The following configuration example allows replication of version 9 export packets to two flow servers.

```
forwarding-options {
 sampling {
 instance inst1 {
 input {
 rate 1;
 }
 family inet;
 output {
 flow-server 10.10.3.2 {
 port 2055;
 version9 {
 template {
 ipv4;
 }
 }
 }
 flow-server 172.17.20.62 {
 port 2055;
 version9 {
 template {
 ipv4;
 }
 }
 }
 }
 flow-inactive-timeout 30;
 flow-active-timeout 60;
 interface sp-4/0/0 {
 source-address 10.10.3.4;
 }
 }
 }
}
```

```
 }
 }
```

## Logging cflowd Flows Before Export

To collect the cflowd flows in a log file before they are exported, include the **local-dump** statement at the **[edit forwarding-options sampling output flow-server *hostname*]** hierarchy level:

```
[edit forwarding-options sampling output flow-server hostname]
local-dump;
```

By default, the flows are collected in **/var/log/sampled**; to change the filename, include the **filename** statement at the **[edit forwarding-options sampling traceoptions]** hierarchy level. For more information about changing the filename, see [“Configuring Traffic Sampling Output” on page 876](#).

**NOTE:** Because the **local-dump** statement adds extra overhead, you should use it only while debugging cflowd problems, not during normal operation.

The following is an example of the flow information. The AS number exported is the origin AS number. All flows that belong under a cflowd header are dumped, followed by the header itself:

```
Jun 27 18:35:43 v5 flow entry
Jun 27 18:35:43 Src addr: 192.53.127.1
Jun 27 18:35:43 Dst addr: 192.6.255.15
Jun 27 18:35:43 Nhop addr: 192.6.255.240
Jun 27 18:35:43 Input interface: 5
Jun 27 18:35:43 Output interface: 3
Jun 27 18:35:43 Pkts in flow: 15
Jun 27 18:35:43 Bytes in flow: 600
Jun 27 18:35:43 Start time of flow: 7230
Jun 27 18:35:43 End time of flow: 7271
Jun 27 18:35:43 Src port: 26629
Jun 27 18:35:43 Dst port: 179
Jun 27 18:35:43 TCP flags: 0x10
Jun 27 18:35:43 IP proto num: 6
Jun 27 18:35:43 TOS: 0xc0
Jun 27 18:35:43 Src AS: 7018
Jun 27 18:35:43 Dst AS: 11111
Jun 27 18:35:43 Src netmask len: 16
Jun 27 18:35:43 Dst netmask len: 0
```

[... 41 more version 5 flow entries; then the following header:]

```
Jun 27 18:35:43 cflowd header:
Jun 27 18:35:43 Num-records: 42
Jun 27 18:35:43 Version: 5
Jun 27 18:35:43 low seq num: 118
Jun 27 18:35:43 Engine id: 0
Jun 27 18:35:43 Engine type: 3
```

- [Example: Multiple Port Mirroring with Next-Hop Groups Configuration on page 1128](#)

## Understanding Port Mirroring

---

On routers containing an Internet Processor II application-specific integrated circuit (ASIC) or T Series Internet Processor, you can send a copy of an IP version 4 (IPv4) or IP version 6 (IPv6) packet from the router to an external host address or a packet analyzer for analysis. This is known as *port mirroring*.

Port mirroring is different from traffic sampling. In traffic sampling, a sampling key based on the IPv4 header is sent to the Routing Engine. There, the key can be placed in a file, or cflowd packets based on the key can be sent to a cflowd server. In port mirroring, the entire packet is copied and sent out through a next-hop interface.

You can configure simultaneous use of sampling and port mirroring, and set an independent sampling rate and run-length for port-mirrored packets. However, if a packet is selected for both sampling and port mirroring, only one action can be performed and port mirroring takes precedence. For example, if you configure an interface to sample every packet input to the interface and a filter also selects the packet to be port mirrored to another interface, only the port mirroring would take effect. All other packets not matching the explicit filter port-mirroring criteria continue to be sampled when forwarded to their final destination.

## Configuring Port Mirroring

---

To prepare traffic for port mirroring, include the **filter** statement at the **[edit firewall family inet]** hierarchy level:

```
filter filter-name;
```

This filter at the **[edit firewall family (inet | inet6)]** hierarchy level selects traffic to be port-mirrored:

```
filter filter-name {
 term term-name {
 then {
 port-mirror;
 accept;
 }
 }
}
```

To configure port mirroring on a logical interface, configure the following statements at the **[edit forwarding-options port-mirroring]** hierarchy level:

```
[edit forwarding-options port-mirroring family inet]
input {
 maximum-packet-length bytes;
 rate rate;
 run-length number;
}
family (inet|inet6) {
 output {
 interface interface-name {
 next-hop address;
 }
 no-filter-check;
 }
}
```

or

```
[edit forwarding-options port-mirroring]
input {
 maximum-packet-length bytes;
 rate rate;
 run-length number;
}
family inet6 {
 output {
 next-hop-group group-name {
 group-type inet6;
 interface interface-name {
 next-hop ipv6-address;
 }
 }
 next-hop-subgroup group-name {
 interface interface-name {
 next-hop ipv6-address;
 }
 }
 }
}
```

**NOTE:** The input statement can also be configured at the `[edit forwarding-options port-mirroring]` hierarchy level. This is only maintained for backward compatibility. However, the configuration of the output statement is deprecated at the `[edit forwarding-options port-mirroring]` hierarchy level.

Specify the port-mirroring destination by including the `next-hop` statement at the `[edit forwarding-options port-mirroring output interface interface-name]` hierarchy level:

```
next-hop address;
```

**NOTE:** For IPv4 port mirroring to reach a next-hop destination, you must manually include a static Address Resolution Protocol (ARP) entry in the router configuration.

You can also specify the port-mirroring destination by including the `next-hop-group` statement at the `[edit forwarding-options port-mirroring family inet6 output]` hierarchy level:

```
next-hop-group group-name {
 group-type inet6;
 interface interface-name {
 next-hop ipv6-address;
 }
 next-hop-subgroup group-name {
 interface interface-name {
 next-hop ipv6-address;
 }
 }
}
```

The `no-filter-check` statement is required when you send port-mirrored traffic to a Tunnel PIC that has a filter applied to it. en

The interface used to send the packets to the analyzer is the output interface configured above at the `[edit forwarding-options port-mirroring family (inet | inet6) output]` hierarchy level. You can use any physical interface type, including generic routing encapsulation (GRE) tunnel interfaces. The next-hop address specifies the destination address; this statement is mandatory for non point-to-point interfaces, such as Ethernet interfaces.

To configure the sampling rate or duration, include the `rate` or `run-length` statement at the `[edit forwarding-options port-mirroring input]` hierarchy level.

You can trace port-mirroring operations the same way you trace sampling operations. For more information, see [“Tracing Traffic Sampling Operations” on page 878](#).

For more information about port mirroring, see the following sections:

- [Examples: Configuring Port Mirroring on page 1120](#)

## Configuring Tunnels

In typical applications, you send the sampled packets to an analyzer or a workstation for analysis, rather than another router. If you must send this traffic over a network, you should use tunnels. For more information about tunnel interfaces, see *Tunnel Properties*.

The MX Series routers support Dense Port Concentrators (DPCs) with built-in Ethernet ports, which do not support Tunnel Services PICs. To create tunnel interfaces on an MX Series router with a DPC, you configure the DPC and the corresponding Packet Forwarding Engine to use for tunneling services at the **[edit chassis]** hierarchy level. You also configure the amount of bandwidth reserved for tunnel services. The Junos OS creates tunnel interfaces on the Packet Forwarding Engine.

To create tunnel interfaces on MX Series routers, include the following statements at the **[edit chassis]** hierarchy level:

```
[edit chassis]
fpc slot-number {
 pic number {
 tunnel-services {
 bandwidth bandwidth-value;
 }
 }
}
```

Include the **fpc slot-number** statement to specify the slot number of the DPC. If two SCBs are installed, the range is 0 through 1. If three SCBs are installed, the range is 0 through 5 and 7 through 11.

Include the **pic number** statement to specify the number of the Packet Forwarding Engine on the DPC. The range is 0 through 3.

You can also specify the amount of bandwidth to allocate for tunnel traffic on each Packet Forwarding Engine by including the **bandwidth bandwidth-value** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level:

- **1g** indicates that 1 Gbps of bandwidth is reserved for tunnel traffic. Configure this option only for a Packet Forwarding Engine on a Gigabit Ethernet 40-port DPC.
- **10g** indicates that 10 Gbps of bandwidth is reserved for tunnel traffic. Configure this option only for a Packet Forwarding Engine on a 10-Gigabit Ethernet 4-port DPC.
- **20g** or **40g**—Configure 20 gigabits per second or 40 gigabits per second only on an MX Series router with the MPC3E and the 100-Gigabit CFP MIC.

If you specify a bandwidth that is not compatible with the type of DPC and Packet Forwarding Engine, tunnel services are not activated. For example, you cannot specify a

bandwidth of 1 Gbps for a Packet Forwarding Engine on a 10-Gigabit Ethernet 4-port DPC.

When you configure tunnel interfaces on the Packet Forwarding Engine of a 10-Gigabit Ethernet 4-port DPC, the Ethernet interfaces for that port are removed from service and are no longer visible in the command-line interface (CLI). The Packet Forwarding Engine of a 10-Gigabit Ethernet 4-port DPC supports either tunnel interfaces or Ethernet interfaces, but not both. Each port on the 10-Gigabit Ethernet 4-port DPC includes two LEDs, one for tunnel services and one for Ethernet services, to indicate which type of service is being used. On the Gigabit Ethernet 40-port DPC, you can configure both tunnel and Ethernet interfaces at the same time.

If your router is equipped with a Tunnel PIC, you can forward duplicate packets to multiple interfaces by configuring a next-hop group. To configure a next-hop group, include the **next-hop-group** statement at the **[edit forwarding-options]** hierarchy level:

```
[edit forwarding-options]
next-hop-group group-names {
 interface interface-name {
 next-hop address;
 }
}
```

The **interface** statement specifies the interface that sends out sampled information. The **next-hop** statement specifies the next-hop addresses to which to send the sampled information.

For IPv6 port mirroring to reach next-hop destination, you can configure a **next-hop-group** statement at the **[edit forwarding-options port-mirroring family inet6 output]** hierarchy level:

```
next-hop-group group-name {
 group-type inet6;
 interface interface-name {
 next-hop ipv6-address;
 }
 next-hop-subgroup group-name {
 interface interface-name {
 next-hop ipv6-address;
 }
 }
}
```

Next-hop groups have the following restrictions:

- Next-hop groups are supported for inet, inet6, and bridge family.
- Next-hop groups are supported on M Series and MX Series routers.
- Next-hop groups or next-hop subgroups support up to 16 next-hop addresses.
- Up to 30 next-hop groups are supported.
- Each next-hop group is expected to have at least two next-hop addresses.
- Each next-hop subgroup supports up to 16 next-hop groups.

## Port Mirroring with Next-Hop Groups

You can configure next-hop groups for M Series, MX Series, and TX Series routers using either IP addresses or Layer 2 addresses for the next hops. Use the **group-type [ inet | inet6 | layer-2 ]** statement at **[edit forwarding-options next-hop-group next-hop-group-name]** hierarchy level to establish the next-hop groups. You can reference more than one port mirroring instance in a filter on MX Series routers. Use the **port-mirror-instance instance-name** statement at the **[edit firewall family family-name filter filter-name term term-name]** hierarchy level to refer to one of several port mirroring instances. For more information about this configuration, see the *Layer 2 Port Mirroring Feature Guide for Routing Devices*.

**NOTE:** On MX Series routers with MPCs, port mirroring instances can only be bound to the FPC level and not up to the PIC level. For MX series routers with a DPC card, both levels are supported.

On M Series, MX Series, and T Series routers only, you can configure port mirroring using next-hop groups, also known as *multipacket port mirroring*, without the presence of a Tunnel PIC. To configure this functionality, include the **next-hop-group** statement at the **[edit forwarding-options port-mirror family [inet | inet6] output]** or **[edit forwarding-options port-mirror instance instance-name family inet output]** hierarchy level:

```
[edit forwarding-options]
port-mirror {
 family inet {
 output {
 next-hop-group group-name {
 interface interface-name {
 next-hop address;
 }
 }
 }
 }
}
or
[edit forwarding-options]
port-mirror {
 family inet6 {
 output {
 next-hop-group group-name {
 group-type inet6;
 interface interface-name {
 next-hop ipv6-address;
 }
 }
 next-hop-subgroup group-name {
 interface interface-name {
 next-hop ipv6-address;
 }
 }
 }
 }
}
```

```

 }
 }
}
or
[edit forwarding-options]
port-mirror {
 instance instance-name {
 family (inet | vpls) {
 output {
 next-hop-group group-name;
 }
 }
 }
}

```

You define the next-hop group by including the **next-hop-group** statement at the **[edit forwarding-options]** hierarchy level. For an example, see [“Examples: Configuring Port Mirroring” on page 940](#). This configuration is supported with IPv4 and IPv6 addresses.

You can disable this configuration by including a **disable** or **disable-all-instances** statement at the **[edit forwarding-options port-mirror]** hierarchy level or by including a **disable** statement at the **[edit forwarding-options port-mirror instance *instance-name*]** hierarchy level. You can display the settings and network status by issuing the **show forwarding-options next-hop-group** and **show forwarding-options port-mirroring** operational commands.

**NOTE:** If you try to bind any derived instance to the FPC, a commit error will occur.

## Configuring Inline Port Mirroring

Inline port mirroring provides you with the ability to specify instances that are not bound to the flexible PIC concentrator (FPC) in the firewall filter’s **then port-mirror-instance** action. This way, you are not limited to only two port-mirror instances per FPC. Inline port mirroring decouples the port-mirror destination from the input parameters like **rate**. While the input parameters are programmed in the switch interface board, the next-hop destination of the mirrored packet is available in the packet itself. Inline port mirroring is supported only on MX Series routers with MPCs.

Using inline port mirroring, a port-mirror instance will have an option to inherit input parameters from another instance that specifies it, as shown in the following CLI configuration example:

```

instance pm2 {
 + input-parameters-instance pm1;
 family inet {
 output {
 interface ge-1/2/3.0 {
 next-hop 50.0.0.3;
 }
 }
 }
}

```

```
 }
 }
}
```

Multiple levels of inheritance are not allowed. One instance can be referred by multiple instances. An instance can refer to another instance that is defined before it. Forward references are not allowed and an instance cannot refer to itself, doing so will cause an error during configuration parsing.

The user can specify an instance that is not bound to the FPC in the firewall filter. The specified filter should inherit one of the two instances that have been bound to the FPC. If it does not, the packet is not marked for port-mirroring. If it does, then the packet will be sampled using the input parameters specified by the referred instance but the copy will be sent to the its own destination.

## Filter-Based Forwarding with Multiple Monitoring Interfaces

If port-mirrored packets are to be distributed to multiple monitoring or collection interfaces based on patterns in packet headers, it is helpful to configure a filter-based forwarding (FBF) filter on the port-mirroring egress interface.

When an FBF filter is installed as an output filter, a packet that is forwarded to the filter has already undergone at least one route lookup. After the packet is classified at the egress interface by the FBF filter, it is redirected to another routing table for additional route lookup. Obviously, the route lookup in the latter routing table (designated by an FBF routing instance) must result in a different next hop from those from the previous tables the packet has passed through, to avoid packet looping inside the Packet Forwarding Engine.

For more information about FBF configuration, see the *Junos OS Routing Protocols Library for Routing Devices*. For an example of FBF applied to an output interface, see [“Examples: Configuring Port Mirroring” on page 940](#).

## Restrictions

The following restrictions apply to port-mirroring configurations:

- The interface you configure for port mirroring should not participate in any kind of routing activity.
- The destination address you specify should not have a route to the ultimate traffic destination. For example, if the sampled IPv4 packets have a destination address of **10.68.9.10** and the port-mirrored traffic is sent to **10.68.20.15** for analysis, the device associated with the latter address should not know a route to **10.68.9.10**. Also, it should not send the sampled packets back to the source address.
- IPv4 and IPv6 traffic is supported. For IPv6 port mirroring, you must configure the next-hop router with an IPv6 neighbor before mirroring the traffic, similar to an ARP request for IPv4 traffic. All the restrictions applied to IPv4 configurations should also apply to IPv6.
- On M120 and M320 routers, multiple next-hop mirroring is not supported.

- Because M320 routers do not support multiple bindings of port-mirror instances per FPC, the **port-mirror-instance** action is not supported in firewall filters for these routers.
- Port mirroring in the ingress and egress direction is not supported for link services IQ (lsq-) interfaces.
- On M Series routers other than the M120 and M320 routers, only one family protocol (either IPv4 or IPv6) is supported at a time.
- Port mirroring supports up to 16 next hops.
- Only transit data is supported.
- You can configure multiple port-mirroring interfaces per router.
- On routers containing an Internet Processor II application-specific integrated circuit (ASIC), you must include a firewall filter with both the **accept** action and the **port-mirror** action modifier on the inbound interface. Do not include the **discard** action, or port mirroring will not work.
- If the port-mirroring interface is a non-point-to-point interface, you must include an IP address under the **port-mirroring** statement to identify the other end of the link. This IP address must be reachable for you to see the sampled traffic. If the port-mirroring interface is an Ethernet interface, the router should have an Address Resolution Protocol (ARP) entry for it. The following sample configuration sets up a static ARP entry.
- You do not need to configure firewall filters on both inbound and outbound interfaces, but at least one is necessary on the inbound interface to provide the copies of the packets to send to an analyzer.
- Inline port mirroring is supported only on MX Series routers with MPCs.
- Configuration for both port mirroring and traffic sampling are handled by the same daemon, so in order to view a trace log file for port mirroring, you must configure the **traceoptions** option under traffic sampling.

## Configuring Port Mirroring on Services Interfaces

A special situation arises when you configure unit **0** of a services interface (AS or Multiservices PIC) to be the port-mirroring logical interface, as in the following example:

```
[edit forwarding-options]
port-mirroring {
 input {
 rate 1;
 }
 family inet {
 output {
 interface sp-1/0/0.0;
 }
 }
}
```

Since any traffic directed to unit **0** on a services interface is targeted for monitoring (cflowd packets are generated for it), the sample port-mirroring configuration indicates

that the customer would like to have cflowd records generated for the port-mirrored traffic.

However, generation of cflowd records requires the following additional configuration; if it is missing, the port-mirrored traffic is simply dropped by the services interface without generating any cflowd packets.

```
[edit forwarding-options]
sampling {
 instance instance1 { # named instances of sampling parameters
 input {
 rate 1;
 }
 family inet {
 output {
 flow-server 172.16.28.65 {
 port 1230;
 }
 }
 interface sp-1/0/0 { # If the port-mirrored traffic requires monitoring, this
 # interface must be same as that specified in the
 # port-mirroring configuration.
 source-address 3.1.2.3;
 }
 }
 }
}
```

**NOTE:** Another way to configure sp-1/0/0 to generate cflowd records is to use only the sampling configuration, but include a firewall filter `sample` action instead of a port-mirror action.

---

## Examples: Configuring Port Mirroring

The following example sends port-mirrored traffic to multiple cflowd servers or packet analyzers:

```
[edit interfaces]
ge-1/0/0 { # This is the input interface where packets enter the router.
 unit 0 {
 family inet {
 filter {
 input mirror_pkts; # Here is where you apply the first filter.
 }
 address 10.11.0.1/24;
 }
 }
}
ge-1/1/0 { # This is an exit interface for HTTP packets.
 unit 0 {
 family inet {
 address 10.12.0.1/24;
 }
 }
}
```

```

 }
 }
 ge-1/2/0 { # This is an exit interface for HTTP packets.
 unit 0 {
 family inet {
 address 10.13.0.1/24;
 }
 }
 }
 so-0/3/0 { # This is an exit interface for FTP packets.
 unit 0 {
 family inet {
 address 10.1.1.1/30;
 }
 }
 }
 so-4/3/0 { # This is an exit interface for FTP packets.
 unit 0 {
 family inet {
 address 10.2.2.2/30;
 }
 }
 }
 so-7/0/0 { # This is an exit interface for all remaining packets.
 unit 0 {
 family inet {
 address 10.5.5.5/30;
 }
 }
 }
 so-7/0/1 { # This is an exit interface for all remaining packets.
 unit 0 {
 family inet {
 address 10.6.6.6/30;
 }
 }
 }
 vt-3/3/0 { # The tunnel interface is where you send the port mirrored traffic.
 unit 0 {
 family inet;
 }
 unit 1 {
 family inet {
 filter {
 input collect_pkts; # This is where you apply the second firewall filter.
 }
 }
 }
 }
}
[edit forwarding-options]
port-mirroring { # This is required when you configure next-hop groups.
 input {
 rate 1; # This rate port mirrors one packet for every one received (1:1 = all
 # packets).
 }
 family inet {

```

```
 output { # This sends traffic to a tunnel interface to prepare for multiport mirroring.
 interface vt-3/3/0.1;
 no-filter-check;
 }
 }
}
next-hop-group ftp-traffic { # Point-to-point interfaces require you to specify the interface
 # name only.
 interface so-4/3/0.0;
 interface so-0/3/0.0;
}
next-hop-group http-traffic { # You need to configure a next hop for multipoint interfaces
 # (Ethernet).
 interface ge-1/1/0.0 {
 next-hop 10.12.0.2;
 }
 interface ge-1/2/0.0 {
 next-hop 10.13.0.2;
 }
}
next-hop-group default-collect {
 interface so-7/0/0.0;
 interface so-7/0/1.0;
}
[edit firewall]
family inet {
 filter mirror_pkts { # Apply this filter to the input interface.
 term catch_all {
 then {
 count input_mirror_pkts;
 port-mirror; # This action sends traffic to be copied and port mirrored.
 accept;
 }
 }
 }
 filter collect_pkts { # Apply this filter to the tunnel interface.
 term ftp-term { # This term sends FTP traffic to an FTP next-hop group.
 from {
 protocol ftp;
 }
 then next-hop-group ftp-traffic;
 }
 term http-term { # This term sends HTTP traffic to an HTTP next-hop group.
 from {
 protocol http;
 }
 then next-hop-group http-traffic;
 }
 term default { # This term sends all remaining traffic to a final next-hop group.
 then next-hop-group default-collectors;
 }
 }
}
```

The following example demonstrates configuration of filter-based forwarding at the output interface. In this example, the packet flow follows this path:

1. A packet arrives at interface **fe-1/2/0.0** with source and destination addresses **10.50.200.1** and **10.50.100.1**, respectively.
2. The route lookup in routing table **inet.0** points to the egress interface **so-0/0/3.0**.
3. The output filter installed at **so-0/0/3.0** redirects the packet to routing table **fbf.inet.0**.
4. The packet matches the entry **10.50.100.0/25**, and finally leaves the router from interface **so-2/0/0.0**.

```
[edit interfaces]
so-0/0/3 {
 unit 0 {
 family inet {
 filter {
 output fbf;
 }
 address 10.50.10.2/25;
 }
 }
}
fe-1/2/0 {
 unit 0 {
 family inet {
 address 10.50.50.2/25;
 }
 }
}
so-2/0/0 {
 unit 0 {
 family inet {
 address 10.50.20.2/25;
 }
 }
}
[edit firewall]
filter fbf {
 term 0 {
 from {
 source-address {
 10.50.200.0/25;
 }
 }
 then routing-instance fbf;
 }
 term d {
 then count d;
 }
}
[edit routing-instances]
fbf {
 instance-type forwarding;
 routing-options {
```

```
 static {
 route 10.50.100.0/25 next-hop so-2/0/0.0;
 }
 }
}
[edit routing-options]
interface-routes {
 rib-group inet fbf-group;
}
static {
 route 10.50.100.0/25 next-hop 10.50.10.1;
}
rib-groups {
 fbf-group {
 import-rib [inet.0 fbf.inet.0];
 }
}
```

The following example shows configuration of port mirroring using next-hop groups or multipacket port mirroring:

```
forwarding-options {
 next-hop-group inet_nhg {
 group-type inet;
 interface ge-2/0/2.101 {
 next-hop 10.2.0.2;
 }
 interface ge-2/2/8.2 {
 next-hop 10.8.0.2;
 }
 }
 next-hop-group vpls_nhg {
 group-type layer-2;

 }
 }
 }
}
}

```

The following example shows configuration of port mirroring using next-hop groups or multipacket port mirroring on a T Series router:

```
forwarding-options {
 next-hop-group inet_nhg {
 group-type inet;
 interface so-0/0/0.0; # There is no need for the nexthop address on T Series routers
 interface ge-2/0/2.0 {
 next-hop 1.2.3.4
 }
 }
 next-hop-subgroup sub_inet {
 interface so-1/2/0.0;
 interface ge-6/1/2.0 {
 next-hop 6.7.8.9;
 }
 }
 next-hop-group vpls_nhg_2 {
 group-type layer-2;
 interface ge-2/2/1.100;
 interface ge-2/3/9.0;
 }
}
port-mirroring {
 disable-all-instances; /*Disable all port-mirroring instances */
 disable; /* Disable the global instance */
 input {
 rate 10;
 run-length 4;
 }
 family inet {
 output {
 next-hop-group inet_nhg;
 }
 }
 family vpls {
 output {
 next-hop-group vpls_nhg;
 }
 }
 instance {
 inst1 {
 disable; /* Disable this instance */
 input {
 rate 1;
 maximum-packet-length 200;
 }
 family inet {
 output {
 next-hop-group inet_nhg;
 }
 }
 family vpls {
 output {
 next-hop-group vpls_nhg_2;
 }
 }
 }
 }
}
```

```
}

```

The following example shows configuration of inline port mirroring using PM1, PM2, and PM3 as our port mirror instances.

```
instance {
 pm1 {
 input {
 rate 3;
 }
 family inet {
 output {
 interface ge-1/2/2.0 {
 next-hop 40.0.0.2;
 }
 }
 }
 }
 pm2 {
 input-parameters-instance pm1;
 family inet {
 output {
 interface ge-1/2/3.0 {
 next-hop 50.0.0.3;
 }
 }
 }
 }
 pm3 {
 input {
 rate 3;
 }
 family inet6 {
 output {
 interface ge-1/2/3.0 {
 next-hop 5::5:5:1;
 }
 }
 }
 }
}
firewall {
 filter pm_filter {
 term t1 {
 then port-mirror-instance pm2;
 }
 }
 filter nhg6_filter6 {
 term t6 {
 then next-hop-group inet6-nhg6;
 }
 }
}
chassis {
 fpc 1 {
 port-mirror-instance pm1;
 }
}
```

```
}
```

The packets will be sampled at a rate of 3, and the copy is sent to 50.0.0.3.

## Example: Multiple Port Mirroring with Next-Hop Groups Configuration

When you need to analyze traffic containing more than one packet type, or you wish to perform multiple types of analysis on a single type of traffic, you can implement multiple port mirroring and next-hop groups. You can make up to 16 copies of traffic per group and send the traffic to next-hop group members. A maximum of 30 groups can be configured on a router at any given time. The port-mirrored traffic can be sent to any interface, except aggregated SONET/SDH, aggregated Ethernet, loopback (**lo0**), or administrative (**fxp0**) interfaces. To send port-mirrored traffic to multiple flow servers or packet analyzers, you can use the **next-hop-group** statement at the **[edit forwarding-options]** hierarchy level.

Figure 42: Active Flow Monitoring—Multiple Port Mirroring with Next-Hop Groups Topology Diagram

Figure 35 on page 950 shows an example of how to configure multiple port mirroring with next-hop groups. All traffic enters the monitoring router at interface **ge-1/0/0**. A firewall filter counts and port-mirrors all incoming packets to a Tunnel Services PIC. A second filter is applied to the tunnel interface and splits the traffic into three categories: HTTP traffic, FTP traffic, and all other traffic. The three types of traffic are assigned to three separate next-hop groups. Each next-hop group contains a unique pair of exit interfaces that lead to different groups of packet analyzers and flow servers.

**NOTE:** Instances enabled to mirror packets to different destinations from the same PFE, also use different sampling parameters for each instance. When we configure Layer2 Port-mirroring with both global port-mirroring and instance based port-mirroring, PIC level instances will override FPC level and the FPC level will override the Global instance.

## Real-Time Performance Monitoring Services Overview

---

Real-Time Performance Monitoring (RPM) enables you to configure active probes to track and monitor traffic. Probes collect packets per destination and per application, including PING Internet Control Message Protocol (ICMP) packets, User Datagram Protocol and Transmission Control Protocol (UDP/TCP) packets with user-configured ports, user-configured Differentiated Services code point (DSCP) type-of-service (ToS) packets, and Hypertext Transfer Protocol (HTTP) packets. RPM provides Management Information Base (MIB) support with extensions for RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*.

You can also configure RPM services to determine automatically whether a path exists between a host router and its configured BGP neighbors. You can view the results of the discovery using an SNMP client. Results are stored in **pingResultsTable**, **jnxPingResultsTable**, **jnxPingProbeHistoryTable**, and **pingProbeHistoryTable**.

Probe configuration and probe results are supported by the command-line interface (CLI) and SNMP.

The following probe types are supported with DSCP marking:

- ICMP echo
- ICMP timestamp
- HTTP get (not available for BGP RPM services)
- UDP echo
- TCP connection
- UDP timestamp

With probes, you can monitor the following:

- Minimum round-trip time
- Maximum round-trip time
- Average round-trip time
- Standard deviation of the round-trip time
- Jitter of the round-trip time—The difference between the minimum and maximum round-trip time

One-way measurements for ICMP timestamp probes include the following:

- Minimum, maximum, standard deviation, and jitter measurements for egress and ingress times
- Number of probes sent
- Number of probe responses received
- Percentage of lost probes

**NOTE:** Timestamping is not supported on PTX Series Packet Transport Routers.

---

You can configure the following RPM thresholds:

- Round-trip time
- Ingress/egress delay
- Standard deviation
- Jitter
- Successive lost probes
- Total lost probes (per test)

Support is also implemented for user-configured CoS classifiers and for prioritization of RPM packets over regular data packets received on an input interface.

## Configuring RPM Probes

The owner name and test name identifiers of an RPM probe together represent a single RPM configuration instance. When you specify the test name, you also can configure the test parameters.

To configure the probe owner, test name, and test parameters, include the **probe** statement at the **[edit services rpm]** hierarchy level:

```
probe owner {
 test test-name {
 data-fill data;
 data-size size;
 destination-interface interface-name;
 destination-port port;
 dscp-code-point dscp-bits;
 hardware-timestamp;
 history-size size;
 moving-average-size number;
 one-way-hardware-timestamp;
 probe-count count;
 probe-interval seconds;
 probe-type type;
 routing-instance instance-name;
 source-address address;
 target (url url | address address);
 test-interval interval;
 thresholds thresholds;
 traps traps;
 }
}
```

Keep the following points in mind when you configure RPM clients and RPM servers:

- You cannot configure an RPM client that is PIC-based and an RPM server that is based on either the Packet Forwarding Engine or Routing Engine to receive the RPM probes.
- You cannot configure an RPM client that is Packet Forwarding Engine-based and an RPM server that receives the RPM probes to be on the PIC or Routing Engine.
- The RPM client and RPM server must be located on the same type of module. For example, if the RPM client is PIC-based, the RPM server must also be PIC-based, and if the RPM server is Packet Forwarding Engine-based, the RPM client must also be Packet Forwarding Engine-based.

- To specify a probe owner, include the **probe** statement at the **[edit services rpm]** hierarchy level. The probe owner identifier can be up to 32 characters in length.
- To specify a test name, include the **test** statement at the **[edit services rpm probe owner]** hierarchy level. The test name identifier can be up to 32 characters in length. A test represents the range of probes over which the standard deviation, average, and jitter are calculated.
- To specify the contents of the data portion of Internet Control Message Protocol (ICMP) probes, include the **data-fill** statement at the **[edit services rpm probe owner]** hierarchy level. The value can be a hexadecimal value. The **data-fill** statement is not valid with the **http-get** or **http-metadata-get** probe types.
- To specify the size of the data portion of ICMP probes, include the **data-size** statement at the **[edit services rpm probe owner]** hierarchy level. The size can be from 0 through 65400 and the default size is 0. The **data-size** statement is not valid with the **http-get** or **http-metadata-get** probe types.

**NOTE:** If you configure the hardware timestamp feature (see [“Configuring RPM Timestamping” on page 964](#)):

- The **data-size** default value is 32 bytes and 32 is the minimum value for explicit configuration. The UDP timestamp probe type is an exception; it requires a minimum data size of 44 bytes.
  - The **data-size** must be at least 100 bytes smaller than the default MTU of the interface of the RPM client interface.
- 
- On M Series and T Series routers, you configure the **destination-interface** statement to enable hardware timestamping of RPM probe packets. You specify an **sp-** interface to have the AS or Multiservices PIC add the hardware timestamps; for more information, see [“Configuring RPM Timestamping” on page 964](#). You can also include the **one-way-hardware-timestamp** statement to enable one-way delay and jitter measurements.
  - To specify the User Datagram Protocol (UDP) port or Transmission Control Protocol (TCP) port to which the probe is sent, include the **destination-port** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. The **destination-port** statement is used only for the UDP and TCP probe types. The value can be 7 or from 49160 through 65535.

When you configure either **probe-type udp-ping** or **probe-type udp-ping-timestamp** along with hardware timestamping, the value for the **destination-port** can be only 7. A constraint check prevents you from configuring any other value for the destination port in this case. This constraint does not apply when you are using one-way hardware timestamping.

- To specify the value of the Differentiated Services (DiffServ) field within the IP header, include the **dscp-code-point** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. The DiffServ code point (DSCP) bits value can be set to a valid 6-bit pattern; for example, 001111. It also can be set using an alias configured at

the **[edit class-of-service code-point-aliases dscp]** hierarchy level. The default is 000000.

- To specify the number of stored history entries, include the **history-size** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. Specify a value from 0 to 512. The default is 50.
- To specify a number of samples for making statistical calculations, include the **moving-average-size** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. Specify a value from 0 through 255.
- To specify the number of probes within a test, include the **probe-count** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. Specify a value from 1 through 15.
- To specify the time to wait between sending packets, include the **probe-interval** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. Specify a value from 1 through 255 seconds.
- To specify the packet and protocol contents of the probe, include the **probe-type** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. The following probe types are supported:
  - **http-get**—Sends a Hypertext Transfer Protocol (HTTP) get request to a target URL.
  - **http-metadata-get**—Sends an HTTP get request for metadata to a target URL.
  - **icmp-ping**—Sends ICMP echo requests to a target address.
  - **icmp-ping-timestamp**—Sends ICMP timestamp requests to a target address.
  - **tcp-ping**—Sends TCP packets to a target.
  - **udp-ping**—Sends UDP packets to a target.
  - **udp-ping-timestamp**—Sends UDP timestamp requests to a target address.

The following probe types support hardware timestamping of probe packets: **icmp-ping**, **icmp-ping-timestamp**, **udp-ping**, **udp-ping-timestamp**.

**NOTE:** Some probe types require additional parameters to be configured. For example, when you specify the **tcp-ping** or **udp-ping** option, you must configure the destination port using the **destination-port** statement. The **udp-ping-timestamp** option requires a minimum data size of 12; any smaller data size results in a commit error. The minimum data size for TCP probe packets is 1.

When you configure either **probe-type udp-ping** or **probe-type udp-ping-timestamp** along with the **one-way-hardware-timestamp** command, the value for the **destination-port** can be only 7. A constraint check prevents you for configuring any other value for the destination port in this case.

- To specify the routing instance used by ICMP probes, include the **routing-instance** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. The default routing instance is Internet routing table **inet.0**.
- To specify the source IP address used for ICMP probes, include the **source-address** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. If the source IP address is not one of the router's assigned addresses, the packet will use the outgoing interface's address as its source.
- To specify the destination address used for the probes, include the **target** statement at the **[edit services rpm probe owner test test-name]** hierarchy level.
  - For HTTP probe types, specify a fully formed URL that includes **http://** in the URL address.
  - For all other probe types, specify an IP version 4 (IPv4) address for the target host.
- To specify the time to wait between tests, include the **test-interval** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. Specify a value from 1 through 86400 seconds.

**NOTE:** Starting with Junos OS Release 15.1, the minimum period for which the RPM client waits between two tests is modified to be 1 second instead of 0 seconds. Also, if you do not configure the test interval, the default value is 1 second.

- To specify thresholds used for the probes, include the **thresholds** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. A system log message is generated when the configured threshold is exceeded. Likewise, an SNMP trap (if configured) is generated when a threshold is exceeded. The following options are supported:
  - **egress-time**—Measures maximum source-to-destination time per probe.
  - **ingress-time**—Measures maximum destination-to-source time per probe.
  - **jitter-egress**—Measures maximum source-to-destination jitter per test.
  - **jitter-ingress**—Measures maximum destination-to-source jitter per test.
  - **jitter-rtt**—Measures maximum jitter per test, from 0 through 60000000 microseconds.
  - **rtt**—Measures maximum round-trip time per probe, in microseconds.
  - **std-dev-egress**—Measures maximum source-to-destination standard deviation per test.
  - **std-dev-ingress**—Measures maximum destination-to-source standard deviation per test.
  - **std-dev-rtt**—Measures maximum standard deviation per test, in microseconds.

- **successive-loss**—Measures successive probe loss count, indicating probe failure.
- **total-loss**—Measures total probe loss count indicating test failure, from 0 through 15.
- Traps are sent if the configured threshold is met or exceeded. To set the trap bit to generate traps, include the **traps** statement at the **[edit services rpm probe owner test test-name]** hierarchy level. The following options are supported:
  - **egress-jitter-exceeded**—Generates traps when the jitter in egress time threshold is met or exceeded.
  - **egress-std-dev-exceeded**—Generates traps when the egress time standard deviation threshold is met or exceeded.
  - **egress-time-exceeded**—Generates traps when the maximum egress time threshold is met or exceeded.
  - **ingress-jitter-exceeded**—Generates traps when the jitter in ingress time threshold is met or exceeded.
  - **ingress-std-dev-exceeded**—Generates traps when the ingress time standard deviation threshold is met or exceeded.
  - **ingress-time-exceeded**—Generates traps when the maximum ingress time threshold is met or exceeded.
  - **jitter-exceeded**—Generates traps when the jitter in round-trip time threshold is met or exceeded.
  - **probe-failure**—Generates traps for successive probe loss thresholds crossed.
  - **rtt-exceeded**—Generates traps when the maximum round-trip time threshold is met or exceeded.
  - **std-dev-exceeded**—Generates traps when the round-trip time standard deviation threshold is met or exceeded.
  - **test-completion**—Generates traps when a test is completed.
  - **test-failure**—Generates traps when the total probe loss threshold is met or exceeded.

---

## Configuring RPM Receiver Servers

The RPM TCP and UDP probes are proprietary to Juniper Networks and require a receiver to receive the probes. To configure a server to receive the probes, include the **probe-server** statement at the **[edit services rpm]** hierarchy level:

```
[edit services rpm]
probe-server {
```

```
tcp {
 destination-interface interface-name;
 port number;
}
udp {
 port number;
}
}
```

The port number specified for the UDP and TCP server can be 7 or from 49160 through 65535.

**NOTE:** The `destination-interface` statement is not supported on PTX Series Packet Transport Routers.

When you configure either `probe-type udp-ping` or `probe-type udp-ping-timestamp` along with the `one-way-hardware-timestamp` command, the value for the `destination-port` can be only 7. A constraint check prevents you for configuring any other value for the destination port in this case.

---

## Limiting the Number of Concurrent RPM Probes

To configure the maximum number of concurrent probes allowed, include the `probe-limit` statement at the `[edit services rpm]` hierarchy level:

```
probe-limit limit;
```

Specify a limit from 1 through 500. The default maximum number is 100.

---

## Configuring RPM Timestamping

To account for latency in the communication of probe messages, you can enable timestamping of the probe packets. You can timestamp the following RPM probe types: `icmp-ping`, `icmp-ping-timestamp`, `udp-ping`, and `udp-ping-timestamp`.

On M Series and T Series routers with an Adaptive Services (AS) or Multiservices PIC, and on EX Series switches with a Multiservices DPC, and on EX Series switches, you can enable hardware timestamping of RPM probe messages. The timestamp is applied on both the RPM client router (the router or switch that originates the RPM probes) and the RPM probe server and applies only to IPv4 traffic. It is supported on the following:

- Layer 2 services package on all Multiservices PICs and DPCs.
- Layer 3 service package on AS and Multiservices PICs and Multiservices DPCs.
- Extension-provider services package on M Series, MX Series, and T Series services PICs that support the Extension-Provider packages (In Junos OS releases earlier than 12.3, the extension-provider packages were variously referred to as Junos Services Framework (JSF), MP-SDK, and eJunos.)
- Layer 2, Layer 3, SDK Services, and PFE RPM timestamping interoperate with each other. Here, the RPM client can be on the Layer 3 **sp-** interface and the RPM server can be on an SDK Services package.

**NOTE:** Hardware timestamping is not supported on PTX Series Packet Transport Routers.

Two-way timestamping is available on **sp-** and **ms-** interfaces. To configure two-way timestamping on M Series and T Series routers, include the **destination-interface** statement at the **[edit services rpm probe probe-owner test test-name]** hierarchy level:

```
destination-interface sp-fpc/pic/port.logical-unit
destination-interface ms-fpc/pic/port.logical-unit
```

Specify the RPM client router and the RPM server router on the adaptive services logical interface or the multiservices interface by including the **rpm** statement at the **[edit interfaces interface-name unit logical-unit-number]** hierarchy level:

```
rpm (client | server);
```

The logical interface must be dedicated to the RPM task. It requires configuration of the **family inet** statement and a **/32** address, as shown in the example. This configuration is also needed for other services such as NAT and stateful firewall. You cannot configure RPM service on **unit 0** because RPM requires a dedicated logical interface; the same unit cannot support both RPM and other services. Because active flow monitoring requires **unit 0**, but RPM can function on any logical interface, a constraint check prevents you from committing an RPM configuration there.

**NOTE:** If you configure RPM timestamping on an AS PIC, you cannot configure the **source-address** statement at the **[edit services rpm probe probe-name test test-name]** hierarchy level.

On MX Series routers, on M-320 routers using the Enhanced Queuing MPC, and on EX Series switches, you include the **hardware-timestamp** statement at the **[edit services rpm**

**probe *probe-name* test *test-name*]** hierarchy level to specify that the probes are to be timestamped in the Packet Forwarding Engine host processor:

**hardware-timestamp;**

On the client side, these probes are timestamped in the Packet Forwarding Engine host processor on the egress DPC on the MX or M-320 Series router or EX Series switch originating the RPM probes (RPM client). On the responder side (RPM server), the RPM probes to be timestamped are handled by the Packet Forwarding Engine host processor, which generates the response instead of the RPM process. The RPM probes are timestamped only on the router that originates them (RPM client). As a result, only round-trip time is measured for these probes.

When using the **hardware-timestamp**, the **data-size** value for the probe must be at least 100 bytes smaller than the default MTU of the interface of the RPM client interface (see [“Configuring RPM Probes” on page 959](#)). If hardware timestamping of RPM probe messages is enabled, the maximum data size that you can configure by using the data-size statement is limited to 1400.

**NOTE:** The Packet Forwarding Engine-based RPM feature does not support any stateful firewall configurations. If you need to combine RPM timestamping with a stateful firewall, you should use the interface-based RPM timestamping service described earlier in this section. Multiservices DPCs support stateful firewall processing as well as RPM timestamping.

---

To configure one-way timestamping, you must also include the **one-way-hardware-timestamp** statement at the **[edit services rpm probe *probe-owner* test *test-name*]** hierarchy level:

**one-way-hardware-timestamp;**

**NOTE:** If you configure RPM probes for a services interface (sp-), you need to announce local routes in a specific way for the following routing protocols:

- For OSPF, you can announce the local route by including the services interface in the OSPF area. To configure this setting, include the interface `sp-fpc/pic/port` statement at the [edit protocols ospf area *area-number*] hierarchy level.
- For BGP and IS-IS, you must export interface routes and create a policy that accepts the services interface local route. To export interface routes, include the point-to-point and lan statements at the [edit routing-options interface-routes family inet export] hierarchy level. To configure an export policy that accepts the services interface local route, include the protocol local, rib inet.0, and route-filter `sp-interface-ip-address/32` exact statements at the [edit policy-options policy-statement *policy-name* term *term-name* from] hierarchy level and the accept action at the [edit policy-options policy-statement *policy-name* term *term-name* then] hierarchy level. For the export policy to take effect, apply the policy to BGP or IS-IS with the export *policy-name* statement at the [edit protocols *protocol-name*] hierarchy level.

For more information about these configurations, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices* or the *Junos OS Routing Protocols Library for Routing Devices*.

Routing the probe packets through the adaptive services or Multiservices PIC also enables you to filter the probe packets to particular queues. The following example shows the RPM configuration and the filter that specifies queuing:

```
services rpm {
 probe p1 {
 test t1 {
 probe-type icmp-ping;
 target address 10.8.4.1;
 probe-count 10;
 probe-interval 10;
 test-interval 10;
 dscp-code-points af11;
 data-size 100;
 destination-interface sp-1/2/0.0;
 }
 }
}
firewall {
 filter f1 {
 term t1 {
 from {
 dscp af11;
 }
 then {
 forwarding-class assured-forwarding;
 }
 }
 }
}
```

```
 }
 }
}
interfaces sp-1/2/0 {
 unit 2 {
 rpm client;
 family inet {
 address 10.8.4.2/32;
 filter {
 input f1;
 }
 }
 }
}
interfaces sp-1/2/1 {
 unit 2 {
 rpm server;
 family inet {
 address 10.8.3.2/32;
 filter {
 input f1;
 }
 }
 }
}
```

For more information about firewall filters, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*; for more information about queuing, see the *Class of Service Feature Guide for Routing Devices*.

---

## Configuring TWAMP

You can configure the Two-Way Active Measurement Protocol (TWAMP) on all M Series and T Series routers that support Multiservices PICs (running in either Layer 2 or Layer 3 mode), and on MX Series routers. Only the responder (server) side of TWAMP is supported.

**NOTE:** TWAMP is not supported on EX Series switches and PTX Series Packet Transport Routers.

For more information on TWAMP, see RFC 5357, *A Two-Way Active Measurement Protocol (TWAMP)*.

To configure TWAMP properties, include the **twamp** statement at the [\[edit services rpm\]](#) hierarchy level:

```
[edit services rpm]
```

```

twamp {
 server {
 client-list list-name {
 [address address];
 }
 authentication-mode mode;
 max-connection-duration hours;
 maximum-connections count;
 maximum-connections-per-client count;
 maximum-sessions count;
 maximum-sessions-per-connection count;
 port number;
 routing-instance-list {
 instance-name {
 port number;
 }
 }
 server-inactivity-timeout minutes;
 }
}

```

The TWAMP configuration process includes the following tasks:

- [Configuring TWAMP Interfaces on page 1147](#)
- [Configuring TWAMP Servers on page 1147](#)

## Configuring TWAMP Interfaces

To specify the service PIC logical interface that provides the TWAMP service, include the **twamp-server** statement at the **[edit interfaces sp-fpc/pic/port unit logical-unit-number]** hierarchy level:

```
twamp-server;
```

**NOTE:** On MX Series routers that do not include a Multiservices DPC, you can configure the **twamp-server** statement on any interface (for example, ge-1/0/1.10). It is not necessary to configure this statement on a service interface (sp- or ms-) but you do need to include it in the configuration to activate the TWAMP reflector functionality.

## Configuring TWAMP Servers

You can specify a number of TWAMP server properties, some of which are optional, by including the **server** statement at the **[edit services rpm twamp]** hierarchy level:

```

[edit services rpm twamp]
server {
 client-list list-name {
 [address address];
 }
 authentication-mode mode;
 max-connection-duration hours;
 maximum-connections count;

```

```
maximum-connections-per-client count;
maximum-sessions count;
maximum-sessions-per-connection count;
port number;
routing-instance-list {
 instance-name {
 port number;
 }
}
server-inactivity-timeout minutes;
}
```

The preceding configuration settings that are described define a TWAMP server on the router that enables a TWAMP client to connect to the server using any media interface IP address such as a **ge-** interface. In such a scenario, the router functions as a TWAMP server and timestamping is performed in the ukernel of the media-facing FPC.

To configure an inline TWAMP server, which causes timestamping to be performed as part of the inline services (**si-**) interface processing, configure the amount of bandwidth reserved on each Packet Forwarding Engine for tunnel traffic using inline services by including the **bandwidth (1g | 10g)** statement at the **[edit chassis fpc slot-number pic number inline-services]** hierarchy level and specify the service PIC logical interface that provides the TWAMP service by including the **twamp-server** statement at the **[edit interfaces sp-fpc/pic/port unit logical-unit- number family inet]** hierarchy level.

- To specify the list of allowed control client hosts that can connect to this server, include the **client-list** statement at the **[edit services rpm twamp server]** hierarchy level. Each value you include must be a Classless Interdomain Routing (CIDR) address (IP address plus mask) that represents a network of allowed hosts. You can include multiple client lists, each of which can contain a maximum of 64 entries. You must configure at least one client address to enable TWAMP.
- You must specify the authentication mode by including the **authentication-mode** statement at the **[edit services rpm twamp server]** hierarchy level. There is no default value. You can configure **authenticated** or **encrypted** mode, based on RFC 4656; if there is no authentication or encryptions mode specified, you should set the value to **none**. This statement is required in the TWAMP configuration.
- To specify the inactivity timeout period in seconds, include the **inactivity-timeout** statement at the **[edit services rpm twamp server]** hierarchy level. By default, the value is **1800**; the range is 0 through 3600 seconds.
- To specify the maximum number of concurrent connections the server can have to client hosts, include the **maximum-connections** statement at the **[edit services rpm twamp server]** hierarchy level. The allowed range of values is 1 through 1000 and the default value is 64. You can also limit the number of connections the server can make to a particular client host by including the **maximum-connections-per-client** statement. The allowed range of values is 1 through 500 and the default value is 64.
- To specify the maximum number of sessions the server can have running at one time, include the **maximum-sessions** statement at the **[edit services rpm twamp server]** hierarchy level. The allowed range of values is 1 through 2048 and the default value is

64. You can also limit the number of sessions the server can have on a single connection by including the **maximum-sessions-per-connection** statement.

- To specify the TWAMP server listening port, include the **port** statement at the **[edit services rpm twamp server]** hierarchy level. The range is 1 through 65,535.
- To specify the server inactivity timeout period in minutes, include the **server-inactivity-timeout** statement at the **[edit services rpm twamp server]** hierarchy level. The range is 0 through 30 minutes.
- To specify the TWAMP servers on specific routing instances, instead of associating the TWAMP server at the system-level to apply to all routing instances configured on a router, include the **routing-instance-list instance-name port port-number** statement at the **[edit services rpm twamp server]** hierarchy level. The port number of the specified routing instance is used for TWAMP probes that are received by a TWAMP server. The default routing instance is Internet routing table inet.0. If you do not specify a routing instance, the TWAMP probe applies to all routing instances. To apply the TWAMP probe to only the default routing instance, you must explicitly set the value of instance-name to default. If an interface is not part of any routing instance, the default port is used for TWAMP probes. You can configure up to 100 routing instances for a TWAMP server.

## Configuring BGP Neighbor Discovery Through RPM

BGP neighbors can be configured at the following hierarchy levels:

- **[edit protocols bgp group group-name]**—Default logical system and default routing instance.
- **[edit routing-instances instance-name protocols bgp group group-name]**—Default logical system with a specified routing instance.
- **[edit logical-systems logical-system-name protocols bgp group group-name]**—Configured logical system and default routing instance.
- **[edit logical-systems logical-system-name routing-instances instance-name protocols bgp group group-name]**—Configured logical system with a specified routing instance.

When you configure BGP neighbor discovery through RPM, if you do not specify a logical system, the RPM probe applies to configured BGP neighbors for all logical systems. If you do not specify a routing instance, the RPM probe applies to configured BGP neighbors in all routing instances. You can explicitly configure RPM probes to apply only to the default logical system, the default routing instance, or to a particular logical system or routing instance.

To configure BGP neighbor discovery through RPM, configure the probe properties at the **[edit services rpm bgp]** hierarchy:

```
data-fill data;
data-size size;
destination-port port;
history-size size;
logical-system logical-system-name [routing-instances routing-instance-name];
```

**moving-average-size** *number*;  
**probe-count** *count*;  
**probe-interval** *seconds*;  
**probe-type** *type*;  
**routing-instances** *instance-name*;  
**test-interval** *interval*;

- To specify the contents of the data portion of Internet Control Message Protocol (ICMP) probes, include the **data-fill** statement at the **[edit services rpm bgp]** hierarchy level. The value can be a hexadecimal value.
- To specify the size of the data portion of ICMP probes, include the **data-size** statement at the **[edit services rpm bgp]** hierarchy level. The size can be from **0** through **65400** and the default size is **0**.
- To specify the User Datagram Protocol (UDP) port or Transmission Control Protocol (TCP) port to which the probe is sent, include the **destination-port** statement at the **[edit services rpm bgp]** hierarchy level. The **destination-port** statement is used only for the UDP and TCP probe types. The value can be **7** or from **49160** through **65535**.
- To specify the number of stored history entries, include the **history-size** statement at the **[edit services rpm bgp]** hierarchy level. Specify a value from **0** to **512**. The default is **50**.
- To specify the logical system used by ICMP probes, include the **logical-system** *logical-system-name* statement at the **[edit services rpm bgp]** hierarchy level. If you do not specify a logical system, the RPM probe applies to configured BGP neighbors for all logical systems. To apply the probe to only the default logical system, you must set the value of *logical-system-name* to null.
- To specify a number of samples for making statistical calculations, include the **moving-average-size** statement at the **[edit services rpm bgp]** hierarchy level. Specify a value from 0 through 255.
- To specify the number of probes within a test, include the **probe-count** statement at the **[edit services rpm bgp]** hierarchy level. Specify a value from 1 through 15.
- To specify the time to wait between sending packets, include the **probe-interval** statement at the **[edit services rpm bgp]** hierarchy level. Specify a value from 1 through 255 seconds.
- To specify the packet and protocol contents of the probe, include the **probe-type** statement at the **[edit services rpm bgp]** hierarchy level. The following probe types are supported:
  - **icmp-ping**—Sends ICMP echo requests to a target address.
  - **icmp-ping-timestamp**—Sends ICMP timestamp requests to a target address.
  - **tcp-ping**—Sends TCP packets to a target.
  - **udp-ping**—Sends UDP packets to a target.
  - **udp-ping-timestamp**—Sends UDP timestamp requests to a target address.

**NOTE:** Some probe types require additional parameters to be configured. For example, when you specify the `tcp-ping` or `udp-ping` option, you must configure the destination port using the `destination-port port` statement. The `udp-ping-timestamp` option requires a minimum data size of 12; any smaller data size results in a commit error. The minimum data size for TCP probe packets is 1.

- To specify the routing instance used by ICMP probes, include the **routing-instances** statement at the `[edit services rpm bgp]` hierarchy level. The default routing instance is Internet routing table `inet.0`. If you do not specify a routing instance, the RPM probe applies to configured BGP neighbors in all routing instances. To apply the RPM probe to only the default routing instance, you must explicitly set the value of *instance-name* to **default**.
- To specify the time to wait between tests, include the **test-interval** statement at the `[edit services bgp probe]` hierarchy level. Specify a value from 1 through 86400 seconds.

**NOTE:** Starting with Junos OS Release 15.1, the minimum period for which the RPM client waits between two tests is modified to be 1 second instead of 0 seconds. Also, if you do not configure the test interval, the default value is 1 second.

#### Related Documentation

- [Real-Time Performance Monitoring Services Overview on page 957](#)
- [\[edit services rpm\] Hierarchy Level on page 1631](#)
- [Examples: Configuring BGP Neighbor Discovery Through RPM on page 973](#)

## Examples: Configuring BGP Neighbor Discovery Through RPM

Configure BGP neighbor discovery through RPM for all logical systems and all routing instances:

```
[edit services rpm]
bgp {
 probe-type icmp-ping;
 probe-count 5;
 probe-interval 1;
 test-interval 60;
 history-size 10;
 data-size 255;
 data-fill 0123456789;
}
```

Configure BGP neighbor discovery through RPM for only the following logical systems and routing instances: **LS1/RI1**, **LS1/RI2**, **LS2**, and **RI3**:

```
[edit services rpm]
bgp {
```

```
probe-type icmp-ping;
probe-count 5;
probe-interval 1;
test-interval 60;
history-size 10;
data-size 255;
data-fill 0123456789;
logical-system {
 LS1 {
 routing-instances {
 RI1;
 RI2;
 }
 }
 LS2;
}
routing-instance {
 RI3;
}
}
```

**NOTE:** The `logical-system` statement is not supported on PTX Series Packet Transport Routers.

Configure BGP neighbor discovery through RPM for only the default logical system and default routing instance:

```
[edit services rpm]
bgp {
 probe-type icmp-ping;
 probe-count 5;
 probe-interval 1;
 test-interval 60;
 history-size 10;
 data-size 255;
 data-fill 0123456789;
 logical-system {
 null {
 routing-instances {
 default;
 }
 }
 }
}
```

**Related

## Tracing RPM Operations

Tracing operations track all RPM operations and record them in a log file. The logged error descriptions provide detailed information to help you solve problems faster.

By default, no events are traced. If you include the **traceoptions** statement at the **[edit services rpm]** hierarchy level, the default tracing behavior is the following:

- Important events are logged in a file called **rmopd** located in the **/var/log** directory.
- When the log file reaches 128 kilobytes (KB), it is renamed **rmopd.0**, then **rmopd.1**, and so on, until there are three trace files. Then the oldest trace file (**rmopd.2**) is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)
- Log files can be accessed only by the user who configures the tracing operation.

You can change this default behavior by using the **traceoptions** statements. Changing the defaults is described in the following sections:

1. [Configuring the RPM Log File Name on page 1153](#)
2. [Configuring the Number and Size of RPM Log Files on page 1153](#)
3. [Configuring Access to the Log File on page 1154](#)
4. [Configuring a Regular Expression for Lines to Be Logged on page 1154](#)
5. [Configuring the Trace Operations on page 1154](#)

### Configuring the RPM Log File Name

By default, the name of the file that records RPM trace output is **rmopd**. To specify a different file name:

```
[edit services rpm traceoptions]
user @host set file filename
```

### Configuring the Number and Size of RPM Log Files

To configure the limits on the number and size of RPM trace files:

```
[edit services rpm traceoptions]
user@host set file filename files number size size
```

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

For example, set the maximum file size to 2 MB, and the maximum number of files to 20 for a log file named **rpmtrace**:

```
[edit services rpm traceoptions]
user@host set file rpmtrace files 20 size 2MB
```

When the **rpmtrace** file reaches 2 MB, it is renamed **rpmtrace.0**, and a new file called **rpmtrace** is created. When the new **rpmtrace** reaches 2 MB, **rpmtrace.0** is renamed

**rpmtrace.1** and **rpmtrace** is renamed **rpmtrace.0**. This process repeats until there are 20 trace files. Then the oldest file (**rpmtrace.19**) is overwritten by **rpmtrace.18**.

## Configuring Access to the Log File

By default, log files can be accessed only by the user who configures the tracing operation.

To specify that any user can read all log files:

```
[edit services rpm traceoptions]
user@host set file filename world-readable
```

To explicitly set the default behavior:

```
[edit services rpm traceoptions]
user@host set file filename no-world-readable
```

## Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged events.

To refine the output by specifying a regular expression (regex) to be matched:

```
[edit services rpm traceoptions]
user@host set file filename match regular-expression
```

## Configuring the Trace Operations

By default, if the **traceoptions** configuration is present, only important events are logged. You can configure the trace operations to be logged by including the following statements at the **[edit services rpm traceoptions]** hierarchy level:

```
flag {
 all;
 configuration;
 error;
 ipc;
 ppm;
 statistics
}
```

[Table 7 on page 51](#) describes the meaning of the RPM tracing flags.

**Table 46: RPM Tracing Flags**

Flag	Description	Default Setting
<b>all</b>	Trace all operations.	Off
<b>configuration</b>	Trace configuration events.	Off
<b>error</b>	Trace events related to catastrophic errors in daemon.	Off
<b>ipc</b>	Trace IPC events.	Off

Table 46: RPM Tracing Flags (*continued*)

Flag	Description	Default Setting
<b>ppm</b>	Trace ppm events.	Off
<b>statistics</b>	Trace statistics.	Off

## Examples: Configuring Real-Time Performance Monitoring

Configure an RPM instance identified by the probe name **probe1** and the test name **test1**:

```
[edit services rpm]
probe probe1 {
 test test1 {
 dscp-code-points 001111;
 probe-interval 1;
 probe-type icmp-ping;
 target address 172.17.20.182;
 test-interval 20;
 thresholds rtt 10;
 traps rtt-exceeded;
 }
}
probe-server {
 tcp {
 destination-interface lt-0/0/0.0
 port 50000;
 }
 udp {
 destination-interface lt-0/0/0.0
 port 50001;
 }
}
probe-limit 200;
```

Configure packet classification, using **lt-** interfaces to send the probe packets to a logical tunnel input interface. By sending the packet to the logical tunnel interface, you can configure regular and multifield classifiers, firewall filters, and header rewriting for the probe packets. To use the existing tunnel framework, the **dlci** and **encapsulation** statements must be configured.

```
[edit services rpm]
probe p1 {
 test t1 {
 probe-type icmp-ping;
 target address 10.8.4.1;
 probe-count 10;
 probe-interval 10;
 test-interval 10;
 source-address 10.8.4.2;
 dscp-code-points ef;
 data-size 100;
 destination-interface lt-0/0/0.0;
 }
}
```

```
}
[edit interfaces]
lt-0/0/0 {
 unit 0 {
 encapsulation frame-relay;
 dlci 10;
 peer-unit 1;
 family inet;
 }
 unit 1 {
 encapsulation frame-relay;
 dlci 10;
 peer-unit 0;
 family inet;
 }
}
[edit class-of-service]
interfaces {
 lt-0/0/0 {
 unit 1 {
 classifiers {
 dscp default;
 }
 }
 }
}
}
```

Configure an input filter on the interface on which the RPM probes are received. This filter enables prioritization of the received RPM packets, separating them from the regular data packets received on the same interface.

```
[edit firewall]
filter recos {
 term recos {
 from {
 source-address {
 10.8.4.1/32;
 }
 destination-address {
 10.8.4.2/32;
 }
 }
 then {
 loss-priority high;
 forwarding-class network-control;
 }
 }
}
[edit interfaces]
fe-5/0/0 {
 unit 0 {
 family inet {
 filter {
 input recos;
 }
 address 10.8.4.2/24;
 }
 }
}
```

```

 }
 }
}

```

Configure an RPM instance and enable RPM for the extension-provider packages on the adaptive services interface:

```

[edit services rpm]
probe probe1 {
 test test1 {
 data-size 1024;
 data-fill 0;
 destination-interface ms-1/2/0.10;
 dscp-code-points 001111;
 probe-count 10;
 probe-interval 1;
 probe-type icmp-ping;
 target address 172.17.20.182;
 test-interval 20;
 thresholds rtt 10;
 traps rtt-exceeded;
 }
}
[edit interfaces]
ms-1/2/0 {
 unit 0 {
 family inet;
 }
 unit 10 {
 rpm client;
 family inet {
 address 1.1.1.1/32;
 }
 }
}
[edit chassis]
fpc 1 {
 pic 2 {
 adaptive-services {
 service-package {
 extension-provider {
 control-cores 1;
 data-cores 1;
 object-cache-size 512;
 policy-db-size 64;
 package jservices-rpm;
 syslog {
 daemon any;
 }
 }
 }
 }
 }
}
}
}
}

```

**NOTE:** TWAMP is not supported on PTX Series Packet Transport Routers.

Configure the minimum statements necessary to enable TWAMP:

```
[edit services]
rpm {
 twamp {
 server {
 authentication-mode none;
 port 10000; # Twamp server's listening port
 client-list LIST-1 { # LIST-1 is the name of the client-list. Multiple lists can be
 configured.
 address {
 20.0.0.2/30; # IP address of the control client.
 }
 }
 }
 }
}
[edit interfaces sp-5/0/0]
unit 0 {
 family inet;
}
unit 10 {
 rpm {
 twamp-server; # You must configure a separate logical interface on the service PIC
 interface for the TWAMP server.
 }
 family inet {
 address 50.50.50.50/32; # This address must be a host address with a 32-bit mask.
 }
}
[edit chassis]
fpc 5 {
 pic 0 {
 adaptive-services {
 service-package layer-2; # Configure the service PIC to run in Layer 2 mode.
 }
 }
}
```

Configure additional TWAMP settings:

```
[edit services]
rpm {
 twamp {
 server {
 maximum-sessions 5;
 maximum-sessions-per-connection 2;
 maximum-connections 3;
 maximum-connections-per-client 1;
 port 10000;
 server-inactivity-timeout ;
 client-list LIST-1 {
 address {
```

```

 20.0.0.2/30;
 }
}
}
}
}

```

#### Related Documentation

- [\[edit services rpm\] Hierarchy Level on page 1631](#)
- [Examples: Configuring BGP Neighbor Discovery Through RPM on page 973](#)

## Enabling RPM for the Junos OS extension-provider package

Real-time performance monitoring (RPM), which has been supported on the adaptive services interface, is now supported by the Junos OS extension-provider package. RPM is supported on all platforms and service PICs that support the extension-provider package.

**NOTE:** In Junos OS releases earlier than 12.3, the extension provider package was variously known as MP-SDK, Junos Services Framework (JSF), and eJunos.

To enable RPM for the Junos OS extension-provider package on the adaptive services interface, configure the **object-cache-size**, **policy-db-size**, and **package** statements at the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level. For the extension-provider package, **package-name** in the **package package-name** statement is **jservices-rpm**.

For more information about the extension-provider package, see the *SDK Applications Configuration Guide and Command Reference*.

The following example shows how to enable RPM for the extension-provider package on the adaptive services interface:

```

chassis fpc 1 {
 pic 2 {
 adaptive-services {
 service-package {
 extension-provider {
 control-cores 1;
 data-cores 1;
 object-cache-size 512;
 policy-db-size 64;
 package jservices-rpm;
 syslog daemon any;
 }
 }
 }
 }
}

```

}

## RFC2544-Based Benchmarking Tests Overview

RFC2544 defines a series of tests that can be used to describe the performance characteristics of a network-interconnecting device, such as a router, and outlines specific formats to report the results of the tests. These tests can be used to benchmark interconnected network devices and devise a guideline or a measurement pattern to analyze the health and efficiency of the network devices. These tests are the standard benchmarking tests for Ethernet networks and are known as RFC2544-based benchmarking tests. These tests measure throughput, latency, frame loss rate, and bursty frames. The test methodology enables you to define various parameters such as different frame sizes to be examined (64, 128, 256, 512, 1024, 1280, and 1518 bytes), the test time for each test iteration (10 seconds to 1,728,000 seconds), and the frame format (UDP-over-IP).

**NOTE:** RFC2544-based benchmarking tests support only UDP over IPv4 test traffic.

An RFC2544-based benchmarking test is performed by transmitting test packets from a device that functions as the generator or the initiator (which is also called the originator). These packets are sent to a device that functions as a reflector, which receives and returns the packets to the initiator.

Juniper Networks MX104 3D Universal Edge Routers support only the reflector function and the corresponding benchmarking tests. These tests display only the reflecting benchmarking tests. These benchmarking tests display the results of the test. For instance, in the case of the throughput test, the results display the number of transmitted frames and the number of received frames.

The RFC2544-based benchmarking test methodology assesses different parameters that are defined in service-level agreements (SLAs). By measuring the performance availability, transmission delay, link bursts, and service integrity, a carrier provider can certify that the working parameters of the deployed Ethernet circuit comply with the SLA and other defined policies.

[Table 37 on page 984](#) describes the different network topologies in which the benchmarking test is supported.

**Table 47: Supported Network Topologies for RFC2544 Benchmarking Tests**

Service Type	Traffic Direction	Mode	Initial Release on MX104 Routers	Whether the Benchmarking Test Is Supported
E-Line and E-LAN (family <b>bridge</b> )	(UNI) Egress	Port Port, VLAN	14.2R1 (E-Line and E-LAN family bridge)	Supported
E-Line (family <b>ccc</b> )	Ingress Egress		13.3R1 (E-Line Pseudowire)	Supported
IP Services (family <b>inet</b> )	NNI		13.3R1	Supported

**NOTE:** You can configure a total of four simultaneous active reflection sessions. The four active reflection sessions can be of the same type or can be a combination of the different types of reflection sessions. For instance, you can configure either four IPv4 reflection sessions or two pseudowire reflection sessions, one Layer 2 reflection session, and one IPv4 reflection session. The maximum reflection bandwidth supported is 4Gbps.

[Table 38 on page 985](#) lists the interfaces and the reflection type on which the benchmarking tests are supported.

**Table 48: Supported Interfaces for RFC2544 Benchmarking Tests**

Type of Reflection	Gigabit Interfaces (ge)	Aggregated Interfaces (ae)	10G Interfaces (xe)	Pseudo Interfaces (irb, lt, vt, lo0, and others)
IPv4	Yes	No	No	No
Pseudowire Ingress	Yes	No	No	No
Pseudowire Egress	Yes	No	No	No
Layer 2 Bridge	Yes	Yes	Yes	No

All active RFC2544-based benchmarking tests are stopped when any of the following events takes place either in the initiator or in the reflector:

- System events such as Packet Forwarding Engine restarts, routing engine restarts, and so on.
- Test interface change events such as deactivation and reactivation of the interface, disabling and enabling of the interface, and so on.

After the benchmarking tests are stopped, the test states of the tests are removed and the user can restart the same test. Other ongoing tests on other interfaces are not interrupted.

**NOTE:** RFC2544-based benchmarking tests are not supported during unified in-service software upgrade (ISSU) and graceful routing engine switchover (GRES).

## Configuring an RFC 2544-Based Benchmarking Test

You can configure a benchmarking test to detect and measure performance attributes, such as throughput, latency, frame loss, and bursty or back-to-back frames, of network devices. RFC 2544-based benchmarking test is performed by transmitting test packets from a device that functions as the generator or the initiator. These packets are sent to a device that functions as the reflector, which receives and returns the packets back to the initiator.

**NOTE:** The test configuration is applied only when you start the test. If you update the test configuration during the test, you have to start the test again for the updated configuration to take effect.

You must configure a test profile and reference the test profile in a unique test name that defines the parameters for the test to be performed on a certain device. However, the test profile is required when the test mode is configured as initiation and termination. The **test-profile** parameter is disregarded when the test mode is configured as reflection. MX104 routers support only the reflection function in the RFC 2544-based benchmarking tests. A reflection service does not use the parameters specified in the test profile.

The following topics describe how to configure a test name for an RFC 2544-based benchmarking test on an MX104 router for Layer 3 IPv4, Ethernet pseudowire, and Layer 2 bridge networks:

- [Configuring a Test Name for an RFC 2544-Based Benchmarking Test for a IPv4 Network on page 1164](#)
- [Configuring a Test Name for an RFC 2544-Based Benchmarking Test for an Ethernet Pseudowire on page 1165](#)
- [Configuring a Test Name for an RFC 2544-Based Benchmarking Test for a Layer 2 E-LAN Service in Bridge Domain on page 1167](#)

## Configuring a Test Name for an RFC 2544-Based Benchmarking Test for a IPv4 Network

You can configure a test name by including the **test-name test-name** statement at the **[edit services rpm rfc2544-benchmarking]** hierarchy level. In the test name, you can configure attributes of the test iteration, such as the address family (type of service, IPv4 or Ethernet), the logical interface, and test duration that are used for a benchmarking test to be run.

To configure a test name and define its attributes for an IPv4 network:

1. In configuration mode, go to the **[edit services]** hierarchy level.

```
[edit]
user@host# edit services
```

2. Configure a instance.

```
[edit services]
user@host# edit rpm
```

3. Configure an RFC 2544-based benchmarking test for the RPM instance.

```
[edit services rpm]
user@host# edit rfc2544-benchmarking
```

4. Define a name for the test—for example, test1. The test name identifier can be up to 32 characters in length.

```
[edit services rpm rfc2544-benchmarking]
user@host# edit tests test-name test1
```

5. Specify the test mode for the packets that are sent during the benchmarking test. The **reflect** option causes the test frames to be reflected on the IPv4 network.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set mode reflect
```

6. Configure the address type family for the benchmarking test. The **inet** option indicates that the test is run on an IPv4 service.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set family inet
```

7. Configure the destination IPv4 address for the test packets. This parameter is required only if you configure IPv4 family **inet**. If you do not configure the destination IPv4 address, the default value of 192.168.1.20 is used.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set destination-ipv4-address address
```

8. Specify the UDP port of the destination to be used in the UDP header for the generated frames. If you do not specify the UDP port, the default value of 4041 is used.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set destination-udp-port port-number
```

9. (Optional) Specify the source IPv4 address to be used in generated test frames. If you do not configure the source IPv4 address for **inet** family, the source address of the interface is used to transmit the test frames.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set source-ipv4-address address
```

10. Specify the UDP port of the source to be used in the UDP header for the generated frames. If you do not specify the UDP port, the default value of 4041 is used.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set source-udp-port port-number
```

11. Specify the logical interface on which the RFC 2544-based benchmarking test is run. If you configure an **inet** family and the test mode to reflect the frames back on the sender from the other end, then the logical interface is used as the interface to enable the reflection service (reflection is performed on the packets entering the specified interface). If you not configure the logical interface for reflection test mode, then a lookup is performed on the source IPv4 address to determine the interface that hosts the address.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set test-interface interface-name
```

## Configuring a Test Name for an RFC 2544-Based Benchmarking Test for an Ethernet Pseudowire

You can configure a test name by including the **test-name test-name** statement at the **[edit services rpm rfc2544-benchmarking]** hierarchy level. In the test name, you can configure attributes of the test iteration, such as the address family (type of service IPv4 or Ethernet), the logical interface, and test duration, that are used for a benchmarking test to be run. The test name combined with the test profile represent a single real-time performance monitoring (RPM) configuration instance.

To configure a test name and define its attributes for an Ethernet Pseudowire:

1. In configuration mode, go to the **[edit services]** hierarchy level.

```
[edit]
user@host# edit services
```

2. Configure an RPM service instance.

```
[edit services]
user@host# edit rpm
```

3. Configure an RFC 2544-based benchmarking test for the RPM instance.

```
[edit services rpm]
user@host# edit rfc2544-benchmarking
```

4. Define a name for the test—for example, test1. The test name identifier can be up to 32 characters in length.

```
[edit services rpm rfc2544-benchmarking]
user@host# edit tests test-name test1
```

5. Specify the test mode for the packets that are sent during the benchmarking test. The **reflect** option causes the test frames to be reflected on the Ethernet pseudowire.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set mode reflect
```

6. Configure the address type family for the benchmarking test. The **ccc** option indicates that the test is run on a CCC or Ethernet pseudowire service.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set family ccc
```

7. Specify the direction of the interface on which the test must be run. This parameter is valid only for a family. To enable the test to be run in the egress direction of the interface (network-to-network interface (NNI)), use the **egress** option. To enable the test to be run in the ingress direction of the interface (user-to-network interface (UNI)), use the **ingress** option.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set direction egress
```

8. (Optional) Specify the source IPv4 address to be used in generated test frames. If you do not configure the source IPv4 address for family, the default value of 192.168.1.10 is used.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set source-ipv4-address address
```

9. Specify the logical interface on which the RFC 2544-based benchmarking test is run.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set test-interface interface-name
```

## Configuring a Test Name for an RFC 2544-Based Benchmarking Test for a Layer 2 E-LAN Service in Bridge Domain

You can configure a test name by including the **test-name test-name** statement at the **[edit services rpm rfc2544-benchmarking]** hierarchy level. In the test name, you can configure attributes of the test iteration, such as the address family (bridge), the logical interface, and test duration, that are used for a benchmarking test to be run. The test name combined with the test profile represent a single real-time performance monitoring (RPM) configuration instance.

To configure a test name and define its attributes for a layer 2 E-LAN service in Bridge domains:

1. In configuration mode, go to the **[edit services]** hierarchy level.

```
[edit]
user@host# edit services
```

2. Configure an RPM service instance.

```
[edit services]
user@host# edit rpm
```

3. Configure an RFC 2544-based benchmarking test for the RPM instance.

```
[edit services rpm]
user@host# edit rfc2544-benchmarking
```

4. Define a name for the test—for example, l2b-test1. The test name identifier can be up to 32 characters in length.

```
[edit services rpm rfc2544-benchmarking]
user@host# edit tests test-name l2b-test1
```

5. Specify the source and destination MAC addresses of the test packet. Both these parameters are valid only for the bridge family.

```
[edit services rpm rfc2544-benchmarking tests test-name l2b-test1]
user@host# set source-mac-address address destination-mac-address address
```

6. Specify the service type under test. This parameter is applicable only for the bridge family.

```
[edit services rpm rfc2544-benchmarking tests test-name l2b-test1]
user@host# set service-type elan
```

7. Specify the test mode for the packets that are sent during the benchmarking test. The **reflect** option causes the test frames to be reflected over the Layer 2 bridge.

```
[edit services rpm rfc2544-benchmarking tests test-name l2b-test1]
user@host# set mode reflect
```

8. Configure the address type family for the benchmarking test. The **bridge** option indicates that the test is run on a E-LAN service over a bridge domain.

```
[edit services rpm rfc2544-benchmarking tests test-name l2b-test1]
user@host# set family bridge
```

9. Specify the direction of the interface on which the test must be run. This parameter is valid only for a family. To enable the test to be run in the egress direction of the interface (network-to-network interface (NNI)), use the **egress** option. To enable the test to be run in the ingress direction of the interface (user-to-network interface (UNI)), use the **ingress** option.

```
[edit services rpm rfc2544-benchmarking tests test-name l2b-test1]
user@host# set direction egress
```

10. Specify the logical interface on which the RFC 2544-based benchmarking test is run.

```
[edit services rpm rfc2544-benchmarking tests test-name l2b-test1]
user@host# set test-interface interface-name
```

### Example: Configuring an RFC 2544-Based Benchmarking Test for Layer 3 IPv4 Services

- [Requirements on page 1168](#)
- [Overview on page 1168](#)
- [Configuration on page 1169](#)
- [Verifying the Results of the Benchmarking Test for Layer 3 IPv4 Services on page 1175](#)

#### Requirements

This example uses the following hardware and software components:

- 
- An ACX Series Universal Access Router—
- Junos OS Release or later

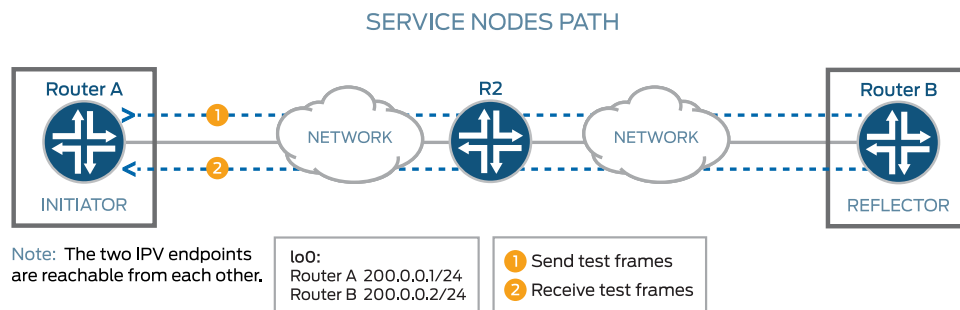

#### Overview

Consider a sample topology in which a router, Router A, functions as an initiator and terminator of the test frames for an RFC 2544-based benchmarking test. Router A is connected over a Layer 3 network to another router, Router B, which functions as a reflector to reflect back the test frames it receives from Router A. IPv4 is used for transmission of test frames over the Layer 3 network. This benchmarking test is used to compute the IPv4 service parameters between Router A and Router B. Logical interfaces

on both the routers are configured with IPv4 addresses to measure the performance attributes, such as throughput, latency, frame loss, and bursty frames, of network devices for the IPv4 service.

Figure 37 on page 994 shows the sample topology to perform an RFC 2544 test for a Layer 3 IPv4 service.

Figure 43: RFC 2544-Based Benchmarking Test for a Layer 3 IPv4 Service

## Configuration

In this example, you configure the benchmarking test for a Layer 3 IPv4 service that is between interface ge-0/0/0 on Router A and interface ge-0/0/4 on Router B to detect and analyze the performance of the interconnecting routers.

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

### Configuring Benchmarking Test Parameters on Router A

```
set interfaces ge-0/0/0 unit 0 family inet address 200.0.0.1/24
set interfaces ge-0/0/0 unit 0 family mpls
set rfc2544-benchmarking profiles test-profile throughput test-type throughput
set rfc2544-benchmarking profiles test-profile throughput packet-size 64
set rfc2544-benchmarking profiles test-profile throughput test-duration 20m
set rfc2544-benchmarking profiles test-profile throughput bandwidth-kbps 500
set rfc2544-benchmarking tests test-name test1 test-profile throughput
set rfc2544-benchmarking tests test-name test1 interface ge-0/0/0.1
set rfc2544-benchmarking tests test-name test1 mode initiate-and-terminate
set rfc2544-benchmarking tests test-name test1 family inet
set rfc2544-benchmarking tests test-name test1 dest-address 200.0.0.2
set rfc2544-benchmarking tests test-name test1 udp-port 4001
```

## Configuring Benchmarking Test Parameters on Router B

```
set interfaces ge-0/0/4 unit 0 family inet address 200.0.0.2/24
set interfaces ge-0/0/4 unit 0 family mpls
set services rpm rfc2544-benchmarking tests test-name test1 interface ge-0/0/4.1
set services rpm rfc2544-benchmarking tests test-name test1 mode reflect
set services rpm rfc2544-benchmarking tests test-name test1 family inet
set services rpm rfc2544-benchmarking tests test-name test1 dest-address 200.0.0.1
set services rpm rfc2544-benchmarking tests test-name test1 udp-port 4001
```

---

### Configuring Benchmarking Test Parameters on Router A

#### Step-by-Step Procedure

The following require you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the test parameters on Router A:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:  

```
[edit]
user@host# edit interfaces
```
2. Configure the interface on which the test must be run.  

```
[edit interfaces]
user@host# edit ge-0/0/0
```
3. Configure a logical unit and specify the protocol family.  

```
[edit interfaces ge-0/0/0]
user@host# edit unit 0 family inet
```
4. Specify the address for the logical interface.  

```
[edit interfaces ge-0/0/0 unit 0 family inet]
user@host# set address 200.0.0.1/24
```
5. Enter the **up** command to go the previous level in the configuration hierarchy.  

```
[edit interfaces ge-0/0/0 unit 0 family inet]
user@host# up
```
6. Configure the MPLS family on the logical interface.  

```
[edit interfaces ge-0/0/0 unit 0]
user@host# set family mpls
```
7. Go to the top level of the configuration command mode.  

```
[edit interfaces ge-0/0/0 unit 0]
user@host# top
```
8. In configuration mode, go to the **[edit services]** hierarchy level.  

```
[edit]
user@host# edit services
```

9. Configure a real-time performance monitoring service (RPM) instance.  
[edit services]  
user@host# **edit rpm**
10. Configure an RFC 2544-based benchmarking test for the RPM instance.  
[edit services rpm]  
user@host# **edit rfc2544-benchmarking**
11. Define a name for a test profile—for example, throughput.  
[edit services rpm rfc2544-benchmarking]  
user@host# **edit profiles test-profile throughput**
12. Configure the type of test to be performed as throughput.  
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]  
user@host# **set test-type throughput**
13. Specify the size of the test packet as 64 bytes.  
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]  
user@host# **set test-type packet-size 64**
14. Specify the period for which the test is to be performed in hours, minutes, or seconds by specifying a number followed by the letter h (for hours), m (for minutes), or s (for seconds), respectively.  
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]  
user@host# **set test-type test-duration 20m**
15. Define the theoretical maximum bandwidth for the test in kilobits per second, with a value from 1 Kbps through 1,000,000 Kbps.  
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]  
user@host# **set test-type bandwidth-kbps 500**
16. Enter the **up** command to go the previous level in the configuration hierarchy.  
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]  
user@host# **up**
17. Enter the **up** command to go the previous level in the configuration hierarchy.  
[edit services rpm rfc2544-benchmarking profiles]  
user@host# **up**
18. Define a name for the test—for example, test1. The test name identifier can be up to 32 characters in length.  
[edit services rpm rfc2544-benchmarking]  
user@host# **edit tests test-name test1**
19. Specify the name of the test profile—for example, throughput—to be associated with a particular test name.  
[edit services rpm rfc2544-benchmarking tests test-name test1]  
user@host# **set test-profile throughput**
20. Specify the logical interface, ge-0/0/0.1, on which the RFC 2544-based benchmarking test is run.  
[edit services rpm rfc2544-benchmarking tests test-name test1]

```
user@host# set test-interface ge-0/0/0.1
```

21. Specify the test mode for the packets that are sent during the benchmarking test as initiation and termination.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set mode initiate-and-terminate
```

22. Configure the address type family, **inet**, for the benchmarking test.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set family inet
```

23. Configure the destination IPv4 address for the test packets.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set dest-address 200.0.0.2
```

24. Specify the UDP port of the destination to be used in the UDP header for the generated frames as 4001.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set udp-port 4001
```

25. Start the benchmarking test on the initiator.

```
user@> test services rpm rfc2544-benchmarking test test1 start
```

After the test is successfully completed, it is automatically stopped at the initiator.

---

### Configuring Benchmarking Test Parameters on Router B

#### Step-by-Step Procedure

The following you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the test parameters on Router B:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Configure the interface on which the test must be run.

```
[edit interfaces]
user@host# edit ge-0/0/4
```

3. Configure a logical unit and specify the protocol family as **inet**.

```
[edit interfaces ge-0/0/4]
user@host# edit unit 0 family inet
```

4. Specify the address for the logical interface.

```
[edit interfaces ge-0/0/4 unit 0 family inet]
user@host# set address 200.0.0.2/24
```

5. Enter the **up** command to go the previous level in the configuration hierarchy.

```
[edit interfaces ge-0/0/4 unit 0 family inet]
user@host# up
```

6. Configure the MPLS family on the logical interface.  

```
[edit interfaces ge-0/0/4 unit 0]
user@host# set family mpls
```
7. Go to the top level of the configuration command mode.  

```
[edit interfaces ge-0/0/4 unit 0]
user@host# top
```
8. In configuration mode, go to the **[edit services]** hierarchy level.  

```
[edit]
user@host# edit services
```
9. Configure a real-time performance monitoring service (RPM) instance.  

```
[edit services]
user@host# edit rpm
```
10. Configure an RFC 2544-based benchmarking test for the RPM instance.  

```
[edit services rpm]
user@host# edit rfc2544-benchmarking
```
11. Define a name for the test—for example, test1. The test name identifier can be up to 32 characters in length.  

```
[edit services rpm rfc2544-benchmarking]
user@host# edit tests test-name test1
```
12. Specify the logical interface, ge-0/0/4.1, on which the RFC 2544-based benchmarking test is run.  

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set test-interface ge-0/0/4.1
```
13. Specify **reflect** as the test mode for the packets that are sent during the benchmarking test.  

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set mode reflect
```
14. Configure the address type family, **inet**, for the benchmarking test.  

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set family inet
```
15. Configure the destination IPv4 address for the test packets as 200.0.0.1.  

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set dest-address 200.0.0.1
```
16. Specify the UDP port of the destination to be used in the UDP header for the generated frames as 4001.  

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set udp-port 4001
```
17. Start the benchmarking test on the reflector.  

