| <b>Output Fields</b>            | Table 95 on page 1508 lists the output fields for the <b>show igmp snooping interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 95: show igmp snooping interface Output Fields**

| Field Name       | Field Description                   | Level of Output |
|------------------|-------------------------------------|-----------------|
| Routing-instance | Routing instance for IGMP snooping. | All levels      |
| Learning Domain  | Learning domain for snooping.       | All levels      |

Table 95: show igmp snooping interface Output Fields (*continued*)

| Field Name                         | Field Description                                                                                                                    | Level of Output |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| IGMP Query Interval                | Frequency (in seconds) with which this router sends membership queries when it is the querier.                                       | All levels      |
| IGMP Query Response Interval       | Time (in seconds) that the router waits for a response to a general query.                                                           | All levels      |
| IGMP Last Member Query Interval    | Time (in seconds) that the router waits for a report in response to a group-specific query.                                          | All levels      |
| IGMP Robustness Count              | Number of times the router retries a query.                                                                                          | All levels      |
| immediate-leave                    | State of immediate leave: <b>On</b> or <b>Off</b> .                                                                                  | All levels      |
| router-interface                   | Router interfaces that are part of this learning domain.                                                                             | All levels      |
| Group limit                        | Maximum number of (source,group) pairs allowed per interface. When a group limit is not configured, this field is not shown.         | All levels      |
| interface                          | Interfaces that are being snooped in this learning domain.                                                                           | All levels      |
| Groups                             | Number of groups on the interface.                                                                                                   | All levels      |
| State                              | State of the interface: <b>Up</b> or <b>Down</b> .                                                                                   | All levels      |
| Up Groups                          | Number of active multicast groups attached to the logical interface.                                                                 | All levels      |
| IGMP Membership Timeout            | Timeout for group membership. If no report is received for these groups before the timeout expires, the group membership is removed. | All levels      |
| IGMP Other Querier Present Timeout | Time that the router waits for the IGMP querier to send a query.                                                                     | All levels      |

## Sample Output

### show igmp snooping interface

```

user@host> show igmp snooping interface ge-0/1/4
Instance: default-switch

Bridge-Domain: sample

Learning-Domain: default
Interface: ge-0/1/4.0
State: Up Groups: 0
Immediate leave: Off
Router interface: no

Configured Parameters:
IGMP Query Interval: 125.0

```

```
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0
```

### show igmp snooping interface

```
user@host> show igmp snooping interface logical-system all
logical-system: default
Instance: VPLS-6
Learning-Domain: default
Interface: ge-0/2/2.601
 State: Up Groups: 10
 Immediate leave: Off
 Router interface: no

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Instance: VS-4
Bridge-Domain: VS-4-BD-1
Learning-Domain: vlan-id 1041
Interface: ae2.3
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: no
Interface: ge-0/2/2.1041
 State: Up Groups: 20
 Immediate leave: Off
 Router interface: no

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Instance: default-switch
Bridge-Domain: bd-200
Learning-Domain: default
Interface: ge-0/2/2.100
 State: Up Groups: 20
 Immediate leave: Off
 Router interface: no

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Bridge-Domain: bd0
Learning-Domain: default
Interface: ae0.0
 State: Up Groups: 0
```

```

 Immediate leave: Off
 Router interface: yes
Interface: ae1.0
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: no
Interface: ge-0/2/2.0
 State: Up Groups: 32
 Immediate leave: Off
 Router interface: no

```

```

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

```

```

Instance: VPLS-1
Learning-Domain: default
Interface: ge-0/2/2.502
 State: Up Groups: 11
 Immediate leave: Off
 Router interface: no

```

```

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

```

```

Instance: VS-1
Bridge-Domain: VS-BD-1
Learning-Domain: default
Interface: ae2.0
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: no
Interface: ge-0/2/2.1010
 State: Up Groups: 20
 Immediate leave: Off
 Router interface: no

