administrators Only)

This example shows how to configure logical systems in a basic active/passive chassis cluster.

**NOTE:** The master administrator configures the chassis cluster and creates logical systems (including an optional interconnect logical system), administrators, and security profiles. Either the master administrator or the user logical system administrator configures a user logical system. The configuration is synchronized between nodes in the cluster.

- [Requirements on page 3692](#)
- [Overview on page 3693](#)
- [Configuration on page 3696](#)
- [Verification on page 3719](#)

### Requirements

Before you begin:

- Obtain two high-end SRX Series Services Gateways with identical hardware configurations. See *Example: Configuring an Active/Passive Chassis Cluster On a High-End SRX Series Services Gateway*. This chassis cluster deployment scenario includes the configuration of the SRX Series device for connections to an MX240 edge router and an EX8208 Ethernet Switch.
- Physically connect the two devices (back-to-back for the fabric and control ports) and ensure that they are the same models. You can configure both the fabric and control ports on the SRX5000 line. See *Connecting SRX Series Devices to Create a Chassis Cluster*.
- Set the chassis cluster ID and node ID on each device and reboot the devices to enable clustering. See *Example: Setting the Chassis Cluster Node ID and Cluster ID for Branch SRX Series Devices*.

**NOTE:** For this example, chassis cluster and logical system configuration is performed on the primary (node 0) device at the root level by the master administrator. Log in to the device as the master administrator. See [“Understanding the Master Logical System and the Master Administrator Role” on page 3543](#).

**NOTE:** When you use SRX Series devices running logical systems in a chassis cluster, you must purchase and install the same number of logical system licenses for each node in the chassis cluster. Logical system licenses pertain to a single chassis or node within a chassis cluster and not to the cluster collectively. See [“Understanding Licenses for Logical Systems on SRX Series Devices” on page 3531](#).

## Overview

In this example, the basic active/passive chassis cluster consists of two devices:

- One device actively provides logical systems, along with maintaining control of the chassis cluster.
- The other device passively maintains its state for cluster failover capabilities should the active device become inactive.

**NOTE:** Logical systems in an active/active chassis cluster are configured in a similar manner as for logical systems in an active/passive chassis cluster. For active/active chassis clusters, there can be multiple redundancy groups that can be primary on different nodes.

The master administrator configures the following logical systems on the primary device (node 0):

- Master logical system—The master administrator configures a security profile to provision portions of the system’s security resources to the master logical system and configures the resources of the master logical system.
- User logical systems LSYS1 and LSYS2 and their administrators—The master administrator also configures security profiles to provision portions of the system’s security resources to user logical systems. The user logical system administrator can then configure interfaces, routing, and security resources allocated to his or her logical system.
- Interconnect logical system LSYS0 that connects logical systems on the device—The master administrator configures logical tunnel interfaces between the interconnect logical system and each logical system. These peer interfaces effectively allow for the establishment of tunnels.

NOTE: This example does not describe configuring features such as NAT, IDP, or VPNs for a logical system. See [“SRX Series Logical System Master Administrator Configuration Tasks Overview” on page 3544](#) and [“User Logical System Configuration Overview” on page 3547](#) for more information about features that can be configured for logical systems.