```
user@host> test services rpm rfc2544-benchmarking test test1 start
```

After the test is successfully completed at the initiator, you can stop the test at the reflector by entering the **test services rpm rfc2544-benchmarking test test1** command.

## Results

---

In configuration mode, confirm your configuration on Router A and Router B by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

### Benchmarking Test Parameters on Router A:

```
[edit interfaces]
ge-0/0/0 {
 unit 0 {
 family inet {
 address 200.0.0.1/24;
 }
 family mpls;
 }
}

[edit services rpm]
rfc2544-benchmarking {
 profiles {
 test-profile throughput {
 test-type throughput
 packet-size 64;
 test-duration 20m;
 bandwidth-kbps 500;
 }
 }

 tests {
 test-name test1 {
 test-profile throughput;
 interface ge-0/0/0.1;
 mode initiate,terminate;
 family inet;
 dest-address 200.0.0.2
 udp-port 4001;
 }
 }
}
```

### Benchmarking Test Parameters on Router B:

```
[edit interfaces]
ge-0/0/4 {
 unit 0 {
 family inet {
 address 200.0.0.2/24;
 }
 family mpls;
 }
}

[edit services rpm]
rfc2544-benchmarking {
 # Note, When in reflector mode, test profile is not needed
```

```
tests {
 test-name test1 {
 interface ge-0/0/4.1;
 mode reflect;
 family inet;
 dest-address 200.0.0.1;
 udp-port 4001;
 }
}
```

After you have configured the device, enter the **commit** command in configuration mode.

## Verifying the Results of the Benchmarking Test for Layer 3 IPv4 Services

Examine the results of the benchmarking test that is performed on the configured service between Router A and Router B.

## Example: Configuring an RFC 2544-Based Benchmarking Test for UNI Direction of Ethernet Pseudowires

This example shows how to configure the benchmarking test for the user-to-network interface (UNI) direction of an Ethernet pseudowire service.

- [Requirements on page 1176](#)
- [Overview on page 1176](#)
- [Configuration on page 1177](#)
- [Verifying the Results of the Benchmarking Test for UNI Direction of an Ethernet Pseudowire Service on page 1182](#)

## Requirements

This example uses the following hardware and software components:

- An ACX Series router—f
- Junos OS Release or later

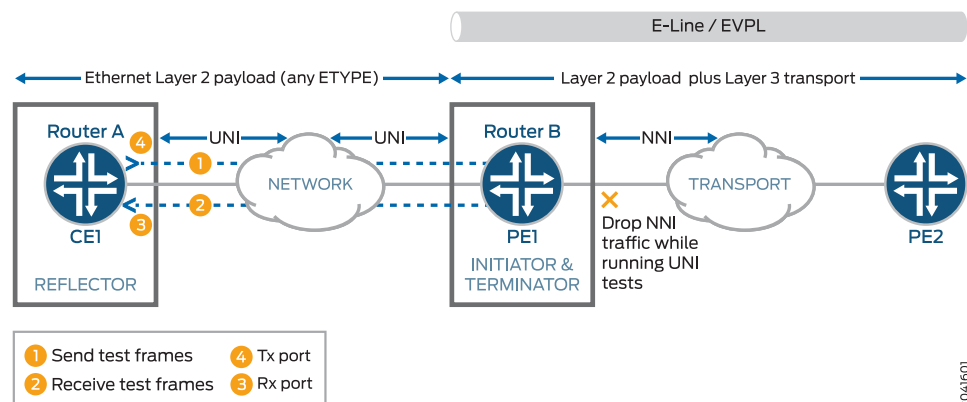

## Overview

Consider a sample topology in which a router, Router A, functions as a reflector of the test frames for an RFC 2544-based benchmarking test. The logical customer edge (CE)-facing interface and `inet` family are configured on Router A. Router A is not part of a pseudowire and therefore, a Layer 3 family configuration is required on it. Router A, which is a customer edge device CE1 is connected to Router B, which functions as a provider edge device PE1 over an Ethernet pseudowire in the UNI direction with EtherType or Layer 2 Ethernet payload. The logical interface, family, and UNI direction are configured on Router B. Router B or PE1 is connected over an Ethernet pseudowire in the NNI direction to a provider edge device at the remote site, PE2. The link between CE1 and PE1 is an Ethernet Layer 2 network and it can be configured with any EtherType value. The link between PE1 and PE2 is an Ethernet line (E-LINE) or an Ethernet Private Line (EPL) that has Layer 2 payload and Layer 3 transport sent over it. Router B or PE1 functions as an initiator and terminator of the test frames that are sent to Router A and reflected back from it.

This benchmarking test is used to compute the performance attributes in the user-to-network interface (UNI) direction of an Ethernet pseudowire service between Router A and Router B. Data traffic arriving from a network-to-network interface (NNI) toward the customer edge is ignored while the test is in progress. Packets from the CE are not sent toward the NNI because all packets are assumed to be test probes.

Figure 38 on page 1002 shows the sample topology to perform an RFC 2544 test for the UNI direction of an Ethernet pseudowire service.

**Figure 44: RFC 2544-Based Benchmarking Test for UNI Direction of an Ethernet Pseudowire**

## Configuration

In this example, you configure the benchmarking test for the UNI direction of an Ethernet pseudowire service that is enabled between two routers to detect and analyze the performance of the interconnecting routers.

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `[edit]` hierarchy level:

#### Configuring Benchmarking Test Parameters on Router A

```
set interfaces ge-0/0/0 vlan-tagging
set interfaces ge-0/0/0 unit 0 vlan-id 101
set interfaces ge-0/0/0 unit 0 family inet address 200.0.0.1/24
set services rpm rfc2544-benchmarking profiles test-profile throughput test-type
 throughput
set services rpm rfc2544-benchmarking profiles test-profile throughput packet-size 64
set services rpm rfc2544-benchmarking profiles test-profile throughput test-duration
 20m
set services rpm rfc2544-benchmarking profiles test-profile throughput bandwidth-kbps
 500
set services rpm rfc2544-benchmarking tests test-name test1 interface ge-0/0/0.1
set services rpm rfc2544-benchmarking tests test-name test1 test-profile throughput
set services rpm rfc2544-benchmarking tests test-name test1 mode initiate,terminate
set services rpm rfc2544-benchmarking tests test-name test1 family inet
set services rpm rfc2544-benchmarking tests test-name test1 dest-address 200.0.0.2
set services rpm rfc2544-benchmarking tests test-name test1 udp-port 4001
```

#### Configuring Benchmarking Test Parameters on Router B

```
set interfaces ge-0/0/4 vlan-tagging
set interfaces ge-0/0/4 unit 0 encapsulation vlan-ccc
set interfaces ge-0/0/4 unit 0 vlan-id 101
set services rpm rfc2544-benchmarking tests test-name test1 interface ge-0/0/4.1
set services rpm rfc2544-benchmarking tests test-name test1 mode reflect
set services rpm rfc2544-benchmarking tests test-name test1 mode family ccc
set services rpm rfc2544-benchmarking tests test-name test1 direction uni
```

### Configuring Benchmarking Test Parameters on Router A

---

**Step-by-Step Procedure** The following require you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the test parameters on Router A:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:  

```
[edit]
user@host# edit interfaces
```
2. Configure the interface on which the test must be run.  

```
[edit interfaces]
user@host# edit ge-0/0/0
```
3. Configure VLAN tagging for transmission and reception of 802.1Q VLAN-tagged frames.  

```
[edit interfaces ge-0/0/0]
user@host# set vlan-tagging
```
4. Configure a logical unit and specify the protocol family as **inet**.  

```
[edit interfaces ge-0/0/0]
user@host# edit unit 0 family inet
```
5. Specify the address for the logical interface.  

```
[edit interfaces ge-0/0/0 unit 0 family inet]
user@host# set address 200.0.0.1/24
```
6. Configure the VLAN ID on the logical interface as 101.  

```
[edit interfaces ge-0/0/0 unit 0]
user@host# set vlan-id 101
```
7. Go to the top level of the configuration command mode.  

```
[edit interfaces ge-0/0/0 unit 0]
user@host# top
```
8. In configuration mode, go to the **[edit services]** hierarchy level.  

```
[edit]
user@host# edit services
```
9. Configure a real-time performance monitoring service (RPM) instance.  

```
[edit services]
user@host# edit rpm
```
10. Configure an RFC 2544-based benchmarking test for the RPM instance.  

```
[edit services rpm]
user@host# edit rfc2544-benchmarking
```
11. Define a name for a test profile—for example, throughput.  

```
[edit services rpm rfc2544-benchmarking]
user@host# edit profiles test-profile throughput
```

12. Configure the type of test to be performed as throughput.  

```
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]
user@host# set test-type throughput
```
13. Specify the size of the test packet as 64 bytes.  

```
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]
user@host# set test-type packet-size 64
```
14. Specify the period for which the test is to be performed in hours, minutes, or seconds by specifying a number followed by the letter h (for hours), m (for minutes), or s (for seconds). In this example, you configure the period as 20 minutes.  

```
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]
user@host# set test-type test-duration 20m
```
15. Define the theoretical maximum bandwidth for the test in kilobits per second, with a value from 1 Kbps through 1,000,000 Kbps.  

```
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]
user@host# set test-type bandwidth-kbps 500
```
16. Enter the **up** command to go the previous level in the configuration hierarchy.  

```
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]
user@host# up
```
17. Enter the **up** command to go the previous level in the configuration hierarchy.  

```
[edit services rpm rfc2544-benchmarking profiles]
user@host# up
```
18. Define a name for the test—for example, test1. The test name identifier can be up to 32 characters in length.  

```
[edit services rpm rfc2544-benchmarking]
user@host# edit tests test-name test1
```
19. Specify the name of the test profile—for example, throughput—to be associated with a particular test name.  

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set test-profile throughput
```
20. Specify the logical interface, ge-0/0/0.1, on which the RFC 2544-based benchmarking test is run.  

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set test-interface ge-0/0/0.1
```
21. Specify the test mode for the packets that are sent during the benchmarking test as initiation and termination.  

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set mode initiate-and-terminate
```
22. Configure the address type family, **inet**, for the benchmarking test.  

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set family inet
```
23. Configure the destination IPv4 address for the test packets as 200.0.0.2.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set dest-address 200.0.0.2
```

24. Specify the UDP port of the destination to be used in the UDP header for the generated frames as 4001.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set udp-port 4001
```

---

### Configuring Benchmarking Test Parameters on Router B

#### Step-by-Step Procedure

The following require you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the test parameters on Router B:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Configure the interface on which the test must be run.

```
[edit interfaces]
user@host# edit ge-0/0/4
```

3. Configure VLAN tagging for transmission and reception of 802.1Q VLAN-tagged frames.

```
[edit interfaces ge-0/0/4]
user@host# set vlan-tagging
```

4. Configure a logical unit for the interface.

```
[edit interfaces ge-0/0/4]
user@host# edit unit 0
```

5. Specify the encapsulation for Ethernet VLAN circuits.

```
[edit interfaces ge-0/0/4 unit 0]
user@host# set encapsulation vlan-ccc
```

6. Configure the VLAN ID as 101 on the logical interface.

```
[edit interfaces ge-0/0/4 unit 0]
user@host# set vlan-id 101
```

7. Go to the top level of the configuration command mode.

```
[edit interfaces ge-0/0/4 unit 0]
user@host# top
```

8. In configuration mode, go to the **[edit services]** hierarchy level.

```
[edit]
user@host# edit services
```

9. Configure a real-time performance monitoring service (RPM) instance.

```
[edit services]
user@host# edit rpm
```

10. Configure an RFC 2544-based benchmarking test for the RPM instance.

```
[edit services rpm]
user@host# edit rfc2544-benchmarking
```

11. Define a name for the test—for example, test1. The test name identifier can be up to 32 characters in length.

```
[edit services rpm rfc2544-benchmarking]
user@host# edit tests test-name test1
```

12. Specify the logical interface on which the RFC 2544-based benchmarking test is run.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set test-interface ge-0/0/4.1
```

13. Specify **reflect** as the test mode for the packets that are sent during the benchmarking test.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set mode reflect
```

14. Configure the address type family, **ccc**, for the benchmarking test.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set family ccc
```

15. Specify the direction of the interface on which the test must be run, which is UNI in this example.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set direction uni
```

16. Start the benchmarking test on the reflector.

```
user@host> test services rpm rfc2544-benchmarking test test1 start
```

After the test is successfully completed at the initiator, you can stop the test at the reflector by entering the **test services rpm rfc2544-benchmarking test test1 stop** command.

## Results

In configuration mode, confirm your configuration on Router A and Router B by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

Benchmarking Test Parameters on Router A:

```
[edit interfaces]
ge-0/0/0 {
 vlan-tagging;
 unit 0 {
 vlan-id 101;
 family inet {
 address 200.0.0.1/24;
 }
 }
}
```

```
[edit services rpm]
rfc2544-benchmarking {
 profiles {
 test-profile throughput {
 test-type throughput
 packet-size 64;
 test-duration 20m;
 bandwidth-kbps 500;
 }
 }

 tests {
 test-name test1 {
 interface ge-0/0/0.1;
 test-profile throughput;
 mode initiate,terminate;
 family inet;
 dest-address 200.0.0.2
 udp-port 4001;
 }
 }
}
```

Benchmarking Test Parameters on Router B:

```
[edit interfaces]
ge-0/0/4 {
 vlan-tagging;
 unit 0 {
 encapsulation vlan-ccc;
 vlan-id 101;
 }
}

[edit services rpm]
rfc2544-benchmarking {
 # Note, When in reflector mode, test profile is not needed
 tests {
 test-name test1 {
 interface ge-0/0/4.1;
 mode reflect;
 family ccc;
 direction uni;
 }
 }
}
```

After you have configured the device, enter the **commit** command in configuration mode.

## Verifying the Results of the Benchmarking Test for UNI Direction of an Ethernet Pseudowire Service

Examine the results of the benchmarking test that is performed on the configured service between Router A and Router B.

- [Verifying the Benchmarking Test Results on page 1183](#)

### Verifying the Benchmarking Test Results

---

<b>Purpose</b>	Verify that the necessary and desired statistical values are displayed for the benchmarking test that is run on the configured service between Router A and Router B.
<b>Action</b>	In operational mode, enter the <b>show services rpm rfc2544-benchmarking (aborted-tests   active-tests   completed-tests   summary)</b> command to display information about the results of each category or state of the RFC 2544-based benchmarking test, such as aborted tests, active tests, and completed tests, for each real-time performance monitoring (RPM) instance.
<b>Meaning</b>	The output displays the details of the benchmarking test that was performed. For more information about the <b>show services rpm rfc2544-benchmarking</b> operational command, see <b>show services rpm rfc2544-benchmarking</b> in the <a href="#">CLI Explorer</a> .
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RFC2544-Based Benchmarking Tests Overview on page 983</a></li><li>• <a href="#">Configuring an RFC 2544-Based Benchmarking Test on page 989</a></li></ul>

## Example: Configuring an RFC 2544-Based Benchmarking Test for NNI Direction of Ethernet Pseudowires

---

This example shows how to configure the benchmarking test for a network-to-network interface (NNI) direction of an Ethernet pseudowire service.

- [Requirements on page 1183](#)
- [Overview on page 1183](#)
- [Configuration on page 1184](#)
- [Verifying the Results of the Benchmarking Test for NNI Direction of an Ethernet Pseudowire Service on page 1190](#)

### Requirements

This example uses the following hardware and software components:

- An ACX Series router
- Junos OS Release or later

### Overview

Consider a sample topology in which a router, Router A, functions as an initiator and terminator of the test frames for an RFC 2544-based benchmarking test. Router A operates as a provider edge device PE1, which is connected to a customer edge device CE1 on one side and over an Ethernet pseudowire to another router Router B, which functions as a reflector to reflect back the test frames it receives from Router A. Router B operates as a provider edge device, PE2, which is the remote router located at the other side of the service provider core. The UNI direction of CE1 is connected to the NNI direction

of PE1. An MPLS tunnel connects PE1 and PE2 over the Ethernet pseudowire or the Ethernet line (E-LINE).

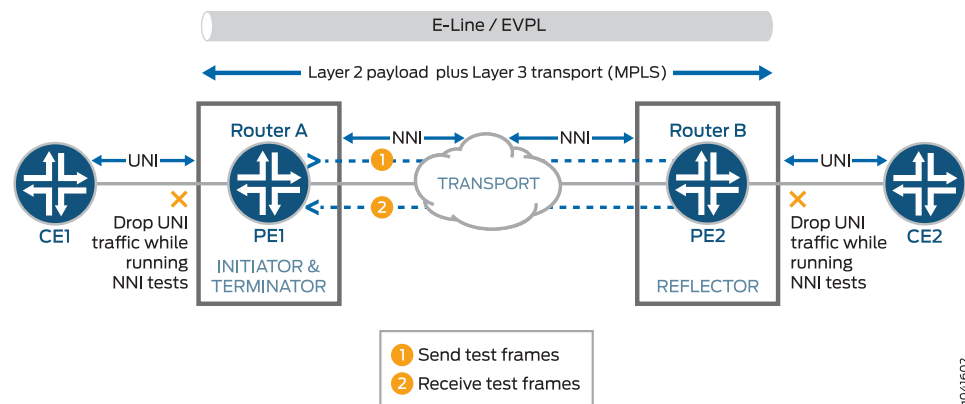

**NOTE:** When pseudowire reflection is enabled on an interface, the router does not block the ingress or egress traffic through the test interface. To block other data traffic, you must explicitly configure firewall filters.

This benchmarking test is used to compute the performance attributes in the network-to-network interface (NNI) direction of an Ethernet pseudowire service between Router A and Router B. The logical interface under test on Router A is the CE1 interface with UNI as the direction, and the logical interface under test on Router B is the CE2 interface with NNI as the direction. Data traffic arriving from UNI toward NNI is ignored while the test is in progress. Packets from NNI are not sent toward the customer edge because all packets are assumed to be test frames. The family and NNI direction are configured on routers A and B.

Figure 39 on page 1010 shows the sample topology to perform an RFC 2544 test for the NNI direction of an Ethernet pseudowire service.

**Figure 45: RFC 2544-Based Benchmarking Test for NNI Direction of an Ethernet Pseudowire**

## Configuration

In this example, you configure the benchmarking test for the NNI direction of an Ethernet pseudowire service that is enabled between two routers to detect and analyze the performance of the interconnecting routers.

- [Results on page 1189](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `[edit]` hierarchy level:

### Configuring Benchmarking Test Parameters on Router A

```
set interfaces ge-0/0/0 vlan-tagging
set interfaces ge-0/0/0 unit 0 encapsulation vlan-ccc
set interfaces ge-0/0/0 unit 0 vlan-id 101
set services rpm rfc2544-benchmarking profiles test-profile throughput test-type
throughput
set services rpm rfc2544-benchmarking profiles test-profile throughput packet-size 64
set services rpm rfc2544-benchmarking profiles test-profile throughput test-duration 20
set services rpm rfc2544-benchmarking profiles test-profile throughput bandwidth-kbps
500
set services rpm rfc2544-benchmarking tests test-name test1 interface ge-0/0/0.1
set services rpm rfc2544-benchmarking tests test-name test1 test-profile throughput
set services rpm rfc2544-benchmarking tests test-name test1 mode initiate,terminate
set services rpm rfc2544-benchmarking tests test-name test1 family ccc
set services rpm rfc2544-benchmarking tests test-name test1 direction nni
```

### Configuring Benchmarking Test Parameters on Router B

```
set interfaces ge-0/0/4 vlan-tagging
set interfaces ge-0/0/4 unit 0 encapsulation vlan-ccc
set interfaces ge-0/0/4 unit 0 vlan-id 101
set services rpm rfc2544-benchmarking tests test-name test1 interface ge-0/0/4.1
set services rpm rfc2544-benchmarking tests test-name test1 mode reflect
set services rpm rfc2544-benchmarking tests test-name test1 mode family ccc
set services rpm rfc2544-benchmarking tests test-name test1 direction uni
```

## Configuring Benchmarking Test Parameters on Router

### Step-by-Step Procedure

The following require you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the test parameters on Router A:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:  

```
[edit]
user@host# edit interfaces
```
2. Configure the interface on which the test must be run.  

```
[edit interfaces]
user@host# edit ge-0/0/0
```
3. Configure VLAN tagging for transmission and reception of 802.1Q VLAN-tagged frames.  

```
[edit interfaces ge-0/0/0]
user@host# set vlan-tagging
```
4. Configure a logical unit for the interface.

- ```
[edit interfaces ge-0/0/0]
user@host# edit unit 0
```
5. Specify the encapsulation for Ethernet VLAN circuits.

```
[edit interfaces ge-0/0/0 unit 0]
user@host# set encapsulation vlan-ccc
```
 6. Configure the VLAN ID on the logical interface.

```
[edit interfaces ge-0/0/0 unit 0]
user@host# set vlan-id 101
```
 7. Go to the top level of the configuration command mode.

```
[edit interfaces ge-0/0/0 unit 0]
user@host# top
```
 8. In configuration mode, go to the **[edit services]** hierarchy level.

```
[edit]
user@host# edit services
```
 9. Configure a real-time performance monitoring service (RPM) instance.

```
[edit services]
user@host# edit rpm
```
 10. Configure an RFC 2544-based benchmarking test for the RPM instance.

```
[edit services rpm]
user@host# edit rfc2544-benchmarking
```
 11. Define a name for a test profile—for example, throughput.

```
[edit services rpm rfc2544-benchmarking]
user@host# edit profiles test-profile throughput
```
 12. Configure the type of test to be performed as throughput.

```
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]
user@host# set test-type throughput
```
 13. Specify the size of the test packet as 64 bytes.

```
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]
user@host# set test-type packet-size 64
```
 14. Specify the period—for example, 20 minutes—for which the test is to be performed in hours, minutes, or seconds by specifying a number followed by the letter h (for hours), m (for minutes), or s (for seconds).

```
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]
user@host# set test-type test-duration 20m
```
 15. Define the theoretical maximum bandwidth for the test in kilobits per second, with a value from 1 Kbps through 1,000,000 Kbps.

```
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]
user@host# set test-type bandwidth-kbps 500
```
 16. Enter the **up** command to go the previous level in the configuration hierarchy.

```
[edit services rpm rfc2544-benchmarking profiles test-profile throughput]
```

```
user@host# up
```

17. Enter the **up** command to go the previous level in the configuration hierarchy.

```
[edit services rpm rfc2544-benchmarking profiles]  
user@host# up
```

18. Define a name for the test—for example, test1. The test name identifier can be up to 32 characters in length.

```
[edit services rpm rfc2544-benchmarking]  
user@host# edit tests test-name test1
```

19. Specify the name of the test profile—for example, throughput—to be associated with a particular test name.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]  
user@host# set test-profile throughput
```

20. Specify the logical interface, ge-0/0/0.1, on which the RFC 2544-based benchmarking test is run.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]  
user@host# set test-interface ge-0/0/0.1
```

21. Specify the test mode for the packets that are sent during the benchmarking test as initiation and termination.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]  
user@host# set mode initiate-and-terminate
```

22. Configure the address type family, ccc, for the benchmarking test.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]  
user@host# set family ccc
```

23. Specify the direction of the interface on which the test must be run, which is NNI in this example.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]  
user@host# set direction nni
```

Configuring Benchmarking Test Parameters on Router B

Step-by-Step Procedure

The following require you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the test parameters on Router B:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]  
user@host# edit interfaces
```

2. Configure the interface on which the test must be run.

```
[edit interfaces]  
user@host# edit ge-0/0/4
```

3. Configure VLAN tagging for transmission and reception of 802.1Q VLAN-tagged frames.

```
[edit interfaces ge-0/0/4]  
user@host# set vlan-tagging
```
4. Configure a logical unit for the interface.

```
[edit interfaces ge-0/0/4]  
user@host# edit unit 0
```
5. Specify the encapsulation for Ethernet VLAN circuits.

```
[edit interfaces ge-0/0/4 unit 0]  
user@host# set encapsulation vlan-ccc
```
6. Configure the VLAN ID on the logical interface.

```
[edit interfaces ge-0/0/4 unit 0]  
user@host# set vlan-id 101
```
7. Go to the top level of the configuration command mode.

```
[edit interfaces ge-0/0/4 unit 0]  
user@host# top
```
8. In configuration mode, go to the **[edit services]** hierarchy level.

```
[edit]  
user@host# edit services
```
9. Configure a real-time performance monitoring service (RPM) instance.

```
[edit services]  
user@host# edit rpm
```
10. Configure an RFC 2544-based benchmarking test for the RPM instance.

```
[edit services rpm]  
user@host# edit rfc2544-benchmarking
```
11. Define a name for the test—for example, test1. The test name identifier can be up to 32 characters in length.

```
[edit services rpm rfc2544-benchmarking]  
user@host# edit tests test-name test1
```
12. Specify the logical interface, ge-0/0/4.1, on which the RFC 2544-based benchmarking test is run.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]  
user@host# set test-interface ge-0/0/4.1
```

NOTE: When pseudowire reflection is enabled on an interface, the router does not block the ingress or egress traffic through the test interface. To block other data traffic, you must explicitly configure firewall filters.

13. Specify **reflect** as the test mode for the packets that are sent during the benchmarking test.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set mode reflect
```

14. Configure the address type family, **ccc**, for the benchmarking test.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set family ccc
```

15. Specify the direction of the interface on which the test must be run, which is **NNI** in this example.

```
[edit services rpm rfc2544-benchmarking tests test-name test1]
user@host# set direction nni
```

16. Start the benchmarking test on the reflector.

```
user@host> test services rpm rfc2544-benchmarking test test1 start
```

After the test is successfully completed at the initiator, you can stop the test at the reflector by entering the **test services rpm rfc2544-benchmarking test test1 stop** command.

Results

In configuration mode, confirm your configuration on Router A and Router B by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

Benchmarking Test Parameters on Router A:

```
[edit interfaces]
ge-0/0/0 {
  vlan-tagging;
  unit 0 {
    encapsulation vlan-ccc;
    vlan-id 101;
  }
}

[edit services rpm]
rfc2544-benchmarking {
  profiles {
    test-profile throughput {
      test-type throughput
      packet-size 64;
      test-duration 20m;
      bandwidth-kbps 500;
    }
  }

  tests {
    test-name test1 {
      interface ge-0/0/0.1;
      test-profile throughput;
      mode initiate,terminate;
      family ccc;
      direction nni;
    }
  }
}
```

Benchmarking Test Parameters on Router B:

```
[edit interfaces]
ge-0/0/4 {
  vlan-tagging;
  unit 0 {
    encapsulation vlan-ccc;
    vlan-id 101;
  }
}

[edit services rpm]
rfc2544-benchmarking {
  # Note, When in reflector mode, test profile is not needed
  tests {
    test-name test1 {
      interface ge-0/0/4.1;
      mode reflect;
      family ccc;
      direction nni;
    }
  }
}
```

After you have configured the device, enter the **commit** command in configuration mode.

Verifying the Results of the Benchmarking Test for NNI Direction of an Ethernet Pseudowire Service

Examine the results of the benchmarking test that is performed on the configured service between Router A and Router B.

CHAPTER 73

Tracking Streaming Media Traffic Using Inline Video Monitoring

- [Inline Video Monitoring Overview on page 1191](#)
- [Configuring Inline Video Monitoring on page 1193](#)
- [Inline Video Monitoring Syslog Messages on page 1195](#)

Inline Video Monitoring Overview

Junos OS supports inline video monitoring using Media Delivery Index (MDI) metrics.

Inline video monitoring is available on MX Series routers using only the following MPCs:

- MPCE1
- MPCE2
- MPC-16XGE

You use the **video-monitoring** statement at the **[edit services]** hierarchy level to specify monitoring criteria for two key indicators of video traffic problems: delay factor and media loss rate (MLR), and to apply these metrics to flows on designated interfaces.

Before you use the inline video monitoring feature, ensure that you understand the following terms:

- **media delivery index**—These metrics facilitate identification of buffering needs for streaming media. Buffering must be adequate to compensate for packet jitter, measured by the MDI delay factor, and quality problems indicated by lost packets, measured by the MDI media loss rate (MLR). By performing measurements under varying load conditions, you can identify sources of significant jitter or packet loss and take appropriate action.
- **delay factor** —Delay factor is the maximum observed time difference between the arrival of media data and the drain of media data. The expected drain rate is the nominal, constant traffic rate for constant bit rate streams or the computed traffic rate of variable rate media stream packet data.

For typical stream rates of 1 megabit per second and higher, an interval of one second provides an adequate sample time. The delay factor indicates how long a data stream must be buffered (delayed) at its nominal bit rate to prevent packet loss.

The delay factor suggests the minimum size of the buffer required at the next downstream node. As a stream progresses, the variation of the delay factor indicates packet bunching or packet gaps (jitter). Greater delay factor values also indicate that more network latency is needed to deliver a stream due to the need to pre-fill a receive buffer before beginning the drain to guarantee no underflow.

When the nominal drain bit rate at a receiving node is known, the delay factor's maximum indicates the size of buffer required to accommodate packet jitter.

- **Media rate variation (MRV)**—This value is the difference between the expected packet rate and actual packet rate expressed as a percentage of the expected packet rate.
- **Media loss rate (MLR)**—This value is the number of media packets lost over a configurable time interval (*interval-duration*), where the flow packets are packets carrying streaming application information. A single IP packet can contain zero or more streaming packets. For example, an IP packet typically contains seven 188-byte MPEG transport stream packets. In this case, a single IP packet loss results in seven lost packets counted (if those seven lost packets did not include null packets). Including out-of-order packets is important, because many stream consumer-type devices do not attempt to reorder packets that are received out of order.

To configure the monitoring process, define criteria templates and apply them to the interfaces and flows you want to monitor. Monitoring templates include the following criteria:

- Duration of each measurement cycle
- Flow rate information used to establish expected flow rates
- Threshold levels for media rate variation and media loss rate that trigger desired syslog alerts

For each interface you want to monitor, you can define one or more filters to select flows for monitoring. Flows are designated as input or output flows and are uniquely identified by:

- Source IP address
- Source port
- Destination IP address
- Destination port

Junos OS supports the definition of filters for up to 256 flows, which can consist of input flows, output flows, or a combination of input and output flows. These filters provide criteria for selecting flows for monitoring. If the selection criteria consist of lists of IP addresses or ports, you could exceed the maximum number of match conditions for flows. Video monitoring selects a widely variable number of flows based on flow filters. The total number of flows that can be measured at a time depends on the specific MPC card being used, as shown in [Table 41 on page 1045](#).

When you do not define input or output flow filters for a monitored interfaces, all flows on the interface are subject to monitoring.

Table 49: MPC Flow Monitoring Capacity by Model

| MPC Model | Maximum Number of Flows Monitored Simultaneously |
|-----------|--|
| MPCE1 | 1000 |
| MPCE2 | 2000 |
| MPC-16XGE | 4000 |

NOTE: Junos OS measures both UDP flows (the default) and RTP flows. Junos OS differentiates media traffic over UDP or RTP by inspecting the first byte in the UDP payload. If the first byte of the UDP payload is 0x47 (MPEG2-TS sync byte), the traffic is treated as media traffic over UDP. Traffic is treated as media traffic over RTP if the version field is 2 and the payload type is 33 in the RTP header. When neither of these criteria are met, the packet is not considered for video monitoring.

Configuring Inline Video Monitoring

To configure inline video monitoring, perform the following tasks.

- [Configuring Media Delivery Indexing Criteria on page 1193](#)
- [Configuring Interface Flow Criteria on page 1195](#)

Configuring Media Delivery Indexing Criteria

To configure media delivery indexing criteria:

1. In edit mode, create a named template for video monitoring.

```
user@host# edit services video-monitoring templates template-name
```

For example,

```
user@host# edit services video-monitoring templates t1
```
2. Set the duration for sampling in seconds. Flow media delivery indexing statistics are updated at the end of this interval.

```
[edit services video-monitoring templates t1]
```

```
user@host# set interval-duration 1
```

BEST PRACTICE: If you change the interval duration when a template is being used, you cause a change in the calculated number of expected packets in an measurement interval for the template. We recommend that you do not change the interval duration for a template that is in use.

3. Set the inactivity timeout.

```
[edit services video-monitoring templates t1]
user@host# set inactivity-timeout 30
```

4. Configure either **media-rate** or **layer3-packet-rate** to establish expected flow rates used to compare to monitored flow rates.

NOTE: The media rate is the configured media bit rate for the stream. The media rate is used to establish *expected packets per second (pps)*.

The layer 3 packet rate in packets per second (pps) and is used to establish *expected bits per second (bps)*.

```
[edit services video-monitoring templates t1]
user@host# set media-rate 2972400
```

5. Set delay factor thresholds for syslog message levels.

```
[edit services video-monitoring templates t1]
user@host# set delay-factor threshold info 100
user@host# set delay-factor threshold warning 200
user@host# set delay-factor threshold critical 300
```

6. Set media loss rate thresholds for syslog message levels. You can set the threshold based on number of packets lost, or percentage of packets lost.

Or

```
[edit services video-monitoring templates t1]
user@host# set media-loss-rate threshold info percentage 5
user@host# set media-loss-rate threshold warning percentage 10
user@host# set media-loss-rate threshold critical percentage 20
```

7. Set the media rate variation thresholds for syslog message levels. The threshold is based on the ratio of the *difference* between the configured media rate and the monitored media rate to the configured media rate, expressed as a percentage.

```
[edit services video-monitoring templates t1]
user@host# set media-rate-variation threshold info 10
user@host# set media-rate-variation threshold warning 15
user@host# set media-rate-variation threshold critical 20
```

Configuring Interface Flow Criteria

To configure monitoring of flows for interfaces:

1. In edit mode, identify an interface for monitoring .

```
user@host# edit services video-monitoring interfaces interface-name
```

2. Identify input flows for monitoring. Flows are uniquely identified by source IP address, source port, destination IP address, and destination port. You can restrict flow measurement by specifying values for these identifiers. You can specify individual addresses or ports or lists of addresses and ports. If you do not specify any identifiers, all flows on the interface are monitored.

```
[edit services video-monitoring interfaces interface-name]
user@host# set input-flows input-flow-name
user@host# set input-flows input-flow-name source-address address
user@host# set input-flows input-flow-name source-port port
user@host# set input-flows input-flow-name destination-address address
user@host# set input-flows input-flow-name destination-port port
```

NOTE: You can configure a maximum of 256 flow definitions. If your flow definitions contain lists of addresses and ports, you may exceed the number of match conditions. When you exceed the limits for flows or match conditions, you receive the following constraint message when you commit:

```
'interfaces xe-0/2/2.0'
  Number of flows or Number of match condition under flows exceeded
  limit
error: configuration check-out failed
```

3. Identify output flows for monitoring, using the same options listed in Step 2.
4. Identify the template used to monitor the flows on the interface.

```
[edit services video-monitoring interfaces interface-name]
set template t1
```

Tunnel Services Overview

By encapsulating arbitrary packets inside a transport protocol, tunneling provides a private, secure path through an otherwise public network. Tunnels connect discontinuous subnetworks and enable encryption interfaces, virtual private networks (VPNs), and MPLS. If you have a Tunnel Physical Interface Card (PIC) installed in your M Series or T Series router, you can configure unicast, multicast, and logical tunnels.

You can configure two types of tunnels for VPNs: one to facilitate routing table lookups and another to facilitate VPN routing and forwarding instance (VRF) table lookups.

For information about encryption interfaces, see [“Configuring Encryption Interfaces” on page 1251](#) and the *Junos OS Administration Library for Routing Devices*. For information about VPNs, see the *Junos OS VPNs Library for Routing Devices*. For information about MPLS, see the *Junos OS MPLS Applications Library for Routing Devices*.

On SRX Series devices, Generic Routing Encapsulation (GRE) and IP-IP tunnels use internal interfaces, `gr-0/0/0` and `ip-0/0/0`, respectively. The Junos OS creates these interfaces at system bootup; they are not associated with physical interfaces.

The Juniper Networks Junos OS supports the tunnel types shown in [Table 50 on page 1199](#).

Table 50: Tunnel Interface Types

| Interface | Description |
|-----------------------|---|
| <code>gr-0/0/0</code> | <p>Configurable generic routing encapsulation (GRE) interface. GRE allows the encapsulation of one routing protocol over another routing protocol.</p> <p>Within a router, packets are routed to this internal interface, where they are first encapsulated with a GRE packet and then re-encapsulated with another protocol packet to complete the GRE. The GRE interface is an internal interface only and is not associated with a physical interface. You must configure the interface for it to perform GRE.</p> |

Table 50: Tunnel Interface Types (*continued*)

| Interface | Description |
|-----------------|---|
| gre | <p>Internally generated GRE interface. This interface is generated by the Junos OS to handle GRE.</p> <p>NOTE: You can configure GRE interfaces (<code>gre-x/y/z</code>) only for GMPLS control channels. GRE interfaces are not supported or configurable for other applications. This type of interface does not require a Tunnel PIC. For more information about GMPLS, see the <i>Junos OS MPLS Applications Library for Routing Devices</i> and the <i>Junos OS, Release 14.2</i>.</p> |
| ip-0/0/0 | <p>Configurable IP-over-IP encapsulation (also called IP tunneling) interface. IP tunneling allows the encapsulation of one IP packet over another IP packet.</p> <p>Packets are routed to an internal interface where they are encapsulated with an IP packet and then forwarded to the encapsulating packet's destination address. The IP-IP interface is an internal interface only and is not associated with a physical interface. You must configure the interface for it to perform IP tunneling.</p> |
| ipip | Internally generated IP-over-IP interface. This interface is generated by the Junos OS to handle IP-over-IP encapsulation. It is not a configurable interface. |
| lt-0/0/0 | <p>The lt interface on M Series and T Series routers supports configuration of logical systems—the capability to partition a single physical router into multiple logical devices that perform independent routing tasks.</p> <p>On SRX Series devices, the lt interface is a configurable logical tunnel interface that interconnects logical systems. See the <i>Junos OS Logical Systems Configuration Guide for Security Devices</i>.</p> |
| mt-0/0/0 | <p>Internally generated multicast tunnel interface. Multicast tunnels filter all unicast packets; if an incoming packet is not destined for a 224/8-or-greater prefix, the packet is dropped and a counter is incremented.</p> <p>Within a router, packets are routed to this internal interface for multicast filtering. The multicast tunnel interface is an internal interface only and is not associated with a physical interface. If your router has a Tunnel Services PIC, the Junos OS automatically configures one multicast tunnel interface (mt-) for each virtual private network (VPN) you configure. You do not need to configure multicast tunnel interfaces. However, you can configure properties on mt- interfaces, such as the multicast-only statement.</p> |
| mtun | Internally generated multicast tunnel interface. This interface is generated by the Junos OS to handle multicast tunnel services. It is not a configurable interface. |

Table 50: Tunnel Interface Types (*continued*)

| Interface | Description |
|-----------------|--|
| pd-0/0/0 | <p>Configurable Protocol Independent Multicast (PIM) de-encapsulation interface. In PIM sparse mode, the first-hop router encapsulates packets destined for the rendezvous point router. The packets are encapsulated with a unicast header and are forwarded through a unicast tunnel to the rendezvous point. The rendezvous point then de-encapsulates the packets and transmits them through its multicast tree.</p> <p>Within a router, packets are routed to this internal interface for de-encapsulation. The PIM de-encapsulation interface is an internal interface only and is not associated with a physical interface. You must configure the interface for it to perform PIM de-encapsulation.</p> <p>NOTE: On SRX Series devices, this interface type is ppd0.</p> |
| pe-0/0/0 | <p>Configurable PIM encapsulation interface. In PIM sparse mode, the first-hop router encapsulates packets destined for the rendezvous point router. The packets are encapsulated with a unicast header and are forwarded through a unicast tunnel to the rendezvous point. The rendezvous point then de-encapsulates the packets and transmits them through its multicast tree.</p> <p>Within a router, packets are routed to this internal interface for encapsulation. The PIM encapsulation interface is an internal interface only and is not associated with a physical interface. You must configure the interface for it to perform PIM encapsulation.</p> <p>NOTE: On SRX Series devices, this interface type is ppe0.</p> |
| pimd | Internally generated PIM de-encapsulation interface. This interface is generated by the Junos OS to handle PIM de-encapsulation. It is not a configurable interface. |
| pime | Internally generated PIM encapsulation interface. This interface is generated by the Junos OS to handle PIM encapsulation. It is not a configurable interface. |
| vt-0/0/0 | <p>Configurable virtual loopback tunnel interface. Facilitates VRF table lookup based on MPLS labels. This interface type is supported on M Series and T Series routers, but not on SRX Series devices.</p> <p>To configure a virtual loopback tunnel to facilitate VRF table lookup based on MPLS labels, you specify a virtual loopback tunnel interface name and associate it with a routing instance that belongs to a particular routing table. The packet loops back through the virtual loopback tunnel for route lookup.</p> |

Related Documentation

- [GRE Keepalive Time Overview on page 1205](#)
- [Configuring Unicast Tunnels on page 1213](#)
- [Restricting Tunnels to Multicast Traffic on page 1219](#)
- [Configuring Tunnel Interfaces on MX Series Routers on page 1202](#)
- [Configuring Tunnel Interfaces on T4000 Routers on page 1203](#)

Configuring Tunnel Interfaces on MX Series Routers

Because the MX Series routers do not support Tunnel Services PICs, you create tunnel interfaces on MX Series routers by including the following statements at the **[edit chassis]** hierarchy level:

```
[edit chassis]
fpc slot-number {
  pic number {
    tunnel-services {
      bandwidth (1g | 10g | 20g | 40g);
    }
  }
}
```

fpc slot-number is the slot number of the DPC, MPC, or MIC. On the MX80 router, the range is 0 through 1. On other MX series routers, if two SCBs are installed, the range is 0 through 11. If three SCBs are installed, the range is 0 through 5 and 7 through 11.

The **pic number** On MX80 routers, if the FPC is 0, the PIC number can only be 0. If the FPC is 1, the PIC range is 0 through 3. For all other MX series routers, the range is 0 through 3.

bandwidth (1g | 10g | 20g | 40g) is the amount of bandwidth to reserve for tunnel traffic on each Packet Forwarding Engine.

NOTE: When you use MPCs and MICs, tunnel interfaces are soft interfaces and allow as much traffic as the forwarding-path allows, so it is advantageous to setup tunnel services without artificially limiting traffic by use of the **bandwidth** option. However, you *must* specify **bandwidth** when configuring tunnel services for MX Series routers with DPCs or FPCs. The GRE key option is not supported on the tunnel interfaces for DPCs on MX960 routers.

Bandwidth rates of 20 gigabits per second and 40 gigabits per second require use of an MX Series router with the 100-Gigabit Ethernet Modular Port Concentrator (MPC) and the 100-Gigabit CFP MIC.

1g indicates that 1 gigabit per second of bandwidth is reserved for tunnel traffic.

10g indicates that 10 gigabits per second of bandwidth is reserved for tunnel traffic.

20g indicates that 20 gigabits per second of bandwidth is reserved for tunnel traffic.

40g indicates that 40 gigabits per second of bandwidth is reserved for tunnel traffic.

If you specify a bandwidth that is not compatible, tunnel services are not activated. For example, you cannot specify a bandwidth of 1 Gbps for a Packet Forwarding Engine on a 10-Gigabit Ethernet 4-port DPC.

To verify that the tunnel interfaces have been created, issue the **show interfaces terse** operational mode command. For more information, see the [CLI Explorer](#). The bandwidth

that you specify determines the port number of the tunnel interfaces that are created. When you specify a bandwidth of **1g**, the port number is always 10. When you specify any other bandwidth, the port number is always 0.

NOTE: Ingress queueing and tunnel services cannot be configured on the same MPC as it causes PFE forwarding to stop. Each feature can, however, be configured and used separately.

Related Documentation

- *Example: Configuring Tunnel Interfaces on a Gigabit Ethernet 40-Port DPC*
- *Example: Configuring Tunnel Interfaces on a 10-Gigabit Ethernet 4-Port DPC*
- *Example: Configuring Tunnel Interfaces on the MPC3E*
- *bandwidth (Tunnel Services)*
- *tunnel-services (Chassis)*
- *[edit chassis] Hierarchy Level*

Configuring Tunnel Interfaces on T4000 Routers

To create tunnel interfaces on a T4000 Core Router, include the following statements at the **[edit chassis]** hierarchy level:

```
[edit chassis]
fpc slot-number {
  pic number {
    tunnel-services {
      bandwidth bandwidth-value;
    }
  }
}
```

fpc slot-number denotes the slot number of the FPC. On the T4000 router, the range is 0 through 7.

NOTE:

- This applies only to the T4000 Type 5 FPC. If any other type of FPC is configured in this slot, this configuration is ignored and no tunnel physical interface is created.
- When you use Type 5 FPCs, the tunnel interfaces are soft interfaces and allow as much traffic as the forwarding-path allows. So, it is advantageous to setup tunnel services without artificially limiting traffic by setting the **bandwidth** statement.

pic number on the T4000 router is 0 or 1.

bandwidth *bandwidth-value* is the amount of bandwidth to reserve for the tunnel traffic on each Packet Forwarding Engine. The bandwidth value accepted includes every multiple of 10g up to 100g.

If you specify a bandwidth that is not compatible, tunnel services are not activated. For example, you cannot specify a bandwidth of 1 Gbps for a Packet Forwarding Engine on a 100-Gigabit Ethernet PIC with CFP.

To verify that the tunnel interfaces have been created, issue the **show interfaces terse** operational mode command. For more information, see the *Junos Interfaces Command Reference*.

GRE Keepalive Time Overview

Generic routing encapsulation (GRE) tunnel interfaces do not have a built-in mechanism for detecting when a tunnel is down. You can enable keepalive messages to serve as the detection mechanism.

Keepalives can be configured on the physical or on the logical interface. If configured on the physical interface, keepalives are sent on all logical interfaces that are part of the physical interface. If configured on a individual logical interface, keepalives are only sent to that logical interface. In addition to configuring a keepalive, you must configure the hold time.

Configuring Keepalive Time and Hold time for a GRE Tunnel Interface

You can configure the keepalives on a generic routing encapsulation (GRE) tunnel interface by including both the **keepalive-time** statement and the **hold-time** statement at the **[edit protocols oam gre-tunnel interface *interface-name*]** hierarchy level.

NOTE: For proper operation of keepalives on a GRE interface, you must also include the **family inet** statement at the **[edit interfaces *interface-name* unit *unit*]** hierarchy level. If you do not include this statement, the interface is marked as down.

To configure a GRE tunnel interface:

1. Configure the GRE tunnel interface at **[edit interfaces *interface-name* unit *unit-number*]** hierarchy level, where the interface name is gr-x/y/z, and the family is set as **inet**.

```
user@host# set interfaces interface-name unit unit-number family family-name
```

2. Configure the rest of the GRE tunnel interface options as explained in *Configuring a GRE Tunnel Interface Between a PE and CE Router* or *Configuring a GRE Tunnel Interface Between PE Routers* based on requirement.

To configure keepalive time for a GRE tunnel interface:

1. Configure the Operation, Administration, and Maintenance (OAM) protocol at the **[edit protocols]** hierarchy level for the GRE tunnel interface.

```
[edit]
user@host# edit protocols oam
```

2. Configure the GRE tunnel interface option for OAM protocol.

```
[edit protocols oam]
user@host# edit gre-tunnel interface interface-name
```

3. Configure the keepalive time from 1 through 50 seconds for the GRE tunnel interface.

```
[edit protocols oam gre-tunnel interface interface-name]
user@host# set keepalive-time seconds
```

4. Configure the hold time from 5 through 250 seconds. Note that the hold time must be at least twice the keepalive time.

```
[edit protocols oam gre-tunnel interface interface-name]
user@host# set hold-time seconds
```

Display GRE Keepalive Time Configuration

Purpose Display the configured keepalive time value as 10 and hold time value as 30 on a GRE tunnel interface (for example, gr-1/1/10.1).

Action To display the configured values on the GRE tunnel interface, run the **show oam gre-tunnel** command at the **[edit protocols]** hierarchy level:

Display Keepalive Time Information on a GRE Tunnel Interface

Action To verify the current status information on a GRE tunnel interface (for example, gr-3/3/0.3), run the **show interfaces gr-3/3/0.3 terse** and **show interfaces gr-3/3/0.3 extensive** operational commands.

| | | | | | |
|------------|-------|------|--------------|--------------|--------|
| Interface | Admin | Link | Proto | Local | Remote |
| gr-3/3/0.3 | up | up | inet
mpls | 200.1.3.1/24 | |

Copyright © 2015, Juniper Networks, Inc.

**NOTE:**

When the hold time expires:

- The GRE tunnel will stay up even though the interface cannot send or receive traffic.
- The Link status will be Up and the Gre keepalives adjacency state will be Down.

Meaning The current status information of a GRE tunnel interface with keepalive time and hold time parameters is displayed as expected when the hold time expires.

Related Documentation

- [GRE Keepalive Time Overview on page 1205](#)

- [hold-time on page 1795](#)

Enabling Fragmentation on GRE Tunnels

To enable fragmentation of IPv4 packets in generic routing encapsulation (GRE) tunnels, include the **clear-dont-fragment-bit** statement and a maximum transmission unit (MTU) setting for the tunnel as part of an existing GRE configuration at the **[edit interfaces]** hierarchy level:

```
[edit interfaces]
gr-fpc/pic/port {
  unit logical-unit-number {
    clear-dont-fragment-bit;
    ...
  }
  family inet {
    mtu 1000;
    ...
  }
}
```

This statement clears the Don't Fragment (DF) bit in the packet header, regardless of the packet size. If the packet size exceeds the tunnel MTU value, the packet is fragmented before encapsulation. The maximum MTU size configurable on the AS or Multiservices PIC is 9192 bytes.

NOTE: The **clear-dont-fragment-bit** statement is supported only on MX Series routers and all M Series routers except the M320 router.

Fragmentation is enabled only on IPv4 packets being encapsulated in IPv4-based GRE tunnels.

.....

NOTE: This configuration is supported only on GRE tunnels on AS or Multiservices interfaces. If you commit `gre-fragmentation` as the encapsulation type on a standard Tunnel PIC interface, the following console log message appears when the PIC comes online:

`gr-fpc/pic/port: does not support this encapsulation`

The Packet Forwarding Engine updates the IP identification field in the outer IP header of GRE-encapsulated packets, so that reassembly of the packets is possible after fragmentation. The previous CLI constraint check that required you to configure either the `clear-dont-fragment-bit` statement or a tunnel key with the `allow-fragmentation` statement is no longer enforced.

When you configure the `clear-dont-fragment-bit` statement on an interface with the MPLS protocol family enabled, you must specify an MTU value. This MTU value must not be greater than maximum supported value (9192).

.....

CHAPTER 76

Encapsulating One IP Packet Over Another Using IP-IP Interfaces

- [Configuring IPv6-over-IPv4 Tunnels on page 1211](#)
- [Example: Configuring an IPv6-over-IPv4 Tunnel on page 1211](#)

Configuring IPv6-over-IPv4 Tunnels

If you have a Tunnel PIC installed in your M Series or T Series router, you can configure IPv6-over-IPv4 tunnels. To define a tunnel, you configure a unicast tunnel across an existing IPv4 network infrastructure. IPv6/IPv4 packets are encapsulated in IPv4 headers and sent across the IPv4 infrastructure through the configured tunnel. You manually configure configured tunnels on each end point.

On SRX Series devices, Generic Routing Encapsulation (GRE) and IP-IP tunnels use internal interfaces, `gr-0/0/0` and `ip-0/0/0`, respectively. The Junos OS creates these interfaces at system bootup; they are not associated with a physical interface.

IPv6-over-IPv4 tunnels are defined in RFC 2893, *Transition Mechanisms for IPv6 Hosts and Routers*. For information about configuring a unicast tunnel, see [“Configuring Unicast Tunnels” on page 1213](#). For an IPv6-over-IPv4 tunnel configuration example, see [“Example: Configuring an IPv6-over-IPv4 Tunnel” on page 1211](#).

Filtering Unicast Packets Through Multicast Tunnel Interfaces

- [Configuring Unicast Tunnels on page 1213](#)
- [Examples: Configuring Unicast Tunnels on page 1218](#)
- [Restricting Tunnels to Multicast Traffic on page 1219](#)

Configuring Unicast Tunnels

To configure a unicast tunnel, you configure a **gr-** interface (to use GRE encapsulation) or an **ip-** interface (to use IP-IP encapsulation) and include the **tunnel** and **family** statements:

```
gr-fpc/pic/port or ip-fpc/pic/port {
  unit logical-unit-number {
    copy-tos-to-outer-ip-header;
    reassemble-packets;
    tunnel {
      allow-fragmentation;
      destination destination-address;
      do-not-fragment;
      key number;
      routing-instance {
        destination routing-instance-name;
      }
      source address;
      ttl number;
    }
    family family {
      address address {
        destination address;
      }
    }
  }
}
```

You can configure these statements at the following hierarchy levels:

- **[edit interfaces]**
- **[edit logical-systems *logical-system-name* interfaces]**

You can configure multiple logical units for each GRE or IP-IP interface, and you can configure only one tunnel per unit.

NOTE: On M Series and T Series routers, you can configure the interface on a service PIC or a tunnel PIC. On MX Series routers, configure the interface on a Multiservices DPC.

Each tunnel interface must be a point-to-point interface. Point to point is the default interface connection type, so you do not need to include the **point-to-point** statement in the logical interface configuration.

You must specify the tunnel's destination and source addresses. The remaining statements are optional.

NOTE: For transit packets exiting the tunnel, forwarding path features, such as reverse path forwarding (RPF), forwarding table filtering, source class usage, destination class usage, and stateless firewall filtering, are not supported on the interfaces you configure as tunnel sources, but are supported on tunnel-pic interfaces.

However, class-of-service (CoS) information obtained from the GRE or IP-IP header is carried over the tunnel and is used by the re-entering packets. For more information, see the *Class of Service Feature Guide for Routing Devices*.

To prevent an invalid configuration, the Junos OS disallows setting the address specified by the source or destination statement at the [edit interfaces *gr-fpc/pic/port* unit *logical-unit-number* tunnel] hierarchy level to be the same as the interface's own subnet address, specified by the address statement at the [edit interfaces *gr-fpc/pic/port* unit *logical-unit-number* family *family-name*] hierarchy level.

To set the time-to-live (TTL) field that is included in the encapsulating header, include the **ttl** statement. If you explicitly configure a TTL value for the tunnel, you must configure it to be one larger than the number of hops in the tunnel. For example, if the tunnel has seven hops, you must configure a TTL value of 8.

You must configure at least one family on the logical interface. To enable MPLS over GRE tunnel interfaces, you must include the **family mpls** statement in the GRE interface configuration. In addition, you must include the appropriate statements at the [edit **protocols**] hierarchy level to enable Resource Reservation Protocol (RSVP), MPLS, and label-switched paths (LSPs) over GRE tunnels. Unicast tunnels are bidirectional.

A configured tunnel cannot go through Network Address Translation (NAT) at any point along the way to the destination. For more information, see [“Examples: Configuring Unicast Tunnels” on page 1218](#) and the *MPLS Applications Feature Guide for Routing Devices*.

For a GRE tunnel, the default is to set the ToS bits in the outer IP header to all zeros. To have the Routing Engine copy the ToS bits from the inner IP header to the outer, include

the **copy-tos-bits-to-outer-ip-header** statement. (This inner-to-outer ToS bits copying is already the default behavior for IP-IP tunnels.)

For GRE tunnel interfaces on Adaptive Services or Multiservices interfaces, you can configure additional tunnel attributes, as described in the following sections:

- [Configuring a Key Number on GRE Tunnels on page 1215](#)
- [Enabling Fragmentation on GRE Tunnels on page 1216](#)
- [Specifying an MTU Setting for the Tunnel on page 1216](#)
- [Configuring a GRE Tunnel to Copy ToS Bits to the Outer IP Header on page 1217](#)
- [Configuring Packet Reassembly on page 1217](#)

Configuring a Key Number on GRE Tunnels

For Adaptive Services and Multiservices interfaces on M Series and T Series routers, you can assign a key value to identify an individual traffic flow within a GRE tunnel, as defined in RFC 2890, *Key and Sequence Number Extensions to GRE*. However, only one key is allowed for each tunnel source and destination pair.

Each IP version 4 (IPv4) packet entering the tunnel is encapsulated with the GRE tunnel key value. Each IPv4 packet exiting the tunnel is verified by the GRE tunnel key value and de-encapsulated. The Adaptive Services or Multiservices PIC drops packets that do not match the configured key value.

To assign a key value to a GRE tunnel interface, include the **key** statement:

```
key number;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* tunnel]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* tunnel]

The key number can be 0 through 4,294,967,295. You must configure the same GRE tunnel key value on tunnel endpoints.

The following example illustrates the use of the key statement in a GRE tunnel configuration:

```
interfaces {
  gr-1/2/0 {
    unit 0 {
      tunnel {
        source 10.58.255.193;
        destination 10.58.255.195;
        key 1234;
      }
    }
    ...
    family inet {
      mtu 1500;
      address 10.200.0.1/30;
    }
  }
}
```

```
    ...  
  }  
}  
}
```

Enabling Fragmentation on GRE Tunnels

For GRE tunnel interfaces on Adaptive Services and Multiservices interfaces only, you can enable fragmentation of IPv4 packets in GRE tunnels.

By default, IPv4 traffic transmitted over GRE tunnels is not fragmented. To enable fragmentation of IPv4 packets in GRE tunnels, include the **clear-dont-fragment-bit** statement:

```
clear-dont-fragment-bit;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

When you include the **clear-dont-fragment-bit** statement in the configuration, the don't-fragment (DF) bit is cleared on all packets, even packets that do not exceed the tunnel maximum transmission unit (MTU). If the packet's size exceeds the tunnel's MTU value, the packet is fragmented before encapsulation. If the packet's size does not exceed the tunnel's MTU value, the packet is not fragmented.

NOTE: The Packet Forwarding Engine updates the IP identification field in the outer IP header of GRE-encapsulated packets, so that reassembly of the packets is possible after fragmentation. The previous CLI constraint check that required you to configure either the **clear-dont-fragment-bit** statement or a tunnel key with the **allow-fragmentation** statement is no longer enforced.

You can also clear the DF bit in packets transmitted over IP Security (IPsec) tunnels. For more information, see *Enabling IPsec Packet Fragmentation*.

Specifying an MTU Setting for the Tunnel

To enable key numbers and fragmentation on GRE tunnels (as described in “[Configuring a Key Number on GRE Tunnels](#)” on page 1215 and “[Enabling Fragmentation on GRE Tunnels](#)” on page 1216), you must also specify an MTU setting for the tunnel.

To specify an MTU setting for the tunnel, include the **mtu** statement:

```
mtu bytes;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *gr-fpc/pic/port* unit *logical-unit-number* family inet]

- [edit logical-system *logical-system-name* interfaces *gr-fpc/pic/port* unit *logical-unit-number* family inet]

For more information about MTU settings, see the *Junos OS Network Interfaces Library for Routing Devices*.

Configuring a GRE Tunnel to Copy ToS Bits to the Outer IP Header

Unlike IP-IP tunnels, GRE tunnels do not copy the ToS bits to the outer IP header by default. To have the Routing Engine copy the inner ToS bits to the outer IP header (which is required for some tunneled routing protocols) on packets sent by the Routing Engine, include the **copy-tos-to-outer-ip-header** statement at the logical unit hierarchy level of a GRE interface. This example copies the inner ToS bits to the outer IP header on a GRE tunnel:

```
[edit interfaces]
gr-0/0/0 {
  unit 0 {
    copy-tos-to-outer-ip-header;
    family inet;
  }
}
```

Configuring Packet Reassembly

On GRE tunnel interfaces only, you can enable reassembly of fragmented tunnel packets. To activate this capability, include the **reassemble-packets** statement:

```
reassemble-packets;
```

You can configure this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

For each tunnel you configure on the interface, you can enable or disable fragmentation of GRE packets by including the **allow-fragmentation** or **do-not-fragment** statement:

```
allow-fragmentation;
do-not-fragment;
```

You can configure these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* tunnel]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* tunnel]

If you configure **allow-fragmentation** on a tunnel, it clears the DF bit in the outer IP header, enabling post fragmentation of GRE-encapsulated packets if the packet size exceeds the maximum transmission unit (MTU) value for the egress interface. By default, packets that exceed the MTU size are dropped and post fragmentation of GRE packets is disabled.

NOTE: Whenever you configure **allow-fragmentation** on a tunnel, you must also include either the **tunnel key** or the **clear-dont-fragment-bit** statement. This configuration enables the router to send affected packets to the PIC so that the correct IP header can be placed in the fragments. Otherwise, on the reassembly side some packets might be lost when fragments arrive in the PIC out of sequence at high speeds.

Starting with Junos OS Release 14.2, you can configure the generic routing encapsulation (GRE) tunnel interfaces on MX Series routers with Trio-based FPCs (MPCs) to support IP packet reassembly. The IP packet is fragmented over a GRE tunnel when the packet size exceeds the maximum transmission unit (MTU) defined for the connection. When a GRE packet passes through a link that contains an MTU less than that of the packet size, the packet is fragmented. The other endpoint of the tunnel needs to reassemble it before GRE processing starts. You can configure the GRE interfaces to reassemble the fragmented packets at the endpoint of the tunnel before they can be further processed on the network by including the **reassemble-packets** statement at the **[edit interfaces gr-fpc/pic/port unit logical-unit-number]** hierarchy level. You can view the reassembly statistics by using the **show services inline ip-reassembly stastics <fpc fpc-slot | pfe pfe-slot>** command. MX Series routers can be used as the data center edge or data center interconnect devices in network environments as needed to enable interconnection of data centers across an IP backbone using GRE encapsulation. Inline IP reassembly is supported on MX80, MX240, MX480, MX960, MX2010, MX2020, and MX104 routers. The line modules compatible with the corresponding MX Series routers that support the reassembly of GRE packets are MPC1, MPC2, MPC3, MPC4, and MPC-16X10GE. Until Junos OS Release 14.1, reassembly of IP fragments received at GRE tunnels is supported only on MX Series routers with MS-DPCs.

Examples: Configuring Unicast Tunnels

Configure two unnumbered IP-IP tunnels:

```
[edit interfaces]
ip-0/3/0 {
  unit 0 {
    tunnel {
      source 192.168.4.18;
      destination 192.168.4.253;
    }
    family inet;
  }
  unit 1 {
    tunnel {
      source 192.168.4.18;
      destination 192.168.4.254;
    }
  }
}
```

```

        family inet;
    }
}

```

Configure numbered tunnel interfaces by including an address at the **[edit interfaces ip-0/3/0 unit (0 | 1) family inet]** hierarchy level:

```

[edit interfaces]
ip-0/3/0 {
  unit 0 {
    tunnel {
      source 192.168.4.18;
      destination 192.168.4.253;
    }
    family inet {
      address 10.5.5.1/30;
    }
  }
  unit 1 {
    tunnel {
      source 192.168.4.18;
      destination 192.168.4.254;
    }
    family inet {
      address 10.6.6.100/30;
    }
  }
}

```

Configure an MPLS over GRE tunnel by including the **family mpls** statement at the **[edit interfaces gr-1/2/0 unit 0]** hierarchy level:

```

[edit interfaces]
gr-1/2/0 {
  unit 0 {
    tunnel {
      source 192.168.1.1;
      destination 192.168.1.2;
    }
    family inet {
      address 10.1.1.1/30;
    }
    family mpls;
  }
}

```

 - [Configuring Unicast Tunnels on page 1213](#)

Restricting Tunnels to Multicast Traffic

For interfaces that carry IPv4 or IP version 6 (IPv6) traffic, you can configure a tunnel interface to allow multicast traffic only. To configure a multicast-only tunnel, include the **multicast-only** statement:

multicast-only;

You can configure this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

Multicast tunnels filter all unicast packets; if an incoming packet is not destined for a 224/8 or greater prefix, the packet is dropped and a counter is incremented.

You can configure this property on GRE, IP-IP, PIM, and multicast tunnel (**mt**) interfaces only.

NOTE: If your router has a Tunnel Services PIC, the Junos OS automatically configures one multicast tunnel interface (**mt**) for each virtual private network (VPN) you configure. You do not need to configure multicast tunnel interfaces.

Connecting Logical Systems Using Logical Tunnel Interfaces

- [Configuring Logical Tunnel Interfaces on page 1221](#)
- [Example: Configuring Logical Tunnels on page 1222](#)
- [Redundant Logical Tunnels Overview on page 1224](#)
- [Configuring Redundant Logical Tunnels on page 1226](#)
- [Example: Configuring Redundant Logical Tunnels on page 1227](#)

Configuring Logical Tunnel Interfaces

Logical tunnel (**lt-**) interfaces provide quite different services depending on the host router:

- On M Series, MX Series, and T Series routers, logical tunnel interfaces allow you to connect logical systems, virtual routers, or VPN instances. M Series and T Series routers must be equipped with a Tunnel Services PIC or an Adaptive Services Module (only available on M7i routers). MX Series routers must be equipped with a Trio MPC/MIC module. For more information about connecting these applications, see the *Junos OS VPNs Library for Routing Devices*.
- On SRX Series Services Gateways, the logical tunnel interface is used to interconnect logical systems. See the *Junos OS Logical Systems Configuration Guide for Security Devices*.

For M Series, MX Series, and T Series routers, see the following section:

- [Connecting Logical Systems on page 1221](#)

Connecting Logical Systems

To connect two logical systems, you configure a logical tunnel interface on both logical systems. Then you configure a peer relationship between the logical tunnel interfaces, thus creating a point-to-point connection.

To configure a point-to-point connection between two logical systems, configure the logical tunnel interface by including the **lt-fpc/pic/port** statement:

```
lt-fpc/pic/port {
```

```
unit logical-unit-number {  
    encapsulation encapsulation;  
    peer-unit unit-number; # peering logical system unit number  
    dlcid dlcid-number;  
    family (inet | inet6 | iso | mpls);  
}  
}
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces]**
- **[edit logical-systems *logical-system-name* interfaces]**

When configuring logical tunnel interfaces, note the following:

- You can configure each logical tunnel interface with one of the following encapsulation types: Ethernet, Ethernet circuit cross-connect (CCC), Ethernet VPLS, Frame Relay, Frame Relay CCC, VLAN, VLAN CCC, or VLAN VPLS.
- You can configure the IP, IPv6, International Organization for Standardization (ISO), or MPLS protocol family.
- The peering logical interfaces must belong to the same logical tunnel interface derived from the Tunnel Services PIC or Adaptive Services Module.
- You can configure only one peer unit for each logical interface. For example, unit 0 cannot peer with both unit 1 and unit 2.
- To enable the logical tunnel interface, you must configure at least one physical interface statement.
- Logical tunnels are not supported with Adaptive Services, Multiservices, or Link Services PICs (but they are supported on the Adaptive Services Module on M7i routers, as noted above).
- On M Series routers other than the M40e router, logical tunnel interfaces require an Enhanced Flexible PIC Concentrator (FPC).
- On MX Series routers, logical tunnel interfaces require Trio MPC/MIC modules. They do not require a Tunnel Services PIC in the same system.

For more information about configuring logical systems, see the *Junos OS Routing Protocols Library for Routing Devices*.

Redundant Logical Tunnels Overview

You can connect two devices, such as an access-facing device and a core-facing device, through logical tunnels. To provide redundancy for the tunnels, you can create and configure multiple physical logical tunnels and add them to a virtual redundant logical tunnel.

NOTE: Redundant logical tunnels are supported only on MX Series routers with MPCs.

For example, in an MPLS access network, you can configure multiple pseudowires between an access node and an MX Series router with MPCs and add them to a redundant logical tunnel. You can then add multiple logical tunnels to the redundant logical tunnel.

Figure 46 on page 1224 shows a redundant logical tunnel between the access node and the MX Series router.

Figure 46: Redundant Logical Tunnels

The redundant logical tunnel has peer logical interfaces at each end, `lt0.0` and `lt0.1`. You can configure router features on these interfaces for the redundant logical tunnel and its members.

Each member logical tunnel has peer logical interfaces. In Figure 46 on page 1224, `lt-0/0/10.0` and `lt-0/0/10.1` are peers.

The MX Series router performs IP lookup in the Layer 3 VPN routing and forwarding (VRF) table on the router where the pseudowires that are grouped in logical tunnels terminate.

Redundant Logical Tunnel Configuration

In Junos Releases 13.3R1, 13.3R2, and 14.1R1 you can create up to 16 redundant logical tunnels, depending on the number of Packet Forwarding Engines and the number of

loopback interfaces on each Packet Forwarding Engine on your device. For Junos Release 13.3R3, 14.1R2, and 14.2 the valid range for device-count is from 1 to 255.

You can add up to 32 logical tunnels as members of a redundant logical tunnel.

When you add more than two members to the redundant logical tunnel, they are in active mode. The traffic is load-balanced over all the tunnel members.

When you add only two members to the redundant logical tunnel, you can configure the members in one of these ways:

- Both members in active mode
- One member in active mode and the other in backup mode

Redundant Logical Tunnel Failure Detection and Failover

A logical tunnel fails and is removed from the redundant logical tunnel group, and the backup logical tunnel becomes active due to one of these events:

- A hardware failure on the MPC module occurs.
- An MPC failure occurs due to a microkernel crash.
- The MPC module is administratively shut down and removed from the redundant logical tunnel.
- A power failure on the MPC module occurs.

NOTE: You can decrease the time it takes for failure detection and failover to occur. Configure the `enhanced-ip` statement at the `[edit chassis network-services]` hierarchy level to enable Packet Forwarding Engine liveliness detection.

Configuring Redundant Logical Tunnels

Use redundant logical tunnels to provide redundancy for logical tunnels between two devices, such as an access-facing device and a core-facing device.

When configuring redundant logical tunnel interfaces, note the following:

- In Junos OS Release 13.3 or later, you can configure redundant logical tunnels only on MX Series routers with MPCs.

In Junos Releases 13.3R1, 13.3R2, and 14.1R1 you can create up to 16 redundant logical tunnels, depending on the number of Packet Forwarding Engines and the number of loopback interfaces on each Packet Forwarding Engine on your device. For Junos Release 13.3R3, 14.1R2, and 14.2 the valid range for device-count is from 1 to 255. The command is shown below

set chassis redundancy-group interface-type redundant-logical-tunnel device-count *[number]*;

You can add up to 32 logical tunnels as members.

- When a logical tunnel with an existing configuration joins a redundant logical tunnel, you must configure the redundant logical tunnel with the settings from the existing configuration.
- You can add member logical tunnels to a parent logical tunnel for redundancy.
- When you add more than two logical tunnels to the redundant logical tunnel, the members are in active mode by default.
- When you add only two members, you can configure the members in one of these ways:
 - Both members in active mode
 - One member in active mode and the other in backup mode

To configure a redundant logical tunnel between two devices:

1. Create the logical tunnel and redundant logical tunnel interfaces.

```
[edit chassis]
user@host# set redundancy-group interface-type redundant-logical-tunnel
device-count count
user@host# set fpc slot-number pic number tunnel-services bandwidth 1g
```

2. Bind the member logical tunnels to the redundant logical tunnel.

```
[edit interfaces]
user@host# set interface-name redundancy-group member-interface interface-name
```

3. Configure the redundant logical tunnel interfaces.
4. Attach the redundant logical tunnel interface to a Layer 2 circuit.
5. Add the peer redundant logical tunnel interface to a Layer 3 VRF instance.
6. Configure MPLS and LDP in the pseudowires and the Layer 3 VPN.

```
[edit protocols]
user@host# set mpls no-cspf
user@host# set mpls interface all
user@host# set ldp interface all
```

7. Configure BGP in the Layer 3 VPN.
8. Configure OSPF on the core-facing interfaces and the router local loopback interface.
9. Set the policy options for BGP.
10. Set the router ID and the autonomous system (AS) number.

Example: Configuring Redundant Logical Tunnels

This example shows how to configure redundant logical tunnels in an MPLS access network.

- [Requirements on page 1227](#)
- [Overview on page 1227](#)
- [Configuration on page 1228](#)
- [Verification on page 1234](#)

Requirements

In Junos OS Release 13.3 or later, you can configure redundant logical tunnels only on MX Series routers with MPCs.

Overview

When a logical tunnel with an existing configuration joins a redundant logical tunnel, you must configure the redundant logical tunnel with the settings from the existing configuration.

You can add member logical tunnels to a parent logical tunnel for redundancy.

On MX Series routers with MPCs, you can configure redundant logical tunnels as follows:

- In Junos Releases 13.3R1, 13.3R2, and 14.1R1 you can create up to 16 redundant logical tunnels, depending on the number of Packet Forwarding Engines and the number of loopback interfaces on each Packet Forwarding Engine on your device. For Junos Releases 13.3R3, 14.1R2, and 14.2 the valid range for device-count is from 1 to 255. The command is shown below

```
set chassis redundancy-group interface-type redundant-logical-tunnel device-count
[number];
```

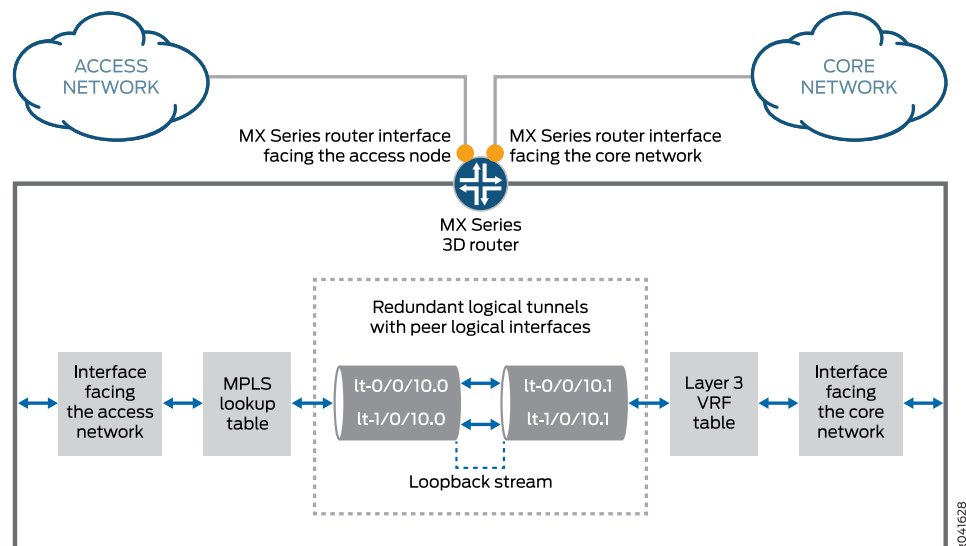

- You can add up to 32 logical tunnels as members.

- When you add more than two logical tunnels to a redundant logical tunnel, the members are in active mode by default.
- When you add only two members, you can configure the members in one of these ways:
 - Both members in active mode
 - One member in active mode and the other in backup mode

Topology

Figure 46 on page 1224 shows a redundant logical tunnel between the access node and the MX Series router in an MPLS access network.

Figure 47: Redundant Logical Tunnels

The redundant logical tunnel has peer logical interfaces at each end, `rt0.0` and `rt0.1`. You can configure router features on these interfaces for the redundant logical tunnel and its members.

Each member logical tunnel has peer logical interfaces on the access-facing and core-facing devices. In Figure 46 on page 1224, `lt-0/0/10.0` and `lt-0/0/10.1` are peers.

The MX Series router performs IP lookup in the Layer 3 VPN routing and forwarding (VRF) table on the router where the pseudowires that are grouped in logical tunnels terminate.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set chassis redundancy-group interface-type redundant-logical-tunnel device-count 4
set chassis fpc 1 pic 0 tunnel-services bandwidth 1g
```

```

set chassis fpc 1 pic 2 tunnel-services bandwidth 1g
set interfaces rlt0 redundancy-group member-interface lt-1/0/10
set interfaces rlt0 redundancy-group member-interface lt-2/0/10
set interfaces rlt0 unit 0 description "Towards Layer 2 Circuit"
set interfaces rlt0 unit 0 encapsulation vlan-ccc
set interfaces rlt0 unit 0 vlan-id 600
set interfaces rlt0 unit 0 peer-unit 1
set interfaces rlt0 unit 0 family ccc
set interfaces rlt0 unit 1 description "Towards Layer 3 VRF"
set interfaces rlt0 unit 1 encapsulation vlan
set interfaces rlt0 unit 1 vlan-id 600
set interfaces rlt0 unit 1 peer-unit 0
set interfaces rlt0 unit 1 family inet address 10.10.10.2/24
set protocols l2circuit neighbor 2.2.2.2 interface rlt0.0 virtual-circuit-id 100
set protocols l2circuit neighbor 2.2.2.2 interface rlt0.0 no-control-word
set routing-instances pe-vrf instance-type vrf
set routing-instances pe-vrf interface rlt0.1
set routing-instances pe-vrf route-distinguisher 65056:1

set policy-options community VPN-A members target:100:100
set routing-options router-id 3.3.3.3
set routing-options autonomous-system 65056

```

Step-by-Step Procedure

In this example, all the logical tunnels are in active mode.

1. Create the logical tunnel and redundant logical tunnel interfaces.

```

[edit chassis]
user@host# set redundancy-group interface-type redundant-logical-tunnel
device-count 4
user@host# set fpc 1 pic 0 tunnel-services bandwidth 1g
user@host# set fpc 1 pic 2 tunnel-services bandwidth 1g

```

2. Bind the member logical tunnels to the redundant logical tunnel.

```
[edit interfaces]
user@host# set rlt0 redundancy-group member-interface lt-1/0/10
user@host# set rlt0 redundancy-group member-interface lt-2/0/10
```

3. Configure the redundant logical tunnel interfaces.

```
[edit interfaces]
user@host# set rlt0 unit 0 description "Towards Layer 2 Circuit"
user@host# set rlt0 unit 0 encapsulation vlan-ccc
user@host# set rlt0 unit 0 vlan-id 600
user@host# set rlt0 unit 0 peer-unit 1
user@host# set rlt0 unit 0 family ccc
```

```
user@host# set rlt0 unit 1 description "Towards Layer 3 VRF"
user@host# set rlt0 unit 1 encapsulation vlan
user@host# set rlt0 unit 1 vlan-id 600
user@host# set rlt0 unit 1 peer-unit 0
user@host# set rlt0 unit 1 family inet address 10.10.10.2/24
```

4. Attach rlt0.0 to a Layer 2 circuit.

```
[edit protocols]
user@host# set l2circuit neighbor 2.2.2.2 interface rlt0.0 virtual-circuit-id 100
user@host# set l2circuit neighbor 2.2.2.2 interface rlt0.0 no-control-word
```

5. Add rlt0.1 to a Layer 3 VRF instance.

```
[edit routing-instances]
user@host# set pe-vrf instance-type vrf
user@host# set pe-vrf interface rlt0.1
user@host# set pe-vrf route-distinguisher 65056:1
user@host# set pe-vrf vrf-import VPN-A-Import
user@host# set pe-vrf vrf-export VPN-A-Export
user@host# set pe-vrf vrf-table-label
user@host# set pe-vrf protocols ospf export VPN-A-Import
user@host# set pe-vrf protocols ospf area 0.0.0.0 interface rlt0.1
```

6. Configure MPLS and LDP in the pseudowires and the Layer 3 VPN.

```
[edit protocols]
user@host# set mpls no-cspf
user@host# set mpls interface all
user@host# set ldp interface all
```

7. Configure BGP in the Layer 3 VPN.

```
[edit protocols]
user@host# set bgp export local-routes
user@host# set bgp group internal type internal
user@host# set bgp group internal local-address 3.3.3.3
user@host# set bgp group internal family inet any
user@host# set bgp group internal family inet-vpn unicast
user@host# set bgp group internal neighbor 4.4.4.4
```

8. Configure OSPF on the core-facing interfaces and the router local loopback interface.

```
[edit protocols]
user@host# set ospf area 0.0.0.0 interface ge-5/3/8.0
```

```

user@host# set ospf area 0.0.0.0 interface ge-5/2/5.0
user@host# set ospf area 0.0.0.0 interface lo0.3 passive

```

9. Set the policy options for BGP.

```

[edit policy-options]
user@host# set policy-statement VPN-A-Export term a then community add VPN-A
user@host# set policy-statement VPN-A-Export term a then accept
user@host# set policy-statement VPN-A-Export term b then reject
user@host# set policy-statement VPN-A-Import term a from protocol bgp
user@host# set policy-statement VPN-A-Import term a from community VPN-A
user@host# set policy-statement VPN-A-Import term a then accept
user@host# set policy-statement VPN-A-Import term b then reject
user@host# set policy-statement local-routes then accept
user@host# set community VPN-A members target:100:100

```

10. Set the router ID and the autonomous system (AS) number.

```

[edit routing-options]
user@host# set router-id 3.3.3.3
user@host# set autonomous-system 65056

```

Results

From configuration mode, confirm your configuration by entering the following commands:

- **show chassis**
- **show interfaces**
- **show policy-options**
- **show protocols**
- **show routing-instances**
- **show routing-options**

If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@host# show chassis
redundancy-group {
  interface-type {
    redundant-logical-tunnel {
      device-count 4;
    }
  }
}
fpc 1 {
  pic 0 {
    tunnel-services {
      bandwidth 1g;
    }
  }
}
fpc 1 {
  pic 2 {

```

```
tunnel-services {
    bandwidth 1g;
}
}

user@host# show interfaces rlt0

Verifying the Redundant Logical Tunnel Configuration

Purpose Verify that the redundant logical tunnel with the child logical tunnel interfaces are created with the correct encapsulations.

Action user@host# run show interfaces terse | match rlt0

| | | | | |
|-------------|----|----|--------------|---------------|
| lt-1/0/10.0 | up | up | container--> | rlt0.0 |
| lt-1/0/10.1 | up | up | container--> | rlt0.1 |
| lt-2/0/10.0 | up | up | container--> | rlt0.0 |
| lt-2/0/10.1 | up | up | container--> | rlt0.1 |
| rlt0 | up | up | | |
| rlt0.0 | up | up | ccc | |
| rlt0.1 | up | up | inet | 10.10.10.2/24 |

Verifying the Layer 2 Circuit

Purpose Verify that the Layer 2 circuit is up.

Action user@host# run show l2circuit connections
Layer-2 Circuit Connections:

Legend for connection status (St)

| | |
|---------------------------------|--------------------------------------|
| EI -- encapsulation invalid | NP -- interface h/w not present |
| MM -- mtu mismatch | Dn -- down |
| EM -- encapsulation mismatch | VC-Dn -- Virtual circuit Down |
| CM -- control-word mismatch | Up -- operational |
| VM -- vlan id mismatch | CF -- Call admission control failure |
| OL -- no outgoing label | IB -- TDM incompatible bitrate |
| NC -- intf encaps not CCC/TCC | TM -- TDM misconfiguration |
| BK -- Backup Connection | ST -- Standby Connection |
| CB -- rcvd cell-bundle size bad | SP -- Static Pseudowire |
| LD -- local site signaled down | RS -- remote site standby |
| RD -- remote site signaled down | HS -- Hot-standby Connection |
| XX -- unknown | |

Legend for interface status

Up -- operational

Dn -- down

Neighbor: 2.2.2.2

| Interface | Type | St | Time last up | # Up trans |
|--|------|----|---------------------|------------|
| rlt0.0(vc 100) | rmt | Up | Aug 8 00:28:04 2013 | 1 |
| Remote PE: 2.2.2.2, Negotiated control-word: No | | | | |
| Incoming label: 299776, Outgoing label: 299776 | | | | |
| Negotiated PW status TLV: No | | | | |
| Local interface: rlt0.0, Status: Up, Encapsulation: VLAN | | | | |

Verifying OSPF Neighbors

Purpose Verify that routers are adjacent and able to exchange OSPF data.

Action user@host# run show ospf neighbor

| Address | Interface | State | ID | Pri | Dead |
|------------|------------|-------|---------|-----|------|
| 30.30.30.2 | ge-5/2/5.0 | Full | 4.4.4.4 | 128 | 38 |
| 20.20.20.1 | ge-5/3/8.0 | Full | 2.2.2.2 | 128 | 38 |

Verifying the BGP Group

Purpose Verify that the BGP group is created.

Action user@host# run show bgp group internal

| | | |
|--------------------------|----------------|----------------------|
| Group Type: Internal | AS: 65056 | Local AS: 65056 |
| Name: internal | Index: 0 | Flags: <Export Eval> |
| Export: [local-routes] | | |
| Holdtime: 0 | | |
| Total peers: 1 | Established: 1 | |
| 4.4.4.4+179 | | |
| inet.0: 1/6/3/0 | | |
| inet.2: 0/0/0/0 | | |
| bgp.l3vpn.0: 2/2/2/0 | | |
| pe-vrf.inet.0: 2/2/2/0 | | |

Verifying the BGP Routes in the Routing Table

Purpose Verify that the BGP routes are in the pe-vrf.inet.0 routing table.

Action user@host# run show route protocol bgp table pe-vrf.inet.0
pe-vrf.inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

50.50.50.0/24 *[BGP/170] 01:18:14, localpref 100, from 4.4.4.4
 AS path: I, validation-state: unverified
 > to 30.30.30.2 via ge-5/2/5.0, Push 16

50.50.51.0/24 *[BGP/170] 01:18:14, MED 2, localpref 100, from 4.4.4.4
 AS path: I, validation-state: unverified
 > to 30.30.30.2 via ge-5/2/5.0, Push 16

Understanding Default PIM Tunnel Configurations

- [Configuring PIM Tunnels on page 1237](#)

Configuring PIM Tunnels

PIM tunnels are enabled automatically on routers that have a tunnel PIC and on which you enable PIM sparse mode. You do not need to configure the tunnel interface.

PIM tunnels are unidirectional.

In PIM sparse mode, the first-hop router encapsulates packets destined for the rendezvous point (RP) router. The packets are encapsulated with a unicast header and are forwarded through a unicast tunnel to the RP. The RP then de-encapsulates the packets and transmits them through its multicast tree. To perform the encapsulation and de-encapsulation, the first-hop and RP routers must be equipped with Tunnel PICs.

The Junos OS creates two interfaces to handle PIM tunnels:

- **pe**—Encapsulates packets destined for the RP. This interface is present on the first-hop router.
- **pd**—De-encapsulates packets at the RP. This interface is present on the RP.

NOTE: The **pe** and **pd** interfaces do not support class-of-service (CoS) configurations.

Configuring Virtual Loopback Tunnels for VRF Table Lookup

To enable egress filtering, you can either configure filtering based on the IP header, or you can configure a virtual loopback tunnel on routers equipped with a Tunnel PIC. [Table 51 on page 1239](#) describes each method.

Table 51: Methods for Configuring Egress Filtering

| Method | Interface Type | Configuration Guidelines | Comments |
|---|---|--|--|
| Filter traffic based on the IP header | Nonchannelized Point-to-Point Protocol / High Level Data Link Control (PPP/HDLC) core-facing SONET/SDH interfaces | Include the vrf-table-label statement at the [edit routing-instances instance-name] hierarchy level.

For more information, see the <i>Junos OS VPNs Library for Routing Devices</i> . | There is no restriction on customer-edge (CE) router-to-provider edge (PE) router interfaces. |
| Configure a virtual loopback tunnel on routers equipped with a Tunnel PIC | All interfaces | See the guidelines in this section. | Router must be equipped with a Tunnel PIC.

There is no restriction on the type of core-facing interface used or CE router-to-PE router interface used.

You cannot configure a virtual loopback tunnel and the vrf-table-label statement at the same time. |

You can configure a virtual loopback tunnel to facilitate VRF table lookup based on MPLS labels. You might want to enable this functionality so you can do either of the following:

- Forward traffic on a PE router to CE device interface, in a shared medium, where the CE device is a Layer 2 switch without IP capabilities (for example, a metro Ethernet switch).

The first lookup is done based on the VPN label to determine which VRF table to refer to, and the second lookup is done on the IP header to determine how to forward packets to the correct end hosts on the shared medium.

- Perform egress filtering at the egress PE router.

The first lookup on the VPN label is done to determine which VRF table to refer to, and the second lookup is done on the IP header to determine how to filter and forward packets. You can enable this functionality by configuring output filters on the VRF interfaces.

To configure a virtual loopback tunnel to facilitate VRF table lookup based on MPLS labels, you specify a virtual loopback tunnel interface name and associate it with a routing instance that belongs to a particular routing table. The packet loops back through the virtual loopback tunnel for route lookup. To specify a virtual loopback tunnel interface name, you configure the virtual loopback tunnel interface at the **[edit interfaces]** hierarchy level and include the **family inet** and **family mpls** statements:

```
vt-fpc/pic/port {  
  unit 0 {  
    family inet;  
    family mpls;  
  }  
  unit 1 {  
    family inet;  
  }  
}
```

To associate the virtual loopback tunnel with a routing instance, include the virtual loopback tunnel interface name at the **[edit routing-instances]** hierarchy level:

```
interface vt-fpc/pic/port;
```

NOTE: On virtual loopback tunnel interfaces, none of the logical interface statements except the **family** statement is supported. Note that you can configure only **inet** and **mpls** families, and you cannot configure IPv4 or IPv6 addresses on virtual loopback tunnel interfaces. Also, virtual loopback tunnel interfaces do not support class-of-service (CoS) configurations.

- [Example: Configuring a Virtual Loopback Tunnel for VRF Table Lookup on page 1241](#)

Configuring Tunnel Interfaces for Routing Table Lookup

To configure tunnel interfaces to facilitate routing table lookups for VPNs, you specify a tunnel's endpoint IP addresses and associate them with a routing instance that belongs to a particular routing table. This enables the Junos OS to search in the appropriate routing table for the route prefix, because the same prefix can appear in multiple routing tables. To configure the destination VPN, include the **routing-instance** statement:

```
routing-instance {
  destination routing-instance-name;
}
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *gr-fpc/pic/port* unit *logical-unit-number* tunnel]
- [edit logical-systems *logical-system-name* interfaces *gr-fpc/pic/port* unit *logical-unit-number* tunnel]

This configuration indicates that the tunnel's destination address is in routing instance **routing-instance-name**. By default, the tunnel route prefixes are assumed to be in the default Internet routing table **inet.0**.