```

```

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

```

```

Bridge-Domain: VS-BD-2
Learning-Domain: default
Interface: ae2.0
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: no
Interface: ge-0/2/2.1011
 State: Up Groups: 20
 Immediate leave: Off
 Router interface: no

```

```

Configured Parameters:
IGMP Query Interval: 125.0

```

```
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

```
Instance: VPLS-p2mp
Learning-Domain: default
Interface: ge-0/2/2.3001
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: no
```

```
Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

#### show igmp snooping interface (Group Limit Configured)

```
user@host> show igmp snooping interface instance vpls1
Instance: vpls1
```

```
Learning-Domain: default
Interface: ge-1/3/9.0
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: yes
Interface: ge-1/3/8.0
 State: Up Groups: 0
 Immediate leave: Off
 Router interface: yes
 Group limit: 1000
```

```
Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

## show igmp snooping membership

### show mld group brief

The output for the **show mld group brief** command is identical to that for the **show mld group** command. For sample output, see [show mld group \(Include Mode\) on page 1526](#) and [show mld group \(Exclude Mode\) on page 1527](#).

### show mld group detail (Include Mode)

```

user@host> show mld group detail
Interface: fe-0/1/2.0

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                            |

**Table 100: show mld interface Output Fields**

| Field Name            | Field Description                                                                              | Level of Output |
|-----------------------|------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>      | Name of the interface.                                                                         | All levels      |
| <b>Querier</b>        | Address of the router that has been elected to send membership queries.                        | All levels      |
| <b>State</b>          | State of the interface: <b>Up</b> or <b>Down</b> .                                             | All levels      |
| <b>SSM Map Policy</b> | Name of the source-specific multicast (SSM) map policy that has been applied to the interface. | All levels      |
| <b>SSM Map Policy</b> | Name of the source-specific multicast (SSM) map policy at the MLD interface.                   | All levels      |
| <b>Timeout</b>        | How long until the MLD querier is declared to be unreachable, in seconds.                      | All levels      |
| <b>Version</b>        | MLD version being used on the interface: 1 or 2.                                               | All levels      |

Table 100: show mld interface Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Groups</b>             | Number of groups on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels      |
| <b>Passive</b>            | <p>State of the passive mode option:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router can run IGMP or MLD on the interface but not send or receive control traffic such as IGMP or MLD reports, queries, and leaves.</li> <li>• <b>Off</b>—Indicates that the router can run IGMP or MLD on the interface and send or receive control traffic such as IGMP or MLD reports, queries, and leaves.</li> </ul> <p>The <b>passive</b> statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the <b>on</b> state declaration:</p> <ul style="list-style-type: none"> <li>• <b>send-general-query</b>—The interface sends general queries.</li> <li>• <b>send-group-query</b>—The interface sends group-specific and group-source-specific queries.</li> <li>• <b>allow-receive</b>—The interface receives control traffic</li> </ul> | All levels      |
| <b>OIF map</b>            | Name of the OIF map associated to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>SSM map</b>            | Name of the source-specific multicast (SSM) map used on the interface, if configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Group limit</b>        | Maximum number of groups allowed on the interface. Any memberships requested after the limit is reached are rejected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Group threshold</b>    | <p>Configured threshold at which a warning message is generated.</p> <p>This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Group log-interval</b> | Time (in seconds) between consecutive log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Immediate Leave</b>    | <p>State of the immediate leave option:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router removes a host from the multicast group as soon as the router receives a multicast listener done message from a host associated with the interface.</li> <li>• <b>Off</b>—Indicates that after receiving a multicast listener done message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels      |