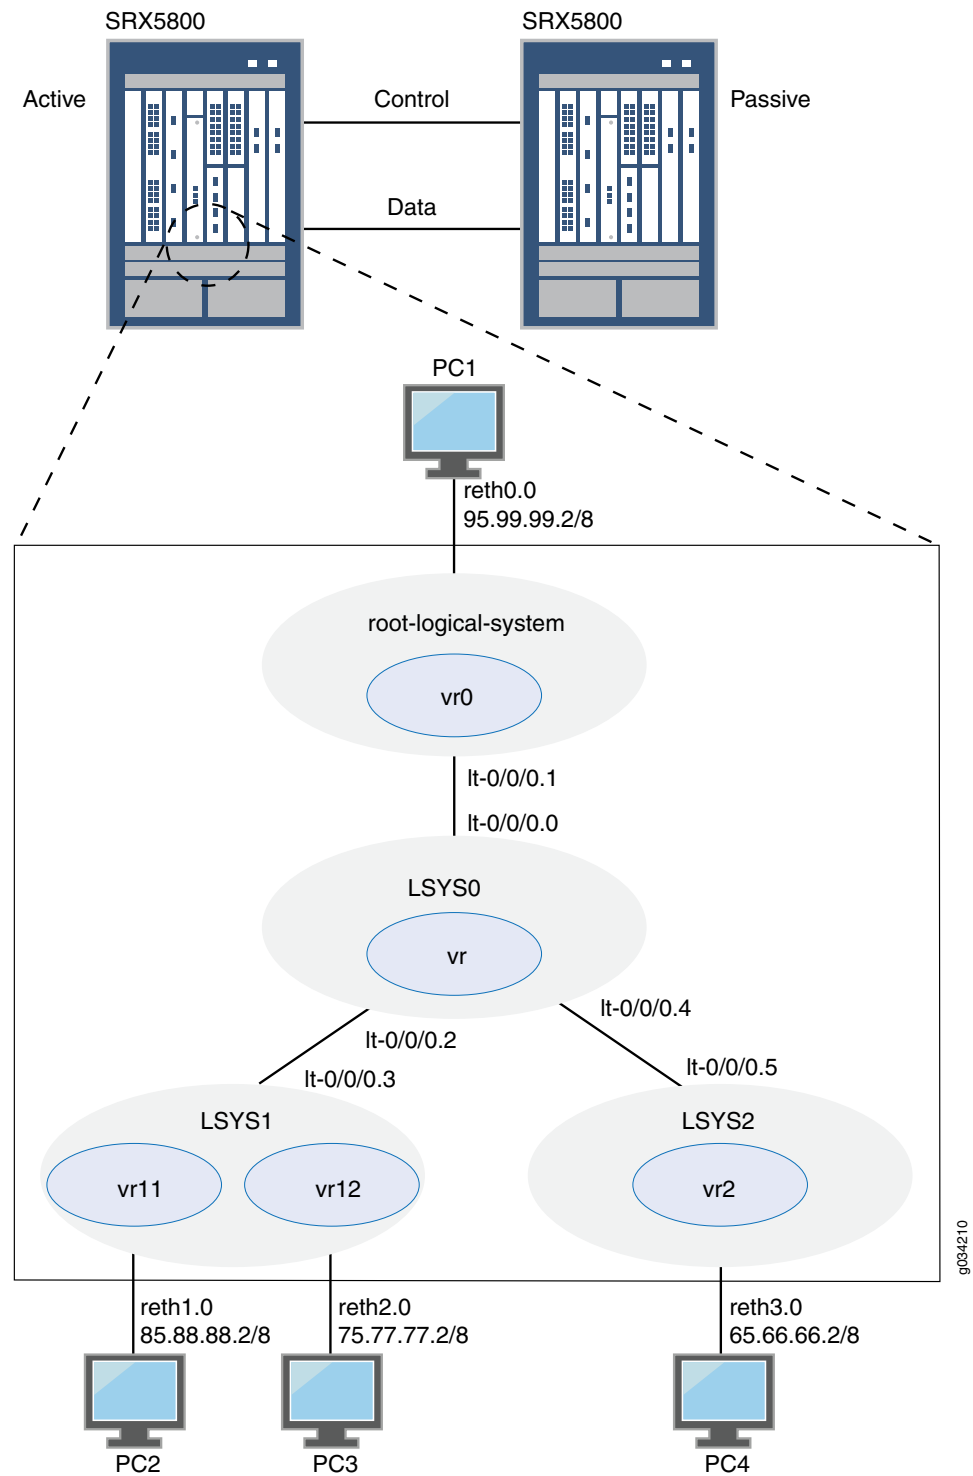

If you are performing proxy ARP in a chassis cluster configuration, you must apply the proxy ARP configuration to the reth interfaces rather than the member interfaces because the reth interfaces contain the logical configurations. See [“Configuring Proxy ARP \(CLI Procedure\)” on page 5183](#).

---

### Topology

[Figure 155](#) shows the topology used in this example.

Figure 155: Logical Systems in a Chassis Cluster

## Configuration

- [User Logical System Configuration \(User Logical System Administrator\) on page 3709](#)

### Chassis Cluster Configuration (Master Administrator)

#### CLI Quick Configuration

To quickly create logical systems and user logical system administrators and configure the master and interconnect logical systems, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

On {primary:node0}

```
set chassis cluster control-ports fpc 0 port 0
set chassis cluster control-ports fpc 6 port 0
set interfaces fab0 fabric-options member-interfaces ge-1/1/0
set interfaces fab1 fabric-options member-interfaces ge-7/1/0
set groups node0 system host-name SRX5800-1
set groups node0 interfaces fxp0 unit 0 family inet address 10.157.90.24/9
set groups node0 system backup-router 10.157.64.1 destination 0.0.0.0/0
set groups node1 system host-name SRX5800-2
set groups node1 interfaces fxp0 unit 0 family inet address 10.157.90.23/19
set groups node1 system backup-router 10.157.64.1 destination 0.0.0.0/0
set apply-groups "${node}"
set chassis cluster reth-count 5
set chassis cluster redundancy-group 0 node 0 priority 200
set chassis cluster redundancy-group 0 node 1 priority 100
set chassis cluster redundancy-group 1 node 0 priority 200
set chassis cluster redundancy-group 1 node 1 priority 100
set interfaces ge-1/0/0 gigether-options redundant-parent reth0
set interfaces ge-1/0/1 gigether-options redundant-parent reth1
set interfaces ge-1/0/2 gigether-options redundant-parent reth2
set interfaces ge-1/0/3 gigether-options redundant-parent reth3
set interfaces ge-7/0/0 gigether-options redundant-parent reth0
set interfaces ge-7/0/1 gigether-options redundant-parent reth1
set interfaces ge-7/0/2 gigether-options redundant-parent reth2
set interfaces ge-7/0/3 gigether-options redundant-parent reth3
set interfaces reth0 redundant-ether-options redundancy-group 1
set interfaces reth0 unit 0 family inet address 95.99.99.1/8
set interfaces reth1 redundant-ether-options redundancy-group 1
set interfaces reth2 redundant-ether-options redundancy-group 1
set interfaces reth3 redundant-ether-options redundancy-group 1
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a chassis cluster:

**NOTE:** Perform the following steps on the primary device (node 0). They are automatically copied over to the secondary device (node 1) when you execute a **commit** command.

1. Configure control ports for the clusters.  

```
[edit chassis cluster]
user@host# set control-ports fpc 0 port 0
user@host# set control-ports fpc 6 port 0
```
2. Configure the fabric (data) ports of the cluster that are used to pass RTOs in active/passive mode.  

```
[edit interfaces]
user@host# set fab0 fabric-options member-interfaces ge-1/1/0
user@host# set fab1 fabric-options member-interfaces ge-7/1/0
```
3. Assign some elements of the configuration to a specific member. Configure out-of-band management on the fxp0 interface of the SRX Services Gateway using separate IP addresses for the individual control planes of the cluster.  

```
[edit]
user@host# set groups node0 system host-name SRX5800-1
user@host# set groups node0 interfaces fxp0 unit 0 family inet address 10.157.90.24/9
user@host# set groups node0 system backup-router 10.157.64.1 destination 0.0.0.0/0
user@host# set groups node1 system host-name SRX5800-2
user@host# set groups node1 interfaces fxp0 unit 0 family inet address 10.157.90.23/19
user@host# set groups node1 system backup-router 10.157.64.1 destination 0.0.0.0/0
user@host# set apply-groups "${node}"
```
4. Configure redundancy groups for chassis clustering.  

```
[edit chassis cluster]
user@host# set reth-count 5
user@host# set redundancy-group 0 node 0 priority 200
user@host# set redundancy-group 0 node 1 priority 100
user@host# set redundancy-group 1 node 0 priority 200
user@host# set redundancy-group 1 node 1 priority 100
```
5. Configure the data interfaces on the platform so that in the event of a data plane failover, the other chassis cluster member can take over the connection seamlessly.  