NOTE: If you configure a virtual loopback tunnel interface and the **vrf-table-label** statement on the same routing instance, the **vrf-table-label** statement takes precedence over the virtual loopback tunnel interface. For more information, see “Configuring Virtual Loopback Tunnels for VRF Table Lookup” on page 1239.

For more information about VPNs, see the *Junos OS VPNs Library for Routing Devices*.

Example: Configuring a Virtual Loopback Tunnel for VRF Table Lookup

Configure a virtual loopback tunnel for VRF table lookup:

```
[edit routing-instances]
routing-instance-1 {
  instance-type vrf;
  interface vt-1/0/0.0;
  interface so-0/2/2.0;
  route-distinguisher 2:3;
  vrf-import VPN-A-import;
  vrf-export VPN-A-export;
  routing-options {
    static {
      route 10.0.0.0/8 next-hop so-0/2/2.0;
    }
  }
}
```

```
    }
  }
  routing-instance-2 {
    instance-type vrf;
    interface vt-1/0/0.1;
    interface so-0/3/2.0;
    route-distinguisher 4:5;
    vrf-import VPN-B-import;
    vrf-export VPN-B-export;
    routing-options {
      static {
        route 10.0.0.0/8 next-hop so-0/3/2.0;
      }
    }
  }
}
[edit interfaces]
vt-1/0/0 {
  unit 0 {
    family inet;
    family mpls;
  }
  unit 1 {
    family inet;
  }
}
```

Enabling a VPN to Travel Through a Non-MPLS Network Using Dynamic Tunnels

- [Configuring Dynamic Tunnels on page 1245](#)

Configuring Dynamic Tunnels

A VPN that travels through a non-MPLS network requires a GRE tunnel. This tunnel can be either a static tunnel or a dynamic tunnel. A static tunnel is configured manually between two PE routers. A dynamic tunnel is configured using BGP route resolution.

When a router receives a VPN route that resolves over a BGP next hop that does not have an MPLS path, a GRE tunnel can be created dynamically, allowing the VPN traffic to be forwarded to that route. Only GRE IPv4 tunnels are supported.

To configure a dynamic tunnel between two PE routers, include the **dynamic-tunnels** statement:

```
dynamic-tunnels tunnel-name {  
    destination-networks prefix;  
    source-address address;  
}
```

You can configure this statement at the following hierarchy levels:

- [edit routing-options]
- [edit routing-instances *routing-instance-name* routing-options]
- [edit logical-systems *logical-system-name* routing-options]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options]

For more information about configuring routing options or BGP, see the *Junos OS Routing Protocols Library for Routing Devices*. For more information about VPNs, see the *Junos OS VPNs Library for Routing Devices*.

CHAPTER 82

Overview

- [Encryption Overview on page 1249](#)
- [Configuring an ES Tunnel Interface for a Layer 3 VPN on page 1249](#)

Encryption Overview

The IP Security (IPsec) architecture provides a security suite for the IP version 4 (IPv4) and IP version 6 (IPv6) network layers. The suite provides functionality such as authentication of origin, data integrity, confidentiality, replay protection, and nonrepudiation of source. It also defines mechanisms for key generation and exchange, management of security associations, and support for digital certificates.

IPsec defines a security association (SA) and key management framework that can be used with any network layer protocol. The SA specifies what protection policy to apply to traffic between two IP-layer entities. For more information, see the *Junos OS Administration Library for Routing Devices*. The standards are defined in the following RFCs:

- RFC 2401, *Security Architecture for the Internet Protocol*
- RFC 2406, *IP Encapsulating Security Payload (ESP)*

Configuring an ES Tunnel Interface for a Layer 3 VPN

To configure an ES tunnel interface for a Layer 3 VPN, you need to configure an ES tunnel interface on the provider edge (PE) router and on the customer edge (CE) router. You also need to configure IPsec on the PE and CE routers. For more information about configuring an ES tunnel for a Layer 3 VPN, see the *Junos OS VPNs Library for Routing Devices*.

Sending Encrypted Traffic Through Tunnels

- [Configuring Encryption Interfaces on page 1251](#)
- [Configuring Filters for Traffic Transiting the ES PIC on page 1253](#)

Configuring Encryption Interfaces

When you configure the encryption interface, you associate the configured SA with a logical interface. This configuration defines the tunnel, including the logical unit, tunnel addresses, maximum transmission unit (MTU), optional interface addresses, and the name of the IPsec SA to apply to traffic. To configure an encryption interface, include the following statements at the `[edit interfaces es-fpc/pic/port unit logical-unit-number]` hierarchy level:

```
family inet {
  ipsec-sa ipsec-sa; # name of security association to apply to packet
  address address; # local interface address inside local VPN
  destination address; # destination address inside remote VPN
}
tunnel {
  source source-address;
  destination destination-address;
}
```

The addresses configured as the tunnel source and destination are the addresses in the outer IP header of the tunnel.

NOTE: You must configure the tunnel source address locally on the router, and the tunnel destination address must be a valid address for the security gateway terminating the tunnel.

The ES Physical Interface Card (PIC) is supported on M Series and T Series routers.

The SA must be a valid tunnel-mode SA. The interface address and destination address listed are optional. The destination address allows the user to configure a static route to

encrypt traffic. If a static route uses that destination address as the next hop, traffic is forwarded through the portion of the tunnel in which encryption occurs.

Specifying the Security Association Name for Encryption Interfaces

The security association is the set of properties that defines the protocols for encrypting Internet traffic. To configure encryption interfaces, you specify the SA name associated with the interface by including the **ipsec-sa** statement at the **[edit interfaces es-fpc/pic/port unit logical-unit-number family inet]** hierarchy level:

```
ipsec-sa sa-name;
```

For information about configuring the security association, see [“Configuring Filters for Traffic Transiting the ES PIC” on page 1253](#).

Configuring the MTU for Encryption Interfaces

The protocol MTU value for encryption interfaces must always be less than the default interface MTU value of 3900 bytes; the configuration fails to commit if you select a greater value. To set the MTU value, include the **mtu** statement at the **[edit interfaces interface-name unit logical-unit-number family inet]** hierarchy level:

```
mtu bytes;
```

For more information, see the *Junos OS Network Interfaces Library for Routing Devices*.

Example: Configuring an Encryption Interface

Configure an IPsec tunnel as a logical interface on the ES PIC. The logical interface specifies the tunnel through which the encrypted traffic travels. The **ipsec-sa** statement associates the security profile with the interface.

```
[edit interfaces]
es-0/0/0 {
  unit 0 {
    tunnel {
      source 10.5.5.5; # tunnel source address
      destination 10.6.6.6; # tunnel destination address
    }
    family inet {
      ipsec-sa manual-sa1; # name of security association to apply to packet
      mtu 3800;
      address 10.1.1.8/32 { # local interface address inside local VPN
        destination 10.2.2.254; # destination address inside remote VPN
      }
    }
  }
}
```

Configuring Filters for Traffic Transiting the ES PIC

This section contains the following topics:

- [Traffic Overview on page 1253](#)
- [Configuring the Security Association on page 1254](#)
- [Configuring an Outbound Traffic Filter on page 1255](#)
- [Applying the Outbound Traffic Filter on page 1256](#)
- [Configuring an Inbound Traffic Filter on page 1256](#)
- [Applying the Inbound Traffic Filter to the Encryption Interface on page 1257](#)

Traffic Overview

Traffic configuration defines the traffic that must flow through the tunnel. You configure outbound and inbound firewall filters, which identify and direct traffic to be encrypted and confirm that decrypted traffic parameters match those defined for the given tunnel. The outbound filter is applied to the LAN or WAN interface for the incoming traffic you want to encrypt. The inbound filter is applied to the ES PIC to check the policy for traffic coming in from the remote host. Because of the complexity of configuring a router to forward packets, no automatic checking is done to ensure that the configuration is correct.

NOTE: The valid firewall filters statements for IPsec are **destination-port**, **source-port**, **protocol**, **destination-address**, and **source-address**.

In [Figure 48 on page 1253](#), Gateway A protects the network 10.1.1.0/24, and Gateway B protects the network 10.2.2.0/24. The gateways are connected by an IPsec tunnel. For more information about firewalls, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

Figure 48: Example: IPsec Tunnel Connecting Security Gateways

The SA and ES interface for security Gateway A are configured as follows:

```
[edit security ipsec]
security-association manual-sa1 {
  manual {
    direction bidirectional {
      protocol esp;
      spi 2312;
      authentication {
        algorithm hmac-md5-96;
```

```
        key ascii-text 1234123412341234;
    }
    encryption {
        algorithm 3des-cbc;
        key ascii-text 123456789009876543211234;
    }
}
}
[edit interfaces es-0/1/0]
unit 0 {
    tunnel {
        source 10.5.5.5;
        destination 10.6.6.6;
    }
    family inet {
        ipsec-sa manual-sa1;
        address 10.1.1.8/32 {
            destination 10.2.2.254;
        }
    }
}
}
```

Configuring the Security Association

To configure the SA, include the **security-association** statement at the **[edit security]** hierarchy level:

```
security-association name {
    mode (tunnel | transport);
    manual {
        direction (inbound | outbound | bi-directional) {
            auxiliary-spi auxiliary-spi-value;
            spi spi-value;
            protocol (ah | esp | bundle);
            authentication {
                algorithm (hmac-md5-96 | hmac-sha1-96);
                key (ascii-text key | hexadecimal key);
            }
            encryption {
                algorithm (des-cbc | 3des-cbc);
                key (ascii-text key | hexadecimal key);
            }
        }
        dynamic {
            replay-window-size (32 | 64);
            ipsec-policy policy-name;
        }
    }
}
```

For more information about configuring an SA, see the *Junos OS Administration Library for Routing Devices*. For information about applying the SA to an interface, see [“Specifying the Security Association Name for Encryption Interfaces” on page 1252](#).

Configuring an Outbound Traffic Filter

To configure the outbound traffic filter, include the **filter** statement at the **[edit firewall]** hierarchy level:

```
filter filter-name {
  term term-name {
    from {
      match-conditions;
    }
    then {
      action;
      action-modifiers;
    }
  }
}
```

For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

Example: Configuring an Outbound Traffic Filter

Firewall filters for outbound traffic direct the traffic through the desired IPsec tunnel and ensure that the tunneled traffic goes out the appropriate interface (see [Figure 48 on page 1253](#)). Here, an outbound firewall filter is created on security Gateway A; it identifies the traffic to be encrypted and adds it to the input side of the interface that carries the internal virtual private network (VPN) traffic:

```
[edit firewall]
filter ipsec-encrypt-policy-filter {
  term term1 {
    from {
      source-address { # local network
        10.1.1.0/24;
      }
      destination-address { # remote network
        10.2.2.0/24;
      }
    }
  }
  then ipsec-sa manual-sa1; # apply SA name to packet
  term default {
    then accept;
  }
}
```

NOTE: The source address, port, and protocol on the outbound traffic filter must match the destination address, port, and protocol on the inbound traffic filter. The destination address, port, and protocol on the outbound traffic filter must match the source address, port, and protocol on the inbound traffic filter.

Applying the Outbound Traffic Filter

After you have configured the outbound firewall filter, you apply it by including the **filter** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family inet]** hierarchy level:

```
filter {  
  input filter-name;  
}
```

Example: Applying the Outbound Traffic Filter

Apply the outbound traffic filter. The outbound filter is applied on the Fast Ethernet interface at the **[edit interfaces *fe-0/0/1* unit 0 family inet]** hierarchy level. Any packet matching the IPsec action term (**term 1**) on the input filter (**ipsec-encrypt-policy-filter**), configured on the Fast Ethernet interface, is directed to the ES PIC interface at the **[edit interfaces *es-0/1/0* unit 0 family inet]** hierarchy level. So, if a packet arrives from the source address **10.1.1.0/24** and goes to the destination address **10.2.2.0/24**, the Packet Forwarding Engine directs the packet to the ES PIC interface, which is configured with the **manual-sa1** SA. The ES PIC receives the packet, applies the **manual-sa1** SA, and sends the packet through the tunnel.

The router must have a route to the tunnel end point; add a static route if necessary.

```
[edit interfaces]  
fe-0/0/1 {  
  unit 0 {  
    family inet {  
      filter {  
        input ipsec-encrypt-policy-filter;  
      }  
      address 10.1.1.254/24;  
    }  
  }  
}
```

Configuring an Inbound Traffic Filter

To configure an inbound traffic filter, include the **filter** statement at the **[edit firewall]** hierarchy level:

```
filter filter-name {  
  term term-name {  
    from {  
      match-conditions;  
    }  
    then {  
      action;  
      action-modifiers;  
    }  
  }  
}
```

For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

Example: Configuring an Inbound Traffic Filter

Configure an inbound firewall filter. This filter performs the final IPsec policy check and is created on security gateway A. The policy check ensures that only packets that match the traffic configured for this tunnel are accepted.

```
[edit firewall]
filter ipsec-decrypt-policy-filter {
  term term1 { # perform policy check
    from {
      source-address { # remote network
        10.2.2.0/24;
      }
      destination-address { # local network
        10.1.1.0/24;
      }
    }
  }
  then accept;
```

Applying the Inbound Traffic Filter to the Encryption Interface

After you create the inbound firewall filter, you can apply it to the ES PIC. To apply the filter to the ES PIC, include the **filter** statement at the **[edit interfaces es-fpc/pic/port unit logical-unit-number family inet filter]** hierarchy level:

```
filter {
  input filter;
}
```

The input filter is the name of the filter applied to received traffic. For a configuration example, see “[Example: Configuring an Inbound Traffic Filter](#)” on page 1257. For more information about firewall filters, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

Example: Applying the Inbound Traffic Filter to the Encryption Interface

Apply the inbound firewall filter (**ipsec-decrypt-policy-filter**) to the decrypted packet to perform the final policy check. The IPsec **manual-sa1** SA is referenced at the **[edit interfaces es-1/2/0 unit 0 family inet]** hierarchy level and decrypts the incoming packet.

The Packet Forwarding Engine directs IPsec packets to the ES PIC. It uses the packet's security parameter index (SPI), protocol, and destination address to look up the SA configured on one of the ES interfaces. The IPsec **manual-sa1** SA is referenced at the **[edit interfaces es-1/2/0 unit 0 family inet]** hierarchy level and is used to decrypt the incoming packet. When the packets are processed (decrypted, authenticated, or both), the input firewall filter (**ipsec-decrypt-policy-filter**) is applied on the decrypted packet to perform the final policy check. **term1** defines the decrypted (and verified) traffic and performs the required policy check. For information about **term1**, see “[Example: Configuring an Inbound Traffic Filter](#)” on page 1257.

NOTE: The inbound traffic filter is applied after the ES PIC has processed the packet, so the decrypted traffic is defined as any traffic that the remote gateway is encrypting and sending to this router. IKE uses this filter to determine the policy required for a tunnel. This policy is used during the negotiation with the remote gateway to find the matching SA configuration.

```
[edit interfaces]
es-1/2/0 {
  unit 0 {
    tunnel {
      source 10.5.5.5; # tunnel source address
      destination 10.6.6.6; # tunnel destination address
    }
    family inet {
      filter {
        input ipsec-decrypt-policy-filter;
      }
      ipsec-sa manual-sa1; # SA name applied to packet
      address 10.1.1.8/32 { # local interface address inside local VPN
        destination 10.2.2.254; # destination address inside remote VPN
      }
    }
  }
}
```

Configuring Redundancy in Case of Service Failure

- [Configuring ES PIC Redundancy on page 1259](#)
- [Configuring IPsec Tunnel Redundancy on page 1260](#)

Configuring ES PIC Redundancy

You can configure ES PIC redundancy on M Series and T Series routers that have multiple ES PICs. With ES PIC redundancy, one ES PIC is active and another ES PIC is on standby. When the primary ES PIC has a servicing failure, the backup becomes active, inherits all the tunnels and SAs, and acts as the new next hop for IPsec traffic. Reestablishment of tunnels on the backup ES PIC does not require new Internet Key Exchange (IKE) negotiations. If the primary ES PIC comes online, it remains in standby and does not preempt the backup. To determine which PIC is currently active, use the **show ipsec redundancy** command.

NOTE: ES PIC redundancy is supported on M Series and T Series routers.

To configure an ES PIC as the backup, include the **backup-interface** statement at the **[edit interfaces fpc/pic/port es-options]** hierarchy level:

```
backup-interface es-fpc/pic/port;
```

Example: Configuring ES PIC Redundancy

After you create the inbound firewall filter, apply it to the master ES PIC. Here, the inbound firewall filter (**ipsec-decrypt-policy-filter**) is applied on the decrypted packet to perform the final policy check. The IPsec **manual-sa1** SA is referenced at the **[edit interfaces es-1/2/0 unit 0 family inet]** hierarchy level and decrypts the incoming packet. This example does not show SA and filter configuration. For information about SA and filter configuration, see the *Junos OS Administration Library for Routing Devices*, the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*, and “Example: Configuring an Inbound Traffic Filter” on page 1257.

```
[edit interfaces]
es-1/2/0 {
  es-options {
```

```

        backup-interface es-1/0/0;
    }
    unit 0 {
        tunnel {
            source 10.5.5.5;
            destination 10.6.6.6;
        }
        family inet {
            ipsec-sa manual-sa1;
            filter {
                input ipsec-decrypt-policy-filter;
            }
            address 10.1.1.8/32 {
                destination 10.2.2.254;

Configuring IPsec Tunnel Redundancy

You can configure IPsec tunnel redundancy by specifying a backup destination address. The local router sends keepalives to determine the remote site's reachability. When the peer is no longer reachable, a new tunnel is established. For up to 60 seconds during failover, traffic is dropped without notification being sent. [Figure 49 on page 1260](#) shows IPsec primary and backup tunnels.

Figure 49: IPsec Tunnel Redundancy

To configure IPsec tunnel redundancy, include the **backup-destination** statement at the **[edit interfaces unit *logical-unit-number* tunnel]** hierarchy level:

```

backup-destination address;
destination address;
source address;

```

NOTE: Tunnel redundancy is supported on M Series and T Series routers.

The primary and backup destinations must be on different routers.

The tunnels must be distinct from each other and policies must match.

For more information about tunnels, see *Tunnel Properties*.

| Syntax | <code>services <i>severity-level</i>;</code> |
| Hierarchy Level | [edit services l2tp tunnel-group <i>group-name</i> syslog host <i>hostname</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the system logging severity level. |
| Options | <i>severity-level</i> —Assigns a severity level to the facility. Valid entries include: <ul style="list-style-type: none">• alert—Conditions that should be corrected immediately.• any—Matches any level.• critical—Critical conditions.• emergency—Panic conditions.• error—Error conditions.• info—Informational messages.• notice—Conditions that require special handling.• warning—Warning messages. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring System Logging of L2TP Tunnel Activity on page 644 |

services (Stateful Firewall)

| | |
|---------------------------------|---|
| Syntax | <code>services stateful-firewall { ... }</code> |
| Hierarchy Level | [edit] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 10.4. |
| Description | Define the service rules to be applied to traffic. |
| Options | stateful-firewall —Identifies the stateful firewall set of rules statements. |
| Usage Guidelines | See <i>Junos Network Secure</i> . |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

services (System Logging)

| | |
|---------------------------------|---|
| Syntax | <code>services severity-level;</code> |
| Hierarchy Level | [edit services service-set service-set-name syslog host hostname] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the severity level for system logging messages. |
| Options | <p>severity-level—Assigns a severity level to the facility. Valid entries are:</p> <ul style="list-style-type: none">• alert—Conditions that should be corrected immediately.• any—Matches any level.• critical—Critical conditions.• emergency—Panic conditions.• error—Error conditions.• info—Informational messages.• notice—Conditions that require special handling.• warning—Warning messages. |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none">• Configuring System Logging for Service Sets on page 47 |

services-options

Syntax

```

services-options {
  cgn-pic;
  close-timeout
  fragment-limit
  disable-global-timeout-override;
  ignore-errors <alg> <tcp>;
  inactivity-non-tcp-timeout seconds;
  inactivity-tcp-timeout seconds;
  inactivity-timeout seconds
  open-timeout seconds;
  pba-interim-logging-interval seconds;
  reassembly-timeout
  session-limit {
    maximum number;
    rate new-sessions-per-second;
    cpu-load-threshold percentage;
  }
  session-timeout seconds;
  jflow-log {
    message-rate-limit messages-per-second;
  }
  syslog {
    host hostname {
      facility-override facility-name;
      log-prefix prefix-value;
      port port-number;
      services severity-level;
    }
    message-rate-limit messages-per-second;
  }
  tcp-tickles tcp-tickles;
  trio-flow-offload minimum-bytes minimum-bytes;
}

```

Hierarchy Level [edit interfaces *interface-name*]

Release Information Statement introduced before Junos OS Release 7.4.

Description Define the service options to be applied on an interface.

Options The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

Related Documentation

- *Interface Properties*.

syslog (Interfaces)

| | |
|---------------------------------|--|
| Syntax | <pre>syslog {
 host <i>hostname</i> {
 services <i>severity-level</i>;
 facility-override <i>facility-name</i>;
 log-prefix <i>prefix-value</i>;
 port <i>port-number</i>;
 }
 message-rate-limit <i>messages-per-second</i>;
}</pre> |
| Hierarchy Level | [edit interfaces <i>interface-name</i> services-options] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Configure generation of system log messages for the service set. System log information is passed to the kernel for logging in the <code>/var/log</code> directory. Any values configured in the service set definition override these values. |
| Options | The remaining statements are described separately. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring System Logging for Services Interfaces on page 20 |

tcp-tickles

| | |
|---------------------------------|---|
| Syntax | <pre>tcp-tickles <i>tcp-tickles</i>;</pre> |
| Hierarchy Level | [edit interfaces <i>interface-name</i> services-options] |
| Release Information | Statement introduced in Junos OS Release 11.4. |
| Description | Define the maximum number of keep-alive messages sent before a TCP session is allowed to timeout. |
| Options | <i>tcp-tickles</i> —Number of keep-alive messages.
Range: 0 through 30
Default: 4 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Default Timeout Settings for Services Interfaces on page 19 |

[edit services application-identification] Hierarchy Level

To configure application identification services (APPID), include the **application-identification** statement at the **[edit services]** hierarchy level:

```
[edit services]
application-identification {
  application application-name {
    disable;
    idle-timeout seconds;
    index number;
    session-timeout seconds;
    type type;
    type-of-service service-type;
    port-mapping {
      port-range {
        tcp (port | range);
        udp (port | range);
      }
      disable;
    }
  }
}
application-group group-name {
  application-groups {
    name [application-group-name];
  }
  applications {
    name [application-name];
  }
  index number;
  disable;
}
application-system-cache-timeout seconds;
enable-heuristics
max-checked-bytes bytes;
min-checked-bytes bytes;

adaptive-services-pics

| | |
|---------------------------------|---|
| Syntax | <pre>adaptive-services-pics {
 traceoptions {
 file <i>filename</i> <files <i>number</i>> <match <i>regular-expression</i>> <size <i>size</i>> <world-readable
 no-world-readable>;
 flag <i>flag</i>;
 no-remote-trace;
 }
}</pre> |
| Hierarchy Level | [edit services] |
| Release Information | Statement introduced before Junos OS Release 7.4. The file option was added in Release 8.0. |
| Description | Define global services properties. |
| Options | The remaining statement is explained separately. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Tracing Services PIC Operations on page 48 |

address (Interfaces)

| | |
|---------------------------------|---|
| Syntax | <code>address address {
...
}</code> |
| Hierarchy Level | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>],
[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Configure the interface address. |
| Options | <i>address</i> —Address of the interface. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • <i>Junos OS Network Interfaces Library for Routing Devices</i> for other statements that do not affect services interfaces. • Configuring the Logical Interface Address for the MLPPP Bundle on page 622 • <i>Junos OS Network Interfaces Library for Routing Devices</i> |

address (Services NAT Pool)

| | |
|---------------------------------|--|
| Syntax | <code>address ip-prefix</prefix-length>;</code> |
| Hierarchy Level | [edit services nat pool <i>nat-pool-name</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4.
<i>prefix</i> option enhanced to support IPv6 addresses in Junos OS Release 8.5. |
| Description | Specify the NAT pool prefix value. |
| Options | <i>prefix</i> —Specify an IPv4 or IPv6 prefix value. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Source and Destination Addresses Network Address Translation Overview on page 66 |

address-allocation

| | |
|--------------------------|--|
| Syntax | address-allocation round-robin; |
| Hierarchy Level | [edit services nat pool <i>pool-name</i>] |
| Release Information | Statement introduced in Junos OS Release 11.2. |
| Description | <p>When you use round-robin allocation, one port is allocated from each address in a range before repeating the process for each address in the next range. After ports have been allocated for all addresses in the last range, the allocation process wraps around and allocates the next unused port for addresses in the first range.</p> <p>Regardless of whether the round-robin method of allocation is addresses is enabled by using the address-allocation round-robin statement, round-robin allocation is enabled by default on MS-MICs and MS-MPCs.</p> |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

address-range

| | |
|--------------------------|--|
| Syntax | address-range low <i>minimum-value</i> high <i>maximum-value</i> ; |
| Hierarchy Level | [edit services nat pool <i>nat-pool-name</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4.
<i>minimum-value</i> and <i>maximum-value</i> options enhanced to support IPv6 addresses in Junos OS Release 8.5. |
| Description | Specify the NAT pool address range. |
| Options | <i>minimum-value</i> —Lower boundary for the IPv4 or IPv6 address range.
<i>maximum-value</i> —Upper boundary for the IPv4 or IPv6 address range. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Source and Destination Addresses Network Address Translation Overview on page 66 |

aggregation

| | |
|---------------------------------|--|
| Syntax | <pre>aggregation {
 destination-prefix <i>prefix-value</i> destination-prefix-ipv6 <i>prefix-value</i>;
 source-prefix <i>prefix-value</i> source-prefix-ipv6 <i>prefix-value</i>;
}</pre> |
| Hierarchy Level | [edit services ids rule <i>rule-name</i> term <i>term-name</i> then] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the type of data to be aggregated. |
| Options | The remaining statements are explained separately. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring IDS Rules on page 355 |

allow-ip-options

Syntax `allow-ip-options [values];`

Hierarchy Level `[edit services stateful-firewall rule rule-name term term-name then]`

Release Information Statement introduced before Junos OS Release 7.4.

Description Configure how the stateful firewall handles IP header information. This statement is optional.

Options *value*—Can be a set or range of numeric values, or one or more of the following predefined option types. You can enter either the option name or its numeric equivalent.

| Option Name | Numeric Value |
|---------------------|---------------|
| any | 0 |
| ip-security | 130 |
| ip-stream | 8 |
| loose-source-route | 3 |
| route-record | 7 |
| router-alert | 148 |
| strict-source-route | 9 |
| timestamp | 4 |

Usage Guidelines See “[Configuring Actions in Stateful Firewall Rules](#)” on page 334.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

allow-multicast

| | |
|---------------------------------|---|
| Syntax | allow-multicast; |
| Hierarchy Level | [edit services service-set <i>service-set-name</i>] |
| Release Information | Statement introduced in Junos OS Release 8.0. |
| Description | Allow multicast traffic to be sent to the Adaptive Services or Multiservices PIC. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Enabling Services PICs to Accept Multicast Traffic on page 38 |

allow-overlapping-nat-pools

| | |
|---------------------------------|---|
| Syntax | allow-overlapping-nat-pools; |
| Hierarchy Level | [edit services nat] |
| Release Information | Statement introduced with Junos OS Release 12.1. |
| Description | Specify that NAT source or destination pools can be shared between multiple service sets. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Service Sets for Network Address Translation on page 75 |

anti-replay-window-size (Services IPsec VPN)

| | |
|---------------------------------|--|
| Syntax | anti-replay-window-size <i>bits</i> ; |
| Hierarchy Level | [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] |
| Release Information | Statement introduced in Junos OS Release 10.0. |
| Description | Specify the size of the IPsec antireplay window. |
| Options | <i>bits</i> —Size of the antireplay window, in bits.
Default: 64 bits (AS PICs), 128 bits (Multiservices PICs and DPCs)
Range: 64 through 4096 bits |
| Required Privilege Level | admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring IPsec Rules on page 422 |

anti-replay-window-size (Services Service Set)

| | |
|---------------------------------|--|
| Syntax | <code>anti-replay-window-size <i>bits</i>;</code> |
| Hierarchy Level | [edit services service-set <i>service-set-name</i> ipsec-vpn-options] |
| Release Information | Statement introduced in Junos OS Release 10.0. |
| Description | <p>Specify the size of the IPsec antireplay window. This statement is useful for dynamic endpoint tunnels for which you cannot configure the anti-replay-window-size statement at the [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level.</p> <p>For static IPsec tunnels, this statement sets the antireplay window size for all the static tunnels within this service set. If a particular tunnel needs a specific value for antireplay window size, set the anti-replay-window-size statement at the [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level. If antireplay check has to be disabled for a particular tunnel in this service set, set the no-anti-replay statement at the [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level.</p> |
| | <div>  <p>NOTE: The anti-replay-window-size and no-anti-replay settings at the [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level override the settings specified at the [edit services service-set <i>service-set-name</i> ipsec-vpn-options] hierarchy level.</p> </div> |
| Options | <p><i>bits</i>—Size of the antireplay window, in bits.</p> <p>Default: 64 bits (AS PICs), 128 bits (Multiservices PICs and DPCs)</p> <p>Range: 64 through 4096 bits</p> |
| Required Privilege Level | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none"> • Configuring IPsec Service Sets on page 430 • Configuring IPsec Rules |

app-mapping-timeout

| | |
|---------------------------------|---|
| Syntax | <code>app-mapping-timeout <i>app-mapping-timeout</i>;</code> |
| Hierarchy Level | [edit services nat pool <i>nat-pool-name</i>] |
| Release Information | <code>mapping-timeout</code> statement introduced in JUNOS Release 12.3. |
| Description | Specify the duration for address pooling paired (AP-P) mappings that use the specified NAT pool. If this option is not configured and a timeout value is configured for mapping-timeout , the timeout value configured for mapping-timeout is used. If neither option is specified, the default value of 300 seconds is used. |
| Options | <code>app-mapping-timeout</code> —Lifetime of AP-P mappings in seconds.
Default: 300
Range: 120 through 864,000 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Source and Destination Addresses Network Address Translation Overview on page 66 |

application

| | |
|---------------------------------|--|
| Syntax | <pre> application <i>application-name</i> { application-protocol <i>protocol-name</i>; destination-port <i>port-number</i>; icmp-code <i>value</i>; icmp-type <i>value</i>; inactivity-timeout <i>value</i>; protocol <i>type</i>; rpc-program-number <i>number</i>; snmp-command <i>command</i>; source-port <i>port-number</i>; ttl-threshold <i>number</i>; uuid <i>hex-value</i>; } </pre> |
| Hierarchy Level | [edit applications],
[edit applications application-set <i>application-set-name</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Configure properties of an application and whether to include it in an application set. |
| Options | <p><i>application-name</i>—Identifier of the application.</p> <p>The remaining statements are explained separately.</p> |
| Required Privilege Level | interface—To view this statement in the configuration.

authentication-algorithm (Services IPsec)

| | |
|----------------------------|--|
| Syntax | authentication-algorithm (hmac-md5-96 hmac-sha-256-128 hmac-sha1-96); |
| Hierarchy Level | [edit services ipsec-vpn ipsec proposal <i>ipsec-proposal-name</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Configure the IPsec hash algorithm that authenticates packet data. |

NOTE: Keep the following points in mind when you configure the authentication algorithm in an IPsec proposal:

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, an error occurs and the tunnel is not established in this scenario. For example, if one end of the tunnel contains router 1 configured with the authentication algorithm as hmac-sha-256-128 and the other end of the tunnel contains router 2 configured with the authentication algorithm as hmac-md5-96, the VPN tunnel is not established.
- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, and when one end of the tunnel contains two IPsec proposals to check whether a less secure algorithm is selected or not, an error occurs and the tunnel is not established. For example, if you configure two authentication algorithms for an IPsec proposal as hmac-sha-256-128 and hmac-md5-96 on one end of the tunnel, router 1, and if you configure the algorithm for an IPsec proposal as hmac-md5-96 on the other end of the tunnel, router 2, the tunnel is not established and the number of proposals mismatch.
- When you configure two IPsec proposals at both ends of a tunnel, such as the authentication-algorithm hmac-sha-256-128 and authentication-algorithm hmac-md5-96 statements at the [edit services ipsec-vpn ipsec proposal *proposal-name*] hierarchy level on one of the tunnel, router 1 (with the algorithms in two successive statements to specify the order), and the authentication-algorithm hmac-md5-96 and authentication-algorithm hmac-sha-256-128 statements at the [edit services ipsec-vpn ipsec proposal *proposal-name*] hierarchy level on one of the tunnel, router 2 (with the algorithms in two successive statements to specify the order, which is the reverse order of router 1), the tunnel is established in this combination as expected because the number of proposals is the same on both ends and they contain the same set of algorithms. However, the authentication algorithm selected is hmac-md5-96 and not the stronger algorithm of hmac-sha-256-128. This method of selection of the algorithm occurs because the first matching proposal is selected. Also, for a default proposal, regardless of whether the router supports the Advanced Encryption Standard (AES) encryption algorithm, the 3des-cbc algorithm is chosen and not the aes-cfb algorithm, which is because of the first algorithm in

the default proposal being selected. In the sample scenario described here, on router 2, if you reverse the order of the algorithm configuration in the proposal so that it is the same order as the one specified on router 1, hmac-sha-256-128 is selected as the authentication method.

- You must be aware of the order of proposals in an IPsec policy at the time of configuration if you want the matching of proposals to happen in a certain order of preference, such as the strongest algorithm to be considered first when a match is made when both policies from the two peers have a proposal.

| Syntax | <code>destination-address (address any-unicast) <except>;</code> |
| Hierarchy Level | [edit services ids rule rule-name term term-name from] |
| Release Information | Statement introduced before Junos OS Release 7.4.
address option enhanced to support IPv4 and IPv6 addresses in Junos OS Release 8.5. |
| Description | Specify the destination address for rule matching. |
| Options | address —Destination IPv4 or IPv6 address or prefix value.

any-unicast —Any unicast packet.

except —(Optional) Exempt the specified address, prefix, or unicast packets from rule matching. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Match Conditions in IDS Rules on page 357 |

destination-address (Services IPsec VPN)

| | |
|---------------------------------|---|
| Syntax | <code>destination-address <i>address</i>;</code> |
| Hierarchy Level | [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> from] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the destination address for rule matching. |
| Options | <i>address</i> —Destination IP address. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring IPsec Rules on page 422 |

destination-address (Services NAT)

| | |
|---------------------------------|--|
| Syntax | <code>destination-address (<i>address</i> any-unicast) <except>;</code> |
| Hierarchy Level | [edit services nat rule <i>rule-name</i> term <i>term-name</i> from] |
| Release Information | Statement introduced before Junos OS Release 7.4.
<i>any-unicast</i> and <i>except</i> options introduced in Junos OS Release 7.6.
<i>address</i> option enhanced to support IPv6 and addresses in Junos OS Release 8.5. |
| Description | Specify the destination address for rule matching. |
| Options | <i>address</i> —Destination IPv4 or IPv6 address or prefix value.
<i>any-unicast</i> —Any unicast packet.
<i>except</i> —(Optional) Prevent the specified address, prefix, or unicast packets from being translated. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Network Address Translation Rules Overview on page 69 |

destination-address (Services Stateful Firewall)

| | |
|---------------------------------|---|
| Syntax | <code>destination-address (address any-unicast) <except>;</code> |
| Hierarchy Level | [edit services stateful-firewall rule rule-name term term-name from] |
| Release Information | Statement introduced before Junos OS Release 7.4.
any-unicast and except options introduced in Junos OS Release 7.6.
address option enhanced to support IPv4 and IPv6 addresses in Junos OS Release 8.5. |
| Description | Specify the destination address for rule matching. |
| Options | address —Destination IPv4 or IPv6 address or prefix value. Using a value of 0::0/0 with IPv6 is not allowed for M-Series and MX-Series routers.

any-unicast —Match all unicast packets.

except —(Optional) Exclude the specified address, prefix, or unicast packets from rule matching. |
| Usage Guidelines | See “ Configuring Match Conditions in Stateful Firewall Rules ” on page 332. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

destination-address-range (Services IDS)

| | |
|---------------------------------|--|
| Syntax | <code>destination-address-range low minimum-value high maximum-value <except>;</code> |
| Hierarchy Level | [edit services ids rule rule-name term term-name from] |
| Release Information | Statement introduced in Junos OS Release 7.6.
minimum-value and maximum-value options enhanced to support IPv4 and IPv6 addresses in Junos OS Release 8.5. |
| Description | Specify the destination address range for rule matching. |
| Options | minimum-value —Lower boundary for the IPv4 or IPv6 address range.

maximum-value —Upper boundary for the IPv4 or IPv6 address range.

except —(Optional) Exempt the specified address range from rule matching. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Match Conditions in IDS Rules on page 357 |

destination-address-range (Services NAT)

| | |
|--------------------------|--|
| Syntax | destination-address-range low <i>minimum-value</i> high <i>maximum-value</i> <except>; |
| Hierarchy Level | [edit services nat rule <i>rule-name</i> term <i>term-name</i> from] |
| Release Information | Statement introduced in Junos OS Release 7.6.
<i>minimum-value</i> and <i>maximum-value</i> options enhanced to support IPv6 addresses in Junos OS Release 8.5. |
| Description | Specify the destination address range for rule matching.

If the translation-type statement in the then statement of the nat rule is set to stateful-nat-64 , the destination address range for rule matching must be within the range specified by the destination-prefix statement in the then statement. |
| Options | <i>minimum-value</i> —Lower boundary for the IPv4 or IPv6 address range.

<i>maximum-value</i> —Upper boundary for the IPv4 or IPv6 address range.

except —(Optional) Prevent the specified address range from being translated. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Network Address Translation Rules Overview on page 69 |

destination-address-range (Services Stateful Firewall)

| | |
|--------------------------|---|
| Syntax | destination-address-range low <i>minimum-value</i> high <i>maximum-value</i> <except>; |
| Hierarchy Level | [edit services stateful-firewall rule <i>rule-name</i> term <i>term-name</i> from] |
| Release Information | Statement introduced in Junos OS Release 7.6.
<i>minimum-value</i> and <i>maximum-value</i> options enhanced to support IPv4 and IPv6 addresses in Junos OS Release 8.5. |
| Description | Specify the destination address range for rule matching. |
| Options | <i>minimum-value</i> —Lower boundary for the IPv4 or IPv6 address range.

<i>maximum-value</i> —Upper boundary for the IPv4 or IPv6 address range.

except —(Optional) Exclude the specified address range from rule matching. |
| Usage Guidelines | See “ Configuring Match Conditions in Stateful Firewall Rules ” on page 332. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

destination-pool

| | |
|---------------------------------|--|
| Syntax | <code>destination-pool <i>nat-pool-name</i>;</code> |
| Hierarchy Level | [edit services nat rule <i>rule-name</i> term <i>term-name</i> then translated] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the destination address pool for translated traffic. |
| Options | <i>nat-pool-name</i> —Destination pool name. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Network Address Translation Rules Overview on page 69 |

destination-port

| | |
|----------------------------|---|
| Syntax | <code>destination-port <i>port-value</i>;</code> |
| Hierarchy Level | [edit applications application application-name] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) destination port number. |
| Options | <i>port-value</i> —Identifier for the port or range of ports. For a complete list of supported application destination port requirements, see “Configuring Source and Destination Ports” on page 309 .
Range: 1 through 65,535 |

NOTE: If you specify a value of 0 as a destination port or beginning of a destination report range, you will receive the following error:

```
'application application-name'  
  TCP Destination Port 0 Invalid  
error: configuration check-out failed
```

ecmp-alb

Syntax `ecmp-alb {
 apply-groups;
 apply-groups-except;
 tolerance;
 }`

Hierarchy Level [edit chassis]

Release Information Statement introduced in Junos OS Release 14.2.

Description Enable adaptive load balancing for equal-cost multipath (ECMP) next hops.

NOTE: The `ecmp-alb` statement can be enabled only when the `[edit chassis network-services enhanced-ip]` statement is configured.

Options **apply-groups**—Specify the groups from which to inherit configuration data.

apply-groups-except—Specify the groups from which configuration data should not be inherited.

tolerance—Specify the adaptive tolerance in percentage.

Default: 20%.

Required Privilege interface—To view this statement in the configuration.

Level interface-control—To add this statement to the configuration.

ei-mapping-timeout

| | |
|---------------------------------|--|
| Syntax | mapping-timeout <i>seconds</i> ; |
| Hierarchy Level | [edit services nat pool <i>nat-pool-name</i>] |
| Release Information | ei-mapping-timeout statement introduced in JUNOS Releases 12.3. |
| Description | Specify the duration for endpoint independent translations that use the specified NAT pool. This includes endpoint-independent mapping (EIM) and endpoint-independent filtering (EIF). |
| Options | seconds —Lifetime of endpoint independent mappings in seconds.
Default: 300
Range: 120 through 864,000 |

eif-flow-limit

| | |
|---------------------------------|--|
| Syntax | eif-flow-limit <i>number-of-flows</i> |
| Hierarchy Level | [edit services nat rule <i>rule-name</i> term <i>term-name</i> then translated secure-nat-mapping] |
| Release Information | Statement introduced in Junos OS Release 12.3 |
| Description | Specify the maximum number of inbound flows allowed on EIF mapping to the configured value. This limit is per EIF mapping and is per given instance of time. For example, if eif-flow-limit is configured as n, then only n inbound connections are allowed at a given instance of time. The n+1 and subsequent connections arriving when n connections are alive are dropped . A new inbound connection is allowed only when one of the n connections times out or is closed. This limit is applied for all type of flows. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

encryption

| | |
|----------------------------|---|
| Syntax | <pre> encryption { algorithm <i>algorithm</i>; key (ascii-text <i>key</i> hexadecimal <i>key</i>); } </pre> |
| Hierarchy Level | [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then manual direction <i>direction</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4.
aes-128-cbc , aes-192-cbc , and aes-256-cbc options added in Junos OS Release 7.6. |
| Description | Configure an encryption algorithm and key for manual SA. |

Options **algorithm**—Type of encryption algorithm. The algorithm can be one of the following:

- **des-cbc**—Has a block size of 8 bytes (64 bits); the key size is 48 bits long.
- **3des-cbc**—Has a block size of 8 bytes (64 bits); the key size is 192 bits long.
- **aes-128-cbc**—Advanced Encryption Standard (AES) 128-bit encryption algorithm.
- **aes-192-cbc**—Advanced Encryption Standard (AES) 192-bit encryption algorithm.
- **aes-256-cbc**—Advanced Encryption Standard (AES) 256-bit encryption algorithm.

NOTE: For **3des-cbc**, the first 8 bytes should differ from the second 8 bytes, and the second 8 bytes should be the same as the third 8 bytes.

key—Type of encryption key. The key can be one of the following:

- **ascii-text**—ASCII text key. Following are the key lengths, in ASCII characters, for the different encryption options:
 - **des-cbc** option, 8 ASCII characters
 - **3des-cbc** option, 24 ASCII characters
 - **aes-128-cbc** option, 16 ASCII characters
 - **aes-192-cbc** option, 24 ASCII characters
 - **aes-256-cbc** option, 32 ASCII characters
- **hexadecimal**—Hexadecimal key. Following are the key lengths, in hexadecimal characters, for the different encryption options:
 - **des-cbc** option, 16 hexadecimal characters
 - **3des-cbc** option, 48 hexadecimal characters
 - **aes-128-cbc** option, 32 hexadecimal characters
 - **aes-192-cbc** option, 48 hexadecimal characters

- **aes-256-cbc** option, 64 hexadecimal characters

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

high-availability-options (aggregated Multiservices)

Syntax high-availability-options {
 many-to-one {
 preferred-backup *preferred-backup*;
 }
 }

Hierarchy Level [edit interfaces *interface-name* load-balancing-options]

Release Information Statement introduced in Junos OS Release 11.4.

Description Configure the high availability options for the aggregated Multiservices (AMS) interface. For service applications, if only the load-balancing feature is being used, then this configuration is optional.

For many-to-one (N:1) high availability support for service applications like Network Address Translation (NAT), the preferred backup Multiservices PIC, in hot standby mode, backs up one or more (N) active Multiservices PICs.

NOTE: In both cases, if one of the active Multiservices PICs goes down, then the backup replaces it as the active Multiservices PIC. When the failed PIC comes back up, it becomes the new backup. This is called floating backup.

The remaining statements are explained separately.

Required Privilege interface—To view this statement in the configuration.
Level interface-control—To add this statement to the configuration.

            ingress-key (destination-ip | source-ip);
        }
        member-interface interface-name;
    }
```

Hierarchy Level [edit interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 11.4.

Description Configure the high availability (HA) options for the aggregated Multiservices (AMS) interface.

Many-to-one (N:1) high availability mode for service applications like Network Address Translation (NAT) is supported. In this case, one Multiservices PIC is the backup (in hot standby mode) for one or more (N) active Multiservices PICs. If one of the active Multiservices PICs goes down, then the backup replaces it as the active Multiservices PIC. When the failed PIC comes back online, it becomes the new backup. This is called floating backup mode.

The remaining statements are explained separately.

Load-balancing might not be uniform among member interfaces in certain network deployments. The variance can be owing to a misconfiguration, which causes the traffic itself to be not sufficiently randomly distributed, causing the hash-keys to be ineffective. (for example, the hash key is destination IP but all sessions have only source IP address. The variation can be within the expected range and the load-balancing depends on the IP addresses chosen. The hash calculation performs a checksum on several bits of the IP address and not only on the last few lower significant bits of the IP address. In such a scenario, the load-balancing ratio can change, say, if the source IP address is changed from 20.0.0.0/24 to 20.0.1.0/24.

The distribution of traffic across member interfaces of an AMS interface is static load-balancing. Flows are load-balanced based on a packet-hash on parameters such as source IP or destination IP. Load-balancing effectiveness depends on the IP address

or protocol diversity. For example, if the hash-key is destination IP and all packets have the same destination, then all flows are directed to the same member. This is flow-level load-balancing and not per packet. As a result, traffic between a pair of addresses may be 10000 pps, whereas another pair of addresses may have 1 pps. The load of the former is not distributed among members. High availability is limited to stateless HA. When a backup interface takes over as an active interface, all flows are established afresh (for example, packets may undergo NAT processing differently after failover). However, such stateless failover does not impact other actives' running.

With a stateful firewall, static NAT as `basic-nat44` or `destination-nat44`, and dynamic NAT as `nat64`, `napt-44`, `dynamic-nat44`, and with application layer gateways (ALGs) configured, NAT hairpinning is not supported. Input direction for rule match to be applied is supported only for dynamic NAT types (NAT64, NAT44, and dynamic-NAT44). Service-set policies need to have "input" or "input-output" direction only. Flows on all active members are reset when the number of actives changes. The resetting of flows can be avoided at the cost of failed-member's traffic loss using certain options.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the direction in which the rule match is applied. |
| Options | input —Apply the rule match on the input side of the interface.
output —Apply the rule match on the output side of the interface.
input-output —Apply the rule match bidirectionally. |
| Usage Guidelines | See “ Configuring Stateful Firewall Rules ” on page 331. |
| Required Privilege Level | interface —To view this statement in the configuration.
interface-control —To add this statement to the configuration. |

max-drop-flows

| | |
|---------------------------------|---|
| Syntax | <pre>max-drop-flows { ingress <i>ingress-flows</i>; egress <i>egress-flows</i>; }</pre> |
| Hierarchy Level | [edit services service-set service-set-name] |
| Release Information | Statement introduced in Junos OS Release 12.3 |
| Description | <p>Configure the maximum drop flows allowed per ingress and egress direction. The configuration is per service set. The configured limits indicate the maximum number of drop flows that can be created at a given instance of time in both directions. If max drop flows ingress is 10 and egress is 5 then at a given instance of time maximum of 10 ingress drop flows and 5 egress drop flows can be present. Two counters, one for each direction ingress and egress, are to be added to service set stateful-firewall statistics to track the number of drop flows not created due to the drop flow limits exceeded. These limits applies to all types of drop flows i.e., TCP, UDP, ICMP etc. Ingress drop flows are forward flows for match-direction input rules and reverse flows for match-direction output rules. Similarly egress drop flows are reverse flows for match-direction input and forward flows for match-direction output rules. The limits are applied cumulatively on all the nat rules associated with the service-set.</p> |
| Options | <p><i>ingress-flows</i>—Maximum number of drop flows on the ingress interface.</p> <p><i>egress-flows</i>—Maximum number of drop flows on the egress interface.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |

member-failure-options (Aggregated Multiservices)

Syntax

```
member-failure-options {
  drop-member-traffic {
    rejoin-timeout rejoin-timeout;
  }
  redistribute-all-traffic {
    enable-rejoin;
  }
}
```

Hierarchy Level [edit interfaces *interface-name* load-balancing-options]

Release Information Statement introduced in Junos OS Release 11.4.

Description Configure the possible behavior for the aggregated Multiservices (AMS) interface in case of failure of more than one active member.

NOTE: The `drop-member-traffic` configuration and the `redistribute-all-traffic` configuration are mutually exclusive.

Table 52 on page 1408 displays the behavior of the member interface after the failure of the first Multiservices PIC. Table 53 on page 1409 displays the behavior of the member interface after the failure of two Multiservices PICs.

NOTE: The AMS infrastructure has been designed to handle one failure automatically. However, in the unlikely event that more than one Multiservices PIC fails, the AMS infrastructure provides configuration options to minimize the impact on existing traffic flows.

Table 52: Behavior of Member Interface After One Multiservices PIC Fails

| High Availability Mode | Member Interface Behavior |
|--|---|
| Many-to-one (N:1) high availability support for service applications | Automatically handled by the AMS infrastructure |

Table 53: Behavior of Member Interface After Two Multiservices PICs Fail

| High Availability Mode | Configuration | rejoin-timeout | Behavior when member rejoins before rejoin-timeout expires | Behavior when member rejoins after rejoin-timeout expires |
|--|---------------------------------|----------------|---|---|
| Many-to-one (N:1) high availability support for service applications | drop-member-traffic | Configured | <p>The existing traffic for the second failed member will <i>not</i> be redistributed to the other members.</p> <p>The first member to rejoin becomes an active member. The second member to rejoin becomes the backup. This behavior is handled automatically by the AMS infrastructure.</p> | <p>The existing traffic for the second failed member will <i>not</i> be redistributed to the other members.</p> <p>The first member will rejoin the AMS automatically. However, the other members who are rejoining will be moved to the discard state.</p> |
| Many-to-one (N:1) high availability support for service applications | redistribute-all-traffic | Not applicable | <p>Before rejoin, the traffic is redistributed to existing active members.</p> <p>After a failed member rejoins, the traffic is load-balanced afresh. This may impact existing traffic flows.</p> | |

The remaining statements are explained separately.

Default If **member-failure-options** are not configured, then the default behavior is to drop member traffic with a rejoin timeout of 120 seconds.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

no-fragmentation

| | |
|---------------------------------|--|
| Syntax | no-fragmentation; |
| Hierarchy Level | [edit class-of-service fragmentation-maps forwarding-class <i>class-name</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | <p>For link services IQ (lsq) interfaces only, set traffic on a particular forwarding class to be interleaved, rather than fragmented. This statement specifies that no extra fragmentation header is prepended to the packets received on this queue and that static-link load balancing is used to ensure in-order packet delivery.</p> <p>Static-link load balancing is done based on packet payload. For IP version 4 (IPv4) and IP version 6 (IPv6) traffic, the link is chosen based on a hash computed from the source address, destination address, and protocol. If the IP payload is Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) traffic, the hash also includes source port and destination port. For MPLS traffic, the hash includes all MPLS labels and fields in the payload, whether the MPLS payload is IPv4 or IPv6.</p> |
| Default | If you do not include this statement, the traffic in forwarding class <i>class-name</i> is fragmented. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

per-unit-scheduler

| | |
|----------------------------|---|
| Syntax | <code>per-unit-scheduler;</code> |
| Hierarchy Level | <code>[edit interfaces <i>interface-name</i>]</code> |
| Release Information | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 13.2 on 16x10GE MPC and MPC3E line cards.</p> <p>Statement introduced in Junos OS Release 13.2 on PTX Series Packet Transport Routers.</p> <p>Statement introduced in Junos OS Release 13.3 on MPC4E line cards.</p> <p>Statement introduced in Junos OS Release 15.1 on MPC6E line cards.</p> |
| Description | For Channelized OC3 IQ, Channelized OC12 IQ, Channelized STM1 IQ, Channelized T3 IQ, Channelized E1 IQ, E3 IQ, link services IQ interfaces (lsq-), Gigabit Ethernet IQ, Gigabit Ethernet IQ2 and IQ2-E, and 10-, 40-, and 100-Gigabit Ethernet interfaces (including the 16x10GE MPC), enable the association of scheduler map names with logical interfaces. |

CAUTION: Turning on per-unit scheduling causes the interface to reinitialize, which means all logical interfaces (units) on the interface are deleted and recreated.

NOTE: Per-unit scheduling is not supported on T1 interfaces configured on the Channelized OC12 IQ PIC.

NOTE: On Gigabit Ethernet IQ2 and IQ2-E PICs without the `per-unit-scheduler` statement, the entire PIC supports 4071 VLANs and the user can configure all the VLANs on the same port.

On Gigabit Ethernet IQ2 and IQ2-E PICs with the `per-unit-scheduler` statement, the entire PIC supports $1024 - 2 * \text{number of ports}$ (1024 minus two times the number of ports), because each port is allocated two default schedulers.

When including the `per-unit-scheduler` statement, you must also include the `vlan-tagging` statement or the `flexible-vlan-tagging` statement (to apply scheduling to VLANs) or the `encapsulation frame-relay` statement (to apply scheduling to DLCIs) at the `[edit interfaces interface-name]` hierarchy level.

| | |

port (Services NAT)

Syntax port {
 automatic (sequential | random-allocation);
 range low *minimum-value* high *maximum-value* random-allocation;
 preserve-parity;
 preserve-range;
 deterministic-port-block-allocation <block-size *block-size*> <include-boundary-addresses>;
 secured-port-block-allocation {
 active-block-timeout *timeout-seconds*;
 block-size *block-size*;
 max-blocks-per-user *max-blocks*;
 }
 }
}

Hierarchy Level [edit [services](#) nat [pool](#) *nat-pool-name*]

Release Information port statement introduced before Junos OS Release 7.4.
 random-allocation statement introduced in Junos OS Release 9.3.
 secured-port-block-allocation statement introduced in Junos OS Release 11.2.
 deterministic-port-block-allocation statement introduced in Junos OS Release 12.1.
 sequential statement introduced in Junos OS Release 14.2.

Description Specify the NAT pool port or range. You can configure an automatically assigned port or specify a range with minimum and maximum values.

NOTE: Until Junos OS release 14.1, you could include the port automatic statement at the [edit services nat pool *nat-pool-name*] hierarchy level without having to use the auto option with the port automatic statement. Although the default method of assignment of ports was sequential (indicated by the auto option), the auto option was not required to be specified. Starting with Junos OS release 14.2, the sequential option is introduced to enable you to configure sequential allocation of ports. The sequential and random-allocation options available with the port automatic statement at the [edit services nat pool *nat-pool-name*] hierarchy level are mutually exclusive. You can include the sequential option for sequential allocation and the random-allocation option for random delegation of ports. By default, sequential allocation of ports takes place if you include only the port automatic statement at the [edit services nat pool *nat-pool-name*] hierarchy level. The auto option is hidden and is deprecated in Junos OS Release 14.2 and later, and is only maintained for backward compatibility. It might be removed completely in a future software release.

If you upgrade a router running a Junos OS release earlier than Release 14.2 to Release 14.2 and if the router contains the port automatic statement defined without the auto option included with the configuration, the router validates the auto option present in the configuration for sequential allocation of ports.

Options **automatic**—Cause the port assignment type to be automatically performed by the router.

sequential—Allocate ports in a sequential manner. With sequential allocation, the next available address in the NAT pool is selected only when all the ports available from an address are exhausted.

NOTE: The **auto** option is hidden and is deprecated in Junos OS Release 14.2 and later, and is only maintained for backward compatibility. It might be removed completely in a future software release. Starting with Junos OS Release 14.2, you must use the **sequential** option to allocate ports in a sequential manner, which is the default mode of allocation of ports.

minimum-value—Lower boundary for the port range.

maximum-value—Upper boundary for the port range.

preserve-parity—Allocate ports with same parity as the original port.

preserve-range—Preserve privileged port range after translation.

random-allocation—Allocate ports within a specified range randomly.

Other options are described separately.

Required Privilege **interface**—To view this statement in the configuration.

Level **interface-control**—To add this statement to the configuration.

secured-port-block-allocation

Syntax `secured-port-block-allocation {
 active-block-timeout timeout-seconds;
 block-size block-size;
 max-blocks-per-address max-blocks;
 }`

Hierarchy Level [edit [services](#) nat [pool](#) *pool-name* port]

Release Information Statement introduced in Junos OS Release 11.2.

Description When you use block allocation, one or more blocks of ports in a NAT pool address range are available for assignment to a subscriber.

NOTE: If you define the session lifetime globally for a Multiservices (ms-) interface (by using the `session-timeout seconds` statement at the [edit `interfaces interface-name services-options`] hierarchy level), the session is terminated even if traffic continues to flow beyond that time period. When continuous traffic transmission occurs, the session is reset immediately after the timeout period. When the session timeout value is the same as the timeout value for active port block allocation, it might be possible that the system does not determine that the active port block timeout period has elapsed. As a result, for the first allocation of a port block after the active block timeout occurs, the same block that was previously used might be used for allocation. However, for the subsequent allocation of a port block, the system identifies the active block timeout value correctly and allocates a port from a new block. This behavior is expected when the session timeout and port block timeout values are identical. To avoid this problem, we recommend that you configure different values for session timeout and port block timeout so that the `JSERVICES_NAT_PORT_BLOCK_ALLOC` system logging message is generated at correct intervals of the active port block timeout value.

Options *block-size*—Number of ports included in a block.

Default: 128

Range: 1 through 32,000

max-blocks—Maximum number of blocks that can be allocated to a user address.

Default: 8

Range: 1 to 512

timeout-seconds—Interval, in seconds, during which a block is active. After timeout, a new block is allocated, even if ports are available in the active block.

Default: 120

Range: 0 through 86400. When you specify 0, the active block transitions to inactive only when it runs out of ports and a new block is allocated. Any inactive block without any ports in use will be freed to the NAT pool.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

 long-lifetime-error long-lifetime-error;
 nat-options {
 pool pool-name ;
 }
 pcp-options {
 third-party
 prefer-failure
 }
 max-mapping-per-client max-mapping-per-client;
}`

Hierarchy Level [edit services pcp]

Release Information Statement introduced in Junos OS Release 13.2R1.

Description Configure PCP server options.

Options *ipv4-address*—IPv4 address of the PCP server.

ipv6-address—IPv6 address of the PCP server.

software-concentrator-name—Softwire concentrator name whose softwire-address is used in creating PCP mappings. The PCP server address must be the same as the softwire-concentrator address.

mapping-lifetime-min—Minimum lifetime, in seconds, for PCP mapping. If a PCP client requests a lifetime less than the minimum configured, the server will assign a minimum lifetime and respond accordingly.

Default: 300 seconds

Range: 120 through 3600 seconds

mapping-lifetime-max mapping-lifetime-max—Maximum lifetime, in seconds, for PCP mapping. If the PCP client requests a lifetime less than the maximum configured, the server will assign the maximum lifetime and respond accordingly.

Default: 86,400 seconds

Range: 3600 through 2147483647 seconds

short-lifetime-error short-lifetime-error—Certain error opcodes mentioned in section 2 are classified as short lifetime errors. In case of these errors, the PCP server will use the value configured with this option to respond to the PCP client.

Default: 30 seconds

Range: 15 through 300 seconds

long-lifetime-error—Certain error opcodes mentioned in section 2 are classified as long lifetime errors. In case of these errors, the PCP server will use the value configured with this option to respond to the PCP client.

Default: 1800 seconds

Range: 900 through 18,000 seconds

max-mapping-per-client *number-of-mappings*—Maximum number of PCP mappings that the PCP client can request.

Default: 32

Range: 1 through 32

The other statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

set-dont-fragment-bit (Services Set)

| | |
|---------------------------------|---|
| Syntax | set-dont-fragment-bit; |
| Hierarchy Level | [edit services service-set <i>service-set-name</i> ipsec-vpn-options] |
| Release Information | Statement introduced in Junos OS Release 14.1. |
| Description | Configure the do not fragment (DF) bit in only the outer header of the IPsec packet and leave the inner header unmodified for dynamic endpoint tunnels. If the encapsulated packet size exceeds the tunnel maximum transmission unit (MTU), the packet is fragmented before encapsulation. These settings apply for dynamic endpoint tunnels and not for static tunnels, for which you need to include the set-dont-fragment-bit statement at the [edit services ipsec-vpn rule rule-name term term-name then] hierarchy level to set the DF bit in the outer header of the IPv4 packets that enter the static IPsec tunnel. This functionality is supported on MX Series routers with MS-MICs and MS-MPCs. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring IPsec Service Sets on page 430• Configuring IPsec Rules |

syn-cookie

| | |
|---------------------------------|--|
| Syntax | <pre>syn-cookie {
 mss value;
 threshold rate;
}</pre> |
| Hierarchy Level | [edit services ids rule <i>rule-name</i> term <i>term-name</i> then] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | <p>Enable SYN-cookie defenses against SYN attacks. By default, SYN-cookie techniques are not applied.</p> <p>When SYN cookie is enabled on Junos OS and becomes the TCP-negotiating proxy for the destination server, it replies to each incoming SYN segment with a SYN/ACK containing an encrypted cookie as its initial sequence number (ISN). The cookie is an MD5 hash of the original source address and port number, destination address and port number, and ISN from the original SYN packet. After sending the cookie, Junos OS drops the original SYN packet and deletes the calculated cookie from memory. If there is no response to the packet containing the cookie, the attack is noted as an active SYN attack and is effectively stopped.</p> <p>If the initiating host responds with a TCP packet containing the cookie +1 in the TCP ACK field, Junos OS extracts the cookie, subtracts 1 from the value, and recomputes the cookie to validate that it is a legitimate ACK. If it is legitimate, Junos OS starts the TCP proxy process by setting up a session and sending a SYN to the server containing the source information from the original SYN. When Junos OS receives a SYN/ACK from the server, it sends ACKs to the server and to the initiation host. At this point the connection is established and the host and server are able to communicate directly.</p> |

threshold (Services Logging and SYN-Cookie Defenses)

| | |
|---------------------------------|--|
| Syntax | <code>threshold <i>rate</i>;</code> |
| Hierarchy Level | [edit services ids rule <i>rule-name</i> term <i>term-name</i> then logging],
[edit services ids rule <i>rule-name</i> term <i>term-name</i> then syn-cookie] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the threshold for logging or applying SYN-cookie defenses. |
| Options | rate —Logging threshold number of events per second.
rate —SYN-cookie defense number of SYN attacks per second. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Actions in IDS Rules on page 358 |

traceoptions (Security PKI)

| | |
|------------------------|--|
| Syntax | <pre> traceoptions { file <i>filename</i> <files <i>number</i>> <match <i>regular-expression</i>> <size <i>maximum-file-size</i>> <world-readable no-world-readable>; flag <i>flag</i>; } </pre> |
| Hierarchy Level | [edit security pki] |
| Description | Configure security public key infrastructure (PKI) trace options. To specify more than one trace option, include multiple flag statements. Trace option output is recorded in the <code>/var/log/pkid</code> file. |
| Options | <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the file statement, you must specify a filename.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file (for example, pkid) reaches its maximum size, it is renamed pkid.0, then pkid.1, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the size option.</p> <p>Range: 2 through 1000 files</p> <p>Default: 2 files</p> <p>flag—Trace operation to perform. To specify more than one trace operation, include multiple flag statements:</p> <ul style="list-style-type: none"> all—Trace with all flags enabled. certificate-verification—Trace PKI certificate verification events. online-crl-check—Trace PKI online certificate revocation list (CRL) events. enrollment—PKI certificate enrollment tracing. <p>match <i>regular-expression</i>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p>size <i>maximum-file-size</i>—(Optional) Maximum size of each trace file, in kilobytes (KB). If you specify a maximum file size, you also must specify a maximum number of trace files with the files <i>number</i> option.</p> <p>Default: 1024 KB</p> <p>world-readable no-world-readable—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The world-readable option enables any user to read the file. To explicitly set the default behavior, use the no-world-readable option.</p> |

traceoptions (Services L2TP)

| | |
|----------------------------|--|
| Syntax | <pre> traceoptions { debug-level <i>level</i>; file <i>filename</i> <files <i>number</i>> <match <i>regular-expression</i> > <size <i>maximum-file-size</i>> <world-readable no-world-readable>; filter { protocol <i>name</i>; user <i>user@domain</i>; user-name <i>username</i>; } flag <i>flag</i>; interfaces <i>interface-name</i> { debug-level <i>level</i>; flag <i>flag</i>; } level (all error info notice verbose warning); no-remote-trace; } </pre> |
| Hierarchy Level | [edit services l2tp] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Define tracing operations for L2TP processes. |
| Options | <p>debug-level <i>level</i>—Trace level for PPP, L2TP, RADIUS, and UDP; this option does not apply to L2TP on MX Series routers:</p> <ul style="list-style-type: none"> detail—Trace detailed debug information. error—Trace error information. packet-dump—Trace packet decoding information. <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p>Range: 2 through 1000</p> <p>Default: 3 files</p> <p>filter—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.</p> <ul style="list-style-type: none"> protocol <i>name</i>—One of the following protocols; this option does not apply to L2TP on MX Series routers: <ul style="list-style-type: none"> l2tp |

- **ppp**
- **radius**
- **udp**
- **user** *user@domain*—Username of a subscriber; this option does not apply to L2TP on M Series routers. Optionally use an asterisk (*) as a wildcard to substitute for characters at the beginning or end of either term or both terms.
- **user-name** *username*—Username of a subscriber; this option does not apply to L2TP on MX Series routers.

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **configuration**—Trace configuration events.
- **events**—Trace interface events.
- **general**—Trace general events.
- **gres**—Trace GRES events.
- **init**—Trace daemon initialization.
- **ipc-rx**—Trace IPC receive events.
- **ipc-tx**—Trace IPC transmit events.
- **memory**—Trace memory management code.
- **message**—Trace message processing code.
- **packet-error**—Trace packet error events.
- **parse**—Trace parsing events.
- **protocol**—Trace L2TP events.
- **receive-packets**—Trace received L2TP packets.
- **routing-process**—Trace routing process interactions.
- **routing-socket**—Trace routing socket events.
- **session-db**—Trace session database interactions.
- **states**—Trace state machine events.
- **timer**—Trace timer events.
- **transmit-packets**—Trace transmitted L2TP packets.
- **tunnel**—Trace tunnel events.

interfaces *interface-name*—Apply L2TP traceoptions to a specific services interface. This option does not apply to L2TP on MX Series routers.

- **debug-level *level***—Trace level for the interface; this option does not apply to L2TP on MX Series routers:
 - **detail**—Trace detailed debug information.
 - **error**—Trace error information.
 - **extensive**—Trace all PIC debug information.
- **flag *flag***—Tracing operation to perform for the interface. This option does not apply to L2TP on MX Series routers. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:
 - **all**—Trace everything.
 - **ipc**—Trace L2TP Inter-Process Communication (IPC) messages between the PIC and the Routing Engine.
 - **packet-dump**—Dump each packet content based on debug level.
 - **protocol**—Trace L2TP, PPP, and multilink handling.
 - **system**—Trace packet processing on the PIC.

level—Specify level of tracing to perform. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- **all**—Match messages of all levels.
- **error**—Match error messages.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

Default: error

match *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

no-remote-trace—Disable remote tracing.

no-world-readable—(Optional) Disable unrestricted file access.

size *maximum-file-size*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

Range: 10240 through 1073741824

world-readable—(Optional) Enable unrestricted file access.

| | |

traceoptions (Services Logging)

| | |
|----------------------------|---|
| Syntax | <pre> traceoptions { file <i>filename</i> <files <i>number</i>> <match <i>regular-expression</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i>; no-remote-trace; } </pre> |
| Hierarchy Level | [edit services adaptive-services-pics],
[edit services logging] |
| Release Information | Statement introduced before Junos OS Release 7.4.
file option added in Release 8.0. |
| Description | Configure Adaptive Services or Multiservices PIC tracing operations. The messages are output to /var/log/serviced . |
| Options | <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. All files are placed in the directory /var/log.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p>Range: 2 through 1000 files</p> <p>Default: 3 files</p> <p>flag <i>flag</i>—Tracing operation to perform:</p> <ul style="list-style-type: none"> • all—Trace everything. • command-queued—Trace command enqueue events. • config—Trace configuration events. • handshake—Trace handshake events. • init—Trace initialization events. • interfaces—Trace interface events. • mib—Trace GGSN SNMP MIB events. • removed-client—Trace client cleanup events. • show—Trace CLI command servicing. <p>match <i>regex</i>—(Optional) Match output to a defined regular expression (regex).</p> |

Default: If you do not include this option, the trace operation output includes all lines relevant to the logged events.

no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

[edit services aacl] Hierarchy List

To configure application-aware access list (AACL) services, include the **aacl** statements at the **[edit services]** hierarchy level:

```
[edit services]
aac1 {
  rule rule-name {
    match-direction (input | output | input-output);
    term term-name {
      from {
        application-group-any;
        application-groups [ application-group-names ];
        application-unknown;
        applications [ application-names ];
        destination-address address <any-unicast>;
        destination-address-range low minimum-value high maximum-value;
        destination-prefix-list list-name;
        source-address address <any-unicast>;
        source-address-range low minimum-value high maximum-value;
        source-prefix-list list-name;
      }
      then {
        (accept | discard);
        count (application | application-group | application-group-any | none);
        forwarding-class class-name;
        policer policer-name;
      }
    }
  }
  rule-set rule-set-name {
    [ rule rule-names ];
  }
}
```

[edit services application-identification] Hierarchy Level

To configure application identification services (APPID), include the **application-identification** statement at the [edit services] hierarchy level:

```
[edit services]
application-identification {
  application application-name {
    disable;
    idle-timeout seconds;
    index number;
    session-timeout seconds;
    type type;
    type-of-service service-type;
    port-mapping {
      port-range {
        tcp (port | range);
        udp (port | range);
      }
      disable;
    }
  }
}
application-group group-name {
  application-groups {
    name [application-group-name];
  }
  applications {
    name [application-name];
  }
  index number;
  disable;
}
application-system-cache-timeout seconds;
enable-heuristics
max-checked-bytes bytes;
min-checked-bytes bytes;
nested-application
nested-application-settings
no-application-identification;
no-application-system-cache;
no-clear-application-system-cache;
no-protocol-method;
no-signature-based;
profile profile-name {
  [ rule-set rule-set-name ];
}
rule rule-name {
  disable;
  address address-name {
    destination {
      ip address</prefix-length>;
      port-range {
```

```

        tcp [ ports-and-port-ranges ];
        udp [ ports-and-port-ranges ];
    }
}
source {
    ip address </prefix-length>;
    port-range {
        tcp [ ports-and-port-ranges ];
        udp [ ports-and-port-ranges ];
    }
}
order number;
}
application application-name;
}
rule-set rule-set-name {
    rule application-rule-name;
}
signature-method-all-ports
traceoptions {
    file filename <files number> <match regex> <size size> <world-readable |
        no-world-readable>;
    flag flag;
    no-remote-trace;
}
}
[edit services]
hcm {
    url-rule url-rule-name {
        term term-num {
            from {
                url-list url-list-name ;
                url url_identifier {
                    host hostname ;
                    request-url page-name ;
                }
            }
            then {
                discard;
                accept;
                count;
                log-request;
            }
        }
    }
    url-rule-set url-rule-set-name {
        url-rule rule1 ;
        url-rule rule2 ;
    }
}
}

nested-application-settings

| | |
|---------------------------------|---|
| Syntax | nested-application-settings {
no-application-system-cache;
no-nested-application;
} |
| Hierarchy Level | [edit services application-identification] |
| Release Information | Statement introduced in Junos OS Release 10.2. |
| Description | Configure nested application options for application identification services. |
| Required Privilege Level | system—To view this statement in the configuration.
system control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Application Identification for Nested Applications on page 681. |

no-application-identification

| | |
|---------------------------------|---|
| Syntax | no-application-identification; |
| Hierarchy Level | [edit services application-identification] |
| Release Information | Statement introduced in Junos OS Release 9.5. |
| Description | Disable all application identification methods. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Global APPID Properties on page 683 |

no-application-system-cache

| | |
|---------------------------------|--|
| Syntax | no-application-system-cache; |
| Hierarchy Level | [edit services application-identification],
[edit services application-identification nested-application-settings] |
| Release Information | Statement introduced in Junos OS Release 9.5. |
| Description | Disable storing application identification results in the application system cache. Nested application identification information is saved in the application system cache to improve performance. This cache is updated when a different application is identified. This caching is turned on by default. Use the no-application-system-cache statement to turn it off. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Global APPID Properties on page 683• Application Identification for Nested Applications on page 681. |

no-clear-application-system-cache

| | |
|---------------------------------|---|
| Syntax | no-clear-application-system-cache; |
| Hierarchy Level | [edit services application-identification] |
| Release Information | Statement introduced in Junos OS Release 9.5. |
| Description | Disable clearing the application system cache. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

no-nested-application

| | |
|---------------------------------|--|
| Syntax | no-nested-application; |
| Hierarchy Level | [edit services application-identification nested-application-settings] |
| Release Information | Statement introduced in Junos OS Release 10.2. |
| Description | Sometimes there is a need to identify multiple different applications running on the same Layer 7 protocols. For example, both Facebook and Yahoo Messenger can run over HTTP, but there is a need to identify them as two different applications. To do this, the application layer is split into two layers: Layer 7 applications and Layer 7 protocols. This function is turned on by default. Use the no-nested-application statement to turn it off. |
| Required Privilege Level | system—To view this statement in the configuration.
system control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Application Identification for Nested Applications on page 681 |

no-protocol-method

| | |
|---------------------------------|---|
| Syntax | no-protocol-method; |
| Hierarchy Level | [edit services application-identification] |
| Release Information | Statement introduced in Junos OS Release 10.1. |
| Description | Disable the protocol-based application identification method. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Global APPID Properties on page 683 |

no-signature-based

| | |
|---------------------------------|---|
| Syntax | no-signature-based; |
| Hierarchy Level | [edit services application-identification] |
| Release Information | Statement introduced in Junos OS Release 9.5. |
| Description | Disable the signature-based application identification method. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

order (Services Application Identification)

| | |
|---------------------------------|--|
| Syntax | order <i>number</i> ; |
| Hierarchy Level | [edit services application-identification <i>nested-application name signature name member name</i>]
[edit services application-identification <i>rule rule-name address</i>] |
| Release Information | Statement introduced in Junos OS Release 9.5. |
| Description | Define application matching priority. For address configurations, the order number resolves the conflict when multiple address entries are matched for a specific session. The lower number has higher priority. |
| Options | <i>number</i> —Order number. This value is mandatory and must be unique. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring APPID Rules on page 676• Application Identification for Nested Applications on page 681 |

pattern

| | |
|---------------------------------|--|
| Syntax | <code>pattern <i>dfa-pattern</i>;</code> |
| Hierarchy Level | [edit services application-identification nested-application name signature name member name] |
| Release Information | Statement introduced in Junos OS Release 10.2. |
| Description | Define an attack pattern to be detected. |
| Options | <i>dfa-pattern</i> —Pattern of attack to match. Deterministic Finite Automata (DFA) is a powerful pattern matching engine. |
| Required Privilege Level | system—To view this statement in the configuration.
system control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Application Identification for Nested Applications on page 681 |

policy-decision-statistics-profile

| | |
|---------------------------------|---|
| Syntax | <pre>policy-decision-statistics-profile <i>profile-name</i> {
 aacl-fields {
 <i>field-name</i>;
 }
 file <i>filename</i>;
 files <i>file-number</i>;
 size <i>bytes</i>;
}</pre> |
| Hierarchy Level | [edit accounting-options],
[edit services service-set <i>service-set-name</i>] |
| Release Information | Statement introduced in Junos OS Release 9.5. |
| Description | Create a policy decision statistics profile, which configures the files to which statistics records are exported and the format that is exported. |
| Options | <p>file <i>filename</i>—Name of the file to receive the accounting-data output. Enclose the name within quotation marks. All files are placed in the directory /var/log.</p> <p>files <i>number</i>—(Optional) Maximum number of accounting files.
Range: 2 through 1000 files
Default: 2 files</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p><i>profile-name</i>—Name of the policy decision statistics profile.</p> <p>size <i>size</i>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).
Syntax: xk to specify KB, xm to specify MB, or xg to specify GB
Range: 10240 through 1073741824 or the maximum file size supported on your system</p> <p>If you specify a maximum file size, you also must specify a maximum number of trace files with the files option.</p> <p>The remaining statements are explained separately.</p> |
| Required Privilege Level | interface —To view this statement in the configuration.
interface-control —To add this statement to the configuration. |

fragment-threshold

| | |
|---------------------------------|---|
| Syntax | <code>fragment-threshold bytes;</code> |
| Hierarchy Level | [edit interfaces <i>ls-fpc/pic/port:channel</i> mlfr-uni-nni-bundle-options],
[edit interfaces (<i>ls-fpc/pic/port</i> <i>ml-fpc/pic/port</i>) unit <i>logical-unit-number</i>],
[edit logical-systems <i>logical-system-name</i> interfaces <i>ls-fpc/pic/port:channel</i> mlfr-uni-nni-bundle-options],
[edit logical-systems <i>logical-system-name</i> interfaces (<i>ls-fpc/pic/port</i> <i>ml-fpc/pic/port</i>) unit <i>logical-unit-number</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | For multilink and link services interfaces only, set the fragmentation threshold, in bytes. |
| Options | bytes —Maximum size, in bytes, for multilink packet fragments. Any nonzero value must be a multiple of 64 bytes.
Range: 128 through 16,320 bytes
Default: 0 bytes (no fragmentation) |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Limiting Packet Payload Size on Multilink and Link Services Logical Interfaces on page 732• Example: Configuring a Multilink Interface with MLPPP on page 747 |

hello-timer

| | |
|---------------------------------|--|
| Syntax | <code>hello-timer milliseconds;</code> |
| Hierarchy Level | [edit interfaces <i>ls-fpc/pic/port:channel</i> mlfr-uni-nni-bundle-options] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | For link services interfaces only, configure the rate at which hello messages are sent. A hello message is transmitted after a period defined in milliseconds has elapsed. |
| Options | milliseconds —The rate at which hello messages are sent.
Range: 1 through 180 milliseconds
Default: 10 milliseconds |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Acknowledgment Timers on Link Services Physical Interfaces on page 727• address (Interfaces) on page 1598, acknowledge-timer on page 1597 |

interfaces

| | |
|---------------------------------|---|
| Syntax | interfaces { ... } |
| Hierarchy Level | [edit] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Configure interfaces on the router. |
| Default | The management and internal Ethernet interfaces are automatically configured. You must configure all other interfaces. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • <i>Junos OS Network Interfaces Library for Routing Devices</i> |

interleave-fragments

| | |
|---------------------------------|--|
| Syntax | interleave-fragments; |
| Hierarchy Level | [edit interfaces ls-fpc/pic/port:channel unit logical-unit-number],
[edit logical-systems logical-system-name interfaces ls-fpc/pic/port unit logical-unit-number] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | <p>For link services and voice services interfaces only, interleave long packets with high-priority packets.</p> <p>Allows small delay-sensitive packets, such as voice over IP (VoIP) packets, to interleave with long fragmented packets. This minimizes the latency of delay-sensitive packets.</p> |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Delay-Sensitive Packet Interleaving on Link Services Logical Interfaces on page 773 |

lmi-type

| | |
|---------------------------------|--|
| Syntax | <code>lmi-type (ansi itu);</code> |
| Hierarchy Level | <code>[edit interfaces ls-fpc/pic/port:channel mlfr-uni-nni-bundle-options]</code> |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Set the Frame Relay Local Management Interface (LMI) type. |
| Options | ansi —Use American National Standards Institute (ANSI) T1.167 Annex D LMIs.
itu —Use ITU Q933 Annex A LMIs.
Default: <code>itu</code> |
| Required Privilege Level | interface —To view this statement in the configuration.
interface-control —To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Keepalives on Link Services Physical Interfaces on page 728 |

minimum-links

| | |
|---------------------------------|---|

[edit logical-systems <i>logical-system-name</i> interfaces (<i>ml-fpc/pic/port</i> <i>ls-fpc/pic/port</i>) unit <i>logical-unit-number</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | For multilink or link services interfaces only, set the maximum received reconstructed unit (MRRU). The MRRU is similar to the maximum transmission unit (MTU), but is specific to multilink interfaces. |
| Options | bytes —MRRU size.
Range: 1500 through 4500 bytes
Default: 1500 bytes |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring MRRU on Multilink and Link Services Logical Interfaces on page 734 |

mtu

| | |
|---------------------------------|---|
| Syntax | <code>mtu bytes;</code> |
| Hierarchy Level | [edit interfaces <i>interface-name</i>],
[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>],
[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. |
| Options | bytes —MTU size.
Range: 0 through 5012 bytes
Default: 1500 bytes (inet , inet6 , and iso families), 1448 bytes (mpls) |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring MRRU on Multilink and Link Services Logical Interfaces on page 734 • Junos OS Network Interfaces Library for Routing Devices |

multicast-dlci

| | |
|---------------------------------|--|
| Syntax | <code>multicast-dlci <i>dlci-identifier</i>;</code> |
| Hierarchy Level | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>],
[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | For point-to-multipoint link services interfaces only, enable multicast support on the interface. You can configure multicast support on the interface if the Frame Relay switch performs multicast replication. |
| Options | <i>dlci-identifier</i> —DLCI identifier, a number from 16 through 1022 that defines the Frame Relay DLCI over which the switch expects to receive multicast packets for replication. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Multicast-Capable DLCIs for MLFR FRF.16 Bundles on page 778 |

n391

| | |
|---------------------------------|---|
| Syntax | n391 <i>number</i> ; |
| Hierarchy Level | [edit interfaces ls-fpc/pic/port:channel mlfr-uni-nni-bundle-options] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | For link services interfaces only, set the Frame Relay full status polling interval. |
| Options | <i>number</i> —Polling interval.
Range: 1 through 255
Default: 6 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

[edit forwarding-options] Hierarchy Level

To configure flow monitoring and accounting properties, include the following statements at the [edit forwarding-options] hierarchy level:

```
[edit forwarding-options]
accounting name {
  output {
    aggregate-export-interval seconds;
    cflowd hostname {
      aggregation {
        autonomous-system;
        destination-prefix;
        protocol-port;
        source-destination-prefix {
          caida-compliant;
        }
        source-prefix;
      }
    }
    autonomous-system-type (origin | peer);
    port port-number;
    version format;
  }
  flow-active-timeout seconds;
  flow-inactive-timeout seconds;
  interface interface-name {
    engine-id number;
    engine-type number;
    source-address address;
  }
}
monitoring name {
  family family {
    output {
      cflowd hostname port port-number;
      export-format format;
      flow-active-timeout seconds;
      flow-export-destination {
        collector-pic;
      }
      flow-inactive-timeout seconds;
      interface interface-name {
        engine-id number;
        engine-type number;
        input-interface-index number;
      }
    }
  }
}
```

```

        output-interface-index number;
        source-address address;
    }
}
}
next-hop-group group-names {
    interface interface-name {
        next-hop address;
    }
}
port-mirroring {
    input {
        rate rate;
        run-length number;
        maximum-packet-length bytes
    }
    family (inet | inet6) {
        output {
            interface interface-name {
                next-hop address;
            }
            no-filter-check;
        }
    }
    traceoptions {
        file filename {

[edit interfaces] Hierarchy Level

To configure flow monitoring and accounting interfaces, include the following statements at the [edit interfaces] hierarchy level:

```

[edit interfaces]
mo-fpc/pic/port {
    unit logical-unit-number {
        family inet {
            accounting {
                destination-class-usage;
                source-class-usage direction;
            }
        }
    }
    address address {
        destination address;
    }
    filter {
        group filter-group-number;
        input filter-name;
        output filter-name;
    }
}

```

```
    }
    receive-options-packets;
    receive-ttl-exceeded;
    sampling direction;
  }
}
multiservice-options {
  (core-dump | no-core-dump);
  (syslog | no-syslog);
  flow-control-options {
    down-on-flow-control;
    dump-on-flow-control;
    reset-on-flow-control;
  }
}
(at-fpc/pic/port | fe-fpc/pic/port | ge-fpc/pic/port) {
  passive-monitor-mode;
}
so-fpc/pic/port {
  unit logical-unit-number {
    passive-monitor-mode;
  }
}
```

 - [\[edit services flow-monitoring\] Hierarchy Level on page 1630](#)

[\[edit services dynamic-flow-control\] Hierarchy Level](#)

To configure dynamic flow capture, include the **dynamic-flow-capture** statement at the **[edit services]** hierarchy level:

```
[edit services]
dynamic-flow-capture {
  capture-group client-name {
    content-destination identifier {
      address address;
      hard-limit bandwidth;
      hard-limit-target bandwidth;
      soft-limit bandwidth;
      soft-limit-clear bandwidth;
      ttl hops;
    }
    control-source identifier {
      allowed-destinations [ destinations ];
      minimum-priority value;
      no-syslog;
      notification-targets address port port-number;
      service-port port-number;
      shared-key value;
      source-addresses [ addresses ];
    }
  }
  duplicates-dropped-periodicity seconds;
  input-packet-rate-threshold rate;
```

```

    interfaces interface-name;
    max-duplicates number;
    pic-memory-threshold percentage percentage;
  }
  g-duplicates-dropped-periodicity seconds;
  g-max-duplicates number;
  traceoptions{
    file filename <files number> <size size> <world-readable | non-world-readable>;
  }
}

```

Related Documentation • [Configuring Junos Capture Vision on page 849](#)

[edit services flow-collector] Hierarchy Level

To configure flow collection, include the **flow-collector** statement at the **[edit services]** hierarchy level:

```

flow-collector {
  analyzer-address address;
  analyzer-id name;
  destinations {
    ftp:url {
      password "password";
    }
  }
  file-specification {
    variant variant-number {
      data-format format;
      name-format format;
      transfer {
        record-level number;
        timeout seconds;
      }
    }
  }
  interface-map {
    collector interface-name;
    file-specification variant-number;
    interface-name {
      collector interface-name;
      file-specification variant-number;
    }
  }
  retry number;
  retry-delay seconds;
  transfer-log-archive {
    archive-sites {
      ftp:url {
        password "password";
        username username;
      }
    }
  }
  filename-prefix prefix;
  maximum-age minutes;
}

```

```
}  
}
```

- [\[edit services\] Hierarchy Level](#)

[edit services flow-tap] Hierarchy Level

To configure flow-tap services, include the **flow-tap** statement at the **[edit services]** hierarchy level. You can also specify whether you want to apply the flow-tap service to IPv4 traffic or IPv6 traffic by including the **family inet | inet6** statement. If the **family** statement is not included in the configuration, the flow-tap service is applied only to the IPv4 traffic.

