**Hierarchy Level** [edit system services]

**Release Information** Statement introduced in Junos OS Release 15.1 for MX240, MX480, MX960, MX2010, and MX2020 routers.

**Description** Enable the resource monitoring capability to provision sufficient headroom (memory space limits that are set for the application or virtual router) for monitoring the health and operating efficiency of DPCs and MPCs. You can configure the resource-monitoring capability on MX240, MX480, MX960, MX2010, and MX2020 routers with I-chip-based DPCs and Trio-based FPCs.

**Options** **resource-monitor**—Enable the memory resource monitoring mechanism to avoid the system operations from compromising on the health and traffic-handling stability of the line cards by generating error logs when a specified watermark value for memory regions and threshold value for the jtree memory region are exceeded. A trade-off on the system performance can be detrimental for supporting live traffic and protocols.

The remaining statements are explained separately.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX80, MX104, MX240, MX480, MX960, MX2010, and MX2020 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Configure the type of resource as free or unused memory double words (dwords) for which you want to enable the monitoring mechanism to provide sufficient headroom for ensuring effective system performance and traffic-handling capacity. You can monitor the memory utilization of resource types on MX Series routers with DPCs and MPCs.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b>free-dwords</b>—Specify that memory resource utilization needs to be monitored for free or empty memory dwords.</p> <p><b>low-watermark <i>number</i></b>—Configure the lower range of the watermark or checkpoint value as a percentage for which the resource type configured needs to be monitored. When the low threshold value is exceeded, error log messages are generated.<br/><b>Range:</b> 1 through 100</p> <p><b>high-watermark <i>number</i></b>—Configure the higher range of the watermark or checkpoint value as a percentage for which the resource type configured needs to be monitored. When the high threshold value is exceeded, error log messages are generated.<br/><b>Range:</b> 1 through 100</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | Configure the type of resource as free or unused memory pages for which you want to enable the monitoring mechanism to provide sufficient headroom for ensuring effective system performance and traffic-handling capacity. You can monitor the memory utilization of resource types on MX Series routers with DPCs and MPCs.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b>free-pages</b>—Specify that memory resource utilization needs to be monitored for free or empty memory blocks or pages.</p> <p><b>low-watermark <i>number</i></b>—Configure the lower range of the watermark or checkpoint value as a percentage for which the resource type configured needs to be monitored. When the low threshold value is exceeded, error log messages are generated.<br/><b>Range:</b> 1 through 100</p> <p><b>high-watermark <i>number</i></b>—Configure the higher range of the watermark or checkpoint value as a percentage for which the resource type configured needs to be monitored. When the high threshold value is exceeded, error log messages are generated.<br/><b>Range:</b> 1 through 100</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 15.1 for MX80, MX104, MX240, MX480, MX960, MX2010, and MX2020 routers.

**Description** Configure the properties for evaluating and tracking the utilization of memory resources, such as ukern memory (heap), next-hop memory, and firewall or filter memory. You can define the characteristics to control the generation of system logging error messages, based on the watermark or checkpoint values that are exceeded for the different memory regions or blocks. Also, you can specify the resource category that you want to monitor and analyze for ensuring system stability, especially the health and operating efficiency of I-chip-based line cards and Trio-based FPCs on MX Series routers.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## tracoptions (Resource Monitor)

---

| Release Information      | Statement introduced in Junos OS Release 15.1 for MX80, MX104, MX240, MX480, MX960, MX2010, and MX2020 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description              | Define tracing operations for the memory resource utilization processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Options                  | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <code>/var/log</code>.<br/><b>Default:</b> <code>rmopd</code></p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.<br/><b>Range:</b> 2 through 1000<br/><b>Default:</b> 3 files</p> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.<br/><b>Range:</b> 10 KB through 1 GB<br/><b>Default:</b> 128 KB</p> <p><b>world-readable</b>—(Optional) Enable unrestricted file access.</p> <p><b>no-world-readable</b>—(Default) Disable unrestricted file access. This means the log file can be accessed only by the user who configured the tracing operation.</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations.</li></ul> |
| Required Privilege Level | <p><b>trace</b>—To view this statement in the configuration.</p> <p><b>trace-control</b>—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

```

**Hierarchy Level** [edit snmp]

**Release Information** Statement introduced in Junos OS Release 14.1.

**Description** Configure the alarm management system to monitor and report active alarms as well as the history of alarms through the SNMP MIB tables supported by the *Alarm MIB*.

**NOTE:** You cannot configure alarms without notifications. It is mandatory to include the notification identifier in the configuration.

The remaining statements are explained separately.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.</p> <p>The SNMP client application specifies an SNMP community name in <b>Get</b>, <b>GetBulk</b>, <b>GetNext</b>, and <b>Set</b> SNMP requests.</p> |
| <b>Default</b>                  | If you omit the <b>community</b> statement, all SNMP requests are denied.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <p><b>community-name</b>—Community string. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                   |
| <b>Required Privilege Level</b> | <p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>         | Configure a device to act as a proxy SNMP agent, and specify a name for the proxy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>context <i>context-name</i></b>—Specify the SNMPv3 context name as configured on the device specified at <b>edit snmp proxy <i>proxy-name</i> device-name <i>device-name</i></b>. For more information about this statement, see <a href="#">context</a>.</p> <p><b>device-name <i>device-name</i></b>—Specify the name of the device to be managed through the proxy SNMP agent.</p> <p><b>no-default-comm-to-v3-config</b>—(Optional) Specify whether you have to manually configure the statements at the <b>[edit snmp v3 snmp-community <i>community-name</i>]</b> and <b>[edit snmp v3 vacm]</b> hierarchy levels. If this statement is not included in the configuration, the <b>[edit snmp v3 snmp-community <i>community-name</i>]</b> and <b>[edit snmp v3 vacm]</b> hierarchy level configurations are automatically initialized.</p> <p><b><i>proxy-name</i></b>—Specify the name of the proxy.</p> <p><b>security-name <i>security-name</i></b>—Specify the SNMPv3 security name as configured on the device specified at <b>edit snmp proxy <i>proxy-name</i> device-name <i>device-name</i></b>. For more information about this statement, see <a href="#">security-name</a>.</p> <p><b>snmp-community <i>community-name</i></b>—Specify the name of the SNMP community. The community name you configure should match the <b>snmp-community</b> configuration on the device specified at <b>edit snmp proxy <i>proxy-name</i> device-name <i>device-name</i></b>. For more information about this statement, see <a href="#">snmp-community</a>.</p> <p><b>(version-v1   version-v2c)</b>—Specify the SNMP version, and add the relevant configuration.</p> |

**version-v3**—Add the SNMPv3 configuration.

The remaining statements are explained separately.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Set the source address of every SNMP trap packet sent by this router to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.                                                                                                                                                                                                 |
| <b>Options</b>                  | <b><i>address</i></b> —Source address of SNMP traps. You can configure the source address of trap packets two ways: <b>lo0</b> or a valid IPv4 address configured on one of the router interfaces. The value <b>lo0</b> indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface <b>lo0</b> .<br><b>Default:</b> Disabled. (The source address is the address of the outgoing interface.) |
| <b>Required Privilege Level</b> | <b>snmp</b> —To view this statement in the configuration.<br><b>snmp-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>         | <p>The output of the tracing operations is placed into log files in the <b>/var/log</b> directory. Each log file is named after the SNMP agent that generates it. Currently, the following logs are created in the <b>/var/log</b> directory when the <b>tracoptions</b> statement is used:</p> <ul style="list-style-type: none"> <li>• chassisd</li> <li>• craftd</li> <li>• ilmids</li> <li>• mib2d</li> <li>• rmopd</li> <li>• serviced</li> <li>• snmpd</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—By default, the name of the log file that records trace output is the name of the process being traced (for example, <b>mib2d</b> or <b>snmpd</b>). Use this option to specify another name.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, <b>snmpd</b>) reaches its maximum size, it is archived by being renamed to <b>snmpd.0</b>. The previous <b>snmpd.1</b> is renamed to <b>snmpd.2</b>, and so on. The oldest archived file is deleted.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 10 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Log all SNMP events.</li> <li>• <b>general</b>—Log general events.</li> </ul> |

- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **subagent**—Log subagent restarts.
- **timer**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**size *size***—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

**Range:** 10 KB through 1 GB

**Default:** 1000 KB

**world-readable | no-world-readable**—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

| Description                                                                                                                                                                                                                                     | Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The <b>view</b> statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the <b>view</b> statement at the <b>[edit snmp community <i>community-name</i>]</b> hierarchy level. |
| <div> <b>NOTE:</b> To remove an OID completely, use the <code>delete view all oid oid-number</code> command but omit the <code>include</code> parameter.</div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | The local engine ID is defined as the administratively unique identifier of an SNMPv3 engine, and is used for identification, not for addressing. There are two parts of an engine ID: prefix and suffix. The prefix is formatted according to the specifications defined in RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i> . You can configure the suffix here. |
| <div>  <p><b>NOTE:</b> SNMPv3 authentication and encryption keys are generated based on the associated passwords and the engine ID. If you configure or change the engine ID, you must commit the new engine ID before you configure SNMPv3 users. Otherwise the keys generated from the configured passwords are based on the previous engine ID.</p> <p>For the engine ID, we recommend using the MAC address of the management port.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## group (Configuring Group Name)

```
Syntax group group-name {
 (default-context-prefix | context-prefix context-prefix){
 security-model (any | usm | v1 | v2c) {
 security-level (authentication | none | privacy) {
 notify-view view-name;
 read-view view-name;
 write-view view-name;
 }
 }
 }
}
```

**Hierarchy Level** [edit snmp v3 vacm access]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The **default-context-prefix** statement, when included, adds all the contexts configured on the device to the group, whereas the **context-prefix context-prefix** statement enables you to specify a context and to add that particular context to the group.

(Not applicable to the QFX Series and OCX Series.) When the context prefix is specified as default (for example, **context-prefix default**), the context associated with the master routing instance is added to the group. To specify a routing instance that is part of a logical system, specify it as **logical system/routing instance**. For example, to specify routing instance ri1 in logical system ls1, include **context-prefix ls1/ri1**.

The remaining statements under this hierarchy are explained separately.

**Options** *group-name*—SNMPv3 group name created for the SNMPv3 group.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

**Hierarchy Level** [edit snmp v3 [usm](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure local engine information for the user-based security model (USM).  
  
The remaining statements are explained separately.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the remote engine information for the user-based security model (USM). To send inform messages to an SNMPv3 user on a remote device, you must configure the engine identifier for the SNMP agent on the remote device where the user resides.                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b><i>engine-id</i></b>—Specify engine identifier in hexadecimal format. Used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                           |
| <b>Required Privilege Level</b> | <p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## target-parameters

**Syntax** At the `[edit snmp v3]` hierarchy level:

```
target-parameters target-parameters-name {
 profile-name;
 parameters {
 message-processing-model (v1 | v2c | V3);
 security-level (authentication | none | privacy);
 security-model (usm | v1 | v2c);
 security-name security-name;
 }
}
```

At the `[edit snmp v3 target-address target-address-name]` hierarchy level:

```
target-parameters target-parameters-name;
```

**Hierarchy Level** `[edit snmp v3]`  
`[edit snmp v3 target-address target-address-name]`

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the `[edit snmp v3]` hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the `[edit snmp v3 target-parameters target-parameters-name]` hierarchy level to the target address configuration at the `[edit snmp v3]` hierarchy level.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

## CHAPTER 101

# Operational Commands

- clear chassis cluster ip-monitoring failure-count
- clear chassis cluster ip-monitoring failure-count ip-address
- clear ilmi statistics
- clear snmp history
- clear snmp statistics
- request pppoe connect
- request pppoe disconnect
- request services ip-monitoring preempt-restore policy
- request snmp spoof-trap
- show chassis alarms
- show chassis cluster ip-monitoring status redundancy-group
- show interfaces (SRX Series)
- show interfaces snmp-index
- show interfaces summary
- show ilmi statistics
- show security alarms
- show security datapath-debug capture
- show security datapath-debug counter
- show security monitoring
- show security monitoring fpc fpc-number
- show security monitoring performance session
- show security monitoring performance spu
- show services ip-monitoring status
- show snmp health-monitor
- show snmp inform-statistics
- show snmp mib
- show snmp rmon
- show snmp statistics

- [show snmp stats-response-statistics](#)
- [show snmp v3](#)
- [show system alarms](#)
- [show system resource-monitor fpc](#)

## clear chassis cluster ip-monitoring failure-count

---

|                                 |                                                                                                                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | clear chassis cluster ip-monitoring failure-count                                                                                                                                                                       |
| <b>Release Information</b>      | Command introduced in Junos OS Release 10.1.                                                                                                                                                                            |
| <b>Description</b>              | Clear the failure count for all IP addresses.                                                                                                                                                                           |
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                                                   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">clear chassis cluster ip-monitoring failure-count</a></li><li>• <a href="#">clear chassis cluster ip-monitoring failure-count ip-address on page 2118</a></li></ul> |
| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request.                                                                                                                                   |

### Sample Output

```
user@host> clear chassis cluster ip-monitoring failure-count
node0:

Cleared failure count for all IPs

node1:

Cleared failure count for all IPs
```

## clear chassis cluster ip-monitoring failure-count ip-address

---

|                            |                                                                      |
|----------------------------|----------------------------------------------------------------------|
| <b>Syntax</b>              | clear chassis cluster ip-monitoring failure-count ip-address 1.1.1.1 |
| <b>Release Information</b> | Command introduced in Junos OS Release 10.1.                         |
| <b>Description</b>         | Clear the failure count for a specified IP address.                  |

**NOTE:** Entering an IP address at the end of this command is optional. If you do not specify an IP address, the failure count for all monitored IP addresses is cleared.

|                                 |                                                                                                                                                                                        |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>clear chassis cluster failover-count</i></li><li>• <a href="#">clear chassis cluster ip-monitoring failure-count on page 2117</a></li></ul> |
| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request.                                                                                                  |

### Sample Output

```
user@host> clear chassis cluster ip-monitoring failure-count ip-address 1.1.1.1
node0:

Cleared failure count for IP: 1.1.1.1

node1:

Cleared failure count for IP: 1.1.1.1
```

## clear ilmi statistics

---

|                                 |                                                                                                     |
|---------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | clear ilmi statistics                                                                               |
| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                     |
| <b>Description</b>              | Set Integrated Local Management Interface (ILMI) statistics to zero.                                |
| <b>Options</b>                  | This command has no options.                                                                        |
| <b>Required Privilege Level</b> | clear                                                                                               |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">show ilmi statistics on page 2171</a></li></ul> |
| <b>List of Sample Output</b>    | <a href="#">clear ilmi statistics on page 2119</a>                                                  |
| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request.               |

### Sample Output

#### clear ilmi statistics

```
user@host> clear ilmi statistics
```

## clear snmp history

---

|                                 |                                                                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | clear snmp history ( <i>index</i>   all)                                                                                                                                                 |
| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series. |
| <b>Description</b>              | Delete the history record of Simple Network Management Protocol (SNMP) samples of Ethernet statistics collected.                                                                         |
| <b>Options</b>                  | <b>all</b> —Clear all the entries in the history index.<br><br><b>index</b> —Clear the contents of the specified entry in the history index.                                             |
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                    |

## Sample Output

### clear snmp statistics

In the following example, SNMP statistics are displayed before and after the **clear snmp statistics** command is issued:

```

user@host> show snmp statistics
SNMP statistics:
 Input:
 Packets: 8, Bad versions: 0, Bad community names: 0,
 Bad community uses: 0, ASN parse errors: 0,
 Too bigs: 0, No such names: 0, Bad values: 0,
 Read onlys: 0, General errors: 0,
 Total request varbinds: 8, Total set varbinds: 0,
 Get requests: 0, Get nexts: 8, Set requests: 0,
 Get responses: 0, Traps: 0,
 Silent drops: 0, Proxy drops 0
 Output:
 Packets: 2298, Too bigs: 0, No such names: 0,
 Bad values: 0, General errors: 0,
 Get requests: 0, Get nexts: 0, Set requests: 0,
 Get responses: 8, Traps: 2290

user@host> clear snmp statistics

user@host> show snmp statistics
SNMP statistics:
 Input:
 Packets: 0, Bad versions: 0, Bad community names: 0,
 Bad community uses: 0, ASN parse errors: 0,
 Too bigs: 0, No such names: 0, Bad values: 0,
 Read onlys: 0, General errors: 0,

| <b>Release Information</b>      | Command introduced in Junos OS Release 11.1 for SRX Series devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Display information about the conditions that have been configured to trigger alarms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | This command has no options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Additional Information</b>   | <p>You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm is lit, it indicates that you are running the device in a manner that we do not recommend.</p> <p>On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.</p> <p>In Junos OS Release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 236: show chassis cluster ip-monitoring status Output Fields**

| Field Name               | Field Description                                                                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Redundancy-group</b>  | ID number (0 - 255) of a redundancy group in the cluster.                                                                                                                                                                                          |
| <b>Global threshold</b>  | Failover value for all IP addresses monitored by the redundancy group.                                                                                                                                                                             |
| <b>Current threshold</b> | Value equal to the global threshold minus the total weight of the unreachable IP address.                                                                                                                                                          |
| <b>IP Address</b>        | Monitored IP address in the redundancy group.                                                                                                                                                                                                      |
| <b>Status</b>            | <p>Current reachability state of the monitored IP address.</p> <p>Values for this field are: <b>reachable</b>, <b>unreachable</b>, and <b>unknown</b>. The status is “unknown” if Packet Forwarding Engines (PFEs) are not yet up and running.</p> |
| <b>Failure count</b>     | Number of attempts to reach an IP address.                                                                                                                                                                                                         |
| <b>Reason</b>            | Explanation for the reported status. See <a href="#">Table 237</a> .                                                                                                                                                                               |
| <b>Weight</b>            | Combined weight (0 - 255) assigned to all monitored IP addresses. A higher weight value indicates greater importance.                                                                                                                              |

Expanded reason output fields for unreachable IP addresses added in Junos OS Release 10.1. You might see any of the following reasons displayed.