Table 100: show mld interface Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Configured Parameters</b> | Information configured by the user. <ul style="list-style-type: none"> <li>• <b>MLD Query Interval (.1 secs)</b>—Interval at which this router sends membership queries when it is the querier.</li> <li>• <b>MLD Query Response Interval (.1 secs)</b>—Time that the router waits for a report in response to a general query.</li> <li>• <b>MLD Last Member Query Interval (.1 secs)</b>—Time that the router waits for a report in response to a group-specific query.</li> <li>• <b>MLD Robustness Count</b>—Number of times the router retries a query.</li> </ul> | All levels      |
| <b>Derived Parameters</b>    | Derived information. <ul style="list-style-type: none"> <li>• <b>MLD Membership Timeout (.1 secs)</b>—Timeout period for group membership. If no report is received for these groups before the timeout expires, the group membership will be removed.</li> <li>• <b>MLD Other Querier Present Timeout (.1 secs)</b>—Time that the router waits for the IGMP querier to send a query.</li> </ul>                                                                                                                                                                        | All levels      |

## Sample Output

### show mld interface

```

user@host> show mld interface
Interface: fe-0/0/0
 Querier: None
 State: Up Timeout: 0 Version: 1 Groups: 0
 SSM Map Policy: ssm-policy-A
Interface: at-0/3/1.0
 Querier: 8038::c0a8:c345
 State: Up Timeout: None Version: 1 Groups: 0
 SSM Map Policy: ssm-policy-B
Interface: fe-1/0/1.0
 Querier: ::192.168.195.73
 State: Up Timeout: None Version: 1 Groups: 3
 SSM Map Policy: ssm-policy-C
 SSM map: ipv6map1
Immediate Leave: On

Configured Parameters:
MLD Query Interval (.1 secs): 1250
MLD Query Response Interval (.1 secs): 100
MLD Last Member Query Interval (.1 secs): 10
MLD Robustness Count: 2

Derived Parameters:
MLD Membership Timeout (.1secs): 2600
MLD Other Querier Present Timeout (.1 secs): 2550

```

### show mld interface brief

The output for the **show mld interface brief** command is identical to that for the **show mld interface** command. For sample output, see [show mld interface on page 1531](#).

### show mld interface detail

The output for the **show mld interface detail** command is identical to that for the **show mld interface** command. For sample output, see [show mld interface on page 1531](#).

### show mld interface <interface-name>

```
user@host# show mld interface ge-3/2/0.0
Interface: ge-3/2/0.0
Querier: 20.1.1.1
State: Up Timeout: None Version: 3 Groups: 1
Group limit: 8
Group threshold: 60
Group log-interval: 10
Immediate leave: Off
Promiscuous mode: Off
```

## show mld statistics

|                                 |                                                                                                                                                                                                                                                                                                                                      |

| <b>MLD Message type</b>      | Summary of MLD statistics. <ul style="list-style-type: none"> <li>• <b>Listener Query (v1/v2)</b>—Number of membership queries sent and received.</li> <li>• <b>Listener Report (v1)</b>—Number of version 1 membership reports sent and received.</li> <li>• <b>Listener Done (v1/v2)</b>—Number of Listener Done messages sent and received.</li> <li>• <b>Listener Report (v2)</b>—Number of version 2 membership reports sent and received.</li> <li>• <b>Other Unknown types</b>—Number of unknown message types received.</li> <li>• <b>MLD v2 source required for SSM</b>—Number of MLD version 2 messages received that contained no source.</li> <li>• <b>MLD v2 mode not applicable for SSM</b>—Number of MLD version 2 messages received that did not contain a mode applicable for source-specific multicast (SSM).</li> </ul>          |
| <b>MLD Global Statistics</b> | Summary of MLD statistics for all interfaces. <ul style="list-style-type: none"> <li>• <b>Bad Length</b>—Number of messages received with length errors so severe that further classification could not occur.</li> <li>• <b>Bad Checksum</b>—Number of messages received with an invalid IP checksum. No further classification was performed.</li> <li>• <b>Bad Receive If</b>—Number of messages received on an interface not enabled for MLD.</li> <li>• <b>Rx non-local</b>—Number of messages received from nonlocal senders.</li> <li>• <b>Timed out</b>—Number of groups that timed out as a result of not receiving an explicit leave message.</li> <li>• <b>Rejected Report</b>—Number of reports dropped because of the MLD group policy.</li> <li>• <b>Total Interfaces</b>—Number of interfaces configured to support IGMP.</li> </ul> |