```
[edit interfaces]
user@host# set ge-1/0/0 gigether-options redundant-parent reth0
user@host# set ge-1/0/1 gigether-options redundant-parent reth1
user@host# set ge-1/0/2 gigether-options redundant-parent reth2
```

```

user@host# set ge-1/0/3 gigether-options redundant-parent reth3
user@host# set ge-7/0/0 gigether-options redundant-parent reth0
user@host# set ge-7/0/1 gigether-options redundant-parent reth1
user@host# set ge-7/0/2 gigether-options redundant-parent reth2
user@host# set ge-7/0/3 gigether-options redundant-parent reth3
user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth0 unit 0 family inet address 95.99.99.1/8
user@host# set reth1 redundant-ether-options redundancy-group 1
user@host# set reth2 redundant-ether-options redundancy-group 1
user@host# set reth3 redundant-ether-options redundancy-group 1

```

**Results** From operational mode, confirm your configuration by entering the **show configuration** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

user@host> show configuration
version ;
groups {
 node0 {
 system {
 host-name SRX58001;

### Logical System Configuration (Master Administrator)

#### CLI Quick Configuration

To quickly create logical systems and user logical system administrators and configure the master and interconnect logical systems, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**NOTE:** You are prompted to enter and then reenter plain-text passwords.

On {primary:node0}

```

set logical-systems LSYS1
set logical-systems LSYS2
set logical-systems LSYS0
set system login class lsys1 logical-system LSYS1
set system login class lsys1 permissions all
set system login user lsys1admin full-name lsys1-admin
set system login user lsys1admin class lsys1
set user lsys1admin authentication plain-text-password
set system login class lsys2 logical-system LSYS2
set system login class lsys2 permissions all
set system login user lsys2admin full-name lsys2-admin

```

```
set system login user lsys2admin class lsys2
set system login user lsys2admin authentication plain-text-password
set system security-profile SP-root policy maximum 200
set system security-profile SP-root policy reserved 100
set system security-profile SP-root zone maximum 200
set system security-profile SP-root zone reserved 100
set system security-profile SP-root flow-session maximum 200
set system security-profile SP-root flow-session reserved 100
set system security-profile SP-root root-logical-system
set system security-profile SP0 logical-system LSYS0
set system security-profile SP1 policy maximum 100
set system security-profile SP1 policy reserved 50
set system security-profile SP1 zone maximum 100
set system security-profile SP1 zone reserved 50

set logical-systems LSYS2 interfaces lt-0/0/0 unit 5 family inet address 2.1.1.5/24

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To create logical systems and user logical system administrators and configure the master and interconnect logical systems:

1. Create the interconnect and user logical systems.

```

[edit logical-systems]
user@host# set LSYS0
user@host# set LSYS1
user@host# set LSYS2

```

2. Configure user logical system administrators.
  - a. Configure the user logical system administrator for LSYS1.

```

[edit system login]
user@host# set class lsys1 logical-system LSYS1
user@host# set class lsys1 permissions all
user@host# set user lsys1admin full-name lsys1-admin
user@host# set user lsys1admin class lsys1
user@host# set user lsys1admin authentication plain-text-password

```

- b. Configure the user logical system administrator for LSYS2.

```
[edit system login]
user@host# set class lsys2 logical-system LSYS2
user@host# set class lsys2 permissions all
user@host# set user lsys2admin full-name lsys2-admin
user@host# set user lsys2admin class lsys2
user@host# set user lsys2admin authentication plain-text-password
```

3. Configure security profiles and assign them to logical systems.

- a. Configure a security profile and assign it to the root logical system.

```
[edit system security-profile]
user@host# set SP-root policy maximum 200
user@host# set SP-root policy reserved 100
user@host# set SP-root zone maximum 200
user@host# set SP-root zone reserved 100
user@host# set SP-root flow-session maximum 200
user@host# set SP-root flow-session reserved 100
user@host# set SP-root root-logical-system
```

- b. Assign a dummy security profile containing no resources to the interconnect logical system LSYS0.

```
[edit system security-profile]
user@host# set SP0 logical-system LSYS0
```

- c. Configure a security profile and assign it to LSYS1.

```
[edit system security-profile]
user@host# set SP1 policy maximum 100
user@host# set SP1 policy reserved 50
user@host# set SP1 zone maximum 100
user@host# set SP1 zone reserved 50
user@host# set SP1 flow-session maximum 100
user@host# set SP1 flow-session reserved 50
user@host# set SP1 logical-system LSYS1
```

- d. Configure a security profile and assign it to LSYS2.

```
[edit system security-profile]
user@host# set SP2 policy maximum 100
user@host# set SP2 policy reserved 50
user@host# set SP2 zone maximum 100
user@host# set SP2 zone reserved 50
user@host# set SP2 flow-session maximum 100
user@host# set SP2 flow-session reserved 50
user@host# set SP2 logical-system LSYS2
```

4. Configure the master logical system.

- a. Configure logical tunnel interfaces.

```
[edit interfaces]
user@host# set lt-0/0/0 unit 1 encapsulation ethernet
user@host# set lt-0/0/0 unit 1 peer-unit 0
user@host# set lt-0/0/0 unit 1 family inet address 2.1.1.24
```

- b. Configure a routing instance.

```
[edit routing-instances]
user@host# set vr0 instance-type virtual-router
user@host# set vr0 interface lt-0/0/0.1
user@host# set vr0 interface reth0.0
user@host# set vr0 routing-options static route 85.0.0.0/8 next-hop 2.1.1.3
user@host# set vr0 routing-options static route 75.0.0.0/8 next-hop 2.1.1.3
user@host# set vr0 routing-options static route 65.0.0.0/8 next-hop 2.1.1.5
```

- c. Configure zones.

```
[edit security zones]
user@host# set security-zone root-trust host-inbound-traffic system-services
all
user@host# set security-zone root-trust host-inbound-traffic protocols all
user@host# set security-zone root-trust interfaces reth0.0
user@host# set security-zone root-untrust host-inbound-traffic system-services
all
user@host# set security-zone root-untrust host-inbound-traffic protocols all
user@host# set security-zone root-untrust interfaces lt-0/0/0.1
```