**Table 237: show chassis cluster ip-monitoring status redundancy group Reason Fields**

| Reason                         | Reason Description                                                                                                                                               |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No route to host               | The router could not resolve the ARP, which is needed to send the ICMP packet to the host with the monitored IP address.                                         |
| No auxiliary IP found          | The redundant Ethernet interface does not have an auxiliary IP address configured.                                                                               |
| Reth child not up              | A child interface of a redundant Ethernet interface is down.                                                                                                     |
| redundancy-group state unknown | Unable to obtain the state (primary, secondary, secondary-hold, disable) of a redundancy-group.                                                                  |
| No reth child MAC address      | Could not extract the MAC address of the redundant Ethernet child interface.                                                                                     |
| Secondary link not monitored   | The secondary link might be down (the secondary child interface of a redundant Ethernet interface is either down or non-functional).                             |
| Unknown                        | The IP address has just been configured and the router still does not know the status of this IP.<br><br>or<br><br>Do not know the exact reason for the failure. |

## Sample Output

### show chassis cluster ip-monitoring status

```
user@host> show chassis cluster ip-monitoring status
node0:
```

```

Redundancy group: 1
Global threshold: 200
Current threshold: -120
```

| IP address  | Status    | Failure count | Reason | Weight |
|-------------|-----------|---------------|--------|--------|
| 10.254.5.44 | reachable | 0             | n/a    | 220    |
| 2.2.2.1     | reachable | 0             | n/a    | 100    |

```
node1:
```

```

Redundancy group: 1
Global threshold: 200
Current threshold: -120
```

| IP address  | Status    | Failure count | Reason | Weight |
|-------------|-----------|---------------|--------|--------|
| 10.254.5.44 | reachable | 0             | n/a    | 220    |
| 2.2.2.1     | reachable | 0             | n/a    | 100    |

## Sample Output

### show chassis cluster ip-monitoring status redundancy-group

```
user@host> show chassis cluster ip-monitoring status redundancy-group 1
node0:
```

-----

Redundancy group: 1

| IP address  | Status    | Failure count | Reason |
|-------------|-----------|---------------|--------|
| 10.254.5.44 | reachable | 0             | n/a    |
| 2.2.2.1     | reachable | 0             | n/a    |
| 1.1.1.5     | reachable | 0             | n/a    |
| 1.1.1.4     | reachable | 0             | n/a    |
| 1.1.1.1     | reachable | 0             | n/a    |

node1:

-----

Redundancy group: 1

| IP address  | Status    | Failure count | Reason |
|-------------|-----------|---------------|--------|
| 10.254.5.44 | reachable | 0             | n/a    |
| 2.2.2.1     | reachable | 0             | n/a    |
| 1.1.1.5     | reachable | 0             | n/a    |
| 1.1.1.4     | reachable | 0             | n/a    |
| 1.1.1.1     | reachable | 0             | n/a    |

## show interfaces (SRX Series)

**Syntax** show interfaces {  
 <brief | detail | extensive | terse>  
 controller *interface-name*  
 descriptions *interface-name*  
 destination-class (all | *destination-class-name logical-interface-name*)  
 diagnostics optics *interface-name*  
 far-end-interval *interface-fpc/pic/port*  
 filters *interface-name*  
 flow-statistics *interface-name*  
 interval *interface-name*  
 load-balancing (detail | *interface-name*)  
 mac-database mac-address *mac-address*  
 mc-ae id *identifier* unit *number* revertive-info  
 media *interface-name*  
 policers *interface-name*  
 queue both-ingress-egress egress forwarding-class *forwarding-class* ingress l2-statistics  
 redundancy (detail | *interface-name*)  
 routing brief detail summary *interface-name*  
 routing-instance (all | *instance-name*)  
 snmp-index *snmp-index*  
 source-class (all | *destination-class-name logical-interface-name*)  
 statistics *interface-name*  
 switch-port *switch-port number*  
 transport pm (all | optics | otn) (all | current | currentday | interval | previousday) (all |  
   *interface-name*)  
 zone *interface-name*  
 }

**Release Information** Command modified in Junos OS Release 9.5.

**Description** Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

On SRX Series appliance, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

- Options**
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
    - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
    - **ce1-*pim*/0/ *port***—Channelized E1 interface.
    - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
    - **ct1-*pim*/0/*port***—Channelized T1 interface.
    - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
    - **e1-*pim*/0/*port***—E1 interface.
    - **e3-*pim*/0/*port***—E3 interface.

- **fe-pim/0/port**—Fast Ethernet interface.
- **ge-pim/0/port**—Gigabit Ethernet interface.
- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
  
- **brief | detail | extensive | terse**—(Optional) Display the specified level of output.
- **controller**—(Optional) Show controller information.
- **descriptions**—(Optional) Display interface description strings.
- **destination-class**—(Optional) Show statistics for destination class.
- **diagnostics**—(Optional) Show interface diagnostics information.
- **far-end-interval**—(Optional) Show far end interval statistics.
- **filters**—(Optional) Show interface filters information.
- **flow-statistics**—(Optional) Show security flow counters and errors.
- **interval**—(Optional) Show interval statistics.
- **load-balancing**—(Optional) Show load-balancing status.
- **mac-database**—(Optional) Show media access control database information.
- **mc-ae**—(Optional) Show MC-AE configured interface information.
- **media**—(Optional) Display media information.
- **policers**—(Optional) Show interface policers information.
- **queue**—(Optional) Show queue statistics for this interface.
- **redundancy**—(Optional) Show redundancy status.
- **routing**—(Optional) Show routing status.
- **routing-instance**—(Optional) Name of routing instance.
- **snmp-index**—(Optional) SNMP index of interface.
- **source-class**—(Optional) Show statistics for source class.
- **statistics**—(Optional) Display statistics and detailed output.
- **switch-port**—(Optional) Front end port number (0..15).
- **transport**—(Optional) Show interface transport information.
- **zone**—(Optional) Interface's zone.

| <p><b>Output Fields</b></p>         | <p>Table 238 lists the output fields for the <b>show interfaces</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 238: show interfaces Output Fields

| Field Name                | Field Description                                                                                                                                                                                                                                   | Level of Output              |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                                                                                                                     |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                                                                                                                     | All levels                   |
| <b>Enabled</b>            | State of the interface.                                                                                                                                                                                                                             | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                                                                                                                                 | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                                                                                                                       | <b>detail extensive none</b> |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                                                                                                                                 | All levels                   |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                   | <b>detail extensive</b>      |
| <b>MTU</b>                | Maximum transmission unit size on the physical interface.                                                                                                                                                                                           | All levels                   |
| <b>Link mode</b>          | Link mode: Full-duplex or Half-duplex.                                                                                                                                                                                                              |                              |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                                                                                                                                            | All levels                   |
| <b>BPDU error</b>         | Bridge protocol data unit (BPDU) error: Detected or None                                                                                                                                                                                            |                              |
| <b>Loopback</b>           | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                                                                                                                      | All levels                   |
| <b>Source filtering</b>   | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                        | All levels                   |
| <b>Flow control</b>       | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                            | All levels                   |
| <b>Auto-negotiation</b>   | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                           | All levels                   |
| <b>Remote-fault</b>       | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul> | All levels                   |
| <b>Device flags</b>       | Information about the physical device.                                                                                                                                                                                                              | All levels                   |
| <b>Interface flags</b>    | Information about the interface.                                                                                                                                                                                                                    | All levels                   |

Table 238: show interfaces Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output              |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Last flapped</b>                     | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                          | <b>detail extensive none</b> |
| <b>Input Rate</b>                       | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                                                                                                                                                                                                                                                             | None                         |
| <b>Output Rate</b>                      | Output rate in bps and pps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | None                         |
| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul> | <b>detail extensive none</b> |
| <b>Statistics last cleared</b>          | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b>      |
| <b>Traffic statistics</b>               | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                  | <b>detail extensive</b>      |

Table 238: show interfaces Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output  |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b>  | <p>Input errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>                                                                                                                                                    | <b>extensive</b> |
| <b>Output errors</b> | <p>Output errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 238: show interfaces Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Ingress queues</b>                  | Total number of ingress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>extensive</b>        |
| <b>Queue counters and queue number</b> | CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>MAC statistics</b>                  | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> <li>• Packet length exceeds 1518 octets, or</li> <li>• Packet length exceeds MRU</li> </ul> </li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b>        |

Table 238: show interfaces Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Filter statistics                      | <p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul> | extensive       |
| Autonegotiation information            | <p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | extensive       |

| <b>Transit statistics</b>                             | Number and rate of bytes and packets transiting the switch.<br><br><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler. | <b>extensive</b>             |

## Sample Output

### show interfaces Gigabit Ethernet

```
user@host> show interfaces ge-0/0/1
```

```

Physical interface: ge-0/0/1, Enabled, Physical link is Down
 Interface index: 135, SNMP ifIndex: 510
 Link-level type: Ethernet, MTU: 1514, Link-mode: Full-duplex, Speed: 1000mbps,

 BPDU Error: None, MAC-REWRITE Error: None, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
 Remote fault: Online
 Device flags : Present Running Down
 Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
 Link flags : None
 CoS queues : 8 supported, 8 maximum usable queues
 Current address: 00:1f:12:e4:b1:01, Hardware address: 00:1f:12:e4:b1:01
 Last flapped : 2015-05-12 08:36:59 UTC (1w1d 22:42 ago)
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)
 Active alarms : LINK
 Active defects : LINK
 Interface transmit statistics: Disabled

Logical interface ge-0/0/1.0 (Index 71) (SNMP ifIndex 514)
 Flags: Device-Down SNMP-Traps 0x0 Encapsulation: ENET2
 Input packets : 0
 Output packets: 0
 Security: Zone: public
 Protocol inet, MTU: 1500
 Flags: Sendbroadcast-pkt-to-re
 Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
 Destination: 1.1.1/24, Local: 1.1.1.1, Broadcast: 1.1.1.255

```

## Sample Output

### show interfaces brief (Gigabit Ethernet)

```

user@host> show interfaces ge-3/0/2 brief
Physical interface: ge-3/0/2, Enabled, Physical link is Up
 Link-level type: 52, MTU: 1522, Speed: 1000mbps, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
 Remote fault: Online
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Link flags : None

Logical interface ge-3/0/2.0
 Flags: SNMP-Traps 0x4000
 VLAN-Tag [0x8100.512 0x8100.513] In(pop-swap 0x8100.530) Out(swap-push
 0x8100.512 0x8100.513)
 Encapsulation: VLAN-CCC
 ccc

Logical interface ge-3/0/2.32767
 Flags: SNMP-Traps 0x4000 VLAN-Tag [0x0000.0] Encapsulation: ENET2

```

## Sample Output

### show interfaces detail (Gigabit Ethernet)

```

user@host> show interfaces ge-0/0/1 detail
Physical interface: ge-0/0/1, Enabled, Physical link is Down
 Interface index: 135, SNMP ifIndex: 510, Generation: 138
 Link-level type: Ethernet, MTU: 1514, Link-mode: Full-duplex, Speed: 1000mbps,
 BPDU Error: None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering:

```

```

### show interfaces mac-database mac-address

```

user@host> show interfaces mac-database xe-0/3/3 mac-address 00:00:c8:01:01:09
Physical interface: xe-0/3/3, Enabled, Physical link is Up
 Interface index: 372, SNMP ifIndex: 788
 Link-level type: Ethernet, MTU: 1514, LAN-PHY mode, Speed: 10Gbps, Loopback:
None, Source filtering: Disabled, Flow control: Enabled
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Link flags : None

 Logical interface xe-0/3/3.0 (Index 364) (SNMP ifIndex 829)
 Flags: SNMP-Traps 0x4004000 Encapsulation: ENET2
 MAC address: 00:00:c8:01:01:09, Type: Configured,
 Input bytes : 202324652
 Output bytes : 202324560
 Input frames : 4398362
 Output frames : 4398360
 Policer statistics:
 Policer type Discarded frames Discarded bytes
 Output aggregate 3992386 183649756

```

## Sample Output

### show interfaces mc-ae

```

user@host> show interfaces mc-ae ae0 unit 512
Member Links : ae0
Local Status : active
Peer Status : active
Logical Interface : ae0.512
Core Facing Interface : Label Ethernet Interface
ICL-PL : Label Ethernet Interface

```

### show interfaces media (SONET/SDH)

The following example displays the output fields unique to the **show interfaces media** command for a SONET interface (with no level of output specified):

```

user@host> show interfaces media so-4/1/2
Physical interface: so-4/1/2, Enabled, Physical link is Up
 Interface index: 168, SNMP ifIndex: 495
 Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC48,
Loopback: None, FCS: 16, Payload scrambler: Enabled
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps 16384
 Link flags : Keepalives
 Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
 Keepalive: Input: 1783 (00:00:00 ago), Output: 1786 (00:00:08 ago)
 LCP state: Opened

```

```

NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
mpls: Not-configured
CHAP state: Not-configured
CoS queues : 8 supported
Last flapped : 2005-06-15 12:14:59 PDT (04:31:29 ago)
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)
SONET alarms : None
SONET defects : None
SONET errors:
 BIP-B1: 121, BIP-B2: 916, REI-L: 0, BIP-B3: 137, REI-P: 16747, BIP-BIP2: 0
Received path trace: routerb so-1/1/2
Transmitted path trace: routera so-4/1/2

```

## Sample Output

## Sample Output

### show interfaces queue

The following truncated example shows the CoS queue sizes for queues 0, 1, and 3. Queue 1 has a queue buffer size (guaranteed allocated memory) of 9192 bytes.

```

user@host> show interfaces queue
Physical interface: ge-0/0/0, Enabled, Physical link is Up
 Interface index: 134, SNMP ifIndex: 509
Forwarding classes: 8 supported, 8 in use
Egress queues: 8 supported, 8 in use
Queue: 0, Forwarding classes: class0
 Queued:
 Packets : 0 0 pps
 Bytes : 0 0 bps

```

```

Transmitted:
 Packets : 0 0 pps
 Bytes : 0 0 bps
 Tail-dropped packets : 0 0 pps
 RL-dropped packets : 0 0 pps
 RL-dropped bytes : 0 0 bps
 RED-dropped packets : 0 0 pps
 Low : 0 0 pps
 Medium-low : 0 0 pps
 Medium-high : 0 0 pps
 High : 0 0 pps
 RED-dropped bytes : 0 0 bps
 Low : 0 0 bps
 Medium-low : 0 0 bps
 Medium-high : 0 0 bps
 High : 0 0 bps
Queue Buffer Usage:
 Reserved buffer : 118750000 bytes
 Queue-depth bytes :
 Current : 0
..
..

## Sample Output

### show security zones

```

user@host> show security zones
Functional zone: management
 Description: This is the management zone.
 Policy configurable: No
 Interfaces bound: 1
 Interfaces:
 ge-0/0/0.0
Security zone: Host
 Description: This is the host zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 fxp0.0
Security zone: abc
 Description: This is the abc zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes
 Interfaces bound: 1
 Interfaces:
 ge-0/0/1.0
Security zone: def
 Description: This is the def zone.
 Send reset for non-SYN session TCP packets: Off
 Policy configurable: Yes

```

```
Interfaces bound: 1
Interfaces:

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>show interfaces snmp-index <i>snmp-index</i></code>                                                                                                                                                                                                                  |
| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                                                                                                                                                                                            |
| <b>Description</b>              | Display information for the interface with the specified SNMP index.                                                                                                                                                                                                       |
| <b>Options</b>                  | This command has no options.                                                                                                                                                                                                                                               |
| <b>Additional Information</b>   | Output from both the <code>show interfaces <i>interface-name</i> detail</code> and the <code>show interfaces <i>interface-name</i> extensive</code> command includes all the information displayed in the output from the <code>show interfaces snmp-index</code> command. |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                       |
| <b>List of Sample Output</b>    | <a href="#">show interfaces snmp-index on page 2168</a>                                                                                                                                                                                                                    |
| <b>Output Fields</b>            | The output fields from the <code>show interfaces snmp-index <i>snmp-index</i></code> command are identical to those produced by the <code>show interfaces <i>interface-name</i></code> command. For a description of output fields, see the other chapters in this manual. |

## Sample Output

### show interfaces snmp-index

```
user@host> show interfaces snmp-index 33
Physical interface: so-2/1/1, Enabled, Physical link is Down
 Interface index: 149, SNMP ifIndex: 33
 Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: 0C48,
 Loopback: None, FCS: 16, Payload scrambler: Enabled
 Device flags : Present Running Down
 Interface flags: Hardware-Down Point-To-Point SNMP-Traps 16384
 Link flags : Keepalives
 CoS queues : 8 supported
 Last flapped : 2005-06-15 11:45:57 PDT (05:38:43 ago)
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)
 SONET alarms : LOL, PLL, LOS
 SONET defects : LOL, PLL, LOF, LOS, SEF, AIS-L, AIS-P
```

## show interfaces summary

|                                 |                                                                                                                                                               |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|

## show security alarms

---

**Syntax**    show security alarms  
              <detail>  
              <alarm-id *id-number*>  
              <alarm-type [ *types* ]>  
              <newer-than YYYY-MM-DD.HH:MM:SS>  
              <older-than YYYY-MM-DD.HH:MM:SS>  
              <process *process*>  
              <severity *severity*>

**Release Information**    Command introduced in Junos OS Release 11.2.

**Description**    Display the alarms that are active on the device. Run this command when the CLI prompt indicates that a security alarm has been raised, as shown here:

```
[1 SECURITY ALARM] user@host#
```

**Options**    **none**—Display all active alarms.

**detail**—(Optional) Display detailed output.

**alarm-id *id-number***—(Optional) Display the specified alarm.

**alarm-type [ *types* ]**—(Optional) Display the specified alarm type or a set of types.

You can specify one or more of the following alarm types:

- authentication
- cryptographic-self-test
- decryption-failures
- encryption-failures
- ike-phase1-failures
- ike-phase2-failures
- key-generation-self-test
- non-cryptographic-self-test
- policy
- replay-attacks

**newer-than YYYY-MM-DD.HH:MM:SS**—(Optional) Display active alarms that were raised after the specified date and time.

**older-than YYYY-MM-DD.HH:MM:SS**—(Optional) Display active alarms that were raised before the specified date and time.

**process *process***—(Optional) Display active alarms that were raised by the specified system process.

**severity severity**—(Optional) Display active alarms of the specified severity.

You can specify the following severity levels:

- **alert**
- **crit**
- **debug**
- **emerg**
- **err**
- **info**
- **notice**
- **warning**

**Required Privilege Level** security—To view this statement in the configuration.

**List of Sample Output**

[show security alarms on page 2176](#)  
[show security alarms detail on page 2176](#)  
[show security alarms alarm-id on page 2176](#)  
[show security alarms alarm-type authentication on page 2176](#)  
[show security alarms newer-than <time> on page 2177](#)  
[show security alarms older-than <time> on page 2177](#)  
[show security alarms process <process> on page 2177](#)  
[show security alarms severity <severity> on page 2177](#)

**Output Fields** [Table 241](#) lists the output fields for the **show security alarms** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the **detail** keyword is used.

**Table 241: show security alarms**

| Field Name        | Field Description                                                                                        | Level of Output |
|-------------------|----------------------------------------------------------------------------------------------------------|-----------------|
| <b>ID</b>         | Identification number of the alarm.                                                                      | All levels      |
| <b>Alarm time</b> | Date and time the alarm was raised..                                                                     | All levels      |
| <b>Message</b>    | Information about the alarm, including the alarm type, username, IP address, and port number.            | All levels      |
| <b>Process</b>    | System process (For example, login or sshd) and process identification number associated with the alarm. | <b>detail</b>   |

Table 241: show security alarms (*continued*)

| Field Name | Field Description            | Level of Output |
|------------|------------------------------|-----------------|
| Severity   | Severity level of the alarm. | detail          |

## Sample Output

### show security alarms