## Sample Output

### show mld statistics

```

user@host> show mld statistics
MLD packet statistics for all interfaces
MLD Message type Received Sent Rx errors
Listener Query (v1/v2) 0 2 0
Listener Report (v1) 0 0 0
Listener Done (v1/v2) 0 0 0
Listener Report (v2) 0 0 0
Other Unknown types 0 0 0
MLD v2 source required for SSM 2
MLD v2 mode not applicable for SSM 0

MLD Global Statistics
Bad Length 0
Bad Checksum 0
Bad Receive If 0
Rx non-local 0
Timed out 0

```

|                  |   |
|------------------|---|
| Rejected Report  | 0 |
| Total Interfaces | 2 |

#### show mld statistics interface

```
user@host> show mld statistics interface fe-1/0/1.0
MLD interface packet statistics for fe-1/0/1.0
MLD Message type Received Sent Rx errors
Listener Query (v1/v2) 0 2 0
Listener Report (v1) 0 0 0
Listener Done (v1/v2) 0 0 0
Listener Report (v2) 0 0 0
Other Unknown types 0 0 0
MLD v2 source required for SSM 2
MLD v2 mode not applicable for SSM 0

MLD Global Statistics
Bad Length 0
Bad Checksum 0
Bad Receive If 0
Rx non-local 0
Timed out 0
Rejected Report 0
Total Interfaces 2
```

|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Peer-Group           | Peer group name.                                                                                                                                                                    | All levels      |
| SA Count             | Number of source-active cache entries advertised by each peer that were accepted, compared to the number that were received, in the format <i>number-accepted/number-received</i> . | All levels      |
| Peer Connect Retries | Number of peer connection retries.                                                                                                                                                  | detail          |
| State timer expires  | Number of seconds before another message is sent to a peer.                                                                                                                         | detail          |
| Peer Times out       | Number of seconds to wait for a response from the peer before the peer is declared unavailable.                                                                                     | detail          |
| SA accepted          | Number of entries in the source-active cache accepted from the peer.                                                                                                                | detail          |
| SA received          | Number of entries in the source-active cache received by the peer.                                                                                                                  | detail          |

## Sample Output

### show msdp

```

user@host> show msdp
Peer address Local address State Last up/down Peer-Group SA Count
198.32.8.193 198.32.8.195 Established 5d 19:25:44 North23 120/150
198.32.8.194 198.32.8.195 Established 3d 19:27:27 North23 300/345
198.32.8.196 198.32.8.195 Established 5d 19:39:36 North23 10/13
198.32.8.197 198.32.8.195 Established 5d 19:32:27 North23 5/6
198.32.8.198 198.32.8.195 Established 3d 19:33:04 North23 2305/3000

```

### show msdp brief

The output for the **show msdp brief** command is identical to that for the **show msdp** command. For sample output, see [show msdp on page 1537](#).

### show msdp detail

```

user@host> show msdp detail
Peer: 10.255.70.15
Local address: 10.255.70.19
State: Established
Peer Connect Retries: 0
State timer expires: 22
Peer Times out: 49
SA accepted: 0
SA received: 0

```

## show msdp source

**Output Fields** Table 104 on page 1541 describes the output fields for the **show msdp source-active** command. Output fields are listed in the approximate order in which they appear.

**Table 104: show msdp source-active Output Fields**

| Field Name                              | Field Description                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                                                   |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                                                        |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.                                         |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).                                |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                                                        |
| Group address                           | Multicast address of the group.                                                                                                                            |
| Source address                          | IP address of the source.                                                                                                                                  |
| Peer address                            | IP address of the peer.                                                                                                                                    |
| Originator                              | Router ID configured on the source of the rendezvous point (RP) that originated the message, or the loopback address when the router ID is not configured. |
| Flags                                   | Flags: <b>Accept</b> , <b>Reject</b> , or <b>Filtered</b> .                                                                                                |