```
flow-tap {
  interface interface-name;
  family inet | inet6;
}
```

Other statements are configured at the **[edit interfaces]** and **[edit system]** hierarchy levels.

| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | For cflowd version 8 only, specify the type of data to be aggregated; cflowd records and sends only those flows that match the specified criteria. |
| Options | <p>autonomous-system—Aggregate by autonomous system (AS) number.</p> <p>caida-compliant—Record source and destination mask-length values in compliance with the Version 2.1b1 release of CAIDA's cflowd application. If this statement is not configured, the Junos OS records source and destination mask length values in compliance with the <i>cflowd Configuration Guide</i>, dated August 30, 1999.</p> <p>destination-prefix—Aggregate by destination prefix.</p> <p>protocol-port—Aggregate by protocol and port number.</p> <p>source-destination-prefix—Aggregate by source and destination prefix.</p> <p>source-prefix—Aggregate by source prefix.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none"> • Enabling Flow Aggregation on page 898 |

allowed-destinations

| | |
|---------------------------------|---|
| Syntax | <code>allowed-destinations [<i>identifiers</i>];</code> |
| Hierarchy Level | <code>[edit services dynamic-flow-capture capture-group <i>client-name</i> control-source <i>identifier</i>]</code> |
| Release Information | Statement introduced in Junos OS Release 7.4. |
| Description | Identify flow capture destinations that are allowed in messages sent from this control source. |
| Options | <i>identifier</i> —Allowed content destination name. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring the Control Source on page 851 |

analyzer-address

| | |
|---------------------------------|---|
| Syntax | <code>analyzer-address <i>address</i>;</code> |
| Hierarchy Level | <code>[edit services flow-collector]</code> |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Configure an IP address for the packet analyzer that overrides the default value. |
| Options | <i>address</i> —IP address for packet analyzer. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring a Packet Analyzer on page 841 |

analyzer-id

| | |
|---------------------------------|---|
| Syntax | <code>analyzer-id <i>name</i>;</code> |
| Hierarchy Level | [edit services flow-collector] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Configure an identifier for the packet analyzer that overrides the default value. |
| Options | <i>name</i> —Identifier for packet analyzer. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring a Packet Analyzer on page 841 |

archive-sites

| | |
|---------------------------------|--|
| Syntax | <pre>archive-sites { ftp:url { password "<i>password</i>"; username <i>username</i>; } }</pre> |
| Hierarchy Level | [edit services flow-collector transfer-log-archive] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the destination for transfer logs. |
| Options | The statements are explained separately. |
| Required Privilege Level | interface—To view this statement in the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Transfer Logs on page 842 |

authentication-mode

| | |
|---------------------------------|--|
| Syntax | authentication-mode (authenticated control-only-encrypted encrypted none); |
| Hierarchy Level | [edit services rpm twamp server]
[edit services rpm twamp client control-connection <i>control-client-name</i>] |
| Release Information | Statement introduced in Junos OS Release 9.5.
Statement at the [edit services rpm twamp client control-connection <i>control-client-name</i>] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers. |
| Description | Specify the authentication or encryption mode support for the TWAMP test protocol. This statement is required in the configuration; if no authentication or encryption is specified, you should set the value to none . |
| Options | <p>authenticated—Data packets are authenticated.</p> <hr/> <p> NOTE: This mode is supported only on TWAMP servers.</p> <hr/> <p>control-only-encrypted—TWAMP control packets are encrypted. TWAMP data packets are in plain text format.</p> <hr/> <p> NOTE: This mode is supported only on TWAMP servers.</p> <hr/> <p>encrypted—Data packets are encrypted.</p> <hr/> <p> NOTE: This mode is supported only on TWAMP servers.</p> <hr/> <p>none—No authentication or encryption.</p> <hr/> <p> NOTE: This mode is supported on both TWAMP servers and clients.</p> <hr/> |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring TWAMP on page 968 • Two-Way Active Measurement Protocol Overview |

autonomous-system-type

| | |
|---------------------------------|---|
| Syntax | <code>autonomous-system-type (origin peer);</code> |
| Hierarchy Level | [edit forwarding-options sampling instance <i>instance-name</i> family (inet inet6 mpls) output flow-server <i>hostname</i>],
[edit forwarding-options sampling family (inet inet6 mpls) output flow-server <i>hostname</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the type of AS numbers that cflowd exports. |
| Default | <code>origin</code> |
| Options | <p>origin—Export origin AS numbers of the packet source address in the Source Autonomous System cflowd field.</p> <p>peer—Export peer AS numbers through which the packet passed in the Source Autonomous System cflowd field.</p> |
| Required Privilege Level | <p><code>interface</code>—To view this statement in the configuration.</p> <p><code>interface-control</code>—To add this statement to the configuration.</p> |

bgp

Syntax `bgp {
 data-fill data;
 data-size size;
 destination-port port;
 history-size size;
 logical-system logical-system-name <routing-instances routing-instance-name>;
 moving-average-size size;
 probe-count count;
 probe-interval seconds;
 probe-type type;
 routing-instances instance-name;
 test-interval interval;
 }`

Hierarchy Level `[edit services rpm bgp]
 [edit protocols bgp group group-name]
 [edit routing-instances instance-name protocols bgp group group-name]
 [edit logical-system logical-system-name protocols bgp group group-name]
 [edit logical-system logical-system-name routing-instances instance-name protocols bgp
 group group-name]`

Release Information Statement introduced before Junos OS Release 7.4.

Description Configure BGP neighbor discovery through Real-Time Performance Monitoring (RPM).

Options **bgp**—Define properties for configuring BGP neighbor discovery.

The remaining statements are explained separately.

NOTE: On MX Series routers, you can configure all the statements. On M Series and T Series routers, you can configure only the **logical-system** and **routing-instances** statements.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

data-fill

| | |
|---------------------------------|---|
| Syntax | <code>data-fill <i>data</i>;</code>
<code>data-fill-with-zeros <i>data</i>;</code> |
| Hierarchy Level | [edit services rpm bgp],
[edit services rpm probe owner test <i>test-name</i>]
[edit services rpm twamp client control-connection <i>control-client-name</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 9.3 for PTX Series Packet Transport Routers.
Statement at the [edit services rpm twamp client control-connection <i>control-client-name</i>] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers. |
| Description | Specify the contents of the data portion of Internet Control Message Protocol (ICMP) probes. The data-fill statement is not valid with the http-get or http-metadata-get probe types. For TWAMP client, if this knob is set, then fill the test packet with zeros, if the knob is not set then the data content would be random value as indicated in RFC. |
| Options | data —A hexadecimal value; for example, 0-9 , A-F . |
| Required Privilege Level | system—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring BGP Neighbor Discovery Through RPM on page 971 • Configuring RPM Probes on page 959 • Two-Way Active Measurement Protocol Overview |

data-format

| | |
|---------------------------------|---|
| Syntax | <code>data-format <i>format</i>;</code> |
| Hierarchy Level | [edit services flow-collector file-specification variant <i>variant-number</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the data format for a specific file format variant. |
| Options | format —Data format. Specify flow-compressed as the data format. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring File Formats on page 841 |

data-size

| | |
|---------------------|--|
| Syntax | <code>data-size size;</code> |
| Hierarchy Level | [edit services rpm bgp],
[edit services rpm probe owner test test-name]
[edit services rpm twamp client control-connection control-client-name] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.
Statement at the [edit services rpm twamp client control-connection control-client-name] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers. |
| Description | Specify the size of the data portion of ICMP probes. The data-size statement is not valid with the http-get or http-metadata-get probe type. |
| Options | data —The size can be from 0 through 65400
Default: 0 |

NOTE: If you configure the hardware timestamp feature (see [“Configuring RPM Timestamping” on page 964](#)):

- The **data-size** default value is 32 bytes and 32 is the minimum value for explicit configuration. The UDP timestamp probe type is an exception; it requires a minimum data size of 52 bytes.
 - The **data-size** must be at least 100 bytes smaller than the default MTU of the interface of the RPM client interface.
-

| | |

| Related Documentation | <ul style="list-style-type: none"> • Configuring Destination FTP Servers for Flow Records on page 840 |

direction (RFC2544 Benchmarking)

| | |
|---------------------------------|---|
| Syntax | direction (egress ingress); |
| Hierarchy Level | [edit services rpm rfc2544-benchmarkingtests test-name test-name] |
| Release Information | Statement introduced in Junos OS Release 12.3X52 for ACX Series routers.
Statement introduced in Junos OS Release 13.3 for MX104 3D Universal Edge Routers. |
| Description | Specify the direction of the interface on which the test must be run. This parameter is valid only for a ccc family and a bridge family. RFC2544 tests are supported only in the egress direction or the user-to-network interface (UNI) direction of an E-line or E-LAN service parameters in a bridge domain between two routers for unicast traffic. You cannot compute the NNI direction of Ethernet services between two routers for multicast or broadcast traffic. |
| Options | egress —Run the test in the egress direction of the interface (network-to-network interface (NNI)). This option is applicable for a ccc and bridge family.

ingress —Run the test in the ingress direction of the interface (user-to-network interface (UNI)). You cannot configure this option for a bridge family. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• rfc2544-benchmarking on page 1740• RFC2544-Based Benchmarking Tests Overview on page 983• Configuring an RFC 2544-Based Benchmarking Test on page 989 |

| | |
|----------------------------|---|
| Syntax | <pre> flow-server <i>hostname</i> { aggregation { autonomous-system; destination-prefix; protocol-port; source-destination-prefix { caida-compliant; } source-prefix; } autonomous-system-type (origin peer); (local-dump no-local-dump); port <i>port-number</i>; source-address <i>address</i>; version <i>format</i>; version9 { template <i>template-name</i>; } } </pre> |
| Hierarchy Level | [edit forwarding-options sampling instance <i>instance-name</i> family (inet inet6 mpls) output],
[edit forwarding-options sampling family (inet inet6 mpls) output] |
| Release Information | Statement introduced before Junos OS Release 7.4.
version9 statement introduced in Junos OS Release 8.3. |
| Description | <p>Collect an aggregate of sampled flows and send the aggregate to a specified host system that runs the collection utility cfdcollect. Specify a host system to collect sampled flows using the version 9 format.</p> <p>You can configure up to one version 5 and one version 8 flow format at the [edit forwarding-options sampling family (inet inet6 mpls) output flow-server <i>hostname</i>] hierarchy level. For the same configuration, you can specify only either version 9 flow record formats or formats using versions 5 and 8, not both types of formats.</p> |
| Options | <p>hostname—The IP address—IPv4 or IPv6—or identifier of the host system (the workstation either running the cflowd utility or collecting traffic flows using version 9).</p> <p>You can configure only one host system for version 9.</p> |

NOTE: IPv6 configuration for **flow-server** is supported only in Junos OS Release 12.3 and later.

Note that when you configure an IPv6 address for the **flow-server** statement, you must also configure an IPv6 address for the **inline-jflow source-address** statement at the **[edit forwarding-options sampling instance *instance-name* family (inet | inet6 | mpls) output]** hierarchy level.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.

flow-table-size

Syntax

```
flow-table-size {  
    ipv4-flow-table-size units;  
    ipv6-flow-table-size units;  
    ipv6-extended-attrib;  
}
```

Hierarchy Level [edit chassis fpc *slot-number* inline-services]

Release Information Statement introduced in Junos OS Release 12.1.
ipv6-extended-attrib option added in Junos OS Release 14.2 for MX Series routers.

Description Configure the size of hash tables for inline services sampling.

Options The remaining statements are defined separately.

flow-tap

| | |
|---------------------------------|--|
| Syntax | <pre>flow-tap { (interface <i>interface-name</i> tunnel-interface <i>interface-name</i> family (inet inet6)); }</pre> |
| Hierarchy Level | [edit services] |
| Release Information | Statement introduced in Junos OS Release 8.1. |
| Description | Enable the flow-tap or FlowTapLite application on an interface. FlowTapLite is a lighter version of the flow-tap application that is available on MX Series platforms, M120 routers, and M320 routers with Enhanced III FPCs only. |
| Options | <p>interface <i>interface-name</i>—Specify the interface name for the flow-tap application.</p> <p>tunnel-interface <i>interface-name</i>—Specify the tunnel interface name for the FlowTapLite application.</p> <p>The remaining statements are explained separately.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |

max-connection-duration

| | |
|---------------------------------|---|
| Syntax | <code>max-connection-duration <i>hours</i>;</code> |
| Hierarchy Level | [edit services rpm twamp server] |
| Release Information | Statement introduced in Junos OS Release 11.1. |
| Description | Specify the maximum time a connection can exist between a client and the server. |
| Options | <i>hours</i> —Number of hours a connection can exist between a client and the server. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring TWAMP on page 968 |

max-duplicates

| | |
|---------------------------------|---|
| Syntax | <code>max-duplicates <i>number</i>;</code> |
| Hierarchy Level | [edit services dynamic-flow-capture capture-group <i>client-name</i>] |
| Release Information | Statement introduced in Junos OS Release 9.2. |
| Description | Specify the maximum number of content destinations to which the DFC PIC can send data from a single input set of packets. Limiting the number of duplicates reduces the load on the PIC. This setting overrides the globally applied g-max-duplicates setting. |
| Default | If no value is configured, a default setting of 3 is used. |
| Options | <i>number</i> —Maximum number of content destinations.
Range: 1 through 64 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• g-max-duplicates on page 1683• Limiting the Number of Duplicates of a Packet on page 855 |

max-packets-per-second

| | |
|--|--|
| Syntax | <code>max-packets-per-second <i>number</i>;</code> |
| Hierarchy Level | [edit forwarding-options sampling input],
[edit forwarding-options sampling instance instance-name input] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Specify the traffic threshold that must be exceeded before packets are dropped. A value of 0 instructs the Packet Forwarding Engine not to sample any traffic. |
| <div>  NOTE: When you configure active monitoring and specify a Monitoring Services, Adaptive Services, or Multiservices PIC in the output statement, the <code>max-packets-per-second</code> value is ignored. </div> | |
| Options | <i>number</i> —Maximum number of packets per second.
Range: 0 through 65,535
Default: 1000 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

maximum-packet-length

| | |
|----------------------------|--|
| Syntax | <code>maximum-packet-length bytes;</code> |
| Hierarchy Level | [edit forwarding-options analyzer analyzer-name input],
[edit forwarding-options port-mirroring input],
[edit forwarding-options port-mirroring instance <i>instance-name</i> input],
[edit forwarding-options sampling input],
[edit forwarding-options sampling instance <i>instance-name</i> input] |
| Release Information | Statement introduced in Junos OS Release 9.6.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
The [edit forwarding-options analyzer analyzer-name input] hierarchy level for MX Series routers introduced in Junos OS Release 14.1. |
| Description | Set the maximum length of the packet used for port mirroring or traffic sampling. Packets with lengths greater than the specified maximum are truncated. |

NOTE: The `maximum-packet-length` statement is not supported on MX80 routers.

NOTE: For MX-Series devices with Modular Port Interface Concentrators (MPCs), when `maximum-packet-length` (clip length) is configured for port-mirrored packets and the mirror-destination interface is a next-hop-group, the clip length would be effective only for the first member interface of the next-hop-group. The mirrored packet copy sent to the rest of the interfaces would not be clipped.

Native analyzer sessions (that is, the [edit forwarding-options analyzer analyzer-name input] hierarchy level for MX Series routers) can be configured without specifying input parameters, which would mean that the instance uses default input values: `rate = 1` and `maximum-packet-length = 0`.

| | |
|----------------|--|
| Options | <i>bytes</i> —Maximum length (in bytes) of the mirrored packet or the sampled packet.
Range: 0 through 9216
Default: 0 |
|----------------|--|

For MX Series routers with Modular Port Concentrators (MPCs), port-mirrored or sampled packets can be truncated (or clipped) to any length in the range of 1 to 255 bytes. Only 1 to 255 are valid values for packet truncation on these devices. For other devices, the range is from 0 to 9216. A `maximum-packet-length` value of zero represents that truncation is disabled, and the entire packet is mirrored or sampled.

observation-domain-id

| | |
|---------------------------------|---|
| Syntax | <code>observation-domain-id <i>domain-id</i>;</code> |
| Hierarchy Level | [edit services flow-monitoringversion-ipfix template <i>template-name</i>] |
| Release Information | Statement introduced in Junos OS Release 14.1. |
| Description | <p>For IPFIX flows, an identifier of an Observation Domain is locally unique to an exporting process of the templates. The export process uses the Observation Domain ID to uniquely identify to the collection process in which the flows were metered. We recommend that you configure this ID to be unique for each IPFIX flow. A value of 0 indicates that no specific Observation Domain is identified by this information element. Typically, this attribute is used to limit the scope of other information elements. If the observation domain is not unique, the collector cannot uniquely identify an IPFIX device.</p> <p>If you configure the same Observation Domain ID for different template types, such as for IPv4 and IPv6, it does not impact flow monitoring because the actual or the base observation domain ID is transmitted in the flow. The actual observation domain ID is derived from the value you configure and also in conjunction with other parameters such as the slot number, lookup chip (LU) instance, Packet Forwarding Engine instance. Such a method of computation of the observation domain ID ensures that this ID is not the same for two IPFIX devices.</p> |
| Options | <p><i>domain-id</i>—Specify a unique identifier for the observation domain for IPFIX flows.</p> <p>Range: 0 through 255</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |

one-way-hardware-timestamp

| | |
|---------------------------------|---|
| Syntax | one-way-hardware-timestamp; |
| Hierarchy Level | [edit services rpm probe owner test test-name] |
| Release Information | Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.3 for EX Series switches. |
| Description | Enable timestamping of RPM probe messages for one-way delay and jitter measurements. You must configure this statement along with the destination-interface statement to invoke timestamping. This feature is supported only with icmp-ping , icmp-ping-timestamp , udp-ping , and udp-ping-timestamp probe types. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring RPM Timestamping on page 964• destination-interface on page 1652• hardware-timestamp on page 1684 |

option-refresh-rate

| | |
|---------------------------------|--|
| Syntax | option-refresh-rate packets <i>packets</i> seconds <i>seconds</i> ; |
| Hierarchy Level | [edit services flow-monitoring version9],
[edit services flow-monitoring version9 template <i>template-name</i>]
[edit services flow-monitoringversion-ipfix template <i>template-name</i>] |
| Release Information | Statement introduced in Junos OS Release 8.3.
Support at the [edit services flow-monitoring version-ipfix template <i>template-name</i>]
hierarchy level added in Junos OS Release 10.2. |
| Description | Specify the refresh rate, in either packets or seconds. |
| Options | <p><i>packets</i>—Refresh rate, in number of packets.
Range: 1 through 480,000
Default: 4800</p> <p><i>seconds</i>—Refresh rate, in number of seconds.
Range: 10 through 600
Default: 600</p> |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

options-template-id

| | |
|---------------------------------|---|
| Syntax | <code>options-template-id <i>id</i>;</code> |
| Hierarchy Level | <code>[edit services flow-monitoring version9 template <i>template-name</i>]</code>
<code>[edit services flow-monitoringversion-ipfix template <i>template-name</i>]</code> |
| Release Information | Statement introduced in Junos OS Release 14.1. |
| Description | Define a unique options template ID to be used for flow aggregation of version 9 and IPFIX flows. If you do not configure values for the template ID and options template ID, default values are assumed for these IDs, which are different for the various address families. If you configure the same template ID or options template ID value for different address families, such a setting is not processed properly and might cause unexpected behavior. For example, if you configure the same template ID value for both IPv4 and IPv6, the collector validates the export data based on the template ID value that it last receives. In this case, if IPv6 is configured after IPv4, the value is effective for IPv6 and the default value is used for IPv4. |
| Options | <i>id</i> —Specify a unique identifier for the options template to be used for version 9 or IPFIX flows.
Range: 1024 through 65535 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Observation Domain ID and Source ID for Version 9 and IPFIX Flows on page 918 • Configuring Template ID and Options Template ID for Version 9 and IPFIX Flows on page 921 |

required-depth

| | |
|---------------------------------|--|
| Syntax | <code>required-depth <i>number</i>;</code> |
| Hierarchy Level | [edit interfaces <i>interface-name</i> atm-options mpls pop-all-labels],
[edit interfaces <i>interface-name</i> fastether-options mpls pop-all-labels],
[edit interfaces <i>interface-name</i> gigether-options mpls pop-all-labels],
[edit interfaces <i>interface-name</i> sonet-options mpls pop-all-labels] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | <p>For passive monitoring on ATM, SONET/SDH, Fast Ethernet, and Gigabit Ethernet interfaces only, specify the number of MPLS labels an incoming packet must have for the pop-all-labels statement to take effect.</p> <p>If you include the required-depth 1 statement, the pop-all-labels statement takes effect for incoming packets with one label only. If you include the required-depth 2 statement, the pop-all-labels statement takes effect for incoming packets with two labels only.</p> |
| Options | <p>number—Number of MPLS labels on incoming IP packets.</p> <p>Range: 1 through 2 labels.</p> <p>Default: If you omit this statement, the pop-all-labels statement takes effect for incoming packets with one or two labels. The default is equivalent to including the required-depth [1 2] statement.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none">• Passive Flow Monitoring for MPLS Encapsulated Packets on page 832• <i>Junos OS Network Interfaces Library for Routing Devices</i> |

retry (Services Flow Collector)

| | |
|---------------------------------|--|
| Syntax | <code>retry number;</code> |
| Hierarchy Level | [edit services flow-collector] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Configure the maximum number of attempts the flow collector interface will make to transfer log files to the FTP server. |
| Options | <i>number</i> —Maximum number of transfer retry attempts.
Range: 0 through 10 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Retry Attempts on page 843 |

retry-delay

| | |
|---------------------------------|---|
| Syntax | <code>retry-delay seconds;</code> |
| Hierarchy Level | [edit services flow-collector] |
| Release Information | Statement introduced before Junos OS Release 7.4. |
| Description | Configure the amount of time the flow collector interface waits between retry attempts. |
| Options | <i>seconds</i> —Amount of time between transfer retry attempts.
Range: 0 through 60 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Retry Attempts on page 843 |

rfc2544-benchmarking

Syntax rfc2544-benchmarking {
 tests{
 test-name *test-name* {
 test-interface *interface-name*;
 mode reflect;
 family (bridge| inet | ccc);
 destination-ipv4-address *address*;
 destination-udp-port *port-number*;
 source-ipv4-address *address*;
 source-udp-port *port-number*;
 direction (egress | ingress);
 }
 }
 }

Hierarchy Level [edit [services](#) rpm]

Release Information Statement introduced in Junos OS Release 12.3X52 for ACX Series routers.
 Statement introduced in Junos OS Release 13.3 for MX104 3D Universal Edge Routers.

Description Configure the parameters for the RFC 2544-based benchmarking test. You must configure a test profile, which specifies the type of test and the manner in which it must be performed, and associate the test profile with a test name. The test name that you configure contains details, such as the address family and the test mode, for the test. You can associate the same test profile with multiple test names.

Options **rfc2544-benchmarking**—Define the attributes for the RFC 2544-based benchmarking test to examine and analyze the performance characteristics of a network interconnecting device.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

source-address (Services)

| | |
|---------------------------------|---|
| Syntax | <code>source-address <i>address</i>;</code> |
| Hierarchy Level | [edit services rpm probe owner test <i>test-name</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers. |
| Description | Specify the source IP address used for probes. If the source IP address is not one of the router's or switch's assigned addresses, the packet will use the outgoing interface's address as its source.

The following addresses cannot be used for the source IP address used for probes: <ul style="list-style-type: none"> • 0.0.0.0 • 127.0.0.0/8 (loopback) • 224.0.0.0/4 (multicast) • 255.255.255.255 (broadcast) |
| Options | <i>address</i> —Valid IP address. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring RPM Probes on page 959 |

source-addresses

| | |
|---------------------------------|---|
| Syntax | <code>source-addresses [<i>addresses</i>];</code> |
| Hierarchy Level | [edit services dynamic-flow-capture capture-group <i>client-name</i> control-source <i>identifier</i>] |
| Release Information | Statement introduced in Junos OS Release 7.4. |
| Description | List of IP addresses from which the control source can send control protocol requests to the Juniper Networks router. |
| Options | <i>address</i> —Allowed IP source address. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring the Control Source on page 851 |

source-id

| | |
|---------------------------------|---|
| Syntax | <code>source-id <i>source-id</i>;</code> |
| Hierarchy Level | [edit services flow-monitoring version9 template <i>template-name</i>] |
| Release Information | Statement introduced in Junos OS Release 14.1. |
| Description | For version 9 flows, a 32-bit value that identifies the Exporter Observation Domain is called the source ID. NetFlow collectors use the combination of the source IP address and the source ID field to separate different export streams originating from the same exporter. |
| Options | <i>source-id</i> —Specify a unique identifier for the source for version 9 flows.
Range: 0 through 255 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Observation Domain ID and Source ID for Version 9 and IPFIX Flows on page 918• Configuring Template ID and Options Template ID for Version 9 and IPFIX Flows on page 921 |

source-ipv4-address (RFC 2544 Benchmarking)

| | |
|---------------------------------|---|
| Syntax | <code>source-ipv4-address <i>address</i>;</code> |
| Hierarchy Level | [edit services rpm rfc2544-benchmarkingtests <i>test-name</i> <i>test-name</i>] |
| Release Information | Statement introduced in Junos OS Release 12.3X52 for ACX Series routers.
Statement introduced in Junos OS Release 13.3 for MX104 3D Universal Edge Routers. |
| Description | Specify the source IPv4 address to be used in generated test frames. This parameter is optional for both ccc and inet families. If you do not configure the source IPv4 address for an inet family, the source address of the interface is used to transmit the test frames. |
| Options | <i>address</i> —Valid IPv4 address.
Default: If you do not configure the source IPv4 address for a ccc family, default value of 192.168.1.10 is used. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

```

Hierarchy Level [edit services [video-monitoring](#)]

Release Information Statement introduced in Junos OS Release 14.1.

Description Configure the media delivery index template containing the measurement parameters for video monitoring.

Options **delay-factor**—Define delay factor syslog threshold levels.

delay-factor-threshold—Delay factor threshold in milliseconds. When the threshold is exceeded, a syslog message is generated.

Default: 0—Do not generate syslogs.

Range: 0 though 65535 milliseconds

disable—Disable logging for the threshold.

inactive-timeout—Number of seconds of flow inactivity after which time media delivery index statistics collection for a flow is terminated.

Range: 30 through 300 seconds

info | warning | critical—Level of syslog message generated when a threshold is exceeded.

interval-duration—Number of seconds after which time media delivery index flow monitoring statistics for the interval are reported.

Range: 1 through 50

layer3-packets-per-second—Layer 3 packet rate in IP packets per second.

Range: 0 through 4,294,967,295 pps

media-bits-per-second—Media bit rate for the stream in bits per second.

media-loss-rate—Define media loss rate syslog threshold levels.

media-packets-count-in-layer-3—Number of media packets in an IP packet.

Range: 1 through 32

media-packet-size—Size of media packet in bits.

Default: 188

Range: 1 through 2048

media-rate-variation—Define delay factor syslog threshold levels.

mlr-packet-count—Media loss rate threshold expressed as the number of packets dropped. When the threshold is exceeded, a syslog message is generated.

mlr-percentage—Media loss rate threshold expressed as the percentage of total packets dropped. When the threshold is exceeded, a syslog message is generated.

Range: 0 through 100

mrv-variation—Media rate variation threshold. The variation is the ratio of actual media rate to the configured media rate, expressed as a percentage.

template-name—Name of the template containing media delivery index measurement criteria. The template can be assigned to an interface.

test-interface (RFC 2544 Benchmarking)

| | |
|---------------------------------|--|
| Syntax | <code>test-interface <i>interface-name</i>;</code> |
| Hierarchy Level | [edit services rpm rfc2544-benchmarkingtests <i>test-name</i> <i>test-name</i>] |
| Release Information | Statement introduced in Junos OS Release 13.3 for MX104 3D Universal Edge Routers. |
| Description | Specify the logical interface on which the RFC 2544-based benchmarking test is run. If you configure an inet family and the test mode to initiate and terminate test frames on the same device, the interface you configure is not effective. Instead, the test is run on the egress logical interface that is determined using route lookup on the specified destination IPv4 address. If you configure an inet family and the test mode to reflect the frames back on the sender from the other end, the logical interface is used as the interface to enable the reflection service (reflection is performed on the packets entering the specified interface). If you not configure the logical interface for reflection test mode, a lookup is performed on the source IPv4 address to determine the interface that hosts the address. |
| Options | <i>interface-name</i> —Name of the logical interface on which the test needs to be run. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

thresholds

| | |
|---------------------------------|--|
| Syntax | <code>thresholds thresholds;</code> |
| Hierarchy Level | <code>[edit services rpm probe owner test test-name]</code>
<code>[edit services rpm twamp client control-connection control-client-name]</code> |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Packet Series Transport Routers.
Statement at the <code>[edit services rpm twamp client control-connection control-client-name]</code> hierarchy level introduced in Junos OS Release 15.1 for MX Series routers. |
| Description | Specify thresholds used for the probes. A system log message is generated when the configured threshold is exceeded. Likewise, an SNMP trap (if configured) is generated when a threshold is exceeded. |
| Options | <p>thresholds—Specify one or more threshold measurements. The following options are supported:</p> <ul style="list-style-type: none"> • egress-time—Measures maximum source-to-destination time per probe. • ingress-time—Measures maximum destination-to-source time per probe. • jitter-egress—Measures maximum source-to-destination jitter per test. • jitter-ingress—Measures maximum destination-to- source jitter per test. • jitter-rtt—Measures maximum jitter per test, from 0 through 60,000,000 microseconds. • rtt—Measures maximum round-trip time per probe, in microseconds. • std-dev-egress—Measures maximum source-to-destination standard deviation per test. • std-dev-ingress—Measures maximum destination-to-source standard deviation per test. • std-dev-rtt—Measures maximum standard deviation per test, in microseconds. • successive-loss—Measures successive probe loss count, indicating probe failure. • total-loss—Measures total probe loss count indicating test failure, from 0 through 15. |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |

traps

| | |
|----------------------------|--|
| Syntax | <code>traps traps;</code> |
| Hierarchy Level | [edit services rpm probe owner test test-name]
[edit services rpm twamp client control-connection control-client-name] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.
Statement at the [edit services rpm twamp client control-connection control-client-name] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers. |
| Description | Set the trap bit to generate traps for probes. Traps are sent if the configured threshold is met or exceeded. |
| Options | traps —Specify one or more traps. The following options are supported: <ul style="list-style-type: none">• egress-jitter-exceeded—Generates traps when the jitter in egress time threshold is met or exceeded.• egress-std-dev-exceeded—Generates traps when the egress time standard deviation threshold is met or exceeded.• egress-time-exceeded—Generates traps when the maximum egress time threshold is met or exceeded.• ingress-jitter-exceeded—Generates traps when the jitter in ingress time threshold is met or exceeded.• ingress-std-dev-exceeded—Generates traps when the ingress time standard deviation threshold is met or exceeded.• ingress-time-exceeded—Generates traps when the maximum ingress time threshold is met or exceeded.• jitter-exceeded—Generates traps when the jitter in round-trip time threshold is met or exceeded.• probe-failure—Generates traps for successive probe loss thresholds crossed.• rtt-exceeded—Generates traps when the maximum round-trip time threshold is met or exceeded.• std-dev-exceeded—Generates traps when the round-trip time standard deviation threshold is met or exceeded.• test-completion—Generates traps when a test is completed.• test-failure—Generates traps when the total probe loss threshold is met or exceeded. |

NOTE: For RPM traps to be generated, you must configure the `remote-operations` SNMP trap category by including the `categories` statement at the `[edit snmp trap-group trap-group-name hierarchy level`.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

    port number;
    routing-instance-list {
      instance-name {
        port number;
      }
    }
    server-inactivity-timeout minutes;
  }
}
```

Hierarchy Level [edit services rpm]

Release Information Statement introduced in Junos OS Release 9.3.

Description Configure the Two-Way Active Measurement Protocol (TWAMP) responder or sever settings on all M Series and T Series routers that support Multiservices PICs (running in either Layer 2 or Layer 3 mode), and on MX Series routers.

TWAMP is an open protocol for measurement of two-way metrics. The host that initiates the TCP connection takes the roles of the control-client and (in the two-host implementation) the session-sender. Such a device is also called the TWAMP client. The host that acknowledges the TCP connection accepts the roles of a server and (in the two-host implementation) and the session-reflector. Such a device is also called the TWAMP server. The TWAMP-Test messages are exchanged between the session-sender and the session-reflector, and the TWAMP-Control messages are exchanged between the control-client and the server.

The following addresses cannot be used for the **client-list** source IP address used for probes:

- 0.0.0.0
- 127.0.0.0/8 (loopback)
- 224.0.0.0/4 (multicast)

- 255.255.255.255 (broadcast)

The remaining statements are described separately.

template-id

| | |
|---------------------------------|--|
| Syntax | template-id <i>id</i> ; |
| Hierarchy Level | [edit services flow-monitoring version9 template <i>template-name</i>]
[edit services flow-monitoringversion-ipfix template <i>template-name</i>] |
| Release Information | Statement introduced in Junos OS Release 14.1. |
| Description | Define a template ID to be used for flow aggregation of version 9 and IPFIX flows. If you do not configure values for the template ID and options template ID, default values are assumed for these IDs, which are different for the various address families. If you configure the same template ID or options template ID value for different address families, such a setting is not processed properly and might cause unexpected behavior. For example, if you configure the same template ID value for both IPv4 and IPv6, the collector validates the export data based on the template ID value that it last receives. In this case, if IPv6 is configured after IPv4, the value is effective for IPv6 and the default value is used for IPv4. |
| Options | <i>id</i> —Specify a unique identifier for the template to be used for version 9 or IPFIX flows.
Range: 1024 through 65535 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Observation Domain ID and Source ID for Version 9 and IPFIX Flows on page 918• Configuring Template ID and Options Template ID for Version 9 and IPFIX Flows on page 921 |

template-refresh-rate

| | |
|---------------------------------|--|
| Syntax | template-refresh-rate packets <i>packets</i> seconds <i>seconds</i> ; |
| Hierarchy Level | [edit services flow-monitoring version9 template <i>template-name</i>]
[edit services flow-monitoringversion-ipfix template <i>template-name</i>] |
| Release Information | Statement introduced in Junos OS Release 8.3.
Support at the [edit services flow-monitoring version-ipfix template <i>template-name</i>] hierarchy level added in Junos OS Release 10.2. |
| Description | Specify the refresh rate, in either packets or seconds. |
| Options | <i>packets</i> —Refresh rate, in number of packets.
Range: 1 through 480,000
Default: 4800

<i>seconds</i> —Refresh rate, in number of seconds.
Range: 10 through 600
Default: 600 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

clear services cos statistics

| | |
|---------------------------------|---|
| Syntax | <code>clear services cos statistics</code>
<code><interface <i>interface-name</i>></code>
<code><service-set <i>service-set-name</i>></code> |
| Release Information | Command introduced in Junos OS Release 8.1. |
| Description | Clear statistics for class-of-service (CoS) code point bit patterns and forwarding classes as configured in CoS services for the AS PIC. |
| Options | none —Clear all services CoS statistics.

interface <i>interface-name</i> —(Optional) Clear statistics for the specified interface only.

service-set <i>service-set-name</i> —(Optional) Clear statistics for the specified service set only. |
| Required Privilege Level | view |
| List of Sample Output | clear services cos statistics on page 1815 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services cos statistics

```
user@host> clear services cos statistics
```

clear services crtp statistics

| | |
|---------------------------------|--|
| Syntax | clear services crtp statistics
<interface <i>interface-name</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Clear Compressed Real-Time Transport Protocol (CRTP) flow statistics. |
| Options | none —Clear CRTP flow statistics on all interfaces.

interface <i>interface-name</i> —(Optional) Clear CRTP flow statistics for the specified interface.
On M Series and T Series routers, a link services IQ (lsq-<i>fpc/pic/port</i>) or redundant link services IQ (rlsq-<i>fpc/pic/port</i>) interface. |
| Required Privilege Level | view |
| List of Sample Output | clear services crtp statistics on page 1816 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services crtp statistics

```
user@host> clear services crtp statistics
```

clear services ids

| | |
|---------------------------------|---|
| Syntax | clear services ids
<interface <i>interface-name</i> >
<service-set <i>service-set-name</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Clear intrusion detection service (IDS) events. |
| Options | <p>none—Clear all IDS events for all adaptive services interfaces for all service sets, and clear and reset IDS.</p> <p>interface <i>interface-name</i>—(Optional) On M Series and T Series routers, the <i>interface-name</i> can be <i>sp-fpc/pic/port</i> or <i>rspnumber</i>.</p> <p>service-set <i>service-set-name</i>—(Optional) Clear all IDS events for a particular service set.</p> |
| Required Privilege Level | view |
| List of Sample Output | clear services ids on page 1817 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services ids

```
user@host> clear services ids
```

clear services ids destination-table

| | |
|---------------------------------|--|
| Syntax | <code>clear services ids destination-table</code>
<code><destination-prefix <i>destination-prefix-name</i>></code>
<code><interface <i>interface-name</i>></code>
<code><service-set <i>service-set-name</i>></code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Clear the intrusion detection service (IDS) events for a particular address that might be under attack. |
| Options | <p>none—Clear the attack destination address table.</p> <p>destination-prefix <i>destination-prefix-name</i>—(Optional) Clear the attack destination table for a particular destination prefix.</p> <p>interface <i>interface-name</i>—(Optional) Clear the attack destination table for a particular interface. On M Series and T Series routers, the <i>interface-name</i> can be <i>sp-fpc/pic/port</i> or <i>rspnumber</i>.</p> <p>service-set <i>service-set-name</i>—(Optional) Clear the attack destination table for a particular service set.</p> |
| Required Privilege Level | view |
| List of Sample Output | clear services ids destination-table on page 1818 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services ids destination-table

```
user@host> clear services ids destination-table
```

clear services ids pair-table

| | |
|---------------------------------|--|
| Syntax | clear services ids pair-table
<destination-prefix <i>destination-prefix-name</i> >
<interface <i>interface-name</i> >
<service-set <i>service-set-name</i> >
<source-prefix <i>source-prefix-name</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Clear the intrusion detection service (IDS) attack source and destination address pair table. |
| Options | <p>none—Clear the attack source and destination address pair table.</p> <p>destination-prefix <i>destination-prefix-name</i>—(Optional) Clear the attack source and destination address pair table for a particular destination prefix.</p> <p>interface <i>interface-name</i>—(Optional) Clear the attack destination table for a particular interface. On M Series and T Series routers, the <i>interface-name</i> can be sp-fpc/pic/port or rspnumber.</p> <p>service-set <i>service-set-name</i>—(Optional) Clear the attack source and destination address pair table for a particular service set.</p> <p>source-prefix <i>source-prefix-name</i>—(Optional) Clear the attack source and destination address pair table for a particular source prefix.</p> |
| Required Privilege Level | view |
| List of Sample Output | clear services ids pair-table on page 1819 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services ids pair-table

```
user@host> clear services ids pair-table
```

clear services ids source-table

| | |
|---------------------------------|---|
| Syntax | <code>clear services ids source-table</code>
<code><interface <i>interface-name</i>></code>
<code><service-set <i>service-set-name</i>></code>
<code><source-prefix <i>source-prefix-name</i>></code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Clear all intrusion detection service (IDS) events for addresses that are suspected attackers. |
| Options | <p>none—Clear the attack source address table.</p> <p>interface <i>interface-name</i>—(Optional) On M Series and T Series routers, the <i>interface-name</i> can be <i>sp-fpc/pic/port</i> or <i>rspnumber</i>.</p> <p>service-set <i>service-set-name</i>—(Optional) Clear the attack source address table for a particular service set.</p> <p>source-prefix <i>source-prefix-name</i>—(Optional) Clear the attack source address table for a particular source prefix.</p> |
| Required Privilege Level | view |
| List of Sample Output | clear services ids source-table on page 1820 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services ids source-table

```
user@host> clear services ids source-table
```

clear services inline nat pool

| | |
|---------------------------------|--|
| Syntax | clear services inline nat pool <i>pool-name</i> |
| Release Information | Command introduced in Junos OS Release 11.4. |
| Description | Clear global inline NAT statistics. |
| Options | pool-name —Name of the NAT pool for which statistic are cleared. |
| Required Privilege Level | clear |
| List of Sample Output | clear services inline nat pool on page 1821 |
| Output Fields | When you enter this command, the NAT pool statistics are cleared. There is no specific output. |

Sample Output

clear services inline nat pool

```
user@host> clear services inline nat pool p1
```

clear services inline nat statistics

| | |
|---------------------------------|--|
| Syntax | clear services inline nat statistics
<interface <i>interface-name</i> > |
| Release Information | Command introduced in Junos OS Release 11.4. |
| Description | Clear global inline NAT statistics. |
| Options | interface <i>interface-name</i> —(Optional) Clear inline NAT statistics for the specified interface only. |
| Required Privilege Level | clear |
| List of Sample Output | clear services inline nat statistics on page 1822 |
| Output Fields | When you enter this command, the global inline NAT statistics are cleared. There is no specific output. |

Sample Output

clear services inline nat statistics

```
user@host> clear services inline nat statistics
```

clear services ipsec-vpn certificates

| | |
|---------------------------------|---|
| Syntax | clear services ipsec-vpn certificates (all service-set <i>service-set</i>)
<certificate-cache-entry <i>number</i> > |
| Release Information | Command introduced in Junos OS Release 7.5. |
| Description | (Adaptive services interfaces only) Delete digital certificates from the IPsec configuration memory cache. Issuing this command also clears the certificate revocation list (CRL) from the cache along with the certificates. |
| Options | all —Delete digital certificates for all service sets.

service-set <i>service-set</i> —Delete digital certificates for the specified service set. |
| Required Privilege Level | clear |
| List of Sample Output | clear services ipsec-vpn certificates all on page 1823 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services ipsec-vpn certificates all

```
user@host> clear services ipsec-vpn certificates all
```

clear services ipsec-vpn ike security-associations

| | |
|---------------------------------|---|
| Syntax | clear services ipsec-vpn ike security-associations
<peer-address-name>
<service-set service-set-name> |
| Release Information | Command introduced before Junos OS Release 7.4.
service-set option added in Junos OS Release 8.5. |
| Description | (Adaptive services interfaces only) Clear Internet Key Exchange (IKE) security associations. |
| Options | peer-address-name —(Optional) Clear only the security association specified by the peer address.

service-set service-set-name —(Optional) Clear only the security association specified by the service-set name. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none">• show services ipsec-vpn ike security-associations on page 1961 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

```
user@host> clear services ipsec-vpn ike security-associations
```

clear services ipsec-vpn ipsec security-associations

| | |
|---------------------------------|--|
| Syntax | clear services ipsec-vpn security-associations
<peer-address-name>
<remote-gateway remote-gateway-address>
<service-set-name>
<tunnel-index tunnel-index-number> |
| Release Information | Command introduced before Junos OS Release 7.4.
remote-gateway , service-set-name , and tunnel-index options added in Junos OS Release 8.4. |
| Description | (Adaptive services interfaces only) Clear IP Security (IPsec) security associations. You can combine the options for greater specificity. |
| Options | <p>peer-address-name—(Optional) Clear only the security association specified by the peer address.</p> <p>remote-gateway remote-gateway-address—(Optional) Clear only the security association specified by the remote gateway address.</p> <p>service-set-name—(Optional) Clear only the security association specified by the service-set name.</p> <p>tunnel-index tunnel-index-number—(Optional) Clear only the security association specified by the tunnel index number.</p> |

```

clear services l2tp destination

| | |
|---------------------------------|---|
| Syntax | clear services l2tp destination
<all local-gateway <i>gateway-address</i> peer-gateway <i>gateway-address</i> > |
| Release Information | Command introduced in Junos OS Release 10.4.
Statistics option introduced in Junos OS Release 13.1 |
| Description | Clear all Layer 2 Tunneling Protocol (L2TP) destinations and all tunnels and sessions that belong to the destinations. This command is available only for LAC on MX Series routers. |
| Options | <p>all—Close all L2TP destinations.</p> <p>local-gateway <i>gateway-address</i>—Clear only the L2TP destinations and all tunnels and sessions associated with the specified local gateway address.</p> <p>peer-gateway <i>gateway-address</i>—Clear only the L2TP destinations and all tunnels and sessions associated with the peer gateway with the specified address.</p> |
| Required Privilege Level | clear |

| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services l2tp destination statistics

```
user@host>clear services l2tp destination statistics all
Destination 1 statistics cleared
```

clear services l2tp multilink

| | |
|---------------------------------|---|
| Syntax | clear services l2tp multilink (all <statistics> bundle-id <i>number</i> <statistics> statistics (all bundle-id <i>number</i>)) |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M10i and M7i routers only) Close Layer 2 Tunneling Protocol (L2TP) multilink sessions or clear session statistics. |
| Options | <p>all <statistics>—Close all L2TP multilink sessions or clear statistics for all L2TP multilink sessions.</p> <p>bundle-id <i>number</i> <statistics>—L2TP multilink bundle ID. The value is an internally generated number from 1 to 65535. Close the specified L2TP multilink session, or using the statistics keyword with this option, clear statistics for the specified session.</p> <p>statistics (all bundle-id <i>number</i>)—Clear all session statistics or clear statistics for the specified multilink bundle ID.</p> |
| Required Privilege Level | view |

clear services nat flows

| | |
|---------------------------------|--|
| Syntax | clear services nat flows
<b4address b4address>
<service-set service-set>
<subscriber subscriber-address> |
| Release Information | Command introduced in Junos OS Release 14.1. |
| Description | Clear NAT flows. |
| Options | <p>none—Clear all NAT flows.</p> <p>b4address b4address—(Optional) Clear NAT flows for a particular B4 address.</p> <p>service-set service-set—(Optional) Clear NAT flows for a particular service set.</p> <p>subscriber ip—(Optional) Clear NAT flows for a particular subscriber, identified by IPv4 address.</p> |
| Required Privilege Level | view |
| Related Documentation | |
| List of Sample Output | clear services nat flows subscriber (IPv4 address) on page 1838 |
| Output Fields | Table 54 on page 1838 lists the output fields for the clear services nat flows command. Output fields are listed in the approximate order in which they appear. |

Table 54: clear services nat flows Output Fields

| Field Name | Field Description |
|----------------------|---|
| Interface | Name of a services interface. |
| Service set | Name of the service set from which flows are being cleared. |
| Flows removed | Number of flows removed. |

Sample Output

clear services nat flows subscriber (IPv4 address)

```

user@host> clear services nat flows subscriber ip 3.3.3.3
Interface  Service set  Flows removed

sp-2/0/0   ss1             0

```

Sample Output

clear services nat mappings

| | |
|---------------------------------|--|
| Syntax | clear services nat mappings
<app>
<eim>
<pcp>
<service-set <i>service-set</i> > |
| Release Information | Command introduced in Junos OS Release 14.1. |
| Description | Clear NAT mappings. |
| Options | <p>none—Clear all NAT mappings.</p> <p>app—(Optional) Clear address-pooling paired NAT mappings.</p> <p>eim—(Optional) Clear endpoint-independent NAT mappings.</p> <p>pcp—(Optional) Clear Port Control Protocol NAT mappings.</p> <p>service-set <i>service-set</i>—(Optional) Clear NAT mappings for a specified service set..</p> |

```

clear services stateful-firewall flows

Syntax clear services stateful-firewall flows
<application-protocol *protocol*>
<destination-port *destination-port*>
<destination-prefix *destination-prefix*>
<interface *interface-name*>
<protocol *protocol*>
<service-set *service-set*>
<source-port *source-port*>
<source-prefix *source-prefix*>

Release Information Command introduced before Junos OS Release 7.4.

Description Clear stateful firewall flows. Issue this command to clear the stateful firewall flows for the specified option. The default option is "none", that is, to close all stateful firewall flows unless another option is specified.

Starting in Junos Release 14.1, the method for closing flows has changed. With the change, even for peak flows, the command prompt now returns to an active state after 30 seconds and the clear command completes in 90 to 120 seconds. In previous releases, closing peak flows could take as long as 4 minutes, after which the command prompt would return. Note too that during the first 30 seconds of issuing the command, the flows to be deleted remain visible in the **show services stateful-firewall flows** command output.

Options **none**—Clear all stateful firewall flows.

destination-port *destination-port*—(Optional) Clear stateful firewall flows for a particular destination port. The range of values is 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Clear stateful firewall flows for a particular destination prefix.

interface *interface-name*—(Optional) Clear stateful firewall flows for a particular interface. On M Series and T Series routers, the *interface-name* can be *ms-fpc/pic/port* or *rspnumber*.

protocol—(Optional) Clear stateful firewall flows for one of the following IP types:

- **number**—Numeric protocol value from 0 to 255.
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-over-IP Encapsulation Protocol

- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Clear stateful firewall flows for a particular service set.

source-port *source-port*—(Optional) Clear stateful firewall flows for a particular source port. The range of values is from 0 through 65535.

source-prefix *source-prefix*—(Optional) Clear stateful firewall flows for a particular source prefix.

<service-set *service-set*>
<source-port *source-port*>
<source-prefix *source-prefix*>

Release Information Command introduced in Junos OS Release 7.4.

Description Clear Session Initiation Protocol (SIP) call information in stateful firewall flows.

Options **none**—Clear stateful firewall statistics for all interfaces and all service sets.

application-protocol—(Optional) Clear information about one of the following application protocols:

- **bootp**—(SIP only) Bootstrap protocol
- **dce-rpc**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—(SIP only) Domain Name System protocol
- **exec**—(SIP only) Exec
- **ftp**—(SIP only) File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol
- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol

- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

destination-port *destination-port*—(Optional) Clear information for a particular destination port. The range of values is 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Clear information for a particular destination prefix.

interface *interface-name*—(Optional) Clear information for a particular adaptive services interface. On M Series and T Series routers, the *interface-name* can be **sp-fpc/pic/port** or **rspnumber**.

protocol—(Optional) Clear information about one of the following IP types:

- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ipv6**—IPv6 within IP
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Clear information for a particular service set.

source-port *source-port*—(Optional) Clear information for a particular source port. The range of values is 0 to 65535.

source-prefix *source-prefix*—(Optional) Clear information for a particular source prefix.

|---------------------------------|---|
| Interface | Name of an adaptive services interface. |
| Service set | Name of the service set from which flows are being cleared. |
| SIP registration removed | Number of SIP registers removed. |

Sample Output

clear services stateful-firewall sip-register

```
user@host> clear services stateful-firewall sip-register
Interface  Service set      SIP registration removed
sp-0/3/0   test_sip_777     1
```

clear services stateful-firewall statistics

| | |
|--------------------------|--|
| Syntax | clear services stateful-firewall statistics
<interface <i>interface-name</i> >
<service-set <i>service-set</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Clear stateful firewall statistics. |
| Options | <p>none—Clear stateful firewall statistics for all interfaces and all service sets.</p> <p>interface <i>interface-name</i>—(Optional) Clear stateful firewall statistics for the specified interface. On M Series and T Series routers, the <i>interface-name</i> can be <i>ms-fpc/pic/port</i> or <i>rspnumber</i>.</p> <p>service-set <i>service-set</i>—(Optional) Clear stateful firewall statistics for the specified service set.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none">• show services stateful-firewall statistics on page 2067 |
| List of Sample Output | clear services stateful-firewall statistics on page 1862 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services stateful-firewall statistics

```
user@host> clear services stateful-firewall statistics
```

request interface (revert | switchover) (Adaptive Services)

| | |
|--|--|
| Syntax | request interface (revert switchover) (<i>rspnumber</i> <i>rlsqnumber</i>) |
| Release Information | Command introduced before Junos OS Release 7.4.
Support for rlsq interfaces added in Junos OS Release 7.6. |
| Description | (M Series and T Series routers only) Manually revert to the primary adaptive services interface or link services IQ interface, or to switch from the primary to the secondary interface. |
| <div>  NOTE: All rlsq switchover or revert operations are allowed from the rlsqnumber level only and not for individual channelized interfaces (rlsqnumber:unit). </div> | |
| <p>On an aggregated Ethernet interface with link protection enabled, use the request interface (revert switchover) (Aggregated Ethernet Link Protection) operational command to manually revert egress traffic from the designated backup link to the designated primary link, or to manually switch egress traffic from the primary link to the backup link. For information about this command, see <i>request interface (revert switchover) (Aggregated Ethernet Link Protection)</i>.</p> | |
| Options | <p>(revert switchover)—The revert keyword restores active processing to the primary adaptive services (sp) or link services IQ (lsq) interface. The switchover keyword transfers active processing to the secondary (backup) interface.</p> <p>rspnumber—Redundant adaptive services interface name.</p> <p>rlsqnumber—Redundant link services IQ interface name.</p> |
| Required Privilege Level | view |
| List of Sample Output | request interface revert on page 1863
request interface switchover on page 1863 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request interface revert

```
user@host> request interface revert rlsq0
request succeeded
```

request interface switchover

```
user@host> request interface switchover rlsq0
error: rlsq0: already on secondary
```

request security pki ca-certificate enroll

| | |
|---------------------------------|--|
| Syntax | request security pki ca-certificate enroll ca-profile <i>ca-profile-name</i> |
| Release Information | Command introduced in Junos OS Release 7.5. |
| Description | Request a digital certificate from a certificate authority (CA) online by using the Simple Certificate Enrollment Protocol (SCEP). |
| Options | ca-profile <i>ca-profile-name</i> —CA profile name. |
| Required Privilege Level | maintenance |
| Related Documentation | <ul style="list-style-type: none">• clear security pki ca-certificate on page 1846• show security pki ca-certificate on page 1930 |
| List of Sample Output | request security pki ca-certificate enroll on page 1864 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request security pki ca-certificate enroll

```
user@host> request security pki ca-certificate enroll ca-profile entrust
Received following certificates:
Certificate: C=us, O=juniper, CN=First Officer
Fingerprint: 46:71:15:34:f0:a6:41:76:65:81:33:4f:68:47:c4:df:78:b8:e3:3f
Certificate: C=us, O=juniper, CN=First Officer
Fingerprint: bc:78:87:9b:a7:91:13:20:71:db:ac:b5:56:71:42:ad:1a:b6:46:17
Certificate: C=us, O=juniper
Fingerprint: 00:8e:6f:58:dd:68:bf:25:0a:e3:f9:17:70:d6:61:f3:53:a7:79:10
Do you want to load the above CA certificate ? [yes,no] (no) yes
```

request security pki ca-certificate load

| | |
|---------------------------------|---|
| Syntax | <code>request security pki ca-certificate load ca-profile <i>ca-profile-name</i> filename <i>path/filename</i></code> |
| Release Information | Command introduced in Junos OS Release 7.5. |
| Description | Manually load a certificate authority (CA) digital certificate from a specified location. |
| Options | <p>ca-profile <i>ca-profile-name</i>—Load the specified CA profile.</p> <p>filename <i>path/filename</i>—Directory location and filename of the CA digital certificate.</p> |
| Required Privilege Level | maintenance |
| Related Documentation | <ul style="list-style-type: none"> • clear security pki ca-certificate on page 1846 • show security pki ca-certificate on page 1930 |
| List of Sample Output | request security pki ca-certificate load on page 1865 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request security pki ca-certificate load

```
user@host> request security pki ca-certificate load ca-profile ca-private filename pki-file
```

request security pki ca-certificate verify

| | |
|---------------------------------|---|
| Syntax | <code>request security pki ca-certificate verify ca-profile <i>ca-profile-name</i></code> |
| Release Information | Command introduced in Junos OS Release 8.5. |
| Description | Verify the digital certificate installed for the specified certificate authority (CA). |
| Options | ca-profile <i>ca-profile-name</i> —Name of the local digital certificate identifier. |
| Required Privilege Level | maintenance |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

You receive the following response before the certificate revocation list (CRL) is downloaded:

```
request security pki ca-certificate verify ca-profile ca1 (CRL not downloaded)
user@host> request security pki ca-certificate verify ca-profile ca1
```

```
CA certificate ca1: CRL verification in progress. Please check the PKId debug
logs for completion status
```

request security pki crt load

| | |
|---------------------------------|---|
| Syntax | <code>request security pki crt load ca-profile <i>ca-profile-name</i> filename <i>path/filename</i></code> |
| Release Information | Command introduced in Junos OS Release 8.1. |
| Description | Manually install a certificate revocation list (CRL) on the router from a specified location. |
| Options | <code>ca-profile <i>ca-profile-name</i></code> —Load the specified certificate authority (CA) profile.
<code>filename <i>path/filename</i></code> —Directory location and filename of the CRL. |
| Required Privilege Level | maintenance |
| List of Sample Output | request security pki crt load on page 1867 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request security pki crt load

```
user@host> request security pki crt load ca-profile ca-private filename pki-file
```

request security pki generate-certificate-request

| | |
|---------------------------------|--|
| Syntax | <code>request security pki generate-certificate-request certificate-id <i>certificate-id-name</i>
domain-name <i>domain-name</i> subject <i>subject-distinguished-name</i>
<email <i>email-address</i>>
<filename (<i>path</i> <i>terminal</i>)>
<ip-address <i>ip-address</i>></code> |
| Release Information | Command introduced in Junos OS Release 7.5. |
| Description | Manually generate a local digital certificate request in the Public-Key Cryptography Standards #10 (PKCS-10) format. |
| Options | <p>certificate-id <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p>subject <i>subject-distinguished-name</i>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none">• CN—Common name• OU—Organizational unit name• O—Organization name• ST—State• C—Country <p>email <i>email-address</i>—(Optional) E-mail address of the certificate holder.</p> <p>filename (<i>path</i> <i>terminal</i>)—(Optional) Location where the local digital certificate request should be placed or the login terminal.</p> <p>ip-address <i>ip-address</i>—(Optional) IP address of the router.</p> |
| Required Privilege Level | maintenance |
| Related Documentation | <ul style="list-style-type: none">• clear security pki certificate-request on page 1847• show security pki certificate-request on page 1934 |
| List of Sample Output | request security pki generate-certificate-request on page 1869 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request security pki generate-certificate-request

```
user@host> request security pki generate-certificate-request certificate-id local-entrust2
domain-name router2.juniper.net filename entrust-req2 subject cn=router2.juniper.net
```

request security pki generate-key-pair

| | |
|---------------------------------|---|
| Syntax | request security pki generate-key-pair certificate-id <i>certificate-id-name</i>
<size (512 1024 2048)> |
| Release Information | Command introduced in Junos OS Release 7.5. |
| Description | Generate a Public Key Infrastructure (PKI) public and private key pair for a local digital certificate. |
| Options | certificate-id <i>certificate-id-name</i> —Name of the local digital certificate and the public/private key pair.

size —(Optional) Key pair size. The key pair size can be 512 , 1024 , or 2048 bits. |
| Required Privilege Level | maintenance |
| List of Sample Output | request security pki generate-key-pair on page 1870 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request security pki generate-key-pair

```
user@host> request security pki generate-key-pair certificate-id billy size 2048
Generated key pair billy, key size 2048 bits
```

request security pki local-certificate enroll

| | |
|---------------------------------|--|
| Syntax | request security pki local-certificate enroll <i>ca-profile ca-profile-name</i>
<i>certificate-id certificate-id-name</i> challenge-password <i>password</i> domain-name
<i>domain-name</i> subject <i>subject-distinguished-name</i>
<email <i>email-address</i> >
<ip-address <i>ip-address</i> > |
| Release Information | Command introduced in Junos OS Release 7.5. |
| Description | Request that a certificate authority (CA) enroll and install a local digital certificate online by using the Simple Certificate Enrollment Protocol (SCEP). |
| Options | <p>ca-profile <i>ca-profile-name</i>—CA profile name.</p> <p>certificate-id <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p>challenge-password <i>password</i>—Password set by the administrator and normally obtained from the SCEP enrollment webpage of the CA. The password is 16 characters in length.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p>subject <i>subject-distinguished-name</i>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none"> • CN—Common name • OU—Organizational unit name • O—Organization name • ST—State • C—Country <p>email <i>email-address</i>—(Optional) E-mail address of the certificate holder.</p> <p>ip-address <i>ip-address</i>—(Optional) IP address of the router.</p> |
| Required Privilege Level | maintenance |
| Related Documentation | <ul style="list-style-type: none"> • show security pki local-certificate on page 1938 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

```
user@host> request security pki local-certificate enroll certificate-id r3-entrust-scep ca-profile  
entrust domain-name router3.juniper.net subject "CN=router3,OU=Engineering,O=juniper,C=US"  
challenge-password 123
```

Certificate enrollment has started. To view the status of your enrollment, check the public key infrastructure log (pkid) log file at /var/log/pkid. Please save the challenge-password for revoking this certificate in future. Note that this password is not stored on the router.

request security pki local-certificate generate-self-signed

| | |
|---------------------------------|---|
| Syntax | <code>request security pki local-certificate generate-self-signed certificate-id <i>certificate-id-name</i>
domain-name <i>domain-name</i> ip-address <i>ip-address</i> email <i>email-address</i>
subject <i>subject-distinguished-name</i></code> |
| Release Information | Command introduced in Junos OS Release 9.1. |
| Description | Manually generate a self-signed certificate for the given distinguished name. |
| Options | <p>certificate-id <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p>email <i>email-address</i>—E-mail address of the certificate holder.</p> <p>ip-address <i>ip-address</i>—IP address of the router.</p> <p>subject <i>subject-distinguished-name</i>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none"> • CN—Common name • OU—Organizational unit name • O—Organization name • ST—State • C—Country |
| Required Privilege Level | maintenance
security |
| Related Documentation | <ul style="list-style-type: none"> • show security pki local-certificate on page 1938 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

```
user@host> request security pki local-certificate generate-self-signed certificate-id self-cert
subject cn=abc domain-name juniper.net email mholmes@juniper.net
Self-signed certificate generated and loaded successfully
```

request security pki local-certificate load

| | |
|---------------------------------|---|
| Syntax | <code>request security pki local-certificate load certificate-id <i>certificate-id-name</i> filename <i>path</i></code> |
| Release Information | Command introduced in Junos OS Release 7.5. |
| Description | Manually load a local digital certificate from a specified location. |
| Options | <p>certificate-id <i>certificate-id-name</i>—Name of the public/private key pair mapped to the local digital certificate.</p> <p>filename <i>path/filename</i>—Directory location and filename of the local digital certificate provided by the CA.</p> |
| Required Privilege Level | maintenance |
| List of Sample Output | request security pki local-certificate load on page 1874 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request security pki local-certificate load

```
user@host> request security pki local-certificate load filename /tmp/router2-cert certificate-id
local-entrust2
Local certificate local-entrust2 loaded successfully
```

request security pki local-certificate verify

| | |
|---------------------------------|--|
| Syntax | <code>request security pki local-certificate verify certificate-id <i>certificate-id-name</i></code> |
| Release Information | Command introduced in Junos OS Release 8.5. |
| Description | Verify the validity of the local digital certificate identifier. |
| Options | <code>certificate-id <i>certificate-id-name</i></code> —Display the specified certificate identifier name. |
| Required Privilege Level | maintenance |
| Related Documentation | <ul style="list-style-type: none"> • show security pki local-certificate on page 1938 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

You receive the following response before the certificate revocation list (CRL) is downloaded:

```
request security pki local-certificate verify certificate-id bme1 (not downloaded)
user@host> request security pki local-certificate verify certificate-id bme1
```

```
Local certificate bme1: CRL verification in progress. Please check the PKId debug
logs for completion status
```

You receive the following response after the certificate revocation list (CRL) is downloaded:

```
request security pki local-certificate verify certificate bme1 (downloaded)
user@host> request security pki local-certificate verify certificate-id bme1
Local certificate bme1 verification success
```

request services ipsec-vpn ipsec switch tunnel

| | |
|--------------------------|--|
| Syntax | request services ipsec-vpn ipsec switch tunnel local-gateway <i>address</i> remote-gateway <i>address</i>
<routing-instance <i>instance-name</i> > |
| Release Information | Command introduced before Junos OS Release 7.4.
routing-instance option added in Release 8.1. |
| Description | (Adaptive services interface only) Manually switch between primary and backup IP Security (IPsec) tunnels. |
| Options | local-gateway <i>address</i> —Gateway address of the local system.

remote-gateway <i>address</i> —Gateway address of the remote system.

routing-instance <i>instance-name</i> —(Optional) VRF instance associated with local gateway address. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none">• show services ipsec-vpn ipsec security-associations on page 1965 |
| List of Sample Output | request services ipsec-vpn ipsec switch tunnel on page 1876 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request services ipsec-vpn ipsec switch tunnel

```
user@host> request services ipsec-vpn ipsec switch tunnel local-gateway 10.1.1.1 remote gateway 10.100.10.1
```

show interfaces (Adaptive Services)

| | |
|---------------------------------|--|
| Syntax | <pre>show interfaces <i>interface-type</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display status information about the specified adaptive services interface. |
| Options | <p><i>interface-type</i>—On M Series and T Series routers, the interface type is sp-<i>fpc/pic/port</i>.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p> |
| Required Privilege Level | view |
| List of Sample Output | <p>show interfaces (Adaptive Services) on page 1882</p> <p>show interfaces brief (Adaptive Services) on page 1882</p> <p>show interfaces detail (Adaptive Services) on page 1882</p> <p>show interfaces extensive (Adaptive Services) on page 1883</p> |
| Output Fields | Table 62 on page 1877 lists the output fields for the show interfaces (adaptive services and redundant adaptive services) command. Output fields are listed in the approximate order in which they appear. |

Table 62: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface's index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |

Table 62: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

| Field Name | Field Description | Level of Output |
|--------------------------------|--|------------------------------|
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Type | Encapsulation being used on the interface. | All levels |
| Link-level type | Encapsulation being used on the physical interface. | All levels |
| MTU | MTU size on the physical interface. | All levels |
| Clocking | Reference clock source: can be Internal or External . | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Device flags | Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Link type | Physical interface link type: Full-Duplex or Half-Duplex . | detail extensive none |
| Link flags | Information about the link. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i> . | detail extensive none |
| Physical info | Information about the physical interface. | detail extensive |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Current address | Configured MAC address. | detail extensive none |
| Hardware address | MAC address of the hardware. | detail extensive none |
| Alternate link address | Backup address of the link. | detail extensive none |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) . | detail extensive none |
| Input Rate | Input rate in bits per second (bps) and packets per second (pps). | None specified |
| Output Rate | Output rate in bps and pps. | None specified |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |

Table 62: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

| Field Name | Field Description | Level of Output |
|---------------------------|---|------------------------------|
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | detail extensive |
| Input errors | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Frames received smaller than the runt threshold. • Giants—Frames received larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. | extensive |
| Output errors | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets larger than the MTU threshold. • Resource errors—Sum of transmit drops. | extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

Table 62: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

| Field Name | Field Description | Level of Output |
|-------------------------------|---|------------------------------|
| Flags | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Encapsulation | Encapsulation on the logical interface. | All levels |
| Input packets | Number of packets received on the logical interface. | None specified |
| Output packets | Number of packets transmitted on the logical interface. | None specified |
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the logical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | detail extensive |
| Local statistics | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Transit statistics | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes generally less than 1 second for the counter to stabilize. | detail extensive |
| <i>protocol-family</i> | Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed. | brief |
| Protocol | Protocol family configured on the logical interface, such as iso , inet6 , mpls . | detail extensive none |
| MTU | MTU size on the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route table | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 . | detail extensive |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Addresses, Flags | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |
| Local | IP address of the logical interface. | detail extensive none |

Table 62: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields
(continued)

| Field Name | Field Description | Level of Output |
|-------------------|---|------------------------------|
| Broadcast | Broadcast address. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

Sample Output

show interfaces (Adaptive Services)

```
user@host> show interfaces sp-1/2/0
Physical interface: sp-1/2/0, Enabled, Physical link is Up
  Interface index: 147, SNMP ifIndex: 72
  Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
  Speed: 800mbps
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
  Link type      : Full-Duplex
  Link flags     : None
  Last flapped   : 2006-03-06 11:37:18 PST (00:57:29 ago)
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)

Logical interface sp-1/2/0.16383 (Index 68) (SNMP ifIndex 73)
  Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
  Input packets : 3057
  Output packets: 3044
  Protocol inet, MTU: 9192
  Flags: Receive-options, Receive-TTL-Exceeded
  Addresses, Flags: Is-Preferred Is-Primary
    Destination: 10.0.0.34, Local: 10.0.0.1
```

show interfaces brief (Adaptive Services)

```
user@host> show interfaces sp-1/2/0 brief
Physical interface: sp-1/2/0, Enabled, Physical link is Up
  Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
  Clocking: Unspecified, Speed: 800mbps
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000

Logical interface sp-1/2/0.16383
  Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
  inet 10.0.0.1      --> 10.0.0.34
```

show interfaces detail (Adaptive Services)

```
user@host> show interfaces sp-1/2/0 detail
Physical interface: sp-1/2/0, Enabled, Physical link is Up
  Interface index: 147, SNMP ifIndex: 72, Generation: 30
  Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
  Clocking: Unspecified, Speed: 800mbps
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
  Link type      : Full-Duplex
  Link flags     : None
  Physical info   : Unspecified

show interfaces (Link Services IQ)

| | |
|---------------------------------|--|
| Syntax | <pre>show interfaces lsq-<i>fpc/pic/port</i> <brief detail extensive terse> <descriptions> <l2-statistics> <media> <snmp-index <i>snmp-index</i>> <statistics></pre> |
| Release Information | <p>Command introduced before Junos OS Release 7.4.</p> <p>l2-statistics option introduced with Junos OS Release 12.1.</p> |
| Description | (M Series, MX Series, and T Series routers only) Display status information about the specified link services intelligent queuing (IQ) interface. |
| Options | <p>lsq-<i>fpc/pic/port</i>—Display standard status information about the specified link services IQ interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>l2-statistics—(Optional) Display Layer 2 queue statistics for Multilink Point-to-Point Protocol (MLPPP), FRF.15, and FRF.16 bundles.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p> |
| Additional Information | Link services IQ interfaces are similar to link services interfaces. The important difference is that link services IQ interfaces fully support Junos OS class-of-service (CoS) components. |

Output Fields Table 63 on page 1886 lists the output fields for the **show interfaces** (link services IQ) command. Output fields are listed in the approximate order in which they appear.

Table 63: show interfaces (Link Services IQ) Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| Link-level type | Encapsulation being used on the physical interface:
Multilink-Frame-Relay-UNI-NNI Multilink-Frame-Relay-UNI-NNI (default),
LinkService , Frame-relay , Frame-relay-ccc , or Frame-relay-tcc . | All levels |
| MTU | Maximum transmission unit size on the physical interface. | All levels |
| Device flags | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) . | detail extensive none |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|------------------------------|
| Multilink Frame Relay UNI NNI bundle options | <p>(Multilink Frame Relay UNI NNI only) Configured information about Multilink Frame Relay bundle options.</p> <ul style="list-style-type: none"> • Device type—DCE (data communication equipment) or DTE (data terminal equipment). • MRRU—Configured size of the maximum received reconstructed unit (MRRU): 1500 to 4500 bytes. The default is 1524 bytes. • Bandwidth—Speed at which the interface is running. • Fragmentation threshold—Configured fragmentation threshold: 128 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation. • Red differential delay limit—Red differential delay limit among bundle links has been reached, indicating an action will occur. • Yellow differential delay limit—Yellow differential delay among bundle links has been reached, indicating a warning will occur. • Red differential delay action—Type of actions taken when the red differential delay exceeds the red limit: <i>Disable link transmit</i> or <i>Remove link from service</i>. • Link layer overhead—Percentage of bundle bandwidth to be set aside for link layer overhead. • Reassembly drop timer—Drop timeout value to provide a recovery mechanism if individual links in the link services bundle drop one or more packets: 1 through 127 milliseconds. By default, the drop timeout parameter is 0 (disabled). A value under 5 ms is not recommended. • Links needed to sustain bundle—Minimum number of links to sustain the bundle: 1 through 8. • LIP Hello timer—Link Interleaving Protocol hello timer: 1 through 180 seconds. <ul style="list-style-type: none"> • Acknowledgement timer—Maximum period to wait for an add link acknowledgement, hello acknowledgement, or remove link acknowledgement: 1 through 10 seconds. • Acknowledgement retries—Number of retransmission attempts to be made for consecutive hello or remove link messages after the expiration of the acknowledgement timer: 1 through 5. | detail extensive none |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|---|-----------------------|
| Multilink Frame Relay UNI NNI bundle options (continued) | <ul style="list-style-type: none"> • Bundle class—Bundle class ID. • LMI type—Multilink Frame Relay UNI NNI LMI type: ANSI, Q.933 ANNEX A, or Consortium. <ul style="list-style-type: none"> • T391 LIV polling timer—Multilink Frame Relay UNI NNI Full status polling counter: 1 through 255, with a default value of 6. • T392 polling verification timer—Multilink Frame Relay UNI NNI LMI error threshold. The number of errors required to bring down the link, within the event count specified by <i>N393</i>. The range is 1 through 10, with a default value of 3. • N391 full status polling count—Multilink Frame Relay UNI NNI Full status polling counter: 1 through 255. • N392 error threshold—Multilink Frame Relay UNI NNI LMI error threshold: 1 through 10. • N393 monitored event count—Multilink Frame Relay UNI NNI LMI monitored event count: 1 through 10, with a default value of 4. • Consortium LMI Settings <ul style="list-style-type: none"> • n391dte—DTE full status polling interval in seconds: 1 through 255. • n392dce—DCE error threshold: 1 through 10. • n392dte—DTE error threshold: 1 through 10. • n393dce—DCE monitored event count: 1 through 10. • n393dte—DTE monitored event count: 1 through 10. • t391dte—DTE polling verification timer (in seconds): 5 through 30. • t392dce—DCE polling verification timer (in seconds): 5 through 30. | detail extensive none |
| LMI | <p>Local Management Interface packet statistics:</p> <ul style="list-style-type: none"> • Input—Number of packets arriving on the interface (nn) and timestamp of the most recent packet arrival, in the format:
 Input: nn (last seen hh:mm:ss ago) • Output—Number of packets sent out on the interface (nn) and how much time has passed since the last packet was sent, in the format:
 Output: nn (last seen hh:mm:ss ago) | detail extensive none |
| DTE Statistics | <p>Statistics about information transferred from the data terminal equipment (DTE) to the data communications equipment (DCE).</p> <ul style="list-style-type: none"> • Enquiries sent—Number of link status enquiries sent from the DTE to the DCE. • Full enquiries sent—Number of full enquiries sent from the DTE to the DCE. • Enquiry responses received—Number of enquiry responses received by the DCE from the DTE. • Full enquiry responses received—Number of full enquiry responses received by DCE from the DTE. | detail extensive none |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| DCE Statistics | <p>Statistics about information transferred from the DCE to the DTE.</p> <ul style="list-style-type: none"> • Enquiries received—Number of enquiries received by the DCE from the DTE. • Full enquiries received—Number of full enquiries received by the DCE from the DTE. • Enquiry responses sent—Number of enquiry responses sent from the DCE to the DTE. • Full enquiry responses sent—Number of full enquiry responses sent from the DCE to the DTE. | detail extensive none |
| Common Statistics | <p>Statistics about messages sent between the DTE and the DCE.</p> <ul style="list-style-type: none"> • Unknown messages received—Number of received packets that do not fall into any other category. • Asynchronous updates received—Number of link status peer changes received. • Out-of-sequence packets received—Number of packets for which the sequence of the packets received is different from the expected sequence. • Keepalive responses timed out—Number of keepalive responses that time out when no Local Management Interface (LMI) packet was reported for n392dte or n393dce intervals. (See <i>LMI settings</i>.) | |
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the physical interface. All references to traffic direction (input or output) are defined with respect to the Packet Forwarding Engine (PFE). Input traffic refers to the fragments received by the ingress PFE, which get assembled into Layer 3 input packets. Output packets refer to the IP packets transmitted out of the ingress PFE to the LSQ, which get segmented into output fragments.</p> | detail extensive |
| DLCInn | <p>Data-link connection identifier (DLCI) number of the logical interface. The following information is displayed.</p> <ul style="list-style-type: none"> • Flags—Values are: <ul style="list-style-type: none"> • Active—Set when the link is active and the DTE and DCE are exchanging information. • Down—Set when the link is active, but no information is received from the DTE. • DCE unconfigured—Set when the corresponding DLCI in the DCE is not configured. • Configured—Set when the corresponding DLCCI is configured. • DCE-Configured—Displayed when the command is issued from the DTE. | |
| DLCI Statistics | <p>(Frame Relay) Data-link connection identifier (DLCI) statistics.</p> <ul style="list-style-type: none"> • Active DLCI—Number of active DLCIs. • Inactive DLCI—Number of inactive DLCIs. | |
| Input rate | (Redundant LSQ) Rate of bits and packets received on the interface. | None specified |
| Output rate | (Redundant LSQ) Rate of bits and packets transmitted on the interface. | None specified |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|-------------------------|
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | Number and rate of bytes and packets received and transmitted on the physical interface. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. | detail extensive |
| Frame exceptions | <p>Information about framing exceptions. Includes events recorded under Exception Events for each logical interface.</p> <ul style="list-style-type: none"> • Oversized frames—Number of frames received that exceed maximum frame length. Maximum length is 4500 Kb (kilobits). • Errored input frames—Number of input frame errors. • Input on disabled link/bundle—Number of frames received on disabled links. These frames can result either from an inconsistent configuration, or from a bundle or link being brought up or down with traffic actively flowing through it. • Output for disabled link/bundle—Number of frames sent for a disabled or unavailable link. These frames can result either from an inconsistent configuration, or from a bundle being brought up or down while traffic is flowing through it. • Queuing drops—Total number of packets dropped before traffic enters the link services IQ interface. Indicates that the interface is becoming oversubscribed. | extensive |
| Buffering exceptions | <p>Information about buffering exceptions. Includes events recorded under Exception Events for each logical interface:</p> <ul style="list-style-type: none"> • Packet data buffer overflow—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity. • Fragment data buffer overflow—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. Check the logical interface exception event counters to determine which bundle is responsible. | extensive |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------------|---|------------------------------|
| Assembly exceptions | <p>(Multilink Frame Relay end-to-end only) Information about assembly exceptions. Includes events recorded under Exception Events for each logical interface.</p> <p>An assembly exception does not necessarily indicate an operational problem with the physical link services IQ interface itself. If multilink-encapsulated traffic is dropped or reordered after a sequence number has been assigned, the interface records one or more exception events. The physical interface can drop multilink-encapsulated fragments itself as a result. Any multilink packets or fragments dropped by the interface itself result in packet or fragment drop counts on individual logical interfaces. If the logical interface drop counts are zero, but exception events are seen, the most likely cause is a problem with the individual link interfaces. Even if the logical interface fragment drop counts are nonzero, excess differential delay or traffic losses on individual interfaces can be the root cause.</p> <ul style="list-style-type: none"> • Fragment timeout—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. These events do not necessarily indicate any problem with the operation of the physical link services IQ interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible. • Missing sequence number—A gap was detected in the sequence numbers of fragments on a bundle. These events do not necessarily indicate any problem with the operation of the physical link services IQ interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible. • Out-of-order sequence number—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the link services IQ interface unable to correctly process the resulting stream. Check the logical interface exception event counters to determine which bundle is responsible. • Out-of-range sequence number—Received a frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. Check the logical interface exception event counters to determine which bundle is responsible. | extensive |
| Hardware errors (sticky) | <p>(Multilink Frame Relay end-to-end only) Information about hardware errors:</p> <ul style="list-style-type: none"> • Data memory error—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support. • Control memory error—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support. | extensive |
| Egress queues | Total number of egress queues supported on the specified interface. | detail extensive none |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------|---|------------------------------|
| Queue counters | Queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> Queued packets—Number of queued packets. Transmitted packets—Number of transmitted packets. Dropped packets—Number of packets dropped by the ASIC's RED mechanism. | detail extensive none |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| Flags | Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Encapsulation | Encapsulation being used: PPP or Multilink PPP. | All levels |
| Bandwidth | Speed at which the interface is running. | All levels |
| Bundle options | (Multilink Frame Relay end-to-end interfaces only) <ul style="list-style-type: none"> MRRU—Configured size of the maximum received reconstructed unit (MRRU): 1500 through 4500 bytes. The default is 1504 bytes. Drop timer period—Drop timeout value to provide a recovery mechanism if individual links in link services bundle drop one or more packets: 0 through 2000 milliseconds. Values under 5 ms are not recommended. The default setting is 0, which disables the timer. Sequence number format—Short sequence number header format (MLPPP only). Fragmentation threshold—Configured fragmentation threshold: 64 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation. Links needed to sustain bundle—Minimum number of links to sustain the bundle: 1 through 8. Multilink classes—Number of multilink classes negotiated. Link layer overhead—Percentage of bundle bandwidth to be set aside for link-layer overhead. | detail extensive none |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|---|------------------------------|
| Bundle status
(MLPPP) or
Multilink class status (Multiclass MLPPP) | Information about bundle status: <ul style="list-style-type: none"> • Remote MRRU—MRRU value received from remote peer. If negotiation has not been initiated, the default value is displayed. • Received sequence number—Sequence number for received packets. • Transmitted sequence number—Sequence number for transmitted packets. • Packet drops—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. The packet drop counter is incremented if there is a temporary shortage of packet memory on the AS PIC, which causes packet fragmentation to fail. • Fragment drops—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. This counter also includes fragments that have been received successfully, but had to be dropped because not all fragments that constituted a packet had been received. The fragment drop counter is incremented when a fragment received on constituent links is dropped. Drop fragments can be triggered by sequence ordering errors, duplicate fragments, timed-out fragments, and bad multilink headers. • MRRU exceeded—Number of reassembled packets exceeding the MRRU. This counter is not implemented in this release. • Fragment timeout—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. • Missing sequence number—A gap was detected in the sequence numbers of fragments on a bundle. • Out-of-order sequence number—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream. • Out-of-range sequence number—Received a frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. • Packet data buffer overflow—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity. • Fragment data buffer overflow—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. | detail extensive none |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|---|------------------------------|
| Statistics | <p>Information about fragments and packets received and sent by the router. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. Each field has columns that indicate the number of frames received and transmitted, frames per second (fps), the number of bytes received and transmitted, and bits per second (bps).</p> <ul style="list-style-type: none"> • Bundle—Information for each active bundle link. <ul style="list-style-type: none"> • Fragments: Input and Output—Total number and rate of fragments received and transmitted. • Packets: Input and Output—Total number and rate of packets received and transmitted. • Multilink class—(Multiclass MLPPP only) Information about multiclass links used in the multilink operation. • Link—Information about links used in the multilink operation. <ul style="list-style-type: none"> • Link name—Interface name of the link services IQ channel and state information (physical link up or down). • Input and Output—Total number and rate of fragments and packets received and transmitted. | detail extensive |
| NCP state | <p>(PPP) Network Control Protocol state.</p> <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—NCP negotiation is incomplete (not yet completed or has failed). • Not-configured—NCP is not configured on the interface. • Opened—NCP negotiation is successful. | detail extensive none |
| Protocol | Protocol family configured on the logical interface. | detail extensive none |
| MTU | MTU size on the logical interface. If the MTU value is negotiated down to meet the MRRU requirement on the remote side, this value is marked Adjusted . | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route Table | Routing table in which this address exists. For example, Route table:0 refers to inet.0. | detail extensive |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Addresses, Flags | Information about the addresses configured on the logical interface. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------------|---|------------------------------|
| Local | IP address of the logical interface. | detail extensive none |
| Broadcast | Broadcast address on the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| MLPPP Bundle Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| Flags | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| SNMP-Traps | SNMP trap notifications are enabled. | All levels |
| Encapsulation | Encapsulation being used: PPP, Multilink PPP, or Multilink-FR. | All levels |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: <i>year-month-day hour:minute:second timezone (hour:minute:second ago)</i> . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) . | detail extensive none |
| Bandwidth | Speed at which the interface is running. | All levels |
| Bundle links information | Information about the bundled links. <ul style="list-style-type: none"> • Active bundle links—Number of active links. • Removed bundle links—Information about links used in the multilink operation. • Disabled bundle links—Number of disabled links. | detail extensive none |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-----------------------|--|------------------------------|
| Bundle options | <p>(Multilink Frame Relay end-to-end interfaces only)</p> <ul style="list-style-type: none"> • MRRU—Configured size of the maximum received reconstructed unit (MRRU): 1500 through 4500 bytes. The default is 1504 bytes. • Drop timer period—Drop timeout value to provide a recovery mechanism if individual links in link services bundle drop one or more packets: 0 through 2000 milliseconds. Values under 5 ms are not recommended. The default setting is 0, which disables the timer. • Inner PPP Protocol field compression—Inner PPP protocol compression is enabled or disabled. • Sequence number format—Short sequence number header format (MLPPP only). • Fragmentation threshold—Configured fragmentation threshold: 64 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation. • Links needed to sustain bundle—Minimum number of links to sustain the bundle: 1 through 8. • Multilink classes—Number of multilink classes negotiated. • Link layer overhead—Percentage of bundle bandwidth to be set aside for link-layer overhead. | detail extensive none |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------------|--|------------------------------|
| Bundle status
(MLPPP) | <p>Information about bundle status:</p> <ul style="list-style-type: none"> • Received sequence number—Sequence number for received packets. • Transmit sequence number—Sequence number for transmitted packets. • Packet drops—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. The packet drop counter is incremented if there is a temporary shortage of packet memory on the AS PIC, which causes packet fragmentation to fail. • Fragment drops—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. This counter also includes fragments that have been received successfully but had to be dropped because not all fragments that constituted a packet had been received. The fragment drop counter is incremented when a fragment received on constituent links is dropped. Drop fragments can be triggered by sequence ordering errors, duplicate fragments, timed-out fragments, and bad multilink headers. • MRRU exceeded—Number of reassembled packets exceeding the MRRU. This counter is not implemented in this release. • Fragment timeout—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. • Missing sequence number—A gap was detected in the sequence numbers of fragments on a bundle. • Out-of-order sequence number—Two frames with out-of-order sequence numbers occurred within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream. • Out-of-range sequence number—A frame was received with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. • Packet data buffer overflow—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity. • Fragment data buffer overflow—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. | detail extensive none |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------|--|------------------|
| Statistics | <p>Information about frames, bytes, and bits per second received and sent by the router. All references to traffic direction (input or output) are defined with respect to the router. Each field has columns that indicate the number of frames received and transmitted, frames per second (fps), the number of bytes received and transmitted, and bits per second (bps).</p> <p>The bundle, multilink, and network statistics are reported by the Packet Forwarding Engine (PFE). The Multi Link Detail statistics like fragments, non-fragments and LFI are reported by the PIC.</p> <p>However, the PFE reports an extra overhead of 2 bytes in the output when compared with the Multilink Detail Statistics. This is due to the service-cookie in the PFE which does the link demux for the ML header.</p> <p>The difference in the bytes received and transmitted from Network and Multilink interfaces and Multilink statistics for each member link is divided between the ML and the PPP headers. For example the header counter for a long sequence configuration would be as follows.</p> <ul style="list-style-type: none"> • Input side - Total overhead = 6 bytes. <ul style="list-style-type: none"> • ML: 4 bytes of ML header = 1 byte of Flag + 3 bytes of long sequence number. • PPP: 2 bytes of protocol field. • Output side - Total overhead = 11 bytes. <ul style="list-style-type: none"> • ML: 4 bytes of ML Header = 1 byte of Flag + 3 bytes of Long sequence number. • PPP: 5 bytes = 4 bytes of header + 1 byte of Idle flag. • 2 bytes of Service Cookie. • Bundle—Information for each active bundle link. <ul style="list-style-type: none"> • Multilink: Input and Output—Total number and rate of multilink frames, bytes, and bits per second received and transmitted. It is a module connecting LSQ PIC and its member link. Multilink Input displays L2 fragments received from the member link to the LSQ PIC. Multilink Output displays the L2 fragments transmitted from LSQ PIC to the member links. • Network: Input and Output—Total number of network frames, bytes, and bits per second received and transmitted. It refers to the packets transmitted from an ingress interface to the PFE and then to the LSQ PIC. Network Input displays the L3 packets received from the LSQ PIC to the PFE. Network Output displays the L3 packets transmitted from PFE to LSQ PIC. • Link—Information about links used in the multilink operation. <ul style="list-style-type: none"> • Link name—The interface name of the link services IQ channel and state information (physical link <i>up</i> or <i>down</i>) and up time. • Input and Output—Total number and rate of frames, bytes, and bits per second received and transmitted. | extensive |