```
[3 SECURITY ALARMS] user@router> show security alarms
```

```

ID Alarm time Message
1 2010-01-19 13:41:36 PST SSHD_LOGIN_FAILED_LIMIT: Specified number of login
failures (1) for user 'user' reached from '203.0.113.2'
2 2010-01-19 13:41:52 PST SSHD_LOGIN_FAILED_LIMIT: Specified number of login
failures (1) for user 'user' reached from '203.0.113.2'
3 2010-01-19 13:42:13 PST SSHD_LOGIN_FAILED_LIMIT: Specified number of login
failures (1) for user 'user' reached from '203.0.113.2'
```

### show security alarms detail

```
[3 SECURITY ALARMS] user@router> show security alarms detail
```

```

Alarm ID : 1
Alarm Type : authentication
Time : 2010-01-19 13:41:36 PST
Message : SSHD_LOGIN_FAILED_LIMIT: Specified number of login failures (1) for
user 'user' reached from '203.0.113.2'
Process : sshd (pid 1414)
Severity : notice

Alarm ID : 2
Alarm Type : authentication
Time : 2010-01-19 13:41:52 PST
Message : SSHD_LOGIN_FAILED_LIMIT: Specified number of login failures (1) for
user 'user' reached from '203.0.113.2'
Process : sshd (pid 1414)
Severity : notice

Alarm ID : 3
Alarm Type : authentication
Time : 2010-01-19 13:42:13 PST
Message : SSHD_LOGIN_FAILED_LIMIT: Specified number of login failures (1) for
user 'user' reached from '203.0.113.2'
Process : sshd (pid 1414)
Severity : notice
```

### show security alarms alarm-id

```
[3 SECURITY ALARMS] user@router> show security alarms alarm-id 1
```

```

ID Alarm time Message
1 2010-01-19 13:41:36 PST SSHD_LOGIN_FAILED_LIMIT: Specified number of login
failures (1) for user 'user' reached from '203.0.113.2'
```

### show security alarms alarm-type authentication

```
[3 SECURITY ALARMS] user@router> show security alarms alarm-type authentication
```

| <b>Output Fields</b>            | <a href="#">Table 242</a> lists the output fields for the <b>show security monitoring fpc <i>fpc-number</i></b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 242: show security monitoring fpc fpc-number Output Fields**

| Field Name             | Field Description                                                                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FPC                    | Slot number in which the FPC is installed.                                                                                                                       |
| PIC                    | Slot number in which the PIC is installed.                                                                                                                       |
| CPU Utilization (%)    | Total percentage of CPU being used by the PIC's processors.                                                                                                      |
| Memory Utilization (%) | Percentage of heap space (dynamic memory) being used by the PIC's processor. If this number exceeds 80 percent, there might be a software problem (memory leak). |

Table 242: show security monitoring fpc fpc-number Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Current flow session</b>   | The current number of flow sessions. When SRX Series devices operate in packet mode, flow sessions will not be created and this field will remain zero. |
| <b>Max flow session</b>       | The maximum number of flow sessions allowed. This number will differ from one device to another.                                                        |
| <b>SPU current cp session</b> | The current number of cp sessions for the SPU (on SRX5600, and SRX5800 devices only).                                                                   |
| <b>SPU max cp session</b>     | The maximum number of cp sessions allowed for the SPU (on SRX5600, and SRX5800 devices only).                                                           |

## Sample Output

### show security monitoring fpc 0

```

user@host> show security monitoring fpc 0
FPC 0
 PIC 0
 CPU utilization : 0 %
 Memory utilization : 82 %
 Current flow session : 0
 Max flow session : 0
 Current CP session : 0
 Max CP session : 12000000
 Session Creation Per Second (for last 96 seconds on average): 0
 PIC 1
 CPU utilization : 0 %
 Memory utilization : 54 %
 Current flow session : 0
 Max flow session : 819200
 Current CP session : 0
 Max CP session : 0
 Session Creation Per Second (for last 96 seconds on average): 0

```

## Sample Output

### show security monitoring fpc 1

```

user@host> show security monitoring fpc 1
FPC 1
 PIC 0
 CPU utilization : 0 %
 Memory utilization : 21 %
 Current flow session : 0
 Max flow session : 524288
 Current CP session : 0
 Max CP session : 1048576
 Session Creation Per Second (for last 96 seconds on average): 0

```

## Sample Output

### show security monitoring fpc 8

```
user@host> show security monitoring fpc 5
FPC 5
 PIC 0
 CPU utilization : 0 %
 Memory utilization : 64 %
 Current flow session : 0
 Max flow session : 524288
 Current CP session : 0
 Max CP session : 2359296
 Session Creation Per Second (for last 96 seconds on average): 0
 PIC 1
 CPU utilization : 0 %
 Memory utilization : 65 %
 Current flow session : 0
 Max flow session : 1048576
 Current CP session : 0
 Max CP session : 0
 Session Creation Per Second (for last 96 seconds on average): 0
```

## show security monitoring performance session

**Syntax** show security monitoring performance session

<fpc slot-number>

<pic slot-number>

**Release Information** Command introduced in Junos OS Release of 10.2.

**Description** Display the current session (total number of sessions at that time) for the last 60 seconds.

- Options**
- **fpc slot-number** — Display information about the FPC slot. Use this option to filter the output based on the slot number.
  - **pic slot-number** — Display information about existing PIMs or Mini-PIMs in a particular PIC slot. Use this option to filter the output based on PIC slot.

**NOTE:** The `fpc slot-number` and `pic slot-number` options are not available on SRX300, SRX320, and SRX340 devices.

**Required Privilege Level** View

## show security monitoring performance spu

**Syntax** show security monitoring performance spu

<fpc slot-number>

<pic slot-number>

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Display the services processing unit (SPU) percent utilization for all FPC slots over the last 60 seconds. Use this command to track the percent utilization statistics per second for the past 60 seconds for each FPC slot and PIC.

- Options**
- **fpc slot-number** — Display information about the FPC slot. Use this option to filter the output based on the slot number.
  - **pic slot-number** — Display information about existing PIMs or Mini-PIMs in a particular PIC slot. Use this option to filter the output based on PIC slot.

**NOTE:** The **fpc slot-number** and **pic slot-number** options are not available on SRX300, SRX320, or SRX340 devices or on vSRX instances.

|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Policy</b>           | Name of the policy configured.                                                                                                |
| <b>Probe Name</b>       | Name of the probe configured.                                                                                                 |
| <b>Address</b>          | Displays the configured target address.                                                                                       |
| <b>Status</b>           | Displays the status of the probe on the target address. If the status is PASS, then the target address is reached.            |
| <b>Route-Action</b>     | Displays route injection information configured for the policy and its failover status.                                       |
| <b>Route-Instance</b>   | Displays the routing instance of the route to be injected during failover.                                                    |
| <b>Route</b>            | Routing address of the route to be injected during failover.                                                                  |
| <b>Next-Hop</b>         | Specifies the next-hop address of the route to be injected during failover. P2P interfaces only.                              |
| <b>State</b>            | Display the state of the route injection action. If the state is APPLIED, then the ip-monitoring policy is in failover state. |
| <b>Interface Action</b> | Displays the interface action type as enable or disable.                                                                      |

Table 243: show services ip-monitoring status Output Fields (*continued*)

| Field Name    | Field Description                                     |
|---------------|-------------------------------------------------------|
| Policy Action | Displays the policy action type as enable or disable. |
| Admin State   | Displays the current admin state of the interface.    |
| Action Status | Displays the current action status of the interface.  |

## Sample Output

### show services ip-monitoring status

```

user@host> show services ip-monitoring status

Policy - policy1 (Non-preemptive. Status: FAIL)
RPM Probes:
 Probe name Test Name Address Status

 probe_a a1 15.1.1.10 FAIL
 probe_a a2 200.1.1.1 FAIL
Route-Action:
 route-instance route next-hop State

 inet.0 200.1.1.0 150.1.1.1 APPLIED
Interface-Action:
 interface policy action admin state action status

 fe-0/0/5.2 Enable UP FAILOVER
 fe-0/0/5.4 Disable DOWN FAILOVER
 t1-1/0/0 Enable UP FAILOVER
 d10 Enable UP FAILOVER
 ge-0/0/1 Enable UP FAILOVER

```

## Sample Output

### show services ip-monitoring status

In this example, the policy is in the failback state, and the no-preempt option is not configured.

```

user@host> show services ip-monitoring status

Policy - policy1 (Status: PASS)
RPM Probes:
 Probe name Test Name Address Status

 probe1 a1 99.1.1.2 PASS
Route-Action:
 route-instance route next-hop state

 inet.0 99.1.1.0 12.12.12.2 NOT-APPLIED
Interface-Action:
 interface policy action admin state action status

```

|            |        |      |             |
|------------|--------|------|-------------|
| at-2/0/0   | Enable | DOWN | MARKED-DOWN |
| ge-0/0/2.2 | Enable | DOWN | MARKED-DOWN |
| ge-0/0/2.3 | Enable | DOWN | MARKED-DOWN |

## Sample Output

### show services ip-monitoring status

In this example, the policy is in the failover state, and the primary is restored. The no-preempt option is configured.

```
user@host> show services ip-monitoring status
```

Policy - policy1 (Non-preemptive. Status: FAILOVER-NO-PREEMPT)

RPM Probes:

| Probe name | Test Name | Address  | Status |
|------------|-----------|----------|--------|
| probe1     | a1        | 99.1.1.2 | PASS   |

Route-Action:

| route-instance | route    | next-hop   | state   |
|----------------|----------|------------|---------|
| inet.0         | 99.1.1.0 | 12.12.12.2 | APPLIED |

Interface-Action:

| interface  | policy action | admin state | action status |
|------------|---------------|-------------|---------------|
| at-2/0/0   | Enable        | UP          | FAILOVER      |
| ge-0/0/2.2 | Enable        | UP          | FAILOVER      |
| ge-0/0/2.3 | Enable        | UP          | FAILOVER      |

## Sample Output

### show services ip-monitoring status

When the probe succeeds and the policy is not applied, the output is as follows:

```
user@host> show services ip-monitoring status
```

Policy payment (Status: PASS)

RPM Probes:

| Probe name           | Test Name | Address | Status |
|----------------------|-----------|---------|--------|
| Probe-Payment-Server | paysvr    | 9.9.9.2 | PASS   |

Route-Action:

| route-instance | route      | next-hop   | state       |
|----------------|------------|------------|-------------|
| inet.0         | 9.9.9.0/24 | e1-6/0/0.0 | NOT-APPLIED |

## Sample Output

### show services ip-monitoring status

When the probe fails and the policy is applied, the output is as follows:

```
user@host> show services ip-monitoring status
```

Policy payment (Status: FAIL)

RPM Probes:

| Probe name           | Test Name | Address | Status |
|----------------------|-----------|---------|--------|
| Probe-Payment-Server | paysvr    | 9.9.9.2 | FAIL   |

Route-Action:

| route-instance | route | next-hop | state |
|----------------|-------|----------|-------|
|----------------|-------|----------|-------|

|        |            |            |         |

**Table 245: show snmp inform-statistics Output Fields**

| Field Name            | Field Description                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Target Name</b>    | Name of the device configured to receive and respond to SNMP informs.                                                                              |
| <b>Address</b>        | IP address of the target device.                                                                                                                   |
| <b>Sent</b>           | Number of informs sent to the target device and acknowledged by the target device.                                                                 |
| <b>Pending</b>        | Number of informs held in memory pending a response from the target device.                                                                        |
| <b>Discarded</b>      | Number of informs discarded after the specified number of retransmissions to the target device were attempted.                                     |
| <b>Timeouts</b>       | Number of informs that did not receive an acknowledgement from the target device within the timeout specified.                                     |
| <b>Probe Failures</b> | Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address). |

| <b>Description</b>              | Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b>get</b>—Retrieve and display one or more SNMP object values.</p> <p><b>get-next</b>—Retrieve and display the next SNMP object values.</p> <p><b>walk</b>—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.</p> <p><b>ascii</b>—Display the SNMP object's string indices as an ASCII-key representation.</p> <p><b>decimal</b>—Display the SNMP object values in the decimal (default) format. The <b>decimal</b> option is the default option for this command. Therefore, issuing the <b>show snmp mib (get   get-next   walk) decimal object-id</b> and the <b>show snmp mib (get   get-next   walk) object-id</b> commands display the same output.</p> <p><b>object-id</b>—The object can be represented by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as <b>interfaces</b>). When entering multiple objects, enclose the objects in quotation marks.</p> |
| <b>Required Privilege Level</b> | snmp—To view this statement in the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Output Fields</b>            | Table 246 describes the output fields for the <b>show snmp mib</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 246: show snmp mib Output Fields

| Field Name          | Field Description                                                               |
|---------------------|---------------------------------------------------------------------------------|
| <i>name</i>         | Object name and numeric instance value.                                         |
| <i>object value</i> | Object value. The Junos OS translates OIDs into the corresponding object names. |

## Sample Output

### show snmp mib get

```
user@host> show snmp mib get sysObjectID.0
sysObjectID.0 = jnxProductNameM20
```

### show snmp mib get (Multiple Objects)

```
user@host> show snmp mib get ?sysObjectID.0 sysUpTime.0?
sysObjectID.0 = jnxProductNameM20
sysUpTime.0 = 1640992
```

### show snmp mib get (Layer 2 Policer)

```
user@host> show snmp mib get ifInOctets.25970
ifInOctets.25970 = 7545720
```

### show snmp mib get-next

```
user@host> show snmp mib get-next jnxMibs
jnxBoxClass.0 = jnxProductLineM20.0
```

### show snmp mib get-next (Specify an OID)

```
user@host> show snmp mib get-next 1.3.6.1
sysDescr.0 = Juniper Networks, Inc. m20 internet router, kernel
Junos OS Release: 2004-1 Build date: build date UTC Copyright (c) 1996-2004 Juniper
Networks, Inc.
```

### show snmp mib walk

```
user@host> show snmp mib walk system
sysDescr.0 = Juniper Networks, Inc. m20 internet router, kernel
Junos OS Release #0: 2004-1 Build date: build date UTC Copyright (c) 1996-2004

## Sample Output

### show snmp rmon

```

user@host> show snmp rmon
Alarm
Index State Variable name
 1 falling threshold crossed ifInOctets.1

Event
Index Type Last Event
 1 log and trap 2002-01-30 01:13:01 PST

```

### show snmp rmon alarms detail

```

user@host> show snmp rmon alarms detail

```

```
Alarm Index 1:
Variable name ifInOctets.1
Variable OID 1.3.6.1.2.1.2.2.1.10.1
Sample type delta value
Startup alarm rising or falling alarm
Owner monitor
Creator CLI
State falling threshold crossed
Sample interval 60 seconds
Rising threshold 100000
Falling threshold 80000
Rising event index 1
Falling event index 1
Current value 0
```

#### show snmp rmon events detail

```

| <b>Syntax</b>                   | show snmp statistics<br><subagents>                                                                                                                                                                                                                                                                                                                            |
| <b>Release Information</b>      | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p> <p>Option <b>subagents</b> introduced in Junos OS Release 14.2.</p> |
| <b>Description</b>              | Display statistics about Simple Network Management Protocol (SNMP) packets sent and received by the router or switch.                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <b>subagents</b> —(Optional) Display the statistics of the protocol data unit (PDU), the number of SNMP requests and responses per subagent, and the SNMP statistics received from each subagent per logical system.                                                                                                                                           |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                           |

Table 249 describes the output fields for the **show snmp statistics subagents** command. Output fields are listed in the approximate order in which they appear.

Table 249: show snmp statistics subagents Output Fields

| Field Name                   | Field Description                                                        |
|------------------------------|--------------------------------------------------------------------------|
| <b>Subagent</b>              | Location of the SNMP subagent.                                           |
| <b>Request PDUs</b>          | Number of PDUs requested by the SNMP manager.                            |
| <b>Response PDUs</b>         | Number of response PDUs sent by the SNMP subagent.                       |
| <b>Request Variables</b>     | Number of variable bindings on the PDUs requested by the SNMP manager.   |
| <b>Response Variables</b>    | Number of variable bindings on the PDUs sent by the SNMP subagent.       |
| <b>Average Response Time</b> | Average time taken by the SNMP subagent to send statistics response.     |
| <b>Maximum Response Time</b> | Maximum time taken by the SNMP subagent to send the statistics response. |

## Sample Output

### show snmp statistics

```
user@host> show snmp statistics
SNMP statistics:
 Input:
 Packets: 246213, Bad versions: 12, Bad community names: 12,
 Bad community uses: 0, ASN parse errors: 96,
 Too big: 0, No such names: 0, Bad values: 0,
 Read onlys: 0, General errors: 0,
 Total request varbinds: 227084, Total set varbinds: 67,
 Get requests: 44942, Get nexts: 190371, Set requests: 10712,
 Get responses: 0, Traps: 0,
 Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,
 Throttle drops: 0,
 V3 Input:
 Unknown security models: 0, Invalid messages: 0
 Unknown pdu handlers: 0, Unavailable contexts: 0
 Unknown contexts: 0, Unsupported security levels: 1
 Not in time windows: 0, Unknown user names: 0
 Unknown engine ids: 44, Wrong digests: 23, Decryption errors: 0
 Output:
 Packets: 246093, Too big: 0, No such names: 31561,
 Bad values: 0, General errors: 2,
 Get requests: 0, Get nexts: 0, Set requests: 0,
 Get responses: 246025, Traps: 0
```

### show snmp statistics subagents

```
user@host> show snmp statistics subagents

| <b>Syntax</b>                   | show snmp stats-response-statistics                                                                                                                                       |
| <b>Release Information</b>      | Command introduced in Junos OS Release 14.2.                                                                                                                              |
| <b>Description</b>              | Display statistics of SNMP statistics responses sent from the Packet Forwarding Engine during the MIB II process (mib2d).                                                 |
| <b>Options</b>                  | This command has no options.                                                                                                                                              |
| <b>Required Privilege Level</b> | view                                                                                                                                                                      |
| <b>List of Sample Output</b>    | <a href="#">show snmp stats-response-statistics on page 2215</a>                                                                                                          |
| <b>Output Fields</b>            | Table 250 describes the output fields for the <b>show snmp stats-response-statistics</b> command. Output fields are listed in the approximate order in which they appear. |