## Sample Output

### show msdp source-active

```

user@host> show msdp source-active
Group address Source address Peer address Originator Flags

### show msdp source-active brief

The output for the **show msdp source-active brief** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 1541](#).

### show msdp source-active detail

The output for the **show msdp source-active detail** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 1541](#).

### show msdp source-active source

```
user@host> show msdp source-active source 192.168.215.246
```

```
Global active source limit exceeded: 0
```

```
Global active source limit maximum: 25000
```

```
Global active source limit threshold: 24000
```

```
Global active source limit log-warning: 100
```

```
Global active source limit log interval: 0
```

| <b>Output Fields</b>            | <a href="#">Table 105 on page 1543</a> describes the output fields for the <b>show msdp statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                     |

**Table 105: show msdp statistics Output Fields**

| Field Name                              | Field Description                                                                                                           |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                    |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                         |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.          |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device). |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                         |

Table 105: show msdp statistics Output Fields (*continued*)

| Field Name                                        | Field Description                                                                                                                                                                                     |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Peer</b>                                       | Address of peer.                                                                                                                                                                                      |
| <b>Last State Change</b>                          | How long ago the peer state changed.                                                                                                                                                                  |
| <b>Last message received from the peer</b>        | How long ago the last message was received from the peer.                                                                                                                                             |
| <b>RPF Failures</b>                               | Number of reverse path forwarding (RPF) failures.                                                                                                                                                     |
| <b>Remote Closes</b>                              | Number of times the remote peer closed.                                                                                                                                                               |
| <b>Peer Timeouts</b>                              | Number of peer timeouts.                                                                                                                                                                              |
| <b>SA messages sent</b>                           | Number of source-active messages sent.                                                                                                                                                                |
| <b>SA messages received</b>                       | Number of source-active messages received.                                                                                                                                                            |
| <b>SA request messages sent</b>                   | Number of source-active request messages sent.                                                                                                                                                        |
| <b>SA request messages received</b>               | Number of source-active request messages received.                                                                                                                                                    |
| <b>SA response messages sent</b>                  | Number of source-active response messages sent.                                                                                                                                                       |
| <b>SA response messages received</b>              | Number of source-active response messages received.                                                                                                                                                   |
| <b>SA messages with zero Entry Count received</b> | Entry Count is a field within SA message that defines how many source/group tuples are present in the SA message. The counter is incremented each time an SA with an Entry Count of zero is received. |
| <b>Active source exceeded</b>                     | Number of times this peer has exceeded configured source-active limits.                                                                                                                               |
| <b>Active source Maximum</b>                      | Configured number of active source messages accepted by this peer.                                                                                                                                    |
| <b>Active source threshold</b>                    | Configured threshold on this peer for applying random early discard (RED) to drop some but not all MSDP active source messages.                                                                       |
| <b>Active source log-warning</b>                  | Configured threshold on this peer at which a warning message is logged (percentage of the number of active source messages accepted by the device).                                                   |
| <b>Active source log-interval</b>                 | Time (in seconds) between consecutive log messages on this peer.                                                                                                                                      |
| <b>Keepalive messages sent</b>                    | Number of keepalive messages sent.                                                                                                                                                                    |

Table 105: show msdp statistics Output Fields (*continued*)

| Field Name                  | Field Description                      |
|-----------------------------|----------------------------------------|
| Keepalive messages received | Number of keepalive messages received. |
| Unknown messages received   | Number of unknown messages received.   |
| Error messages received     | Number of error messages received.     |

## Sample Output

### show msdp statistics

```

user@host> show msdp statistics
Global active source limit exceeded: 0
Global active source limit maximum: 10
Global active source limit threshold: 8
Global active source limit log-warning: 60
Global active source limit log interval: 60