- d. Configure security policies.

```
[edit security policies from-zone root-trust to-zone root-untrust]
user@host# set policy root-Trust_to_root-Untrust match source-address any
user@host# set policy root-Trust_to_root-Untrust match destination-address
any
user@host# set policy root-Trust_to_root-Untrust match application any
user@host# set policy root-Trust_to_root-Untrust then permit
```

```
[edit security policies from-zone root-untrust to-zone root-trust]
user@host# set policy root-Untrust_to_root-Trust match source-address any
user@host# set policy root-Untrust_to_root-Trust match destination-address
any
user@host# set policy root-Untrust_to_root-Trust match application any
user@host# set policy root-Untrust_to_root-Trust then permit
```

```
[edit security policies from-zone root-untrust to-zone root-untrust]
user@host# set policy root-Untrust_to_root-Untrust match source-address any
user@host# set policy root-Untrust_to_root-Untrust match destination-address
any
user@host# set policy root-Untrust_to_root-Untrust match application any
user@host# set policy root-Untrust_to_root-Untrust then permit
```

```
[edit security policies from-zone root-trust to-zone root-trust]
user@host# set policy root-Trust_to_root-Trust match source-address any
user@host# set policy root-Trust_to_root-Trust match destination-address any
user@host# set policy root-Trust_to_root-Trust match application any
user@host# set policy root-Trust_to_root-Trust then permit
```

5. Configure the interconnect logical system.

- a. Configure logical tunnel interfaces.

```
[edit logical-systems LSYS0 interfaces]
user@host# set lt-0/0/0 unit 0 encapsulation ethernet-vpls
user@host# set lt-0/0/0 unit 0 peer-unit 1
user@host# set lt-0/0/0 unit 2 encapsulation ethernet-vpls
```

```

user@host# set lt-0/0/0 unit 2 peer-unit 3
user@host# set lt-0/0/0 unit 4 encapsulation ethernet-vpls
user@host# set lt-0/0/0 unit 4 peer-unit 5

```

- b. Configure the VPLS routing instance.

```

[edit logical-systems LSYS0 routing-instances]
user@host# set vr instance-type vpls
user@host# set vr interface lt-0/0/0.0
user@host# set vr interface lt-0/0/0.2
user@host# set vr interface lt-0/0/0.4

```

6. Configure logical tunnel interfaces for the user logical systems.

- a. Configure logical tunnel interfaces for LSYS1.

```

[edit logical-systems LSYS1 interfaces]
user@host# set lt-0/0/0 unit 3 encapsulation ethernet
user@host# set lt-0/0/0 unit 3 peer-unit 2
user@host# set lt-0/0/0 unit 3 family inet address 2.1.1.3/24

```

- b. Configure logical tunnel interfaces for LSYS2.

```

[edit logical-systems LSYS2 interfaces]
user@host# set lt-0/0/0 unit 5 encapsulation ethernet
user@host# set lt-0/0/0 unit 5 peer-unit 4
user@host# set lt-0/0/0 unit 5 family inet address 2.1.1.5/24

```

**Results** From configuration mode, confirm the configuration for LSYS0 by entering the **show logical-systems LSYS0** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@host# show logical-systems LSYS0
interfaces {
 lt-0/0/0 {
 unit 0 {
 encapsulation ethernet-vpls;
 peer-unit 1;
 }
 unit 2 {
 encapsulation ethernet-vpls;
 peer-unit 3;
 }
 unit 4 {
 encapsulation ethernet-vpls;
 peer-unit 5;
 }
 }
}
routing-instances {
 vr {
 instance-type vpls;
 interface lt-0/0/0.0;
 interface lt-0/0/0.2;
 interface lt-0/0/0.4;
 }
}

```

```
 }
 }
```

From configuration mode, confirm the configuration for the master logical system by entering the **show interfaces**, **show routing-instances**, and **show security** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

```

If you are done configuring the device, enter **commit** from configuration mode.

### User Logical System Configuration (User Logical System Administrator)

#### CLI Quick Configuration

To quickly configure user logical systems, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Enter the following commands while logged in as the user logical system administrator for LSYS1:

```

set interfaces reth1 unit 0 family inet address 85.88.88.1/8
set interfaces reth2 unit 0 family inet address 75.77.77.1/8
set routing-instances vr11 instance-type virtual-router
set routing-instances vr11 interface lt-0/0/0.3
set routing-instances vr11 interface reth1.0
set routing-instances vr11 routing-options static route 65.0.0.0/8 next-hop 2.1.1.5
set routing-instances vr11 routing-options static route 95.0.0.0/8 next-hop 2.1.1.1
set routing-instances vr12 instance-type virtual-router
set routing-instances vr12 interface reth2.0
set routing-instances vr12 routing-options interface-routes rib-group inet vr11vr12v4
set routing-instances vr12 routing-options static route 85.0.0.0/8 next-table vr11.inet.0
set routing-instances vr12 routing-options static route 95.0.0.0/8 next-table vr11.inet.0
set routing-instances vr12 routing-options static route 65.0.0.0/8 next-table vr11.inet.0
set routing-instances vr12 routing-options static route 2.1.1.0/24 next-table vr11.inet.0

```

#### Step-by-Step Procedure

**NOTE:** The user logical system administrator performs the following configuration while logged in to his or her user logical system. The master administrator can also configure a user logical system at the [edit logical-systems *logical-system*] hierarchy level.

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure the LSYS1 user logical system:

1. Configure interfaces.
 

```

[edit interfaces]
lsys1-admin@host:LSYS1# set reth1 unit 0 family inet address 85.88.88.1/8
lsys1-admin@host:LSYS1# set reth2 unit 0 family inet address 75.77.77.1/8

```
2. Configure routing.
 

```

[edit routing-instances]
lsys1-admin@host:LSYS1# set vr11 instance-type virtual-router
lsys1-admin@host:LSYS1# set vr11 interface lt-0/0/0.3

```

```

lsys1-admin@host:LSYS1# set vr11 interface reth1.0
lsys1-admin@host:LSYS1# set vr11 routing-options static route 65.0.0.0/8 next-hop
2.1.1.5
lsys1-admin@host:LSYS1# set vr11 routing-options static route 95.0.0.0/8 next-hop
2.1.1.1
lsys1-admin@host:LSYS1# set vr12 instance-type virtual-router
lsys1-admin@host:LSYS1# set vr12 interface reth2.0
lsys1-admin@host:LSYS1# set vr12 routing-options interface-routes rib-group inet
vr11vr12v4
lsys1-admin@host:LSYS1# set vr12 routing-options static route 85.0.0.0/8 next-table
vr11.inet.0
lsys1-admin@host:LSYS1# set vr12 routing-options static route 95.0.0.0/8 next-table
vr11.inet.0
lsys1-admin@host:LSYS1# set vr12 routing-options static route 65.0.0.0/8 next-table
vr11.inet.0
lsys1-admin@host:LSYS1# set vr12 routing-options static route 2.1.1.0/24 next-table
vr11.inet.0

[edit routing-options]
lsys1-admin@host:LSYS1# set rib-groups vr11vr12v4 import-rib vr11.inet.0
lsys1-admin@host:LSYS1# set rib-groups vr11vr12v4 import-rib vr12.inet.0