Table 250: show snmp stats-response-statistics Output Fields

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Average response time statistics</b> | <p>Display the average response time in milliseconds per protocol data unit (PDU) by snmpd. It includes the following information:</p> <ul style="list-style-type: none"> <li>• <b>Stats Type</b>—Type of SNMP statistics.</li> <li>• <b>Stats Responses</b>—Number of SNMP statistics responses received from the Packet Forwarding Engine.</li> <li>• <b>Average Response Time</b>—Average time taken to receive the statistics response from the Packet Forwarding Engine in milliseconds.</li> </ul>                                |
| <b>Bucket statistics</b>                | <p>Information about SNMP statistics responses:</p> <ul style="list-style-type: none"> <li>• <b>Bucket Type</b>—Category of time intervals in which SNMP statistics responses are received from the Packet Forwarding Engine.</li> <li>• <b>Stats Responses</b>—Number of SNMP statistics responses received from the Packet Forwarding Engine.</li> </ul>                                                                                                                                                                              |
| <b>Bad responses</b>                    | <p>Information about top 20 bad responses from a subagent:</p> <ul style="list-style-type: none"> <li>• <b>Response</b>—Time taken to receive the SNMP statistics response from the Packet Forwarding Engine in milliseconds.</li> <li>• <b>Request Time</b>—Date and time of SNMP request.</li> <li>• <b>Key</b>—Display the attribute of SNMP <b>Stats Type</b>. For example, in the case of SNMP statistics responses for interfaces, the Key value is SNMP ifIndex, and for firewalls, the Key value is the filter name.</li> </ul> |

## Sample Output

### show snmp stats-response-statistics

```

user@host> show snmp stats-response-statistics
Average response time statistics:
Stats Stats Average

```

| Type        | Responses | Response<br>Time (ms) |
|-------------|-----------|-----------------------|
| ifd(non ae) | 34182     | 175.48                |
| ifd(ae)     | 0         | 0.00                  |
| ifl(non ae) | 5472      | 5.40                  |
| ifl(ae)     | 0         | 0.00                  |
| firewall    | 15        | 1141.73               |

## Bucket statistics:

| Bucket<br>Type(ms) | Stats<br>Responses |
|--------------------|--------------------|
| 0 - 10             | 39078              |
| 11 - 50            | 588                |
| 51 - 100           | 0                  |
| 101 - 200          | 0                  |
| 201 - 500          | 1                  |
| 501 - 1000         | 2                  |
| 1001 - 2000        | 0                  |
| 2001 - 5000        | 0                  |
| More than 5001     | 0                  |

## Bad responses:

Applies only to users with active status.</li> <li>• <b>Status</b>—Status of the conceptual row. Only rows with an active status are used by the SNMPv3 engine.</li> </ul> |
| <b>Group name</b>     | Name of the group to which this entry belongs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Security model</b> | Identifies the security model context for the security name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Security name</b>  | Used with the security model; identifies a specific security name instance. Each security model/security name combination can be assigned to a specific group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Storage type</b>   | Indicates whether a user is saved to the configuration file (nonvolatile) or not (volatile). Applies only to users with active status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Status</b>         | Status of the conceptual row. Only rows with active status are used by the SNMPv3 engine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Syntax</b>                   | <code>show system resource-monitor fpc slot-number</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Release Information</b>      | Command introduced in Junos OS Release 15.1 for MX80, MX104, MX240, MX480, MX960, MX2010, and MX2020 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Display the utilization of memory resources on the Packet Forwarding Engines of an FPC. The filter memory denotes the filter counter memory used for firewall filter counters. The asterisk (*) displayed next to each of the memory regions denotes the ones for which the configured threshold is being currently exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <p><b>fpc slot-number</b>—Display the Junos OS utilization information of memory resources for the specified slot number in which the FPC is installed.</p> <ul style="list-style-type: none"> <li>MX80 router—Replace <b>fpc-slot</b> with a value from 1. This command is not supported on FPC slot 0.</li> <li>MX104 router—Replace <b>fpc-slot</b> with a value from 0 through 2.</li> <li>MX240 router—Replace <b>fpc-slot</b> with a value from 0 through 2.</li> <li>MX480 router—Replace <b>fpc-slot</b> with a value from 0 through 5.</li> <li>MX-960 router—Replace <b>fpc-slot</b> with a value from 0 through 11.</li> <li>MX2010 router—Replace <b>fpc-slot-number</b> with a value from 0 through 9.</li> <li>MX2020 router—Replace <b>fpc-slot-number</b> with a value from 0 through 19.</li> </ul> |
| <b>Additional Information</b>   | The filter memory denotes the filter counter memory used for firewall filter counters. From the Ukern perspective, MPC5E contains only one Packet Forwarding Engine instance. The <b>show chassis fabric plane</b> command output displays the state of fabric plane connections to the Packet Forwarding Engine. Because two Packet Forwarding Engines exist, you notice PFE-0 and PFE-1 in the output.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>List of Sample Output</b>    | <a href="#">show system resource-monitor fpc on page 2222</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Output Fields</b>            | Table 252 lists the output fields for the <b>show system resource-monitor fpc</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 252: show system resource-monitor fpc Output Fields

| Field Name                 | Field Description                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Free Heap Memory Watermark | Configured watermark value for the percentage of free memory space used for ukernel or heap memory to be monitored    |
| Free FW Memory Watermark   | Configured watermark value for the percentage of free memory space used for firewall or filter memory to be monitored |

Table 252: show system resource-monitor fpc Output Fields (*continued*)

| Field Name               | Field Description                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Free NH Memory Watermark | Configured watermark value for the percentage of free memory space used for next-hop memory to be monitored                                        |
| * - watermark reached    | An asterix (*) displayed beside any of the memory regions denotes the memory types for which the configured threshold is being currently exceeded. |
| Slot #                   | Slot number in which the line card is installed                                                                                                    |
| PFE #                    | Number or identifier of the Packet Forwarding Engine in the specified line card slot                                                               |
| Heap % free              | Percentage of free space associated with heap or ukernel memory                                                                                    |
| Encap mem % free         | Percentage of free space associated with encapsulation memory                                                                                      |
| NH mem % free            | Percentage of free space associated with next-hop memory                                                                                           |
| Filter / FW mem % free   | Percentage of free space associated with firewall or filter memory                                                                                 |

## Accessing Standards Documents on the Internet

---

The following information about the location of standards on the Internet is accurate as of February 2011. It is subject to change and is provided only as a courtesy to the reader.

Information about accessing MIBs is provided in the entry for each MIB.

- ANSI standards are published by the American National Standards Institute. You can search for specific standards at <http://webstore.ansi.org>.
- FRF (Frame Relay Forum) standards are published by the Broadband Forum. They can be accessed at <http://www.broadband-forum.org/technical/ipmplstechspec.php>.
- GR (Generic Requirements) standards are published by Telcordia. Information about them can be accessed by clicking the “Document Center” link at <http://telecom-info.telcordia.com/site-cgi/ido/>.
- IEEE standards are published by the Institute of Electrical and Electronics Engineers. They can be accessed at <http://standards.ieee.org/getieee802/index.html>.
- ISO/IEC standards are published by the International Organization for Standardization/International Electrotechnical Commission. They can be accessed at [http://www.iso.org/iso/iso\\_catalogue/catalogue\\_tc/](http://www.iso.org/iso/iso_catalogue/catalogue_tc/).
- INCITS standards are published by the InterNational Committee for Information Technology Standards. They can be accessed at <https://standards.incits.org/>.
- Internet drafts are published by the Internet Engineering Task Force (IETF). They can be accessed at <http://tools.ietf.org/id/>.
- ITU–T Recommendations are published by the International Telecommunication Union. They can be accessed at <http://www.itu.int/rec/T-REC>.

**NOTE:** Junos OS supports ITU-T Y.1731 (year 2006 version) that defines Ethernet service OAM features for fault monitoring, diagnostics, and performance monitoring.

- RFCs are published by the IETF. They can be accessed at <http://www.ietf.org/rfc.html>.

## Supported BFD Standards

---

Junos OS substantially supports the following standards for Bidirectional Forwarding Detection (BFD).

- RFC 5880, *Bidirectional Forwarding Detection*. (Partial support—Echo and Demand mode is not supported).
- RFC 5881, *Bidirectional Forwarding Detection (BFD) for IPv4 and IPv6* (Fully compliant).
- RFC 5882, *Generic Application of Bidirectional Forwarding Detection (BFD)*.
- RFC 5883, *Bidirectional Forwarding Detection (BFD)* (Fully compliant).
- RFC 5884, *Bidirectional Forwarding Detection (BFD) for MPLS Label Switched Paths (LSPs)*. (Partial support—Packets from egress to ingress come with singlehop port and while sending packets, the router alert option is used setting TTL to 1).
- RFC 5885, *Bidirectional Forwarding Detection (BFD) for the Pseudowire Virtual Circuit Connectivity Verification (VCCV)*. (Fully compliant)

## Supported BOOTP and DHCP Standards

---

The Junos operating system (Junos OS) substantially supports the following RFCs, which define standards for the bootstrap protocol (BOOTP) and the Dynamic Host Control Protocol (DHCP).

- RFC 951, *BOOTSTRAP PROTOCOL (BOOTP)*
- RFC 1001, *PROTOCOL STANDARD FOR A NetBIOS SERVICE ON A TCP/UDP TRANSPORT: CONCEPTS AND METHODS*
- RFC 1002, *PROTOCOL STANDARD FOR A NetBIOS SERVICE ON A TCP/UDP TRANSPORT: DETAILED SPECIFICATIONS*
- RFC 1035, *DOMAIN NAMES - IMPLEMENTATION AND SPECIFICATION*
- RFC 1534, *Interoperation Between DHCP and BOOTP*
- RFC 1542, *Clarifications and Extensions for the Bootstrap Protocol*
- RFC 1700, *ASSIGNED NUMBERS*
- RFC 2131, *Dynamic Host Configuration Protocol*

DHCP over virtual LAN (VLAN)-tagged interfaces is not supported.

- RFC 2132, *DHCP Options and BOOTP Vendor Extensions*
- RFC 3046, *DHCP Relay Agent Information Option*
- RFC 3118, *Authentication for DHCP Messages*

Only Section 4, "Configuration token," is supported.

- RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*
- RFC 3397, *Dynamic Host Configuration Protocol (DHCP) Domain Search Option*
- RFC 3633, *IPv6 Prefix Options for Dynamic Host Configuration Protocol (DHCP) version 6*
- RFC 3925, *Vendor-Identifying Vendor Options for Dynamic Host Configuration Protocol version 4 (DHCPv4)*
- RFC 4649, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Relay Agent Remote-ID Option*

### Related Documentation

- [Accessing Standards Documents on the Internet on page 2227](#)

## Supported Mobile IP Standards

---

Junos OS supports only static configuration of home agent addresses and IP tunnels; dynamic configuration is not supported. Junos OS does not support the Mobile IP foreign agent, accounting, QoS, policy, data path, or logical interfaces per mobile node (for a mobile subscriber).

Junos OS substantially supports the following RFCs, which define standards for Mobile IP.

- RFC 2794, *Mobile IP Network Access Identifier Extension for IPv4*
- RFC 3024, *Reverse Tunneling for Mobile IP, revised*
- RFC 3344, *IP Mobility Support for IPv4*

Only the Mobile IP home agent is supported.

- RFC 3543, *Registration Revocation in Mobile IPv4*
- RFC 4433, *Mobile IPv4 Dynamic Home Agent (HA) Assignment*

The following RFC does not define a standard, but provides information about Mobile IP. The IETF classifies it as “Informational.”

- RFC 2977, *Mobile IP Authentication, Authorization, and Accounting Requirements*  
Accounting is not supported.

## Supported Network Management Standards

---

Junos OS supports the majority of network management features defined in the following standards documents.

- Extended Security Options (ESO) Consortium, *ESO Consortium MIB*.

As of February 2011, the text of this MIB is accessible at  
<http://www.snmp.com/eso/esoConsortiumMIB.txt>.

- Institute of Electrical and Electronics Engineers (IEEE) Standard 802.3ad, *Aggregation of Multiple Link Segments* (published as Clause 43 in Section 3 of the 802.3 specification)

Only the following MIB objects are supported:

- **dot3adAggPortDebugActorChangeCount**
- **dot3adAggPortDebugActorSyncTransitionCount**
- **dot3adAggPortDebugMuxState**
- **dot3adAggPortDebugPartnerChangeCount**

- dot3adAggPortDebugPartnerSyncTransitionCount
  - dot3adAggPortDebugRxState
  - dot3adAggPortListTable
  - dot3adAggPortStatsTable
  - dot3adAggPortTable
  - dot3adAggTable
  - dot3adTablesLastChanged
- Integrated Local Management Interface (ILMI) MIB in the *Integrated Local Management Interface (ILMI) Specification, Version 4.0*.

As of February 2011, this document is accessible at

<http://www.broadband-forum.org/ftp/pub/approved-specs/af-ilmi-0065.000.pdf>.

Only the atmfMYIPNmAddress and atmfPortMyIfname objects are supported.

- Internet Assigned Numbers Authority (IANA), *IANAiftype Textual Convention MIB* (referenced by RFC 2863, *The Interfaces Group MIB*)

As of February 2011, the text of this MIB is accessible at

<http://www.iana.org/assignments/ianaiftype-mib>.

- RFC 1122, *Requirements for Internet Hosts -- Communication Layers*
- RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*
- RFC 1156, *Management Information Base for Network Management of TCP/IP-based internets*
- RFC 1157, *A Simple Network Management Protocol (SNMP)*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*

Only the following MIB objects are supported:

- isisAdjIPAddr
- isisAreaAddr
- isisCirc
- isisCircLevel
- isisIPRA
- isisISAdj
- isisISAdjAreaAddr
- isisISAdjProtSupp
- isisMANAreaAddr
- isisPacketCount
- isisRa

- **isisSysProtSupp**
- **isisSummAddr**
- **isisSystem**
- RFC 1212, *Concise MIB Definitions*
- RFC 1213, *Management Information Base for Network Management of TCP/IP-based internets: MIB-II*

Only the following features are supported:

- Junos OS-specific secured access list
- Master configuration keywords
- MIB II and its SNMP version 2 derivatives, including the following:
  - Interface management
  - IP (except for the **ipRouteTable** object, which has been replaced by the **inetCidrRouteTable** object, [RFC 4292, *IP Forwarding MIB*])
  - SNMP management
  - Statistics counters
- Reconfigurations upon receipt of the SIGHUP signal
- SNMP version 1 **Get** and **GetNext** requests and version 2 **GetBulk** requests
- RFC 1215, *A Convention for Defining Traps for use with the SNMP*

Only MIB II SNMP version 1 traps and version 2 notifications are supported.

- RFC 1406, *Definitions of Managed Objects for the DS1 and E1 Interface Types* (obsoleted by RFC 2495)

The T1 MIB is supported.

- RFC 1407, *Definitions of Managed Objects for the DS3/E3 Interface Type* (obsoleted by RFC 2496)

The T3 MIB is supported.

- RFC 1472, *The Definitions of Managed Objects for the Security Protocols of the Point-to-Point Protocol*
- RFC 1473, *The Definitions of Managed Objects for the IP Network Control Protocol of the Point-to-Point Protocol*
- RFC 1657, *Definitions of Managed Objects for the Fourth Version of the Border Gateway Protocol (BGP-4) using SMIv2*

The **bgpBackwardTransition** and **bgpEstablished** notifications are not supported.

- RFC 1695, *Definitions of Managed Objects for ATM Management Version 8.0 Using SMIv2* (obsoleted by RFC 2515)
- RFC 1724, *RIP Version 2 MIB Extension*

- RFC 1850, *OSPF Version 2 Management Information Base*

The following features are not supported:

- Host Table
- **ospfLsdbApproachingOverflow** trap
- **ospfLsdbOverflow** trap
- **ospfOriginateLSA** trap
- **ospfOriginateNewLsas** MIB object
- **ospfRxNewLsas** MIB object
- RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)* (obsoleted by RFC 3416)
- RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)* (obsoleted by RFC 3418)
- RFC 2011, *SNMPv2 Management Information Base for the Internet Protocol using SMIv2*
- RFC 2012, *SNMPv2 Management Information Base for the Transmission Control Protocol using SMIv2*
- RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol using SMIv2*
- RFC 2068, *Hypertext Transfer Protocol -- HTTP/1.1*
- RFC 2096, *IP Forwarding Table MIB*

The **ipCidrRouteTable** object is extended to include the tunnel name when the next hop is through an RSVP-signaled label-switched path (LSP).

**NOTE:** RFC 2096 has been replaced by RFC 4292. However, Junos OS currently supports both RFC 2096 and RFC 4292.

---

- RFC 2115, *Management Information Base for Frame Relay DTEs Using SMIv2*
- RFC 2233, *The Interfaces Group MIB using SMIv2* (obsoleted by RFC 2863)
- RFC 2287, *Definitions of System-Level Managed Objects for Applications*

Only the following MIB objects are supported:

- **sysAppElmtRunTable**
- **sysApplInstallElmtTable**
- **sysApplInstallPkgTable**
- **sysApplMapTable**

- RFC 2465, *Management Information Base for IP Version 6: Textual Conventions and General Group*

IP version 6 (IPv6) and Internet Control Message Protocol version 6 (ICMPv6) statistics are not supported.

- RFC 2466, *Management Information Base for IP Version 6: ICMPv6 Group*
- RFC 2495, *Definitions of Managed Objects for the DS1, E1, DS2 and E2 Interface Types*

The following MIB objects are not supported:

- **dsx1FarEndConfigTable**
  - **dsx1FarEndCurrentTable**
  - **dsx1FarEndIntervalTable**
  - **dsx1FarEndTotalTable**
  - **dsx1FracTable**
- RFC 2496, *Definitions of Managed Objects for the DS3/E3 Interface Type*

The following MIB objects are not supported:

- **dsx3FarEndConfigTable**
  - **dsx3FarEndCurrentTable**
  - **dsx3FarEndIntervalTable**
  - **dsx3FarEndTotalTable**
  - **dsx3FracTable**
- RFC 2515, *Definitions of Managed Objects for ATM Management*

The following MIB objects are not supported:

- **aal5VccTable**
  - **atmVcCrossConnectTable**
  - **atmVpCrossConnectTable**
- RFC 2558, *Definitions of Managed Objects for the SONET/SDH Interface Type* (obsoleted by RFC 3592)
  - RFC 2571, *An Architecture for Describing SNMP Management Frameworks*  
Only read-only access is supported.
  - RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (obsoleted by RFC 3412)  
Only read-only access is supported.
  - RFC 2578, *Structure of Management Information Version 2 (SMIv2)*
  - RFC 2579, *Textual Conventions for SMIv2*

- RFC 2580, *Conformance Statements for SMIv2*
- RFC 2662, *Definitions of Managed Objects for the ADSL Lines*
- RFC 2665, *Definitions of Managed Objects for the Ethernet-like Interface Types*
- RFC 2787, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol*

The following features are not supported:

- Row creation
- **Set** operation
- **vrpStatsPacketLengthErrors** MIB object
- RFC 2790, *Host Resources MIB*

Only the following MIB objects are supported:

- **hrStorageTable** object. The file systems **/**, **/config**, **/var**, and **/tmp** always return the same index number. When SNMP restarts, the index numbers for the remaining file systems might change.
- Objects in the **hrSystem** group.
- Objects in the **hrSWInstalled** group.
- RFC 2819, *Remote Network Monitoring Management Information Base*

Only the following MIB objects are supported:

- **alarmTable**
- **etherStatsTable** object for Ethernet interfaces
- **eventTable**
- **logTable**
- RFC 2863, *The Interfaces Group MIB*
- RFC 2864, *The Inverted Stack Table Extension to the Interfaces Group MIB*
- RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*

Only the following MIB objects are supported:

- **pingCtlTable**
- **pingMaxConcurrentRequests**
- **pingProbeHistoryTable**
- **pingResultsTable**
- **traceRouteCtlTable**
- **traceRouteHopsTable**

- **traceRouteProbeHistoryTable**
- **traceRouteResultsTable**
- RFC 2932, *IPv4 Multicast Routing MIB*
- RFC 2981, *Event MIB*
- RFC 3014, *Notification Log MIB*
- RFC 3019, *IP Version 6 Management Information Base for The Multicast Listener Discovery Protocol*
- RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*
- RFC 3412, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)*
- RFC 3413, *Simple Network Management Protocol (SNMP) Applications*

The proxy MIB is not supported.