Table 63: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|------------------------------------|---|------------------------------|
| Multilink detail statistics | <p>Frames, bytes, and bits per second received and sent by the bundle. All references to traffic direction (input or output) are defined with respect to the router. Each field has columns that indicate the number of frames received and transmitted, frames per second (fps), the number of bytes received and transmitted, and bits per second (bps).</p> <p>The difference in the bytes received and transmitted from the bundle is divided between the ML and the PPP headers. | List of Sample Output | <p>show interfaces (Redundant Link Services IQ) on page 1922</p> <p>show interfaces brief (Redundant Link Services IQ) on page 1922</p> <p>show interfaces detail (Redundant Link Services IQ) on page 1923</p> <p>show interfaces extensive (Redundant Link Services IQ) on page 1924</p> |
| Output Fields | Table 64 on page 1911 lists the output fields for the show interfaces (redundant link services IQ) command. Output fields are listed in the approximate order in which they appear. |

Table 64: show interfaces (Redundant Link Services IQ) Output Fields

| Field Name | Field Description | Level of Output |
|--------------------|-------------------|-----------------|
| Physical Interface | | |

Table 64: show interfaces (Redundant Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|--|------------------------------|
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the "Enabled Field" section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface's index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| Link-level type | Encapsulation being used on the physical interface:
Multilink-Frame-Relay-UNI-NNI (default), LinkService , Frame-relay , Frame-relay-ccc , or Frame-relay-tcc . | All levels |
| MTU | Maximum transmission unit size on the physical interface. | All levels |
| Device flags | Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) . | detail extensive none |
| Input rate | (Redundant LSQ) Rate of bits and packets received on the interface. | None specified |
| Output rate | (Redundant LSQ) Rate of bits and packets transmitted on the interface. | None specified |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | Number and rate of bytes and packets received and transmitted on the physical interface. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. | detail extensive |

Table 64: show interfaces (Redundant Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-----------------------------|---|------------------|
| Frame exceptions | <p>Information about framing exceptions. Includes events recorded under Exception Events for each logical interface.</p> <ul style="list-style-type: none"> • Oversized frames—Number of frames received that exceed maximum frame length. Maximum length is 4500 Kb (kilobits). • Errored input frames—Number of input frame errors. • Input on disabled link/bundle—Number of frames received on disabled links. These frames can result either from an inconsistent configuration, or from a bundle or link being brought up or down with traffic actively flowing through it. • Output for disabled link/bundle—Number of frames sent for a disabled or unavailable link. These frames can result either from an inconsistent configuration, or from a bundle being brought up or down while traffic is flowing through it. • Queuing drops—Total number of packets dropped before traffic enters the link services IQ interface. Indicates that the interface is becoming oversubscribed. | extensive |
| Buffering exceptions | <p>Information about buffering exceptions. Includes events recorded under Exception Events for each logical interface:</p> <ul style="list-style-type: none"> • Packet data buffer overflow—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity. • Fragment data buffer overflow—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. Check the logical interface exception event counters to determine which bundle is responsible. | extensive |

Table 64: show interfaces (Redundant Link Services IQ) Output Fields (continued)

| Field Name | Field Description | Level of Output |
|---------------------------------|---|------------------------------|
| Assembly exceptions | <p>(Multilink Frame Relay end-to-end only) Information about assembly exceptions. Includes events recorded under Exception Events for each logical interface.</p> <p>An assembly exception does not necessarily indicate an operational problem with the physical link services IQ interface itself. If multilink-encapsulated traffic is dropped or reordered after a sequence number has been assigned, the interface records one or more exception events. The physical interface can drop multilink-encapsulated fragments itself as a result. Any multilink packets or fragments dropped by the interface itself result in packet or fragment drop counts on individual logical interfaces. If the logical interface drop counts are zero, but exception events are seen, the most likely cause is a problem with the individual link interfaces. Even if the logical interface fragment drop counts are nonzero, excess differential delay or traffic losses on individual interfaces can be the root cause.</p> <ul style="list-style-type: none"> • Fragment timeout—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. These events do not necessarily indicate any problem with the operation of the physical link services IQ interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible. • Missing sequence number—A gap was detected in the sequence numbers of fragments on a bundle. These events do not necessarily indicate any problem with the operation of the physical link services IQ interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible. • Out-of-order sequence number—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the link services IQ interface unable to correctly process the resulting stream. Check the logical interface exception event counters to determine which bundle is responsible. • Out-of-range sequence number—Received a frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. Check the logical interface exception event counters to determine which bundle is responsible. | extensive |
| Hardware errors (sticky) | <p>(Multilink Frame Relay end-to-end only) Information about hardware errors:</p> <ul style="list-style-type: none"> • Data memory error—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support. • Control memory error—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support. | extensive |
| Egress queues | Total number of egress queues supported on the specified interface. | detail extensive none |

Table 64: show interfaces (Redundant Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------|---|------------------------------|
| Queue counters | Queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. | detail extensive none |
| Logical Interface | | |
| Logical interface | Name of the logical interface | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support | detail extensive |
| Flags | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Encapsulation | Encapsulation being used: PPP or Multilink PPP. | All levels |
| Bandwidth | Speed at which the interface is running. | All levels |
| Bundle options | (Multilink Frame Relay end-to-end interfaces only) <ul style="list-style-type: none"> • MRRU—Configured size of the maximum received reconstructed unit (MRRU): 1500 through 4500 bytes. The default is 1504 bytes. • Drop timer period—Drop timeout value to provide a recovery mechanism if individual links in link services bundle drop one or more packets: 0 through 2000 milliseconds. Values under 5 ms are not recommended. The default setting is 0, which disables the timer. • Sequence number format—Short sequence number header format (MLPPP only). • Fragmentation threshold—Configured fragmentation threshold: 64 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation. • Links needed to sustain bundle—Minimum number of links to sustain the bundle: 1 through 8. • Multilink classes—Number of multilink classes negotiated. • Link layer overhead—Percentage of bundle bandwidth to be set aside for link-layer overhead. | detail extensive none |

Table 64: show interfaces (Redundant Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|-----------------------|
| Bundle status
(MLPPP) or
Multilink class status
(MC-MLPPP) | Information about bundle status: <ul style="list-style-type: none"> • Remote MRRU—MRRU value received from remote peer. If negotiation has not been initiated, the default value is displayed. • Received sequence number—Sequence number for received packets. • Transmitted sequence number—Sequence number for transmitted packets. • Packet drops—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. The packet drop counter is incremented if there is a temporary shortage of packet memory on the AS PIC, which causes packet fragmentation to fail. • Fragment drops—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. This counter also includes fragments that have been received successfully but had to be dropped because not all fragments that constituted a packet had been received. The fragment drop counter is incremented when a fragment received on constituent links is dropped. Drop fragments can be triggered by sequence ordering errors, duplicate fragments, timed-out fragments, and bad multilink headers. • MRRU exceeded—Number of reassembled packets exceeding the MRRU. This counter is not implemented in this release. • Fragment timeout—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. • Missing sequence number—A gap was detected in the sequence numbers of fragments on a bundle. • Out-of-order sequence number—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream. • Out-of-range sequence number—Received a frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. • Packet data buffer overflow—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity. • Fragment data buffer overflow—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. | detail extensive none |

Table 64: show interfaces (Redundant Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|---|------------------------------|
| Statistics | <p>Information about fragments and packets received and sent by the router. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. Each field has columns that indicate the number of frames received and transmitted, frames per second (fps), the number of bytes received and transmitted, and bits per second (bps).</p> <ul style="list-style-type: none"> • Bundle—Information for each active bundle link. <ul style="list-style-type: none"> • Fragments: Input and Output—Total number and rate of fragments received and transmitted. • Packets: Input and Output—Total number and rate of packets received and transmitted. • Multilink class—(MC-MLPPP only) Information about multiclass links used in the multilink operation. • Link—Information about links used in the multilink operation. <ul style="list-style-type: none"> • Link name—Interface name of the link services IQ channel and state information (physical link up or down). • Input and Output—Total number and rate of fragments and packets received and transmitted. | detail extensive |
| NCP state | <p>(PPP) Network Control Protocol state.</p> <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—NCP negotiation is incomplete (not yet completed or has failed). • Not-configured—NCP is not configured on the interface. • Opened—NCP negotiation is successful. | detail extensive none |
| Protocol | Protocol family configured on the logical interface. | detail extensive none |
| MTU | MTU size on the logical interface. If the MTU value is negotiated down to meet the MRRU requirement on the remote side, this value is marked Adjusted . | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route Table | Routing table in which this address exists. For example, Route table:0 refers to inet.0. | detail extensive |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Addresses, Flags | Information about the addresses configured on the logical interface. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |

Table 64: show interfaces (Redundant Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |

[show interfaces extensive \(Redundant Link Services IQ\)](#)

The output for the **show interfaces rlsq extensive** command is identical to that for the **show interfaces rlsq detail** command. For sample output, see [show interfaces detail \(Redundant Link Services IQ\) on page 1923](#).

show interfaces load-balancing

| | |
|---------------------------------|---|
| Syntax | show interfaces load-balancing
<detail> |
| Release Information | Command introduced in Junos OS Release 11.4. |
| Description | Display status information about load balancing on aggregated Multiservices (AMS) interfaces. |
| Options | none —Display standard information about status of all AMS interfaces.
detail —(Optional) Display detailed status of all AMS interfaces. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • Understanding Aggregated Multiservices Interfaces on page 599 • Example: Configuring an Aggregated Multiservices Interface (AMS) on page 608 |
| List of Sample Output | show interfaces load-balancing on page 1927
show interfaces load-balancing detail on page 1927 |
| Output Fields | Table 65 on page 1925 lists the output fields for the show interfaces load-balancing (aggregated Multiservices interfaces) command. Output fields are listed in the approximate order in which they appear. |

Table 65: Aggregated Multiservices show interfaces load-balancing Output Fields

| Field Name | Field Description | Level of Output |
|--------------------------|--|-----------------|
| Interface | Name of the aggregated Multiservices (AMS) interface. | All levels |
| State | Status of AMS interfaces: <ul style="list-style-type: none"> • Up—Interface is configured and operational. • Coming Up—Interface is becoming operational. • Wait Timer—Interface is waiting for member interfaces (mams) to come online. • Members Seen—Member interfaces (mams) are available. • Wait for Members—Member interfaces (mams) are not available. | All levels |
| Last change | Time elapsed since the last change to the interface. Changes that affect the elapsed time displayed include internal events that may not have changed the state of the member | All levels |
| Member count | Number of member PICs (mams) that are part of the aggregated interface. | All levels |
| Members interface | List of all member PICs (mams) that are part of the aggregated interface. | detail |

Table 65: Aggregated Multiservices show interfaces load-balancing Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------|---|-----------------|
| Weight | Weight associated with each member PIC for load balancing. The minimum weight is 1, maximum weight is 100; default weight is 10. | detail |
| State | Status of each member PIC (mams) : <ul style="list-style-type: none">• Invalid—Configured interface is not valid.• Down—Interface is not operational.• Active—Interface is configured and operational.• Discard—Interface has been discarded.• Inactive—Configured interface is not online.• Backup—Interface has been configured as backup. | detail |

Sample Output

show interfaces load-balancing

```

show interfaces redundancy

| | |
|---------------------------------|--|
| Syntax | show interfaces redundancy
<brief detail> |
| Release Information | Command introduced before Junos OS Release 7.4.
detail option added in Junos OS Release 10.0. |
| Description | (M Series, T Series, and MX Series routers only) Display general information about adaptive services and link services intelligent queuing (IQ) interfaces and aggregated Ethernet interfaces redundancy. |
| | <div>  <p>NOTE: When you run the show interfaces redundancy command on an MX80 router, it displays the error message, error:the redundancy-interface-process subsystem is not running. This is because an MX80 router does not have a redundant FPC and does not support link protection.</p> </div> |
| Options | brief detail —(Optional) Display the specified level of output. |
| Required Privilege Level | view |
| List of Sample Output | show interfaces redundancy on page 1929
show interfaces redundancy (Aggregated Ethernet) on page 1929
show interfaces redundancy detail on page 1929 |
| Output Fields | Table 66 on page 1928 lists the output fields for the show interfaces redundancy command. Output fields are listed in the approximate order in which they appear. |

Table 66: show interfaces redundancy Output Fields

| Field Name | Field Description | Level of Output |
|--------------------|---|-----------------|
| Interface | Name of the redundant adaptive services, link services IQ interfaces, or aggregated Ethernet interfaces. | All levels |
| State | State of the redundant interface: Not present , On primary , On secondary or Waiting for primary MS PIC . | All levels |
| Last Change | <p>Timestamp for the last change in status. This value resets after a master Routing Engine switchover event if any of the following conditions is met:</p> <ul style="list-style-type: none"> • GRES is not configured on the router. • The rlsq interface is configured without the hot-standby or warm-standby statements and the backup lsq interface was active before the switchover. • No logical interfaces are configured or all of the configured logical interfaces are down at the time of the switchover. | All levels |

Table 66: show interfaces redundancy Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-----------------------|---|-----------------|
| Primary | Name of the interface configured to be the primary interface. | All levels |
| Secondary | Name of the interface configured to be the backup interface. | All levels |
| Current Status | Physical status of the primary and secondary interfaces. | All levels |
| Mode | Standby mode. | detail |

Sample Output

show interfaces redundancy

```

user@host> show interfaces redundancy
Interface  State           Last change  Primary    Secondary   Current status
rsp0       Not present                    sp-1/0/0   sp-0/2/0   both down
rsp1       On secondary    1d 23:56    sp-1/2/0   sp-0/3/0   primary down
rsp2       On primary      10:10:27    sp-1/3/0   sp-0/2/0   secondary down

show security pki ca-certificate

| | |
|---------------------------------|--|
| Syntax | show security pki ca-certificate
<brief detail>
<ca-profile <i>ca-profile-name</i> > |
| Release Information | Command introduced in Junos OS Release 7.5. |
| Description | Display information about certificate authority (CA) digital certificates installed in the router. |
| Options | <p>none—(Same as brief) Display information about all CA digital certificates.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>ca-profile <i>ca-profile-name</i>—(Optional) Display information about only the specified CA profile.</p> |
| Required Privilege Level | view |
| List of Sample Output | show security pki ca-certificate on page 1931
show security pki ca-certificate detail on page 1932 |
| Output Fields | Table 67 on page 1930 lists the output fields for the show security pki ca-certificate command. Output fields are listed in the approximate order in which they appear. |

Table 67: show security pki ca-certificate Output Fields

| Field Name | Field Description | Level of Output |
|-------------------------------|---|-------------------|
| Certificate identifier | Name of the digital certificate. | All levels |
| Certificate version | Revision number of the digital certificate. | detail |
| Serial number | Unique serial number of the digital certificate. | detail |
| Issued by | Authority that issued the digital certificate. | none brief |
| Issued to | Device that was issued the digital certificate. | none brief |
| Issuer | <p>Authority that issued the digital certificate, including details of the authority organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> • Common name—Name of the authority. • Organization—Organization of origin. • Organizational unit—Department within an organization. • State—State of origin. • Country—Country of origin. | detail |

Table 67: show security pki ca-certificate Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-----------------------------|--|-----------------|
| Subject | Details of the digital certificate holder organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> • Common name—Name of the requestor. • Organization—Organization of origin. • Organizational unit—Department within an organization. • State—State of origin. • Country—Country of origin. | detail |
| Validity | Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> • Not before—Start time when the digital certificate becomes valid. • Not after—End time when the digital certificate becomes invalid. | All levels |
| Public key algorithm | Encryption algorithm used with the private key, such as rsaEncryption(1024 bits) . | All levels |
| Signature algorithm | Encryption algorithm that the CA used to sign the digital certificate, such as sha1WithRSAEncryption . | detail |
| Fingerprint | Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate. | detail |
| Distribution CRL | Distinguished name information and the URL for the certificate revocation list (CRL) server. | detail |
| Use for key | Use of the public key, such as Certificate signing , CRL signing , Digital signature , or Key encipherment . | detail |

Sample Output

show services cos statistics detail on page 1943
show services cos statistics extensive on page 1943 |
| Output Fields | Table 71 on page 1941 describes the output fields for the show services cos statistics command. Output fields are listed in the approximate order in which they appear. |

Table 71: show services cos statistics Output Fields

| Field Name | Field Description | Level of Output |
|--------------------|----------------------------------|-----------------|
| Interface | Name of interface. | All levels |
| Service set | Name of service set. | All levels |
| DSCP | DiffServ code point bit pattern. | All levels |
| Packets in | Number of packets received. | All levels |

Table 71: show services cos statistics Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|--------------------------------|-----------------|
| Packets out | Number of packets transmitted. | All levels |
| Forwarding class | Forwarding class queue number. | All levels |

Sample Output

show services cos statistics

```

user@host> show services cos statistics
Interface: sp-1/0/0, Service set: scos
DSCP          Packets in      Packets out
000000          0             0

show services cos statistics brief

The output for the **show services cos statistics brief** command is identical to that for the **show services cos statistics** command.

show services cos statistics detail

The output for the **show services cos statistics detail** command is identical to that for the **show services cos statistics** command.

show services cos statistics extensive

The output for the **show services cos statistics extensive** command is identical to that for the **show services cos statistics** command.

show services crtp

| | |
|---------------------------------|---|
| Syntax | show services crtp
<extensive>
<interface <i>interface-name</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display Compressed Real-Time Transport Protocol (CRTP) extensive output. |
| Options | <p>none—Display CRTP extensive output for all interfaces.</p> <p>extensive—(Optional) Display extensive CRTP information.</p> <p>interface <i>interface-name</i>—(Optional) Display CRTP flow statistics for the specified interface. On M Series and T Series routers, a link services IQ (lsq-fpc/pic/port) or redundant link services IQ (rlsq-fpc/pic/port) interface.</p> |
| Required Privilege Level | view |
| List of Sample Output | show services crtp extensive on page 1945 |
| Output Fields | Table 72 on page 1944 lists the output fields for the show services crtp command. Output fields are listed in the approximate order in which they appear. |

Table 72: show services crtp Output Fields

| Field Name | Field Description |
|---------------------------------|--|
| Interface | Name of the physical interface. |
| Port minimum
Port maximum | Compression is applied to UDP packets with even ports in the specified range. |
| Maximum UDP compressed sessions | Maximum value of a context identifier in the space of context identifiers allocated for UDP. |
| CRTP maximum period | Maximum interval between full headers. Suggested value is 256. |
| CRTP maximum time | Maximum time interval between full headers. Suggested value is 5 seconds. |
| Compression ratio | Ratio of received packet size to compressed packet size, in percentage. For example, if the packet size is 100 bytes when it is received, and is 40 bytes after compression, the compression ratio is $100 \div 40 / 100 * 100 = 60\%$. |
| Decompression ratio | Ratio of received packet size to decompressed packet size, in percentage. For example, if the packet size is 40 bytes when it is received, and is 100 bytes after compression, the decompression ratio is $100 \div 40 / 100 * 100 = 60\%$. |

Table 72: show services crtp Output Fields (*continued*)

| Field Name | Field Description |
|-----------------------------|--|
| Discards | Number of frames that the incoming packet match code discarded because they were not recognized. |
| Sessions | Total number of active CRTP sessions. |
| IP bytes | Number of IP bytes sent and received. |
| Compressed bytes | Number of compressed IP header bytes sent and received. |
| CRTP packets | Number of CRTP packets sent and received. |
| CUDP/CNTCP packets | Number of compressed UDP packets and compressed non-TCP packets sent and received. |
| Full header packets | Number of full header packets sent and received. Full header packets communicate the uncompressed IP header plus any following headers and data to establish the uncompressed header state in the decompressor for a particular context. |
| Context state packet | Number of context state packets sent and received. Context state packets are sent from the decompressor to the compressor to communicate a list of context IDs for which synchronization is lost or might be lost. |
| IP packets | Number of IP packets sent and received. |
| Compressed packets | Number of compressed packets sent and received. |

Sample Output

show services crtp extensive

```

user@host> show services crtp extensive
Interface: lsq-1/1/0.1
  Port minimum: 2000, Port maximum: 64009
  Maximum UDP compressed sessions: 256
  CRTP maximum period: 256, CRTP maximum time: 5
  Compression ratio: 0, Decompression ratio: 0, Discards: 0
  CRTP stats
    Receive      Transmit
  Sessions           1           1
  IP bytes           60           60
  Compressed bytes   61           60
  CRTP packets       0           0
  CUDP/CNTCP packets 0           0
  Full header packets 1           1
  Context state packets 0           0
  IP packets         1           1
  Compressed packets 1           1

```

show services crtp flows

| | |
|---------------------------------|---|
| Syntax | show services crtp flows
<interface <i>interface-name</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display Compressed Real-Time Transport Protocol (CRTP) flows. |
| Options | <p>none—Display CRTP flows for all interfaces.</p> <p>interface <i>interface-name</i>—(Optional) Display CRTP flows for the specified interface. On M Series and T Series routers, a link services IQ (lsq-<i>fpc/pic/port</i>) or redundant link services IQ (rlsq-<i>fpc/pic/port</i>) interface.</p> |
| Required Privilege Level | view |
| List of Sample Output | show services crtp flows on page 1946 |
| Output Fields | Table 73 on page 1946 lists the output fields for the show services crtp flows command. Output fields are listed in the approximate order in which they appear. |

Table 73: show services crtp flows Output Fields

| Field Name | Field Description |
|--------------------|---|
| Interface | Name of the physical interface. |
| Flow | Received or transmitted flow. |
| Source | IP source address. |
| Destination | IP destination address. |
| SSRC ID | Synchronization source (SSRC) identifier. One of the fields in the RTP header used to select the context. The SSRC identifier is a randomly chosen value unique within a particular CRTP session. |
| Ctx ID | Session context ID. Indicates the session context in which to interpret the packet. The decompressor can use the context ID to index its table of stored session contexts directly. |

Sample Output

show services crtp flows

```

user@host> show services crtp flows
Interface: lsq-1/1/0.1
  Flow      Source           Destination      SSRC ID  Ctx ID
  Receive   60.1.1.3:28004      80.1.1.3:26000   123      0
  Transmit  80.1.1.3:26000      60.1.1.3:28004   123      2

```

show services ids

Syntax show services ids (destination-table | pair-table | source-table)
<brief | extensive | terse>
<destination-prefix *destination-prefix-name*>
<interface *interface-name*>
<limit *number*>
<order (anomalies | bytes | flows | packets)>
<service-set *service-set-name*>
<source-prefix *source-prefix-name*>
<threshold *number*>

Release Information Command introduced before Junos OS Release 7.4.

Description Display information about intrusion detection service (IDS) events. All events gathered by IDS are reported as anomalies. For example, events such as **create forward or watch flow**, **FTP passive**, and **FTP active** are genuinely allowed by the stateful firewall but are logged as anomalies to track the rates and number for these events.

Options **destination-table**—Display information for an address under possible attack.

pair-table—Display information for a particular suspected attack source and destination address pair.

source-table—Display information for an address that is a suspected attacker.

brief | extensive | terse—(Optional) Display the specified level of output.

destination-prefix *destination-prefix-name*—(Optional) Display information for a particular destination prefix.

interface *interface-name*—(Optional) On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port* or *rspnumber*.

limit *number*—(Optional) Maximum number of entries to display. By default, all tables display the top 32 entries sorted by the number of events for the criteria chosen. To display additional entries, configure the limit option to set up to 256 entries.

order—(Optional) Display events according to one of the following table-ordering criteria. The default is anomalies.

- **anomalies**—Display information for particular anomalies.
- **bytes**—Order output by number of bytes received.
- **flows**—Order output by number of flows.
- **packets**—Order output by number of packets received.

service-set *service-set-name*—(Optional) Display information about a particular service set.

source-prefix *source-prefix-name*—(Optional) Display information about a particular source prefix.

threshold *number*—(Optional) Limit the display to events with this number of anomalies, bytes, flows, or packets, whichever criterion you specify for order. For example, to display all events with more than 100 flows, specify order flows and threshold 100.

Required Privilege Level view

Output Fields [Table 74 on page 1949](#) lists the output fields for the **show services ids** command. Output fields are listed in the approximate order in which they appear.

Table 74: show services ids Output Fields

| Field Name | Field Description | Output Level |
|-----------------------|--|--------------|
| Interface | Name of an adaptive services interface. | All levels |
| Service set | Name of a service set. Individual empty service sets are not displayed, but if no service set has any flows, a flow table header is printed for each service set. | All levels |
| Sorting order | Primary mode to display information: Anomalies , Bytes , Flows , or Packets . | All levels |
| Source address | Name of the source address. | All levels |
| Dest address | Name of the destination address. | All levels |
| Time | Total time the information has been in the table. | All levels |
| Flags | Flags can be Forced , F (terse output only), SYNcookie , S (terse output only), Forced+SYNcookie , and F+S (terse output only). The SYNcookie flag is visible only in the destination table. | All levels |
| Application | Configured application, such as FTP or Telnet . | All levels |
| Bytes | Total number of bytes sent from the source to the destination address, in thousands (k) or millions (m). | All levels |
| Packets | Total number of packets sent from the source to the destination address, in thousands (k) or millions (m). | All levels |
| Flows | Total number of flows of packets sent from the source to the destination address, in thousands (k) or millions (m). | All levels |

Table 74: show services ids Output Fields (*continued*)

| Field Name | Field Description | Output Level |
|----------------------------|---|------------------|
| Anomalies | Total number of packets in the anomaly table, in thousands (k) or millions (m). | All levels |
| Anomaly description | <p>One or more of the following types of anomalies. For more information, see the detailed descriptions in the stateful firewall section of the <i>Junos OS System Log Messages Reference</i>.</p> <ul style="list-style-type: none"> • First packet of TCP session not SYN • ICMP echo request dropped, because sequence number duplicated • ICMP echo reply dropped. No matching sequence number • ICMP echo request dropped. Too many echo requests without echo reply • ICMP header length check failed • ICMP packet length greater than 64K • IP fragment assembly timeout • IP fragment length error • IP fragment overlap • IP packet length greater than 64K • IP packet too short • IP packet with broadcast destination address • IP packet with checksum error • IP packet with incorrect length • IP packet with TTL equal to 0 | extensive |

Table 74: show services ids Output Fields (*continued*)

| Field Name | Field Description | Output Level |
|------------------------------------|--|--------------|
| Anomaly description
(continued) | <ul style="list-style-type: none"> • IP packet with version other than 4 • Land attack (IP src address = dest address) • No matching SFW rule; attempting to create discard flow • Number of open sessions exceeds IDS limit; packet dropped • Packet rate exceeds IDS limit; packet dropped • Session creation rate exceeds IDS limit; packet dropped • SFW application message too long • SFW discard packet contains non-configured IP option types • SFW drop packet because of discard flow • SFW dropped TCP watch packet • SFW rules request FTP active mode data packets to be accepted; attempting to create forward flow • SFW rules request FTP passive mode data packets to be accepted; attempting to create forward flow • SFW rules request packet to be accepted; attempting to create forward or watch flow • SFW rules request packet to be discarded; attempting to create discard flow • SFW rules request packet to be rejected; attempting to create reject flow • SFW discard flow requires packet to be dropped • SFW SYN defense • Smurf attack (ping to IP broadcast address) • TCP FIN/RST or SYN/(URG FIN RST) flags set • TCP header length check failed • TCP port scan (port not in LISTEN state) • TCP seq number zero and FIN/PSH/RST flags set • TCP seq number zero and no flags set • TCP source or destination port zero • TCP SYN flood attack • UDP header length check failed • UDP port scan (port not in LISTEN state) • UDP source or destination port zero | extensive |
| Count | Number of times that a particular anomaly occurred, in thousands (k) or millions (M). | extensive |
| Rate (eps) | Anomaly events per second. The IDS subsystem attempts to maintain a weighted average of rates, which might not reflect the exact incoming rate of attack at low rates. However, at high rates exceeding 160 events per second, the rates generally match. | extensive |
| Elapsed | Time since the same type of event last occurred. | extensive |
| Total IDS table entries | Number of entries in the IDS table. This number is not necessarily the sum of all entries displayed. | All levels |

Table 74: show services ids Output Fields (*continued*)

| Field Name | Field Description | Output Level |
|--|---|--------------|
| Total failed IDS table entry insertions | Number of IDS entries not allowed into the table because the table was full | All levels |
| Total number of events (closed flows and anomalies detected) | Total number of events since the system was started or since the show ids services command was executed. | All levels |

Sample Output

show services ids destination-table

```

user@host> show services ids destination-table

show services inline nat pool

| | |
|---------------------------------|---|
| Syntax | <code>show services inline nat pool</code>
<code><pool <i>pool--name</i>></code> |
| Release Information | Command introduced in Junos OS Release 11.4. |
| Description | Display information about inline Network Address Translation (NAT) pool. |
| Options | <i>pool-name</i> —Display information about the specified services-inline interface NAT pool. |
| Required Privilege Level | view |
| List of Sample Output | show services inline nat pool on page 1956 |
| Output Fields | Table 75 on page 1956 lists the output fields for the <code>show services inline nat pool</code> command. Output fields are listed in the order in which they appear. |

Table 75: show services inline nat pool Output Fields

| Field Name | Field Description |
|-------------------------|--|
| Interface | Name of an <code>si</code> interface hosted on a Trio-based line card. |
| NAT pool | Name of the pool used for address translations. |
| Translation type | Translation type specified in the applicable NAT rule for the service set. |
| Address range | Starting and ending public NAT addresses available for translation. |
| NATed packets | Number of packets translated for the specified pool. |
| un-NATed packets | Number of received packets that were not translated. |
| Errors | Number of packets with translation errors. |

Sample Output

show services inline nat pool

```

user@host> show services inline nat pool p1
Interface: si-5/0/0, Service set: ss-inat
NAT pool: p1, Translation type: BASIC NAT44
Address range: 20.20.20.0-20.20.20.255
NATed packets: 0, Un-NATed packets: 0, Errors: 0

```

show services inline nat statistics

| | |
|---------------------------------|---|
| Syntax | <code>show services inline nat statistics</code>
<code><interface <i>interface-name</i>></code> |
| Release Information | Command introduced in Junos OS Release 11.4. |
| Description | Display information about inline Network Address Translation (NAT) address translations. |
| Options | <i>interface-name</i> —(Optional) Display information about the specified NAT services-inline interface only. When a specific interface is not specified, statistics for all services-inline interfaces are shown. |
| Required Privilege Level | view |
| List of Sample Output | show services inline nat statistics on page 1957 |
| Output Fields | Table 76 on page 1957 lists the output fields for the show services inline nat statistics command. Output fields are listed in the order in which they appear. |

Table 76: show services inline nat statistics Output Fields

| Field Name | Field Description | Level of Output |
|-----------------------------------|--|-----------------|
| Service PIC | Name of an si interface hosted on a Trio-based line card. | All levels |
| Slow path packets received | Number of ICMP exception packets received for NAT translation. | All levels |
| Slow path packets dropped | Number of received ICMP exception packets that were dropped. | All levels |

Sample Output

show services inline nat statistics

```

user@host> show services inline nat statistics
Service PIC Name                               :si-5/0/0

Slow path packets received                     :0
Slow path packets dropped                      :0

```

show services ipsec-vpn certificates

| | |
|---------------------------------|--|
| Syntax | <code>show services ipsec-vpn certificates</code>
<code><brief detail></code>
<code><service-set service-set></code> |
| Release Information | Command introduced in Junos OS Release 7.5. |
| Description | (Adaptive services interfaces only) Display local and remote certificates installed in the IPsec configuration memory cache that are used for the IKE negotiation. |
| Options | <p>none—(same as brief) Display information about local and remote certificates associated with all service sets.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>service-set service-set—(Optional) Display information about local and remote certificates associated with only the specified service set.</p> |
| Required Privilege Level | view |
| List of Sample Output | show security ipsec-vpn certificates on page 1959
show security ipsec-vpn certificates detail on page 1959 |
| Output Fields | Table 77 on page 1958 lists the output fields for the show services ipsec-vpn certificates command. Output fields are listed in the approximate order in which they appear. |

Table 77: show services ipsec-vpn certificates Output Fields

| Field Name | Field Description | Level of Output |
|--------------------------------|---|-------------------|
| Service set | Name of the IPsec service set. | All levels |
| Total entries | Number of certificate cache entries. | All levels |
| Certificate cache entry | Identification number of the certificate cache entry. | All levels |
| Flags | Information about the digital certificate, including whether the certificate is a root certificate and trusted. | none brief |
| Issued to | Device that was issued the digital certificate. | none brief |
| Issued by | Authority that issued the digital certificate. | none brief |
| Certificate version | Revision number of the digital certificate. | detail |
| Serial number | Unique serial number of the digital certificate. | detail |
| Alternate subject | Domain name or IP address of the device related to the digital certificate. | All levels |

Table 77: show services ipsec-vpn certificates Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|----------------------|--|-------------------|
| Validity | Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> • Not before—Start time when the digital certificate becomes valid. • Not after—End time when the digital certificate becomes invalid. | none brief |
| Public key algorithm | Specifies the encryption algorithm used with the private key, such as rsaEncryption (1024 bits) . | detail |
| Signature algorithm | Encryption algorithm that the CA used to sign the digital certificate, such as sha1WithRSAEncryption . | detail |
| Fingerprint | Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate. | detail |
| Distribution CRL | Distinguished name information and the URL for the certificate revocation list (CRL) server. | detail |
| Use for key | Use of the public key, such as Certificate signing, CRL signing, Digital signature, or Key encipherment . | detail |

Sample Output

show services ipsec-vpn ike security-associations

| | |
|---------------------------------|--|
| Syntax | show services ipsec-vpn ike security-associations
<brief detail>
<peer-address> |
| Release Information | Command introduced before Junos OS Release 7.4.
Statistics for Internet Key Exchange (IKE) security associations for each services PIC introduced in Junos OS Release 12.1. |
| Description | (Adaptive services interface only) Display information for Internet Key Exchange (IKE) security associations. If no security association is specified, the information for all security associations is displayed. |
| Options | none —(same as brief) Display standard information for all IPsec security associations.

brief detail —(Optional) Display the specified level of output.

peer-address —(Optional) Display information about a particular security association address. |
| Required Privilege Level | view |
| List of Sample Output | show services ipsec-vpn ike security-associations on page 1963
show services ipsec-vpn ike security-associations detail on page 1964 |
| Output Fields | Table 78 on page 1961 lists the output fields for the show services ipsec-vpn ike security-associations command. Output fields are listed in the approximate order in which they appear. |

Table 78: show services ipsec-vpn ike security-associations Output Fields

| Field Name | Field Description | Level of Output |
|-------------------------|---|-----------------|
| IKE peer | Remote end of the IKE negotiation. | detail |
| Role | Part played in the IKE session. The router triggering the IKE negotiation is the initiator, and the router accepting the first IKE exchange packets is the responder. | detail |
| Remote Address | Responder's address. | none specified |
| State | State of the IKE security association: <ul style="list-style-type: none"> • Matured—IKE security association is established. • Not matured—The IKE security association is in the process of negotiation. | none specified |
| Initiator cookie | When the IKE negotiation is triggered, a random number is sent to the remote node. | All levels |

Table 78: show services ipsec-vpn ike security-associations Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|------------------------------|---|-----------------|
| Responder cookie | <p>The remote node generates its own random number and sends it back to the initiator as a verification that the packets were received.</p> <p>Of the numerous security services available, protection against denial of service (DoS) is one of the most difficult to address. A “cookie” or anticlogging token (ACT) is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity. An exchange prior to CPU-intensive public key operations can thwart some DoS attempts (such as simple flooding with invalid IP source addresses).</p> | All levels |
| Exchange type | <p>Specifies the number of messages in an IKE exchange, and the payload types that are contained in each message. Each exchange type provides a particular set of security services, such as anonymity of the participants, perfect forward secrecy of the keying material, and authentication of the participants. Junos OS supports two types of exchanges:</p> <ul style="list-style-type: none"> • Main—The exchange is done with six messages. Main encrypts the payload, protecting the identity of the neighbor. • Aggressive—The exchange is done with three messages. Aggressive does not encrypt the payload, leaving the identity of the neighbor unprotected. • IKEv2—The exchange is negotiated using IKE version 2. | All levels |
| PIC | The services PIC for which the IKE security associations are displayed. | All levels |
| Authentication method | Type of authentication determines which payloads are exchanged and when they are exchanged. The Junos OS supports only pre-shared keys . | detail |
| Local | Prefix and port number of the local end. | detail |
| Remote | Prefix and port number of the remote end. | detail |
| Lifetime | Number of seconds remaining until the IKE security association expires. | detail |
| Algorithms | <p>Header for the IKE algorithms output.</p> <ul style="list-style-type: none"> • Authentication—(detail output only) Type of authentication algorithm used: md5 or sha1 • Encryption—(detail output only) Type of encryption algorithm used: des-cbc, 3des-cbc, or None. • Pseudo random function—Function that generates highly unpredictable random numbers: hmac-md5 or hmac-sha1. | detail |
| Traffic statistics | <p>Number of bytes and packets received and transmitted on the IKE security association.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the IKE security association. • Input packets, Output packets—Number of packets received and transmitted on the IKE security association. | detail |

Table 78: show services ipsec-vpn ike security-associations Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|-----------------|
| Flags | Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> caller notification sent—Caller program notified about the completion of the IKE negotiation. waiting for done—Negotiation is done. The library is waiting for the remote end retransmission timers to expire. waiting for remove—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation. waiting for policy manager—Negotiation is waiting for a response from the policy manager. | detail |
| IPsec security associates | Number of IPsec security associations created and deleted with this IKE security association. | detail |
| Phase 2 negotiations in progress | Number of phase 2 negotiations in progress and status information: <ul style="list-style-type: none"> Negotiation type—Type of phase 2 negotiation. The Junos OS currently supports quick mode. Message ID—Unique identifier for a phase 2 negotiation. Local identity—Identity of the local phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation)</i>. Remote identity—Identity of the remote phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation)</i>. Flags—Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> caller notification sent—Caller program notified about the completion of the IKE negotiation. waiting for done—Negotiation is done. The library is waiting for the remote end retransmission timers to expire. waiting for remove—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation. waiting for policy manager—Negotiation is waiting for a response from the policy manager. | detail |

Table 79: show services ipsec-vpn ipsec security-associations Output Fields

| Field Name | Field Description | Level of Output |
|-------------------------------|---|-------------------------|
| Service set | Name of the service set for which the IPsec security associations are defined. If appropriate, includes the outside service interface VRF name. | All levels |
| Rule | Name of the rule set applied to the security association. | detail extensive |
| Term | Name of the IPsec term applied to the security association. | detail extensive |
| Tunnel index | Numeric identifier of the specific IPsec tunnel for the security association. | detail extensive |
| Local gateway | Gateway address of the local system. | All levels |
| Remote gateway | Gateway address of the remote system. | All levels |
| IPsec inside interface | Name of the logical interface hosting the IPsec tunnels. | All levels |
| Tunnel MTU | MTU of the IPsec tunnel. | All levels |

Table 79: show services ipsec-vpn ipsec security-associations Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------------|--|-----------------|
| Local identity | <p>Protocol, address or prefix, and port number of the local entity of the IPsec association. The format is id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation). The protocol is always displayed as any because it is not user-configurable in the IPsec rule. Similarly, the port number field in the output is always displayed as 0 because it is not user-configurable in the IPsec rule. The value of the id-data-len parameter can be one of the following, depending on the address configured in the IPsec rule:</p> <ul style="list-style-type: none"> For an IPv4 address, the length is 4 and the value displayed is 3. For a subnet mask of an IPv4 address, the length is 8 and the value displayed is 7. For a range of IPv4 addresses, the length is 8 and the value displayed is 7. For an IPv6 address prefix, the length is 16 and the value displayed is 15. For a subnet mask of an IPv6 address prefix, the length is 32 and the value displayed is 31. For a range of IPv6 address prefixes, the length is 32 and the value displayed is 31. <p>The value of the id-data-presentation field denotes the IPv4 address or IPv6 prefix details. If the fully qualified domain name (FQDN) is specified instead of the address for the local peer of the IPsec association, it is displayed instead of the address details.</p> | All levels |
| Remote identity | <p>Protocol, address or prefix, and port number of the remote entity of the IPsec association. The format is id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation). The protocol is always displayed as any because it is not user-configurable in the IPsec rule. Similarly, the port number field in the output is always displayed as 0 because it is not user-configurable in the IPsec rule. The value of the id-data-len parameter can be one of the following, depending on the address configured in the IPsec rule:</p> <ul style="list-style-type: none"> For an IPv4 address, the length is 4 and the value displayed is 3. For a subnet mask of an IPv4 address, the length is 8 and the value displayed is 7. For a range of IPv4 addresses, the length is 8 and the value displayed is 7. For an IPv6 address prefix, the length is 16 and the value displayed is 15. For a subnet mask of an IPv6 address prefix, the length is 32 and the value displayed is 31. For a range of IPv6 address prefixes, the length is 32 and the value displayed is 31. <p>The value of the id-data-presentation field denotes the IPv4 address or IPv6 prefix details. If the fully qualified domain name (FQDN) is specified instead of the address for the remote peer of the IPsec association, it is displayed instead of the address details.</p> | All levels |
| Primary remote gateway | IP address of the configured primary remote peer. | All levels |
| Backup remote gateway | IP address of the configured backup remote peer. | All levels |

Table 79: show services ipsec-vpn ipsec security-associations Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|---|-------------------------|
| State | State of the primary or backup interface: Active , Offline , or Standby . Both ES PICs are initialized to Offline . For primary and backup peers, State can be Active or Standby . If both peers are in a state of Standby , no connection exists yet between the two peers. | All levels |
| Failover counter | Number of times a PIC switched between primary and backup interfaces, or the number of times the tunnel switched between the primary and remote peers since the software has been activated. | All levels |
| Direction | Direction of the security association: inbound or outbound . | All levels |
| SPI | Value of the security parameter index. | All levels |
| AUX-SPI | Value of the auxiliary security parameter index. <ul style="list-style-type: none"> When the value of Protocol is AH or ESP, AUX-SPI is always 0. When the value of Protocol is AH+ESP, AUX-SPI is always a positive integer. | All levels |
| Mode | Mode of the security association: <ul style="list-style-type: none"> transport—Protects single host-to-host protections. tunnel—Protects connections between security gateways. | detail extensive |
| Type | Type of security association: <ul style="list-style-type: none"> manual—Security parameters require no negotiation. They are static, and are configured by the user. dynamic—Security parameters are negotiated by the IKE protocol. Dynamic security associations are not supported in transport mode. | detail extensive |
| State | Status of the security association: <ul style="list-style-type: none"> Installed—The security association is installed in the security association database. (For transport mode security associations, the value of State must always be Installed.) Not installed—The security association is not installed in the security association database. | detail extensive |
| Protocol | Protocol supported: <ul style="list-style-type: none"> transport mode supports Encapsulation Security Protocol (ESP) or Authentication Header (AH). tunnel mode supports ESP or AH+ESP. | All levels |
| Authentication | Type of authentication used: hmac-md5-96 , hmac-sha1-96 , or none . | detail extensive |
| Encryption | Type of encryption algorithm used: aes-cbc (128 bits) , aes-cbc (192 bits) , aes-cbc (256 bits) , des-cbc , 3des-cbc , or None . | detail |

Table 79: show services ipsec-vpn ipsec security-associations Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|--|------------------|
| Soft lifetime
Hard lifetime | <p>Each lifetime of a security association has two display options, hard and soft, one of which must be present for a dynamic security association. The hard lifetime specifies the lifetime of the SA. The soft lifetime, which is derived from the hard lifetime, informs the IPsec key management system that the SA is about to expire. This information allows the key management system to negotiate a new SA before the hard lifetime expires.</p> <ul style="list-style-type: none"> • Expires in seconds seconds—Number of seconds left until the security association expires. • Expires in kilobytes kilobytes—Number of kilobytes left until the security association expires. | detail extensive |
| Anti-replay service | State of the service that prevents packets from being replayed: Enabled or Disabled . | detail extensive |
| Replay window size | Configured size, in packets, of the antireplay service window: 32 or 64 . The antireplay window size protects the receiver against replay attacks by rejecting old or duplicate packets. If the replay window size is 0 , antireplay service is disabled. | detail |

Sample Output

show services ipsec-vpn ipsec security associations extensive

```

user@host> show services ipsec-vpn ipsec security-associations extensive
Service set: service-set-1
  Rule: _junos_, Term: term-1, Tunnel index: 1

```

show services ipsec-vpn ipsec statistics

| | |
|---------------------------------|---|
| Syntax | show services ipsec-vpn ipsec statistics
<brief detail>
<remote-gw remote-peer-address>
<service-set service-set-name> |
| Release Information | Command introduced before Junos OS Release 7.4.
New fields added in Junos OS Release 10.0. |
| Description | (Adaptive services interface only) Display IPsec statistics for the specified service set. If no service set is specified, the statistics for all service sets are displayed. |
| Options | <p>none—Display standard IPsec statistics for all service sets.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>remote-gw remote-peer-address—(Optional) Display IPsec statistics for an individual IPsec tunnel and an individual remote host.</p> <p>service-set service-set-name—(Optional) Display information about a particular service set.</p> |
| Required Privilege Level | view |
| List of Sample Output | show services ipsec-vpn ipsec statistics detail on page 1971
show services ipsec-vpn ipsec statistics remote-gw on page 1971 |
| Output Fields | Table 80 on page 1969 lists the output fields for the show services ipsec-vpn ipsec statistics command. Output fields are listed in the approximate order in which they appear. |

Table 80: show services ipsec-vpn ipsec statistics Output Fields

| Field Name | Field Description | Level of Output |
|-----------------------|---|-----------------|
| PIC | The physical interface on which the IPsec tunnel is configured. | All levels |
| Service set | Name of the service set for which the IPsec tunnel is defined. | All levels |
| Local gateway | Gateway address of the local system. | All levels |
| Remote gateway | Gateway address of the remote system. | All levels |
| Tunnel index | Numeric identifier of the specific IPsec tunnel for the security association. | All levels |

Table 80: show services ipsec-vpn ipsec statistics Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-----------------------|---|-----------------|
| ESP statistics | Encapsulation Security Payload (ESP) statistics: <ul style="list-style-type: none"> • Encrypted bytes—Total number of bytes encrypted by the local system across the IPsec tunnel. • Decrypted bytes—Total number of bytes decrypted by the local system across the IPsec tunnel. • Encrypted packets—Total number of packets encrypted by the local system across the IPsec tunnel. • Decrypted packets—Total number of packets decrypted by the local system across the IPsec tunnel. | All levels |
| AH Statistics | Authentication Header statistics: <ul style="list-style-type: none"> • Input bytes—Total number of bytes received by the local system across the IPsec tunnel. • Output bytes—Total number of bytes transmitted by the local system across the IPsec tunnel. • Input packets—Total number of packets received by the local system across the IPsec tunnel. • Output packets—Total number of packets transmitted by the local system across the IPsec tunnel. | All levels |
| Errors | <ul style="list-style-type: none"> • AH authentication failures—Number of authentication header (AH) failures. An AH failure occurs when there is a mismatch of the authentication header in a packet transmitted across an IPsec tunnel. • ESP authentication failures—Number of Encapsulation Security Payload (ESP) failures. An ESP failure occurs when there is an authentication mismatch in ESP packets. • ESP Decryption failures—Number of ESP decryption failures. • Bad headers—Number of invalid headers detected. • Bad trailers—Number of invalid trailers detected. • Replay before window drops—Number of replay errors. A replay error is generated when a duplicate packet is received within the replay window. • Replayed pkts—Number of packets replayed. • IP integrity errors—Number of IP integrity errors. • Exceeds tunnel MTU—Number of times the tunnel maximum transmission unit (MTU) value was exceeded. • Rule lookup failures—Number of rule lookup failures. • No SA errors—Number of errors resulting from a missing security association (SA). • Flow errors—Number of flow errors. • Misc errors—Number of miscellaneous errors. | All levels |

Sample Output

show services ipsec-vpn ipsec statistics detail

```

user@host> show services ipsec-vpn ipsec statistics
PIC: sp-0/2/0, Service set: ss0

ESP Statistics:
  Encrypted bytes:          0
  Decrypted bytes:         0
  Encrypted packets:       0
  Decrypted packets:       0
AH Statistics:
  Input bytes:             168
  Output bytes:            168
  Input packets:           2
  Output packets:          2
Errors:
  AH authentication failures: 0
  ESP authentication failures: 0
  ESP decryption failures: 0
  Bad headers: 0, Bad trailers: 0
  Replay before window drops: 0, Replayed pkts: 0
  IP integrity errors: 0, Exceeds tunnel MTU: 0
  Rule lookup failures: 0, No SA errors: 0
  Flow errors: 0, Misc errors: 0

```

show services ipsec-vpn ipsec statistics remote-gw

```

user@host> show services ipsec-vpn ipsec statistics remote-gw 22.22.2.1
PIC: sp-3/1/0, Service set: service-set-2
Local gateway: 22.22.1.1, Remote gateway: 22.22.2.1, Tunnel index: 2
ESP Statistics:
  Encrypted bytes:          0
  Decrypted bytes:         0
  Encrypted packets:       0

  Output bytes:            0
  Input packets:           0
  Output packets:          0
Errors:
  AH authentication failures: 0
  ESP authentication failures: 0
  ESP decryption failures: 0
  Bad headers: 0, Bad trailers: 0
  Replay before window drops: 0, Replayed pkts: 0
  IP integrity errors: 0, Exceeds tunnel MTU: 0
  Rule lookup failures: 0, No SA errors: 0
  Flow errors: 0, Misc errors: 0

```

show services link-services cpu-usage

| | |
|---------------------------------|--|
| Syntax | show services link-services cpu-usage
<brief detail>
<interface <i>interface-name</i> > |
| Release Information | Command introduced in Junos OS Release 8.4. |
| Description | (M Series and T Series routers only) Display information about Link Services IQ (LSQ) CPU usage. |
| Options | <p>none—Display standard information about CPU usage for all LSQ interfaces.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>interface <i>interface-name</i>—(Optional) Display information about the specified LSQ interface.</p> |
| Required Privilege Level | view |
| List of Sample Output | show services link-services cpu-usage brief (AS PIC) on page 1974
show services link-services cpu-usage brief (MultiServices PIC) on page 1974
show services link-services cpu-usage detail (AS PIC) on page 1974
show services link-services cpu-usage detail (MultiServices PIC) on page 1975 |
| Output Fields | Table 81 on page 1972 lists the output fields for the show services link-services cpu-usage command. Output fields are listed in the approximate order in which they appear. |

Table 81: show services link-services cpu-usage Output Fields

| Field Name | Field Description | Level of Output |
|-------------------------|---|-----------------|
| Role | CPU functional category. | brief |
| 1 Second Average | Percentage of usage during 1-second duration. | All levels |
| 5 Second Average | Percentage of usage during 5-second duration. | All levels |
| QoS | Quality of service (QoS) CPU, which takes care of queuing and scheduling of incoming IP packets on a per-bundle basis. It schedules packets with higher QoS values first. | All levels |
| Sequencer | Assigns sequence numbers to outgoing MLPPP fragments and interleaves link fragmentation and interleaving (LFI) traffic. | All levels |
| Load Balancer | Distributes load across different fragmenter CPUs. | All levels |
| Fragmenter | Main LSQ CPU; fragments IP packets into MLPPP fragments and also reassembles MLPPP fragments into IP packets. | All levels |
| Total | Sum of all CPU functions. | brief |

Table 81: show services link-services cpu-usage Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|------------------------------------|---|-----------------|
| Idle | Counts idle cycles when the CPU does not have any work. | detail |
| Timer | Takes care of periodic events driven by a timer, such as timeouts. | detail |
| System | System housekeeping thread. | detail |
| Input (QoS) | Acquires and queues incoming IP frames from hardware interfaces. | detail |
| Output (QoS) | Sends scheduled frames to the next processing CPU. | detail |
| Output Frags (QoS) | Sends outstanding frames to the fragmenter CPU. | detail |
| Bypass (QoS) | Sends outstanding frames for LFI. | detail |
| Free frame (QoS) | Frees dropped frames. | detail |
| CPUnumber | Identifier number of specific CPU. | detail |
| Drop (Fragmenter) | Drops frames that have been marked by the QoS CPU. | detail |
| Frag (Fragmenter) | Fragments IP frames into MLPPP fragments. | detail |
| Reass (Fragmenter) | Reassembles MLPPP fragments into IP frames. | detail |
| Freeback (Fragmenter) | Handles freeback of credits from other CPUs (MultiServices PICs only). | detail |
| Input LFI (Sequencer) | Receives LFI traffic from QoS CPU and transmits it with strict priority over MLPPP. | detail |
| Input Frag (Sequencer) | Receives MLPPP fragments from fragmenter CPUs, assigns sequence numbers, and appends MLPPP headers. | detail |
| Output Frag (Sequencer) | Load-balances and transmits fragments across links. | detail |
| Retry (Sequencer) | Retries transmission if hardware was busy in the previous attempt. | detail |
| Input Alloc (Load Balancer) | Acquires frames from hardware interfaces and validates them. | detail |
| Input (Load Balancer) | Performs error and sanity checks and check frames for PortMapping. | detail |
| Output (Load Balancer) | Sends frame to next processing CPU. | detail |

Table 81: show services link-services cpu-usage Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------------|--|-----------------|
| Freeback (Load Balancer) | Handles freeback of credits from other CPUs. | detail |

show services l2tp multilink

| | |
|---------------------------------|---|
| Syntax | show services l2tp multilink
<brief detail extensive statistics>
<bundle-id <i>number</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M10i and M7i routers only) Display L2TP output organized by multilink bundle. |
| Options | <p>none—Same as brief.</p> <p>brief detail extensive statistics—(Optional) Display the specified level of output. Use the statistics option to display packets and bytes that have been encapsulated in the Multilink Protocol. Nonmultilink packets received on member sessions are not counted here.</p> <p>bundle-id <i>number</i>—(Optional) Display L2TP multilink bundle information for only the specified bundle.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • L2TP Services Configuration Overview on page 638 • L2TP Minimum Configuration on page 639 • clear services l2tp multilink on page 1829 |
| List of Sample Output | show services l2tp multilink extensive on page 1979 |
| Output Fields | Table 82 on page 1976 lists the output fields for the show services l2tp multilink command. Output fields are listed in the approximate order in which they appear. |

Table 82: show services l2tp multilink Output Fields

| Field Name | Field Description | Level of Output |
|------------------------|--|-----------------|
| Bundle ID | Bundle identifier. | All levels |
| Links | Number of links in the multilink bundle. | All levels |
| Bundle endpoint | Endpoint discriminator that represents the device transmitting the packet. | All levels |
| Input MRRU | Maximum packet size that the input interface can process. | detail |
| Output MRRU | Maximum packet size that the output interface can process. | detail |

Table 82: show services l2tp multilink Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------|--|-----------------|
| Session local ID | Identifier of the local endpoint of the L2TP session, as assigned by the L2TP network server (LNS). | detail |
| Session remote ID | Identifier of the remote endpoint of the L2TP session, as assigned by the L2TP access concentrator (LAC). | detail |
| State | Status of the L2TP session: <ul style="list-style-type: none"> • Established—The session is operating. • closed—The session is being closed. • destroyed—The session is being destroyed. • clean-up—The session is being cleaned up. • lns-ic-accept-new—A new session is being accepted. • lns-ic-idle—The session has been created and is idle. • lns-ic-reject-new—The new session is being rejected. • lns-ic-wait-connect—The session is waiting for the peer's incoming call connected (ICCN) message. | detail |
| Username | Name of the user logged in to the session. | detail |
| Mode | Mode of the interface representing the multilink bundle: dedicated or shared . | extensive |
| Local IP | IP address of the local endpoint of the Point-to-Point Protocol (PPP) session. | extensive |
| Remote IP | IP address of the remote endpoint of the PPP session. | extensive |
| Local name | Name of the LNS instance in which the session was created. | extensive |
| Remote name | Name of the LAC from which the session was created. | extensive |
| Local MRU | Maximum receive unit (MRU) setting of the local device, in bytes. | extensive |

Table 82: show services l2tp multilink Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|--|-----------------|
| Remote MRU | MRU setting of the remote device, in bytes. | extensive |
| Statistics since | <p>Date and time when collection of the following statistics began:</p> <ul style="list-style-type: none"> • Control Tx—Amount of control information transmitted, in packets and bytes. • Control Rx—Amount of control information received, in packets and bytes. • Data Tx—Amount of data transmitted, in packets and bytes. • Data Rx—Amount of data received, in packets and bytes. • Errors Tx—Number of errors transmitted, in packets. • Errors Rx—Number of errors received, in packets. • Lcp Echo Req Tx—Number of LCP echo requests transmitted, in packets. • Lcp Echo Req Rx—Number of LCP echo requests received, in packets. • Lcp Echo Rep Tx—Number of LCP echo responses transmitted, in packets. • Lcp Echo Rep Rx—Number of LCP echo responses received, in packets. • Lcp Echo Req Timeout—Number of LCP echo requests that timed out. • Lcp Echo Req Error—Number of errors received for LCP echo packets. • Lcp Echo Rep Error—Number of errors transmitted for LCP echo packets. • MRRU—Maximum packet size processed. • TX—Number of packets transmitted. • RX—Number of packets received. • link—Link of the multilink bundle associated with the L2TP session. | extensive |

show services l2tp radius

| | |
|---------------------------------|---|
| Syntax | <pre>show services l2tp radius <accounting (servers statistics)> <authentication (servers statistics)> <servers> <statistics></pre> |
| Release Information | Command introduced in Junos OS Release 9.0. |
| Description | (M7i, M10i, and M120 routers only) Display RADIUS servers and statistics information for the RADIUS servers configured on the router. |
| Options | <p>You must include one of the following keywords to provide a valid completion for the command:</p> <p>accounting (servers statistics)—(Optional) Display RADIUS servers or statistical accounting information only.</p> <p>authentication (servers statistics)—(Optional) Display RADIUS servers or statistical authentication information only.</p> <p>servers—(Optional) Display RADIUS authentication and accounting server information only.</p> <p>statistics—(Optional) Display RADIUS authentication and accounting statistics information only.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • L2TP Services Configuration Overview on page 638 • L2TP Minimum Configuration on page 639 |
| List of Sample Output | show services l2tp radius servers on page 1982
show services l2tp radius statistics on page 1982 |
| Output Fields | <p>Table 83 on page 1980 lists the output fields for the show services l2tp radius command. Output fields are listed in the approximate order in which they appear.</p> |

Table 83: show services l2tp radius Output Fields

| Field Name | Field Description |
|-------------|--|
| IP Address | IP address of the server. |
| State | (servers keyword only) Present state of the server. |
| UDP Port | Number of the UDP port used to send authentication or accounting messages to the server. |
| Retry Count | (servers keyword only) Number of times the RADIUS client resends a packet if no ACK is received. |

Table 83: show services l2tp radius Output Fields (*continued*)

| Field Name | Field Description |
|----------------------------|---|
| Timeout | (servers keyword only) Length of time the client waits for an ACK before retransmission. |
| Pending Requests | (servers keyword only) Number of client pending authentication or accounting requests. |
| Maximum Sessions | (servers keyword only) Maximum number of pending requests on each RADIUS client before the server moves to the next RADIUS client, which is 200 times the maximum number of clients that can be created on a server (which is 12). |
| Dead Time | (servers keyword only) Interval to wait before retrying a server after it fails to send a response to an authentication or accounting request. |
| Secret Type | (servers keyword only) Secret type configured on the RADIUS server. |
| Profile | (servers keyword only) Name of profile configured for the RADIUS server. |
| Access requests | (statistics keyword only) Number of access requests sent to the server. |
| Rollover requests | (statistics keyword only) Number of requests coming into the server as a result of the previous server timing out. |
| Retransmissions | (statistics keyword only) Number of retransmissions. |
| Access accepts | (statistics keyword only) Number of access accept messages received from the server. |
| Access rejects | (statistics keyword only) Number of access reject messages received from the server. |
| Access challenges | (statistics keyword only) Number of access challenges received from the server. |
| Malformed responses | (statistics keyword only) Number of responses with attributes having an invalid length or unexpected attributes (such as two attributes when the response is required to have at most one). |
| Bad authenticators | (statistics keyword only) Number of responses in which the authenticator is incorrect for the matching request. This can occur if the RADIUS secrets for the client and server do not match. |
| Requests pending | (statistics keyword only) Number of requests waiting for a response. |
| Request timeouts | (statistics keyword only) Number of requests that timed out. |
| Unknown responses | (statistics keyword only) Number of unknown responses. The RADIUS response type in the header is invalid or unsupported. |
| Packets dropped | (statistics keyword only) Number of packets dropped because they are too short or because the router receives a response for which there is no corresponding request. For example, if the router sends a request that times out, the router removes the request from the list and sends a new request. If the server is slow and sends a response to the first request after the router removes the request, the packet is dropped. |

Sample Output

show services l2tp radius servers

```
user@host> show services l2tp radius servers
```

RADIUS Authentication Servers

| IP Address | State | UDP Port | Retry Count | Timeout | Pending Requests | Maximum Sessions | Dead Time | Secret Type |

Release Information Command introduced before Junos OS Release 7.4.
Support for LAC on MX Series routers introduced in Junos OS Release 10.4.
Support for LNS on MX Series routers introduced in Junos OS Release 11.4.

Description (M10i and M7i routers only) Display information about active L2TP sessions for LNS.

(MX Series routers only) Display information about active L2TP sessions for LAC and LNS.

Options **none**—Display standard information about all active L2TP sessions.

brief | detail | extensive—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display L2TP session information for only the specified adaptive services or inline services interface. The interface type depends on the line card as follows:

- **si-*fpc/pic/port***—MPCs on MX Series routers only. This option is not available for L2TP on M Series routers.
- **sp-*fpc/pic/port***—AS or Multiservices PICs on M7i, M10i, and M120 routers only. This option is not available for L2TP on MX Series routers.

local-gateway *gateway-address*—(Optional) Display L2TP session information for only the specified local gateway address.

local-gateway-name *gateway-name*—(Optional) Display L2TP session information for only the specified local gateway name.

local-session-id *session-id*—(Optional) Display L2TP session information for only the specified local session identifier.

local-tunnel-id *tunnel-id*—(Optional) Display L2TP session information for only the specified local tunnel identifier.

peer-gateway *gateway-address*—(Optional) Display L2TP session information for only the specified peer gateway address.

peer-gateway-name *gateway-name*—(Optional) Display L2TP session information for only the specified peer gateway name.

statistics—(Optional) Display the number of control packets and bytes transmitted and received for the session. You cannot include this option with any of the level options, **brief**, **detail**, or **extensive**.

tunnel-group *group-name*—(Optional) Display L2TP session information for only the specified tunnel group. To display information about L2TP CPU and memory usage, you can include the tunnel group name in the **show services service-sets memory-usage *group-name*** and **show services service-sets cpu-usage *group-name*** commands. This option is not available for L2TP LAC on MX Series routers.

user *username*—(M Series routers only) (Optional) Display L2TP session information for only the specified username.

Output Fields [Table 84 on page 1985](#) lists the output fields for the **show services l2tp session** command. Output fields are listed in the approximate order in which they appear.

Table 84: show services l2tp session Output Fields

| Field Name | Field Description | Level of Output |
|------------------|---|-----------------|
| Interface | (LNS only) Name of an adaptive services interface. | All levels |
| Tunnel group | (LNS only) Name of a tunnel group. | All levels |
| Tunnel local ID | Identifier of the local endpoint of the tunnel, as assigned by the L2TP network server (LNS). | All levels |
| Session local ID | Identifier of the local endpoint of the L2TP session, as assigned by the LNS. | All levels |

Table 84: show services l2tp session Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|----------------------------|---|------------------|
| Session remote ID | Identifier of the remote endpoint of the L2TP session, as assigned by the L2TP access concentrator (LAC). | All levels |
| State | State of the L2TP session: <ul style="list-style-type: none"> • Established—Session is operating. This is the only state supported for the LAC. • closed—Session is being closed. • destroyed—Session is being destroyed. • clean-up—Session is being cleaned up. • lns-ic-accept-new—New session is being accepted. • lns-ic-idle—Session has been created and is idle. • lns-ic-reject-new—New session is being rejected. • lns-ic-wait-connect—Session is waiting for the peer's incoming call connected (ICCN) message. | All levels |
| Bundle ID | (LNS only) Bundle identifier. Indicates the session is part of a multilink bundle. Sessions that have a blank Bundle field are not participating in the Multilink Protocol. Sessions in a multilink bundle might belong to different L2TP tunnels. For L2TP output organized by bundle ID, issue the show services l2tp multilink extensive command. | All levels |
| Mode | (LNS) Mode of the interface representing the session: shared or exclusive .

(LAC) Mode of the interface representing the session: shared or dedicated . Only dedicated is currently supported for the LAC. | extensive |
| Local IP | IP address of local endpoint of the Point-to-Point Protocol (PPP) session. | extensive |
| Remote IP | IP address of remote endpoint of the PPP session. | extensive |
| Username | (LNS only) Name of the user logged in to the session. | All levels |
| Assigned IP address | (LNS only) IP address assigned to remote client. | extensive |
| Local name | For LNS, name of the LNS instance in which the session was created. For LAC, name of the LAC. | extensive |
| Remote name | For LNS, name of the LAC from which the session was created. For LAC, name of the LAC instance. | extensive |
| Local MRU | (LNS only) Maximum receive unit (MRU) setting of the local device, in bytes. | extensive |
| Remote MRU | (LNS only) MRU setting of the remote device, in bytes. | extensive |

Table 84: show services l2tp session Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|---|------------------|
| Tx speed | <p>Transmit speed of the session conveyed from the LAC to the LNS, in bits per second (bps).</p> <p>Either the initial (initial) line speed or both the initial and current (update) line speeds can be displayed on MX Series routers:</p> <ul style="list-style-type: none"> • When connection speed updates are not enabled, then only the initial line speed is displayed. • When connection speed updates are enabled, then both the initial and the current speeds are displayed. <p>When the Tx connect speed method is set to none, the value of zero (0) is displayed.</p> | extensive |
| Rx speed | <p>Receive speed of the session conveyed from the LAC to the LNS, in bits per second (bps).</p> <p>Either the initial (initial) line speed or both the initial and current (update) line speeds can be displayed on MX Series routers:</p> <ul style="list-style-type: none"> • When connection speed updates are not enabled, then only the initial line speed is displayed. • When connection speed updates are enabled, then both the initial and the current speeds are displayed. <p>When the Tx connect speed method is set to none, the value of zero (0) is displayed.</p> | extensive |
| Bearer type | <p>Type of bearer enabled:</p> <ul style="list-style-type: none"> • 0—Might indicate that the call was not received over a physical link (for example, when the LAC and PPP are located in the same subsystem). • 1—Digital access requested. • 2—Analog access requested. • 4—Asynchronous Transfer Mode (ATM) bearer support. | extensive |
| Framing type | <p>Type of framing enabled:</p> <ul style="list-style-type: none"> • 1—Synchronous framing • 2—Asynchronous framing | extensive |
| LCP renegotiation | <p>(LNS only) Whether Link Control Protocol (LCP) renegotiation is configured: On or Off.</p> | extensive |
| Authentication | <p>Type of authentication algorithm used: Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP).</p> | extensive |
| Interface ID | <p>(LNS only) Identifier used to look up the logical interface for this session.</p> | extensive |
| Interface unit | <p>Logical interface for this session.</p> | All levels |
| Call serial number | <p>Unique serial number assigned to the call.</p> | extensive |

Table 84: show services l2tp session Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------------------|--|------------------|
| Policer bandwidth | Maximum policer bandwidth configured for this session. | extensive |
| Policer burst size | Maximum policer burst size configured for this session. | extensive |
| Firewall filter | Configured firewall filter name. | extensive |
| Session encapsulation overhead | Overhead allowance configured for this session, in bytes. | extensive |
| Session cell overhead | Cell overhead activation (On or Off). | extensive |
| Create time | Date and time when the call was created. | extensive |
| Up time | Length of time elapsed since the call became active, in hours, minutes, and seconds. | extensive |
| Idle time | Length of time elapsed since the call became idle, in hours, minutes, and seconds. | extensive |
| Statistics since | Date and time when collection of the following statistics began: <ul style="list-style-type: none"> • Control Tx—Amount of control information transmitted, in packets and bytes. • Control Rx—Amount of control information received, in packets and bytes. • Data Tx—Amount of data transmitted, in packets and bytes. • Data Rx—Amount of data received, in packets and bytes. • Errors Tx—Number of errors transmitted, in packets. • Errors Rx—Number of errors received, in packets. • LCP echo req Tx—Number of LCP echo requests transmitted, in packets. • LCP echo req Rx—Number of LCP echo requests received, in packets. • LCP echo rep Tx—Number of LCP echo responses transmitted, in packets. • LCP echo rep Rx—Number of LCP echo responses received, in packets. • LCP echo Req timeout—Number of LCP echo requests that timed out. • LCP echo Req error—Number of errors received for LCP echo packets. • LCP echo Rep error—Number of errors transmitted for LCP echo packets. | extensive |

show services l2tp summary

| | |
|---------------------------------|---|
| Syntax | <code>show services l2tp summary</code>
<code><interface sp-fpc/pic/port></code>
<code><statistics></code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Support for LAC on MX Series routers introduced in Junos OS Release 10.4.
Support for LNS on MX Series routers introduced in Junos OS Release 11.4.
Support for statistics option introduced in Junos OS Release 13.1. |
| Description | (M10i and M7i routers: LNS only. MX Series routers: LAC and LNS.) Display Layer 2 Tunneling Protocol (L2TP) summary information. |
| Options | <p>none—Display complete L2TP summary information. For LNS on M Series routers, display L2TP summary information for all adaptive services interfaces. For LNS on MX Series routers, display L2TP summary information for all inline services interfaces.</p> <p>interface sp-fpc/pic/port—(Optional) Display L2TP summary information for only the specified adaptive services interface. This option is not available for L2TP on MX Series routers.</p> <p>statistics—(Optional) Display a summary of control packets and bytes transmitted and received.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> L2TP Services Configuration Overview on page 638 L2TP Minimum Configuration on page 639 |

| Output Fields | Table 85 on page 1992 lists the output fields for the show services l2tp summary command. Output fields are listed in the approximate order in which they appear. |

Table 85: show services l2tp summary Output Fields

| Field Name | Field Description |
|---|---|
| Failover within a preference level | State of this tunnel selection method on the LAC. When enabled, tunnel selection fails over within a preference level. When disabled, tunnel selection drops to the next lower preference level. Not displayed for LNS on M Series routers. |

Table 85: show services l2tp summary Output Fields (*continued*)

| Field Name | Field Description |
|--|---|
| Weighted load balancing | State of this tunnel selection method on the LAC. When enabled, the maximum session limit of a tunnel determines its weight within a preference level. Tunnel selection proceeds from greatest to least weight. When disabled, selection defaults to a round robin method. Not displayed for LNS on M Series routers. |
| Destination equal load balancing | State of this tunnel selection method on the LAC. When enabled, the LAC selects tunnels based on the session count for destinations and the tunnel session count. Not displayed for LNS on M Series routers. |
| Tunnel authentication challenge | State of tunnel authentication, indicating whether the LAC and LNS exchange an authentication challenge and response during the establishment of the tunnel. The state is Enabled when a secret is configured in the tunnel profile or on the RADIUS server in the Tunnel-Password attribute [69]. The state is Disabled when the secret is not present. Not displayed for LNS on M Series routers. |
| Calling number avp | When the state is Enabled , the LAC includes the value of the Calling Number AVP 22 in ICRQ packets sent to the LNS. When the state is Disabled , the attribute is not sent to the LNS. Not displayed for LNS on M Series routers. |
| Failover Protocol | When the state is enabled, the LAC operates in the default <i>failover-protocol-fall-back-to-silent-failover</i> manner. When the state is disabled, the disable-failover-protocol statement has been issued and the LAC operates only in silent failover mode. Not displayed for LNS on M Series routers. |
| Tx connect speed method | <p>The connection speed method configured to send the speed values in the L2TP Tx Connect Speed (AVP 24) and L2TP Rx Connect Speed (AVP 38). Possible values are:</p> <ul style="list-style-type: none"> • actual
This is the default value. • ancp • none • pppoe-ia-tag • static |
| Rx speed avp when equal | Indicates if the Rx connect speed when equal configuration is enabled or disabled . |

Table 85: show services l2tp summary Output Fields (*continued*)

| Field Name | Field Description |
|---|--|
| Tunnel assignment id | <p>Format of the tunnel name.</p> <p>Format of the tunnel name, based on RADIUS attributes returned from the AAA server:</p> <ul style="list-style-type: none"> • authentication-id—Name consists of only Tunnel Assignment-Id [82]. This is the default value. • client-server-id—Name is a combination of Tunnel-Client-Auth-Id [90], Tunnel-Server-Endpoint [67], and Tunnel-Assignment-Id [82]. This format is available only on MX Series routers. |
| Tunnel Tx Address Change | <p>Action taken by LAC when it receives a request from a peer to change the destination IP address, UDP port, or both:</p> <ul style="list-style-type: none"> • accept—Accepts change requests for the IP address or UDP port. This is the default action. • ignore—Ignores all change requests. • ignore-ip-address—Ignores change requests for the IP address but accepts them for the UDP port. • ignore-udp-port—Ignores change requests for the UDP port but accepts them for the IP address. |
| Min Retransmission Timeout for control packets | Minimum number of seconds that the local peer waits for the initial response after transmitting an L2TP control packet. If no response has been received by the time the period expires, the local peer retransmits the packet. |
| Min Retransmission Timeout for control packets | Minimum number of seconds that the local peer waits for the initial response after transmitting an L2TP control packet. If no response has been received by the time the period expires, the local peer retransmits the packet. |
| Max Retransmissions for Established Tunnel | Maximum number of times control messages are retransmitted for established tunnels. |
| Max Retransmissions for Not Established Tunnel | Maximum number of times control messages are retransmitted for tunnels that are not established. |
| Tunnel Idle Timeout | Period that a tunnel can be inactive—that is, carrying no traffic—before it times out and is torn down. |
| Destruct Timeout | Period that the router attempts to maintain dynamic destinations, tunnels, and sessions after they have been destroyed. |
| Reassembly Service Set | Indicates active IP reassembly configured for the interface. |
| Destination Lockout Timeout | Timeout period for which all future destinations are locked out, meaning that they are not considered for selection when a new tunnel is created. |

Table 85: show services l2tp summary Output Fields (*continued*)

| Field Name | Field Description |
|--------------------------------|--|
| Access Line Information | State of LAC global configuration for forwarding subscriber line information to the LNS, Enabled or Disabled .

Indicates active IP reassembly configured for the interface. |
| Speed Updates | State of LAC global configuration for including connection speed updates when it forwards subscriber line information to the LNS, Enabled or Disabled . |
| Destinations | Number of L2TP destinations for the LAC. Not displayed for LNS on M Series routers. |
| Tunnels | Number of L2TP tunnels established on the router. |
| Sessions | Number of L2TP sessions established on the router. |
| Switched sessions | Number of L2TP tunnel-switched sessions established on the router. |
| Control | Count of L2TP control packets and bytes sent and received. |
| Data | Count of L2TP data packets and bytes sent and received. |
| Errors | Count of L2TP error packets and bytes sent and received. |

Sample Output

show services l2tp summary (LAC on M Series routers)

- Output Fields** [Table 86 on page 1998](#) lists the output fields for the **show services l2tp tunnel** command. Output fields are listed in the approximate order in which they appear.

Table 86: show services l2tp tunnel Output Fields

| Field Name | Field Description |
|---------------------|---|
| Interface | (LNS only) Name of an adaptive services interface. |
| Tunnel group | (LNS only) Name of a tunnel group. |
| Local ID | <p>On the LNS, number assigned by the LNS that identifies the local endpoint of the tunnel relative to the LNS: the LNS.</p> <p>On the LAC, number assigned by the LAC that identifies the local endpoint of the tunnel relative to the LAC: the LAC.</p> |
| Remote ID | <p>On the LNS, number assigned by the LAC that identifies the remote endpoint of the tunnel relative to the LNS: the LAC.</p> <p>On the LAC, number assigned by the LNS that identifies the remote endpoint of the tunnel relative to the LAC: the LNS.</p> |
| Remote IP | IP address of the peer endpoint of the tunnel. |
| Sessions | Number of L2TP sessions established through the tunnel. |

Table 86: show services l2tp tunnel Output Fields (*continued*)

| Field Name | Field Description |
|--|--|
| State | <p>State of the L2TP tunnel:</p> <ul style="list-style-type: none"> • cc_responder_accept_new—The tunnel has received and accepted the start control connection request (SCCRQ). • cc_responder_reject_new—The tunnel has received and rejected the SCCRQ. • cc_responder_idle—The tunnel has just been created. • cc_responder_wait_ctl_conn—The tunnel has sent the start control connection response (SCCRP) and is waiting for the start control connection connected (SCCCN) message. • clean-up—The tunnel is being cleaned up. • closed—The tunnel is being closed. • destroyed—The tunnel is being destroyed. • Established—The tunnel is operating. This is the only state supported for the LAC. • Terminate—The tunnel is terminating. • Unknown—The tunnel is not connected to the router. |
| Tunnel Name | (LAC only) Name of the created tunnel. This value includes the destination name followed by the value of the RADIUS Tunnel-Assignment-ID VSA [82]. |
| Local IP | IP address of the local endpoint of the tunnel. |
| Local name | Name used for local tunnel endpoint during tunnel negotiation. |
| Remote name | Name used for remote tunnel endpoint during tunnel negotiation. |
| Effective Peer Resync Mechanism | <p>(LAC only) Peer resynchronization mechanism (PRM) in effect for the tunnel:</p> <ul style="list-style-type: none"> • Failover protocol • Silent failover—Recovery takes place in the failed endpoint only using the proprietary silent failover protocol. |
| Nas Port Method | <p>NAS port method (type), which indicates whether the LAC sends Cisco NAS Port Info AVP (100) in ICRQs to the LNS:</p> <ul style="list-style-type: none"> • cisco-avp—sends the AVP. • none—does not send the AVP. |
| Tunnel Logical System | Logical system in which the L2TP tunnel is brought up. |
| Tunnel Routing Instance | Routing instance in which the L2TP tunnel is brought up. |
| Max sessions | Maximum number of sessions that can be established on this tunnel. |
| Window size | Number of control messages that can be sent without receipt of an acknowledgment. |
| Hello interval | Interval between the transmission of hello messages, in seconds. |

Table 86: show services l2tp tunnel Output Fields (*continued*)

| Field Name | Field Description |
|-------------------------|---|
| Create time | Date and time when the tunnel was created. While the LNS and LAC are connected, this value should correspond to the router's uptime. If connection to the LAC is severed, the State changes to Unknown and the Create time value resets. |
| Up time | Amount of time elapsed since the tunnel became active, in hours, minutes, and seconds. |
| Idle time | Amount of time elapsed since the tunnel became idle, in hours, minutes, and seconds. |
| Statistics since | <p>Date and time when collection of the following statistics began:</p> <ul style="list-style-type: none"> • Control Tx—Amount of control information transmitted, in packets and bytes. • Control Rx—Amount of control information received, in packets and bytes. • Data Tx—Amount of data transmitted, in packets and bytes. • Data Rx—Amount of data received, in packets and bytes. • Errors Tx—Number of errors transmitted, in packets. • Errors Rx—Number of errors received, in packets. |

show services l2tp user

| | |
|---------------------------------|--|
| Syntax | show services l2tp user
<brief detail extensive statistics>
<user <i>username</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M10i and M7i routers only) Display a list of active Layer 2 Tunneling Protocol (L2TP) users. |
| Options | <p>none—Display all active L2TP users.</p> <p>brief detail extensive statistics—(Optional) Display the specified level of output. Use the statistics option to display L2TP user statistics.</p> <p>user <i>username</i>—(Optional) Display L2TP user information for only the specified username.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • L2TP Services Configuration Overview on page 638 • L2TP Minimum Configuration on page 639 |
| List of Sample Output | show services l2tp user extensive on page 2005 |
| Output Fields | Table 87 on page 2003 lists the output fields for the show services l2tp user command. Output fields are listed in the approximate order in which they appear. |

Table 87: show services l2tp user Output Fields

| Field Name | Field Description |
|--------------------------|--|
| Interface | Name of an adaptive services interface. |
| Tunnel group | Name of a tunnel group. |
| Tunnel local ID | Local identifier of the tunnel, as assigned by the L2TP network server (LNS). |
| Session local ID | Local identifier of the session, as assigned by the L2TP network server (LNS). |
| Session remote ID | Remote identifier of the session, as assigned by the L2TP access concentrator (LAC). |

Table 87: show services l2tp user Output Fields (*continued*)

| Field Name | Field Description |
|----------------------------|---|
| State | State of the L2TP session: <ul style="list-style-type: none"> • Established—The session is operating. • closed—The session is being closed. • destroyed—The session is being destroyed. • clean-up—The session is being cleaned up. • Ins-ic-accept-new—A new session is being accepted. • Ins-ic-idle—The session has been created and is idle. • Ins-ic-reject-new—The new session is being rejected. • Ins-ic-wait-connect—The session is waiting for the peer's incoming call connected (ICCN) message. |
| Mode | Mode of the interface representing the session: shared or exclusive . |
| Local IP | IP address of the local endpoint of the tunnel. |
| Remote IP | IP address of the peer endpoint of the tunnel. |
| Username | Name of the user logged in to the session. |
| Assigned IP address | IP address assigned to remote client. |
| Local name | Name of the local device. |
| Remote name | Name of the remote device. |
| Local MRU | Maximum receive unit (MRU) setting of the local device, in bytes. |
| Remote MRU | MRU setting of the remote device, in bytes. |
| Tx speed | Transmit speed of the tunnel session, in bps. |
| Rx speed | Receive speed of the tunnel session, in bps. |
| Bearer type | Type of bearer enabled: <ul style="list-style-type: none"> • 0—Might indicate that the call was not received over a physical link (for example, when the LAC and PPP are located in the same subsystem) • 1—Digital access requested • 2—Analog access requested • 4—Asynchronous Transfer Mode (ATM) bearer support |
| Framing type | Type of framing enabled: <ul style="list-style-type: none"> • 1—Synchronous framing • 2—Asynchronous framing |
| LCP renegotiation | Whether Link Control Protocol (LCP) renegotiation is configured: On or Off . |

Table 87: show services l2tp user Output Fields (*continued*)

| Field Name | Field Description |
|---------------------------|---|
| Authentication | Type of authentication algorithm used: Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP). |
| Interface ID | Name of the logical unit. |
| Interface unit | Logical unit number. |
| Call serial number | Unique serial number assigned to the call. |
| Create time | Date and time when the call was created. |
| Up time | Amount of time elapsed since the call became active, in hours, minutes, and seconds. |
| Idle time | Amount of time elapsed since the call became idle, in hours, minutes, and seconds. |
| Statistics since | <p>Date and time when collection of the following statistics began:</p> <ul style="list-style-type: none"> • Control Tx—Amount of control information transmitted, in packets and bytes. • Control Rx—Amount of control information received, in packets and bytes. • Data Tx—Amount of data transmitted, in packets and bytes. • Data Rx—Amount of data received, in packets and bytes. • Errors Tx—Number of errors transmitted, in packets. • Errors Rx—Number of errors received, in packets. |

show services nat mappings

| | |
|----------------------------|---|
| Syntax | <pre>show services nat mappings <brief detail summary> <nptv6 (ipv6-address external ipv6-address internal ipv6-address)> <pool-name> <address-pooling-paired endpoint-independent pcp></pre> |
| Release Information | <p>Command introduced in Junos OS Release 10.1.</p> <p>summary option introduced in Junos OS Release 11.1.</p> <p>address-pooling paired option introduced in Junos OS Release 13.2.</p> <p>endpoint-independent option introduced in Junos OS Release 13.2.</p> <p>pcp option introduced in Junos OS Release 13.2.</p> <p>nptv6 option introduced in Junos OS Release 15.1.</p> |
| Description | Display information about Network Address Translation (NAT) address, port, and port control protocol (PCP) mappings. |
| Options | <p>none—Display standard information about all NAT pools.</p> <p>brief detail summary—(Optional) Display the specified level of output.</p> <p>nptv6—(Optional) Display information about the network prefix translation for IPv6 traffic.</p> <p>ipv6-address—(Optional) Display the network prefix translation details for the specified IPv6 address.</p> <p>external—(Optional) Display the external to internal address mapping for a given external address if the mapping exists for stateless network IPv6 prefix translation.</p> <p>internal—(Optional) Display the internal to external address mapping for a given internal address if the mapping exists for stateless network IPv6 prefix translation.</p> <p>pool-name—(Optional) Display detailed information about a specific NAT pool. Used only with detail level output.</p> <p>address-pooling-paired—(Optional) Display only information about address-pooling paired mappings.</p> <p>endpoint-independent—(Optional) Display only information about endpoint-independent mappings.</p> <p>pcp—(Optional) Display only information about port control protocol mappings.</p> |

NOTE: PCP requests with the prefer-failure option request a particular external IP address and port. When the request cannot be fulfilled, the mapping is not created. In this case, the subscriber does not have a mapped IP address. Such a subscriber is counted in the summary of the number or address mappings, but is not displayed in the list of address mappings, as shown in the following examples:

```
user@host# show services nat mappings summary
Service Interface:                               sp-2/0/0
Total number of address mappings:                 1
Total number of endpoint independent port mappings: 0
Total number of endpoint independent filters:      0

user@host# show services nat mappings address-pooling-paired
[edit]
```

This is expected behavior because unfulfilled address mappings (IP of 0.0.0.0) are not displayed in the output of the second CLI command. These address mappings will time out based on configured or default values.

Required Privilege Level view

Output Fields [Table 89 on page 2010](#) lists the output fields for the **show services nat mappings** command. Output fields are listed in the approximate order in which they appear.