```

### 3. Configure zones and security policies.

```

[edit security zones]
lsys1-admin@host:LSYS1# set security-zone lsys1-trust host-inbound-traffic
system-services all
lsys1-admin@host:LSYS1# set security-zone lsys1-trust host-inbound-traffic
protocols all
lsys1-admin@host:LSYS1# set security-zone lsys1-trust interfaces reth1.0
lsys1-admin@host:LSYS1# set security-zone lsys1-trust interfaces lt-0/0/0.3
lsys1-admin@host:LSYS1# set security-zone lsys1-untrust host-inbound-traffic
system-services all
lsys1-admin@host:LSYS1# set security-zone lsys1-untrust host-inbound-traffic
protocols all
lsys1-admin@host:LSYS1# set security-zone lsys1-untrust interfaces reth2.0

[edit security policies from-zone lsys1-trust to-zone lsys1-untrust]
lsys1-admin@host:LSYS1# set policy lsys1trust-to-lsys1untrust match source-address
any
lsys1-admin@host:LSYS1# set policy lsys1trust-to-lsys1untrust match
destination-address any
lsys1-admin@host:LSYS1# set policy lsys1trust-to-lsys1untrust match application
any
lsys1-admin@host:LSYS1# set policy lsys1trust-to-lsys1untrust then permit

[edit security policies from-zone lsys1-untrust to-zone lsys1-trust]
lsys1-admin@host:LSYS1# set policy lsys1untrust-to-lsys1trust match source-address
any
lsys1-admin@host:LSYS1# set policy lsys1untrust-to-lsys1trust match
destination-address any
lsys1-admin@host:LSYS1# set policy lsys1untrust-to-lsys1trust match application
any
lsys1-admin@host:LSYS1# set policy lsys1untrust-to-lsys1trust then permit

[edit security policies from-zone lsys1-untrust to-zone lsys1-untrust]
lsys1-admin@host:LSYS1# set policy lsys1untrust-to-lsys1untrust match
source-address any

```

```

lsys1-admin@host:LSYS1# set policy lsys1untrust-to-lsys1untrust match
destination-address any
lsys1-admin@host:LSYS1# set policy lsys1untrust-to-lsys1untrust match application
any
lsys1-admin@host:LSYS1# set policy lsys1untrust-to-lsys1untrust then permit

[edit security policies from-zone lsys1-trust to-zone lsys1-trust]
lsys1-admin@host:LSYS1# set policy lsys1trust-to-lsys1trust match source-address
any
lsys1-admin@host:LSYS1# set policy lsys1trust-to-lsys1trust match
destination-address any
lsys1-admin@host:LSYS1# set policy lsys1trust-to-lsys1trust match application any
lsys1-admin@host:LSYS1# set policy lsys1trust-to-lsys1trust then permit

```

**Step-by-Step Procedure** To configure the LSYS2 user logical system:

1. Configure interfaces.
 

```

[edit interfaces]
lsys2-admin@host:LSYS2# set reth3 unit 0 family inet address 65.66.66.1/8

```
2. Configure routing.
 

```

[edit routing-instances]
lsys2-admin@host:LSYS2# set vr2 instance-type virtual-router
lsys2-admin@host:LSYS2# set vr2 interface lt-0/0/0.5
lsys2-admin@host:LSYS2# set vr2 interface reth3.0
lsys2-admin@host:LSYS2# set vr2 routing-options static route 75.0.0.0/8 next-hop
2.1.1.3
lsys2-admin@host:LSYS2# set vr2 routing-options static route 85.0.0.0/8 next-hop
2.1.1.3
lsys2-admin@host:LSYS2# set vr2 routing-options static route 95.0.0.0/8 next-hop
2.1.1.1

```
3. Configure zones and security policies.
 

```

[edit security zones]
lsys2-admin@host:LSYS2# set security-zone lsys2-trust host-inbound-traffic
system-services all
lsys2-admin@host:LSYS2# set security-zone lsys2-trust host-inbound-traffic
protocols all
lsys2-admin@host:LSYS2# set security-zone lsys2-trust interfaces reth3.0
lsys2-admin@host:LSYS2# set security zones security-zone lsys2-untrust
host-inbound-traffic system-services all
lsys2-admin@host:LSYS2# set security-zone lsys2-untrust host-inbound-traffic
protocols all
lsys2-admin@host:LSYS2# set security-zone lsys2-untrust interfaces lt-0/0/0.5

[edit security policies from-zone lsys2-trust to-zone lsys2-untrust]
lsys2-admin@host:LSYS2# set policy lsys2trust-to-lsys2untrust match
source-address any
lsys2-admin@host:LSYS2# set policy lsys2trust-to-lsys2untrust match
destination-address any
lsys2-admin@host:LSYS2# set policy lsys2trust-to-lsys2untrust match application
any
lsys2-admin@host:LSYS2# set policy lsys2trust-to-lsys2untrust then permit

[edit security policies from-zone from-zone lsys2-untrust to-zone lsys2-trust]

```

```

lsys2-admin@host:LSYS2# set policy lsys2untrust-to-lsys2trust match
source-address any
lsys2-admin@host:LSYS2# set policy lsys2untrust-to-lsys2trust match
destination-address any
lsys2-admin@host:LSYS2# set policy lsys2untrust-to-lsys2trust match application
any
lsys2-admin@host:LSYS2# set policy lsys2untrust-to-lsys2trust then permit

[edit security policies from-zone lsys2-untrust to-zone lsys2-untrust]
lsys2-admin@host:LSYS2# set policy lsys2untrust-to-lsys2untrust match
source-address any
lsys2-admin@host:LSYS2# set policy lsys2untrust-to-lsys2untrust match
destination-address any
lsys2-admin@host:LSYS2# set policy lsys2untrust-to-lsys2untrust match application
any
lsys2-admin@host:LSYS2# set policy lsys2untrust-to-lsys2untrust then permit

[edit security policies from-zone lsys2-trust to-zone lsys2-trust]
lsys2-admin@host:LSYS2# set policy lsys2trust-to-lsys2trust match source-address
any
lsys2-admin@host:LSYS2# set policy lsys2trust-to-lsys2trust match
destination-address any
lsys2-admin@host:LSYS2# set policy lsys2trust-to-lsys2trust match application
any
lsys2-admin@host:LSYS2# set policy lsys2trust-to-lsys2trust then permit