- RFC 3414, *User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)*
- RFC 3415, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)*
- RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*
- RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*
- RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*
- RFC 3498, *Definitions of Managed Objects for Synchronous Optical Network (SONET) Linear Automatic Protection Switching (APS) Architectures*

Support is implemented under the Juniper Networks Enterprise branch.

- RFC 3592, *Definitions of Managed Objects for the Synchronous Optical Network/Synchronous Digital Hierarchy (SONET/SDH) Interface Type*
- RFC 3635, *Definitions of Managed Objects for the Ethernet-like Interface Types*

Supports all objects, except **dot3StatsRateControlAbility** and **dot3StatsRateControlStatus** in **dot3StatsEntry** table.

**NOTE:** The values of the following objects in **dot3HCStatsEntry** table will be always zero for both 32-bit counters and 64-bit counters:

- **dot3HCStatsSymbolErrors**
- **dotHCStatsInternalMacTransmitErrors**

- RFC 3811, *Definitions of Textual Conventions (TCs) for Multiprotocol Label Switching (MPLS) Management*
- RFC 3812, *Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) Management Information Base (MIB)*

Only read-only access is supported, and the following features and MIB objects are not supported:

- MPLS tunnels as interfaces
- **mplsTunnelCRLDResTable** object
- **mplsTunnelPerfTable** object
- The following objects in the **TunnelResource** table:
  - **mplsTunnelResourceExBurstSize**
  - **mplsTunnelResourceMaxBurstSize**
  - **mplsTunnelResourceMeanBurstSize**
  - **mplsTunnelResourceMeanRate**
  - **mplsTunnelResourceWeight**

The **mplsTunnelCHopTable** object is supported on ingress routers only.

**NOTE:** The branch used by the proprietary LDP MIB (**ldpmib.mib**) conflicts with RFC 3812. **ldpmib.mib** has been deprecated and replaced by **jnx-mpls-ldp.mib**.

- RFC 3813, *Multiprotocol Label Switching (MPLS) Label Switching Router (LSR) Management Information Base (MIB)*

Only read-only access is supported, and the following MIB objects are not supported:

- **mplsInSegmentMapTable**
- **mplsInSegmentPerfTable**
- **mplsInterfacePerfTable**
- **mplsOutSegmentPerfTable**
- **mplsXCDown**
- **mplsXCUp**
- RFC 3815, *Definitions of Managed Objects for the Multiprotocol Label Switching (MPLS), Label Distribution Protocol (LDP)*

Only the following MIB objects are supported:

- **mplsLdpLsrID**
- **mplsLdpSesPeerAddrTable**

- RFC 3826, *The Advanced Encryption Standard (AES) Cipher Algorithm in the SNMP User-based Security Model*

- RFC 4087, *IP Tunnel MIB*

Supports MIB objects with **MAX-ACCESS** of read-only in the following tables:

- **tunnelIfTable**
- **tunnelInetConfigTable**

- RFC 4133, *Entity MIB*

Supports tables and objects except:

- **entityLogicalGroup** table
- **entPhysicalMfgDate** and **entPhysicalUris** objects in **entityPhysical2Group** table
- **entLPMappingTable** and **entPhysicalContainsTable** in **entityMappingGroup** table
- **entityNotificationsGroup** table

**NOTE:** Supported only on MX240, MX480, and MX960 routers.

- RFC 4188, *Definitions of Managed Objects for Bridges*
- RFC 4268, *Entity State MIB*

**NOTE:** Supported only on MX240, MX480, and MX960 routers.

- RFC 4292, *IP Forwarding MIB*

Supports the following table and associated MIB objects:

- **inetCidrRouteTable**
- **inetCidrRouteNumber**
- **inetCidrRouteDiscards**

- RFC 4382, *MPLS/BGP Layer 3 Virtual Private Network (VPN) MIB*

Supports the following scalar objects and tables:

- **mplsL3VpnConfiguredVrfs**
- **mplsL3VpnActiveVrfs**
- **mplsL3VpnConnectedInterfaces**
- **mplsL3VpnNotificationEnable**
- **mplsL3VpnVrfConfMaxPossRts**
- **mplsL3VpnVrfConfRteMxThrshTime**
- **mplsL3VpnIlliLbIRcvThrsh**

- **mplsL3VpnVrfTable**
- **mplsL3VpnVrfPerfTable**
- **mplsL3VpnVrfRteTable**
- **mplsVpnVrfRTTable**
- RFC 6527, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol Version 3 (VRRPv3)*

The following features are not supported:

- Row creation
- **Set** operation
- **vrrpv3StatisticsPacketLengthErrors** MIB object
- **vrrpv3StatisticsRowDiscontinuityTime** MIB object
- Internet draft draft-ietf-bfd-mib-02.txt, *Bidirectional Forwarding Detection Management Information Base*

Only read-only access is supported, and the **bfdSessDown** and **bfdSessUp** traps are supported. Objects in the **bfdSessMapTable** and **bfdSessPerfTable** tables are not supported. The MIB that supports this draft is **mib-jnx-bfd-exp.txt** under the Juniper Networks Enterprise **jnxExperiment** branch.

- RFC 4273, *Definitions of Managed Objects for the Fourth Version of Border Gateway Protocol (BGP-4), Second Version*

Only the following MIB objects are supported:

- **jnxBgpM2PrefixInPrefixes**
- **jnxBgpM2PrefixInPrefixesAccepted**
- **jnxBgpM2PrefixInPrefixesRejected**
- RFC 4444, *Management Information Base for Intermediate System to Intermediate System (IS-IS)*

Only the following tables are supported:

- **isisISAdjAreaAddrTable**
- **isisISAdjIPAddrTable**
- **isisISAdjProtSuppTable**
- **isisISAdjTable**
- RFC 5601, *Pseudowire (PW) Management Information Base (MIB)*
- RFC 5603, *Ethernet Pseudowire (PW) Management Information Base (MIB)*
- Internet draft draft-ietf-msdp-mib-08.txt, *Multicast Source Discovery protocol MIB*

The following MIB objects are not supported:

- **msdpBackwardTransition**
- **msdpEstablished**
- **msdpRequestsTable**
- Internet draft draft-ietf-ospf-ospfv3-mib-11.txt, *Management Information Base for OSPFv3*

Only read-only access is supported, and only for the **ospfv3NbrTable** table. The MIB that supports this draft is **mib-jnx-ospfv3mib.txt** under the Juniper Networks Enterprise **jnxExperiment** branch; MIB object names are prefixed with **jnx** (for example, **jnxOspfv3NbrAddressType**).

- Internet draft draft-reeder-snmpv3-usm-3desede-00.txt, *Extension to the User-Based Security Model (USM) to Support Triple-DES EDE in "Outside" CBC Mode*

The following RFCs do not define standards, but provide information about network management. The IETF classifies them variously as "Best Current Practice," "Experimental" or "Informational."

- RFC 1901, *Introduction to Community-based SNMPv2*
- RFC 2330, *Framework for IP Performance Metrics*
- RFC 2934, *Protocol Independent Multicast MIB for IPv4*
- RFC 3410, *Introduction and Applicability Statements for Internet Standard Management Framework*
- RFC 3584, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*
- RFC 5601, *PW-FRAME-MIB*

Supported on MX Series routers with MPC/MIC interfaces that use the ATM MIC with SFP.

- RFC 5603, *PWE3 MIB*

Supported on MX Series routers with MPC/MIC interfaces that use the ATM MIC with SFP.

- Internet draft draft-ietf-l3vpn-mvpn-mib-03.txt, *MPLS/BGP Layer 3 VPN Multicast Management Information Base*

Implemented under the Juniper Networks enterprise branch [**jnxExperiment**]. OID for **jnxMvpnExperiment** is **.1.3.6.1.4.1.2636.5.12**. This includes **jnxMvpnNotifications** traps.

## Supported RADIUS and TACACS+ Standards for User Authentication

---

For validation of the identity of users who attempt to access a router, Junos OS supports RADIUS authentication, TACACS+ authentication, and authentication by means of Junos OS user accounts configured on the router. Junos OS supports the configuration of Juniper Networks-specific RADIUS and TACACS+ attributes, and the creation of template accounts.

All users who can log in to the router must already be assigned to a Junos OS login class. A *login class* defines its members' access privileges during a login session, the commands they can and cannot issue, the configuration statements they can and cannot view or change, and the idle time before a member's login session is terminated.

Junos OS substantially supports the following RFCs, which define standards for RADIUS and TACACS+.

- RFC 1492, *An Access Control Protocol, Sometimes Called TACACS*
- RFC 2865, *Remote Authentication Dial In User Service (RADIUS)*
- RFC 3162, *RADIUS and IPv6*
- RFC 4818, *RADIUS Delegated-IPv6-Prefix Attribute*

The following Internet drafts do not define standards, but provide information about RADIUS. The IETF classifies them as "Informational."

- RFC 2866, *RADIUS Accounting*
- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*
- RFC 2869, *RADIUS Extensions*
- RFC 4679, *DSL Forum Vendor-Specific RADIUS Attributes*
- RFC 5176, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*

### Related Documentation

- [Supported System Access Standards on page 2244](#)
- [Accessing Standards Documents on the Internet on page 2227](#)

## Supported System Access Standards

---

Junos OS substantially supports the following protocols and applications for remote access to routers: telnet, FTP, rlogin, and finger. In addition, the Canada and U.S. version of Junos OS substantially supports SSH as an access protocol.

Junos OS substantially supports RFC 1994, *PPP Challenge Handshake Authentication Protocol (CHAP)*.

The Canada and U.S. version of Junos OS substantially supports the following RFCs, which define standards for technologies used with Secure Sockets Layer (SSL).

- RFC 1319, *The MD2 Message-Digest Algorithm*
- RFC 1321, *The MD5 Message-Digest Algorithm*
- RFC 2246, *The TLS Protocol Version 1.0*
- RFC 3280, *Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile*

The following RFCs provide information about TFTP, which Junos OS supports as a remote access protocol. The IETF does not include the RFCs in its Standards track, instead assigning them status “Unknown (Legacy Stream.)”

- RFC 783, *THE TFTP PROTOCOL (REVISION 2)*
- RFC 906, *Bootstrap Loading using TFTP*

**Related  
Documentation**

---

## Supported Time Synchronization Standard

Junos OS substantially supports RFC 1305, *Network Time Protocol (Version 3) Specification, Implementation and Analysis*.

RFC 2030, *Simple Network Time Protocol (SNTP) Version 4 for IPv4, IPv6 and OSI*, does not define a standard, but provides information about time synchronization technology. The IETF classifies it as “Informational.”

In CLI operational mode, you can set the current date and time on the router manually or from an NTP server.

On MX Series routers with the Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP, Junos OS substantially supports RFC 4553, *Structure-Agnostic Time Division Multiplexing (TDM) over Packet (SAToP)*

## Supported ATM Interface Standards

---

Junos OS substantially supports the following standards for Asynchronous Transfer Mode (ATM) interfaces.

- International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation I.432.3, *B-ISDN user-network interface - Physical layer specification: 1544 kbit/s and 2048 kbit/s operation*
- RFC 1483, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*  
Only routed protocol data units (PDUs) are supported.
- RFC 2225, *Classical IP and ARP over ATM*  
Only responses are supported.
- RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*  
Only routed PDUs and Ethernet bridged PDUs are supported.
- RFC 4717, *Encapsulation Methods for Transport of Asynchronous Transfer Mode (ATM) over MPLS Networks*

## Supported Frame Relay Interface Standards

Junos OS substantially supports the following standards for Frame Relay interfaces.

- American National Standards Institute (ANSI), *Annex D, Additional Procedures for Permanent Virtual Connections (PVCs) Using Unnumbered Information Frames* to T1.617-1991, *Integrated Services Digital Network (ISDN)—Signaling Specification for Frame Relay Bearer Service for Digital Subscriber Signaling System Number 1 (DSS1)*
- Broadband Forum standard FRF.12, *Frame Relay Fragmentation Implementation Agreement*
- FRF.15, *End-to-End Multilink Frame Relay Implementation Agreement*
- FRF.16.1, *Multilink Frame Relay UNI/NNI Implementation Agreement*
- International Telecommunication Union—Telecommunication Standardization (ITU-T), *Annex A, Additional procedures for Permanent Virtual Connection (PVC) status management (using Unnumbered Information frames)* to Recommendation Q.933, *ISDN Digital Subscriber Signalling System No. 1 (DSS1) - Signalling specifications for frame mode switched and permanent virtual connection control and status monitoring*
- RFC 1973, *PPP in Frame Relay*
- RFC 2390, *Inverse Address Resolution Protocol*
- RFC 2427, *Multiprotocol Interconnect over Frame Relay* (obsoletes RFC 1490)
- RFC 2590, *Transmission of IPv6 Packets over Frame Relay Networks Specification*
- Internet draft draft-martini-frame-encap-mpls-01.txt, *Frame Relay Encapsulation over Pseudo-Wires* (expires December 2002)

Translation of the command/response bit and sequence numbers and padding are not supported.

### Related Documentation

## Supported GRE and IP-IP Interface Standards

Junos OS substantially supports the following RFCs, which define standards for generic routing encapsulation (GRE) and IP-IP interfaces.

- RFC 2003, *IP Encapsulation within IP*
- RFC 2784, *Generic Routing Encapsulation (GRE)*
- RFC 2890, *Key and Sequence Number Extensions to GRE*

The key field is supported, but the sequence number field is not.

The following RFCs do not define standards, but provide information about GRE, IP-IP, and related technologies. The IETF classifies them as “Informational.”

- RFC 1701, *Generic Routing Encapsulation (GRE)*

- RFC 1702, *Generic Routing Encapsulation over IPv4 networks*
- RFC 2547, *BGP/MPLS VPNs* (over GRE tunnels)

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2227](#)

---

## Supported PPP Interface Standards

---

Junos OS substantially supports the following RFCs, which define standards for Point-to-Point Protocol (PPP) interfaces.

- RFC 1332, *The PPP Internet Protocol Control Protocol (IPCP)*
- RFC 1334, *PPP Authentication Protocols*
- RFC 1661, *The Point-to-Point Protocol (PPP)*
- RFC 1662, *PPP in HDLC-like Framing*
- RFC 1989, *PPP Link Quality Monitoring*
- RFC 1990, *The PPP Multilink Protocol (MP)*
- RFC 2364, *PPP Over AAL5*
- RFC 2615, *PPP over SONET/SDH*
- RFC 2686, *The Multi-Class Extension to Multi-Link PPP*

The following features are not supported:

- Negotiation of address field compression and protocol field compression PPP NCP options; instead, a full 4-byte PPP header is always sent
- Prefix elision
- RFC 3021, *Using 31-Bit Prefixes on IPv4 Point-to-Point Links*

The following RFCs do not define standards, but provide information about PPP. The IETF classifies them as “Informational.”

- RFC 1877, *PPP Internet Protocol Control Protocol Extensions for Name Server Addresses*
- RFC 2153, *PPP Vendor Extensions*

**Related  
Documentation**

- [Accessing Standards Documents on the Internet on page 2227](#)

## Supported SDH and SONET Interface Standards

Junos OS substantially supports the following standards for SDH and SONET interfaces.

- American National Standards Institute (ANSI) standard T1.105-2001, *Synchronous Optical Network (SONET) – Basic Description including Multiplex Structure, Rates, and Formats*
- ANSI standard T1.105.02-2001, *Synchronous Optical Network (SONET) – Payload Mappings*
- ANSI standard T1.105.06-2002, *Synchronous Optical Network (SONET): Physical Layer Specifications*
- GR-253-CORE (Telcordia Generic Requirements standard), *Synchronous Optical Network (SONET) Transport Systems: Common Generic Criteria* (replaces GR-1377-CORE, SONET OC-192 Transport System Generic Criteria)
- GR-499-CORE, *Transport Systems Generic Requirements (TSGR): Common Requirements*
- International Telecommunication Union–Telecommunication Standardization (ITU–T) Recommendation G.691, *Optical interfaces for single channel STM-64 and other SDH systems with optical amplifiers*
- ITU–T Recommendation G.707 (1996), *Network node interface for the synchronous digital hierarchy (SDH)*
- ITU–T Recommendation G.783 (1994), *Characteristics of synchronous digital hierarchy (SDH) equipment functional blocks*
- ITU–T Recommendation G.813 (1996), *Timing characteristics of SDH equipment slave clocks (SEC)*
- ITU–T Recommendation G.825 (1993), *The control of jitter and wander within digital networks which are based on the synchronous digital hierarchy (SDH)*
- ITU–T Recommendation G.826 (1999), *Error performance parameters and objectives for international, constant bit-rate digital paths at or above the primary rate*
- ITU–T Recommendation G.831 (1993), *Management capabilities of transport networks based on the synchronous digital hierarchy (SDH)*
- ITU–T Recommendation G.957 (1995), *Optical interfaces for equipments and systems relating to the synchronous digital hierarchy*
- ITU–T Recommendation G.958 (1994), *Digital line systems based on the synchronous digital hierarchy for use on optical fibre cables*
- ITU–T Recommendation I.432 (1993), *B-ISDN user-network interface – Physical layer specification*
- RFC 1619, *PPP over SONET/SDH*

## Supported L2TP Standards

---

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, Junos OS substantially supports the following RFC, which defines the standard for Layer 2 Tunneling Protocol (L2TP).

- RFC 2661, *Layer Two Tunneling Protocol "L2TP"*

The following RFC does not define a standard, but provides information about technology related to L2TP. The IETF classifies it as "Informational."

- RFC 2866, *RADIUS Accounting*

## Supported VPWS Standards

---

Junos OS substantially supports the following RFCs, which define standards for VPWS and Layer 2 circuits.

- RFC 4447, *Pseudowire Setup and Maintenance Using the Label Distribution Protocol (LDP)*

Junos OS does not support Section 5.3, "The Generalized PWid FEC Element."