Table 89: show services nat mappings Output Fields

| Field Name | Field Description | Level of Output |
|-------------|---|-----------------|
| Interface | Name of a service interface. | All levels |
| Service set | Name of a service set. Individual empty service sets are not displayed, but if none of the service sets has any flows, a flow table header is printed for each service set. | All levels |
| NAT pool | Name of the NAT pool. | All levels |

Table 89: show services nat mappings Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|-----------------|
| Address Mapping
or
Mapping | Mapping performed by NAT to conceal the network address. | All levels |
| No. of port mappings | Number of port mappings. | All levels |
| Port mapping | Port mapping performed by NAT. | detail |
| Flow Count | Number of flows. | detail |
| Total number of address mappings | Total number of address mappings, by service interface. | summary |
| Total number of endpoint independent port mappings: | Total number of port mappings by service interface. | summary |
| Total number of endpoint independent filters | Total number of independent filters that filter out only packets that are not destined to the internal address and port, regardless of the external IP address and port source, by service interface. | summary |
| Mapping State | NAT mapping state. The following states are possible: <ul style="list-style-type: none"> • ACTIVE—Indicates that the entry is active and in use. • TIMEOUT—Indicates that the mapping is not in use. After the mapping-timeout, configured at the [edit services nat pool pool-name] hierarchy level, lapses, the mapping is deleted. This field also displays the number of seconds after which the timeout occurs. | |
| Ports In Use | The number of ports used for a specific address-pooling paired mapping. | |
| PCP Lifetime | Elapsed PCP lifetime in seconds. | |
| PCP Client | Address of the PCP client sending the PCP request. | |
| Session Count | Number of sessions currently using the mapping. | |

-> aaaa:bbbb:cccc:dddd:bbbb::1

```

show services nat pool

| | |
|----------------------------|---|
| Syntax | <code>show services nat pool</code>
<code><brief detail></code>
<code><pool-name></code>
<code>pgcp <ports-per-session remotely-controlled></code> |
| Release Information | Command introduced before Junos OS Release 7.4.
<code>pgcp</code> option added in Junos OS Release 8.5. |
| Description | Display information about Network Address Translation (NAT) pools. |

NOTE: On MS-MPCs and MS-MICs, if the line cards receive a packet immediately after the active port block timeout interval has expired, a new port block is allocated and the old port block is released thereafter (if no more ports are being used from that block). In such a scenario, you might notice that the Max number of port blocks used field displays a higher value than the value shown for the Unique pool users field in the output of the `show services nat pool detail` command. This behavior is expected with port block allocation.

With MS-MPCs and MS-MICs, in the output of the `show services nat pool detail` command, the Max ports used and the Ports in use fields display values that indicate a higher number than the number of active subscribers on the member interfaces of an ams interface. This behavior of an increased value displayed for the number of ports allocated and maximum number of ports used is expected after you perform a Graceful Routing Engine switchover (GRES) and a restart of the MPC.

With MS-MPCs and MS-MICs on MX Series routers with AMS interfaces, it is observed that the subscriber and port count details are displayed only after a long time in the output of the `show services nat pool detail` command. This behavior is expected with NAT pool counters and occurs, regardless of port block allocation being configured.

| | |
|----------------|---|
| Options | none —Display standard information about all NAT pools. |
| | brief detail —(Optional) Display the specified level of output. |
| | pool-name —(Optional) Display information about the specified NAT pool. |
| | pgcp —(Optional) Display information about a NAT pool that is exclusive to the BGF. |
| | ports-per-session —(Optional) Display the number of ports allocated per session from the NAT pool. |
| | remotely-controlled —(Optional) Display if the NAT pool is explicitly specified by the gateway controller. |

Output Fields [Table 90 on page 2015](#) lists the output fields for the **show services nat pool** command. Output fields are listed in the approximate order in which they appear.

Table 90: show services nat pool Output Fields

| Field Name | Field Description | Level of Output |
|---|--|-----------------|
| DetNat subscriber exceeded port limits | The number of times a subscriber exceeded its port limits for a NAT pool that uses deterministic port block allocation. | All levels. |
| MAX number of port blocks used | The maximum number of port blocks used. | All levels. |
| Port block memory allocation errors | The number of memory allocation errors for port blocks. | All levels. |
| Current number of port blocks in use | Current count of the port blocks that are being used. | |
| Unique pool users | The number of different users of the NAT pools. | All levels. |
| Port block allocation errors | The consolidated number of port block allocation errors. | All levels. |
| Port blocks limit exceeded errors | The total number of times when a request for more than the allowed port blocks allocated for a user arrives from a user. | All levels. |
| Interface | Name of an adaptive services interface. | All levels |
| Service set | Name of a service set. Individual empty service sets are not displayed, but if none of the service sets has any flows, a flow table header is printed for each service set. | All levels |
| NAT pool | Name of the Network Address Translation pool. | All levels |
| Type or Translation type | Address translation type: basic-nat-pt , basic-nat44 , basic-nat66 , deterministic-napt44 , dnat-44 , dynamic-nat44 , napt44 , napt-66 , napt-pt , stateful-nat64 , twice-basic-nat-44 , twice-dynamic-nat-44 , twice-dynamic-napt-44 . | All levels |
| Address or Address range | IPv4 address range of the pool. | All levels |

Table 90: show services nat pool Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|---|-----------------|
| Configured port range | The range of ports configured to be used for NAT pool. | detail |
| Preserve range enabled | Whether the capability to preserve the privileged port range after translation is enabled. One of the following is displayed: <ul style="list-style-type: none"> • Is active—Preservation of port range is enabled. • Not active—Preservation of port range is not enabled. | detail |
| Port or Port range | Port range of the pool. Applicable only for dynamic NAT pools. Not displayed for static NAT pools. | All levels |
| Ports used' or Ports in use | Number of ports allocated in this pool with this name. Applicable only for dynamic NAT pools. Not displayed for static NAT pools. | All levels |
| Port block type | Type of port block allocation: secured or deterministic | All levels |
| Out of port errors | Number of port allocation errors. Applicable only for dynamic NAT pools. Not displayed for static NAT pools. | detail |
| Max ports used | Maximum number of ports used. Applicable only for dynamic NAT pools. Not displayed for static NAT pools. | detail |
| Addresses in use | Number of addresses in use for dynamic source address NAT pools. | detail |
| Out of Port Errors | No more ports available to allocate. | Detail |
| Max Ports Used | The maximum number of ports in use at any time since the services PIC was started. | Detail |
| AP-P out of port errors | When address pooling paired (AP-P) is configured, a private IP is paired to a public IP. This is counter of translation errors where there are free ports available in the NAT pool, but none for the NAT IP to which the private IP is paired. | Detail |
| Current EIF Inbound flows count | Current count of EIF inbound flows, including all EIF flows per pool. | |
| EIF flow limit exceeded drops | Current number of flow drops due to exceeded flow limit. This number is per pool, not per EIF mapping. | |

EIF flow limit exceeded drops: 0
```

Sample Output

show services pcsp statistics

| | |
|---------------------------------|---|
| Syntax | show services pcsp statistics |
| Release Information | Command introduced in Junos OS Release 13.2 |
| Description | Display information PCP mappings. |
| Required Privilege Level | view |
| List of Sample Output | show services pcsp statistics pcsp on page 2020 |
| Output Fields | Table 91 on page 2019 lists the output fields for the show services pcsp statistics command. Output fields are listed in the approximate order in which they appear. |

Table 91: show services pcsp statistics Output Fields

| Field Name | Field Description |
|-------------------------------|--|
| Services PIC Name | Name of a service interface. |
| Protocol Statistics | Overall PCP statistics, consisting of: operational, option, and results statistics. |
| Operational Statistics | Operational statistics group. |
| Map request received | Total PCP MAP requests received from PCP clients. |
| Peer request received | Number of peer requests received. |
| Option Statistics | Number of requests using available options. |
| Unprocessed requests received | Number of requests received with no option specified. |
| Third party requests received | Number of third-party requests received. |
| Prefer fail option received | Number of prefer fail requests received. |
| Filter option received | Number of filter option requests received. |
| Other options counters | Number of packets received with options other than prefer-fail and third-party . |
| Other optional received | |
| Results Statistics | Information about the results of PCP requests. |
| PCP success | Number of PCP MAP requests successfully processed by the server. |
| PCP unsupported version | Number of PCP packets received with version other than 1. |
| Not authorized | Number of unauthorized MAP delete requests. |

Table 91: show services pcp statistics Output Fields (*continued*)

| Field Name | Field Description |
|----------------------------------|--|
| Bad requests | Number of requests with invalid PCP packets. |
| Unsupported opcode | Number of packets that have an unsupported opcode. |
| Unsupported option | Number of packets that have an unsupported option. |
| Bad option | Number of packet that have a malformed option. |
| Network failure | Number of times a mapping could not be provided due to a network failure. |
| Out of resources | Number of times a mapping could not be provided because the PCP server ran out of pool resources. |
| Unsupported protocol | Number of requests for which the protocol was neither TCP nor UDP. |
| User exceeded quota | Number of requests for which the PCP client requested more than the configured number of ports. |
| Cannot provide external | Number of requests for which the PCP server cannot provide the external address or port requested by the client. |
| Address mismatch | Number of requests for which the PCP client IP address and the layer-3 source IP do not match. |
| Excessive number of remote peers | This counter is not currently used. |
| Processing error | Number of requests with malformed PCP packets information, such as an invalid IP address in a third-party request . |
| Other result counters | Not currently used. |

Sample Output

show services pcp statistics pcp

```
user@host> show services pcp statistics pcp
Services PIC Name:    sp-2/1/0
```

```
Protocol Statistics:
```

```
Operational Statistics
```

```
Map request received           : 0
Peer request received          : 0
Other operational counters     : 0
```

```
Option Statistics
```

```
Unprocessed requests received  : 0
Third party requests received   : 0
```

| | |
|-----------------------------|-----|
| Prefer fail option received | : 0 |
| Filter option received | : 0 |
| Other options counters | : 0 |
| Option optional received | : 0 |

Result Statistics

| | |
|----------------------------------|-----|
| PCP success | : 0 |
| PCP unsupported version | : 0 |
| Not authorized | : 0 |
| Bad requests | : 0 |
| Unsupported opcode | : 0 |
| Unsupported option | : 0 |
| Bad option | : 0 |
| Network failure | : 0 |
| Out of resources | : 0 |
| Unsupported protocol | : 0 |
| User exceeded quota | : 0 |
| Cannot provide external | : 0 |
| Address mismatch | : 0 |
| Excessive number of remote peers | : 0 |
| Processing error | : 0 |
| Other result counters | : 0 |

show services service-sets cpu-usage

| | |
|---------------------------------|--|
| Syntax | show services service-sets cpu-usage
<interface <i>interface-name</i> >
<service-set <i>service-set-name</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display service set CPU usage as a percentage. The command is supported only on Adaptive Services PICs (SP PICs). |
| Options | <p>none—Display CPU usage for all adaptive services interfaces and service sets.</p> <p>interface <i>interface-name</i>—(Optional) Display CPU usage for a particular interface. On M Series and T Series routers, the <i>interface-name</i> parameter can have the value <i>sp-fpc/pic/port</i> or <i>rspnumber</i>.</p> <p>service-set <i>service-set-name</i>—(Optional) Display CPU usage for a particular service set. For the Layer 2 Tunneling Protocol (L2TP), you can use a tunnel group to represent a service set.</p> |
| Required Privilege Level | view |
| List of Sample Output | show services service-sets cpu-usage on page 2022 |
| Output Fields | Table 92 on page 2022 lists the output fields for the show services service-sets cpu-usage command. Output fields are listed in the approximate order in which they appear. |

Table 92: show services service-sets cpu-usage Output Fields

| Field Name | Field Description |
|-------------------------------|--|
| Interface | Name of an adaptive services interface |
| Service set (system category) | Name of the CPU usage category: <ul style="list-style-type: none"> • idp_recommended—Name of the service sets (displays all the service sets attached to the service PICs) • Idle • System • Receive • Transmit |
| CPU utilization % | Percentage of the CPU resources being used |

Sample Output

show services service-sets cpu-usage

```
user@host> show services service-sets cpu-usage
```

| Interface | Service set (system category) | CPU utilization % |
|-----------|-------------------------------|-------------------|
| sp-4/1/0 | idp_recommended | 18.20 % |
| sp-4/1/0 | Idle | 44.69 % |
| sp-4/1/0 | System | 7.01 % |
| sp-4/1/0 | Receive | 15.10 % |
| sp-4/1/0 | Transmit | 15.00 % |

show services service-sets memory-usage

Syntax show services service-sets memory-usage
 <interface *interface-name*>
 <service-set *service-set-name*>
 <zone>

Release Information Command introduced before Junos OS Release 7.4.

Description Display service set memory usage.

Options none—Display service set memory usage.

interface *interface-name*—(Optional) Display memory usage for a particular interface. On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port*, or *rspnumber*.

NOTE: This command is not supported on Multilink Protocol–based services PICs.

The interface option is not supported on Multiservice PICs.

service-set *service-set-name*—(Optional) Display memory usage for a particular service set. For Layer 2 Tunneling Protocol (L2TP), you can use a tunnel group to represent a service set.

zone—(Optional) Display the memory usage zone of the adaptive services interface or an individual service set.

Required Privilege Level view

Table 97: show services service-sets summary Output Fields

| Field Name | Field Description |
|--------------------------------|--|
| Interface | Name of an adaptive services interface |
| Service type | Type of adaptive service, such as stateful firewall (SFW), Network Address Translation (NAT), intrusion detection service (IDS), Layer 2 Tunneling Protocol (L2TP), Compressed Real-Time Transport Protocol (CRTP), or IP Security (IPsec) |
| Service sets configured | Total number of service sets configured on the PIC that use internal service set IDs and do not consume external service sets, including CRTP and L2TP |
| Bytes used | Bytes used by a particular service or all services |
| Policy bytes used | Policy bytes used by a particular service or all services |
| CPU utilization | Percentage of the CPU resources being used |

Sample Output

show services service-sets summary

```

user@host> show services service-sets summary
Service sets
Interface  configured      Bytes used  Policy bytes used  CPU
utilization

```

| | | | | |
|----------|---|--------------------|------------------|-----|
| ms-4/0/0 | 1 | 14821556 (4.53 %) | 855124 (0.40 %) | N/A |
| ms-4/1/0 | 1 | 14691700 (4.49 %) | 855068 (0.40 %) | N/A |

show services service-sets summary interface

```
user@host> show services service-sets summary interface sp-1/3/0
Interface: sp-1/3/0
```

| Service type | Service sets
configured | Bytes used | CPU
utilization |
|--------------|----------------------------|------------------|--------------------|
| SFW/NAT/IDS | 1 | 54 (0.00 %) | N/A |
| L2TP | 1 | 58 (0.00 %) | N/A |
| C RTP | 1 | 58 (0.00 %) | N/A |
| System | 0 | 920831 (0.44 %) | N/A |

| Total | 3 | 921001 (0.44 %) | N/A |

show services software

| | |
|---------------------------------|--|
| Syntax | show services software
<count> |
| Release Information | Command introduced in Junos OS Release 10.4.
<count> option added in Junos OS Release 11.2. |
| Description | Display information about software services. Information is displayed on both 6rd and DS-Lite services. |
| Options | count <i>interface-name</i> — (Optional) Display the current software counts for a service set for both DS-Lite and 6rd. |
| Required Privilege Level | view |
| List of Sample Output | show services software on page 2034
show services software count on page 2034 |
| Output Fields | Table 98 on page 2034 lists the output fields for the command-name command. Output fields are listed in the approximate order in which they appear. |

Table 98: show-services-software Output Fields

| Field Name | Field Description | Level of Output |
|--------------------|--|-----------------|
| Interface | Interface for which information is displayed. | All levels |
| Service Set | Service set containing the software rules for the interface. | All levels |
| Software | Name of the software concentrator. | All levels |
| Direction | Direction of the flow. | All levels |
| Flow count | Number of flows. | All levels |

Sample Output

show services software

```

user@host> show services software
Interface: sp-3/0/0, Service set: v6rd-dom1-dom3-service-set
Software          Direction    Flow count
10.10.10.2        ->          30.30.30.1    I           13

```

show services software count

```

user@host> show services software count
Interface  Service set    DS-Lite    6RD
sp-0/0/0   dslite-svc-set1  2          0

```

show services software flows

Syntax `show services software flows`
 (`<interface interface-name> <service-set service-set-name>|`
`count <interface interface-name> <service-set service-set-name>|`
`ds-lite <B4 b4-address> <AFTR aftr-address>|`
`v6rd <initiator initiator-ip-address><concentrator concentrator-ip-address>)`

Release Information Command introduced in Junos OS Release 10.2.

Description Display statistics information about the software flows.

NOTE: Starting with Junos OS Release 14.1R4, the IPv6 prefix length associated with a subscriber's basic broadband bridging device that is subject to a limited number of sessions (`dslite-ipv6-prefix-length` attribute) is taken into account while the session count is calculated and displayed in the output of the `show services software flows` command. Until Junos OS Release 14.1R3, only IPv4 flows were counted and IPv6 flows were not considered for the statistics about software flows

Options `interface interface-name`—(Optional) Display statistics information about the specified interface only.

`service-set service-set-name`—(Optional) Display statistics information about the specified service set only.

`count <interface interface-name> <service-set service-set-name>|`—(Optional) Display flow count information only, with optional filtering by interface and service set.

`ds-lite <B4 b4-address> <AFTR aftr-address>|`—(Optional) Display DS-Lite flow information, with optional filtering by B4 (software initiator) and AFTR (software concentrator).

`v6rd <initiator initiator-ip-address><concentrator concentrator-ip-address>|`—(Optional) Display v6rd flow information, with optional filtering by the software initiator and software concentrator.

Required Privilege Level view

List of Sample Output [show services software flows on page 2036](#)

Output Fields [Table 99 on page 2036](#) lists the output fields for the `show services software flows` command. Output fields are listed in the approximate order in which they appear.

Table 99: show services software flows Output Fields

| Field Name | Field Description |
|--------------------|--|
| Interface | Name of the interface. |
| Service set | Name of the service set. |
| Flow | Description of flow, including protocol input and output interface addresses. |
| State | Flow state. Value is: <ul style="list-style-type: none"> • Forward |
| Dir | Flow direction. Values are: <ul style="list-style-type: none"> • I—inbound • O—outbound |
| Frm count | Number of frames transferred. |
| NAT dest | NAT translation of the decapsulated address. |
| Software | For outbound flows, the address of the local software initiator (B4 for DS-Lite) is shown first, followed by the address of the software concentrator (AFTR for DS-Lite). For inbound flows, the address of the software concentrator is shown first, followed by the address of the software initiator. |

Sample Output

show services software statistics

| | |
|---------------------------------|--|
| Syntax | <pre>show services software statistics <ds-lite> <ds-lite> <interface interface-name> <v6rd></pre> |
| Release Information | Command introduced in Junos OS Release 10.4. |
| Description | Display information about software services. |
| Options | <p>ds-lite—(Optional) Display only DS-Lite.</p> <p>interface interface-name —(Optional) Name of the interface servicing the software. When you omit this option, data for all interfaces are shown.</p> <p>v6rd—(Optional) Display only 6rd statistics.</p> |
| Required Privilege Level | view |
| List of Sample Output | show services software statistics on page 2041
show services software statistics ds-lite on page 2042 |
| Output Fields | Table 100 on page 2038 lists the output fields for the command-name command. Output fields are listed in the approximate order in which they appear. |

Table 100: command-name Output Fields

| Field Name | Field Description | Level of Output |
|------------------------------|--|-----------------------------|
| Service PIC Name | Name of service PIC for which statistics are shown. | statistics |
| Softwires Created | Number of softwires created. | statistics |
| Softwires Created for EIF/HP | Number of softwires created for endpoint-independent filtering (EIF) or hairpinning (HP). | statistics for ds-lite only |
| Softwires Deleted | Number of softwires deleted. | statistics |
| Softwires Flows Created | Number of flows created. | statistics |
| Softwires Flows Deleted | Number of flows deleted. | statistics |
| Slow Path Packets Processed | Number of packets processed as initial packets in a software session. These packets require a rule lookup and setting up of flows; this processing of an initial packet in a flow is called <i>the slow path</i> . | statistics |

Table 100: command-name Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|--|---------------------------------------|
| Slow Path Packets Processed for EIF/HP | Number of slow path EIF/HP packets processed. | statistics for ds-lite only |
| Fast Path Packets Processed | Number of packets processed that are not <i>slow path</i> . | statistics |
| Fast Path Encapsulated | Number of packets encapsulated in the fast path. | statistics |
| Softwire EIF Accept | Number of packets that matched an EIF entry that initiated the creation of a DS-Lite tunnel. The EIF entry was previously triggered by a DS-Lite packet. | statistics for ds-lite only |
| Rule Match Succeeded | Number of packets that matched a softwire rule. | statistics |
| Rule Match Failed | Number of packets that did not match any softwire rule. | statistics |
| IPv6 Packets Fragmented | Number of packets fragmented by the services PIC. | statistics for ds-lite only |
| IPv4 Client Fragments | Number of IPv4 fragments received from the client end over the softwire tunnel destined to the server. | statistics for ds-lite only |
| IPv4 Server First Fragments | Number of IPv4 first fragments received from the server destined to go over the softwire tunnel to the client. | statistics for ds-lite only |
| IPv4 Server More Fragments | Number of IPv4 other fragments (excluding first and last fragment) received from the server destined to go over the softwire tunnel to the client. | statistics for ds-lite only |
| IPv4 Server Last Fragments | Number of IPv4 last fragments received from the server destined to go over the softwire tunnel to the client. | statistics for ds-lite only |
| ICMPv4 Packets sent | Number of ICMPv4 packets sent to the softwire concentrator. | statistics |
| ICMPv4 Error Packets sent | Number of ICMPv4 error packets sent to the softwire concentrator. | statistics |
| ICMPv6 Packets sent | Number of ICMPv6 packets sent to the softwire concentrator. | statistics |
| Dropped ICMPv6 packets destined to AFTR | Number of ICMPv6 packets dropped instead of sending to the softwire concentrator. | statistics |
| Softwire Creation Failed | Number of softwire creation failures. | statistics for ds-lite and 6rd |

Table 100: command-name Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|------------------------------------|
| Softwire Creation Failed for EIF/HP | Number of softwire creation failures for EIF/HP. | statistics for ds-lite only |
| Flow Creation Failed | Number of flow creation failures. | statistics |
| Flow Creation Failed for EIF/HP | Number of flow creation failures for EIF/HP. | statistics for ds-lite only |
| Flow Creation Failed - Retry | Number of flow creations retried after failure. | statistics |
| Slow Path Failed | Number of failures detected in the slow path. | statistics |
| Slow Path Failed - Retry | Number of times processing of a packet was reprocessed in the slow path. | statistics |
| Packet not IPv4-in-IPv6 | Number of IPv4 packets not encapsulated in IPv6. | statistics for ds-lite only |
| IPv6 Fragmentation Error | Number of IPv6 packets with fragmentation errors. | statistics |
| Slow Path Failed-IPv6 Next Header Offset | Number of IPv6 header errors detected in slow path processing. | statistics for ds-lite only |
| Decapsulated Packet not IPv4 | Number of packets without IPv4 inner header. | statistics for ds-lite only |
| Decap Failed - IPv6 Next Header Offset | Decapsulation failure due to an unexpected inner header. | statistics for ds-lite only |
| Decap Failed - IPv4 L3 Integrity | Decapsulation failure due to incorrect Layer 3 data, such as not an IP packet, bad source or destination address, checksum error, or protocol error. | statistics for ds-lite only |
| Decap Failed - IPv4 L4 Integrity | Decapsulation failure due to incorrect Layer 4 data, such as errors in TCP, UDP, or TCP headers. | statistics for ds-lite only |
| No Softwire ID | Number of times a softwire ID was not found. | statistics |
| No Flow Extension | Number of times flow extensions were not found. | statistics |
| ICMPv4 Dropped Packets | Number of ICMPv4 packets dropped. | statistics |
| Packet not IPv6-in-IPv4 | Number of IPv6 packets not encapsulated in IPv4. | statistics for v6rd only |

Table 100: command-name Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|--|------------------------------------|
| Decapsulated
Packet not IPv6 | Number of packets without an IPv6 inner header. | statistics for v6rd only |
| Encapsulation
Failed - No packet
memory | Failed to encapsulate IPv6 packets in IPv4 due to low memory. | statistics for v6rd only |
| Flow limit exceeded | Flow not created because configured maximum flows per software is exceeded. | statistics |
| Session limit
exceeded | Flow not created because configured maximum DS-Lite software sessions per IPv6 prefix is exceeded. | statistics for ds-lite only |

Release Information Command introduced before Junos OS Release 7.4.
pgcp option introduced in Junos OS Release 8.4.

Description Display information about stateful firewall conversations.

Options **none**—Display standard information about all stateful firewall conversations.

brief | extensive | terse—(Optional) Display the specified level of output.

application-protocol *protocol*—(Optional) Display information about one of the following application protocols:

- **bootp**—Bootstrap protocol
- **dce-rpc**—Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—Domain Name System protocol
- **exec**—Exec
- **ftp**—File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol
- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol

- **shell**—Shell
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

destination-port *destination-port*—(Optional) Display information for a particular destination port. The range of values is 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Display information for a particular destination prefix.

interface *interface-name*—(Optional) Display information about a particular interface. On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port* or *rspnumber*.

limit *number*—(Optional) Maximum number of entries to display.

pgcp—(Optional) Display information about stateful firewall conversations for Packet Gateway Control Protocol (PGCP) flows.

protocol *protocol*—(Optional) Display information about one of the following IP types:

- **number**—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Display information for the specific service set.

source-port *source-port*—(Optional) Display information for a particular source port. The range of values is 0 to 65535.

source-prefix *source-prefix*—(Optional) Display information for a particular source prefix.

List of Sample Output [show services stateful-firewall conversations on page 2047](#)
[show services stateful-firewall conversations destination-port on page 2047](#)

Output Fields Table 101 on page 2046 lists the output fields for the **show services stateful-firewall conversations** command. Output fields are listed in the approximate order in which they appear.

Table 101: show services stateful-firewall conversations Output Fields

| Field Name | Field Description |
|--------------------------|--|
| Interface | Name of an adaptive services interface. |
| Service set | Name of a service set. Individual empty service sets are not displayed, but if no service set has any flows, a flow table header is printed for each service set. |
| Conversation | Information about a group of related flows. <ul style="list-style-type: none"> • ALG Protocol—Application-level gateway protocol. • Number of initiators—Number of flows that initiated a session. • Number of responders—Number of flows that responded in a session. |
| Flow or Flow Prot | Protocol used for this flow. |
| Source | Source prefix of the flow, in the format <i>source-prefix-port</i> . |
| Destination | Destination prefix of the flow. |
| State | Status of the flow: <ul style="list-style-type: none"> • Drop—Drop all packets in the flow without response. • Forward—Forward the packet in the flow without looking at it. • Reject—Drop all packets in the flow with response. • Watch—Inspect packets in the flow. |
| Dir | Direction of the flow: input (I) or output (O). |
| Source NAT | Original and translated source IPv4 or IPv6 addresses are displayed if Network Address Translation (NAT) is configured on this particular flow or conversation. |
| Frm Count | Number of frames in the flow. |
| Destin NAT | Original and translated destination IPv4 or IPv6 addresses are displayed if NAT is configured on this particular flow or conversation. |

Table 101: show services stateful-firewall conversations Output Fields (*continued*)

| Field Name | Field Description |
|-----------------|---|
| Byte count | Number of bytes forwarded in the flow. |
| TCP established | Whether a TCP connection was established: Yes or No . |
| TCP window size | Negotiated TCP connection window size, in bytes. |
| TCP acknowledge | TCP acknowledgment sequence number. |
| TCP tickle | Whether TCP inquiry mode is on (enabled or disabled) and the time remaining to send the next inquiry, in seconds. |
| Master flow | Flow that initiated the conversation. |
| Timeout | Lifetime of the flow, in seconds. |

Sample Output

show services stateful-firewall flow-analysis

| | |
|---------------------------------|--|
| Syntax | show services stateful-firewall flow-analysis
<interface <i>interface-name</i> > |
| Release Information | Command introduced in Junos OS Release 10.4R1. |
| Description | Display stateful firewall flow statistics. |
| Options | none —Display standard information about all stateful firewall flow statistics.

interface <i>interface-name</i> —(Optional) Display information about a particular interface. . |
| Required Privilege Level | view |
| List of Sample Output | show services stateful-firewall flow-analysis on page 2049
show services stateful-firewall flow-analysis interface sp-3/0/0 on page 2050 |
| Output Fields | Table 102 on page 2048 lists the output fields for the show services stateful-firewall flow-analysis command. Output fields are listed in the approximate order in which they appear. |

Table 102: show services stateful-firewall flow-analysis Output Fields

| Field Name | Field Description |
|------------------------------|---|
| Total Flows Active | Total active flows in the MS-PIC including TCP, UDP, ICMP and Softwires. |
| Total TCP Flows Active | Total active TCP flows in the MS-PIC. |
| Total UDP Flows Active | Total active UDP flows in the MS-PIC. |
| Total Other Flows Active | Total other active flows in the MS-PIC including ICMP and softwires. |
| Total Predicted Flows Active | Predicted flows are created only by the ALG traffic using the L3/L4 information available. |
| Created Flows per Second | Flow setup rate at the time of running the command. |
| Deleted Flows per Second | Flow deletion rate at the time of running the command. |
| Peak Total Flows Active | The highest number of active flows since the last PIC restart or since the last time flow statistics are flushed. |
| Peak Total TCP Flows Active | The highest number of active TCP flows since the last PIC restart or since the last time flow stats are flushed. |
| Peak Total UDP Flows Active | The highest number of active UDP flows since the last PIC restart or since the last time flow statistics are flushed. |

Table 102: show services stateful-firewall flow-analysis Output Fields (*continued*)

| Field Name | Field Description |
|---|---|
| Peak Total Other Flows Active | The highest number of other active flows since the last PIC restart or since the last time flow statistics are flushed. |
| Peak Created Flows per Second | The maximum flow setup rate observed since the last PIC restart or since the last time flow statistics are flushed. |
| Peak Deleted Flows per Second | The maximum flow deletion rate observed since the last PIC restart or from the last time flow statistics are flushed. |
| Average HTTP Flow Lifetime(ms) | Average HTTP Flow Lifetime in millisecond. |
| Packets received | The total number of packets received by the MS-PIC. |
| Packets transmitted | The total number of packets transmitted by the MS-PIC. |
| Slow path forward | The number of packets forwarded in the slow path (i.e. after the successful rule match and flow creation). |
| Slow path discard | The number of packets discarded before the flow creation. |
| Flow Rate Data: Number of Samples | The number of samples used to calculate the flow rate, since the last PIC restart or since the last time flow statistics are flushed. |
| Flow Rate Distribution(sec) Flow Operation :Creation Flow Operation :Deletion | Histogram of the samples used for flow rate calculation. |
| Flow Lifetime Distribution(sec): | Histogram of the samples used to calculate the flow life time in sec. |

show services stateful-firewall flows

Syntax `show services stateful-firewall flows`
 `<brief | extensive | summary | terse>`
 `<application-protocol protocol>`
 `<count>`
 `<destination-port destination-port>`
 `<destination-prefix destination-prefix>`
 `<interface interface-name>`
 `<limit number>`
 `<protocol protocol>`
 `<service-set service-set>`
 `<source-port source-port>`
 `<source-prefix source-prefix>`

Release Information Command introduced before Junos OS Release 7.4.
 pgcp option introduced in Junos OS Release 8.4.
 application-protocol option introduced in Junos OS Release 10.4.

Description Display stateful firewall flow table entries. When the interface is used for software processing, the type of software concentrator (**DS-LITE** or **6rd**) is shown, and frame counts are provided.

Options **none**—Display standard information about all stateful firewall flows.

brief | extensive | summary | terse—(Optional) Display the specified level of output.

application-protocol *application-protocol*—(Optional) Display information about one of the following application-level gateway (ALG) protocol types:

- **bootp**—Bootstrap protocol
- **dce-rpc**—Distributed Computing Environment (DCE) remote procedure call (RPC) protocol

NOTE: Use this option to select Microsoft Remote Procedure Call (MSRPC).

- **dce-rpc-portmap**—Distributed Computing Environment (DCE) remote procedure call (RPC) portmap protocol
- **dns**—Domain Name Service protocol
- **exec**—Remote execution protocol
- **ftp**—File Transfer Protocol
- **h323**—H.323 protocol
- **icmp**—Internet Control Message Protocol
- **iioip**—Internet Inter-ORB Protocol

- **ip**—Internet protocol
- **netbios**—NetBIOS protocol
- **netshow**—Netshow protocol
- **pptp**—Point-to-Point Tunneling Protocol
- **realaudio**—RealAudio protocol
- **rpc**—Remote Procedure Call protocol

NOTE: Use this option to select Sun Microsystems Remote Procedure Call protocol (SunRPC).

- **rpc-portmap**—Remote Procedure Call portmap protocol
- **rtsp**—Real-Time Streaming Protocol
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **talk**—Talk protocol
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

count—(Optional) Display a count of the matching entries.

destination-port *destination-port*—(Optional) Display information for a particular destination port. The range of values is from 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Display information for a particular destination prefix.

interface *interface-name*—(Optional) Display information about a particular interface. On M Series and T Series routers, *interface-name* can be *ms-fpc/pic/port* or *rspnumber*.

limit *number*—(Optional) Maximum number of entries to display.

protocol *protocol*—(Optional) Display information about one of the following IP types:

- ***number***—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol

- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Display information for a particular service set.

source-port *source-port*—(Optional) Display information for a particular source port. The range of values is from 0 to 65535.

source-prefix *source-prefix*—(Optional) Display information for a particular source prefix.

 <source-prefix *source-prefix*>

Release Information Command introduced in Junos OS Release 7.4.

Description Display stateful firewall Session Initiation Protocol (SIP) call information.

Options **count**—(Optional) Display a count of the matching entries.

brief—(Optional) Display brief SIP call information.

extensive—(Optional) Display detailed SIP call information.

terse—(Optional) Display terse SIP call information.

application-protocol—(Optional) Display information about one of the following application protocols:

- **bootp**—(SIP only) Bootstrap protocol
- **dce-rpc**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—(SIP only) Domain Name System protocol
- **exec**—(SIP only) Exec
- **ftp**—(SIP only) File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol

- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

destination-port *destination-port*—(Optional) Display information for a particular destination port. The range of values is from 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Display information for a particular destination prefix.

interface *interface-name*—(Optional) Display information about a particular adaptive services interface. On M Series and T Series routers, *interface-name* can be *sp-fpc/pic/port* or *rspnumber*.

limit *number*—(Optional) Maximum number of entries to display.

protocol—(Optional) Display information about one of the following IP types:

- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ipv6**—IPv6 within IP
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Display information for a particular service set.

source-port *source-port*—(Optional) Display information for a particular source port. The range of values is from 0 to 65535.

source-prefix *source-prefix*—(Optional) Display information for a particular source prefix.

List of Sample Output [show services stateful-firewall sip-call extensive on page 2061](#)

Output Fields [Table 104 on page 2060](#) lists the output fields for the **show services stateful-firewall sip-call** command. Output fields are listed in the approximate order in which they appear.

Table 104: show services stateful-firewall sip-call Output Fields

| Field Name | Field Description |
|----------------------------------|---|
| Interface | Name of an adaptive services interface. |
| Service set | Name of a service set. |
| From | Initiator address. |
| To | Responder address. |
| Call ID | SIP call identification string. |
| Number of initiator flows | Number of control , contact , or media initiator flows. |
| Number of responder flows | Number of control , contact , or media responder flows. |
| protocol | Protocol used for this flow. |
| source-prefix | Source prefix of the flow in the format source-prefix : port . |
| destination-prefix | Destination prefix of the flow. |
| state | Status of the flow: <ul style="list-style-type: none"> • Drop—Drop all packets in the flow without a response. • Forward—Forward the packet in the flow without examining it. • Reject—Drop all packets in the flow with a response. • Unknown—Unknown status. • Watch—Inspect packets in the flow. |
| direction | Direction of the flow: input (I), output (O), or unknown (U). |

Table 104: show services stateful-firewall sip-call Output Fields (*continued*)

| Field Name | Field Description |
|--------------------|--|
| <i>frame-count</i> | Number of frames in the flow. |
| Byte count | Number of bytes forwarded in the flow. |
| Flow role | Role of the flow that is under evaluation: Initiator , Master , Responder , or Unknown . |
| Timeout | Lifetime of the flow, in seconds. |

Table 106: show services stateful-firewall statistics Output Fields

| Field Name | Field Description |
|--|--|
| Interface | Name of an adaptive services interface. |
| Service set | Name of a service set. |
| New flows | Rule match counters for new flows: <ul style="list-style-type: none"> Rule Accepts—New flows accepted. Rule Discards—New flows discarded. Rule Rejects—New flows rejected. |
| Existing flow types packet counters | Rule match counters for existing flows: <ul style="list-style-type: none"> Accepts—Match existing forward or watch flow. Drop—Match existing discard flow. Rejects—Match existing reject flow. |

Table 106: show services stateful-firewall statistics Output Fields (*continued*)

| Field Name | Field Description |
|-----------------------------|--|
| Hairpinning Counters | <p>Hairpinning counters:</p> <ul style="list-style-type: none"> • Slow Path Hairpinned Packets—Slow path packets that were hairpinned back to the internal network. • Fast Path Hairpinned Packets—Fast path packets that were hairpinned back to the internal network. |
| Drops | <p>Drop counters:</p> <ul style="list-style-type: none"> • IP option—Packets dropped in IP options processing. • TCP SYN defense—Packets dropped by SYN defender. • NAT ports exhausted—Hide mode. The router has no available Network Address Translation (NAT) ports for a given address or pool. • Sessions dropped due to subscriber flow limit—Sessions dropped because the subscriber's flow limit was exceeded. |
| Errors | <p>Total errors, categorized by protocol:</p> <ul style="list-style-type: none"> • IP—Total IP version 4 errors. • TCP—Total Transmission Control Protocol (TCP) errors. • UDP—Total User Datagram Protocol (UDP) errors. • ICMP—Total Internet Control Message Protocol (ICMP) errors. • Non-IP packets—Total non-IPv4 errors. • ALG—Total application-level gateway (ALG) errors |

Table 106: show services stateful-firewall statistics Output Fields (*continued*)

| Field Name | Field Description |
|------------|---|
| IP Errors | <p>IPv4 errors:</p> <ul style="list-style-type: none"> • IP packet length inconsistencies—IP packet length does not match the Layer 2 reported length. • Minimum IP header length check failures—Minimum IP header length is 20 bytes. The received packet contains less than 20 bytes. • Reassembled packet exceeds maximum IP length—After fragment reassembly, the reassembled IP packet length exceeds 65,535. • Illegal source address 0—Source address is not a valid address. Invalid addresses are, loopback, broadcast, multicast, and reserved addresses. Source address 0, however, is allowed to support BOOTP and the destination address 0xffffffff. • Illegal destination address 0—Destination address is not a valid address. The address is reserved. • TTL zero errors—Received packet had a time-to-live (TTL) value of 0. • Illegal IP protocol number (0 or 255)—IP protocol is 0 or 255. • Land attack—IP source address is the same as the destination address. • Non-IPv4 packets—Packet was not IPv4. (Only IPv4 is supported.) • Bad checksum—Packet had an invalid IP checksum. • Illegal IP fragment length—Illegal fragment length. All fragments (other than the last fragment) must have a length that is a multiple of 8 bytes. • IP fragment overlap—Fragments have overlapping fragment offsets. • IP fragment reassembly timeout—Some of the fragments for an IP packet were not received in time, and the reassembly handler dropped partial fragments. • IP fragment limit exceeded: 0—Fragments that exceeded the limit. • Unknown: 0—Unknown fragments. |

Table 106: show services stateful-firewall statistics Output Fields (*continued*)

| Field Name | Field Description |
|------------|-------------------|
| TCP Errors | |

Table 106: show services stateful-firewall statistics Output Fields (*continued*)

| Field Name | Field Description |
|------------|---|
| | TCP protocol errors: |
| | <ul style="list-style-type: none"> • TCP header length inconsistencies—Minimum TCP header length is 20 bytes, and the IP packet received does not contain at least 20 bytes. • Source or destination port number is zero—TCP source or destination port is zero. • Illegal sequence number and flags combinations — Dropped because of TCP errors, such as an illegal sequence number, which causes an illogical combination of flags to be set. • SYN attack (multiple SYN messages seen for the same flow)—Multiple SYN packets received for the same flow are treated as a SYN attack. The packets might be retransmitted SYN packets and therefore valid, but a large number is cause for concern. • First packet not a SYN message—First packets for a connection are not SYN packets. These packets might originate from previous connections or from someone performing an ACK/FIN scan. • TCP port scan (TCP handshake, RST seen from server for SYN)—In the case of a SYN defender, if an RST (reset) packet is received instead of a SYN/ACK message, someone is probably trying to scan the server. This behavior can result in false alarms if the RST packet is not combined with an intrusion detection service (IDS). • Bad SYN cookie response—SYN cookie generates a SYN/ACK message for all incoming SYN packets. If the ACK received for the SYN/ACK message does not match, this counter is incremented. • TCP reconstructor sequence number error—This counter is incremented in the following cases:
The TCP seqno is 0 and all the TCP flags are also 0.
The TCP seqno is 0 and FIN/PSH/URG TCP flags are set. • TCP reconstructor retransmissions—This counter is incremented for the retransmitted packets during connection 3-way handshake. • TCP partially opened connection timeout (SYN)—This counter is incremented when the SYN Defender is enabled and the 3-way handshake is not completed within the SYN DEFENDER TIMEOUT. The connection will be closed and resources will be released by sending RST to the responder. • TCP partially opened connection timeout (SYN-ACK)—This counter is incremented when the SYN Defender is enabled and the 3-way handshake is not completed within the SYN DEFENDER TIMEOUT. The connection will be closed and resources will be released by sending RST to the responder. • TCP partially closed connection reuse—Not supported. • TCP 3-way error - client sent SYN+ACK—A SYN/ACK should be sent by the server on receiving a SYN. This counter is incremented when the first message received from the initiator is SYN+ACK. • TCP 3-way error - server sent ACK—ACK should be sent by the client on receiving a SYN/ACK from the server. This counter is incremented when the ACK is received from the Server instead of from the Client. • TCP 3-way error - SYN seq number retransmission mismatch—This counter is incremented when the SYN is received again with a different sequence number from the first SYN sequence number. • TCP 3-way error - RST seq number mismatch—A reset could be received from either side. The server could send a RST on receiving a SYN or the client could send a RST on receiving SYN/ACK. This counter is incremented when the |

Table 106: show services stateful-firewall statistics Output Fields (*continued*)

| Field Name | Field Description |
|-------------|--|
| | <p>RST is received either from the client or server with a non-matching sequence number.</p> <ul style="list-style-type: none"> • TCP 3-way error - FIN received—This counter is incremented when the FIN is received during the 3-way handshake. • TCP 3-way error - invalid flags (PSH, URG, ECE, CWR)—This counter is incremented when any of the PSH, URG, ECE, or CWR flags were received during the 3-way handshake. • TCP 3-way error - SYN recvd but no client flows—This counter is incremented when SYN is received but not from the connection initiator. The counter is not incremented in the case of simultaneous open, when the SYN is received in both the directions. • TCP 3-way error - first packet SYN+ACK—The first packet received was SYN+ACK instead of SYN. • TCP 3-way error - first packet FIN+ACK—The first packet received was FIN+ACK instead of SYN. • TCP 3-way error - first packet FIN—The first packet received was FIN instead of SYN. • TCP 3-way error - first packet RST—The first packet received was RST instead of SYN. • TCP 3-way error - first packet ACK—The first packet received was ACK instead of SYN. • TCP 3-way error - first packet invalid flags (PSH, URG, ECE, CWR)—The first packet received had invalid flags. • TCP Close error - no final ACK—This counter is incremented when ACK is not received after the FINs are received from both directions. • TCP Resumed Flow—Plain ACKs create flows if rule match permits, and these are classified as TCP Resumed Flows. This counter is incremented in the case of a TCP Resumed Flow. |
| UDP Errors | <p>UDP protocol errors:</p> <ul style="list-style-type: none"> • IP data length less than minimum UDP header length (8 bytes)—Minimum UDP header length is 8 bytes. The received IP packets contain less than 8 bytes. • Source or destination port is zero—UDP source or destination port is 0. • UDP port scan (ICMP error seen for UDP flow)—ICMP error is received for a UDP flow. This could be a genuine UDP flow, but it is counted as an error. |
| ICMP Errors | <p>ICMP protocol errors:</p> <ul style="list-style-type: none"> • IP data length less than minimum ICMP header length (8 bytes)—ICMP header length is 8 bytes. This counter is incremented when received IP packets contain less than 8 bytes. • ICMP error length inconsistencies—Minimum length of an ICMP error packet is 48 bytes, and the maximum length is 576 bytes. This counter is incremented when the received ICMP error falls outside this range. • Duplicate ping sequence number—Received ping packet has a duplicate sequence number. • Mismatched ping sequence number—Received ping packet has a mismatched sequence number. • No matching flow—No matching existing flow was found for the ICMP error. |

Table 106: show services stateful-firewall statistics Output Fields (*continued*)

| Field Name | Field Description |
|-------------------|---|
| ALG errors | <p>Accumulation of all the application-level gateway protocol (ALG) drops counted separately in the ALG context:</p> <ul style="list-style-type: none"> • BOOTP—Bootstrap protocol errors • DCE-RPC—Distributed Computing Environment-Remote Procedure Call protocols errors • DCE-RPC portmap—Distributed Computing Environment-Remote Procedure Call protocols portmap service errors • DNS—Domain Name System protocol errors • Exec—Exec errors • FTP—File Transfer Protocol errors • H323—H.323 standards errors • ICMP—Internet Control Message Protocol errors • IIOB—Internet Inter-ORB Protocol errors • Login—Login errors • NetBIOS—NetBIOS errors • Netshow—NetShow errors • Real Audio—RealAudio errors • RPC—Remote Procedure Call protocol errors • RPC portmap—Remote Procedure Call protocol portmap service errors • RTSP—Real-Time Streaming Protocol errors • Shell—Shell errors • SIP—Session Initiation Protocol errors • SNMP—Simple Network Management Protocol errors • SQLNet—SQLNet errors • TFTP—Trivial File Transfer Protocol errors • Traceroute—Traceroute errors |
| Drop Flows | <ul style="list-style-type: none"> • Maximum Ingress Drop flows allowed—Maximum number of ingress flow drops allowed. • Maximum Egress Drop flows allowed—Maximum number of egress flow drops allowed. • Current Ingress Drop flows—Current number of ingress flow drops. • Current Egress Drop flows—Current number of egress flow drops. • Ingress Drop Flow limit drops count—Number of ingress flow drops due to maximum number of ingress flow drops being exceeded. • Egress Drop Flow limit drops count—Number of egress flow drops due to maximum number of egress flow drops being exceeded. |

user@host> show services stateful-firewall statistics extensive
Interface: ms-1/3/0
Service set: interface-svc-set
New flows:
  Rule Accepts: 907, Rule Discards: 0, Rule Rejects: 0
Existing flow types packet counters:
  Accepts: 3535, Drop: 0, Rejects: 0
Haripinning counters:
  Slow Path Hairpinned Packets: 0, Fast Path Hairpinned Packets: 0
Drops:
  IP option: 0, TCP SYN defense: 0
  NAT ports exhausted: 0, Sessions dropped due to subscriber flow limit: 0
Errors:
  IP: 0, TCP: 0
  UDP: 0, ICMP: 0
  Non-IP packets: 0, ALG: 0
IP errors:
  IP packet length inconsistencies: 0
  Minimum IP header length check failures: 0
  Reassembled packet exceeds maximum IP length: 0
  Illegal source address: 0
  Illegal destination address: 0
  TTL zero errors: 0, Illegal IP protocol number (0 or 255): 0
  Land attack: 0
  Non-IPv4 packets: 0, Bad checksum: 0
  Illegal IP fragment length: 0
  IP fragment overlap: 0
  IP fragment reassembly timeout: 0
  IP fragment limit exceeded: 0
  Unknown: 0
TCP errors:
  TCP header length inconsistencies: 0
  Source or destination port number is zero: 0
  Illegal sequence number and flags combination: 0
  SYN attack (multiple SYN messages seen for the same flow): 0
  First packet not a SYN message: 0
  TCP port scan (TCP handshake, RST seen from server for SYN): 0
  Bad SYN cookie response: 0
  TCP reconstructor sequence number error: 0
  TCP reconstructor retransmissions: 0
  TCP partially opened connection timeout (SYN): 0
  TCP partially opened connection timeout (SYN-ACK): 0
  TCP partially closed connection reuse: 0
  TCP 3-way error - client sent SYN+ACK: 0
  TCP 3-way error - server sent ACK: 0
  TCP 3-way error - SYN seq number retransmission mismatch: 0
  TCP 3-way error - RST seq number mismatch: 0
  TCP 3-way error - FIN received: 0
  TCP 3-way error - invalid flags (PSH, URG, ECE, CWR): 0
  TCP 3-way error - SYN recvd but no client flows: 0
  TCP 3-way error - first packet SYN+ACK: 0
  TCP 3-way error - first packet FIN+ACK: 0
  TCP 3-way error - first packet FIN: 0
  TCP 3-way error - first packet RST: 0
  TCP 3-way error - first packet ACK: 0
  TCP 3-way error - first packet invalid flags (PSH, URG, ECE, CWR): 0
  TCP Close error - no final ACK: 0
```

```
TCP Resumed Flow: 0
UDP errors:
  IP data length less than minimum UDP header length (8 bytes): 0
  Source or destination port is zero: 0
  UDP port scan (ICMP error seen for UDP flow): 0
ICMP errors:
  IP data length less than minimum ICMP header length (8 bytes): 0
  ICMP error length inconsistencies: 0
  Duplicate ping sequence number: 0
  Mismatched ping sequence number: 0
  No matching flow: 0
ALG errors:
  BOOTP: 0, DCE-RPC: 0, DCE-RPC portmap: 0

show services stateful-firewall statistics application-protocol sip

| | |
|---------------------------------|--|
| Syntax | show services stateful-firewall application-protocol sip |
| Release Information | Command introduced in Junos OS Release 7.4. |
| Description | Display stateful firewall Session Initiation Protocol (SIP) statistics. |
| Options | This command has no options. |
| Required Privilege Level | view |
| List of Sample Output | show services stateful-firewall statistics application-protocol-sip on page 2077 |
| Output Fields | Table 107 on page 2076 lists the output fields for the show services stateful-firewall statistics application-protocol-sip command. Output fields are listed in the approximate order in which they appear. |

Table 107: show services stateful-firewall statistics application-protocol-sip Output Fields

| Field Name | Field Description |
|-------------------------------|---|
| Interface | Name of an adaptive services interface. |
| Service set | Name of the service set flow. |
| ALG | Name of the application-layer gateway. |
| Active SIP call count | Number of active SIP calls. |
| Active SIP registration count | Number of active SIP registrations. |
| REGISTER | Number of new, invalid, and retransmitted register requests sent to the SIP registrar. |
| INVITE | Number of new, invalid, and retransmitted invite messages sent by user agent clients. |
| ReINVITE | Number of new, invalid, and retransmitted reinvite messages sent by user agent clients. |
| ACK | Number of new, invalid, and retransmitted ACK messages received (in response to a SIP Call Invite message). |
| BYE | Number of new, invalid, and retransmitted requests to terminate SIP dialogues. |
| CANCEL | Number of new, invalid, and retransmitted SIP request cancellations. |
| SUBSCRIBE | Number of new, invalid, and retransmitted SIP requests to subscribe for event notifications. |
| NOTIFY | Number of new, invalid, and retransmitted event notifications in SIP dialogues. |

Table 107: show services stateful-firewall statistics application-protocol-sip
Output Fields (*continued*)

| Field Name | Field Description |
|------------------------------------|---|
| OPTIONS | Number of new, invalid, and retransmitted requests to query SIP capabilities. |
| INFO | Number of new, invalid, and retransmitted requests carrying application-level information. |
| UPDATE | Number of new, invalid, and retransmitted SIP dialogue updates. |
| REFER | Number of new, invalid, and retransmitted requests to the recipient to contact a third party. |
| Provisional responses | Number of new, invalid, and retransmitted responses from the user agent server to indicate the progress of a SIP transaction. |
| OK responses to INVITES | OK responses sent from the user agent clients to user agent servers in response to Invite messages. The server can then return an ACK message. |
| OK responses to non-INVITES | OK responses to SIP messages other than an Invite message. |
| Redirection responses | Responses from the user agent server to a user agent client requesting the client to contact a different SIP uniform resource identifier (URI). |
| Request failure responses | Responses that indicate a definite failure from a particular server. The client must not retry the same request without modification after receiving this response. |
| Server failure responses | Responses that indicate a server failure. |
| Global failure responses | Responses that indicate a server has definitive information about a particular user, not just the particular instance indicated in the Request URI. |
| Invalid responses | Responses that are invalid. |
| Response (all) retransmits | Retransmissions of all responses. |
| Parser | Syntax errors, content errors, and unknown methods counted by the message parser. |

Sample Output

show services stateful-firewall subscriber-analysis

| | |
|---------------------------------|--|
| Syntax | show services stateful-firewall subscriber analysis
<interface <i>interface-name</i> > |
| Release Information | Command introduced in Junos OS Release 11.4. |
| Description | Display information about the number of active subscribers on the service physical interface card (PIC). |
| Options | none —Display standard information about all active subscribers on the PIC.

interface <i>interface-name</i> —(Optional) Display information about a particular interface. |
| Required Privilege Level | view |
| List of Sample Output | show services stateful-firewall subscriber analysis on page 2080
show services stateful-firewall subscriber-analysis on page 2080 |
| Output Fields | Table 108 on page 2079 lists the output fields for the show services stateful-firewall subscriber analysis command. Output fields are listed in the approximate order in which they appear. |

Table 108: show services stateful-firewall subscriber-analysis Output Fields

| Field Name | Field Description |
|-------------------------------------|---|
| Services PIC Name | Name of an adaptive services interface. |
| Total Subscribers Active | Total number of subscribers currently active on the service PIC. |
| Created Subscribers per Second | Rate at which subscribers are currently being created on the service PIC. |
| Deleted Subscribers per Second | Rate at which subscribers are currently being deleted on the service PIC. |
| Peak Total Subscribers Active | Highest number of subscribers that were active during the lifetime of the service PIC. |
| Peak Created Subscribers per Second | Highest rate at which subscribers were being created during the lifetime of the service PIC. |
| Peak Deleted Subscribers per Second | Highest rate at which subscribers were being deleted during the lifetime of the service PIC. |
| Number of Samples | The current sampling period lifetime. |
| Subscriber Operation: Creation | Number of sampling intervals during which a number of subscribers in the indicated range were created during the current sampling period. |
| Subscriber Operation: Deletion | Number of sampling intervals during which a number of subscribers in the indicated range were deleted during the current sampling period. |

| Related Documentation | <ul style="list-style-type: none">• show services local-policy-decision-function statistics on page 2116 |

request services application-identification application

| | |
|---------------------------------|---|
| Syntax | <pre>request services application-identification application copy <i>predefined-application-name</i> request services application-identification application [disable enable] <i>predefined-application-name</i> <no-commit></pre> |
| Release Information | Command introduced in Release 11.4 of Junos OS. |
| Description | Copy, disable, or enable a predefined application signature. |
| Options | <p>copy—(Optional) Copy a predefined application signature from the database to the configuration and change the name (for example, my:FTP). The ID and order will be generated automatically. Do not name your custom application signature with the “junos” prefix; this prefix is reserved for predefined application signatures. You can copy the same predefined application signature only once; duplicate custom signatures are not allowed. The copy command does not initiate signature recompilation.</p> <hr/> <p> NOTE: In configuration mode, if an uncommitted action is pending, the request services application-identification application copy command will fail. Uncompiled application signatures are shown as uncommitted in the show services application-identification application [summary detail] command.</p> <hr/> <p>disable—(Optional) Disable a predefined application signature, initiate signature recompilation, and commit all pending uncompiled signatures to the configuration. Include the <no-commit> keyword to defer signature recompilation.</p> <p>The following conditions apply:</p> <ul style="list-style-type: none"> • You cannot disable a predefined application signature that is referenced by an active security policy or custom application signature. First modify or deactivate the policy or custom application signature. • If you disable an application signature, for example, junos:HTTP, that has nested applications, the nested applications will not be recognized. <p>enable—(Optional) Enable a predefined application signature, initiate signature recompilation, and commit all pending uncompiled signatures to the configuration. Include the <no-commit> keyword to defer signature recompilation.</p> <p>no-commit—(Optional) Enables you to enter multiple enable and disable commands before initiating signature recompilation (which takes some time) and committing the configuration. Uncompiled application signatures are shown as uncommitted in the show services application-identification application [summary detail] command.</p> |
| Required Privilege Level | maintenance |

show services application-identification application-system-cache

Syntax `show application-identification application-system-cache
<interface interface-name>`

Release Information Command introduced in Junos OS Release 9.5.
interface option added in Junos OS Release 10.1.

Description Display the database of cached values stored by the application identification (APPID) system.

NOTE: The `show services application-identification application-system-cache` command gives the information only when the application identifier (AI) is matched with the signature.

Options `interface interface-name`—Displays the services interfaces to query.

Required Privilege Level view

List of Sample Output [show application-identification application-system-cache on page 2094](#)

Output Fields [Table 110 on page 2094](#) lists the output fields for the `command-name` command. Output fields are listed in the approximate order in which they appear.

Table 110: show application-identification application-system-cache Output Fields

| Field Name | Field Description | Level of Output |
|-------------|---------------------|-----------------|
| IP address | IP address. | All levels |
| Port | Port number. | All levels |
| Protocol | Protocol name. | All levels |
| Application | Application number. | All levels |
| CPU | CPU number | All levels |

Sample Output

show application-identification application-system-cache

```
user@host> show application-identification application-system-cache interface ms-1/0/0
pic: 2/0
```

```
IP address      Port      Protocol  Application  CPU

show services application-identification counter

| | |
|---------------------------------|---|
| Syntax | show services application-identification counter
<interface <i>interface-name</i>> |
| Release Information | Command introduced in Junos OS Release 9.5.
interface option added in Junos OS Release 10.1. |
| Description | Display application identification (APPID) counter statistics. |
| Options | interface <i>interface-name</i> —Displays the services interfaces to query. |
| Required Privilege Level | view |
| List of Sample Output | show services application-identification counter on page 2097
show services application-identification counter on page 2097 |
| Output Fields | Table 111 on page 2096 lists the output fields for the show services application-identification counter command. Output fields are listed in the approximate order in which they appear. |

Table 111: show services application-identification counter Output Fields

| Field Name | Field Description |
|--|---|
| pic | PIC number. |
| Total sessions | Total number of sessions. |
| Total identified sessions | Total number of identified sessions. |
| Total unidentified sessions | Total number of unidentified sessions. |
| Total identified-by-address sessions | Number of sessions identified by address. |
| Total unidentified-by-address sessions | Number of sessions not identified by address. |
| Total identified-by-port sessions | Number of sessions identified by port. |
| Total unidentified-by-port sessions | Number of sessions not identified by port. |
| Total identified-by-icmp sessions | Number of sessions identified by ICMP. |
| Total unidentified-by-icmp sessions | Number of sessions not identified by ICMP. |
| Total identified-by-ip-protocol sessions | Number of sessions identified by IP protocol. |
| Total unidentified-by-ip-protocol sessions | Number of sessions not identified by IP protocol. |
| Total identified-by-signature sessions | Number of sessions identified by signature. |

Table 111: show services application-identification counter Output Fields (*continued*)

| Field Name | Field Description |
|--|---|
| Total unidentified-by-signature sessions | Number of sessions not identified by signature. |
| Total unspecified encrypted sessions | Number of encrypted sessions not specified by normal processes. |
| Total encrypted P2P sessions | Number of encrypted point-to-point sessions. |
| Total application system cache hits | Number of sessions found in the application system cache. |
| Total application system cache misses | Number of sessions not found in the application system cache. |
| Total identified-by-protocol sessions | Number of sessions identified by protocol. |
| Total unidentified-by-protocol sessions | Number of sessions not identified by protocol. |

Sample Output

show services application-identification group

| | |
|---------------------------------|---|
| Syntax | <code>show services application-identification group [detail <i>application-group name</i>] summary]</code> |
| Release Information | Command introduced in Release 11.4 of Junos OS. |
| Description | Display detailed or summary information about a specified application signature group or all application signature groups. Both custom and predefined application signature groups can be displayed. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • request services application-identification group on page 2090 |
| List of Sample Output | show services application-identification group summary on page 2099
show services application-identification group detail on page 2100 |
| Output Fields | Table 112 on page 2099 lists the output fields for the show services application-identification group command. Output fields are listed in the approximate order in which they appear. |

Table 112: show services application-identification group Output Fields

| Field Name | Field Description |
|-----------------------------|--|
| Description | Description of the specified application in the detailed display. |
| Group ID or ID | The unique ID number of an application signature or application signature group. ID numbers 1 through 32,767 are automatically generated for predefined application signatures and application signature groups; these IDs do not change. ID numbers for custom application signatures and application signature groups use ID numbers 32,768 to 65,534. |
| Disabled | The status of the application signature group and whether the signature method is currently used to identify this application. The default is No. |
| Application Group(s) | The application signature groups present. |
| Applications | The application signatures associated with this application signature group. |

Sample Output

show services application-identification group summary

```

user@host> show services application-identification group summary
Application Group(s): 24
Application Groups
my:enterprise                Disabled  ID
                             No             32770
junos:enterprise:voip        No             25
junos:peer-to-peer:voip      No             24
junos:peer-to-peer:chat      No             23
junos:peer-to-peer:file-sharing No             22
...
```

show services application-identification group detail

```
user@host> show services application-identification group detail junos:social-networking
Description: Detection for social networking sites such as Myspace, Facebook and
similar.
Group ID: 8
Disabled: no
Application-groups:
    junos:social-networking:facebook;
    junos:social-networking:myspace;

Applications:

show services application-identification application

| | |
|---------------------------------|--|
| Syntax | show services application-identification application [detail <i>application-name</i>] summary] |
| Release Information | Command introduced in Release 11.4 of Junos OS. |
| Description | Display detailed information about a specified application signature, all application signatures, or a summary of the existing application signatures and nested application signatures. Both custom and predefined application signatures and nested application signatures can be displayed. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • request services application-identification application on page 2088 |
| List of Sample Output | show services application-identification application summary on page 2104
show services application-identification application detail on page 2104 |
| Output Fields | Table 114 on page 2103 lists the output fields for the show services application-identification application command. Output fields are listed in the approximate order in which they appear. |

Table 114: show services application-identification application Output Fields

| Field Name | Field Description |
|-----------------------|---|
| Application(s) | The number of application signatures present. |
| Nested Application(s) | The number of nested application signatures present. |
| Application Name | Name of the predefined or custom application signature. Must be a unique name with a maximum length of 32 characters. |
| Application Group | Name of the application signature group associated with this application signature/nested application signature. Must be a unique name with a maximum length of 32 characters. |
| Disabled | The status of the application signature or nested application signature and whether the signature method is currently used to identify this application. The default is No. |
| ID | The unique ID number of an application signature or nested application signature. ID numbers 1 through 32,767 are automatically generated for predefined application signatures and nested application signatures; these IDs do not change. ID numbers for custom application signatures and nested application signatures use ID numbers 32,768 to 65,534. |
| Order | A unique number used to specify priority when multiple patterns are matched for the same session. The lowest order number takes the highest priority. |

Table 114: show services application-identification application Output Fields (*continued*)

| Field Name | Field Description |
|--|---|
| Application Tags | General information about this application type, for example, associated risk factors, technology, type of traffic, and so on.

Support of application signature tags is dependent on the version of the loaded signature database. Please refer to the Juniper Networks security portal for further information. |
| Port Mapping: Default ports | The default port for this application type. |
| Signature: Port range | Default ranges: TCP/0 through 65,535; UDP/0 through 65,535 (optional). |
| Client-to-server: DFA Pattern | Pattern-matching scheme used for client-to-server traffic. Maximum length is 1023 (optional). |
| Client-to-server: Regex Pattern | A compatible regular expression used to match client-to-server traffic. |
| Server to-client: DFA Pattern | Pattern-matching scheme used for server-to-client traffic. Maximum length is 1023 (optional). |
| Server-to-client: Regex Pattern | A compatible regular expression used to match server-to-client traffic. |
| Minimum Data | The minimum number of bytes or packets to apply to the DFA pattern. Default is 10; range is 4 through 1024. |

Sample Output

show services application-identification application summary

```

show services application-identification version

| | |
|---------------------------------|---|
| Syntax | show services application-identification version |
| Release Information | Command introduced in Release 10.2 of Junos OS. |
| Description | Display the Junos OS application package version. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none">• <i>request services application-identification download</i> |
| List of Sample Output | show services application-identification version on page 2106 |

Sample Output

show services application-identification version

The following output shows that the application package version is 1608.

```
user@host> show services application-identification version
Application package version: 1608
```

show services flows

Syntax show services flows
 <all | brief | extensive | terse>
 <application-protocol *protocol*>
 <count>
 <destination-port *destination-port*>
 <destination-prefix *destination-prefix*>
 <interface *interface-name*>
 <limit *number*>
 <protocol *protocol*>
 <service-set *service-set*>
 <source-port *source-port*>
 <source-prefix *source-prefix*>

Release Information Command introduced in Junos OS Release 9.5.
all option introduced in Junos OS Release 11.1.
application-protocol option introduced in Junos OS Release 11.1.

Description Display flow session table entries.

Options **none**—Display standard information about all flows.

all | brief | extensive | terse—(Optional) Display the specified level of output.

application-protocol—(Optional) Display information about one of the following application protocols:

- **bootp**—Bootstrap protocol
- **dce-rpc**—Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—Domain Name System protocol
- **exec**—Exec
- **ftp**—File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **pptp**—Point-to-Point Tunneling Protocol
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol

- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **talk**—Talk Program
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

NOTE: The flows for the DCE RPC ALG match the flows for the DCE RPC Portmap ALG. The flows for the RPC ALG match the flows for the RPC Portmap ALG.

count—(Optional) Display a count of the matching entries.

destination-port *destination-port*—(Optional) Display information for a particular destination port. The range of values is from 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Display information for a particular destination prefix.

interface *interface-name*—(Optional) Display information about a particular interface. On M Series and T Series routers, *interface-name* can be **ms-fpc/pic/port** or **rspnumber**.

limit *number*—(Optional) Maximum number of entries to display.

protocol *protocol*—(Optional) Display information about one of the following IP types:

- **number**—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **icmp6**—Internet Control Message Protocol version 6
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol

- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Transmission Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Display information for a particular service set.

source-port *source-port*—(Optional) Display information for a particular source port. The range of values is from 0 to 65535.

source-prefix *source-prefix*—(Optional) Display information for a particular source prefix.

Required Privilege Level view

Output Fields [Table 115 on page 2109](#) lists the output fields for the **show services flows** command. Output fields are listed in the approximate order in which they appear.

Table 115: show services flows Output Fields

| Field Name | Field Description | Level of Output |
|--------------------|---|-------------------|
| Interface | Name of the interface. | All levels |
| Service set | Name of a service set. Individual empty service sets are not displayed. If no service set has any flows, a flow table header is displayed for each service set. | All levels |
| Flow Count | Number of flows in a session. | count only |

Table 115: show services flows Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------|--|------------------|
| Flow or Flow Prot | Protocol used for this flow. | All levels |
| Source | Source prefix of the flow in the format <i>source-prefix:port</i> . For ICMP flows, port information is not displayed. | All levels |
| Dest | Destination prefix of the flow. For ICMP flows, port information is not displayed. | All levels |
| State | Status of the flow: <ul style="list-style-type: none"> • Drop—Drop all packets in the flow without response. • Forward—Forward the packet in the flow without looking at it. • Reject—Drop all packets in the flow with response. • Watch—Inspect packets in the flow. | All levels |
| Dir | Direction of the flow: input (I) or output (O). | All levels |
| Frm count | Number of frames in the flow. | All levels |
| Byte count | Number of bytes in the flow. | extensive |
| Flow role | Flow role. | extensive |
| Timeout | Timeout value. | extensive |
| Flow path | Flow path: symmetric or asymmetric. | extensive |

show services local-policy-decision-function flows

| | |
|---------------------------------|--|
| Syntax | show services local-policy-decision-function flows (interface <i>interface-name</i> subscriber <i>subscriber-name</i>) |
| Release Information | Command introduced in Junos OS Release 9.5. |
| Description | Display local policy decision function (L-PDF) flows. |
| Options | interface <i>interface-name</i> —Display L-PDF flows for the specified interfaces only.
subscribers <i>subscriber-name</i> —Display L-PDF flows for the specified subscribers only. |
| Required Privilege Level | view |
| List of Sample Output | show services local-policy-decision-function flows by interface on page 2115
show services local-policy-decision-function flows by subscriber on page 2115 |
| Output Fields | Table 116 on page 2114 lists the output fields for the show services local-policy-decision-function flows command. Output fields are listed in the approximate order in which they appear. |

Table 116: show services local-policy-decision-function flows Output Fields

| Field Name | Field Description |
|-------------------------------|--|
| Interface | Interface name. |
| service-set | Service set name. |
| service-set-interface | Service set interface name. |
| Currently active flows | Number of currently active flows. |
| High watermark flows | Maximum number of flows. |
| Protocol | (With interface option) Protocol identifier. |
| Source address | (With interface option) Source address. |
| Source port | (With interface option) Source port. |
| Destination address | (With interface option) Destination address. |
| Destination port | (With interface option) Destination port. |
| Application | (With interface option) Application name. |
| Application group | (With interface option) Application group identifier. |

Sample Output

show services local-policy- decision-function flows by interface

```
user@host> show services local-policy-decision-function flows subscriber user@juniper.net
Interface: ge-0/0/5.26
```

```
service-set: aac1_ms30
service-set interface: ms-3/0/0
```

```
Currently active flows: 0
High watermark flows: 0
```

show services local-policy- decision-function flows by subscriber

```
user@host> show services local-policy-decision-function flows interface ge-1/1/0
Interface: ge-1/1/0.0
```

```
service-set: IDP
service-set interface: ms-2/0/0
```

```
Currently active flows: 2
High watermark flows: 2
```

| Protocol | Source address | Source port | Destination address | Destination port |

Link and Multilink Services Operational Commands

- [show interfaces \(Link Services\)](#)
- [show interfaces \(Link Services IQ\)](#)
- [show interfaces \(Multilink Services\)](#)

show interfaces (Link Services)

Syntax For Multilink Frame Relay user-to-user network-to-network interface (UNI NNI):

```
show interfaces interface-type :channel
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

For Multilink Frame Relay end-to-end:

```
show interfaces interface-type
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

Release Information Command introduced before Junos OS Release 7.4.

Description Display status information about the specified link services interface.

Options *interface-type*—On M Series and T Series routers, the interface type is *ls-fpc/pic/port*.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level view

List of Sample Output [show interfaces extensive \(MFR UNI NNI\) on page 2126](#)
[show interfaces extensive \(MFR End-to-End\) on page 2128](#)

Output Fields [Table 118 on page 2118](#) lists the output fields for the **show interfaces** (link services) command. Output fields are listed in the approximate order in which they appear.

Table 118: Link Services show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|---------------------------------|-----------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |

Table 118: Link Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|--|------------------------------|
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface's index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| Link-level type | Encapsulation being used on the physical interface:
Multilink-Frame-Relay-UNI-NNI (default), LinkService , Frame-relay , Frame-relay-ccc , or Frame-relay-tcc . | All levels |
| MTU | Maximum transmission unit size on the physical interface. | All levels |
| Device flags | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) . | detail extensive none |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Link flags | Information about the link. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Hold-times | Current interface hold time up and hold time down, in milliseconds, in the format Up <i>n</i> ms, Down <i>n</i> ms . | detail extensive |

Table 118: Link Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|--|-----------------------|
| Multilink Frame Relay UNI NNI bundle options | <p>Multilink Frame Relay UNI NNI only) Configured information about Multilink Frame Relay bundle options.</p> <ul style="list-style-type: none"> • Device type—DCE (Data Communication Equipment) or DTE (Data Terminal Equipment). • MRRU—Configured size of the maximum received reconstructed unit (MRRU): 1500 to 4500 bytes. The default is 1524 bytes. • Fragmentation threshold—Configured fragmentation threshold: 128 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation. • Red differential delay limit—Red differential delay limit among bundle links has been reached, indicating an action will occur. • Yellow differential delay limit—Yellow differential delay among bundle links has been reached, indicating a warning will occur. • Red differential delay action—Type of actions taken when the red differential delay exceeds the red limit: Disable link transmit or Remove link from service. • Reassembly drop timer—Drop timeout value to provide a recovery mechanism if individual links in the link services bundle drop one or more packets: 1 through 127 milliseconds. By default, the drop timeout parameter is 0 (disabled). A value that is under 5 ms is not recommended. • Links needed to sustain bundle—Minimum number of links to sustain the bundle: 1 through 8. • LIP Hello timer—Link Interleaving Protocol hello timer: 1 through 180 seconds. <ul style="list-style-type: none"> • Acknowledgement timer—Maximum period to wait for an add link acknowledgement, hello acknowledgement, or remove link acknowledgement: 1 through 10 seconds. • Acknowledgement retries—Number of retransmission attempts to be made for consecutive hello or remove link messages after the expiration of the acknowledgement timer: 1 through 5. | detail extensive none |
| Multilink Frame Relay UNI NNI bundle options (continued) | <ul style="list-style-type: none"> • Bundle class—Bundle class ID. • LMI type—Multilink Frame Relay UNI NNI LMI type: ANSI or Q.933 ANNEX A. <ul style="list-style-type: none"> • T391 LIV polling timer—Multilink Frame Relay UNI NNI Full status polling counter: 1 through 255, with a default value of 6. • T392 polling verification timer—Multilink Frame Relay UNI NNI LMI error threshold. The number of errors required to bring down the link, within the event count specified by N393. The range is 1 through 10, with a default value of 3. • N391 full status polling count—Multilink Frame Relay UNI NNI Full status polling counter: 1 through 255. • N392 error threshold—Multilink Frame Relay UNI NNI LMI error threshold: 1 through 10. • N393 monitored event count—Multilink Frame Relay UNI NNI LMI monitored event count: 1 through 10, with a default value of 4. | detail extensive none |
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the physical interface. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router.</p> | detail extensive |

Table 118: Link Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|---|-----------------------|
| Multilink Frame Relay UNI NNI bundle errors | Information about Multilink Frame Relay bundle errors. <ul style="list-style-type: none"> • Packet drops—Number of packets dropped. • Fragment drops—Number of fragments dropped. • MRRU exceeded—Number of times a packet was dropped because the configured MRRU value was exceeded. • Exception events—Exception events counter. | detail extensive |
| Multilink Frame Relay UNI NNI bundle statistics | Information about Multilink Frame Relay bundles. <ul style="list-style-type: none"> • Fragments—Bundle fragment information. <ul style="list-style-type: none"> • Input—Total number and rate of frames and packets received, in Frames, fps (frames per second), Bytes, and bps (bits per second). • Output—Total number and rate of frames and packets transmitted, in Frames, fps, Bytes, and bps. • Packets—Bundle packet information. <ul style="list-style-type: none"> • Input—Total number and rate of frames and packets received, in Frames, fps (frames per second), Bytes, and bps (bits per second). • Output—Total number and rate of frames and packets transmitted, in Frames, fps, Bytes, and bps. | detail extensive |
| Multilink Frame Relay UNI NNI bundle links information | <ul style="list-style-type: none"> • Active bundle links—Number of bundle links that are currently active. • Removed bundle links—Number of bundle links that have been removed (RED differential delay action). • Disabled bundle links—Number of bundle links that have been disabled (RED differential delay action). | detail extensive none |
| Multilink Frame Relay UNI NNI active bundle links statistics | (Multilink Frame Relay UNI NNI only) Display information for each active bundle link. <ul style="list-style-type: none"> • Frames—Number of multilink control frames received on this bundle link. • fps—Rate of multilink control frames received on this bundle link (in frames per second). • Bytes—Number of bytes received on this bundle link. • bps—Number of bits per second received on this bundle link. • interface-name—Name of the bundle link interface. • Input—Total number and rate of frames and packets received. • Output—Total number and rate of frames and packets transmitted. • Current differential delay—Compare this bundle link's round trip time to the average of all bundle links' round trip times in ms (milliseconds). • Recent high differential delay—Highest differential delay value from the latest 10 intervals, in milliseconds. • Times over red diff delay—Number of times this bundle link exceeded the configured red differential delay limit. • Times over yellow diff delay—Number of times this bundle link exceeded the configured yellow differential delay limit. | detail extensive |

Table 118: Link Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|---|------------------|
| Multilink Frame Relay UNI NNI active bundle links statistics
(continued) | <ul style="list-style-type: none"> LIP—Link Interleaving Protocol information. Rcv—Number of messages received. Xmt—Number of messages transmitted. add_lnk—ADD_LINK message notifies the peer endpoint that the local endpoint supports frame processing. It is generated on both ends of a bundle link when a bundle link endpoint is ready to become operational. lnk_ack—ADD_LINK_ACK message notifies the peer that the local router has received a valid ADD_LINK message. lnk_rej—ADD_LINK_REJ message notifies the peer that the local router has received an invalid ADD_LINK message. hello—HELLO message notifies the peer that the local router is up. Both ends of a link bundle generate this message. hel_ack—HELLO_ACK message notifies the peer that the local router has received a valid HELLO message. lnk_rem—REMOVE_LINK message notifies the peer that the local router has received a REMOVE_LINK message. rem_ack—REMOVE_LINK_ACK message notifies the peer that the local router has received a valid ADD_LINK message. | detail extensive |
| Frame exceptions | <p>For Multilink Frame Relay end-to-end only. Information about framing exceptions. Includes events recorded under Exception Events for each logical interface.</p> <ul style="list-style-type: none"> Oversized frames—Number of frames received that exceed maximum frame length. Maximum length is 4500 Kb (kilobits). Errored input frames—Number of input frame errors. Input on disabled link/bundle—Number of frames received on disabled links. These frames can result either from an inconsistent configuration, or from a bundle or link being brought up or down with traffic actively flowing through it. Output for disabled link/bundle—Number of frames sent for a disabled or unavailable link. These frames can result either from an inconsistent configuration, or from a bundle being brought up or down while traffic is flowing through it. Queuing drops—Total number of packets dropped before traffic enters the link services IQ interface. Indicates that the interface is becoming oversubscribed. | detail extensive |
| Buffering exceptions | <p>For Multilink Frame Relay end-to-end only. Information about buffering exceptions. Includes events recorded under Exception Events for each logical interface:</p> <ul style="list-style-type: none"> Packet data buffer overflow—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services interface capacity. Fragment data buffer overflow—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services interface capacity. Check the logical interface exception event counters to determine which bundle is responsible. | detail extensive |

Table 118: Link Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|---|-------------------------|
| Assembly exceptions | <p>For Multilink Frame Relay end-to-end only. Information about assembly exceptions. Includes events recorded under Exception Events for each logical interface.</p> <p>An assembly exception does not necessarily indicate an operational problem with the physical link services interface itself. If multilink-encapsulated traffic is dropped or reordered after a sequence number has been assigned, the assembling multilink interface records one or more exception events. The multilink interface can drop multilink-encapsulated fragments itself as a result. Any multilink packets or fragments dropped by the physical link services interface itself result in packet or fragment drop counts on individual logical interfaces. If the logical interface drop counts are zero, but exception events are seen, the most likely cause is a problem with the individual link interfaces. Even if the logical interface fragment drop counts are nonzero, excess differential delay or traffic losses on individual interfaces can be the root cause.</p> | detail extensive |
| Assembly exceptions (continued) | <ul style="list-style-type: none"> • Fragment timeout—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. These events do not necessarily indicate any problem with the operation of the physical link services interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible. • Missing sequence number—A gap was detected in the sequence numbers of fragments on a bundle. These events do not necessarily indicate any problem with the operation of the physical link services interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible. • Out-of-order sequence number—Two frames with out-of-order sequence numbers occurred within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream. Check the logical interface exception event counters to determine which bundle is responsible. • Out-of-range sequence number—Frame was received with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. Check the logical interface exception event counters to determine which bundle is responsible. | detail extensive |
| Hardware errors | <p>For Multilink Frame Relay end-to-end only. Information about hardware errors:</p> <ul style="list-style-type: none"> • Data memory error—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support. • Control memory error—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support. | detail extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |

Table 118: Link Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|---|------------------------------|
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| Flags | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Encapsulation | Encapsulation being used: PPP, Multilink - FR or Multilink - PPP | All levels |
| Bandwidth | Speed at which the interface is running. | All levels |
| Bundle options | For Multilink Frame Relay end-to-end interfaces only: <ul style="list-style-type: none"> • MRRU—Configured size of the maximum received reconstructed unit (MRRU): 1500 to 4500 bytes. The default is 1524 bytes. • Drop timer period—Drop timeout value to provide a recovery mechanism if individual links in link services bundle drop one or more packets: 1 through 127 milliseconds. Values under 5 milliseconds are not recommended. The default setting is 0, which disables the timer. • Sequence number format—(MLPPP) Short sequence number header format. • Fragmentation threshold—Configured fragmentation threshold: 128 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation. • Links needed to sustain bundle—Minimum number of links to sustain the bundle: 1 through 8. • Interleave fragments—State of the process that interleaves long packets with high-priority ones. Only Disabled is currently supported. • Remote MRRU—MRRU value received from remote peer. If negotiation has not been initiated, the default value is displayed. | detail extensive none |
| Bundle status (MLPPP) or Multilink class status (MC-MLPPP) | Information about bundle status: <ul style="list-style-type: none"> • Remote MRRU—MRRU value received from remote peer. If negotiation has not been initiated, the default value is displayed. • Received sequence number—Sequence number for received packets. • Transmit sequence number—Sequence number for transmitted packets. • Packet drops—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. The packet drop counter is incremented if there is a temporary shortage of packet memory on the AS PIC, which causes packet fragmentation to fail. • Fragment drops—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. This counter also includes fragments that have been received successfully but had to be dropped because not all fragments that constituted a packet had been received. The fragment drop counter is incremented when a fragment received on constituent links is dropped. Drop fragments can be triggered by sequence ordering errors, duplicate fragments, timed-out fragments, and bad multilink headers. | detail extensive none |

Table 118: Link Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|---|------------------------------|
| Bundle status (MLPPP) or Multilink class status (MC-MLPPP) (continued) | <ul style="list-style-type: none"> • MRRU exceeded—Number of reassembled packets exceeding the MRRU. This counter is not implemented in this release. • Fragment timeout—Drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. • Missing sequence number—Gap detected in the sequence numbers of fragments on a bundle. • Out-of-order sequence number—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream. • Out-of-range sequence number—Frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. • Packet data buffer overflow—Packet buffer memory full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity. • Fragment data buffer overflow—Fragment buffer memory full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. | detail extensive none |
| Bundle errors | <p>Information about bundle errors.</p> <ul style="list-style-type: none"> • Packet drops—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. • Fragment drops—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. • MRRU exceeded—Number of reassembled packets exceeding the MRRU. • Exception events—Number of exceptional events encountered other than MRRU exceeded errors. These events are categorized under the physical interface: Frame exceptions, Buffering exceptions, and Fragment exceptions. Exception events do not necessarily indicate that the multilink interface is not operating properly. Individual link failures can produce exceptional events. | detail extensive |
| Statistics | <p>Information about fragments and packets received and sent by the router. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router.</p> <ul style="list-style-type: none"> • Bundle—Information about bundles. • Link—Information about links used in the multilink operation. | detail extensive |
| Protocol | Protocol family configured on the logical interface. | detail extensive none |
| MTU | MTU size on the logical interface. If the MTU value is negotiated down to meet the MRRU requirement on the remote side, this value is marked Adjusted . | detail extensive none |

Table 118: Link Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|--|-----------------------|
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route table | Routing table in which this address exists. For example, Route table:0 refers to inet.0. | detail extensive |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Addresses, Flags | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |
| Local | IP address of the logical interface. | detail extensive none |
| Broadcast | Broadcast address on the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |

show interfaces (Link Services IQ)

| | |
|---------------------------------|--|
| Syntax | <pre>show interfaces lsq-<i>fpc/pic/port</i> <brief detail extensive terse> <descriptions> <l2-statistics> <media> <snmp-index <i>snmp-index</i>> <statistics></pre> |
| Release Information | <p>Command introduced before Junos OS Release 7.4.</p> <p>l2-statistics option introduced with Junos OS Release 12.1.</p> |
| Description | (M Series, MX Series, and T Series routers only) Display status information about the specified link services intelligent queuing (IQ) interface. |
| Options | <p>lsq-<i>fpc/pic/port</i>—Display standard status information about the specified link services IQ interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>l2-statistics—(Optional) Display Layer 2 queue statistics for Multilink Point-to-Point Protocol (MLPPP), FRF.15, and FRF.16 bundles.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p> |
| Additional Information | Link services IQ interfaces are similar to link services interfaces. The important difference is that link services IQ interfaces fully support Junos OS class-of-service (CoS) components. |

Output Fields Table 63 on page 1886 lists the output fields for the **show interfaces** (link services IQ) command. Output fields are listed in the approximate order in which they appear.

Table 119: show interfaces (Link Services IQ) Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the "Enabled Field" section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| Link-level type | Encapsulation being used on the physical interface:
Multilink-Frame-Relay-UNI-NNI Multilink-Frame-Relay-UNI-NNI (default),
LinkService , Frame-relay , Frame-relay-ccc , or Frame-relay-tcc . | All levels |
| MTU | Maximum transmission unit size on the physical interface. | All levels |
| Device flags | Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) . | detail extensive none |

Table 119: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|------------------------------|
| Multilink Frame Relay UNI NNI bundle options | <p>(Multilink Frame Relay UNI NNI only) Configured information about Multilink Frame Relay bundle options.</p> <ul style="list-style-type: none"> • Device type—DCE (data communication equipment) or DTE (data terminal equipment). • MRRU—Configured size of the maximum received reconstructed unit (MRRU): 1500 to 4500 bytes. The default is 1524 bytes. • Bandwidth—Speed at which the interface is running. • Fragmentation threshold—Configured fragmentation threshold: 128 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation. • Red differential delay limit—Red differential delay limit among bundle links has been reached, indicating an action will occur. • Yellow differential delay limit—Yellow differential delay among bundle links has been reached, indicating a warning will occur. • Red differential delay action—Type of actions taken when the red differential delay exceeds the red limit: <i>Disable link transmit</i> or <i>Remove link from service</i>. • Link layer overhead—Percentage of bundle bandwidth to be set aside for link layer overhead. • Reassembly drop timer—Drop timeout value to provide a recovery mechanism if individual links in the link services bundle drop one or more packets: 1 through 127 milliseconds. By default, the drop timeout parameter is 0 (disabled). A value under 5 ms is not recommended. • Links needed to sustain bundle—Minimum number of links to sustain the bundle: 1 through 8. • LIP Hello timer—Link Interleaving Protocol hello timer: 1 through 180 seconds. <ul style="list-style-type: none"> • Acknowledgement timer—Maximum period to wait for an add link acknowledgement, hello acknowledgement, or remove link acknowledgement: 1 through 10 seconds. • Acknowledgement retries—Number of retransmission attempts to be made for consecutive hello or remove link messages after the expiration of the acknowledgement timer: 1 through 5. | detail extensive none |

| Multilink Frame Relay UNI NNI bundle options (continued) | <ul style="list-style-type: none"> • Bundle class—Bundle class ID. • LMI type—Multilink Frame Relay UNI NNI LMI type: ANSI, Q.933 ANNEX A, or Consortium. <ul style="list-style-type: none"> • T391 LIV polling timer—Multilink Frame Relay UNI NNI Full status polling counter: 1 through 255, with a default value of 6. • T392 polling verification timer—Multilink Frame Relay UNI NNI LMI error threshold. The number of errors required to bring down the link, within the event count specified by <i>N393</i>. The range is 1 through 10, with a default value of 3. • N391 full status polling count—Multilink Frame Relay UNI NNI Full status polling counter: 1 through 255. • N392 error threshold—Multilink Frame Relay UNI NNI LMI error threshold: 1 through 10. • N393 monitored event count—Multilink Frame Relay UNI NNI LMI monitored event count: 1 through 10, with a default value of 4. • Consortium LMI Settings <ul style="list-style-type: none"> • n391dte—DTE full status polling interval in seconds: 1 through 255. • n392dce—DCE error threshold: 1 through 10. • n392dte—DTE error threshold: 1 through 10. • n393dce—DCE monitored event count: 1 through 10. • n393dte—DTE monitored event count: 1 through 10. • t391dte—DTE polling verification timer (in seconds): 5 through 30. • t392dce—DCE polling verification timer (in seconds): 5 through 30. | detail extensive none |
| LMI | <p>Local Management Interface packet statistics:</p> <ul style="list-style-type: none"> • Input—Number of packets arriving on the interface (nn) and timestamp of the most recent packet arrival, in the format:
Input: nn (last seen hh:mm:ss ago) • Output—Number of packets sent out on the interface (nn) and how much time has passed since the last packet was sent, in the format:
Output: nn (last seen hh:mm:ss ago) | detail extensive none |
| DTE Statistics | <p>Statistics about information transferred from the data terminal equipment (DTE) to the data communications equipment (DCE).</p> <ul style="list-style-type: none"> • Enquiries sent—Number of link status enquiries sent from the DTE to the DCE. • Full enquiries sent—Number of full enquiries sent from the DTE to the DCE. • Enquiry responses received—Number of enquiry responses received by the DCE from the DTE. • Full enquiry responses received—Number of full enquiry responses received by DCE from the DTE. | detail extensive none |

Table 119: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| DCE Statistics | <p>Statistics about information transferred from the DCE to the DTE.</p> <ul style="list-style-type: none"> • Enquiries received—Number of enquiries received by the DCE from the DTE. • Full enquiries received—Number of full enquiries received by the DCE from the DTE. • Enquiry responses sent—Number of enquiry responses sent from the DCE to the DTE. • Full enquiry responses sent—Number of full enquiry responses sent from the DCE to the DTE. | detail extensive none |
| Common Statistics | <p>Statistics about messages sent between the DTE and the DCE.</p> <ul style="list-style-type: none"> • Unknown messages received—Number of received packets that do not fall into any other category. • Asynchronous updates received—Number of link status peer changes received. • Out-of-sequence packets received—Number of packets for which the sequence of the packets received is different from the expected sequence. • Keepalive responses timed out—Number of keepalive responses that time out when no Local Management Interface (LMI) packet was reported for n392dte or n393dce intervals. (See <i>LMI settings</i>.) | |
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the physical interface. All references to traffic direction (input or output) are defined with respect to the Packet Forwarding Engine (PFE). Input traffic refers to the fragments received by the ingress PFE, which get assembled into Layer 3 input packets. Output packets refer to the IP packets transmitted out of the ingress PFE to the LSQ, which get segmented into output fragments.</p> | detail extensive |
| DLCInn | <p>Data-link connection identifier (DLCI) number of the logical interface. The following information is displayed.</p> <ul style="list-style-type: none"> • Flags—Values are: <ul style="list-style-type: none"> • Active—Set when the link is active and the DTE and DCE are exchanging information. • Down—Set when the link is active, but no information is received from the DTE. • DCE unconfigured—Set when the corresponding DLCI in the DCE is not configured. • Configured—Set when the corresponding DLCCI is configured. • DCE-Configured—Displayed when the command is issued from the DTE. | |
| DLCI Statistics | <p>(Frame Relay) Data-link connection identifier (DLCI) statistics.</p> <ul style="list-style-type: none"> • Active DLCI—Number of active DLCIs. • Inactive DLCI—Number of inactive DLCIs. | |
| Input rate | (Redundant LSQ) Rate of bits and packets received on the interface. | None specified |
| Output rate | (Redundant LSQ) Rate of bits and packets transmitted on the interface. | None specified |

Table 119: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|-------------------------|
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | Number and rate of bytes and packets received and transmitted on the physical interface. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. | detail extensive |
| Frame exceptions | <p>Information about framing exceptions. Includes events recorded under Exception Events for each logical interface.</p> <ul style="list-style-type: none"> • Oversized frames—Number of frames received that exceed maximum frame length. Maximum length is 4500 Kb (kilobits). • Errored input frames—Number of input frame errors. • Input on disabled link/bundle—Number of frames received on disabled links. These frames can result either from an inconsistent configuration, or from a bundle or link being brought up or down with traffic actively flowing through it. • Output for disabled link/bundle—Number of frames sent for a disabled or unavailable link. These frames can result either from an inconsistent configuration, or from a bundle being brought up or down while traffic is flowing through it. • Queuing drops—Total number of packets dropped before traffic enters the link services IQ interface. Indicates that the interface is becoming oversubscribed. | extensive |
| Buffering exceptions | <p>Information about buffering exceptions. Includes events recorded under Exception Events for each logical interface:</p> <ul style="list-style-type: none"> • Packet data buffer overflow—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity. • Fragment data buffer overflow—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. Check the logical interface exception event counters to determine which bundle is responsible. | extensive |

Table 119: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------------|---|------------------------------|
| Assembly exceptions | <p>(Multilink Frame Relay end-to-end only) Information about assembly exceptions. Includes events recorded under Exception Events for each logical interface.</p> <p>An assembly exception does not necessarily indicate an operational problem with the physical link services IQ interface itself. If multilink-encapsulated traffic is dropped or reordered after a sequence number has been assigned, the interface records one or more exception events. The physical interface can drop multilink-encapsulated fragments itself as a result. Any multilink packets or fragments dropped by the interface itself result in packet or fragment drop counts on individual logical interfaces. If the logical interface drop counts are zero, but exception events are seen, the most likely cause is a problem with the individual link interfaces. Even if the logical interface fragment drop counts are nonzero, excess differential delay or traffic losses on individual interfaces can be the root cause.</p> <ul style="list-style-type: none"> • Fragment timeout—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. These events do not necessarily indicate any problem with the operation of the physical link services IQ interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible. • Missing sequence number—A gap was detected in the sequence numbers of fragments on a bundle. These events do not necessarily indicate any problem with the operation of the physical link services IQ interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible. • Out-of-order sequence number—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the link services IQ interface unable to correctly process the resulting stream. Check the logical interface exception event counters to determine which bundle is responsible. • Out-of-range sequence number—Received a frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. Check the logical interface exception event counters to determine which bundle is responsible. | extensive |
| Hardware errors (sticky) | <p>(Multilink Frame Relay end-to-end only) Information about hardware errors:</p> <ul style="list-style-type: none"> • Data memory error—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support. • Control memory error—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support. | extensive |
| Egress queues | Total number of egress queues supported on the specified interface. | detail extensive none |

Table 119: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------|---|------------------------------|
| Queue counters | Queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> Queued packets—Number of queued packets. Transmitted packets—Number of transmitted packets. Dropped packets—Number of packets dropped by the ASIC's RED mechanism. | detail extensive none |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| Flags | Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Encapsulation | Encapsulation being used: PPP or Multilink PPP. | All levels |
| Bandwidth | Speed at which the interface is running. | All levels |
| Bundle options | (Multilink Frame Relay end-to-end interfaces only) <ul style="list-style-type: none"> MRRU—Configured size of the maximum received reconstructed unit (MRRU): 1500 through 4500 bytes. The default is 1504 bytes. Drop timer period—Drop timeout value to provide a recovery mechanism if individual links in link services bundle drop one or more packets: 0 through 2000 milliseconds. Values under 5 ms are not recommended. The default setting is 0, which disables the timer. Sequence number format—Short sequence number header format (MLPPP only). Fragmentation threshold—Configured fragmentation threshold: 64 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation. Links needed to sustain bundle—Minimum number of links to sustain the bundle: 1 through 8. Multilink classes—Number of multilink classes negotiated. Link layer overhead—Percentage of bundle bandwidth to be set aside for link-layer overhead. | detail extensive none |

Table 119: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|---|------------------------------|
| Bundle status
(MLPPP) or
Multilink class status (Multiclass MLPPP) | Information about bundle status: <ul style="list-style-type: none"> • Remote MRRU—MRRU value received from remote peer. If negotiation has not been initiated, the default value is displayed. • Received sequence number—Sequence number for received packets. • Transmitted sequence number—Sequence number for transmitted packets. • Packet drops—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. The packet drop counter is incremented if there is a temporary shortage of packet memory on the AS PIC, which causes packet fragmentation to fail. • Fragment drops—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. This counter also includes fragments that have been received successfully, but had to be dropped because not all fragments that constituted a packet had been received. The fragment drop counter is incremented when a fragment received on constituent links is dropped. Drop fragments can be triggered by sequence ordering errors, duplicate fragments, timed-out fragments, and bad multilink headers. • MRRU exceeded—Number of reassembled packets exceeding the MRRU. This counter is not implemented in this release. • Fragment timeout—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. • Missing sequence number—A gap was detected in the sequence numbers of fragments on a bundle. • Out-of-order sequence number—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream. • Out-of-range sequence number—Received a frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. • Packet data buffer overflow—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity. • Fragment data buffer overflow—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. | detail extensive none |

Table 119: show interfaces (Link Services IQ) Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|---|------------------------------|
| Statistics | <p>Information about fragments and packets received and sent by the router. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. show interfaces (Multilink Services)

| | |
|---------------------------------|---|
| Syntax | <pre>show interfaces ml-fpc/pic/port <brief detail extensive terse> <descriptions> <media> <snmp-index> <statistics></pre> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M Series and T Series routers only) Display status information about the specified multilink services interface. |
| Options | <p>ml-fpc/pic/port—Display standard status information about the specified multilink services interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index—(Optional) Display the SNMP index of interface.</p> <p>statistics—(Optional) Display static interface statistics.</p> |
| Required Privilege Level | view |
| List of Sample Output | show interfaces extensive (Multilink Services) on page 2161 |
| Output Fields | Table 120 on page 2155 lists the output fields for the show interfaces (Multilink Services) command. Output fields are listed in the approximate order in which they appear. |

Table 120: Multilink Services show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|--|---------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface's index number, which reflects its initialization sequence. | detail extensive
none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive
none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

Table 120: Multilink Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|---------------------------------|
| Link-level type | Encapsulation being used on the physical interface: Multilink . | All levels |
| MTU | MTU size on the physical interface. | All levels |
| Device flags | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) . | detail extensive
none |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | Number and rate of bytes and packets received and transmitted on the physical interface. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. | detail extensive |
| Frame exceptions | Information about framing exceptions. Includes events recorded under Exception Events for each logical interface: <ul style="list-style-type: none"> • Oversized frames—Number of frames received that exceed maximum frame length. Maximum length is 4500 Kb (kilobits). • Errored input frames—Number of input frame errors. • Input on disabled link/bundle—Number of frames received on disabled links. These can result either from an inconsistent configuration, or from a bundle or link being brought up or down with traffic actively flowing through it. • Output for disabled link/bundle—Number of frames sent for a disabled or unavailable link. These can result either from an inconsistent configuration, or from a bundle being brought up or down with traffic actively flowing through it. • Queuing drops—Total number of packets dropped before traffic enters the link services IQ interface. Indicates that the interface is becoming oversubscribed. | extensive |
| Buffering exceptions | Information about buffering exceptions. Includes events recorded under Exception Events for each logical interface: <ul style="list-style-type: none"> • Packet data buffer overflow—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical multilink services interface capacity. • Fragment data buffer overflow—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical multilink services interface capacity. Check the logical interface exception event counters to determine which bundle is responsible. | extensive |

Table 120: Multilink Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|----------------------------|---|------------------|
| Assembly exceptions | <p>Information about assembly exceptions. Includes events recorded under Exception Events for each logical interface.</p> <p>An assembly exception does not necessarily indicate an operational problem with the Multilink PIC itself. If multilink-encapsulated traffic is dropped or reordered after a sequence number has been assigned, the assembling multilink interface records one or more exception events. The multilink interface can drop multilink-encapsulated fragments itself as a result. Any multilink packets or fragments dropped by the Multilink PIC itself result in packet or fragment drop counts on individual logical interfaces. If the logical interface drop counts are zero, but exception events are seen, the most likely cause is a problem with the individual link interfaces. Even if the logical interface fragment drop counts are nonzero, excess differential delay or traffic losses on individual interfaces can be the root cause.</p> <ul style="list-style-type: none"> • Fragment timeout—Drop-timer expired while a fragment sequence number was outstanding. Occurs only if drop-timer is enabled. This can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. These events do not necessarily indicate any problem with the operation of the Multilink PIC itself. If one or more individual links drop traffic, these events can occur. Check the logical interface exception event counters to determine which bundle is responsible. • Missing sequence number—A gap was detected in the sequence numbers of fragments on a bundle. These events do not necessarily indicate any problem with the operation of the Multilink PIC itself. If one or more individual links drop traffic, these events can occur. Check the logical interface exception event counters to determine which bundle is responsible. • Out-of-order sequence number—Two frames with out-of-order sequence numbers occurred within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream. Check the logical interface exception event counters to determine which bundle is responsible. • Out-of-range sequence number—Frame was received with out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost, or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. Check the logical interface exception event counters to determine which bundle is responsible. | extensive |
| Hardware errors | <p>Information about hardware errors:</p> <ul style="list-style-type: none"> • Data memory error—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support. • Control memory error—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support. | extensive |
| Logical Interface | | |
| Logical interface | Logical interface name. | All levels |

Table 120: Multilink Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-----------------------|---|---------------------------------|
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive
none |
| SNMP ifIndex | SNMP interface index number. | detail extensive
none |
| Encapsulation | Encapsulation being used: PPP or Multilink PPP. | All levels |
| Bandwidth | Speed at which the interface is running. | All levels |
| Flags | Logical interface flags. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> . | detail extensive
none |
| Bundle options | Information about configured bundle options: <ul style="list-style-type: none"> • MRRU—Configured size of the MRRU (maximum received reconstructed unit). It can be 1500 to 4500 bytes. • Drop timer period—Configured drop timeout period. It can be 0 through 127 ms. A value of 0 disables the timer. The default setting is 0. • Sequence number format—Configured size of the sequence header: 12 or 24 bits. The default is 24 bits. • Fragmentation threshold—Configured fragmentation threshold. A value of 0 results in no fragmentation. Nonzero values can be 128 through 16,320 bytes, in integer multiples of 64 bytes. The default is 0. • Links needed to sustain bundle—Minimum number of links to sustain the bundle: 1 through 8. | detail extensive
none |

Table 120: Multilink Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|---------------------------------|
| Bundle status (MLPPP) or Multilink class status (MC-MLPPP) | <p>Information about bundle status:</p> <ul style="list-style-type: none"> • Remote MRRU—MRRU value received from remote peer. If negotiation has not been initiated, the default value is displayed. • Received sequence number—Sequence number for received packets. • Transmitted sequence number—Sequence number for transmitted packets. • Packet drops—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. The packet drop counter is incremented if there is a temporary shortage of packet memory on the AS PIC, which causes packet fragmentation to fail. • Fragment drops—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. This counter also includes fragments that have been received successfully but had to be dropped because not all fragments that constituted a packet had been received. The fragment drop counter is incremented when a fragment received on constituent links is dropped. Drop fragments can be triggered by sequence ordering errors, duplicate fragments, timed-out fragments, and bad multilink headers. • MRRU exceeded—Number of reassembled packets exceeding the MRRU. This counter is not implemented in this release. • Fragment timeout—Drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. • Missing sequence number—Gap detected in the sequence numbers of fragments on a bundle. • Out-of-order sequence number—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream. • Out-of-range sequence number—Frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. • Packet data buffer overflow—Packet buffer memory full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity. • Fragment data buffer overflow—Fragment buffer memory full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. | detail extensive |
| Remote MRRU | MRRU value received from remote peer. If negotiation has not been initiated, the default value is displayed. | detail extensive
none |

Table 120: Multilink Services show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|--|---------------------------------|
| Bundle errors | Information about bundle errors: <ul style="list-style-type: none"> • Packet drops—Number and byte count of output packets dropped, rather than being encapsulated and sent out of the router as fragments. • Fragment drops—Number and byte count of input fragments dropped, rather than being reassembled and handled by the router as packets. • MRRU exceeded—Number of reassembled packets exceeding the MRRU. • Exception events—Number of exceptional events encountered while handling traffic on the bundle, other than MRRU exceeded errors. These events are categorized under the physical interface: Frame exceptions, Buffering exceptions, and Fragment exceptions. Exception events do not necessarily indicate that the multilink interface is not operating properly. Individual link failures can produce exceptional events. | detail extensive |
| Statistics | Information about fragments and packets received and sent by the router. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. <ul style="list-style-type: none"> • Bundle—Information about bundles. • Link—Information about links used in the multilink operation. | detail extensive |
| Protocol | Protocol family configured on the logical interface. | detail extensive
none |
| MTU | MTU size on the logical interface. If the MTU value is negotiated down to meet the MRRU requirement on the remote side, this value is marked Adjusted . | detail extensive
none |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive
none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route table | Route table in which this address exists. For example, Route table:0 refers to inet.0. | detail extensive |
| Addresses, Flags | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive
none |
| Destination | IP address of the remote side of the connection. | detail extensive
none |
| Local | IP address of the logical interface. | detail extensive
none |
| Broadcast | Broadcast address on the logical interface. | detail extensive
none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

Sample Output

show interfaces extensive (Multilink Services)