```

**Results** From configuration mode, confirm the configuration for LSYS1 by entering the **show interfaces**, **show routing-instances**, **show routing-options**, and **show security** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying Chassis Cluster Status on page 3719](#)
- [Troubleshooting Chassis Cluster with Logs on page 3720](#)
- [Verifying Logical System Licenses on page 3720](#)
- [Verifying Logical System License Usage on page 3720](#)
- [Verifying Intra-Logical System Traffic on a Logical System on page 3721](#)
- [Verifying Intra-Logical System Traffic Within All Logical Systems on page 3721](#)
- [Verifying Traffic Between User Logical Systems on page 3722](#)

### Verifying Chassis Cluster Status

**Purpose** Verify the chassis cluster status, failover status, and redundancy group information.

**Action** From operational mode, enter the **show chassis cluster status** command.

```

{primary:node0}
show chassis cluster status
Cluster ID: 1
Node Priority Status Preempt Manual failover

Redundancy group: 0 , Failover count: 1
 node0 200 primary no no
 node1 100 secondary no no

Redundancy group: 1 , Failover count: 1

```

|       |     |           |    |    |
|-------|-----|-----------|----|----|
| node0 | 200 | primary   | no | no |
| node1 | 100 | secondary | no | no |

### Troubleshooting Chassis Cluster with Logs

**Purpose** Identify any chassis cluster issues by looking at the logs on both nodes.

**Action** From operational mode, enter these **show log** commands.

```
user@host> show log jsrpd
user@host> show log chassisd
user@host> show log messages
user@host> show log dcd
user@host> show traceoptions
```

### Verifying Logical System Licenses

**Purpose** Verify information about logical system licenses.

**Action** From operational mode, enter the **show system license status logical-system all** command.

```
{primary:node0}
user@host> show system license status logical-system all
node0:

Logical system license status:

Logical system name license status
root-logical-system enabled
LSYS0 enabled
LSYS1 enabled
LSYS2 enabled
```

### Verifying Logical System License Usage

**Purpose** Verify information about logical system license usage.

**NOTE:** The actual number of licenses used is only displayed on the primary node.

**Action** From operational mode, enter the **show system license** command.

```
{primary:node0}
user@host> show system license
License usage:

Feature name Licenses used Licenses installed Licenses needed Expiry
logical-system 4 25 0 permanent

Licenses installed:
License identifier: JUNOS305013
License version: 2
Valid for device: JN110B54BAGB
Features:
```

```
logical-system-25 - Logical System Capacity
permanent
```

### Verifying Intra-Logical System Traffic on a Logical System

**Purpose** Verify information about currently active security sessions within a logical system.

**Action** From operational mode, enter the **show security flow session logical-system LSYS1** command.

```
{primary:node0}
user@host> show security flow session logical-system LSYS1
node0:

Flow Sessions on FPC0 PIC1:
Total sessions: 0

Flow Sessions on FPC2 PIC0:
Total sessions: 0

Flow Sessions on FPC2 PIC1:

Total sessions: 1
```

### Verifying Intra-Logical System Traffic Within All Logical Systems

**Purpose** Verify information about currently active security sessions on all logical systems.

**Action** From operational mode, enter the **show security flow session logical-system all** command.

```
{primary:node0}
user@host> show security flow session logical-system all
node0:

```

```
Flow Sessions on FPC0 PIC1:
```

```

Total sessions: 0

Flow Sessions on FPC2 PIC0:

## Example: Configuring Logical Systems in an Active/Passive Chassis Cluster (IPv6) (Master Administrators Only)

This example shows how to configure logical systems in a basic active/passive chassis cluster with IPv6 addresses.

**NOTE:** The master administrator configures the chassis cluster and creates logical systems (including an optional interconnect logical system), administrators, and security profiles. Either the master administrator or the user logical system administrator configures a user logical system. The configuration is synchronized between nodes in the cluster.

- [Requirements on page 3725](#)
- [Overview on page 3726](#)
- [Configuration on page 3729](#)
- [Verification on page 3753](#)

### Requirements

Before you begin:

- Obtain two high-end SRX Series Services Gateways with identical hardware configurations. See *Example: Configuring an Active/Passive Chassis Cluster On a High-End SRX Series Services Gateway*. This chassis cluster deployment scenario includes the configuration of the SRX Series device for connections to an MX240 edge router and an EX8208 Ethernet Switch.
- Physically connect the two devices (back-to-back for the fabric and control ports) and ensure that they are the same models. You can configure both the fabric and control ports on the SRX5000 line.
- Set the chassis cluster ID and node ID on each device and reboot the devices to enable clustering. See *Example: Setting the Chassis Cluster Node ID and Cluster ID for Branch SRX Series Devices*.

**NOTE:** For this example, chassis cluster and logical system configuration is performed on the primary (node 0) device at the root level by the master administrator. Log in to the device as the master administrator. See [“Understanding the Master Logical System and the Master Administrator Role” on page 3543](#).

**NOTE:** When you use SRX Series devices running logical systems in a chassis cluster, you must purchase and install the same number of logical system licenses for each node in the chassis cluster. Logical system licenses pertain to a single chassis or node within a chassis cluster and not to the cluster collectively. See [“Understanding Licenses for Logical Systems on SRX Series Devices” on page 3531](#).

## Overview

In this example, the basic active/passive chassis cluster consists of two devices:

- One device actively provides logical systems, along with maintaining control of the chassis cluster.
- The other device passively maintains its state for cluster failover capabilities should the active device become inactive.

**NOTE:** Logical systems in an active/active chassis cluster are configured in a similar manner as for logical systems in an active/passive chassis cluster. For active/active chassis clusters, there can be multiple redundancy groups that can be primary on different nodes.

The master administrator configures the following logical systems on the primary device (node 0):

- Master logical system—The master administrator configures a security profile to provision portions of the system's security resources to the master logical system and configures the resources of the master logical system.
- User logical systems LSYS1 and LSYS2 and their administrators—The master administrator also configures security profiles to provision portions of the system's security resources to user logical systems. The user logical system administrator can then configure interfaces, routing, and security resources allocated to his or her logical system.
- Interconnect logical system LSYS0 that connects logical systems on the device—The master administrator configures logical tunnel interfaces between the interconnect logical system and each logical system. These peer interfaces effectively allow for the establishment of tunnels.

NOTE: This example does not describe configuring features such as NAT, IDP, or VPNs for a logical system. See [“SRX Series Logical System Master Administrator Configuration Tasks Overview” on page 3544](#) and [“User Logical System Configuration Overview” on page 3547](#) for more information about features that can be configured for logical systems.

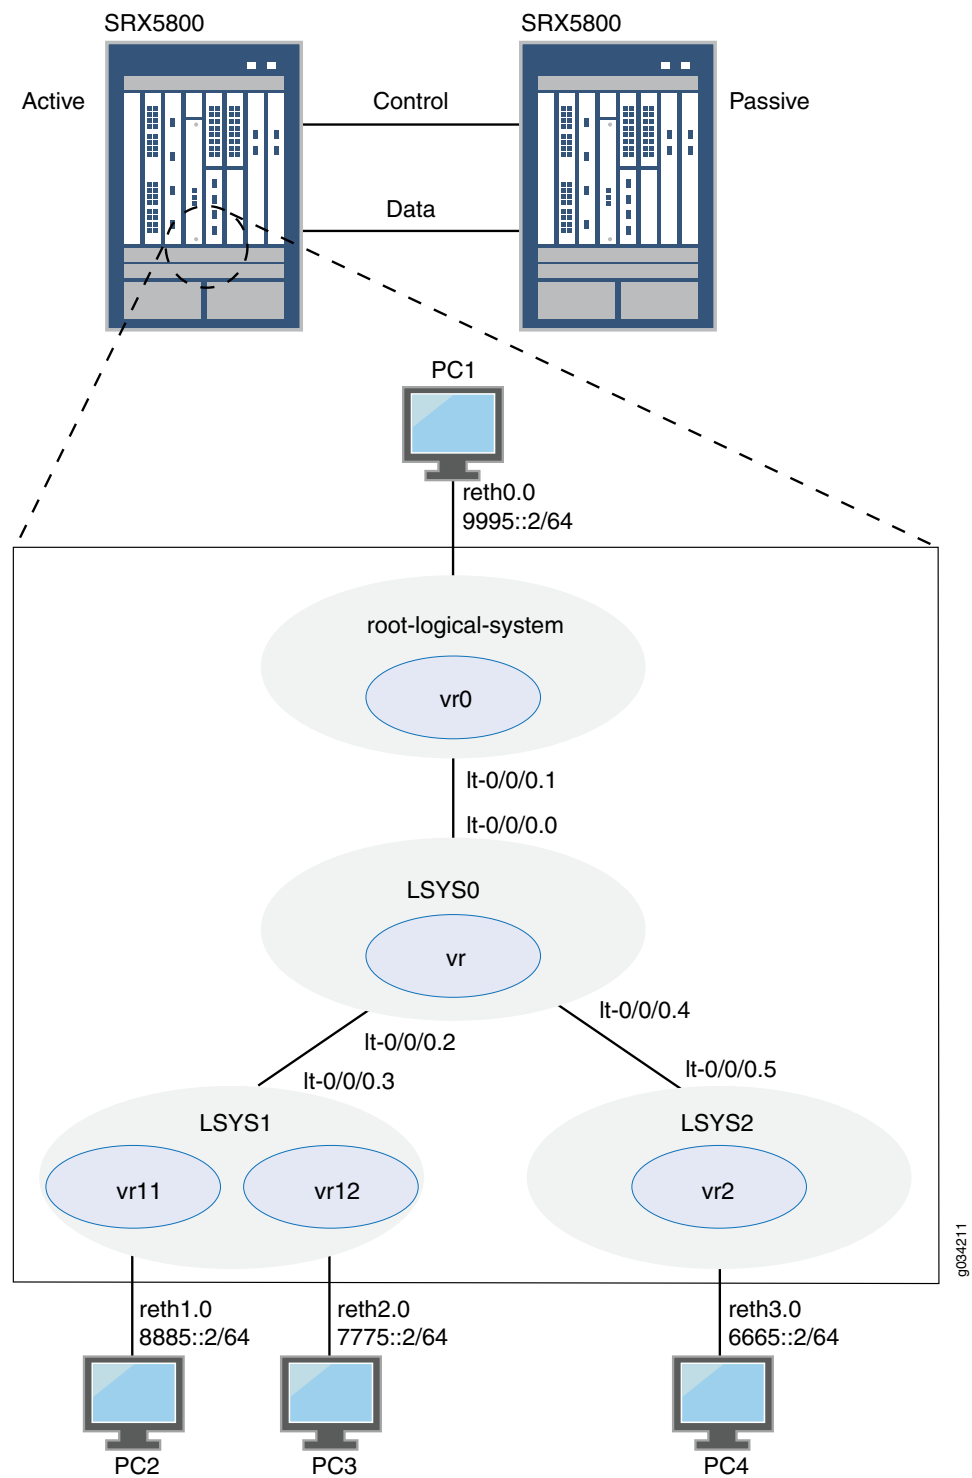

If you are performing proxy ARP in a chassis cluster configuration, you must apply the proxy ARP configuration to the reth interfaces rather than the member interfaces because the reth interfaces contain the logical configurations. See [“Configuring Proxy ARP \(CLI Procedure\)” on page 5183](#).

---

### Topology

[Figure 156](#) shows the topology used in this example.

### Chassis Cluster Configuration with IPv6 Addresses (Master Administrator)

#### CLI Quick Configuration

To quickly create logical systems and user logical system administrators and configure the master and interconnect logical systems, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

On {primary:node0}