- RFC 4448, *Encapsulation Methods for Transport of Ethernet over MPLS Networks*
- RFC 6074, *Provisioning, Auto-Discovery, and Signaling in Layer 2 Virtual Private Networks (L2VPNs)*
- RFC 6391, *Flow-Aware Transport of Pseudowires over an MPLS Packet Switched Network*
- RFC 6790, *The Use of Entropy Labels in MPLS Forwarding*

The following Internet drafts do not define standards, but provide information about Layer 2 technologies. The IETF classifies them as “Historic.”

- Internet draft draft-martini-l2circuit-encap-mpls-11.txt, *Encapsulation Methods for Transport of Layer 2 Frames Over IP and MPLS Networks*

Junos OS differs from the Internet draft in the following ways:

- A packet with a sequence number of 0 (zero) is treated as out of sequence.
- Any packet that does not have the next incremental sequence number is considered out of sequence.
- When out-of-sequence packets arrive, the expected sequence number for the neighbor is set to the sequence number in the Layer 2 circuit control word.
- Internet draft draft-martini-l2circuit-trans-mpls-19.txt, *Transport of Layer 2 Frames Over MPLS*

## Supported Security Standards

---

Junos OS substantially supports the following standard for security.

- IEEE Standard 802.1AE, *IEEE Standard for Local and Metropolitan Area Networks: Media Access Control (MAC) Security*

This document will facilitate standard secure communication between two security devices through secure chassis cluster control and fabric ports.

SRX340 and SRX345 supports only 802.1AE-2006 standard.

## Supported GMPLS Standards

---

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for Generalized MPLS (GMPLS).

- RFC 3471, *Generalized Multi-Protocol Label Switching (GMPLS) Signaling Functional Description*

Only the following features are supported:

- Bidirectional LSPs (upstream label only)
  - Control channel separation
  - Generalized label (suggested label only)
  - Generalized label request (bandwidth encoding only)
- RFC 3473, *Generalized Multi-Protocol Label Switching (GMPLS) Signaling Resource ReserVation Protocol-Traffic Engineering (RSVP-TE) Extensions*  
Only Section 9, "Fault Handling," is supported.
  - RFC 4202, *Routing Extensions in Support of Generalized Multi-Protocol Label Switching*  
Only interface switching is supported.
  - RFC 4206, *Label Switched Paths (LSP) Hierarchy with Generalized Multi-Protocol Label Switching (GMPLS) Traffic Engineering (TE)*
  - Internet draft draft-ietf-ccamp-gmpls-rsvp-te-ason-02.txt, *Generalized MPLS (GMPLS) RSVP-TE Signalling in support of Automatically Switched Optical Network (ASON)* (expires January 2005)
  - Internet draft draft-ietf-ccamp-gmpls-sonet-sdh-08.txt, *Generalized Multi-Protocol Label Switching Extensions for SONET and SDH Control*

Only S,U,K,L,M-format labels and SONET traffic parameters are supported.

- Internet draft draft-ietf-ccamp-lmp-10.txt, *Link Management Protocol (LMP)*
- Internet draft draft-ietf-ccamp-ospf-gmpls-extensions-12.txt, *OSPF Extensions in Support of Generalized Multi-Protocol Label Switching*

The following sub-TLV types for the Link type, link, value (TLV) are not supported:

- Link Local/Remote Identifiers (type 11)
- Link Protection Type (type 14)
- Shared Risk Link Group (SRLG) (type 16)

The features described in Section 2 of the draft, “Implications on Graceful Restart,” are also not supported.

The Interface Switching Capability Descriptor (type 15) sub-TLV type is implemented, but only for packet switching.

- Internet draft draft-ietf-mpls-bundle-04.txt, *Link Bundling in MPLS Traffic Engineering*

#### Related Documentation

---

## Supported LDP Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for LDP.

- RFC 3212, *Constraint-Based LSP Setup using LDP*
- RFC 3478, *Graceful Restart Mechanism for Label Distribution Protocol*
- Internet draft draft-napierala-mpls-targeted-mldp-01.txt, *Using LDP Multipoint Extensions on Targeted LDP Sessions*

The following RFCs do not define standards, but provide information about LDP. The IETF classifies them as “Informational.”

- RFC 3215, *LDP State Machine*
- RFC 5036, *LDP Specification*

For the following features described in the indicated sections of the RFC, Junos OS supports one of the possible modes but not the others:

- Label distribution control (section 2.6.1): Ordered mode is supported, but not Independent mode.

- Label retention (section 2.6.2): Liberal mode is supported, but not Conservative mode.
  - Label advertisement (section 2.6.3): Both Downstream Unsolicited mode and Downstream on Demand mode are supported.
  - RFC 5443, *LDP IGP Synchronization*
  - RFC 6826, *Multipoint LDP In-Band Signaling for Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Paths*
- Junos OS support limited to point-to-multipoint extensions for LDP.

#### Related Documentation

## Supported MPLS Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for MPLS and traffic engineering.

- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 3031, *Multiprotocol Label Switching Architecture*
- RFC 3032, *MPLS Label Stack Encoding*
- RFC 3140, *Per Hop Behavior Identification Codes*
- RFC 3270, *Multi-Protocol Label Switching (MPLS) Support of Differentiated Services*  
Only E-LSPs are supported.
- RFC 3443, *Time To Live (TTL) Processing in Multi-Protocol Label Switching (MPLS) Networks*
- RFC 3478, *Graceful Restart Mechanism for Label Distribution Protocol*
- RFC 4090, *Fast Reroute Extensions to RSVP-TE for LSP Tunnels*  
Node protection in facility backup is not supported.
- RFC 4124, *Protocol Extensions for Support of Diffserv-aware MPLS Traffic Engineering*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*
- RFC 4385, *Pseudowire Emulation Edge-to-Edge (PWE3) Control Word for Use over an MPLS PSN*.

Supported on MX Series routers with the Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP.

- RFC 4875, *Extensions to RSVP-TE for Point-to-Multipoint TE LSPs*
- RFC 4950, *ICMP Extensions for Multiprotocol Label Switching*
- RFC 5317, *Joint Working Team (JWT) Report on MPLS Architectural Considerations for a Transport Profile*
- RFC 5586, *MPLS Generic Associated Channel*
- RFC 5654, *Requirements of an MPLS Transport Profile*

The following capabilities are supported in the Junos OS implementation of MPLS Transport Profile (MPLS-TP):

- MPLS-TP OAM can send and receive packets with GAL and G-Ach, without IP encapsulation.
  - Two unidirectional RSVP LSPs between a pair of routers can be associated with each other to create an associated bidirectional LSP for binding a path for the GAL and G-Ach OAM messages. A single Bidirectional Forwarding Detection (BFD) session is established for the associated bidirectional LSP.
  - RFC 5712, *MPLS Traffic Engineering Soft Preemption*
  - RFC 5718, *An In-Band Data Communication Network For the MPLS Transport Profile*
  - RFC 5860, *Requirements for Operations, Administration, and Maintenance (OAM) in MPLS Transport Networks*
  - RFC 5884, *Bidirectional Forwarding Detection (BFD) for MPLS Label Switched Paths (LSPs)*
  - RFC 5921, *A Framework for MPLS in Transport Networks*
  - RFC 5950, *Network Management Framework for MPLS-based Transport Networks*
  - RFC 5951, *Network Management Requirements for MPLS-based Transport Networks*
  - RFC 5960, *MPLS Transport Profile Data Plane Architecture*
  - RFC 6215, *MPLS Transport Profile User-to-Network and Network-to-Network Interfaces*
  - RFC 6291, *Guidelines for the Use of the "OAM" Acronym in the IETF.*
  - RFC 6370, *MPLS Transport Profile (MPLS-TP) Identifiers*
  - RFC 6371, *Operations, Administration, and Maintenance Framework for MPLS-Based Transport Networks.*
  - RFC 6372, *MPLS Transport Profile (MPLS-TP) Survivability Framework*
  - RFC 6373, *MPLS-TP Control Plane Framework*
  - RFC 6388, *Label Distribution Protocol Extensions for Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Paths*
- Only Point-to-Multipoint LSPs are supported.
- RFC 6424, *Mechanism for Performing Label Switched Path Ping (LSP Ping) over MPLS Tunnels*

- RFC 6425, *Detecting Data-Plane Failures in Point-to-Multipoint MPLS – Extensions to LSP Ping*
- RFC 6426, *MPLS On-Demand Connectivity Verification and Route Tracing*
- RFC 6428, *Proactive Connectivity Verification, Continuity Check, and Remote Defect Indication for the MPLS Transport Profile*
- Internet draft draft-ietf-mpls-rsvp-te-no-php-oob-mapping-01.txt, *Non PHP behavior and Out-of-Band Mapping for RSVP-TE LSPs*

The following RFCs and Internet drafts do not define standards, but provide information about MPLS, traffic engineering, and related technologies. The IETF classifies them variously as “Experimental,” “Historic,” or “Informational.”

- RFC 2547, *BGP/MPLS VPNs*
- RFC 2702, *Requirements for Traffic Engineering Over MPLS*
- RFC 2917, *A Core MPLS IP VPN Architecture*
- RFC 3063, *MPLS Loop Prevention Mechanism*
- RFC 3208, *PGM Reliable Transport Protocol Specification*
- RFC 3469, *Framework for Multi-Protocol Label Switching (MPLS)-based Recovery*
- RFC 3564, *Requirements for Support of Differentiated Services-aware MPLS Traffic Engineering*
- RFC 4125, *Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*
- RFC 4127, *Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*
- Internet draft draft-martini-l2circuit-encap-mpls-11.txt, *Encapsulation Methods for Transport of Layer 2 Frames Over IP and MPLS Networks*

Junos OS differs from the Internet draft in the following ways:

- A packet with a sequence number of 0 is treated as out of sequence.
- Any packet that does not have the next incremental sequence number is considered out of sequence.
- When out-of-sequence packets arrive, the expected sequence number for the neighbor is set to the sequence number in the Layer 2 circuit control word.
- Internet draft draft-martini-l2circuit-trans-mpls-19.txt, *Transport of Layer 2 Frames Over MPLS*
- Internet draft draft-raggarwa-mpls-p2mp-te-02.txt, *Establishing Point to Multipoint MPLS TE LSPs*

The features discussed in the indicated sections of the draft are not supported:

- Nonadjacent signaling for branch LSPs (section 7.1)

- Make-before-break and fast reroute (section 9)
- LSP hierarchy using point-to-point LSPs (section 10)

**Related  
Documentation**

---

## Supported RSVP Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for RSVP.

- RFC 2205, *Resource ReSerVation Protocol (RSVP)—Version 1 Functional Specification*
- RFC 2210, *The Use of RSVP with IETF Integrated Services*
- RFC 2211, *Specification of the Controlled-Load Network Element Service*
- RFC 2212, *Specification of Guaranteed Quality of Service*
- RFC 2215, *General Characterization Parameters for Integrated Service Network Elements*
- RFC 2745, *RSVP Diagnostic Messages*
- RFC 2747, *RSVP Cryptographic Authentication* (updated by RFC 3097)
- RFC 2961, *RSVP Refresh Overhead Reduction Extensions*
- RFC 3097, *RSVP Cryptographic Authentication—Updated Message Type Value*
- RFC 3209, *RSVP-TE: Extensions to RSVP for LSP Tunnels*

The Null Service Object for maximum transmission unit (MTU) signaling in RSVP is not supported.

- RFC 3473, *Generalized Multi-Protocol Label Switching (GMPLS) Signaling Resource ReserVation Protocol-Traffic Engineering (RSVP-TE) Extensions*

Only Section 9, “Fault Handling,” is supported.

- RFC 3477, *Signalling Unnumbered Links in Resource ReSerVation Protocol - Traffic Engineering (RSVP-TE)*
- RFC 4090, *Fast Reroute Extensions to RSVP-TE for LSP Tunnels*
- RFC 4203, *OSPF Extensions in Support of Generalized Multi-Protocol Label Switching (GMPLS)*  
(OSPF extensions can carry traffic engineering information over unnumbered links.)
- RFC 4558, *Node-ID Based Resource Reservation Protocol (RSVP) Hello: A Clarification Statement*
- RFC 4561, *Definition of a Record Route Object (RRO) Node-Id Sub-Object*

The RRO node ID subobject is for use in inter-AS link and node protection configurations.

- RFC 4875, *Extensions to RSVP-TE for Point-to-Multipoint TE LSPs*

The following RFCs do not define standards, but provide information about RSVP and related technologies. The IETF classifies them variously as “Experimental” or “Informational.”

- RFC 2209, *Resource ReSerVation Protocol (RSVP)—Version 1 Message Processing Rules*
- RFC 2216, *Network Element Service Specification Template*
- RFC 4125, *Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*
- RFC 4127, *Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*

**Related  
Documentation**

# Open Standards

- [Supported Open Standards on page 2265](#)

## Supported Open Standards

---

Junos OS substantially supports the following open standards:

- *OpenFlow Switch Specification, Version 1.0.0*

For a detailed list of supported messages and fields, match conditions, wild cards, flow actions, statistics, and features, see *OpenFlow v1.0 Compliance Matrix for Devices Running Junos OS*.

The Junos OS implementation of OpenFlow v1.0 differs from the specification in the following ways:

(The sections of the OpenFlow specification are indicated in the parentheses.)

- Junos OS supports only the following flow action types (section 5.2.4):
  - OFPAT\_OUTPUT—supports OFPP\_NORMAL, OFPP\_FLOOD, OFPP\_ALL, and OFPP\_CONTROLLER for normal flow actions, and OFPP\_FLOOD and OFPP\_ALL for Send Packet flow actions.
  - OFPAT\_SET\_VLAN\_VID—support varies by platform.
  - OFPAT\_STRIP\_VLAN—support varies by platform
- Flow priority is supported according to OpenFlow Switch Specification v1.3.0 in which there is no prioritization of exact match entries over wildcard entries.
- Emergency mode as defined in OpenFlow v1.0 is not supported. If the controller connection is lost and cannot be reestablished, the switch maintains all flow states in the control and data planes.

The following features are not supported:

- Encryption through TLS connection (section 4.4)
- 802.1D Spanning Tree Protocol (sections 4.5 and 5.2.1)
- OFPP\_LOCAL virtual port (section 5.2.1)
- Physical port features OFPPF\_PAUSE and OFPPF\_PAUSE\_ASYM (section 5.2.1)

- Queue structures and queue configuration messages (section 5.2.2 and 5.3.4)
- Flow action types: OFPAT\_SET\_VLAN\_PCP, OFPAT\_SET\_DL\_SRC/DST, OFPAT\_SET\_NW\_SRC/DST/TOS, OFPAT\_SET\_TP\_SRC/DST and OFPAT\_ENQUEUE (section 5.2.4)
- buffer\_id for Modify Flow Entry Message, Send Packet Message, and Packet-In Message (sections 5.3.3, 5.3.6, and 5.4.1)
- Port Modification Message (section 5.3.3)
- Vendor Statistics (section 5.3.5)
- Vendor message (section 5.5.4)

- *OpenFlow Switch Specification, Version 1.3.1*

For a detailed list of supported messages and fields, port structure flags and numbering, match conditions, flow actions, multipart messages, flow instructions, and group types, see *OpenFlow v1.3.1 Compliance Matrix for Devices Running Junos OS*.

The Junos OS implementation of OpenFlow v1.3.1 differs from the specification in the following ways:

(The sections of the OpenFlow specification are indicated in the parentheses.)

- Junos OS supports only the following flow action types (section 5.12):
  - OFPAT\_SET\_VLAN\_VID
  - OFPAT\_POP\_VLAN
  - OFPAT\_GROUP
- Junos OS supports only the following group types (section 5.6.1):
  - OFPGT\_ALL
  - OFPGT\_INDIRECT
- Junos OS supports only one flow instruction per flow entry. Further, only the following flow instructions (section A.2.4) are supported:
  - OFPIT\_WRITE\_ACTIONS
  - OFPIT\_APPLY\_ACTIONS
- For OFPT\_SET\_CONFIG (section A.3.2), Junos OS supports only the OFPC\_FRAG\_NORMAL configuration flag, and the OFPCML\_NO\_BUFFER setting for the miss\_send\_len field.
- On MX Series routers, Junos OS supports only the following IPv6-related match conditions (A.2.3.7):
  - OFPXMT\_OFB\_IPV6\_SRC
  - OFPXMT\_OFB\_IPV6\_DST

The following features are not supported:

- Multiple flow tables (section 5)
- Table metadata (section 2)
- Action sets (section 5.10)
- Meter (section 5.7)
- MPLS fields (section 5.12.1)
- MPLS actions (section 5.10 and 5.12)
- Encryption through TLS connection (section 6.3.3)
- Per-port queues (section A.2.2)
- Auxiliary connections (section 6.3.5)
- Multiple virtual switches (section A.3.1)
- IPv6-related set-field actions (5.12)

**Related  
Documentation**

# Packet Processing Standards

- [Supported CoS Standards on page 2269](#)
- [Supported Packet Filtering Standards on page 2270](#)
- [Supported Policing Standard on page 2270](#)

## Supported CoS Standards

---

Junos OS substantially supports the following standards for class of service (CoS).

- IEEE Standard 802.1D, *IEEE Standard for Local and Metropolitan Area Networks: Media Access Control (MAC) Bridges*

This document discusses Quality of Service (QoS) at the MAC level, often referred to as 802.1p.

- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*

The following RFCs do not define standards, but provide information about CoS and related technologies. The IETF classifies them as “Informational.”

- RFC 2475, *An Architecture for Differentiated Services*
- RFC 2697, *A Single Rate Three Color Marker*
- RFC 2698, *A Two Rate Three Color Marker*
- RFC 2983, *Differentiated Services and Tunnels*
- RFC 3140, *Per Hop Behavior Identification Codes*
- RFC 3246, *An Expedited Forwarding PHB (Per-Hop Behavior)*
- RFC 3260, *New Terminology and Clarifications for Diffserv*

## Supported Packet Filtering Standards

---

Junos OS provides a packet filtering language that enables you to control the flow of packets being forwarded to a network destination, as well as packets destined for and sent by the router. It substantially supports the following RFCs, which define standards for packet filtering.

- RFC 792, *INTERNET CONTROL MESSAGE PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 2460, *Internet Protocol, Version 6 (IPv6) Specification*
- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*
- RFC 3246, *An Expedited Forwarding PHB (Per-Hop Behavior)*
- RFC 4291, *IP Version 6 Addressing Architecture*
- RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*

The following RFCs do not define standards, but provide information about packet filtering and related technologies. The IETF classifies them as “Informational.”

- RFC 2267, *Network Ingress Filtering: Defeating Denial of Service Attacks which employ IP Source Address Spoofing*
- RFC 2475, *An Architecture for Differentiated Services*
- RFC 2983, *Differentiated Services and Tunnels*
- RFC 3260, *New Terminology and Clarifications for Diffserv*

## Supported Policing Standard

---

Junos OS supports policing, or rate limiting, to limit the amount of traffic that passes through an interface. For information about rate limiting, see RFC 2698, *A Two Rate Three Color Marker*.