```

user@host> show interfaces ml-0/3/0 extensive
Physical interface: ml-0/3/0, Enabled, Physical link is Up

clear passive-monitoring statistics

| | |
|---------------------------------|---|
| Syntax | clear passive-monitoring statistics (all interface <i>interface-name</i>) |
| Release Information | Command introduced in Junos OS Release 7.6. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Clear statistics for one passive monitoring interface or for all passive monitoring interfaces. |
| Options | all —Clear statistics for all configured passive monitoring interfaces.

interface <i>interface-name</i> —Clear statistics for the specified passive monitoring interface (<i>mo-fpc/pic/port</i>). |
| Required Privilege Level | network |
| List of Sample Output | clear passive-monitoring statistics on page 2164 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear passive-monitoring statistics

```
user@host> clear passive-monitoring statistics interface mo-5/0/0
```

clear services accounting statistics inline-jflow

| | |
|---------------------------------|---|
| Syntax | clear services accounting statistics inline-jflow
<inline-jflow (fpc-slot <i>slot-number</i>)> |
| Release Information | Command introduced in Junos OS Release 14.2 for MX Series routers. |
| Description | Clear inline flow statistics for a specified FPC. |
| Options | <p>fpc-slot <i>slot-number</i>—Clear inline flow statistics for the specified FPC.</p> <ul style="list-style-type: none"> • MX80 routers only—Replace <i>slot-number</i> with a value from 0 through 1. • MX104 routers only—Replace <i>slot-number</i> with a value from 0 through 2. • MX240 routers only—Replace <i>slot-number</i> with a value from 0 through 2. • MX480 routers only—Replace <i>slot-number</i> with a value from 0 through 5. • MX960 routers only—Replace <i>slot-number</i> with a value from 0 through 11. • MX2010 routers only—Replace <i>slot-number</i> with a value from 0 through 9. • MX2020 routers only—Replace <i>slot-number</i> with a value from 0 through 19. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • show services accounting flow on page 2213 |

Sample Output

clear services accounting statistics inline-jflow

```
user@host> regress@mobsoln480b# run clear services accounting statistics inline-jflow fpc-slot
5
Statistics Cleared
```

clear services dynamic-flow-capture

| | |
|---------------------------------|---|
| Syntax | <code>clear services dynamic-flow-capture capture-group <i>group-name</i></code>
<code><criteria-identifier <i>identifier</i>></code>
<code><destination-identifier <i>identifier</i>></code>
<code><force></code>
<code><static></code> |
| Release Information | Command introduced in Junos OS Release 7.4. |
| Description | (M320 routers and T Series routers only) Clear dynamic flow capture information for specified capture group. |
| Options | <code>capture-group <i>group-name</i></code> —Capture-group identifier.

<code>criteria-identifier <i>identifier</i></code> —(Optional) Criteria identifier.

<code>destination-identifier <i>identifier</i></code> —(Optional) Content destination identifier.

<code>force</code> —(Optional) Force clearing of criteria.

<code>static</code> —(Optional) Clear static criteria. |
| Required Privilege Level | network |
| List of Sample Output | clear services dynamic-flow-capture on page 2166 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services dynamic-flow-capture

```
user@host> clear services dynamic-flow-capture capture-group flow-a
```

clear services flow-collector statistics

| | |
|---------------------------------|--|
| Syntax | clear services flow-collector statistics (all interface <i>interface-name</i>) |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Clear statistics for one flow collector interface or for all flow collector interfaces. |
| Options | <p>all—Clear statistics for all configured flow collector interfaces.</p> <p>interface <i>interface-name</i>—Clear statistics for the specified flow collector interface (<i>cp-fpc/pic/port</i>).</p> |
| Required Privilege Level | network |
| List of Sample Output | clear services flow-collector statistics on page 2167 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear services flow-collector statistics

```

user@host> clear services flow-collector statistics interface cp-5/0/0
Flow collector interface: cp-5/0/0
Interface state: Collecting flows
Statistics cleared successfully

```

clear services rpm twamp server connection

| | |
|---------------------------------|--|
| Syntax | clear services rpm twamp server connection
<i><connection-id></i> |
| Release Information | Command introduced in Junos OS Release 9.3. |
| Description | Clear connections established between the real-time performance monitoring (RPM) Two-Way Active Measurement Protocol (TWAMP) server and control clients. By default all established connections are cleared (along with the sessions on those connections). To clear only a specific connection, specify the connection ID when you issue the command. |
| Options | <i>connection-id</i> —(Optional) Clear only the specified connection. |
| Required Privilege Level | clear |

clear services video-monitoring mdi errors fpc-slot

| | |
|---------------------------------|--|
| Syntax | clear services video-monitoring mdi errors fpc-slot <i>fpc-slot</i> |
| Release Information | Command introduced in Junos OS Release 14.1. |
| Description | Clear all media delivery index error counters. |
| Options | fpc-slot —Number of the fpc slot. |
| Required Privilege Level | clear |
| Related Documentation | <ul style="list-style-type: none">• show services video-monitoring mdi stats fpc-slot on page 2291 |

clear services video-monitoring mdi statistics fpc-slot

| | |
|---------------------------------|--|
| Syntax | clear services video-monitoring mdi statistics fpc-slot <i>fpc-slot</i> |
| Release Information | Command introduced in Junos OS Release 14.1. |
| Description | Clear all media delivery index statistics counters except for active flows. |
| Options | fpc-slot —Number of the fpc slot. |
| Required Privilege Level | clear |
| Related Documentation | <ul style="list-style-type: none">• show services video-monitoring mdi stats fpc-slot on page 2291 |

request services flow-collector change-destination primary interface

| | |
|---------------------------------|--|
| Syntax | request services flow-collector change-destination primary interface <i>cp-fpc/pic/port</i>
<clear-files>
<clear-logs>
<immediately gracefully> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Switch to the primary File Transfer Protocol (FTP) server that is configured as a flow collector. |
| Options | <p>none—Switch to the primary FTP server.</p> <p>cp-fpc/pic/port—Specify the flow collector interface name for the primary destination.</p> <p>clear-files—(Optional) Request clearing of existing data files in the FTP wait queue when the switch takes place.</p> <p>clear-logs—(Optional) Request clearing of existing logs when the switch takes place.</p> <p>immediately gracefully—(Optional) Specify whether you want the switch to take place immediately, or to affect only newly created files.</p> |
| Required Privilege Level | maintenance |
| List of Sample Output | request services flow-collector change-destination primary interface on page 2171 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request services flow-collector change-destination primary interface

```

user@host> request services flow-collector change-destination primary interface cp-6/0/0
Flow collector interface: cp-6/0/0
Interface state: Collecting flows
Destination change successful

```

request services flow-collector change-destination secondary interface

| | |
|---------------------------------|---|
| Syntax | <code>request services flow-collector change-destination secondary interface <i>cp-fpc/pic/port</i></code>
<code><clear-files></code>
<code><clear-logs></code>
<code><immediately gracefully></code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Switch to the secondary File Transfer Protocol (FTP) server that is configured as a flow collector. |
| Options | <p>none—Switch to the secondary FTP server.</p> <p><i>cp-fpc/pic/port</i>—Specify the flow collector interface name (<i>cp-fpc/pic/port</i>) for the secondary destination.</p> <p>clear-files—(Optional) Request clearing of existing data files in the FTP wait queue when the switch takes place.</p> <p>clear-logs—(Optional) Request clearing of existing logs when the switch takes place.</p> <p>immediately gracefully—(Optional) Specify whether you want the switch to take place immediately, or to affect only newly created files.</p> |
| Required Privilege Level | maintenance |
| List of Sample Output | request services flow-collector change-destination secondary interface on page 2172 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request services flow-collector change-destination secondary interface

```
user@host> request services flow-collector change-destination secondary interface cp-6/0/0
Flow collector interface: cp-6/0/0
Interface state: Collecting flows
Destination change successful
```

request services flow-collector test-file-transfer

| | |
|---------------------------------|--|
| Syntax | <code>request services flow-collector test-file-transfer <i>filename</i> interface (all <i>cp-fpc/pic/port</i>) (channel-zero channel-one) (primary secondary)</code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers, PTX Series, and T Series routers only) Transfer a test file to the primary or secondary File Transfer Protocol (FTP) server that is configured as a flow collector. This command verifies that the output side of the flow collector interface is operating properly. |
| Options | <p><i>filename</i>—Name of the test file to transfer.</p> <p>interface all <i>cp-fpc/pic/port</i>—Transfer a test file of flows from all configured flow collector interfaces or from only the specified interface.</p> <p>channel-zero channel-one—Transfer a file from export channel 0 (unit 0) or channel 1 (unit 1) of the PIC.</p> <p>primary secondary—Transfer a file to the primary or secondary server configured as a flow collector.</p> |
| Required Privilege Level | network |
| List of Sample Output | request services flow-collector test-file-transfer on page 2173 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request services flow-collector test-file-transfer

```
user@router> request services flow-collector test-file-transfer test_file interface cp-7/1/0
channel-one primary
```

```
Flow collector interface: cp-7/1/0
Interface state: Collecting flows
Response: Test file transfer successfully scheduled
```

show forwarding-options next-hop-group

| | |
|---------------------------------|--|
| Syntax | show forwarding-options next-hop-group
<terse brief detail>
<group-name> |
| Release Information | Command introduced in Junos OS Release 9.6.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Support for IPv6 introduced in Junos OS Release 14.2 for the MX Series routers. |
| Description | Display current state of next-hop groups. |
| Options | terse brief detail —(Optional) Display the specified level of output.

group-name —(Optional) Display a single next-hop group. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • show forwarding-options port-mirroring on page 2177 |
| List of Sample Output | show forwarding-options next-hop-group terse on page 2175

```

show interfaces (Dynamic Flow Capture)

| | |
|---------------------------------|---|
| Syntax | <pre>show interfaces dfc-<i>fpc/pic/port:channel</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre> |
| Release Information | Command introduced in Junos OS Release 7.4. |
| Description | (M320 and M120 routers and T Series routers only) Display status information about the specified dynamic flow capture interface. |
| Options | <p>dfc-<i>fpc/pic/port:channel</i>—Display standard status information about the specified dynamic flow capture interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p> |
| Required Privilege Level | view |
| List of Sample Output | show interfaces (Dynamic Flow Capture) on page 2182 |
| Output Fields | Table 123 on page 2179 lists the output fields for the show interfaces (Dynamic Flow Capture) command. Output fields are listed in the approximate order in which they appear. |

Table 123: Dynamic Flow Capture show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Type | Type of interface. | All levels |

Table 123: Dynamic Flow Capture show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|--|-------------------------|
| Link-level type | Encapsulation type used on the physical interface. | All levels |
| MTU | Maximum Transmit Unit (MTU). Size of the largest packet to be transmitted. | All levels |
| Speed | Network speed on the interface. | All levels |
| Device flags | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Link type | Data transmission type. | All levels |
| Link flags | Information about the link. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: <i>year-month-day hour:minute:second timezone (hour:minute:second ago)</i> . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) . | detail extensive |
| Input Rate | Input rate in bits per second (bps) and packets per second (pps). | None specified |
| Output Rate | Output rate in bps and pps. | None specified |
| Traffic statistics | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> Input rate, Output rate—Number of bits per second (packets per second) received and transmitted on the interface. Input packets, Output packets—Number of packets received and transmitted on the interface. | detail extensive |
| Input errors | <ul style="list-style-type: none"> Errors—Input errors on the interface. Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. Framing errors—Number of packets received with an invalid frame checksum (FCS). Runts—Frames received smaller than the runt threshold. Giants—Frames received larger than the giant threshold. Policed Discards—Frames that the incoming packet match code discarded because the frames did not recognize them or were not of interest. Usually, this field reports protocols that the Junos OS does not support. Resource errors—Sum of transmit drops. | extensive |

Table 123: Dynamic Flow Capture show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|---|------------------------------|
| Output errors | <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, possibly once every 10 seconds, the cable, the remote system, or the interface is malfunctioning. • Errors—Sum of outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet dropped by the ASIC RED mechanism. • Resource errors—Sum of transmit drops. | extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Flags | Information about the logical interface; values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Encapsulation | Encapsulation on the logical interface. | All levels |
| Input packets | Number of packets received on the logical interface. | None specified |
| Output packets | Number of packets transmitted on the logical interface. | None specified |
| Traffic statistics | <p>Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface. • Input packets, Output packets—Number of packets received and transmitted on the interface. | detail extensive |
| Protocol | Protocol family configured on the logical interface (such as iso or inet6). | detail extensive none |
| MTU | MTU size on the logical interface. | detail extensive none |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Addresses, Flags | Addresses associated with the logical interface and information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |

Table 123: Dynamic Flow Capture show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------|--|-----------------------|
| Destination | IP address of the remote side of the connection. | detail extensive none |
| Local | IP address of the logical interface. | detail extensive none |

Sample Output

show interfaces (Dynamic Flow Capture)

```

user@host> show interfaces dfc-0/0/0
Physical interface: dfc-0/0/0, Enabled, Physical link is Up
  Interface index: 146, SNMP ifIndex: 36
  Type: Adaptive-Services, Link-level type: Dynamic-Flow-Capture, MTU: 9192, Speed:
  2488320kbps
  Device flags : Present Running
  Interface flags: Point-To-Point SNMP-Traps 16384
  Link type : Full-Duplex
  Link flags : None
  Last flapped : 2005-08-26 15:08:36 PDT (01:18:42 ago)
  Input rate : 0 bps (0 pps)
  Output rate : 44800440 bps (100000 pps)

Logical interface dfc-0/0/0.0 (Index 67) (SNMP ifIndex 43)
  Flags: Point-To-Point SNMP-Traps Encapsulation: Dynamic-Flow-Capture
  Input packets : 74
  Output packets: 132
  Protocol inet, MTU: 9192
    Flags: Receive-options, Receive-TTL-Exceeded
    Addresses, Flags: Is-Preferred Is-Primary
    Destination: 10.36.100.1, Local: 10.36.100.2

Logical interface dfc-0/0/0.1 (Index 68) (SNMP ifIndex 49)
  Flags: Point-To-Point SNMP-Traps Encapsulation: Dynamic-Flow-Capture
  Input packets : 0
  Output packets: 402927263
  Protocol inet, MTU: 9192
    Flags: Receive-options, Receive-TTL-Exceeded

Logical interface dfc-0/0/0.2 (Index 69) (SNMP ifIndex 50)
  Flags: Point-To-Point SNMP-Traps Encapsulation: Dynamic-Flow-Capture
  Input packets : 0
  Output packets: 0
  Protocol inet, MTU: 9192
    Flags: Receive-options, Receive-TTL-Exceeded

Logical interface dfc-0/0/0.16383 (Index 70) (SNMP ifIndex 44)
  Flags: Point-To-Point SNMP-Traps Encapsulation: Dynamic-Flow-Capture
  Input packets : 1427
  Output packets: 98
  Protocol inet, MTU: 9192
    Flags: Receive-options, Receive-TTL-Exceeded
    Addresses, Flags: Is-Preferred Is-Primary
    Destination: 10.0.0.16, Local: 10.0.0.1

```

| Traffic statistics | <p>Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface. • Input packets, Output packets—Number of packets received and transmitted on the interface. | detail extensive |

Table 124: Flow Collector Show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| Local statistics | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Transit statistics | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Protocol | Protocol family configured on the logical interface (such as iso or inet6). | detail extensive none |
| MTU | MTU size on the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route table | Route table in which this address exists; for example, Route table:0 refers to inet.0. | detail extensive |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Addresses, Flags | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |
| Local | IP address of the logical interface. | detail extensive none |
| Broadcast | Broadcast address. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

Sample Output

show interfaces extensive (Flow Collector)

```

user@host> show interfaces extensive cp-5/0/0
Physical interface: cp-5/0/0, Enabled, Physical link is Up
  Interface index: 145, SNMP ifIndex: 52, Generation: 29
  Type: Flow-collector, Link-level type: Flow-collection, MTU: 9192,
  Clocking: Unspecified, Speed: 800mbps
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps 16384
  Link type      : Full-Duplex
  Link flags     : None
  Physical info  : Unspecified
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: Unspecified, Hardware address: Unspecified

show interfaces (Flow Monitoring)

| | |
|---------------------------------|---|
| Syntax | <pre>show interfaces mo-fpc/pic/port:channel <brief detail extensive terse> <descriptions> <media> <snmp-index snmp-index> <statistics></pre> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M Series and T Series routers only) Display status information about the specified flow monitoring interface. |
| Options | <p>mo-fpc/pic/port:channel—Display standard status information about the specified flow monitoring interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p> |
| Required Privilege Level | view |
| List of Sample Output | show interfaces extensive (Flow Monitoring) on page 2192 |
| Output Fields | Table 125 on page 2189 lists the output fields for the show interfaces (Flow Monitoring) command. Output fields are listed in the approximate order in which they appear. |

Table 125: show interfaces Output Fields (Flow Monitoring)

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Link | Status of the link: up or down . | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |

Table 125: show interfaces Output Fields (Flow Monitoring) (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|------------------------------|
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Description | Description and name of the interface. | All levels |
| Type | Type of interface. | All levels |
| Link-level type | Encapsulation type used on the physical interface. | All levels |
| MTU | Maximum Transmit Unit (MTU). Size of the largest packet to be transmitted. | All levels |
| Clocking | Reference clock source of the interface. | All levels |
| Speed | Network speed on the interface. | All levels |
| Device flags | Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Link type | Data transmission type. | All levels |
| Link flags | Information about the link. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Physical info | Information about the physical interface. | All levels |
| Hold-times | Current interface hold-time up and hold-time down. Value is in milliseconds. | detail extensive |
| Current address | Configured MAC address. | detail extensive none |
| Hardware address | Media access control (MAC) address of the interface. | detail extensive none |
| Alternate link address | Backup link address. | detail extensive none |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: <i>year-month-day hour:minute:second timezone (hour:minute:second ago)</i> . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) | detail extensive |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |

Table 125: show interfaces Output Fields (Flow Monitoring) (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|---|------------------------------|
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface. • Input packets, Output packets—Number of packets received and transmitted on the interface. | detail extensive |
| Input errors | <ul style="list-style-type: none"> • Errors—Input errors on the interface. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Frames received smaller than the runt threshold. • Giants—Frames received larger than the giant threshold. • Policed Discards—Frames that the incoming packet match code discarded because the frames did not recognize them or were not of interest. Usually, this field reports protocols that Junos does not support. • Resource errors—Sum of transmit drops. | extensive |
| Output errors | <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, possibly once every 10 seconds, the cable, the remote system, or the interface is malfunctioning. • Errors—Sum of outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet dropped by the ASIC Red mechanism. • Resource errors—Sum of transmit drops. | extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Flags | Information about the logical interface; values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Encapsulation | Encapsulation on the logical interface. | All levels |

Table 125: show interfaces Output Fields (Flow Monitoring) (*continued*)

| Field Name | Field Description | Level of Output |

show passive-monitoring error

| | |
|---------------------------------|--|
| Syntax | <code>show passive-monitoring error (* all mo-fpc/pic/port)</code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Display passive monitoring error statistics. |
| Options | <code>* all mo-fpc/pic/port</code> —Display error statistics for monitoring interfaces. Use a wildcard character, specify all interfaces, or provide a specific interface name. |
| Required Privilege Level | view |
| List of Sample Output | show passive-monitoring error all on page 2195 |
| Output Fields | Table 126 on page 2194 lists the output fields for the show passive-monitoring error command. Output fields are listed in the approximate order in which they appear. |

Table 126: show passive-monitoring error Output Fields

| Field Name | Field Description |
|------------------------------------|---|
| Passive monitoring interface | Name of the passive monitoring interface. |
| Local interface index | Index counter of the local interface. |
| Interface state | State of the passive monitoring interface: <ul style="list-style-type: none"> • Monitoring—Specified interface is actively monitoring. • Disabled—Specified interface has been disabled from the CLI. • Not monitoring—The interface is operational, but not monitoring. This condition occurs when an interface first comes online, or when the interface is operational, but no logical unit has been configured under the physical interface. • Unknown—Unknown state. • Error—An error occurred during the process of determining the state of the interface. |
| Error information | |
| Packets dropped (no memory) | Number of packets dropped because of memory shortage. |
| Packets dropped (not IP) | Number of non-IP packets dropped. |
| Packets dropped (not IPv4) | Number of packets dropped because they failed the IPv4 version check. |
| Packets dropped (header too small) | Number of packets dropped because the packet length or IP header length was too small. |

Table 126: show passive-monitoring error Output Fields (*continued*)

| Field Name | Field Description |
|-----------------------------------|---|
| Memory allocation failures | Number of flow record memory allocation failures. A small number reflects failures to replenish the free list. A large number indicates the monitoring station is almost out of memory space. |
| Memory free failures | Number of flow record memory free failures. |
| Memory free list failures | Number of flow records received from free list that failed. Memory is nearly exhausted or too many new flows greater than 128 KB are being created per second. |
| Memory warning | Whether the flows have exceeded 1 million packets per second (Mpps) on a Monitoring Services PIC or 2 Mpps on a Monitoring Services II PIC. The response can be Yes or No . |
| Memory overload | Whether the memory has been overloaded. The response can be Yes or No . |
| PPS overload | Whether the PIC is receiving more packets per second than the configured threshold. The response can be Yes or No . |
| BPS overload | Whether the PIC is receiving more bits per second than the configured threshold. The response can be Yes or No . |

Sample Output

show passive-monitoring error all

```

user@host> show passive-monitoring error all
Passive monitoring interface: mo-4/0/0, Local interface index: 44
Interface state: Monitoring
Error information
  Packets dropped (no memory): 0, Packets dropped (not IP): 0
  Packets dropped (not IPv4): 0, Packets dropped (header too small): 0
  Memory allocation failures: 0, Memory free failures: 0
  Memory free list failures: 0
  Memory warning: No, Memory overload: No, PPS overload: No, BPS overload: No

Passive monitoring interface: mo-4/1/0, Local interface index: 45
Interface state: Not monitoring
Error information
  Packets dropped (no memory): 0, Packets dropped (not IP): 0
  Packets dropped (not IPv4): 0, Packets dropped (header too small): 0
  Memory allocation failures: 0, Memory free failures: 0
  Memory free list failures: 0
  Memory warning: No, Memory overload: No, PPS overload: No, BPS overload: No

```

show passive-monitoring flow

| | |
|---------------------------------|---|
| Syntax | <code>show passive-monitoring flow (* all mo-<i>fpc/pic/port</i>)</code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Display passive flow statistics. |
| Options | <code>* all mo-<i>fpc/pic/port</i></code> —Display passive flow statistics for monitoring interfaces. Use a wildcard character, specify all interfaces, or provide a specific interface name. |
| Required Privilege Level | view |
| List of Sample Output | show passive-monitoring flow all on page 2197 |
| Output Fields | Table 127 on page 2196 lists the output fields for the <code>show passive-monitoring flow</code> command. Output fields are listed in the approximate order in which they appear. |

Table 127: show passive-monitoring flow Output Fields

| Field Name | Field Description |
|------------------------------|---|
| Passive monitoring interface | Name of the passive monitoring interface. |
| Local interface index | Index counter of the local interface. |
| Interface state | State of the passive monitoring interface: <ul style="list-style-type: none"> • Monitoring—Specified interface is actively monitoring. • Disabled—Specified interface has been disabled from the CLI. • Not monitoring—The interface is operational, but not monitoring. This condition occurs when an interface first comes online, or when the interface is operational, but no logical unit has been configured under the physical interface. • Unknown—Unknown state. • Error—An error occurred during the process of determining the state of the interface. |
| Flow information | |
| Flow packets | Number of packets received by an operational PIC. |
| Flow bytes | Number of bytes received by an operational PIC. |
| Flow packets 10-second rate | Number of packets per second handled by the PIC and displayed as a 10-second average. |
| Flow bytes 10-second rate | Number of bytes per second handled by the PIC and displayed as a 10-second average. |
| Active flows | Number of currently active flows tracked by the PIC. |
| Total flows | Total number of flows received by an operational PIC. |

Table 127: show passive-monitoring flow Output Fields (*continued*)

| Field Name | Field Description |
|---------------------------------|--|
| Flows exported | Total number of flows exported by an operational PIC. |
| Flows packets exported | Total number of cflowd packets exported by an operational PIC. |
| Flows inactive timed out | Total number of flows that are exported because of inactivity. |
| Flows active timed out | Total number of long-lived flows that are exported because of an active timeout. |

Sample Output

show passive-monitoring flow all

```

user@host> show passive-monitoring flow all
Passive monitoring interface: mo-4/0/0, Local interface index: 44
Interface state: Monitoring
Flow information
  Flow packets: 6533434, Flow bytes: 653343400
  Flow packets 10-second rate: 0, Flow bytes 10-second rate: 0
  Active flows: 0, Total flows: 1599
  Flows exported: 1599, Flows packets exported: 55
  Flows inactive timed out: 1599, Flows active timed out: 0

Passive monitoring interface: mo-4/1/0, Local interface index: 45
Interface state: Monitoring
Flow information
  Flow packets: 6537780, Flow bytes: 653778000
  Flow packets 10-second rate: 0, Flow bytes 10-second rate: 0
  Active flows: 0, Total flows: 1601
  Flows exported: 1601, Flows packets exported: 55
  Flows inactive timed out: 1601, Flows active timed out: 0

```

show passive-monitoring memory

| | |
|---------------------------------|---|
| Syntax | <code>show passive-monitoring memory (* all mo-<i>fpc/pic/port</i>)</code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Display passive monitoring memory and flow record statistics |
| Options | <code>* all mo-<i>fpc/pic/port</i></code> —Display memory and flow record statistics for monitoring interfaces. Use a wildcard character, specify all interfaces, or provide a specific interface name. |
| Required Privilege Level | view |
| List of Sample Output | show passive-monitoring memory all on page 2198 |
| Output Fields | Table 128 on page 2198 lists the output fields for the show passive-monitoring memory command. Output fields are listed in the approximate order in which they appear. |

Table 128: show passive-monitoring memory Output Fields

| Field Name | Field Description |
|---|---|
| Passive monitoring interface | Name of the passive monitoring interface. |
| Local interface index | Index counter of the local interface. |
| Memory utilization | |
| Allocation count | Number of flow records allocated. |
| Free count | Number of flow records freed. |
| Maximum allocated | Maximum number of flow records allocated since the monitoring station booted. This number represents the peak number of flow records allocated at a time. |
| Allocations per second | Flow records allocated per second during the last statistics interval on the PIC. |
| Frees per second | Flow records freed per second during the last statistics interval on the PIC. |
| Total memory used,
Total memory free | Total memory currently used and total amount of memory currently free (in bytes). |

Sample Output

show passive-monitoring memory all

```
user@host> show passive-monitoring memory all
```

```
Passive monitoring interface: mo-4/0/0, Local interface index: 44
Memory utilization
  Allocation count: 1600, Free count: 1599, Maximum allocated: 1600
  Allocations per second: 3200, Frees per second: 1438
  Total memory used (in bytes): 103579176, Total memory free (in bytes):
  163914184
```

show passive-monitoring status

| | |
|---------------------------------|---|
| Syntax | <code>show passive-monitoring status (* all mo-fpc/pic/port)</code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Display passive monitoring status. |
| Options | <code>* all mo-fpc/pic/port</code> —Display status for monitoring interfaces. Use a wildcard character, specify all interfaces, or provide a specific interface name. |
| Required Privilege Level | view |
| List of Sample Output | show passive-monitoring status all on page 2201 |
| Output Fields | Table 129 on page 2200 lists the output fields for the show passive-monitoring status command. Output fields are listed in the approximate order in which they appear. |

Table 129: show passive-monitoring status Output Fields

| Output Field | Output Field Description |
|------------------------------|--|
| Passive monitoring interface | Name of the passive monitoring interface. |
| Local interface index | Index counter of the local interface. |
| Interface state | Monitoring state of the passive monitoring interface. <ul style="list-style-type: none"> • Monitoring—PIC is actively monitoring. • Disabled—PIC has been disabled using the CLI. • Not monitoring—PIC is operational, but not monitoring. This condition can happen while the PIC is coming online, or when the PIC is operational but has no logical unit configured under the physical interface. • Unknown |
| Group index | Integer that represents the monitoring group of which the PIC is a member. Group index is a mapping from the group name to an index. It is not related to the number of monitoring groups. |
| Export interval | Configured export interval for cflowd records, in seconds. |
| Export format | Configured export format (only cflowd version 5 is supported). |
| Protocol | Protocol the PIC is configured to monitor (only IPv4 is supported). |
| Engine type | Configured engine type that is inserted in output cflowd packets. |
| Engine ID | Configured engine ID that is inserted in output cflowd packets. |

Sample Output

show passive-monitoring status all

```
user@host> show passive-monitoring status all
Passive monitoring interface: mo-4/0/0, Local interface index: 44
Interface state: Monitoring
  Group index: 0
  Export interval: 15 secs, Export format: cflowd v5
  Protocol: IPv4, Engine type: 1, Engine ID: 1

Passive monitoring interface: mo-4/1/0, Local interface index: 45
Interface state: Disabled

Passive monitoring interface: mo-4/2/0, Local interface index: 46
Interface state: Not monitoring
```

show passive-monitoring usage

| | |
|---------------------------------|--|
| Syntax | <code>show passive-monitoring usage (* all mo-fpc/pic/port)</code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Display passive monitoring usage statistics. |
| Options | <code>* all mo-fpc/pic/port</code> —Display usage statistics for monitoring interfaces. Use a wildcard character, specify all interfaces, or provide a specific interface name. |
| Required Privilege Level | view |
| List of Sample Output | show passive-monitoring usage all on page 2202 |
| Output Fields | Table 130 on page 2202 lists the output fields for the show passive-monitoring usage command. Output fields are listed in the approximate order in which they appear. |

Table 130: show passive-monitoring usage Output Fields

| Output Field | Output Field Description |
|------------------------------|--|
| Passive monitoring interface | Name of the passive monitoring interface. |
| Local interface index | Index counter of the local interface. |
| CPU utilization | |
| Uptime | Time, in milliseconds, that the PIC has been operational. |
| Interrupt time | Total time that the PIC has spent processing packets since the last PIC reset. |
| Load (5 second) | CPU load on the PIC, averaged more than 5 seconds. The number is a percentage obtained by dividing the time spent on active tasks by the total elapsed time. |
| Load (1 minute) | CPU load on the PIC, averaged more than 1 minute. The number is a percentage obtained by dividing the time spent on active tasks by the total elapsed time. |

Sample Output

show passive-monitoring usage all

```

user@host> show passive-monitoring usage
Passive monitoring interface: mo-4/0/0, Local interface index: 44
CPU utilization
  Uptime: 653155 milliseconds, Interrupt time: 40213754 microseconds
  Load (5 second): 20%, Load (1 minute): 17%

Passive monitoring interface: mo-4/1/0, Local interface index: 45
CPU utilization

```

Uptime: 652292 milliseconds, Interrupt time: 40223178 microseconds
Load (5 second): 22%, Load (1 minute): 15%

Passive monitoring interface: mo-4/2/0, Local interface index: 46

CPU utilization

Uptime: 649491 milliseconds, Interrupt time: 40173645 microseconds
Load (5 second): 22%, Load (1 minute): 10098862%

show services accounting aggregation

| | |
|---------------------------------|---|
| Syntax | <code>show services accounting aggregation <i>aggregation-type</i> <<i>aggregation-value</i>></code>
<code><detail extensive terse></code>
<code><limit <i>limit-value</i>></code>
<code>< name <i>service-name</i>></code>
<code><order (bytes packets)></code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display information about the aggregated active flows being processed by the accounting service. |
| Options | <p><i>aggregation-type</i> <<i>aggregation-value</i>>—Display information for a particular aggregation type and optional value:</p> <ul style="list-style-type: none"><i>as</i> <<i>source-as-value</i> <i>destination-as-value</i> <i>input-snmp-interface-index-value</i> <i>output-snmp-interface-index-value</i>>—Aggregate by autonomous system (AS).<i>destination-prefix</i> <<i>destination-prefix-value</i> <i>destination-as-value</i> <i>output-snmp-interface-index-value</i>>—Aggregate by destination prefix.<i>protocol-port</i> <<i>protocol-value</i> <i>source-port-value</i> <i>destination-port-value</i>>—Aggregate by protocol and port.<i>source-destination-prefix</i> <<i>source-prefix-value</i> <i>destination-prefix-value</i> <i>destination-as-value</i> <i>source-as-value</i> <i>input-snmp-interface-index-value</i> <i>output-snmp-interface-index-value</i>>—Aggregate by source and destination prefix.<i>source-prefix</i> <<i>source-prefix-value</i> <i>source-as-value</i> <i>input-snmp-interface-index-value</i>>—Aggregate by source prefix. <p>detail extensive terse—(Optional) Display the specified level of output.</p> <p>limit <i>limit-value</i>—(Optional) Limit the display output to this number of flows. The default is no limit.</p> <p>name <i>service-name</i>—(Optional) Display information about the aggregated flows for a particular service name.</p> <p>order (bytes packets)—(Optional) Display the flow with the ordering of the highest number, either by byte count or by packet count.</p> |
| Additional Information | For information about aggregation configuration options, see the <i>Junos OS Services Interfaces Library for Routing Devices</i> . |
| Required Privilege Level | view |
| List of Sample Output | show services accounting aggregation protocol-port detail on page 2206
show services accounting aggregation source-destination-prefix on page 2206 |

[show services accounting aggregation source-destination- prefix order packet detail on page 2206](#)

Output Fields [Table 131 on page 2205](#) lists the output fields for the **show services accounting aggregation** command. Output fields are listed in the approximate order in which they appear.

Table 131: show services accounting aggregation Output Fields

| Field Name | Field Description |
|------------------------------|---|
| Service Accounting interface | Name of the service accounting interface. |
| Local interface index | Index corresponding to the service accounting interface. |
| Service name | Name of a service that was configured at the [edit forwarding-options accounting] hierarchy level. The default display, (default sampling), indicates the service was configured at the [edit forwarding-options sampling-level] hierarchy level. |
| Protocol | Protocol identifier and number. |
| Source Port | Source port identifier and number. |
| Destination Port | Destination port identifier and number. |
| Source-AS | Source autonomous system (AS) number. |
| Destination-AS | Destination AS number. |
| Source Prefix | Source prefix. |
| Destination Prefix | Destination prefix. |
| Source address | Source address. |
| Source prefix length | Source prefix length. |
| Destination address | Destination address. |
| Destination prefix length | Destination prefix length. |
| Input SNMP interface index | SNMP index of the interface the packet came in on. |
| Output SNMP interface index | SNMP index of the interface the packet went out on. |

Table 131: show services accounting aggregation Output Fields (*continued*)

| Field Name | Field Description |
|--------------|---|
| Start time | Actual time when the packet in this aggregation was first seen. |
| End time | Actual time when the packet in this aggregation was last seen. |
| Flow count | Number of flows in the aggregation. |
| Packet count | Number of packets in the aggregation. |
| Byte count | Number of bytes in the aggregation. |

Sample Output

show services accounting aggregation protocol-port detail

```

user@host> show service accounting aggregation protocol-port detail
Service Accounting interface: mo-2/0/0, Local interface index: 468
Service name: (default sampling)
  Protocol: 6, Source port: 20, Destination port: 20
  Start time: 442349, End time: 6425714
  Flow count: 194, Packet count: 4294964388, Byte count: 4294781184

  Protocol: 0, Source port: 0, Destination port: 0

show services accounting errors

| | |
|---------------------------------|--|
| Syntax | show services accounting errors
<inline-jflow name (* all <i>service-name</i>)> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display active flow error statistics. |
| Options | <p>none—Display error statistics for all services accounting instances.</p> <p>inline-jflow fpc-slot <i>slot-number</i>—(Optional) Display error statistics for inline jflow.</p> <p>name (* all <i>service-name</i>)—(Optional) Display active flow error statistics. Use a wildcard character, specify all services, or provide a specific service name.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> show services accounting flow on page 2213 |
| List of Sample Output | <p>show services accounting errors (Monitoring PIC interface) on page 2210</p> <p>show services accounting errors (Service PIC interface) on page 2211</p> <p>show services accounting errors inline-jflow fpc-slot slot-number (when only IPv6 is configured) on page 2211</p> <p>show services accounting errors inline-jflow fpc-slot slot-number (when both IPv4 and IPv6 are configured) on page 2211</p> <p>show services accounting errors inline-jflow (MX80 Router when both IPv4 and IPv6 are configured) on page 2211</p> |
| Output Fields | Table 133 on page 2209 lists the output fields for the show services accounting errors command. Output fields are listed in the approximate order in which they appear. |

Table 133: show services accounting errors Output Fields

| Field | Field Description |
|------------------------------|---|
| Service Accounting interface | Name of the service accounting interface. |
| Local interface index | Index counter of the local interface. |
| FPC slot | Slot number of the FPC for which the flow information is displayed. (Available only when the inline-jflow fpc-slot slot-number option is used.) |
| Service name | Name of a service that was configured at the [edit forwarding-options accounting] hierarchy level. The default display, (default sampling) , indicates the service was configured at the [edit forwarding-options sampling-level] hierarchy level. |

Error Information

Table 133: show services accounting errors Output Fields (*continued*)

| Field | Field Description |
|------------------------------------|---|
| Packets dropped (no memory) | Number of packets dropped because of memory shortage. |
| Packets dropped (not IP) | Number of non-IP packets dropped. |
| Packets dropped (not IPv4) | Number of packets dropped because they failed the IPv4 version check. |
| Packets dropped (header too small) | Number of packets dropped because the packet length or IP header length was too small. |
| Memory allocation failures | Number of flow record memory allocation failures. A small number reflects failures to replenish the free list. A large number indicates the monitoring station is almost out of memory space. |
| Memory free failures | Number of flow record memory free failures. |
| Memory free list failures | Number of flow records received from the free list that failed. Memory is nearly exhausted, or too many new flows greater than 128 KB are being created per second. |
| Memory overload | Whether the memory has been overloaded. The response can be Yes or No . |
| PPS overload | Whether the PIC is receiving more packets per second than the configured threshold. The response can be Yes or No . |
| BPS overload | Whether the PIC is receiving more bits per second than the configured threshold. The response can be Yes or No . |
| Flow Creation Failures | Number of times flow creation failed. |
| Route Record Lookup Failures | Number of times the route record lookup failed. |
| AS Lookup Failures | Number of times autonomous system lookup failed. |
| Export Packet Failures | Number of times packet export failed. |

Sample Output

show services accounting errors (Monitoring PIC interface)

```

user@host> show services accounting errors
Service Accounting interface: mo-1/1/0, Local interface index: 15
Service name: (default sampling)
Error information
  Packets dropped (no memory): 0, Packets dropped (not IP): 0
  Packets dropped (not IPv4): 0, Packets dropped (header too small): 0
  Memory allocation failures: 0, Memory free failures: 0
  Memory free list failures: 0
  Memory overload: No, PPS overload: No, BPS overload: No

```

Sample Output

show services accounting errors (Service PIC interface)

```

user@host> show services accounting errors
Service Accounting interface: sp-0/1/0
Service name: (default sampling)

| Output Fields | Table 134 on page 2213 lists the output fields for the show services accounting flow command. Output fields are listed in the approximate order in which they appear. |

Table 134: show services accounting flow Output Fields

| Output Field | Output Field Description |
|------------------------------|---|
| Service Accounting interface | Name of the service accounting interface. |
| Local interface index | Index counter of the local interface. |

Table 134: show services accounting flow Output Fields (*continued*)

| Output Field | Output Field Description |
|------------------------------------|--|
| Service name | Name of a service that was configured at the [edit forwarding-options accounting] hierarchy level. The default display, (default sampling), indicates the service was configured at the [edit forwarding-options sampling-level] hierarchy level. |
| Flow Information | |
| FPC Slot | Slot number of the FPC for which the flow information is displayed. (Available only when the inline-jflow fpc-slot slot-number option is used.) |
| Flow packets | Number of packets received by an operational PIC. |
| Flow bytes | Number of bytes received by an operational PIC. |
| Flow packets 10-second rate | Number of packets per second handled by the PIC and displayed as a 10-second average. |
| Flow bytes 10-second rate | Number of bytes per second handled by the PIC and displayed as a 10-second average. |
| Active flows | Number of currently active flows tracked by the PIC. |
| Total flows | Total number of flows received by an operational PIC. |
| Flows exported | Total number of flows exported by an operational PIC. |
| Flows packets exported | Total number of cflowd packets exported by an operational PIC. |
| Flows inactive timed out | Total number of flows that are exported because of inactivity. |
| Flows active timed out | Total number of long-lived flows that are exported because of an active timeout. |

Sample Output

show services accounting flow (flow aggregation v5/v8 configuration)

```

user@host> show services accounting flow
Service Accounting interface: rsp0, Local interface index: 171
Service name: (default sampling)
Interface state: Accounting
Flow information
  Flow packets: 87168293, Flow bytes: 5578770752
  Flow packets 10-second rate: 45762, Flow bytes 10-second rate: 2928962
  Active flows: 1000, Total flows: 2000
  Flows exported: 19960, Flows packets exported: 582
  Flows inactive timed out: 1000, Flows active timed out: 29000

```

show services accounting flow (flow aggregation v9 configuration)

```

user@host> show services accounting flow
Flow information
  Service Accounting interface: sp-7/1/0, Local interface index: 149

```

```

Flow packets: 0, Flow bytes: 0
Flow packets 10-second rate: 0, Flow bytes 10-second rate: 0
Active flows: 0, Total flows: 0
Flows exported: 0, Flows packets exported: 1
Flows inactive timed out: 0, Flows active timed out: 0

```

show services accounting flow name

```

user@host> show services accounting flow count2
Service Accounting interface: mo-1/1/0, Local interface index: 15

show services accounting flow-detail

Syntax `show services accounting flow-detail`
 `<detail | extensive | terse>`
 `<filters>`
 `<limit limit-value>`
 `<name (* | all | service-name)>`
 `<order (bytes | packets)>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display information about the flows being processed by the accounting service.

Options `detail | extensive | terse`—(Optional) Display the specified level of output.

filters—(Optional) Filter the display output of the currently active flow records. The following filters query actively changing data structures and result in different results for multiple invocations:

- **destination-as**—Display flow records filtered by destination autonomous system information.
- **destination-port**—Display flow records filtered by destination port information.
- **destination-prefix**—Display flow records filtered by destination prefix information.
- **input-snmp-interface-index**—Display flow records filtered by SNMP input interface index information.
- **output-snmp-interface-index**—Display flow records filtered by SNMP output interface index information.
- **proto**—Display flow records filtered by protocol type.
- **source-as**—Display flow records filtered by source autonomous system information.
- **source-port**—Display flow records filtered by source port information.
- **source-prefix**—Display flow records filtered by source prefix information.
- **tos**—Display flow records filtered by type of service classification.

limit *limit-value*—(Optional) Limit the display output to the specified number of flows. The default is no limit.

name (* | all | *service-name*)—(Optional) Display information about the flows being processed. Use a wildcard character, specify all services, or provide a specific services name.

order (bytes | packets)—(Optional) Display the flow with the ordering of the highest number, either by byte count or by packet count.

Additional Information When no PIC is active, or when no route record has been downloaded from the PIC, this command reports no flows, even though packets are being sampled. This command

displays information about two concurrent sessions only. If a third session is attempted, the command pauses with no output until one of the previous sessions is completed.

Required Privilege Level view

List of Sample Output [show services accounting flow-detail on page 2220](#)
[show services accounting flow-detail limit on page 2221](#)
[show services accounting flow-detail name extensive on page 2221](#)

Output Fields [Table 135 on page 2219](#) lists the output fields for the **show services accounting flow-detail** command. Output fields are listed in the approximate order in which they appear.

Table 135: show services accounting flow-detail Output Fields

| Field Name | Field Description | Output Level |
|-------------------------------------|---|------------------|
| Service Accounting interface | Name of the service accounting interface. | All levels |
| Service name | Name of a service that was configured at the [edit forwarding-options accounting] hierarchy level. The default display, (default sampling) , indicates the service was configured at the [edit forwarding-options sampling] hierarchy level. | All levels |
| Local interface index | Index counter of the local interface. | All levels |
| TOS | Type-of-service value from the IP header. | extensive |
| Input SNMP interface index | SNMP index of the interface on which the packet came in. | extensive |
| Output SNMP interface index | SNMP index of the interface on which the packet went out. | extensive |
| Source-AS | Source AS number. | extensive |
| Destination-AS | Destination AS number. | extensive |
| Protocol | Name of the protocol used for the packet flow from the corresponding source address. | All levels |
| Input interface | Interface on which the packets were received. | All levels |
| Output interface | Interface on which the packets were transmitted. | All levels |
| TCP flags | Number of TCP header flags detected in the flow. | extensive |
| Source address | Address where the flow originated. | All levels |
| Source port | Name of the source port. | All levels |

Table 135: show services accounting flow-detail Output Fields (*continued*)

| Field Name | Field Description | Output Level |
|--------------------------------------|---|------------------|
| Source prefix length | Source prefix length. | extensive |
| Destination address | Address where the flow is sent. | All levels |
| Destination prefix length | Destination prefix length. | extensive |
| Destination port | Name of the destination port. | All levels |
| Start time | Actual time when the packet in this aggregation was first seen. | detail extensive |
| End time | Actual time when the packet in this aggregation was last seen. | detail extensive |
| Packet count | Number of packets in the aggregation. | All levels |
| Byte count | Number of bytes in the aggregation. | All levels |
| Time since last active timeout | Amount of time elapsed since the last active timeout, in the format <i>hh:mm:ss</i> . | None specified |
| Packet count for last active timeout | Number of packets in the aggregation since the last active timeout. | None specified |
| Byte count for last active timeout | Number of bytes in the aggregation since the last active timeout. | None specified |

show services accounting memory

| | |
|---------------------------------|---|
| Syntax | show services accounting memory |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display memory and flow record statistics. |
| Options | This command has no options. |
| Required Privilege Level | view |
| List of Sample Output | show services accounting memory (Monitoring PIC interface) on page 2223
show services accounting memory (Service PIC interface) on page 2224 |
| Output Fields | Table 136 on page 2223 lists the output fields for the show services accounting memory command. Output fields are listed in the approximate order in which they appear. |

Table 136: show services accounting memory Output Fields

| Output Field | Output Field Description |
|------------------------------|---|
| Service Accounting interface | Name of the service accounting interface. |
| Memory Utilization | |
| Local interface index | Index counter of the local interface. |
| Allocation count | Number of flow records allocated. |
| Free count | Number of flow records freed. |
| Maximum allocated | Maximum number of flow records allocated since the monitoring station booted. This number represents the peak number of flow records allocated at a time. |
| Allocations per second | Flow records allocated per second during the last statistics interval on the PIC. |
| Frees per second | Flow records freed per second during the last statistics interval on the PIC. |
| Total memory used | Total amount of memory currently used (in bytes). |
| Total memory free | Total amount of memory currently free (in bytes). |

Sample Output

show services accounting memory (Monitoring PIC interface)

```

user@host> show services accounting memory
Service Accounting interface: mo-2/0/0, Local interface index: 468
Memory utilization

```

```
Allocation count: 437340, Free count: 433699, Maximum allocated: 6782
Allocations per second: 3366, Frees per second: 6412
Total memory used (in bytes): 133460320,
Total memory free (in bytes): 133918352
```

Sample Output

show services accounting memory (Service PIC interface)

```
user@host> show services accounting memory
Service Accounting interface: sp-0/1/0
Memory utilization
  Allocation count: 1000, Free count: 0
  Allocations per second: 0, Frees per second: 0
  Total memory used (in bytes): 218158272
  Total memory free (in bytes): 587147696

Service Accounting interface: sp-1/0/0
Memory utilization
  Allocation count: 1000, Free count: 0
  Allocations per second: 0, Frees per second: 0
  Total memory used (in bytes): 218157592
  Total memory free (in bytes): 587148376
```

show services accounting packet-size-distribution

| | |
|---------------------------------|--|
| Syntax | show services accounting packet-size-distribution
<name (* all <i>service-name</i>)> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display a packet size distribution histogram. |
| Options | <p>none—Display a packet size distribution histogram of all accounting services.</p> <p>name (* all <i>service-name</i>)—(Optional) Display a packet size distribution histogram. Use a wildcard character, specify all services, or provide a specific services name.</p> |
| Required Privilege Level | view |
| List of Sample Output | show services accounting packet-size-distribution name on page 2225 |
| Output Fields | Table 137 on page 2225 lists the output fields for the show services accounting packet-size-distribution command. Output fields are listed in the approximate order in which they appear. |

Table 137: show services accounting packet-size-distribution Output Fields

| Field Name | Field Description |
|------------------------------|---|
| Service Accounting interface | Name of the service accounting interface. |
| Service name | Name of a service that was configured at the [edit-forwarding-options accounting] hierarchy level. The default display, (default sampling), indicates the service was configured at the [edit-forwarding-options sampling-level] hierarchy level. |
| Local interface index | Index counter of the local interface. |
| Range start | Smallest packet length (in bytes) to count. |
| Range end | Largest packet length (in bytes) to count. |
| Number of packets | Count of packets detected in the size between Range start and Range end. |
| Percentage packets | Percentage of the total number of packets that are in this size range. |

Sample Output

show services accounting packet-size-distribution name

```
user@host> show services accounting packet-size-distribution name test3
Service Accounting interface: mo-0/2/0, Local interface index: 163
Service name: test3
```

| Range start | Range end | Number of packets | Percentage packets |
|-------------|-----------|-------------------|--------------------|
| 32 | 64 | 2924 | 100 |

show services accounting status

| | |
|---------------------------------|--|
| Syntax | <code>show services accounting status</code>
<code><inline-jflow fpc-slot <i>slot-number</i> name (* all <i>service-name</i>)></code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 13.2R2 for EX Series switches. |
| Description | Display available Physical Interface Cards (PICs) for accounting services. |
| Options | <p>none—Display available PICs for all accounting services.</p> <p>inline-jflow fpc-slot <i>slot-number</i>—(Optional) Display inline flow accounting status for the specified FPC. For a two-member MX Series Virtual Chassis or EX9200 Virtual Chassis, the master router or switch uses FPC slot numbers 0 through 11 with no offset; the backup router or switch uses FPC slot numbers 12 through 23, with an offset of 12.</p> <p>name (* all <i>service-name</i>)—(Optional) Display available PICs. Use a wildcard character, specify all services, or provide a specific services name.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> show services accounting flow on page 2213 Inline Flow Monitoring for Virtual Chassis Overview |
| List of Sample Output | <p>show services accounting status name (Monitoring PIC interface) on page 2228</p> <p>show services accounting status name (Service PIC interface) on page 2228</p> <p>show services accounting status inline-jflow fpc-slot <i>slot-number</i> (when both IPv4 and IPv6 are configured) on page 2229</p> <p>show services accounting status inline-jflow (MX80 Router when both IPv4 and IPv6 are configured) on page 2229</p> |
| Output Fields | Table 138 on page 2227 lists the output fields for the show services accounting status command. Output fields are listed in the approximate order in which they appear. |

Table 138: show services accounting status Output Fields

| Field | Field Description |
|------------------------------|---|
| Service Accounting interface | Name of the service accounting interface. |
| Service name | Name of a service that was configured at the <code>[edit-forwarding-options accounting]</code> hierarchy level. The default display, <code>(default sampling)</code> , indicates the service was configured at the <code>[edit-forwarding-options sampling-level]</code> hierarchy level. |
| FPC Slot | Slot number of the FPC for which the flow information is displayed. |

Table 138: show services accounting status Output Fields (*continued*)

| Field | Field Description |
|------------------------------|---|
| Local interface index | Index counter of the local interface. |
| Interface state | Accounting state of the passive monitoring interface. <ul style="list-style-type: none"> • Accounting—PIC is actively accounting. • Disabled—PIC has been disabled from the CLI. • Not accounting—PIC is up but not accounting. This can happen while the PIC is coming online, or when the PIC is up but has no logical unit configured under the physical interface. • Unknown |
| Group index | Integer that represents the monitoring group of which the PIC is a member. Group index is a mapping from the group name to an index. It is not related to the number of monitoring groups. |
| Export interval (in seconds) | Configured export interval for cflowd records, in seconds. |
| Export format | Configured export format. |
| Protocol | Protocol the PIC is configured to monitor. |
| Engine type | Configured engine type that is inserted in output cflowd packets. |
| Engine ID | Configured engine ID that is inserted in output cflowd packets. |
| Route Record Count | Number of routes recorded. |
| AS Record Count | Number of autonomous systems recorded. |
| Route Records Set | Status of route recording; whether routes are recorded or not. |
| Configuration Set | Status of monitoring configuration; whether monitoring configuration is set or not. |

Sample Output

show services accounting status name (Monitoring PIC interface)

```

user@host> show services accounting status name count1
Service Accounting interface: mo-2/0/0, Local interface index: 468
Service name: count1
Interface state: Accounting
  Group index: 0
  Export interval (in seconds): 60, Export format: cflowd v8
  Protocol: IPv4, Engine type: 55, Engine ID: 5

show services accounting usage

| | |
|---------------------------------|---|
| Syntax | show services accounting usage
<name <i>service-name</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display the CPU usage of PIC used for active flow monitoring. |
| Options | <p>none—Display CPU usage for all service names.</p> <p>name <i>service-name</i>—(Optional) Display CPU usage for the specified service name.</p> |
| Additional Information | When no route record has been downloaded from the PIC, this command reports no flows, even though packets are being sampled. |
| Required Privilege Level | view |
| List of Sample Output | show services accounting usage (Monitoring PIC interface) on page 2231
show services accounting usage (Service PIC interface) on page 2231 |
| Output Fields | Table 139 on page 2230 lists the output fields for the show services accounting usage command. Output fields are listed in the approximate order in which they appear. |

Table 139: show services accounting usage Output Fields

| Output Field | Output Field Description |
|------------------------------|--|
| Service Accounting interface | Name of the service accounting interface. |
| Service name | Name of a service that was configured at the [edit-forwarding-options accounting] hierarchy level. The default display, (default sampling), indicates the service was configured at the [edit-forwarding-options sampling-level] hierarchy level. |
| Local interface index | Index counter of the local interface. |
| Uptime | Time that the PIC has been operational (in milliseconds). |
| Interrupt time | Total time that the PIC has spent processing packets since the last PIC reset (in microseconds). |
| Load (5 second) | CPU load on the PIC, averaged more than 5 seconds. The number is a percentage obtained by dividing the time spent on active tasks by the total elapsed time. |
| Load (1 minute) | CPU load on the PIC, averaged more than 1 minute. The number is a percentage obtained by dividing the time spent on active tasks by the total elapsed time. |

Sample Output

show services accounting usage (Monitoring PIC interface)

```
user@host> show services accounting usage
Service Accounting interface: mo-1/1/0, Local interface index: 15
Service name: (default sampling)
CPU utilization
  Uptime: 600413856 milliseconds, Interrupt time: 2403 microseconds
  Load (5 second): 43%, Load (1 minute): 24%
```

Sample Output

show services accounting usage (Service PIC interface)

```
user@host> show services accounting usage
Service Accounting interface: sp-0/1/0
Service name: (default sampling)
CPU utilization
  Uptime: 7853940 milliseconds, Interrupt time: 0 microseconds
  Load (5 second): 2%, Load (1 minute): 0%

Service Accounting interface: sp-0/1/0
Service name: (default sampling)
CPU utilization
  Uptime: 331160 milliseconds, Interrupt time: 0 microseconds
  Load (5 second): 2%, Load (1 minute): 0%
```

show services dynamic-flow-capture content-destination

| | |
|---------------------------------|--|
| Syntax | show services dynamic-flow-capture content-destination capture-group <i>group-name</i>
destination-identifier <i>identifier</i>
<terse> |
| Release Information | Command introduced in Junos OS Release 7.4. |
| Description | (M320 routers and T Series routers only) Display information about the content destination that receives packets from the dynamic flow capture (DFC) interface. |
| Options | <p>capture-group <i>group-name</i>—Capture-group identifier.</p> <p>destination-identifier <i>identifier</i>—Content destination identifier.</p> <p>terse—(Optional) Display summary information.</p> |
| Required Privilege Level | view |
| List of Sample Output | show services dynamic-flow-capture content-destination on page 2233 |
| Output Fields | Table 140 on page 2232 lists the output fields for the show services dynamic-flow-capture content-destination command. Output fields are listed in the approximate order in which they appear. |

Table 140: show services dynamic-flow-capture content-destination Output Fields

| Output Field | Output Field Description | Level of Output |
|---------------------------------|--|-----------------|
| Capture group | Name of the capture group. | to be provided |
| Content destination | Name of the content destination. | to be provided |
| Criteria | Number of criteria specified. | to be provided |
| Bandwidth | Bandwidth used by the matched traffic. | to be provided |
| Matched packets | Number of matched packets sent to the content destination. | to be provided |
| Matched bytes | Number of matched bytes sent to the content destination. | to be provided |
| Congestion notifications | Number of notification messages sent. | to be provided |

Sample Output

`show services dynamic-flow-capture content-destination`

```
user@host> show services dynamic-flow-capture content-destination capture-group g1
destination-identifier cd1 terse
  Capture group: g1, Content destination: cd1, Criteria: 0, Bandwidth: 0, Matched
  packets: 0, Matched bytes: 0, Congestion notifications: 0
```

show services dynamic-flow-capture control-source

| | |
|---------------------------------|--|
| Syntax | <code>show services dynamic-flow-capture control-source capture-group <i>group-name</i>
control-source <i>identifier</i>
<detail terse></code> |
| Release Information | Command introduced in Junos OS Release 7.4. |
| Description | (M320 routers and T Series routers only) Display information about the control source that makes dynamic flow capture requests to the dynamic flow capture interface. |
| Options | <p><code>capture-group <i>group-name</i></code>—Capture group identifier.</p> <p><code>control-source <i>identifier</i></code>—Control source identifier.</p> <p><code>detail terse</code>—(Optional) Display the specified level of output.</p> |
| Required Privilege Level | view |
| List of Sample Output | show services dynamic-flow-capture control-source on page 2235
show services dynamic-flow-capture control-source detail on page 2235 |
| Output Fields | Table 141 on page 2234 lists the output fields for the <code>show services dynamic-flow-capture control-source</code> command. Output fields are listed in the approximate order in which they appear. |

Table 141: show services dynamic-flow-capture control-source Output Fields

| Output Field | Output Field Description |
|-------------------------------------|--|
| Capture group | Name of the capture group. |
| Control source | Name of the control source. |
| Criteria added, Criteria add failed | Number of criteria added or added and failed. |
| Active criteria | Number of active criteria. |
| Static criteria, Dynamic criteria | Number of static or dynamic criteria. |
| Control protocol requests | Total number of control protocol requests. |
| Requests | Number of Add , Delete , List , Refresh , and No-op control protocol requests. |
| Failed | Number of Add , Delete , List , Refresh , and No-op failed control protocol requests. |
| Add request rate | Rate of add requests. |

Table 141: show services dynamic-flow-capture control-source Output Fields (*continued*)

| Output Field | Output Field Description |
|-------------------------------|--|
| Add request peak rate | Peak rate of add requests. |
| Bandwidth across all criteria | Bandwidth used by all the requests. |
| Total notifications | Total number of notifications sent and the number of notifications by category: Restart , Rollover , Timeout , Congestion , Congestion delete , and Dups (duplicates) dropped. |
| Criteria deleted | Total number of criteria deleted and the number of deleted criteria by category: Timeout idle , Timeout total , Packets , and Bytes . |
| Sequence number | Sequence number. |

Sample Output

show services dynamic-flow-capture control-source

```

user@host> show services dynamic-flow-capture control-source source-identifier cs0_cg0
capture-group cg_0
Capture group: cg_0, Control source: cs0_cg0
Criteria added: 28, Criteria add failed: 0, Active criteria: 0, Control protocol
requests: 28, Add request rate: 0,
Add request peak rate: 1, Bandwidth across all criteria: 0, Total notifications:
1, Criteria deleted: 28, Sequence number: 0

```

show services dynamic-flow-capture control-source detail

```

user@host> show services dynamic-flow-capture control-source source-identifier cs0_cg0
capture-group cg_0 detail
Capture group: cg_0, Control source: cs0_cg0
Criteria added: 28, Criteria add failed: 0
Active criteria: 0
Static criteria: 0, Dynamic criteria: 0
Control protocol requests: 28

```

| | Add | Delete | List | Refresh | No-op |
|----------|-----|--------|------|---------|-------|
| Requests | 28 | 0 | 0 | 0 | 0 |
| Failed | 0 | 0 | 0 | 0 | 0 |

```

Add request rate: 0
Add request peak rate: 1
Bandwidth across all criteria: 0
Total notifications: 1
Restart: 1, Rollover: 0, No-op: 0, Timeout: 0, Congestion: 0, Congestion
delete: 0, Dups dropped: 0
Criteria deleted: 28
Timeout idle: 0, Timeout total: 0, Packets: 0, Bytes: 0
Sequence number: 0

```

show services dynamic-flow-capture statistics

| | |
|---------------------------------|--|
| Syntax | <code>show services dynamic-flow-capture statistics capture-group <i>group-name</i></code> |
| Release Information | Command introduced in Junos OS Release 7.4. |
| Description | (M320 routers and T Series routers only) Display statistics information about the capture group specified for dynamic flow capture. |
| Options | <code>capture-group <i>group-name</i></code> —Capture group identifier. |
| Required Privilege Level | view |
| List of Sample Output | show services dynamic-flow-capture statistics on page 2237 |
| Output Fields | Table 142 on page 2236 lists the output fields for the show services dynamic-flow-capture statistics command. Output fields are listed in the approximate order in which they appear. |

Table 142: show services dynamic-flow-capture statistics Output Fields

| Output Field | Output Field Description |
|------------------------|--|
| Input | <p>Incoming dynamic flow capture packet statistics:</p> <ul style="list-style-type: none"> • Control protocol packets—Number of control protocol packets received. • Captured data packets—Number of data packets captured. • Control IRI packets—Number of control IRI packets received. |
| Control protocol drops | <p>Control protocol packets dropped for the following reasons:</p> <ul style="list-style-type: none"> • Not IP packets—Dropped packets were not IP packets. • Not UDP packets—Dropped packets were not User Datagram Protocol (UDP) packets. • Invalid destination address—Dropped packets had invalid destination addresses. • No memory—Packets dropped because of insufficient memory. • Unauthorized control source—Packets dropped because the control source was not authenticated. • Bad request—Packets dropped because the request was invalid. • Unknown control source—Packets dropped because the control source was not known. • Not DTCP—Dropped packets did not adhere to the control protocol format. • Bad command line—Packets dropped because of a version mismatch. • Bandwidth exceeded—Packets dropped because the bandwidth was exceeded. • Drop rate due to exceeded bandwidth—Rate of traffic dropped because the bandwidth was exceeded. • Other—Packets dropped for other reasons or undetermined causes. |

Table 142: show services dynamic-flow-capture statistics Output Fields (*continued*)

| Output Field | Output Field Description |
|------------------------|--|
| Input drops | <p>Incoming dynamic flow capture packets dropped for the following reasons:</p> <ul style="list-style-type: none"> • Unknown packets—Packets dropped because the packet type was not recognized. • Captured data not IPv4—Packets dropped because they were not IPv4 packets. • Captured data too small—Packets dropped because they were smaller than the size reported in their headers. • Captured data drops—Data packets dropped because of undetermined causes. • Captured data not matched—Packets dropped because they did not match filter criteria. • Bandwidth exceeded—Packets dropped because the bandwidth was exceeded. • Drop rate due to exceeded bandwidth—Rate of traffic dropped because the bandwidth was exceeded. |
| Output | <p>Outgoing dynamic flow capture packet statistics:</p> <ul style="list-style-type: none"> • Control protocol packets—Number of control protocol packets sent. • Captured data packets—Number of captured data packets sent. |
| Output drops | <p>Outgoing packets dropped:</p> <ul style="list-style-type: none"> • Control protocol drops—Number of control protocol packets dropped. • Captured data drops—Number of captured data packets dropped. |
| Flow Statistics | <p>DFC flow statistics:</p> <ul style="list-style-type: none"> • Active flow cache entries • Active flow cache usage percentage • Flow cache entries allocated • Number of control sources • Number of content destinations • Number of criteria • Maximum criteria matching one flow • Cached flows purged for memory • Maximum filters matching one packet |

Sample Output

show services dynamic-flow-capture statistics

```

user@host> show services dynamic-flow-capture statistics capture-group g1
Input:

  Control protocol packets: 643, Captured data packets: 69977, Control IRI packets:
  337

Control protocol drops:

  Not IP packets: 0, Not UDP packets: 3, Invalid destination address: 0, No memory:
  0, Unauthorized control source: 0,

  Bad request: 0, Unknown control source: 0, Not DTCP: 0, Bad command line: 0,
  Bandwidth exceeded: 0,

```

Drop rate due to exceeded bandwidth: 0, Other: 0

Input drops:

Unknown packets: 0, Captured data not IPv4: 0, Captured data too small: 0,
Captured data drops: 0, Captured data not matched: 0,

Bandwidth exceeded: 0, Drop rate due to exceeded bandwidth: 0

Output:

Control protocol packets: 644, Captured data packets: 1119624

Output drops:

Control protocol drops: 0, Captured data drops: 0

Flow Statistics:

Active flow cache entries: 40, Active flow cache usage percentage: 0, Flow cache
entries allocated: 40,

Number of control sources: 4, Number of content destinations: 64, Number of
criteria: 640,

Maximum criteria matching one flow: 16, Cached flows purged for memory: 0,
Maximum filters matching one packet: 16

show services flow-collector file interface

| | |
|---------------------------------|--|
| Syntax | show services flow-collector file interface (all cp-fpc/pic/port)
<detail extensive terse> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Display information about flow collector files. |
| Options | <p>all cp-fpc/pic/port—Display file information for all configured flow collector interfaces or for the specified interface.</p> <p>detail extensive terse—(Optional) Display the specified level of output.</p> |
| Additional Information | No entries are displayed for files that have been successfully transferred. |
| Required Privilege Level | view |
| List of Sample Output | show services flow-collector file interface extensive on page 2240 |
| Output Fields | Table 143 on page 2239 lists the output fields for the show services flow-collector file interface command. Output fields are listed in the approximate order in which they appear. |

Table 143: show services flow-collector file interface Output Fields

| Output Field | Output Field Description | Level of Output |
|-------------------|---|------------------|
| Filename | Name of the file created on the flow collector interface. | All levels |
| Flows | Total number of collector flows for which records are present in the file. | none specified |
| Throughput | Throughput statistics: <ul style="list-style-type: none"> • Flow records—Number of flow records in the file. <ul style="list-style-type: none"> • per second—Average number of flow records per second. • peak per second—Peak number of flow records per second. • Uncompressed bytes—Total file size before compression. <ul style="list-style-type: none"> • per second—Average number of uncompressed bytes per second. • peak per second—Peak number of uncompressed bytes per second. • Compressed bytes—Total file size after compression. <ul style="list-style-type: none"> • per second—Average number of compressed bytes per second. • peak per second—Peak number of compressed bytes per second. | extensive |

Table 143: show services flow-collector file interface Output Fields (*continued*)

| Output Field | Output Field Description | Level of Output |
|--------------|---|-----------------|
| Status | <p>File statistics:</p> <ul style="list-style-type: none"> • Compressed blocks—(extensive output only) Data blocks in the file that have been compressed. The file is exported only when the compressed block count and block count become the same. • Block count—(extensive output only) Total number of data blocks in the file. • State—Processing state of the file. <ul style="list-style-type: none"> • Active—The flow collector interface is writing to the file. • Export 1—File export is in progress to the primary server. • Export 2—File export is in progress to the secondary server. • Wait—File is pending export. • Transfer attempts 0—Number of attempts made to transfer the file. If the file is successfully transferred in the first attempt, this field is 0. | All levels |

Sample Output

show services flow-collector file interface extensive

```

user@host> show services flow-collector file interface cp-3/2/0 extensive
Filename: cFlowd-py69Ni69-0-20031112_014301-so_3_0_0_0.bcp.bi.gz
Throughput:
  Flow records: 188365, per second: 238, peak per second: 287
  Uncompressed bytes: 21267756, per second: 27007, peak per second: 32526
  Compressed bytes: 2965643, per second: 0, peak per second: 22999
Status:
  Compressed blocks: 156, Block count: 156
  State: Active, Transfer attempts: 0

```

show services flow-collector input interface

| | |
|---------------------------------|--|
| Syntax | show services flow-collector input interface (all cp-fpc/pic/port)
<detail extensive terse> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (M40e, M160, and M320 routers and T Series routers only) Display the number of packets received by collector interfaces from monitoring interfaces. |
| Options | <p>all cp-fpc/pic/port—Display packets received by all configured flow collector interfaces or by the specified interface.</p> <p>detail extensive terse—(Optional) Display the specified level of output.</p> |
| Required Privilege Level | view |
| List of Sample Output | show services flow-collector input interface on page 2241
show services flow-collector input interface all on page 2241 |
| Output Fields | Table 144 on page 2241 lists the output fields for the show services flow-collector input interface command. Output fields are listed in the approximate order in which they appear. |

Table 144: show services flow-collector input interface Output Fields

| Output Field | Output Field Description |
|------------------|--|
| Interface | Name of the monitoring interface. |
| Packets | Number of packets traveling from the monitoring interface to the flow collector interface. |
| Bytes | Number of bytes traveling from the monitoring interface to the flow collector interface. |