```
set chassis cluster control-ports fpc 0 port 0
set chassis cluster control-ports fpc 6 port 0
set interfaces fab0 fabric-options member-interfaces ge-1/1/0
set interfaces fab1 fabric-options member-interfaces ge-7/1/0
set groups node0 system host-name SRX5800-1
set groups node0 interfaces fxp0 unit 0 family inet address 10.157.90.24/9
set groups node0 system backup-router 10.157.64.1 destination 0.0.0.0/0
set groups node1 system host-name SRX5800-2
set groups node1 interfaces fxp0 unit 0 family inet address 10.157.90.23/19
set groups node1 system backup-router 10.157.64.1 destination 0.0.0.0/0
set apply-groups "${node}"
set chassis cluster reth-count 5
set chassis cluster redundancy-group 0 node 0 priority 200
set chassis cluster redundancy-group 0 node 1 priority 100
set chassis cluster redundancy-group 1 node 0 priority 200
set chassis cluster redundancy-group 1 node 1 priority 100
set interfaces ge-1/0/0 gigether-options redundant-parent reth0
set interfaces ge-1/0/1 gigether-options redundant-parent reth1
set interfaces ge-1/0/2 gigether-options redundant-parent reth2
set interfaces ge-1/0/3 gigether-options redundant-parent reth3
set interfaces ge-7/0/0 gigether-options redundant-parent reth0
set interfaces ge-7/0/1 gigether-options redundant-parent reth1
set interfaces ge-7/0/2 gigether-options redundant-parent reth2
set interfaces ge-7/0/3 gigether-options redundant-parent reth3
set interfaces reth0 redundant-ether-options redundancy-group 1
set interfaces reth0 unit 0 family inet6 address 9995::1/64
set interfaces reth1 redundant-ether-options redundancy-group 1
set interfaces reth2 redundant-ether-options redundancy-group 1
set interfaces reth3 redundant-ether-options redundancy-group 1
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a chassis cluster:

**NOTE:** Perform the following steps on the primary device (node 0). They are automatically copied over to the secondary device (node 1) when you execute a **commit** command.

1. Configure control ports for the clusters.  

```
[edit chassis cluster]
user@host# set control-ports fpc 0 port 0
user@host# set control-ports fpc 6 port 0
```
2. Configure the fabric (data) ports of the cluster that are used to pass RTOs in active/passive mode.  

```
[edit interfaces]
user@host# set fab0 fabric-options member-interfaces ge-1/1/0
user@host# set fab1 fabric-options member-interfaces ge-7/1/0
```
3. Assign some elements of the configuration to a specific member. Configure out-of-band management on the fxp0 interface of the SRX Services Gateway using separate IP addresses for the individual control planes of the cluster.  

```
[edit]
user@host# set groups node0 system host-name SRX5800-1
user@host# set groups node0 interfaces fxp0 unit 0 family inet address 10.157.90.24/9
user@host# set groups node0 system backup-router 10.157.64.1 destination 0.0.0.0/0
user@host# set groups node1 system host-name SRX5800-2
user@host# set groups node1 interfaces fxp0 unit 0 family inet address 10.157.90.23/19
user@host# set groups node1 system backup-router 10.157.64.1 destination 0.0.0.0/0
user@host# set apply-groups "${node}"
```
4. Configure redundancy groups for chassis clustering.  

```
[edit chassis cluster]
user@host# set reth-count 5
user@host# set redundancy-group 0 node 0 priority 200
user@host# set redundancy-group 0 node 1 priority 100
user@host# set redundancy-group 1 node 0 priority 200
user@host# set redundancy-group 1 node 1 priority 100
```
5. Configure the data interfaces on the platform so that in the event of a data plane failover, the other chassis cluster member can take over the connection seamlessly.  

```
[edit interfaces]
user@host# set ge-1/0/0 gigether-options redundant-parent reth0
user@host# set ge-1/0/1 gigether-options redundant-parent reth1
user@host# set ge-1/0/2 gigether-options redundant-parent reth2
```

```

user@host# set ge-1/0/3 gigether-options redundant-parent reth3
user@host# set ge-7/0/0 gigether-options redundant-parent reth0
user@host# set ge-7/0/1 gigether-options redundant-parent reth1
user@host# set ge-7/0/2 gigether-options redundant-parent reth2
user@host# set ge-7/0/3 gigether-options redundant-parent reth3
user@host# set reth0 redundant-ether-options redundancy-group 1
user@host# set reth0 unit 0 family inet6 address 9995::1/64
user@host# set reth1 redundant-ether-options redundancy-group 1
user@host# set reth2 redundant-ether-options redundancy-group 1
user@host# set reth3 redundant-ether-options redundancy-group 1

```

**Results** From operational mode, confirm your configuration by entering the **show configuration** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

user@host> show configuration
version ;

### Logical System Configuration with IPv6 Addresses (Master Administrator)

#### CLI Quick Configuration

To quickly create logical systems and user logical system administrators and configure the master and interconnect logical systems, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**NOTE:** You are prompted to enter and then reenter plain-text passwords.

On {primary:node0}

```

set logical-systems LSYS1
set logical-systems LSYS2
set logical-systems LSYS0
set system login class lsys1 logical-system LSYS1
set system login class lsys1 permissions all
set system login user lsys1admin full-name lsys1-admin
set system login user lsys1admin class lsys1
set user lsys1admin authentication plain-text-password
set system login class lsys2 logical-system LSYS2
set system login class lsys2 permissions all
set system login user lsys2admin full-name lsys2-admin

```

```
set system login user lsys2admin class lsys2
set system login user lsys2admin authentication plain-text-password
set system security-profile SP-root policy maximum 200
set system security-profile SP-root policy reserved 100
set system security-profile SP-root zone maximum 200
set system security-profile SP-root zone reserved 100
set system security-profile SP-root flow-session maximum 200
set system security-profile SP-root flow-session reserved 100
set system security-profile SP-root root-logical-system
set system security-profile SP0 logical-system LSYS0
set system security-profile SP1 policy maximum 100
set system security-profile SP1 policy reserved 50
set system security-profile SP1 zone maximum 100
set system security-profile SP1 zone reserved 50
set system security-profile SP1 flow-session maximum 100
set system security-profile SP1 flow-session reserved 50
set system security-profile SP1 logical-system LSYS1
set system security-profile SP2 policy maximum 100