The Junos OS implementation of policing uses a token-bucket algorithm and supports the following features:

- Adaptive shaping for Frame Relay traffic
- Virtual channels

## Supported Standards for BGP

---

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for IP version 4 (IPv4) BGP.

For a list of supported IP version 6 (IPv6) BGP standards, see [“Supported IPv6 Standards” on page 2280](#).

Junos OS BGP supports authentication for protocol exchanges (MD5 authentication).

- RFC 1745, *BGP4/IDRP for IP—OSPF Interaction*
- RFC 1772, *Application of the Border Gateway Protocol in the Internet*
- RFC 1997, *BGP Communities Attribute*
- RFC 2283, *Multiprotocol Extensions for BGP-4*
- RFC 2385, *Protection of BGP Sessions via the TCP MD5 Signature Option*
- RFC 2439, *BGP Route Flap Damping*
- RFC 2545, *Use of BGP-4 Multiprotocol Extensions for IPv6 Inter-Domain Routing*
- RFC 2796, *BGP Route Reflection – An Alternative to Full Mesh IBGP*
- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 2918, *Route Refresh Capability for BGP-4*

- RFC 3065, *Autonomous System Confederations for BGP*
- RFC 3107, *Carrying Label Information in BGP-4*
- RFC 3345, *Border Gateway Protocol (BGP) Persistent Route Oscillation Condition*
- RFC 3392, *Capabilities Advertisement with BGP-4*
- RFC 4271, *A Border Gateway Protocol 4 (BGP-4)*
- RFC 4273, *Definitions of Managed Objects for BGP-4*
- RFC 4360, *BGP Extended Communities Attribute*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4456, *BGP Route Reflection: An Alternative to Full Mesh Internal BGP (IBGP)*
- RFC 4486, *Subcodes for BGP Cease Notification Message*
- RFC 4659, *BGP-MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN*
- RFC 4632, *Classless Inter-domain Routing (CIDR): The Internet Address Assignment and Aggregation Plan*
- RFC 4684, *Constrained Route Distribution for Border Gateway Protocol/MultiProtocol Label Switching (BGP/MPLS) Internet Protocol (IP) Virtual Private Networks (VPNs)*
- RFC 4724, *Graceful Restart Mechanism for BGP*
- RFC 4760, *Multiprotocol Extensions for BGP-4*
- RFC 4781, *Graceful Restart Mechanism for BGP with MPLS*
- RFC 4798, *Connecting IPv6 Islands over IPv4 MPLS Using IPv6 Provider Edge Routers (6PE)*

Option 4b (eBGP redistribution of labeled IPv6 routes from AS to neighboring AS) is not supported.

- RFC 4893, *BGP Support for Four-octet AS Number Space*
- RFC 5004, *Avoid BGP Best Path Transitions from One External to Another*
- RFC 5065, *Autonomous System Confederations for BGP*
- RFC 5082, *The Generalized TTL Security Mechanism (GTSM)*
- RFC 5291, *Outbound Route Filtering Capability for BGP-4 (partial support)*
- RFC 5292, *Address-Prefix-Based Outbound Route Filter for BGP-4 (partial support)*

Devices running Junos OS can receive prefix-based ORF messages.

- RFC 5396, *Textual Representation of Autonomous System (AS) Numbers*
- RFC 5492, *Capabilities Advertisement with BGP-4*
- RFC 5575, *Dissemination of flow specification rules*
- RFC 5668, *4-Octet AS Specific BGP Extended Community*
- RFC 6368, *Internal BGP as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*

- RFC 6810, *The Resource Public Key Infrastructure (RPKI) to Router Protocol*
- RFC 6811, *BGP Prefix Origin Validation*
- RFC 6996, *Autonomous System (AS) Reservation for Private Use*
- RFC 7300, *Reservation of Last Autonomous System (AS) Numbers*
- Internet draft draft-ietf-idr-add-paths-06.txt, *Advertisement of Multiple Paths in BGP* (expires March 2012)
- Internet draft draft-ietf-idr-aigp-06, *The Accumulated IGP Metric Attribute for BGP* (expires December 2011)
- Internet draft draft-ietf-idr-as0-06, *Codification of AS 0 processing* (expires February 2013)
- Internet draft draft-ietf-idr-link-bandwidth-01.txt, *BGP Link Bandwidth Extended Community* (expires August 2010)
- Internet draft draft-ietf-sidr-origin-validation-signaling-00, *BGP Prefix Origin Validation State Extended Community (partial support)* (expires May 2011)

The extended community (origin validation state) is supported in Junos OS routing policy. The specified change in the route selection procedure is not supported.

- Internet draft draft-kato-bgp-ipv6-link-local-00.txt, *BGP4+ Peering Using IPv6 Link-local Address*

The following RFCs and Internet draft do not define standards, but provide information about BGP and related technologies. The IETF classifies them variously as “Experimental” or “Informational.”

- RFC 1965, *Autonomous System Confederations for BGP*
- RFC 1966, *BGP Route Reflection—An alternative to full mesh IBGP*
- RFC 2270, *Using a Dedicated AS for Sites Homed to a Single Provider*
- Internet draft draft-ietf-ngtrans-bgp-tunnel-04.txt, *Connecting IPv6 Islands across IPv4 Clouds with BGP* (expires July 2002)

## Supported ICMP Router Discovery and IPv6 Neighbor Discovery Standards

Junos OS substantially supports the following RFCs, which define standards for the Internet Control Message Protocol (ICMP for IP version 4 [IPv4]) and neighbor discovery (for IP version 6 [IPv6]).

- RFC 1256, *ICMP Router Discovery Messages*
- RFC 4861, *Neighbor Discovery for IP version 6 (IPv6)*
- RFC 2462, *IPv6 Stateless Address Autoconfiguration*
- RFC 2463, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*
- RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*
- RFC 4861, *IPv6 Stateless Address Autoconfiguration*
- RFC 4862, *Neighbor Discovery for IP version 6 (IPv6)*
- RFC 6106, *IPv6 Router Advertisement Options for DNS Configuration*

**Related  
Documentation**

## Supported IP Multicast Protocol Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for IP multicast protocols, including the Distance Vector Multicast Routing Protocol (DVMRP), Internet Group Management Protocol (IGMP), Multicast Listener Discovery (MLD), Multicast Source Discovery Protocol (MSDP), Pragmatic General Multicast (PGM), Protocol Independent Multicast (PIM), Session Announcement Protocol (SAP), and Session Description Protocol (SDP).

- RFC 1112, *Host Extensions for IP Multicasting* (defines IGMP Version 1)
- RFC 2236, *Internet Group Management Protocol, Version 2*

- RFC 2327, *SDP: Session Description Protocol*
  - RFC 2710, *Multicast Listener Discovery (MLD) for IPv6*
  - RFC 2858, *Multiprotocol Extensions for BGP-4*
  - RFC 3031, *Multiprotocol Label Switching Architecture*
  - RFC 3376, *Internet Group Management Protocol, Version 3*
  - RFC 3590, *Source Address Selection for the Multicast Listener Discovery (MLD) Protocol*
  - RFC 3956, *Embedding the Rendezvous Point (RP) Address in an IPv6 Multicast Address*
  - RFC 4601, *Protocol Independent Multicast – Sparse Mode (PIM-SM): Protocol Specification (Revised)*
  - RFC 4604, *Using IGMPv3 and MLDv2 for Source-Specific Multicast*
  - RFC 4607, *Source-Specific Multicast for IP*
  - RFC 4610, *Anycast-RP Using Protocol Independent Multicast (PIM)*
  - RFC 5015, *Bidirectional Protocol Independent Multicast (BIDIR-PIM)*
  - RFC 5059, *Bootstrap Router (BSR) Mechanism for Protocol Independent Multicast (PIM)*
- The scoping mechanism is not supported.
- RFC 6513, *Multicast in MPLS/BGP IP VPNs*
  - RFC 6514, *BGP Encodings and Procedures for Multicast in MPLS/BGP IP VPNs*
  - Internet draft draft-raggarwa-l3vpn-bgp-mvpn-extranet-08.txt, *Extranet in BGP Multicast VPN (MVPN)*
  - Internet draft draft-rosen-l3vpn-spmsi-joins-mldp-03.txt, *MVPN: S-PMSI Join Extensions for mLDP-Created Tunnels*

The following RFCs and Internet drafts do not define standards, but provide information about multicast protocols and related technologies. The IETF classifies them variously as “Best Current Practice,” “Experimental,” or “Informational.”

- RFC 1075, *Distance Vector Multicast Routing Protocol*
- RFC 2362, *Protocol Independent Multicast-Sparse Mode (PIM-SM): Protocol Specification*
- RFC 2365, *Administratively Scoped IP Multicast*
- RFC 2547, *BGP/MPLS VPNs*
- RFC 2974, *Session Announcement Protocol*
- RFC 3208, *PGM Reliable Transport Protocol Specification*
- RFC 3446, *Anycast Rendezvous Point (RP) mechanism using Protocol Independent Multicast (PIM) and Multicast Source Discovery Protocol (MSDP)*
- RFC 3569, *An Overview of Source-Specific Multicast (SSM)*
- RFC 3618, *Multicast Source Discovery Protocol (MSDP)*
- RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*

- RFC 3973, *Protocol Independent Multicast – Dense Mode (PIM-DM): Protocol Specification (Revised)*
  - RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
  - Internet draft draft-ietf-idmr-dvmrp-v3-11.txt, *Distance Vector Multicast Routing Protocol*
  - Internet draft draft-ietf-mboned-ssm232-08.txt, *Source-Specific Protocol Independent Multicast in 232/8*
  - Internet draft draft-ietf-mmusic-sap-00.txt, *SAP: Session Announcement Protocol*
  - Internet draft draft-rosen-vpn-mcast-07.txt, *Multicast in MPLS/BGP VPNs*
- Only section 7, “Data MDT: Optimizing flooding,” is supported.

---

## Supported IPv4, TCP, and UDP Standards

Junos OS substantially supports the following RFCs, which define standards for IP version 4 (IPv4), Transmission Control Protocol (TCP), and User Datagram Protocol (UDP).

- RFC 768, *User Datagram Protocol*
- RFC 791, *INTERNET PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 792, *INTERNET CONTROL MESSAGE PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 793, *TRANSMISSION CONTROL PROTOCOL - DARPA INTERNET PROGRAM PROTOCOL SPECIFICATION*
- RFC 826, *Ethernet Address Resolution Protocol—or—Converting Network Protocol Addresses to 48.bit Ethernet Address for Transmission on Ethernet Hardware*
- RFC 854, *TELNET PROTOCOL SPECIFICATION*
- RFC 862, *Echo Protocol*
- RFC 863, *Discard Protocol*
- RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*
- RFC 896, *Congestion Control in IP/TCP Internetworks*
- RFC 903, *A Reverse Address Resolution Protocol*
- RFC 919, *BROADCASTING INTERNET DATAGRAMS*
- RFC 922, *BROADCASTING INTERNET DATAGRAMS IN THE PRESENCE OF SUBNETS*
- RFC 950, *Internet Standard Subnetting Procedure*
- RFC 959, *FILE TRANSFER PROTOCOL (FTP)*
- RFC 1027, *Using ARP to Implement Transparent Subnet Gateways*

- RFC 1042, *A Standard for the Transmission of IP Datagrams over IEEE 802 Networks*
- RFC 1157, *A Simple Network Management Protocol (SNMP)*
- RFC 1166, *INTERNET NUMBERS*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*
- RFC 1256, *ICMP Router Discovery Messages*
- RFC 1305, *Network Time Protocol (Version 3) Specification, Implementation and Analysis*
- RFC 1519, *Classless Inter-Domain Routing (CIDR): an Address Assignment and Aggregation Strategy*
- RFC 1812, *Requirements for IP Version 4 Routers*
- RFC 2338, *Virtual Router Redundancy Protocol* (obsoleted by RFC 3768 in April 2004)
- RFC 2873, *TCP Processing of the IPv4 Precedence Field*
- RFC 3021, *Using 31-Bit Prefixes on IPv4 Point-to-Point Links*
- RFC 3246, *An Expedited Forwarding PHB (Per-Hop Behavior)*
- RFC 3768, *Virtual Router Redundancy Protocol (VRRP)*
- RFC 5798, *Virtual Router Redundancy Protocol (VRRP) Version 3 for IPv4 and IPv6*
- RFC 6527, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol Version 3 (VRRPv3)*

The following features are not supported:

- Row creation
- **Set** operation
- **vrrpv3StatisticsRowDiscontinuityTime** MIB object
- **vrrpv3StatisticsPacketLengthErrors** MIB object

The following RFCs do not define standards, but provide information about IP, TCP, UDP, and related technologies. The IETF classifies them as “Informational.”

- RFC 1878, *Variable Length Subnet Table For IPv4*
- RFC 1948, *Defending Against Sequence Number Attacks*

**Related  
Documentation**

- [Supported IPv6 Standards on page 2280](#)
- [Accessing Standards Documents on the Internet on page 2227](#)

## Supported IPv6 Standards

---

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for IP version 6 (IPv6).

- RFC 1981, *Path MTU Discovery for IP version 6*
- RFC 2373, *IP Version 6 Addressing Architecture*
- RFC 2375, *Multicast Address Assignments*
- RFC 2460, *Internet Protocol, Version 6 (IPv6) Specification*
- RFC 2461, *Neighbor Discovery for IP Version 6 (IPv6)*
- RFC 2462, *IPv6 Stateless Address Autoconfiguration*
- RFC 2463, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*
- RFC 2464, *Transmission of IPv6 Packets over Ethernet Networks*
- RFC 2465, *Management Information Base for IP Version 6: Textual Conventions and General Group*

IP version 6 (IPv6) and Internet Control Message Protocol version 6 (ICMPv6) statistics are not supported.

- RFC 2472, *IP Version 6 over PPP*
- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2491, *IPv6 Over Non-Broadcast Multiple Access (NBMA) networks*
- RFC 2492, *IPv6 over ATM Networks*
- RFC 2526, *Reserved IPv6 Subnet Anycast Addresses*
- RFC 2545, *Use of BGP-4 Multiprotocol Extensions for IPv6 Inter-Domain Routing*
- RFC 2578, *Structure of Management Information Version 2 (SMIv2)*
- RFC 2675, *IPv6 Jumbograms*
- RFC 2711, *IPv6 Router Alert Option*
- RFC 2740, *OSPF for IPv6* (partial support for RFC 5340)

Junos OS does not support the following components of RFC 5340:

- Multiple interfaces on the same link
- Deprecation of Multicast Extensions to OSPF (MOSPF) for IPv6
- Not-so-stubby area (NSSA) specification
- Link LSA suppression

- LSA options and prefix options updates
- IPv6 site-local addresses
- RFC 2784, *Generic Routing Encapsulation*
- RFC 2767, *Dual Stack Hosts using the "Bump-In-the-Stack" Technique (BIS)*
- RFC 2784, *Generic Routing Encapsulation*
- RFC 2878, *PPP Bridging Control Protocol (BCP)*
- RFC 2893, *Transition Mechanisms for IPv6 Hosts and Routers*
- RFC 3306, *Unicast-Prefix-based IPv6 Multicast Addresses*
- RFC 3307, *Allocation Guidelines for IPv6 Multicast Addresses*
- RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*

Address assignment is supported with IP version 4 (IPv4) but not IP version 6 (IPv6).

- RFC 3484, *Default Address Selection for Internet Protocol version 6 (IPv6)*
- RFC 3513, *Internet Protocol Version 6 (IPv6) Addressing Architecture*
- RFC 3515, *The Session Initiation Protocol (SIP) Refer Method*
- RFC 3590, *Source Address Selection for the Multicast Listener D* (Supported for SSM include mode only)
- RFC 3768, *Virtual Router Redundancy Protocol (VRRP)*
- RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*
- RFC 3971, *Secure Neighbor Discovery for IPv6* (No support for certification paths, anchored on trusted parties)
- RFC 3972, *Cryptographically Generated Addresses*
- RFC 4087, *IP Tunnel MIB*
- RFC 4291, *IP Version 6 Addressing Architecture*
- RFC 4292, *IP Forwarding Table MIB*
- RFC 4293, *Management Information Base for the Internet Protocol (IP)*
- RFC 4294, *IPv6 Node Requirements* (Partial support)
- RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*
- RFC 4552, *Authentication/Confidentiality for OSPFv3*
- RFC 4604, *Using Internet Group Management Protocol Version 3 (IGMPv3)*
- RFC 4659, *BGP-MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN*
- RFC 4798, *Connecting IPv6 Islands over IPv4 MPLS Using IPv6 Provider Edge Routers (6PE)*

Option 4b (eBGP redistribution of labeled IPv6 routes from AS to neighboring AS) is not supported.

- RFC 4861 *Neighbor Discovery for IP Version 6 (IPv6)*
- RFC 4862, *IPv6 Stateless Address Autoconfiguration*
- RFC 4890, *Recommendations for Filtering ICMPv6 Messages in Firewalls*
- RFC 4942, *IPv6 Transition/Coexistence Security Considerations*
- RFC 5072, *IP Version 6 over PPP*
- RFC 5095, *Deprecation of Type 0 Routing Headers in IPv6*
- RFC 5308, *Routing IPv6 with IS-IS*
- RFC 5575, *Dissemination of Flow Specification Rules*
- RFC 5798, *Virtual Router Redundancy Protocol (VRRP) Version 3 for IPv4 and IPv6*
- RFC 5905, *Network Time Protocol Version 4 (for IPv6)*
- RFC 5952, *A Recommendation for IPv6 Address Text Representation*
- RFC 6164, *Using 127-Bit IPv6 Prefixes on Inter-Router Links*
- RFC 6527, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol Version 3 (VRRPv3)*

The following features are not supported:

- Row creation
- **Set** operation
- **vrrpv3StatisticsPacketLengthErrors** MIB object
- **vrrpv3StatisticsRowDiscontinuityTime** MIB object
- RFC 6583, *Operational Neighbor Discovery Problems*

Only Tuning of the NDP Queue Rate Limit and Queue Tuning are supported.

- Internet draft draft-ietf-l3vpn-bgp-ipv6-07.txt, *BGP-MPLS IP VPN extension for IPv6 VPN*
- Internet draft draft-ietf-idr-flow-spec-00.txt, *Dissemination of flow specification rules*
- Internet draft draft-ietf-softwire-dual-stack-lite-04.txt, *Dual-Stack Lite Broadband Deployments Following IPv4 Exhaustion*
- Internet draft draft-kato-bgp-ipv6-link-local-00.txt, *BGP4+ Peering Using IPv6 Link-local Address*

The following RFCs and Internet draft do not define standards, but provide information about IPv6 and related technologies. The IETF classifies them variously as "Experimental" or "Informational."