Sample Output

show services flow-collector input interface

```

user@host> show services flow-collector input interface cp-3/2/0
Interface                Packets    Bytes
mo-3/0/0.0               21706     32328568

show services flow-collector interface extensive on page 2248 |
| Output Fields | Table 145 on page 2243 lists the output fields for the show services flow-collector interface command. Output fields are listed in the approximate order in which they appear. |

Table 145: show services flow-collector interface Output Fields

| Output Field | Output Field Description | Level of Output |
|--------------------------|---|------------------|
| Flow collector interface | Name of the flow collector interface. | All levels |
| Interface state | Collecting flow state for the interface. | All levels |
| Packets | Total number of packets received. | none specified |
| Flows Uncompressed Bytes | Total uncompressed data size for all files created on this PIC. | none specified |
| Compressed Bytes | Total compressed data size for all files created on this PIC. | none specified |
| FTP bytes | Total number of bytes transferred to the FTP server, including those dropped during transfer. | none specified |
| FTP files | Total number of FTP transfers attempted by the server. | none specified |
| Memory | Bytes used on the PIC and bytes free. | detail extensive |

Table 145: show services flow-collector interface Output Fields (*continued*)

| Output Field | Output Field Description | Level of Output |
|-------------------|---|-------------------------|
| Input | Incoming flow collector packet statistics: <ul style="list-style-type: none"> • Packets—Number of packets received on the unit. <ul style="list-style-type: none"> • per second—Average number of packets per second. • peak per second—Peak number of packets per second. • Bytes—Number of bytes received on the unit. <ul style="list-style-type: none"> • per second—Average number of bytes per second. • peak per second—Peak number of bytes per second. • Flow records processed—Number of records in the flow collector packets that were processed by the flow-collector interface. <ul style="list-style-type: none"> • per second—Average number of flow records processed per second. • peak per second—Peak number of flow records per second. | detail extensive |
| Allocation | Data block statistics: <ul style="list-style-type: none"> • Blocks allocated—Total number of data blocks (containing flow records) allocated to the files created on this PIC. <ul style="list-style-type: none"> • per second—Average number of blocks allocated per second. • peak per second—Peak number of blocks allocated per second. • Blocks freed—Total number of data blocks freed. <ul style="list-style-type: none"> • per second—Average number of blocks freed per second. • peak per second—Peak number of blocks freed per second. • Blocks unavailable—Total number of data block requests denied, typically because of a memory shortage. <ul style="list-style-type: none"> • per second—Average number of blocks unavailable per second. • peak per second—Peak number of blocks unavailable per second. | extensive |
| Files | File statistics, incremented since the PIC last booted: <ul style="list-style-type: none"> • Files created—Total number of files created on this PIC. • Files exported— Number of files successfully created and exported. • Files destroyed— (extensive output only) Number of files successfully exported and files dropped by the flow collection interface. | detail extensive |
| Throughput | Throughput statistics: <ul style="list-style-type: none"> • Uncompressed bytes—Total uncompressed data size for all files created on this PIC. <ul style="list-style-type: none"> • per second—Average number of uncompressed bytes per second. • peak per second—Peak number of uncompressed bytes per second. • Compressed bytes—Total compressed data size for all files created on this PIC. <ul style="list-style-type: none"> • per second—Average number of compressed bytes per second. • peak per second—Peak number of compressed bytes per second. | detail extensive |

Table 145: show services flow-collector interface Output Fields (*continued*)

| Output Field | Output Field Description | Level of Output |
|---------------------------------|--|-------------------------|
| Packet drops | <p>Number of packets dropped for the following causes:</p> <ul style="list-style-type: none"> • No memory—Packets dropped because of insufficient memory. • Not IP—Packets dropped because they are not IP packets. • Not IPv4—Packets dropped because they are not IP version 4 packets. • Too small—Packets dropped because each packet was smaller than the size reported in its header. • Fragments—Packets dropped because of fragmentation. Fragments are not reassembled. • ICMP—Packets dropped because they are not ICMP packets. • TCP—Packets dropped because they are not TCP packets. • Unknown—Packets dropped because of undetermined causes. • Not Junos flow—Packets dropped because they are not interpreted by Junos OS. Junos OS interprets only IPv4, UDP cflowd version 5 packets. | extensive |
| File transfer | <p>File transfer statistics:</p> <ul style="list-style-type: none"> • FTP bytes—Total number of bytes transferred to the FTP server, including those dropped during transfer. • FTP files—Total number of FTP transfers attempted by the server. • FTP failure—Total number of FTP failures encountered by the server. | detail extensive |
| Flow collector interface | Physical interface acting as a flow collector. | detail |
| Export channel | <p>Export channel 0 is unit 0. Export channel 1 is unit 1. Flow receive channel is unit 2. Server status statistics are the following:</p> <ul style="list-style-type: none"> • Current server Primary or Secondary—Current FTP server being used. Value is • Primary server state—State of the server: <ul style="list-style-type: none"> • OK—Server is operating without problems. • FTP error—Server encountered an FTP protocol error while sending files. • Network error—Flow-collector interface has errors when contacting the primary FTP server. • Unknown—First file transfer has not been sent to the primary server. • Secondary server state—State of the server: <ul style="list-style-type: none"> • OK—Server is operating without errors. • FTP error—Server encountered an FTP protocol error while sending files. • Network error—Flow-collector interface has errors when contacting the secondary FTP server. • Unknown—First file transfer has not been sent to the secondary server. • Not configured—Secondary server is not configured. | detail extensive |

show services rpm active-servers

| | |
|---------------------------------|---|
| Syntax | show services rpm active-servers |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers. |
| Description | Display the protocols and corresponding ports for which a router or switch is configured as a real-time performance monitoring (RPM) server. |
| Options | This command has no options. |
| Required Privilege Level | view |
| List of Sample Output | show services rpm active-servers on page 2249 |
| Output Fields | Table 146 on page 2249 lists the output fields for the show services rpm active-servers command. Output fields are listed in the approximate order in which they appear. |

Table 146: show services rpm active-servers Output Fields

| Field Name | Field Description |
|-----------------------------------|---|
| Protocol | Protocol configured on the receiving probe server. The protocol can be the User Datagram Protocol (UDP) or the Transmission Control Protocol (TCP). |
| Port | Port configured on the receiving probe server. |
| Destination interface name | Output interface name for the probes. |

Sample Output

show services rpm active-servers

```
user@host> show services rpm active-servers
  Protocol: TCP, Port: 50000, Destination interface name: lt-0/0/0.0
  Protocol: UDP, Port: 50001, Destination interface name: lt-0/0/0.0
```

show services rpm history-results

| | |
|---------------------------------|---|
| Syntax | <pre>show services rpm history-results <brief detail> <owner <i>owner</i>> <since <i>time</i>> <test <i>name</i>></pre> |
| Release Information | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.</p> |
| Description | Display standard information about the results of the last 50 probes for each real-time performance monitoring (RPM) instance. |
| Options | <p>none—Display the results of the last 50 probes for all RPM instances.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>owner <i>owner</i>—(Optional) Display information for the specified probe owner.</p> <p>since <i>time</i>—(Optional) Display information from the specified time. Specify time as <i>yyyy-mm-dd.hh:mm:ss</i>.</p> <p>test <i>name</i>—(Optional) Display information for the specified test.</p> |
| Required Privilege Level | view |
| List of Sample Output | <p>show services rpm history-results on page 2251</p> <p>show services rpm history-results detail on page 2251</p> |
| Output Fields | Table 147 on page 2250 lists the output fields for the show services rpm history-results command. Output fields are listed in the approximate order in which they appear. |

Table 147: show services rpm history-results Output Fields

| Field Name | Field Description | Level of Output |
|------------------------|--|-----------------|
| Owner | Probe owner. | All levels |
| Test | Name of a test for a probe instance. | All levels |
| Probe received | Timestamp when the probe result was determined. | All levels |
| Round trip time | Average ping round-trip time (RTT), in microseconds. | All levels |
| Probe results | <p>Result of a particular probe performed by a remote host. The following information is contained in the results:</p> <ul style="list-style-type: none"> Response received—Timestamp when the probe result was determined. Rtt—Average ping round-trip time (RTT), in microseconds. | detail |

Table 147: show services rpm history-results Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|----------------------------------|--|-----------------|
| Results over current test | Displays the results for the current test by probe at the time each probe was completed, as well as the status of the current test at the time the probe was completed. | detail |
| Probes sent | Number of probes sent with the current test. | detail |
| Probes received | Number of probe responses received within the current test. | detail |
| Loss percentage | Percentage of lost probes for the current test. | detail |
| Measurement | <p>Increment of measurement. Possible values are round-trip time delay and, for the probe type icmp-pin-timestamp, the egress and ingress delay:</p> <ul style="list-style-type: none"> • Minimum—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • Maximum—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • Average—Average RTT, ingress delay, or egress delay measured over the course of the current test. • Jitter—Difference, in microseconds, between the maximum and minimum RTT measured over the course of the current test. • Stddev—Standard deviation of the round-trip time, in microseconds, measured over the course of the current test. | detail |

show services rpm probe-results

| | |
|---------------------------------|--|
| Syntax | show services rpm probe-results
<owner <i>owner</i> >
<test <i>name</i> > |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Series Routers. |
| Description | Display the results of the most recent real-time performance monitoring (RPM) probes. |
| Options | none —Display all results of the most recent RPM probes.

owner <i>owner</i> —(Optional) Display information for the specified probe owner.

test <i>name</i> —(Optional) Display information for the specified test. |
| Required Privilege Level | view |
| List of Sample Output | show services rpm probe-results on page 2256
show services rpm probe-results (BGP Neighbor Discovery) on page 2258 |
| Output Fields | Table 148 on page 2253 lists the output fields for the show services rpm probe-results command. Output fields are listed in the approximate order in which they appear. |

Table 148: show services rpm probe-results Output Fields

| Field Name | Field Description |
|-----------------------|---|
| Owner | Owner name. When you configure the probe owner statement at the [edit services rpm] hierarchy level, this field displays the configured owner name. When you configure BGP neighbor discovery through RPM, the output for this field is Rpm-Bgp-Owner . |
| Test | Name of a test representing a collection of probes. When you configure the test test-name statement at the [edit services rpm probe owner] hierarchy level, the field displays the configured test name. When you configure BGP neighbor discovery through RPM, the output for this field is Rpm-BGP-Test-<i>n</i> , where <i>n</i> is a cumulative number. |
| Target address | Destination address used for the probes. |
| Source address | Source address used for the probes. |
| Probe type | Protocol configured on the receiving probe server: http-get , http-metadata-get , icmp-ping , icmp-ping-timestamp , tcp-ping , udp-ping , or udp-ping-timestamp . |
| Test size | Number of probes within a test. |

Table 148: show services rpm probe-results Output Fields (*continued*)

| Field Name | Field Description |
|----------------------------------|---|
| Routing Instance Name | <p>(BGP neighbor discovery) Name of the configured (if any) routing instance, logical system name, or both, in which the probe is configured:</p> <ul style="list-style-type: none"> When a routing instance is defined within a logical system, the logical system name is followed by the routing instance name. A slash (/) is used to separate the two entities. For example, if the routing instance called R1 is configured within the logical system called LS, the name in the output field is LS/R1. When a routing instance is configured but the default logical system is used, the name in the output field is the name of the routing instance. When a logical system is configured but the default routing instance is used, the name in the output field is the name of the logical system followed by default. A slash (/) is used to separate the two entities. For example, LS/default. |
| Probe results | <p>Raw measurement of a particular probe sample done by a remote host. This data is provided separately from the calculated results. The following information is contained in the raw measurement:</p> <ul style="list-style-type: none"> Response received—Timestamp when the probe result was determined. Client and server hardware timestamps—If timestamps are configured, an entry appears at this point. Rtt—Average ping round-trip time (RTT), in microseconds. Egress jitter—Egress jitter, in microseconds. Ingress jitter—Ingress jitter, in microseconds. Round trip jitter—Round-trip jitter, in microseconds. Egress interarrival jitter—Egress interarrival jitter, in microseconds. Ingress interarrival jitter—Ingress interarrival jitter, in microseconds. Round trip interarrival jitter—Round-trip interarrival jitter, in microseconds. |
| Results over current test | <p>Probes are grouped into tests, and the statistics are calculated for each test. If a test contains 10 probes, the average, minimum, and maximum results are calculated from the results of those 10 probes. If the command is issued while the test is in progress, the statistics use information from the completed probes.</p> <ul style="list-style-type: none"> Probes sent—Number of probes sent within the current test. Probes received—Number of probe responses received within the current test. Loss percentage—Percentage of lost probes for the current test. Measurement—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type icmp-ping-timestamp, the egress delay and ingress delay. <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> Samples—Number of probes. Minimum—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. Maximum—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. Average—Average RTT, ingress delay, or egress delay measured over the course of the current test. Peak to peak—Peak-to-peak difference, in microseconds. Stddev—Standard deviation, in microseconds. Sum—Statistical sum. |

Table 148: show services rpm probe-results Output Fields (*continued*)

| Field Name | Field Description |
|-------------------------------|--|
| Results over last test | <p>Results for the most recently completed test. If the command is issued while the first test is in progress, this information is not displayed</p> <ul style="list-style-type: none"> • Probes sent—Number of probes sent for the most recently completed test. • Probes received—Number of probe responses received for the most recently completed test. • Loss percentage—Percentage of lost probes for the most recently completed test. • Test completed—Time the most recent test was completed. • Measurement—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type icmp-ping-timestamp, the egress delay and ingress delay. <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> • Samples—Number of probes. • Minimum—Minimum RTT, ingress delay, or egress delay measured for the most recently completed test. • Maximum—Maximum RTT, ingress delay, or egress delay measured for the most recently completed test. • Average—Average RTT, ingress delay, or egress delay measured for the most recently completed test. • Peak to peak—Peak-to-peak difference, in microseconds. • Stddev—Standard deviation, in microseconds. • Sum—Statistical sum. |
| Results over all tests | <p>Displays statistics made for all the probes, independently of the grouping into tests, as well as statistics for the current test.</p> <ul style="list-style-type: none"> • Probes sent—Number of probes sent in all tests. • Probes received—Number of probe responses received in all tests. • Loss percentage—Percentage of lost probes in all tests. • Measurement—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe types icmp-ping-timestamp and udp-ping-timestamp, the egress delay and ingress delay. <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> • Samples—Number of probes. • Minimum—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • Maximum—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • Average—Average RTT, ingress delay, or egress delay measured over the course of the current test. • Peak to peak—Peak-to-peak difference, in microseconds. • Stddev—Standard deviation, in microseconds. • Sum—Statistical sum. |

Table 148: show services rpm probe-results Output Fields (*continued*)

| Field Name | Field Description |
|--------------------|---|
| Error Stats | <p>Displays error statistics for each probe.</p> <ul style="list-style-type: none"> • Invalid client rcv timestamp—Number of client receive timestamp less than client send timestamp. • Invalid server send timestamp—Number of server send timestamp less than server receive timestamp. • Invalid server processing time—Number of server side spent time greater than RTT. <p>NOTE: Error Stats is displayed in the output only if non-zero statistics exists.</p> |

show services rpm rfc2544-benchmarking

| | |
|---------------------------------|---|
| Syntax | <pre>show services rpm rfc2544-benchmarking <aborted-tests (test-id test-id brief detail)> <active-tests (test-id test-id brief detail)> <completed-tests (test-id test-id brief detail)> <summary></pre> |
| Release Information | <p>Command introduced in Junos OS Release 12.3X52 for ACX Series routers.</p> <p>Command introduced in Junos OS Release 13.3R1 for MX104 3D Universal Edge Routers.</p> |
| Description | <p>Display information about the results of each category or state of the RFC 2544-based benchmarking test, such as aborted tests, active tests, and completed tests, for each real-time performance monitoring (RPM) instance. You can view the results of each test state for all of the configured test IDs or for a specific test ID. Also, you can display statistics about the total number of tests of each state for a high-level, quick analysis. The values in the output displayed vary, depending on the state in which the test is passing through, when you issue the command.</p> <p>You can view the test results of multiple test IDs at the same time by entering the IDs in a single command. If you enter multiple test ID values, you must separate each number with a space.</p> |
| Options | <p>aborted-tests—Display the list of tests that were aborted or stopped. This list includes tests that failed due to various error conditions and tests that you terminated by entering the test service rpm rfc2544-benchmarking test test-name stop command. The Status field in the output specifies the reason for the termination of the test.</p> <p>test-id test-id—Unique identifier of the test for which the test results must be displayed.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>active-tests—Display the results of the set of tests that are currently running.</p> <p>completed-tests—Display the results of the set of tests that were successfully completed. A completed test is one that passes through all the test steps or states specified in RFC 2544. A test that is marked as completed after it went through all the states from the beginning to the end can still be reported as a failed test. For example, a failed test can be a test that sends the desired number of packets, but does not receive the frames back from the other end.</p> <p>summary—(Optional) Display summary output.</p> |

Output Fields [Table 149 on page 2260](#) lists the output fields for the **show services rpm rfc2544-benchmarking (aborted-tests | active-tests | completed-tests)** command. Output fields are listed in the approximate order in which they appear.

Table 149: show services rpm rfc2544-benchmarking Output Fields

| Field Name | Field Description |
|-------------------------|--|
| Test information | Details of the performed RFC 2544 benchmarking test. |
| Test id | Unique identifier configured for the test. |
| Test name | Name configured for the test. |
| Test type | The type of statistical detail that is collected for the test, based on the configured test type. Throughput-related, latency, frame-loss, or back-to-back frames-related information is displayed for ACX Series routers. Reflected packets-related information is displayed for MX104 routers.. |
| Test mode | Mode configured for the test on the router. Test modes are: <ul style="list-style-type: none"> Initiate-and-Terminate: Test frames are initiated from one end and terminated at the same end. This mode requires a reflector to be configured at the peer end to enable the test frames to be returned to the source. This mode is supported only on ACX Series routers Reflect: Test frames that originate from one end are reflected at the other end on the selected service, such as IPv4 or Ethernet. |
| Test packet size | Size of the test packets in bytes. This field is valid only when the test mode is Initiate-and-Terminate. |
| Test state | State of the test that is in progress or active when the output is displayed. |
| Status | Indicates whether the test is currently in progress or has been terminated. This field is displayed for tests that are in progress or were aborted by entering the test services rpm rfc2544-benchmarking test <test-name test-id> stop command. |
| Test start time | Time at which the test started in Coordinated Universal Time (UTC) format (YYYY-MM-DD-HH:MM:SS). |
| Test finish time | Time at which the test completed. |

Table 149: show services rpm rfc2544-benchmarking Output Fields (*continued*)

| Field Name | Field Description |
|---------------------------|---|
| Counters last cleared | Date, time, and how long ago the statistics for the test were cleared. The format is <i>year-month-day hour:minute:second:timezone</i> (<i>hour:minute:second</i> ago). For example, 2010-05-17 07:51:28 PDT (00:04:33 ago). If you did not clear the statistics previously at any point, Never is displayed. |
| Number of active tests | Total number of tests that are currently running. |
| Number of completed tests | Total number of tests that were successfully completed |
| Number of aborted tests | Total number of tests that were aborted or halted. |

Sample Output

show services rpm rfc2544-benchmarking summary

```
user@host> show services rpm rfc2544-benchmarking summary
```

```
Rfc2544 tests summary :
```

```
    Number of active tests: 0, Number of completed tests: 4, Number of aborted tests: 52
```

This output indicates that no test iteration is currently in progress (at the time of issue of the command), 4 tests were completed successfully, and 52 tests were halted.

show services rpm rfc2544-benchmarking aborted-tests (ACX Series router)

```
user@host> show services rpm rfc2544-benchmarking aborted-tests
```

```
Test information :
```

```
    Test id: 1, Test name: test1, Test type: Throughput
    Test mode: Initiate-and-Terminate
    Test packet size: 64 1280
    Test state: RFC2544_TEST_STATE_STOPPED
    Status: User-aborted-via-cli
    Test start time: 2005-08-05 03:19:58 UTC
    Test finish time: 2005-08-05 03:20:00 UTC
    Counters last cleared: Never
```

```
    Test id: 2, Test name: test1, Test type: Throughput
    Test mode: Initiate-and-Terminate
    Test packet size: 64 1280
    Test state: RFC2544_TEST_STATE_STOPPED
    Status: User-aborted-via-cli
    Test start time: 2005-08-05 03:20:00 UTC
    Test finish time: 2005-08-05 03:20:02 UTC
    Counters last cleared: Never
```

show services rpm rfc2544-benchmarking completed-tests (ACX Series router)

```
user@host> show services rpm rfc2544-benchmarking completed-tests
```

```
Test information :
  Test id: 18, Test name: test1, Test type: Throughput
  Test mode: Initiate-and-Terminate
  Test packet size: 64 1280
  Test state: RFC2544_TEST_STATE_COMPLETED
  Test start time: 2005-08-05 03:20:34 UTC
  Test finish time: 2005-08-05 03:21:23 UTC
  Counters last cleared: Never
```

show services rpm rfc2544-benchmarking active-tests (ACX Series router)

```
user@host> show services rpm rfc2544-benchmarking active-tests
Test information :
  Test id: 57, Test name: test1, Test type: Back-Back-Frames
  Test mode: Initiate-and-Terminate
  Test packet size: 64 1280
  Test state: RFC2544_TEST_STATE_RUNNING
  Status: Running
  Test start time: 2005-08-05 20:15:41 UTC
  Test finish time: TEST_RUNNING
  Counters last cleared: Never
```

show services rpm rfc2544-benchmarking aborted-tests (MX104 router)

```
user@host> show services rpm rfc2544-benchmarking aborted-tests
Test information :
  Test id: 1, Test name: prof_tput1, Test type: Reflect
  Test mode: Reflect
  Test packet size: 0
  Test state: TEST_STATE_STOPPED
  Status: Test-intf-ifl-change
  Test start time: 2013-12-16 22:54:27 PST
  Test finish time: 2013-12-16 23:30:28 PST
  Counters last cleared: Never

  Test id: 2, Test name: prof_tput1, Test type: Reflect
  Test mode: Reflect
  Test packet size: 0
  Test state: TEST_STATE_STOPPED
  Status: User-aborted-via-cli
  Test start time: 2013-12-16 23:31:06 PST
  Test finish time: 2013-12-16 23:36:22 PST
  Counters last cleared: Never

  Test id: 3, Test name: prof_tput1, Test type: Reflect
  Test mode: Reflect
  Test packet size: 0
  Test state: TEST_STATE_STOPPED
  Status: User-aborted-via-cli
  Test start time: 2013-12-16 23:36:24 PST
  Test finish time: 2013-12-17 01:49:24 PST
  Counters last cleared: Never
```

show services rpm rfc2544-benchmarking completed-tests (MX104 router)

```
user@host> show services rpm rfc2544-benchmarking completed-tests
Test information :
  Test id: 18, Test name: test1, Test type: Reflect
  Test mode: Reflect
  Test packet size: 0
  Test state: TEST_STATE_COMPLETED
```

Test start time: 2005-08-05 03:20:34 UTC
Test finish time: 2005-08-05 03:21:23 UTC
Counters last cleared: Never

show services rpm rfc2544-benchmarking active-tests (MX104 router)

```
user@host> show services rpm rfc2544-benchmarking active-tests
Test information :
  Test id: 4, Test name: prof_tput1, Test type: Reflect
  Test mode: Reflect
  Test packet size: 0
  Test state: TEST_STATE_RUNNING
  Status: Running
  Test start time: 2013-12-17 01:49:26 PST
  Test finish time: TEST_RUNNING
  Counters last cleared: Never
```

show services rpm rfc2544-benchmarking test-id

| | |
|---------------------------------|---|
| Syntax | <code>show services rpm rfc2544-benchmarking test-id <i>test-id</i></code>
<code><brief detail></code> |
| Release Information | Command introduced in Junos OS Release 12.3X52 for ACX Series routers.
Command introduced in Junos OS Release 13.3R1 for MX104 3D Universal Edge Routers. |
| Description | Display information about the results of the RFC 2544-based benchmarking test for a specific test ID for each real-time performance monitoring (RPM) instance. The values in the output displayed vary, depending on the state in which the test is passing through, when you issue the command. |
| Options | none —Display brief information about a specific test ID of the benchmarking test.

test-id <i>test-id</i> —Unique identifier of the test for which the test results must be displayed.

brief detail —(Optional) Display the specified level of output. |

Table 150: show services rpm rfc2544-benchmarking test-id Output Fields

| Field Name | Field Description | Level of Output |
|-----------------------------------|---|-----------------|
| Test information | Details of the performed RFC 2544 benchmarking test. | None specified |
| Test id | Unique identifier configured for the test. | None specified |
| Test name | Name configured for the test. | None specified |
| Test type | The type of statistical detail that is collected for the test, based on the configured test type. Throughput-related, latency, frame-loss, or back-to-back frames-related information is displayed for ACX Series routers. Reflected packets-related information is displayed for MX104 routers. | None specified |
| Test mode | Mode configured for the test on the router. Test modes are: <ul style="list-style-type: none"> Initiate-and-Terminate: Test frames are initiated from one end and terminated at the same end. This mode requires a reflector to be configured at the peer end to enable the test frames to be returned to the source. This mode is supported only on ACX Series routers. Reflect: Test frames that originate from one end are reflected at the other end on the selected service, such as IPv4 or Ethernet. | None specified |
| Test packet size | Size of the test packets in bytes. This field is valid only when the test mode is Initiate-and-Terminate. | None specified |
| Test state | State of the test that is in progress or active when the output is displayed. For details about the states, see <i>RFC 2544-Based Benchmarking Test States</i> . | None specified |
| Status | Indicates whether the test is currently in progress or has been terminated. | None specified |
| Test start time | Time at which the test started in Coordinated Universal Time (UTC) format (YYYY-MM-DD-HH:MM:SS). | None specified |
| Test finish time | Time at which the test completed. | None specified |
| Counters last cleared | Date, time, and how long ago the statistics for the test were cleared. The format is <i>year-month-day hour:minute:second:timezone (hour:minute:second ago)</i> . For example, 2010-05-17 07:51:28 PDT (00:04:33 ago). If you did not clear the statistics previously at any point, Never is displayed. | None specified |
| Test-profile Configuration | (ACX Series routers only) Details of the specified test profile | detail |
| Test-profile name | (ACX Series routers only) Name of the configured test profile that contains the parameters for the test | detail |
| Test packet size | (ACX Series routers only) Size of the test packets in bytes | detail |
| Theoretical max bandwidth | (ACX Series routers only) Theoretical maximum bandwidth configured for the test. This value is typically set to the bandwidth of the server being tested. Valid values are 1 Kbps through 1,000,000 Kbps (1 Gbps). The value defined is the highest bandwidth value tested for this test. | detail |

Table 150: show services rpm rfc2544-benchmarking test-id Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|----------------------------------|--|-----------------|
| Test Configuration | Details of the configured test ID. | detail |
| Test mode | Mode configured for the test. Test modes are Initiate-and-Terminate and Reflect. | detail |
| Duration in seconds | Period in seconds for which the test has been performed. | detail |
| Test family | The underlying service on which the test is run. Test families are: <ul style="list-style-type: none"> • INET: Indicates that the test is run on a IPV4 service. • CCC: Indicates that the test is run on a circuit cross-connect (CCC) or pseudowire service. | detail |
| Routing Instance Name | (ACX Series routers only) Name of the routing instance for the test | detail |
| Inet family Configuration | Details of the configured inet family for an IPv4 service | detail |
| Egress Interface | Name of the egress interface from which the test frames are sent | detail |
| Source ipv4 address | Source IPv4 address used in the IP header of the generated test frame. | detail |
| Destination ipv4 address | Destination IPv4 address used in the IP header of the generated test frame. | detail |
| Source udp port | Source UDP port number used in the UDP header of the generated test frame. | detail |
| Destination udp port | Destination UDP port number used in the UDP header of the generated test frame. | detail |
| Ccc family Configuration | Details of the configured CCC family for an Ethernet service | detail |
| Source MAC address | (ACX Series routers only) Source MAC address used in generated test frames for a CCC or Ethernet pseudowire service. | detail |
| Destination MAC address | (ACX Series routers only) Destination MAC address used in generated test frames for a CCC or Ethernet pseudowire service. | detail |
| Ivlan-id | (ACX Series routers only) Inner VLAN ID for test-frames. | detail |
| Ovlan-id | (ACX Series routers only) Outer VLAN ID for test-frames. | detail |
| Direction egress | Test is run in the egress direction of the interface (NNI) | detail |
| Direction ingress | Test is run in the ingress direction of the interface (UNI) | detail |

Table 150: show services rpm rfc2544-benchmarking test-id Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|-----------------|
| Rfc2544 throughput test information | (ACX Series routers only) Details of the throughput test | detail |
| Initial test load percentage | Percentage of the steady state load for the test. | detail |
| Test iteration mode | Mode of the test iteration: Binary or step-down. | detail |
| Test iteration step percent | The test step percentage for tests. If not specified, the default step-percent is 10 percent. This parameter is ignored for all type of tests other than frame-loss tests. | detail |
| Theoretical max bandwidth | The theoretical limit of the media for the frame size configured for the test. This value is typically set to the bandwidth of the server being tested. | detail |
| Test packet size: | Packet size of the test frames in bytes. | detail |
| Iteration | Number of the test iteration. | detail |
| Duration (sec) | Period in seconds for which the test iteration is run | detail |
| Elapsed time | Amount of time that has passed, in seconds, since the start of the test. | detail |
| pps | Total count of packets-per-second (pps) transmitted during the test. | detail |
| Tx Packets | Number of transmitted test packets. | detail |
| Rx Packets | Number of received test packets. | detail |
| Tx Bytes | Number of transmitted bytes. | detail |
| Rx Bytes | Number of received bytes. | detail |
| Percentage throughput | Percentage of throughput for the test iteration. | detail |
| Result of the iteration runs (Throughput) : | Results of the completed throughput test for a particular packet size. | detail |
| Best iteration | Number of the iteration with the highest throughout, among the listed iterations. | detail |
| Best iteration (pps) | Packets-per-second (pps) count of the iteration with the highest throughout, among the listed iterations. | detail |
| Best iteration throughput | Percentage of throughput of the iteration with the highest throughout, among the listed iterations. | detail |

Table 150: show services rpm rfc2544-benchmarking test-id Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|---|-----------------------|
| RFC2544 Throughput test results summary | Consolidated information of the throughput test. | detail summary |
| Packet Size | Size of the test packet in bytes. | detail summary |
| Theoretical rate (pps) | Theoretical frame rate in packets-per-second. | detail summary |
| Tx Packets | Number of transmitted packets. | detail summary |
| Rx Packets | Number of received packets. | detail summary |
| Offered throughput (percentage) | The offered throughput in percentage of the chosen service (such as Layer 3 or Ethernet pseudowire). | detail summary |
| Measured bandwidth (kbps) | Available bandwidth of the service based on the calculated throughput. | detail summary |
| Rfc2544 latency test information : | (ACX Series routers only) Details of the latency test | detail |
| Theoretical max bandwidth | Theoretical maximum bandwidth configured for the test. This value is typically set to the bandwidth of the server being tested. Valid values are 1 Kbps through 1,000,000 Kbps (1 Gbps). The value defined is the highest bandwidth value used for this test. | detail |
| Initial test load percentage | Percentage of the steady state load for the test. | detail |
| Duration in seconds | Period in seconds for which the test has been performed. | detail |
| Test packet size | Size of the test packet in bytes. | detail |
| Iteration | Number of the test iteration. | detail |
| Duration (sec) | Period in seconds for which the test iteration is run. | detail |
| Elapsed time | Amount of time that has passed, in seconds, since the start of the test. | detail |
| pps | Total count of packets-per-second (pps) transmitted during the test. | detail |
| Tx Packets | Number of transmitted test packets. | detail |
| Rx Packets | Number of received test packets. | detail |
| Latency | Displays the latency parameters. | detail |

Table 150: show services rpm rfc2544-benchmarking test-id Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|---|-----------------------|
| Min(ns) | Aggregated minimum latency in nanoseconds. | detail |
| Avg(ns) | Aggregated average latency in nanoseconds. | detail |
| Max(ns) | Aggregated maximum latency in nanoseconds. | detail |
| Probe(ns) | Aggregated probe latency in nanoseconds. | detail |
| Result of the iteration runs (Latency) | Results of the latency test completed for a particular packet size. | detail |
| Avg (min) Latency | Average of the minimum latency in nanoseconds. | detail |
| Avg (avg) latency | Average of the average latency in nanoseconds. | detail |
| Avg (Max) latency | Average of the maximum latency in nanoseconds. | detail |
| Avg (probe) latency | Average of the probe latency in nanoseconds. | detail |
| RFC2544 Latency test results summary: | Consolidated statistics of the latency test. | detail summary |
| Packet Size | Size of the test packet in bytes. | detail summary |
| Theoretical rate (pps) | Theoretical frame rate in packets-per-second. | detail summary |
| Tx Packets | Number of transmitted packets. | detail summary |
| Rx Packets | Number of received packets. | detail summary |
| Latency | Displays the latency parameters. | detail summary |
| Min(ns) | Aggregated minimum latency in nanoseconds. | detail summary |
| Avg(ns) | Aggregated average latency in nanoseconds. | detail summary |
| Max(ns) | Aggregated maximum latency in nanoseconds. | detail summary |
| Probe(ns) | Aggregated probe latency in nanoseconds. | detail summary |
| Rfc2544 Back-Back test information : | (ACX Series routers only) Details of the back-to-back frames or bursty frames test. | detail |
| Initial burst length: | Length of the first burst when test frames are sent, as a measure of number of seconds at the rate of Kbps. | detail |

Table 150: show services rpm rfc2544-benchmarking test-id Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|--|-----------------------|
| Test iteration mode : | Mode of the test iteration: Binary or step-down. | detail |
| Test iteration step percent | The test step percentage for tests. If not specified, the default step-percent is 10 percent. This parameter is ignored for all type of tests other than frame-loss tests. | detail |
| Theoretical max bandwidth | The theoretical limit of the media for the frame size configured for the test. This value is typically set to the bandwidth of the server being tested. | detail |
| Test packet size: | Packet size of the test frames in bytes. | detail |
| Iteration | Number of the test iteration. | detail |
| Burst Length (Packets) | Number of packets in the burst. | detail |
| Elapsed time | Amount of time that has passed, in seconds, since the start of the test. | detail |
| Tx Packets | Number of transmitted test packets. | detail |
| Rx Packets | Number of received test packets. | detail |
| Tx Bytes | Number of transmitted bytes. | detail |
| Rx Bytes | Number of received bytes. | detail |
| Result of the iteration runs : | Results of the back-to-back frames test completed for a certain packet size. | detail |
| Best iteration : | Number of the iteration with the longest burst. | detail |
| Measured burst (num sec) | Time in seconds of the burst of the iteration with the longest burst. | detail |
| Measured burst (num pkts) | Number of packets during the burst of the iteration with the longest burst. | detail |
| RFC2544 Back-Back test results summary: | Consolidated statistics of the back-to-back frames test. | detail summary |
| Packet Size | Size of the test packets in bytes. | detail summary |
| Measure Burst length (Packets) | Computed burst length in terms of number of packets. | detail summary |

Table 150: show services rpm rfc2544-benchmarking test-id Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|-----------------|
| Rfc2544 frame-loss test information : | (ACX Series routers only) Details of the frame-loss test. | detail |
| Initial burst length: | Length of the first burst when test frames are sent, as a measure of number of seconds at the rate of Kbps. | detail |
| Test iteration mode : | Mode of the test iteration: Binary or step-down. | detail |
| Test iteration step percent | The test step percentage for tests. If not specified, the default step-percent is 10 percent. This parameter is ignored for all type of tests other than frame-loss tests. | detail |
| Theoretical max bandwidth | The theoretical limit of the media for the frame size configured for the test. This value is typically set to the bandwidth of the server being tested. | detail |
| Test packet size | Size of the test packets in bytes. | detail |
| Iteration | Number of the test iteration. | detail |
| Duration (sec) | Period, in seconds, for which the test iteration is run. | detail |
| Offered throughput (percentage) | The offered throughput in percentage of the chosen service (such as Layer 3 or Ethernet pseudowire) | detail |
| Elapsed time | Amount of time that has passed, in seconds, since the start of the test. | detail |
| pps | Theoretical frame rate in packets-per-second. | detail |
| Tx Packets | Number of transmitted test packets. | detail |
| Rx Packets | Number of received test packets. | detail |
| Tx Bytes | Number of transmitted bytes. | detail |
| Rx Bytes | Number of received bytes. | detail |
| Frame-loss rate % | Percentage of frames that must been forwarded by the router under steady state (constant) load, but were not forwarded due to lack of resources. | detail |
| Result of the iteration runs : | Results of the frame-loss test completed for a certain packet size. | detail |
| Frame-loss rate (percent) : | Percentage of dropped frames for the specified packet size | detail |
| RFC2544 Frame-loss test results summary | Consolidated statistics of the frame-loss test | detail |

Table 150: show services rpm rfc2544-benchmarking test-id Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|--|-----------------|
| Packet Size | Size of the test packet in bytes. | detail summary |
| Theoretical rate (pps) | Theoretical frame rate in packets-per-second. | detail summary |
| Percentage throughput | Percentage of throughput for the test iteration. | detail summary |
| Tx Packets | Number of transmitted packets. | detail summary |
| Rx Packets | Number of received packets. | detail summary |
| Frame Loss rate percent | Percentage of dropped frames for the specified packet size | detail summary |

Sample Output

show services rpm rfc2544-benchmarking test-id detail (Throughput Test on ACX Series routers)

show services rpm twamp server connection

| | |
|---------------------------------|--|
| Syntax | show services rpm twamp server connection
<i><connection-id></i> |
| Release Information | Command introduced in Junos OS Release 9.3. |
| Description | Display information about the connections established between the real-time performance monitoring (RPM) Two-Way Active Measurement Protocol (TWAMP) server and control-clients. By default, all established sessions are displayed, unless you specify a session ID when you issue the command. |
| Options | <i>connection-id</i> —(Optional) Display only information about the specified connection ID. |
| Required Privilege Level | view |
| List of Sample Output | show services rpm twamp server connection on page 2281 |
| Output Fields | Table 151 on page 2281 lists the output fields for the show services rpm twamp server connection command. Output fields are listed in the approximate order in which they appear. |

Table 151: show services rpm twamp server connection Output Fields

| Field Name | Field Description |
|----------------|---|
| Connection ID | Connection ID that uniquely identifies the connection between the TWAMP server and a particular client. |
| Client address | Client IP address. |
| Client port | Client port number. |
| Server address | Server IP address. |
| Server port | Server port number. |
| Session count | Session count. |
| Auth mode | Authentication mode. |

Sample Output

show services rpm twamp server connection

```

user@host> show services rpm twamp server connection
  Connection  Client      Client  Server      Server  Session  Auth
   ID         address      port    address     port    count    mode

| Output Fields | Table 153 on page 2285 lists the output fields for the show services video-monitoring mdi errors fpc-slot <i>fpc-slot</i> command. Output fields are listed in the approximate order in which they appear. |

Table 153: show services video-monitoring mdi errors fpc-slot Output Fields

| Field Name | Field Description |
|---------------------------------|--|
| FPC slot | Slot number of the monitored FPC. |
| Flow Insert Error | Number of errors during new flow insert operations. |
| Flow Policer Drops | <p>Number of packets dropped by flow policer process.</p> <p>NOTE: New flows usually arrive within a very short time interval (1.5 microseconds). These errors do not represent the loss of entire flows, because subsequent packets in the flow can establish the flow. All packets are monitored after a flow has been established. Packet forwarding occurs independently of the video monitoring, and packets are not dropped due to video monitoring errors.</p> |
| Unsupported Media Packets Count | Number of packets dropped because they are not media packets or they are unsupported media packets. |
| PID Limit Exceeded | <p>Number of packets unmonitored because the process identifier (PID) limit exceeded has been exceeded.</p> <p>NOTE: The current PID limit is 6.</p> |

Sample Output

show services video-monitoring mdi errors fpc-slot

```
user@host> show services video-monitoring mdi errors fpc-slot 2
```

MDI Errors Information

FPC Slot: 2

Flow Insert Error: 0, Flow Policer Drops: 0

test services rpm rfc2544-benchmarking test

Syntax test services rpm rfc2544-benchmarking test(ACX Series)
 <clear-counters>
 <routing-instance>
 <test-name>
 <test-id>
 <start>>
 <stop>

Syntax test services rpm rfc2544-benchmarking test(MX104 Router)
 <test-name>
 <test-id>
 <start>>
 <stop>

Release Information Command introduced in Junos OS Release 12.3X52 for ACX Series routers.
 Command introduced in Junos OS Release 13.3R1 for MX104 3D Universal Edge Routers.

Description Start or stop an RFC 2544-based benchmarking test. You can start or stop all of the test names that are defined on a router, or start or stop a specific test name. You can also stop a test based on its test identifier. You can also clear the statistical counters associated with the test. When you trigger an RFC 2544-based benchmarking test, it passes through a series of states. These states are displayed in the Test state field in the brief or displayed output information of the **show services rpm rfc2544-benchmarking** command.

NOTE: The RFC 2544 test is stopped at the initiator automatically after the test successfully completes all of the test steps. You need not explicitly enter the **test services rpm rfc2544-benchmarking test <test-name | test-id> stop** command. However, at the reflector, you must explicitly enter this command to stop the test after the test is completed at the initiator.

Options **start**—Start the RFC 2544-based benchmarking test

stop—Terminate the RFC 2544-based benchmarking test

clear-counters—(ACX Series routers only) Clear the statistics associated with the benchmarking test that was run.

routing-instance—(ACX Series routers only) Name of the routing instance for the test.

test-name—Name of the benchmarking test that must be started or stopped.

test-id—Unique identifier of the test that must be stopped. You can stop a test based on the test identifier. You can use the **test-id** option with only the **test services rpm rfc2544-benchmarking stop** command.

Additional Information The test session is supported in out-of-service mode for the underlying service. You must not transmit any traffic to the UNI port, configured as a generator or a reflector, that is being tested during the duration of the test.

Required Privilege Level view

List of Sample Output [test services rpm rfc2544-benchmarking on page 2294](#)

Output Fields To display the results of the benchmarking test, use the **show services rpm rfc2544-benchmarking** command.

Sample Output

test services rpm rfc2544-benchmarking

```
user@host> test services rpm rfc2544-benchmarking test test-name test1 start
Test "test1" id 56 started
```

The response specifies that a test has been started with test id 56. The test ID can be further used in **show** commands to view test output.

clear ike security-associations

| | |
|---------------------------------|--|
| Syntax | clear ike security-associations
<destination-ip-address> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (Encryption interface on M Series and T Series routers only) Clear information about the current Internet Key Exchange (IKE) security association. This command is valid for dynamic security associations only. For IKEv2, this command creates new security associations for IKE SA and IPSEC SAs. |
| Options | none —Clear all IKE security associations.

destination-ip-address —(Optional) Clear the IKE security association at the specified destination address. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none">• show ike security-associations on page 2305 |
| List of Sample Output | clear ike security-associations on page 2296 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

clear ike security-associations

```
user@host> clear ike security-associations
```

clear ipsec security-associations

| | |
|---------------------------------|--|
| Syntax | <code>clear ipsec security-associations</code>
<code><sa-name></code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (Encryption interface on M Series and T Series routers only) Clear information about the current IP Security (IPsec) security association. This command is valid for dynamic security associations only. For IKEv1, this command creates new security associations for IKE SA and IPSEC SAs. |
| Options | none —Clear all IPsec security associations.

sa-name —(Optional) Clear the specified security association. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • show ipsec security-associations on page 2350 |
| List of Sample Output | clear ipsec security-associations on page 2297 |
| Output Fields | See the show ipsec security-associations for an explanation of output fields. |

Sample Output

clear ipsec security-associations

The following output from the **show ipsec security-associations detail** command is displayed before and after the **clear ipsec security-associations** command is issued:

```

user@host> show ipsec security-associations detail
Security association: sa-dynamic, Interface family: Up

Direction: inbound, SPI: 242379418, State: Installed
Mode: tunnel, Type: dynamic
Protocol: ESP, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expires in 22979 seconds
Hard lifetime: Expires in 28739 seconds

Direction: outbound, SPI: 368592771, State: Installed
Mode: tunnel, Type: dynamic
Protocol: ESP, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expires in 22979 seconds
Hard lifetime: Expires in 28739 seconds

user@host> clear ipsec security-associations

user@host> show ipsec security-associations detail
Security association: sa-dynamic, Interface family: Up

Direction: inbound, SPI: 1031597683, State: Installed

```

Mode: tunnel, Type: dynamic
Protocol: ESP, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expires in 23037 seconds
Hard lifetime: Expires in 28797 seconds

Direction: outbound, SPI: 1618419878, State: Installed
Mode: tunnel, Type: dynamic
Protocol: ESP, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expires in 23037 seconds
Hard lifetime: Expires in 28797 seconds

request ipsec switch

| | |
|---------------------------------|---|
| Syntax | <code>request ipsec switch (interface <es-fpc/pic/port> security-associations <sa-name>)</code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | (Encryption interface on M Series, PTX Series, and T Series routers and EX Series switches only) Manually switch from the primary to the backup encryption services interface, or switch from the primary to the backup IP Security (IPsec) tunnel. |
| Options | <code>interface <es-fpc/pic/port></code> —Switch to the backup encryption interface.
<code>security-associations <sa-name></code> —Switch to the backup tunnel. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • show ipsec redundancy on page 2348 |
| List of Sample Output | request ipsec switch on page 2299 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request ipsec switch

```
user@host> request ipsec switch security-associations sa-private
```

request security certificate (signed)

| | |
|---|--|
| Syntax | <code>request security certificate enroll filename <i>filename</i> subject <i>subject</i>
alternative-subject <i>alternative-subject</i> certification-authority <i>certification-authority</i> encoding
(binary pem) key-file <i>key-file</i> domain-name <i>domain-name</i></code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | (Encryption interface on M Series and T Series routers and EX Series switches only)
Obtain a signed certificate from a certificate authority (CA). The signed certificate validates the CA and the owner of the certificate. The results are saved in a specified file to the <code>/var/etc/ikecert</code> directory. |
| <div> NOTE: For FIPS mode, the digital security certificates must be compliant with the National Institute of Standards and Technology (NIST) SP 800-131A standard. The <code>request security key-pair</code> command is deprecated and not available with Junos in FIPS mode because it generates RSA and DSA keys with sizes of 512 and 1024 bits that are not compliant with the NIST SP 800-131A standard.</div> | |
| Options | <p>filename <i>filename</i>—File that stores the certificate.</p> <p>subject <i>subject</i>—Distinguished name (dn), which consists of a set of components—for example, an organization (o), an organization unit (ou), a country (c), and a locality (l).</p> <p>alternative-subject <i>alternative-subject</i>—Tunnel source address.</p> <p>certification-authority <i>certification-authority</i>—Name of the certificate authority profile in the configuration.</p> <p>encoding (binary pem)—File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default format is binary.</p> <p>key-file <i>key-file</i>—File containing a local private key.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name.</p> |
| Required Privilege Level | maintenance |
| List of Sample Output | request security certificate (signed) on page 2301 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request security certificate (signed)

```
user@host> request security certificate enroll filename host.crt subject c=uk,o=london
alternative-subject 10.50.1.4 certification-authority verisign key-file host-1.prv domain-name
host.juniper.net
CA name: juniper.net CA file: ca_verisign
local pub/private key pair: host.prv
subject: c=uk,o=london domain name: host.juniper.net
alternative subject: 10.50.1.4
Encoding: binary
Certificate enrollment has started. To view the status of your enrollment, check
the key management process (kmd) log file at /var/log/kmd. <-----
```

request security certificate (unsigned)

| | |
|---------------------------------|--|
| Syntax | <code>request security certificate enroll filename <i>filename</i> ca-file <i>ca-file</i> ca-name <i>ca-name</i> encoding (binary perm) url <i>url</i></code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | (Encryption interface on M Series and T Series routers and EX Series switches only)
Obtain a certificate from a certificate authority (CA). The results are saved in a specified file to the <code>/var/etc/ikecert</code> directory. |
| Options | <p>filename <i>filename</i>—File that stores the public key certificate.</p> <p>ca-file <i>ca-file</i>—Name of the certificate authority profile in the configuration.</p> <p>ca-name <i>ca-name</i>—Name of the certificate authority.</p> <p>encoding (binary pem)—File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default value is binary.</p> <p>url <i>url</i>—Certificate authority URL.</p> |
| Required Privilege Level | maintenance |
| List of Sample Output | request security certificate (unsigned) on page 2302 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request security certificate (unsigned)

```
user@host> request security certificate enroll filename ca_verisign ca-file verisign ca-name
juniper.net urlxyzcompany URL
http://<verisign ca-name xyzcompany url>/cgi-bin/pkiclient.exe CA name: juniper.net
CA file: verisign Encoding: binary
Certificate enrollment has started. To view the status of your enrollment, check
the key management process (kmd) log file at /var/log/kmd. <-----
```

request security key-pair

| | |
|---|---|
| Syntax | <code>request security key-pair <i>filename</i></code>
<code><size <i>key-size</i>></code>
<code><type (rsa dsa)></code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | (Encryption interface on M Series and T Series routers and EX Series switches only)
Generate a public and private key pair for a digital certificate. |
| <div>  <p>NOTE: The <code>request security-certificates</code> command is deprecated and are not available with Junos in FIPS mode because security certificates are not compliant with the NIST SP 800-131A standard.</p> </div> | |
| Options | <p><i>filename</i>—Name of a file in which to store the key pair.</p> <p><i>size key-size</i>—(Optional) Key size, in bits. The key size can be 512, 1024, or 2048. The default value is 1024.</p> <p><i>type</i>—(Optional) Algorithm used to encrypt the key:</p> <ul style="list-style-type: none"> • rsa—RSA algorithm. This is the default. • dsa—Digital signature algorithm with Secure Hash Algorithm (SHA). |
| Required Privilege Level | maintenance |
| List of Sample Output | request security key-pair on page 2303 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request security key-pair

```
user@host> request security key-pair security-key-file
```

request system certificate add

| | |
|---------------------------------|--|
| Syntax | <code>request system certificate add (<i>filename</i> terminal)</code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | (Encryption interface on M Series and T Series routers, PTX Series, and QFX Series switches only) Add a certificate provided by the Juniper Networks certificate authority (CA). |
| Options | <i>filename</i> —Filename (URL, local, or remote).
<i>terminal</i> —Use login terminal. |
| Required Privilege Level | maintenance |
| List of Sample Output | request system certificate add on page 2304 |
| Output Fields | When you enter this command, you are provided feedback on the status of your request. |

Sample Output

request system certificate add

```
user@host> request system certificate add terminal
```

show ike security-associations

| | |
|---------------------------------|---|
| Syntax | show ike security-associations
<brief detail>
<peer-address> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (Encryption interface on M Series and T Series routers only) Display information about Internet Key Exchange (IKE) security associations. |
| Options | <p>none—Display standard information about all IKE security associations.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>peer-address—(Optional) Display IKE security associations for the specified peer address.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • clear ike security-associations on page 2296 |
| List of Sample Output | show ike security-associations on page 2308
show ike security-associations detail on page 2308 |
| Output Fields | Table 156 on page 2305 lists the output fields for the show ike security-associations command. Output fields are listed in the approximate order in which they appear. |

Table 156: show ike security-associations Output Fields

| Field Name | Field Description | Level of Output |
|-------------------------|---|-----------------|
| IKE peer | Remote end of the IKE negotiation. | detail |
| Role | Part played in the IKE session. The router triggering the IKE negotiation is the initiator, and the router accepting the first IKE exchange packets is the responder. | detail |
| Remote Address | Responder's address. | none specified |
| State | State of the IKE security association: <ul style="list-style-type: none"> • Matured—The IKE security association is established. • Not matured—The IKE security association is in the process of negotiation. | none specified |
| Initiator cookie | When the IKE negotiation is triggered, a random number is sent to the remote node. | All levels |

Table 156: show ike security-associations Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|------------------------------|---|-----------------|
| Responder cookie | <p>The remote node generates its own random number and sends it back to the initiator as a verification that the packets were received.</p> <p>Of the numerous security services available, protection against denial of service (DoS) is one of the most difficult to address. A “cookie” or anticlogging token (ACT) is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity. An exchange prior to CPU-intensive public key operations can thwart some DoS attempts (such as simple flooding with invalid IP source addresses).</p> | All levels |
| Exchange type | <p>Specifies the number of messages in an IKE exchange, and the payload types that are contained in each message. Each exchange type provides a particular set of security services, such as anonymity of the participants, perfect forward secrecy of the keying material, and authentication of the participants. Junos OS supports two types of exchanges:</p> <ul style="list-style-type: none"> • Main—The exchange is done with six messages. Main encrypts the payload, protecting the identity of the neighbor. • Aggressive—The exchange is done with three messages. Aggressive does not encrypt the payload, leaving the identity of the neighbor unprotected. | All Levels |
| Authentication method | Type of authentication determines which payloads are exchanged and when they are exchanged. The Junos OS supports only pre-shared keys . | detail |
| Local | Prefix and port number of the local end. | detail |
| Remote | Prefix and port number of the remote end. | detail |
| Lifetime | Number of seconds remaining until the IKE security association expires. | detail |
| Algorithms | <p>Header for the IKE algorithms output.</p> <ul style="list-style-type: none"> • Authentication—Type of authentication algorithm used: md5 or sha1. • Encryption—Type of encryption algorithm used: des-cbc, 3des-cbc, or None. • Pseudo random function—Function that generates highly unpredictable random numbers: hmac-md5 or hmac-sha1. | detail |
| Traffic statistics | <p>Number of bytes and packets received and transmitted on the IKE security association.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the IKE security association. • Input packets, Output packets—Number of packets received and transmitted on the IKE security association. | detail |

Table 156: show ike security-associations Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|---|-----------------|
| Flags | Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> • caller notification sent—Caller program notified about the completion of the IKE negotiation. • waiting for done—Negotiation is done. The library is waiting for the remote end retransmission timers to expire. • waiting for remove—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation. • waiting for policy manager—Negotiation is waiting for a response from the policy manager. | detail |
| IPsec security associates | Number of IPsec security associations created and deleted with this IKE security association. | detail |
| Phase 2 negotiations in progress | Number of phase 2 IKE negotiations in progress and status information: <ul style="list-style-type: none"> • Negotiation type—Type of phase 2 negotiation. The Junos OS currently supports quick mode. • Message ID—Unique identifier for a phase 2 negotiation. • Local identity—Identity of the local phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[O..id-data-len] = iddata-presentation)</i> • Remote identity—Identity of the remote phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[O..id-data-len] = iddata-presentation)</i> • Flags—Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> • caller notification sent—Caller program notified about the completion of the IKE negotiation. • waiting for done—Negotiation is done. The library is waiting for the remote end retransmission timers to expire. • waiting for remove—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation. • waiting for policy manager—Negotiation is waiting for a response from the policy manager. | detail |

| Output Fields | Table 157 on page 2309 lists the output fields for the show interfaces (ES) command. Output fields are listed in the approximate order in which they appear. |

Table 157: Encryption show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface's index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |

Table 157: Encryption show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|--|------------------------------|
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Type | Encapsulation being used on the interface. | All levels |
| Link-level type | Encapsulation being used on the physical interface. | All levels |
| MTU | MTU size on the physical interface. | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Device flags | Information about the physical device. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Input rate | Input rate in bits per second (bps) and packets per second (pps). | None specified |
| Output rate | Output rate in bps and pps. | None specified |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface. • Input packets, Output packets—Number of packets received and transmitted on the interface. • Anti-replay failures—Total number of antireplay failures seen on all tunnels configured on the ES PIC. • Authentication—Total number of authentication failures seen on all tunnels configured on the ES PIC. | detail extensive |
| Egress queues | Total number of egress queues supported on the specified interface. | detail extensive |
| Queue counters | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. | detail extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |

Table 157: Encryption show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|------------------------|---|-----------------------|
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Flags | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| IP-Header | IP header of the logical interface. | All levels |
| Encapsulation | Encapsulation on the logical interface. | All levels |
| <i>protocol-family</i> | Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed. | brief |
| Input packets | Number of packets received on the logical interface. | None specified |
| Output packets | Number of packets transmitted on the logical interface. | None specified |
| Traffic statistics | Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Local statistics | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Transit statistics | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Protocol | Protocol family configured on the logical interface, such as iso , inet6 , mpls . | detail extensive none |
| MTU | MTU size on the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route table | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 . | detail extensive |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Addresses, Flags | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . Address | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |

Table 157: Encryption show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------|---|-----------------------|
| Local | IP address of the logical interface. | detail extensive none |
| Broadcast | Broadcast address of the logical interface. | detail extensive |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

show interfaces (GRE)

| | |
|---------------------------------|---|
| Syntax | <pre>show interfaces <i>interface-type</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre> |
| Release Information | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 12.1 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p> |
| Description | Display status information about the specified generic routing encapsulation (GRE) interface. |
| Options | <p><i>interface-type</i>—On M Series and T Series routers and EX Series switches, the interface type is <i>gr-fpc/pic/port</i>.</p> <p><i>brief detail extensive terse</i>—(Optional) Display the specified output level of interface information.</p> <p><i>descriptions</i>—(Optional) Display interface description strings.</p> <p><i>media</i>—(Optional) Display media-specific information about network interfaces.</p> <p><i>snmp-index snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><i>statistics</i>—(Optional) Display static interface statistics.</p> |
| | <div>  <p>NOTE: You can configure generic routing encapsulation (GRE) interfaces (<i>gre-x/y/z</i>) only for GMPLS control channels. GRE interfaces are not supported or configurable for other applications. For more information about GMPLS, see the <i>MPLS Applications Feature Guide for Routing Devices</i> and the <i>Junos OS, Release 14.2</i>.</p> </div> |
| Required Privilege Level | view |
| List of Sample Output | <p>show interfaces (GRE) on page 2319</p> <p>show interfaces brief (GRE) on page 2319</p> <p>show interfaces detail (GRE) on page 2319</p> <p>show interfaces detail (GRE) on an EX4200 Virtual Chassis Member Switch on page 2320</p> <p>show interfaces extensive (GRE) on page 2321</p> |
| Output Fields | <p>Table 158 on page 2316 lists the output fields for the show interfaces (GRE) command. Output fields are listed in the approximate order in which they appear.</p> |

Table 158: GRE show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|--------------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface's index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Type | Type of interface. | All levels |
| Link-level type | Encapsulation used on the physical interface. | All levels |
| MTU | MTU size on the physical interface. | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Device Flags | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Interface Flags | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Input rate | Input rate in bits per second (bps) and packets per second (pps). | None specified |
| Output rate | Output rate in bps and pps. | None specified |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | <p>The number of and the rate at which input and output bytes and packets are received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | detail extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |

Table 158: GRE show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|--|-----------------------|
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| Flags | <p>Information about the logical interface. Possible values listed in the “Logical Interface Flags” section under <i>Common Output Fields Description</i>. describe general information about the logical interface.</p> <p>GRE-specific information about the logical interface is indicated by the presence or absence of the following value in this field:</p> <ul style="list-style-type: none"> • Reassemble-Pkts—If the Flags field includes this string, the GRE tunnel is configured to reassemble tunnel packets that were fragmented after tunnel encapsulation. | All levels |
| IP-Header | <p>IP header of the logical interface. If the tunnel key statement is configured, this information is included in the IP Header entry.</p> <p>GRE-specific information about the logical interface is indicated by the presence or absence of the following value in this field:</p> <ul style="list-style-type: none"> • df—If the IP-Header field includes this string immediately following the 16 bits of identification information (that is, if :df: displays after the twelfth byte), the GRE tunnel is configured to allow fragmentation of GRE packets after encapsulation. | All levels |
| Encapsulation | Encapsulation on the logical interface. | All levels |
| Copy-tos-to-outer-ip-header | <p>Status of type of service (ToS) bits in the GRE packet header:</p> <ul style="list-style-type: none"> • On—ToS bits were copied from the payload packet header into the header of the IP packet sent through the GRE tunnel. • Off—ToS bits were not copied from the payload packet header and are set to 0 in the GRE packet header. <p>NOTE: EX Series switches do not support copying ToS bits to the encapsulated packet, so the value of this field is always Off in switch output.</p> | detail extensive |
| Gre keepalives configured | <p>Indicates whether a GRE keepalive time and hold time are configured for the GRE tunnel.</p> <p>NOTE: EX Series switches do not support configuration of GRE tunnel keepalive times and hold times, so the value of this field is always Off in switch output.</p> | detail extensive |
| Gre keepalives adjacency state | Status of the other end of the GRE tunnel: Up or Down . If keepalive messages are not received by either end of the GRE tunnel within the hold-time period, the GRE keepalive adjacency state is down even when the GRE tunnel is up. | detail extensive |
| Input packets | Number of packets received on the logical interface. | None specified |
| Output packets | Number of packets transmitted on the logical interface. | None specified |

Table 158: GRE show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------------|---|------------------------------|
| Traffic statistics | <p>Rate of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.</p> <ul style="list-style-type: none"> • Input rate—Rate of bits and packets received on the interface. • Output rate—Rate of bits and packets transmitted on the interface. | detail extensive |
| Local statistics | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Transit statistics | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive none |
| Protocol | Protocol family configured on the logical interface, such as iso , inet6 , or mpls . | detail extensive none |
| <i>protocol-family</i> | Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed. | brief |
| MTU | MTU size on the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route table | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 . | detail extensive |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Addresses, Flags | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |
| Local | IP address of the logical interface. | detail extensive none |
| Broadcast | Broadcast address of the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

| Traffic statistics | <p>Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.</p> <ul style="list-style-type: none"> • Input rate—Rate of bits and packets received on the interface. • Output rate—Rate of bits and packets transmitted on the interface. | detail extensive |
| Local statistics | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Transit statistics | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Protocol | Protocol family configured on the logical interface, such as iso , inet6 , or mpls . | detail extensive none |
| <i>protocol-family</i> | Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed. | brief |
| MTU | MTU size on the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route table | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 . | detail extensive |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |

Sample Output

show interfaces (IP-over-IP)

```

user@host> show interfaces ip-0/0/0
Physical interface: ip-0/0/0, Enabled, Physical link is Up
  Interface index: 133, SNMP ifIndex: 27
  Type: IPIP, Link-level type: IP-over-IP, MTU: Unlimited, Speed: 800mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)

  Logical interface ip-0/0/0.0 (Index 69) (SNMP ifIndex 49)
    Flags: Point-To-Point SNMP-Traps 16384
    IP-Header 2.2.2.1:2.2.2.2:4:df:64:00000000 Encapsulation: IPv4-NUL
    Input packets : 0

```

```

Output packets: 0
Protocol inet, MTU: 1480
Flags: None

```

show interfaces brief (IP-over-IP)

```

user@host> show interfaces ip-0/0/0 brief
Physical interface: ip-0/0/0, Enabled, Physical link is Up
Type: IPIP, Link-level type: IP-over-IP, MTU: Unlimited, Speed: 800mbps
Device flags : Present Running
Interface flags: SNMP-Traps

Logical interface ip-0/0/0.0
Flags: Point-To-Point SNMP-Traps 16384
IP-Header 2.2.2.1:2.2.2.2:4:df:64:00000000 Encapsulation: IPv4-NULl
inet

```

show interfaces detail (IP-over-IP)

```

user@host> show interfaces ip-0/0/0 detail
Physical interface: ip-0/0/0, Enabled, Physical link is Up
Interface index: 133, SNMP ifIndex: 27, Generation: 14
Type: IPIP, Link-level type: IP-over-IP, MTU: Unlimited, Speed: 800mbps
Hold-times : Up 0 ms, Down 0 ms
Device flags : Present Running
Interface flags: SNMP-Traps
Statistics last cleared: Never
Traffic statistics:
Input bytes : 0 0 bps
Output bytes : 0 0 bps
Input packets: 0 0 pps
Output packets: 0 0 pps

Logical interface ip-0/0/0.0 (Index 69) (SNMP ifIndex 49) (Generation 9)
Flags: Point-To-Point SNMP-Traps 16384
IP-Header 2.2.2.1:2.2.2.2:4:df:64:00000000 Encapsulation: IPv4-NULl
Traffic statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Local statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Transit statistics:
Input bytes : 0 0 bps
Output bytes : 0 0 bps
Input packets: 0 0 pps
Output packets: 0 0 pps
Protocol inet, MTU: 1480, Generation: 13, Route table: 0
Flags: None

```

show interfaces extensive (IP-over-IP)

The output for the show interfaces extensive command is identical to that for the show interfaces detail command. For sample output, see [show interfaces detail \(IP-over-IP\) on page 2325](#).

show interfaces (Logical Tunnel)

| | |
|---------------------------------|--|
| Syntax | <pre>show interfaces <i>interface-type</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display status information about the specified logical tunnel interface. |
| Options | <p><i>interface-type</i>—On M Series and T Series routers, the interface type is <i>lt-fpc/pic/port</i>.</p> <p><i>brief detail extensive terse</i>—(Optional) Display the specified level of output.</p> <p><i>descriptions</i>—(Optional) Display interface description strings.</p> <p><i>media</i>—(Optional) Display media-specific information about network interfaces.</p> <p><i>snmp-index snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><i>statistics</i>—(Optional) Display static interface statistics.</p> |
| Required Privilege Level | view |
| List of Sample Output | show interfaces extensive (Logical Tunnel) on page 2330 |
| Output Fields | Table 160 on page 2326 lists the output fields for the show interfaces (logical tunnel) command. Output fields are listed in the approximate order in which they appear. |

Table 160: Logical Tunnel show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

Table 160: Logical Tunnel show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|------------------------------|
| Type | Type of interface. Software-Pseudo indicates a standard software interface with no associated hardware device. | All levels |
| Link-level type | Encapsulation used on the physical interface. | All levels |
| MTU | MTU size on the physical interface. | All levels |
| Clocking | Reference clock source: Internal or External when configured. Otherwise, Unspecified . | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Device flags | Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Link type | Type of link. | All levels |
| Link flags | Information about the link. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Physical info | Information about the physical interface. | All levels |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Current address | Configured MAC address. | detail extensive none |
| Hardware address | Hardware MAC address. | detail extensive none |
| Alternate link address | Backup link address. | detail extensive none |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) . | detail extensive none |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> Input bytes, Output bytes—Number of bytes received and transmitted on the interface. Input packets, Output packets—Number of packets received and transmitted on the interface. | detail extensive |

Table 160: Logical Tunnel show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------|---|------------------------------|
| Input errors | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. | extensive |
| Output errors | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets larger than the MTU threshold. • Resource errors—Sum of transmit drops. | extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Flags | Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Encapsulation | Encapsulation on the logical interface. | All levels |

Table 160: Logical Tunnel show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|---|------------------------------|
| Traffic statistics | <p>Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.</p> <ul style="list-style-type: none"> • Input bytes—Rate of bytes received on the interface. • Output bytes—Rate of bytes transmitted on the interface. • Input packets—Rate of packets received on the interface. • Output packets—Rate of packets transmitted on the interface. | detail extensive |
| Local statistics | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Transit statistics | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Protocol | Protocol family configured on the logical interface, such as iso , inet6 , mpls . | detail extensive none |
| MTU | MTU size on the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route table | Route table in which this address exists. For example, Route table:0 refers to inet.0 . | detail extensive |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Addresses, Flags | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |
| Local | IP address of the logical interface. | detail extensive none |
| Broadcast | Broadcast address of the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

Sample Output

show interfaces extensive (Logical Tunnel)

```
user@host> show interfaces lt-1/0/0 extensive
Physical interface: lt-1/0/0, Enabled, Physical link is Up
  Interface index: 143, SNMP ifIndex: 70, Generation: 26
  Type: Logical-tunnel, Link-level type: Logical-tunnel, MTU: 0,

show interfaces (Multicast Tunnel)

| | |
|---------------------------------|--|
| Syntax | <pre>show interfaces <i>interface-type</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display status information about the specified multicast tunnel interface and its logical encapsulation and de-encapsulation interfaces. |
| Options | <p><i>interface-type</i>—On M Series and T Series routers, the interface type is <i>mt-fpc/pic/port</i>.</p> <p><i>brief detail extensive terse</i>—(Optional) Display the specified level of output.</p> <p><i>descriptions</i>—(Optional) Display interface description strings.</p> <p><i>media</i>—(Optional) Display media-specific information about network interfaces.</p> <p><i>snmp-index snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><i>statistics</i>—(Optional) Display static interface statistics.</p> |
| Additional Information | The multicast tunnel interface has two logical interfaces: encapsulation and de-encapsulation. These interfaces are automatically created by the Junos OS for every multicast-enabled VPN routing and forwarding (VRF) instance. The encapsulation interface carries multicast traffic traveling from the edge interface to the core interface. The de-encapsulation interface carries traffic coming from the core interface to the edge interface. |

Output Fields Table 161 on page 2332 lists the output fields for the **show interfaces** (Multicast Tunnel) command. Output fields are listed in the approximate order in which they appear.

Table 161: Multicast Tunnel show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|--------------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface's index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Type | Type of interface. | All levels |
| Link-level type | Encapsulation used on the physical interface. | All levels |
| MTU | MTU size on the physical interface. | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Device flags | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Input Rate | Input rate in bits per second (bps) and packets per second (pps). | None specified |
| Output Rate | Output rate in bps and pps. | None specified |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |

Table 161: Multicast Tunnel show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|--|-----------------|
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | All levels |

Sample Output

show interfaces (Multicast Tunnel)

```
user@host> show interfaces mt-1/2/0
Physical interface: mt-1/2/0, Enabled, Physical link is Up
Interface index: 145, SNMP ifIndex: 41
Type: Multicast-GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps

show interfaces (PIM)

| | |
|---------------------------------|---|
| Syntax | <pre>show interfaces <i>interface-type</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display status information about the specified Protocol Independent Multicast (PIM) de-encapsulation or PIM encapsulation interface, respectively. |
| Options | <p><i>interface-type</i>—On M Series and T Series routers, the PIM de-encapsulation interface type is pd-fpc/pic/port and the PIM encapsulation interface type is pe-fpc/pic/port.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p> |
| Required Privilege Level | view |
| List of Sample Output | <p>show interfaces (PIM De-Encapsulation) on page 2337</p> <p>show interfaces brief (PIM De-Encapsulation) on page 2338</p> <p>show interfaces detail (PIM De-Encapsulation) on page 2338</p> <p>show interfaces extensive (PIM Encapsulation) on page 2338</p> <p>show interfaces (PIM Encapsulation) on page 2338</p> <p>show interfaces brief (PIM Encapsulation) on page 2338</p> <p>show interfaces detail (PIM Encapsulation) on page 2339</p> <p>show interfaces extensive (PIM Encapsulation) on page 2339</p> |
| Output Fields | Table 162 on page 2336 lists the output fields for the show interfaces (PIM de-encapsulation or encapsulation) command. Output fields are listed in the approximate order in which they appear. |

Table 162: PIM show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|--------------------|---------------------------------|-----------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |

Table 162: PIM show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|------------------------------|
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface's index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Type | Type of interface. | All levels |
| Link-level type | Encapsulation used on the physical interface. | All levels |
| MTU | MTU size on the physical interface. | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Device flags | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Interface flags | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Input Rate | Input rate in bits per second (bps) and packets per second (pps). | None specified |
| Output Rate | Output rate in bps and pps. | None specified |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | detail extensive |

Sample Output

show interfaces (PIM De-Encapsulation)

```

user@host> show interfaces pd-0/0/0
Physical interface: pd-0/0/0, Enabled, Physical link is Up
  Interface index: 130, SNMP ifIndex: 25
  Type: PIMD, Link-level type: PIM-Decapsulator, MTU: Unlimited, Speed: 800mbps
  Device flags   : Present Running

```

```
Interface flags: SNMP-Traps
Input rate      : 0 bps (0 pps)
Output rate     : 0 bps (0 pps)
```

show interfaces brief (PIM De-Encapsulation)

```
user@host> show interfaces pd-0/0/0 brief
Physical interface: pd-0/0/0, Enabled, Physical link is Up
Type: PIMD, Link-level type: PIM-Decapsulator, MTU: Unlimited, Speed: 800mbps
Device flags   : Present Running
Interface flags: SNMP-Traps
```

show interfaces detail (PIM De-Encapsulation)

```
user@host> show interfaces pd-0/0/0 detail
Physical interface: pd-0/0/0, Enabled, Physical link is Up
Interface index: 130, SNMP ifIndex: 25, Generation: 11
Type: PIMD, Link-level type: PIM-Decapsulator, MTU: Unlimited, Speed: 800mbps
Hold-times      : Up 0 ms, Down 0 ms
Device flags    : Present Running
Interface flags: SNMP-Traps
Statistics last cleared: Never
Traffic statistics:
Input bytes      :                      0                0 bps
Output bytes     :                      0                0 bps
Input packets    :                      0                0 pps
Output packets   :                      0                0 pps
```

show interfaces extensive (PIM Encapsulation)

```
user@host> show interfaces pd-0/0/0 extensive
Physical interface: pd-0/0/0, Enabled, Physical link is Up
Interface index: 130, SNMP ifIndex: 25, Generation: 11
Type: PIMD, Link-level type: PIM-Decapsulator, MTU: Unlimited, Speed: 800mbps
Hold-times      : Up 0 ms, Down 0 ms
Device flags    : Present Running
Interface flags: SNMP-Traps
Statistics last cleared: Never
Traffic statistics:
Input bytes      :                      0                0 bps
Output bytes     :                      0                0 bps
Input packets    :                      0                0 pps
Output packets   :                      0                0 pps
```

show interfaces (PIM Encapsulation)

```
user@host> show interfaces pe-0/0/0
Physical interface: pe-0/0/0, Enabled, Physical link is Up
Interface index: 131, SNMP ifIndex: 26
Type: PIME, Link-level type: PIM-Encapsulator, MTU: Unlimited, Speed: 800mbps
Device flags    : Present Running
Interface flags: SNMP-Traps
Input rate      : 0 bps (0 pps)
Output rate     : 0 bps (0 pps)
```

show interfaces brief (PIM Encapsulation)

```
user@host> show interfaces pe-0/0/0 brief
Physical interface: pe-0/0/0, Enabled, Physical link is Up
Type: PIME, Link-level type: PIM-Encapsulator, MTU: Unlimited, Speed: 800mbps
Device flags    : Present Running
Interface flags: SNMP-Traps
```

show interfaces detail (PIM Encapsulation)

```
user@host> show interfaces pe-0/0/0 detail
Physical interface: pe-0/0/0, Enabled, Physical link is Up
  Interface index: 131, SNMP ifIndex: 26, Generation: 12
  Type: PIME, Link-level type: PIM-Encapsulator, MTU: Unlimited, Speed: 800mbps
  Hold-times      : Up 0 ms, Down 0 ms
  Device flags    : Present Running
  Interface flags: SNMP-Traps
  Statistics last cleared: Never
  Traffic statistics:
    Input bytes  :                0                0 bps
    Output bytes :                0                0 bps
    Input packets:                0                0 pps
    Output packets:              0                0 pps
```

show interfaces extensive (PIM Encapsulation)

```
user@host> show interfaces pe-0/0/0 extensive
Physical interface: pe-0/0/0, Enabled, Physical link is Up
  Interface index: 131, SNMP ifIndex: 26, Generation: 12
  Type: PIME, Link-level type: PIM-Encapsulator, MTU: Unlimited, Speed: 800mbps
  Hold-times      : Up 0 ms, Down 0 ms

| List of Sample Output | <p>show interfaces (Virtual Loopback Tunnel) on page 2342</p> <p>show interfaces brief (Virtual Loopback Tunnel) on page 2343</p> <p>show interfaces detail (Virtual Loopback Tunnel) on page 2343</p> <p>show interfaces extensive (Virtual Loopback Tunnel) on page 2343</p> |
| Output Fields | Table 163 on page 2340 lists the output fields for the show interfaces (virtual loopback tunnel) command. Output fields are listed in the approximate order in which they appear. |

Table 163: Virtual Loopback Tunnel show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface's index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |

Table 163: Virtual Loopback Tunnel show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|------------------------------|
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Type | Type of interface. | All levels |
| Link-level type | Encapsulation used on the physical interface. | All levels |
| MTU | MTU size on the physical interface. | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Device flags | Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Input Rate | Input rate in bits per second (bps) and packets per second (pps). | None specified |
| Output Rate | Output rate in bps and pps. | None specified |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface. • Input packets, Output packets—Number of packets received and transmitted on the interface. | detail extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Flags | Information about the logical interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> . | All levels |
| Encapsulation | Encapsulation on the logical interface. | All levels |
| Input packets | Number of packets received on the logical interface. | None specified |
| Output packets | Number of packets transmitted on the logical interface. | None specified |

Table 163: Virtual Loopback Tunnel show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------------|---|------------------------------|
| Bandwidth | Bandwidth allotted to the logical interface, in kilobytes per second. | All levels |
| Traffic statistics | <p>Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | detail extensive |
| Transit statistics | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| <i>protocol-family</i> | Protocol family configured on the logical interface. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | brief |
| Protocol | Protocol family configured on the logical interface. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| MTU | Maximum transmission unit size on the logical interface. | detail extensive none |
| Maximum labels | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route Table | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0. | detail extensive |
| Flags | Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |

Sample Output

show interfaces (Virtual Loopback Tunnel)

```

user@host> show interfaces vt-1/2/0
Physical interface: vt-1/2/0, Enabled, Physical link is Up
  Interface index: 144, SNMP ifIndex: 40

show ipsec certificates

| | |
|---------------------------------|---|
| Syntax | show ipsec certificates
<brief detail>
<crl <i>crl-name</i> <i>serial-number</i> > |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (Encryption interface on M Series and T Series routers only) Display information about the IPsec certificate database. |
| Options | <p>none—Display standard information about all of the entries in the IPsec certificate database.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>crl <i>crl-name</i> <i>serial-number</i>—(Optional) Display information about the entries on the certificate revocation list (CRL) or for the specified serial number. A CRL is a timestamped list identifying revoked certificates. The CRL is signed by a certificate authority (CA) or CRL issuer and made freely available in a public repository. Each revoked certificate is identified in a CRL by its certificate serial number.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • clear ipsec security-associations on page 2297 |
| List of Sample Output | show ipsec certificates detail on page 2346 |
| Output Fields | Table 164 on page 2345 lists the output fields for the show ipsec certificates command. Output fields are listed in the approximate order in which they appear. |

Table 164: show ipsec certificates Output Fields

| Field Name | Field Description | Level of Output |
|-----------------|---|-----------------|
| Database | Display information about the IPsec certificate database. <ul style="list-style-type: none"> • Total entries—Number of database entries, including entries that are not trusted or that are in the process of being deleted. • Active entries—Number of database entries, excluding entries that are marked as deleted. • Locked entries—Number of statically configured database entries that cannot expire, such as CA certificates that are root or trusted. | All levels |
| Subject | Distinguished name for the certificate for C, O, CN , as described in RFC 3280, <i>Internet x.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile</i> . | All levels |
| ID | Identification number of the database entry. ID is generated by the internal certificate database. | All levels |

Table 164: show ipsec certificates Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------------------|---|-----------------|
| References | Reference number the certificate manager has for the particular entry. | detail |
| Serial | Unique serial number assigned to each certificate by the CA. | All levels |
| Flags | State of the certificate. <ul style="list-style-type: none"> • Trusted—Passed validity checks. • Not trusted—Failed validity checks. • Root—Entry is locked and may have been learned through IKE or a locally configured CA certificate. • Non-root—Entry is not locked. • Crl-issuer—Entity issues CRLs. • Non-crl-issuer—Entity does not issue CRLs. | detail |
| Validity period starts | Start time that the certificate is valid, in the format <i>yyyy mon dd, hh:mm:ss GMT</i> . | detail |
| Validity period ends | End time that the certificate is valid, in the format <i>yyyy mon dd, hh:mm:ss GMT</i> . | detail |
| Alternative name information | Auxiliary identity for the certificate: <i>dns-name</i> , <i>email-address</i> , <i>ip-address</i> , or <i>uri</i> (uniform resource identifier). | detail |
| Issuer | Information about the entity that has signed and issued the CRL as described in RFC 2459, <i>Internet X.509 Public Key Infrastructure Certificate and CRL Profile</i> . | detail |

Sample Output

show ipsec certificates detail

```

user@host> show ipsec certificates detail

show ipsec redundancy

| | |
|---------------------------------|--|
| Syntax | <code>show ipsec redundancy (interface <es-fpc/pic/port> security association <sa-name>)</code> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | (Encryption interface on M Series and T Series routers only) Display information about IPsec redundancy. |
| Options | <p>interface <es-fpc/pic/port>—Display information about all encryption interfaces, or optionally, about a particular encryption interface.</p> <p>security association <sa-name>—Display information about all remote tunnels, or optionally, about a particular remote tunnel.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> request ipsec switch on page 2299 |
| List of Sample Output | show ipsec redundancy interface on page 2349
show ipsec redundancy security-associations on page 2349 |
| Output Fields | Table 165 on page 2348 lists the output fields for the show ipsec redundancy command. Output fields are listed in the approximate order in which they appear. |

Table 165: show ipsec redundancy Output Fields

| Field Name | Field Description |
|-----------------------------|---|
| Failure counter | Number of times a PIC switched between primary and backup interfaces, or the number of times the tunnel switched between the primary and remote peers since the software has been activated. |
| Primary interface ' | Name of the interface configured to be the primary interface. |
| Backup interface | Name of the interface configured to be the backup interface. |
| State | State of the primary or backup interface can be Active , Offline , or Standby . Both ES PICs are initialized to Offline . For primary and remote peers, State can be Active or Standby . Both peers are in a state of Standby by default (there is not yet a connection between the two peers). |
| Security association | Name of the security association. |
| Local IP | Local IP address. |
| Primary remote IP | IP address of the configured primary remote peer. |
| Backup remote IP | IP address of the configured backup remote peer. |

Sample Output

show ipsec redundancy interface

```
user@host> show ipsec redundancy interface
Failure counter: 0
Primary interface: es-1/3/0, State: Active
Backup interface : es-1/1/0, State: Standby

show ipsec security-associations

| | |
|---------------------------------|--|
| Syntax | show ipsec security-associations
<brief detail>
<sa-name> |
| Release Information | Command introduced before Junos OS Release 7.4. |
| Description | Display information about the IPsec security associations applied to the local or transit traffic stream. |
| Options | <p>none—Display standard information about all IPsec security associations.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>sa-name—(Optional) Display the specified IPsec security association.</p> |
| Required Privilege Level | view |
| List of Sample Output | show ipsec security-associations brief (Specific Security Association) on page 2352
show ipsec security-associations detail (Specific Security Association) on page 2352 |
| Output Fields | Table 166 on page 2350 lists the output fields for the show ipsec security-associations command. Output fields are listed in the approximate order in which they appear. |

Table 166: show ipsec security-associations Output Fields

| Field Name | Field Description | Level of Output |
|-----------------------------|--|-----------------|
| Security association | Name of the security association. | All levels |
| Interface family | <p>Status of the interface family of the security association. If the interface family field is absent, it is a transport mode security association. The interface family can have one of three options:</p> <ul style="list-style-type: none"> • Up—The security association is referenced in the interface family and the interface family is up. • Down—The security association is referenced in the interface family and the interface family is down. • No reference—The security association is not referenced in the interface family. | All levels |
| Local gateway | Gateway address of the local system. | All levels |
| Remote gateway | Gateway address of the remote system. | All levels |
| Local identity | Prefix and port number of the local end | All levels |
| Remote identity | Prefix and port number of the remote end. | All levels |
| Direction | Direction of the security association: inbound or outbound . | All levels |
| SPI | Value of the security parameter index. | All levels |

Table 166: show ipsec security-associations Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|--|-----------------|
| AUX-SPI | Value of the auxiliary security parameter index. <ul style="list-style-type: none"> When the value is AH or ESP, AUX-SPI is always 0. When the value is AH+ESP, AUX-SPI is always a positive integer. | All levels |
| State | Status of the security association: <ul style="list-style-type: none"> Installed—The security association is installed in the security association database. (For transport mode security associations, the value of State must always be Installed.) Not installed—The security association is not installed in the security association database. | detail |
| Mode | Mode of the security association: <ul style="list-style-type: none"> transport—Protects single host-to-host protections. tunnel—Protects connections between security gateways. | All levels |
| Type | Type of security association: <ul style="list-style-type: none"> manual—Security parameters require no negotiation. They are static, and are configured by the user. dynamic—Security parameters are negotiated by the IKE protocol. Dynamic security associations are not supported in transport mode. | All levels |
| Protocol | Protocol supported: <ul style="list-style-type: none"> transport mode—Supports Encapsulation Security Protocol (ESP) or Authentication Header (AH). tunnel mode—Supports ESP or AH+ESP. | All levels |
| Authentication | Type of authentication used: hmac-md5-96 , hmac-sha1-96 , or None . | detail |
| Encryption | Type of encryption used: des-cbc , 3des-cbc , aes-128-cbc , aes-192-cbc , aes-256-cbc , or None . | detail |
| Soft lifetime
Hard lifetime | (dynamic output only) Each lifetime of a security association has two display options, hard and soft, one of which must be present for a dynamic security association. The hard lifetime specifies the lifetime of the SA. The soft lifetime , which is derived from the hard lifetime, informs the IPsec key management system that the SA is about to expire. This allows the key management system to negotiate a new SA before the hard lifetime expires. <ul style="list-style-type: none"> Expires in seconds seconds—Number of seconds left until the security association expires. Expires in kilobytes kilobytes—Number of kilobytes left until the security association expires. | detail |
| Anti-replay service | State of the service that prevents packets from being replayed: Enabled or Disabled . | detail |

Table 166: show ipsec security-associations Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------|---|-----------------|
| Replay window size | Configured size, in packets, of the antireplay service window: 32 or 64. The antireplay window size protects the receiver against replay attacks by rejecting old or duplicate packets. If the replay window size is 0, the antireplay service is disabled. | detail |

Sample Output

show ipsec security-associations brief (Specific Security Association)

```

user@host> show ipsec security-associations sa-cosmic brief
Security association: sa-cosmic, Interface family: Up
Local gateway: 21.21.1.1, Remote gateway: 21.21.2.1
Local identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Remote identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Direction SPI      AUX-SPI    Mode      Type      Protocol
inbound  2908734119  0          tunnel    dynamic   AH
outbound  3494029335  0          tunnel    dynamic   AH

```

show ipsec security-associations detail (Specific Security Association)

```

user@host> show ipsec security-associations sa-cosmic detail
Security association: sa-cosmic, Interface family: Up

Local gateway: 21.21.1.1, Remote gateway: 21.21.2.1
Local identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Remote identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Direction: inbound, SPI: 2908734119, AUX-SPI: 0, State: Installed
Mode: tunnel, Type: dynamic
Protocol: AH, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expired
Hard lifetime: Expires in 120 seconds
Anti-replay service: Disabled

Direction: outbound, SPI: 3494029335, AUX-SPI: 0, State: Installed
Mode: tunnel, Type: dynamic
Protocol: AH, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expired
Hard lifetime: Expires in 120 seconds
Anti-replay service: Disabled

```

show system certificate

| | |
|---------------------------------|---|
| Syntax | <code>show system certificate</code>
<code><certificate-id></code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series. |
| Description | (Encryption interface on M Series, T Series routers, QFX Series, and OCX Series switches only) Display installed certificates signed by the Juniper Networks certificate authority. |
| Options | none —Display all installed certificates signed by the Juniper Networks certificate authority.

certificate-id —(Optional) Display the details of a particular certificate. |
| Required Privilege Level | maintenance |
| List of Sample Output | show system certificate on page 2354
show system certificate (QFX Series) on page 2354 |
| Output Fields | Table 167 on page 2353 lists the output fields for the show system certificate command. Output fields are listed in the approximate order in which they appear. |

Table 167: show system certificate Output Fields

| Field Name | Field Description |
|---------------------------------|---|
| Certificate identifier | Unique identifier associated with a certificate. The certificate identifier is the common name of the subject. |
| Issuer
Subject | Information about the certificate issuer and the distinguished name (DN) of the issuer, respectively: <ul style="list-style-type: none"> • Organization—Name of the owner's organization. • Organizational unit—Name of the owner's department. • Country—Two-character country code in which the owner's system is located. • State—State in the USA in which the owner is using the certificate. • Locality—City in which the owner's system is located. • Common name—Name of the owner of the certificate. • E-mail address—E-mail address of the owner of the certificate. |
| Validity | When a certificate is valid. |
| Signature algorithm | Encryption algorithm applied to the installed certificate. |
| Public key algorithm | Encryption algorithm applied to the public key. |

Sample Output

show system certificate

```
user@host> show system certificate
Certificate identifier: Dallas-v3
Issuer:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
E-mail address:ca@juniper.net
Subject:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas-v3,
E-mail address:ca@juniper.net
Validity:
Not before: Mar 13 03:23:25 2004 GMT
Not after: Mar 24 03:23:25 2014 GMT
Signature algorithm: sha1WithRSAEncryption
Public key algorithm: dsaEncryption
```

show system certificate (QFX Series)

```
user@host> show system certificate
Certificate identifier: Dallas-v3
Issuer:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
E-mail address:ca@juniper.net
Subject:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas-v3,
E-mail address:ca@juniper.net
Validity:
Not before: Mar 13 03:23:25 2004 GMT
Not after: Mar 24 03:23:25 2014 GMT
Signature algorithm: sha1WithRSAEncryption
Public key algorithm: dsaEncryption
```