- RFC 1901, *Introduction to Community-based SNMPv2*
- RFC 2767, *Dual Stack Hosts using the "Bump-In-the-Stack" Technique (BIS)*

- RFC 3587, *IPv6 Global Unicast Address Format*
- Internet draft draft-ietf-ngtrans-bgp-tunnel-04.txt, *Connecting IPv6 Islands across IPv4 Clouds with BGP*

Only MP-BGP over IP version 4 (IPv4) approach is supported.

**Related  
Documentation**

- [Supported IPv4, TCP, and UDP Standards on page 2278](#)
- [Accessing Standards Documents on the Internet on page 2227](#)

## Supported Standards for IS-IS

Junos OS substantially supports the following standards for IS-IS.

- International Organization for Standardization/International Electrotechnical Commission (ISO/IEC) 8473, *Information technology — Protocol for providing the connectionless-mode network service*
- ISO 9542, *End System to Intermediate System Routing Exchange Protocol for Use in Conjunction with the Protocol for the Provision of the Connectionless-mode Network Service*
- ISO/IEC 10589, *Information technology — Telecommunications and information exchange between systems — Intermediate System to Intermediate System intra-domain routing information exchange protocol for use in conjunction with the protocol for providing the connectionless-mode network service (ISO 8473)*
- RFC 1195, *Use of OSI IS-IS for Routing in TCP/IP and Dual Environments*
- RFC 3719, *Recommendations for Interoperable Networks using Intermediate System to Intermediate System (IS-IS)*
- RFC 3847, *Restart Signaling for Intermediate System to Intermediate System (IS-IS)*
- RFC 5120, *M-ISIS: Multi Topology (MT) Routing in Intermediate System to Intermediate Systems (IS-ISs)*
- RFC 5130, *A Policy Control Mechanism in IS-IS Using Administrative Tags*
- RFC 5286, *Basic Specification for IP Fast Reroute: Loop-Free Alternates*
- RFC 5301, *Dynamic Hostname Exchange Mechanism for IS-IS*
- RFC 5302, *Domain-Wide Prefix Distribution with Two-Level IS-IS*
- RFC 5303, *Three-Way Handshake for IS-IS Point-to-Point Adjacencies*
- RFC 5304, *IS-IS Cryptographic Authentication*
- RFC 5305, *IS-IS Extensions for Traffic Engineering*
- RFC 5306, *Restart Signaling for IS-IS*
- RFC 5307, *IS-IS Extensions in Support of Generalized Multi-Protocol Label Switching (GMPLS)*
- RFC 5308, *Routing IPv6 with IS-IS*

- RFC 5310, *IS-IS Generic Cryptographic Authentication*
- RFC 5880, *Bidirectional Forwarding Detection (BFD)*

The following RFCs do not define standards, but provide information about IS-IS and related technologies. The IETF classifies them as “Informational.”

- RFC 2973, *IS-IS Mesh Groups*
- RFC 3358, *Optional Checksums in Intermediate System to Intermediate System (ISIS)*
- RFC 3359, *Reserved Type, Length and Value (TLV) Codepoints in Intermediate System to Intermediate System*
- RFC 3373, *Three-Way Handshake for Intermediate System to Intermediate System (IS-IS) Point-to-Point Adjacencies*
- RFC 3567, *Intermediate System to Intermediate System (IS-IS) Cryptographic Authentication*
- RFC 3787, *Recommendations for Interoperable IP Networks using Intermediate System to Intermediate System (IS-IS)*
- RFC 5309, *Point-to-Point Operation over LAN in Link State Routing Protocols*
- Internet draft draft-ietf-isis-wg-255adj-02.txt, *Maintaining more than 255 circuits in IS-IS*

**Related  
Documentation**

- *IS-IS Overview*
- [Supported ES-IS Standards on page 2275](#)
- [Accessing Standards Documents on the Internet on page 2227](#)

---

## Supported OSPF and OSPFv3 Standards

Junos OS substantially supports the following RFCs and Internet drafts, which define standards for OSPF and OSPF version 3 (OSPFv3).

- RFC 1583, *OSPF Version 2*
- RFC 1765, *OSPF Database Overflow*
- RFC 1793, *Extending OSPF to Support Demand Circuits*
- RFC 1850, *OSPF Version 2 Management Information Base*
- RFC 2154, *OSPF with Digital Signatures*
- RFC 2328, *OSPF Version 2*
- RFC 2370, *The OSPF Opaque LSA Option*

Support is provided by the **update-threshold** configuration statement at the **[edit protocols rsvp interface *interface-name* ]** hierarchy level.

- RFC 2740, *OSPF for IPv6* (partial support for RFC 5340)

Junos OS does not support the following components of RFC 5340:

- Multiple interfaces on the same link
- Deprecation of Multicast Extensions to OSPF (MOSPF) for IPv6
- Not-so-stubby area (NSSA) specification
- Link LSA suppression
- LSA options and prefix options updates
- IPv6 site-local addresses
- RFC 3101, *The OSPF Not-So-Stubby Area (NSSA) Option*
- RFC 3623, *Graceful OSPF Restart*
- RFC 3630, *Traffic Engineering (TE) Extensions to OSPF Version 2*
- RFC 4136, *OSPF Refresh and Flooding Reduction in Stable Topologies*
- RFC 4203, *OSPF Extensions in Support of Generalized Multi-Protocol Label Switching (GMPLS)*

Only interface switching is supported.

- RFC 4552, *Authentication/Confidentiality for OSPFv3*
- RFC 4576, *Using a Link State Advertisement (LSA) Options Bit to Prevent Looping in BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4577, *OSPF as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4811, *OSPF Out-of-Band Link State Database (LSDB) Resynchronization*
- RFC 4812, *OSPF Restart Signaling*
- RFC 4813, *OSPF Link-Local Signaling*
- RFC 4915, *Multi-Topology (MT) Routing in OSPF*
- RFC 5185, *OSPF Multi-Area Adjacency*
- RFC 5187, *OSPFv3 Graceful Restart*
- RFC 5250, *The OSPF Opaque LSA Option*

**NOTE:** RFC 4750, mentioned in this RFC as a "should" requirement is not supported. However, RFC 1850, the predecessor to RFC 4750 is supported.

- RFC 5286, *Basic Specification for IP Fast Reroute: Loop-Free Alternates*
- RFC 5838, *Support of Address Families in OSPFv3*
- Internet draft draft-ietf-ospf-af-alt-10.txt, *Support of address families in OSPFv3*
- Internet draft draft-katz-ward-bfd-02.txt, *Bidirectional Forwarding Detection*

Transmission of echo packets is not supported.

The following RFCs do not define standards, but provide information about OSPF and related technologies. The IETF classifies them as “Informational.”

- RFC 3137, *OSPF Stub Router Advertisement*
- RFC 3509, *Alternative Implementations of OSPF Area Border Routers*
- RFC 5309, *Point-to-Point Operation over LAN in Link State Routing Protocols*

---

## Supported RIP and RIPng Standards

Junos OS substantially supports the following RFCs, which define standards for RIP (for IP version 4 [IPv4]) and RIP next generation (RIPng, for IP version 6 [IPv6]).

Junos OS supports authentication for all RIP protocol exchanges (MD5 or simple authentication).

- RFC 1058, *Routing Information Protocol*
- RFC 2080, *RIPng for IPv6*
- RFC 2082, *RIP-2 MD5 Authentication*

Multiple keys using distinct key IDs are not supported.

- RFC 2453, *RIP Version 2*

The following RFC does not define a standard, but provides information about RIPng. The IETF classifies it as “Informational.”

- RFC 2081, *RIPng Protocol Applicability Statement*

## Supported DTCP Standard

---

Junos OS substantially supports Internet draft draft-cavuto-dtcp-03.txt, *DTCP: Dynamic Tasking Control Protocol*.

### Related Documentation

- Accessing Standards Documents on the Internet on page 2227

## Supported Flow Monitoring and Discard Accounting Standards

---

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions), Monitoring Services PICs, or Multiservices PICs or DPCs, Junos OS substantially supports the standards for cflowd version 5 and version 8 formats that are maintained by CAIDA and accessible at <http://www.caida.org>.

The following RFC does not define a standard, but provides information about flow monitoring. The IETF classifies it as “Informational.”

- RFC 3954, *Cisco Systems NetFlow Services Export Version 9*

On MX Series routers, Junos OS partially supports the following RFCs:

- RFC 5101, *Specification of the IP Flow Information Export (IPFIX) Protocol for the Exchange of IP Traffic Flow Information*
- RFC 5102, *Information Model for IP Flow Information Export*

---

## Supported IPsec and IKE Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Canada and U.S. version of Junos OS substantially supports the following RFCs, which define standards for IP Security (IPsec) and Internet Key Exchange (IKE).

- RFC 2085, *HMAC-MD5 IP Authentication with Replay Prevention*
- RFC 2401, *Security Architecture for the Internet Protocol* (obsoleted by RFC 4301)
- RFC 2402, *IP Authentication Header* (obsoleted by RFC 4302)  
This RFC is not supported on the ES PIC.
- RFC 2403, *The Use of HMAC-MD5-96 within ESP and AH*
- RFC 2404, *The Use of HMAC-SHA-1-96 within ESP and AH* (obsoleted by RFC 4305)
- RFC 2405, *The ESP DES-CBC Cipher Algorithm With Explicit IV*
- RFC 2406, *IP Encapsulating Security Payload (ESP)* (obsoleted by RFC 4303 and RFC 4305)
- RFC 2407, *The Internet IP Security Domain of Interpretation for ISAKMP* (obsoleted by RFC 4306)
- RFC 2408, *Internet Security Association and Key Management Protocol (ISAKMP)* (obsoleted by RFC 4306)
- RFC 2409, *The Internet Key Exchange (IKE)* (obsoleted by RFC 4306)
- RFC 2410, *The NULL Encryption Algorithm and Its Use With IPsec*
- RFC 2451, *The ESP CBC-Mode Cipher Algorithms*
- RFC 2460, *Internet Protocol, Version 6 (IPv6)*
- RFC 3193, *Securing L2TP using IPsec*
- RFC 3602, *The AES-CBC Cipher Algorithm and Its Use with IPsec*
- RFC 3947, *Negotiation of NAT-Traversal in the IKE*
- RFC 3948, *UDP Encapsulation of IPsec ESP Packets*
- RFC 4301, *Security Architecture for the Internet Protocol*
- RFC 4302, *IP Authentication Header*  
This RFC is not supported on the ES PIC.
- RFC 4303, *IP Encapsulating Security Payload (ESP)*

- RFC 4305, *Cryptographic Algorithm Implementation Requirements for Encapsulating Security Payload (ESP) and Authentication Header (AH)*
- RFC 4306, *Internet Key Exchange (IKEv2) Protocol*
- RFC 4307, *Cryptographic Algorithms for Use in the Internet Key Exchange Version 2 (IKEv2)*
- RFC 4308, *Cryptographic Suites for IPsec*

**NOTE:** Only Suite VPN-A is supported in Junos OS.

- RFC 4835, *Cryptographic Algorithm Implementation Requirements for Encapsulating Security Payload (ESP) and Authentication Header (AH)*
- RFC 5996, *Internet Key Exchange Protocol Version 2 (IKEv2)*

Junos OS partially supports the following RFCs for IPsec and IKE:

- RFC 3526, *More Modular Exponential (MODP) Diffie-Hellman groups for Internet Key Exchange (IKE)*
- RFC 5114, *Additional Diffie-Hellman Groups for Use with IETF Standards*
- RFC 5903, *Elliptic Curve Groups modulo a Prime (ECP Groups) for IKE and IKEv2*

The following RFCs and Internet draft do not define standards, but provide information about IPsec, IKE, and related technologies. The IETF classifies them as “Informational.”

- RFC 2104, *HMAC: Keyed-Hashing for Message Authentication*
- RFC 2412, *The OAKLEY Key Determination Protocol*
- RFC 3706, *A Traffic-Based Method of Detecting Dead Internet Key Exchange (IKE) Peers*
- Internet draft draft-eastlake-sha2-02.txt, *US Secure Hash Algorithms (SHA and HMAC-SHA)* (expires July 2006)

## Supported L2TP Standards

---

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, Junos OS substantially supports the following RFC, which defines the standard for Layer 2 Tunneling Protocol (L2TP).

- RFC 2661, *Layer Two Tunneling Protocol "L2TP"*

The following RFC does not define a standard, but provides information about technology related to L2TP. The IETF classifies it as "Informational."

- RFC 2866, *RADIUS Accounting*

### Related Documentation

## Supported Link Services Standards

---

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, Junos OS substantially supports the following RFCs, which define standards for link services.

- RFC 1990, *The PPP Multilink Protocol (MP)*
- RFC 2364, *PPP Over AAL5*
- RFC 2686, *The Multi-Class Extension to Multi-Link PPP*

The following features are not supported:

- Negotiation of address field compression and protocol field compression PPP NCP options; instead, a full 4-byte PPP header is always sent
- Prefix elision

### Related Documentation

## Supported NAT and SIP Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, Junos OS substantially supports the following Network Address Translation (NAT) and Session Initiation Protocol (SIP) standards. NAT supports SIP dialogs and UDP/IP version 4 (IPv4) transport of SIP messages.

Junos OS substantially supports the following RFC and Internet draft.

- RFC 3261, *SIP: Session Initiation Protocol*
- Internet draft draft-mrw-behave-nat66-01.txt, *IPv6-to-IPv6 Network Address Translation (NAT66)*

The following RFCs do not define standards, but provide information about NAT. The IETF classifies them variously as “Best Current Practice,” “Historic,” or “Informational.”

- RFC 1631, *The IP Network Address Translator (NAT)*
- RFC 2663, *IP Network Address Translator (NAT) Terminology and Considerations*
- RFC 2766, *Network Address Translation - Protocol Translation (NAT-PT)*
- RFC 2993, *Architectural Implications of NAT*
- RFC 3022, *Traditional IP Network Address Translator (Traditional NAT)*
- RFC 4787, *Network Address Translation (NAT) Behavioral Requirements for Unicast UDP*
- RFC 5382, *NAT Behavioral Requirements for TCP*
- RFC 5508, *NAT Behavioral Requirements for ICMP*

### Related Documentation

- [Services Interfaces Overview for Routing Devices](#)
- [MX Series Interface Module Reference](#)
- [Accessing Standards Documents on the Internet on page 2227](#)

## Supported RPM Standard

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, Junos OS substantially supports real-time performance monitoring (RPM), and provides MIB support with extensions in substantial support of RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*.

### Related Documentation

- [Services Interfaces Overview for Routing Devices](#)
- [MX Series Interface Module Reference](#)

## Supported Voice Services Standards

---

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, Junos OS substantially supports the following following RFCs, which define standards for technologies used with voice services.

- RFC 2508, *Compressing IP/UDP/RTP Headers for Low-Speed Serial Links*
- RFC 2509, *IP Header Compression over PPP*

### Related Documentation

- [Supported VPLS Standards on page 2296](#)

## Supported Carrier-of-Carriers and Interprovider VPN Standards

Junos OS substantially supports the following RFCs, which define standards for carrier-of-carriers and interprovider virtual private networks (VPNs).

- RFC 3107, *Carrying Label Information in BGP-4*
- RFC 3916, *Requirements for Pseudo-Wire Emulation Edge-to-Edge (PWE3)*  
Supported on MX Series routers with the Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP.
- RFC 3985, *Pseudo Wire Emulation Edge-to-Edge (PWE3) Architecture*  
Supported on MX Series routers with the Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP.
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 5601, *Pseudowire (PW) Management Information Base (MIB)*
- RFC 5603, *Ethernet Pseudowire (PW) Management Information Base (MIB)*
- RFC 6368, *Internal BGP as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*

### **Related Documentation**

- [Accessing Standards Documents on the Internet on page 2227](#)

---

## Supported EVPN Standards

Junos OS supports the following RFCs and Internet drafts that define standards for EVPNs:

- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4761, *Virtual Private LAN Service (VPLS) Using BGP for Auto-Discovery and Signaling*
- RFC 7432, *BGP MPLS-Based Ethernet VPN*

The following features are not supported:

- Automatic derivation of Ethernet segment (ES) values. Only static ES configurations are supported.
- Host proxy ARP.
- MAC mobility extended community.
- VLAN bundle service interface.

---

## Supported Layer 2 VPN Standards

Junos OS substantially supports the following Internet drafts, which define standards for Layer 2 virtual private networks (VPNs).

- Internet draft draft-kompella-l2vpn-vpls-multihoming, *Multi-homing in BGP-based Virtual Private LAN Service*
- Internet draft draft-kompella-ppvnp-l2vpn-03.txt, *Layer 2 VPNs Over Tunnels*

## Supported Layer 3 VPN Standards

Junos OS substantially supports the following RFCs, which define standards for Layer 3 virtual private networks (VPNs).

- RFC 2283, *Multiprotocol Extensions for BGP-4*
- RFC 2685, *Virtual Private Networks Identifier*
- RFC 2858, *Multiprotocol Extensions for BGP-4*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*

The traceroute functionality is supported only on transit routers.

- RFC 4576, *Using a Link State Advertisement (LSA) Options Bit to Prevent Looping in BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4577, *OSPF as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4659, *BGP-MPLS IP Virtual Private Network (VPN) Extension for IPv6 VPN*
- RFC 4684, *Constrained Route Distribution for Border Gateway Protocol/MultiProtocol Label Switching (BGP/MPLS) Internet Protocol (IP) Virtual Private Networks (VPNs)*

The following RFCs do not define a standard, but provide information about technology related to Layer 3 VPNs. The IETF classifies them as a “Best Current Practice” or “Informational.”

- RFC 1918, *Address Allocation for Private Internets*
- RFC 2917, *A Core MPLS IP VPN Architecture*

## Supported Multicast VPN Standards

---

Junos OS substantially supports the following RFCs and Internet draft, which define standards for multicast virtual private networks (VPNs).

- RFC 6513, *Multicast in MPLS/BGP IP VPNs*
- RFC 6514, *BGP Encodings and Procedures for Multicast in MPLS/BGP IP VPNs*
- RFC 6515, *IPv4 and IPv6 Infrastructure Addresses in BGP Updates for Multicast VPN*

## Supported VPLS Standards

---

Junos OS substantially supports the following Internet RFCs and draft, which define standards for virtual private LAN service (VPLS).

- RFC 4761, *Virtual Private LAN Service (VPLS) Using BGP for Auto-Discovery and Signaling*
  - RFC 4762, *Virtual Private LAN Service (VPLS) Using Label Distribution Protocol (LDP) Signaling*
- FEC 128, FEC 129, control bit 0, the Ethernet pseudowire type 0x0005, and the Ethernet tagged mode pseudowire type 0x0004 are supported.
- RFC 6391, *Flow-Aware Transport of Pseudowires over an MPLS Packet Switched Network*
  - RFC 6790, *The Use of Entropy Labels in MPLS Forwarding*
  - Internet draft draft-kompella-l2vpn-vpls-multihoming, *Multi-homing in BGP-based Virtual Private LAN Service*