Peer: 10.255.245.39
Last State Change: 11:54:49 (00:24:59)
Last message received from peer: 11:53:32 (00:26:16)

| <b>Description</b>              | Display backup PE router group information when ingress PE redundancy is configured. Ingress PE redundancy provides a backup resource when point-to-multipoint LSPs are configured for multicast distribution.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b>none</b>—Display standard information about all backup PE groups.</p> <p><b>address <i>pe-address</i></b>—(Optional) Display the groups that a PE address is associated with.</p> <p><b>group <i>group</i></b>—(Optional) Display the backup PE group information for a particular group.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display backup PE group information for a specific multicast instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Output Fields</b>            | <a href="#">Table 106 on page 1547</a> describes the output fields for the <b>show multicast backup-pe-groups</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 106: show multicast backup-pe-groups Output Fields**

| Field Name      | Field Description                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Backup PE Group | Group name.                                                                                                                                                          |
| Designated PE   | Primary PE router. Address of the PE router that is currently forwarding traffic on the static route.                                                                |
| Transitions     | Number of times that the designated PE router has transitioned from the most eligible PE router to a backup PE router and back again to the most eligible PE router. |
| Last Transition | Time of the most recent transition.                                                                                                                                  |
| Local Address   | Address of the local PE router.                                                                                                                                      |
| Backup PE List  | List of PE routers that are configured to be backups for the group.                                                                                                  |

## Sample Output

### show multicast backup-pe-groups

```
user@host> show multicast backup-pe-groups
Instance: master

Backup PE group: b1
 Designated PE: 10.255.165.7
 Transitions: 1
 Last Transition: 03:15:01
 Local Address: 10.255.165.7
 Backup PE List:
 10.255.165.8

Backup PE group: b2
 Designated PE: 10.255.165.7
 Transitions: 2
 Last Transition: 02:58:20
 Local Address: 10.255.165.7
 Backup PE List:
 10.255.165.9
 10.255.165.8
```

## show multicast flow-map

|                                                     |                                                                                                                                                                                                                                                                                                                                              |

**Table 107: show multicast flow-map Output Fields**

| Field Name           | Field Description                                         | Levels of Output |
|----------------------|-----------------------------------------------------------|------------------|
| <b>Name</b>          | Name of the flow map.                                     | All levels       |
| <b>Policy</b>        | Name of the policy associated with the flow map.          | All levels       |
| <b>Cache-timeout</b> | Cache timeout value assigned to the flow map.             | All levels       |
| <b>Bandwidth</b>     | Bandwidth setting associated with the flow map.           | All levels       |
| <b>Adaptive</b>      | Whether or not adaptive mode is enabled for the flow map. | none             |
| <b>Flow-map</b>      | Name of the flow map.                                     | <b>detail</b>    |

Table 107: show multicast flow-map Output Fields (*continued*)

| Field Name                | Field Description                                         | Levels of Output |
|---------------------------|-----------------------------------------------------------|------------------|
| <b>Adaptive Bandwidth</b> | Whether or not adaptive mode is enabled for the flow map. | <b>detail</b>    |
| <b>Redundant Sources</b>  | Redundant sources defined for the same destination group. | <b>detail</b>    |

## Sample Output

### show multicast flow-map

```

user@host> show multicast flow-map
Instance: master
Name Policy Cache timeout Bandwidth Adaptive
map2 policy2 never 2000000 no
map1 policy1 60 seconds 2000000 no

```

## Sample Output

### show multicast flow-map detail

```

user@host> show multicast flow-map detail
Instance: master
Flow-map: map1
 Policy: policy1
 Cache Timeout: 600 seconds
 Bandwidth: 2000000
 Adaptive Bandwidth: yes
 Redundant Sources: 11.11.11.11
 Redundant Sources: 11.11.11.12
 Redundant Sources: 11.11.11.13

```

## show multicast forwarding-cache statistics

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                         |

Table 108: show multicast forwarding-cache statistics Output Fields

| Field Name                | Field Description                                                                                                                                                                                                                                                                           |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>           | Name of the routing instance for which multicast forwarding cache statistics are displayed.                                                                                                                                                                                                 |
| <b>Family</b>             | Protocol family for which multicast forwarding cache statistics are displayed: <b>ALL</b> , <b>INET</b> , or <b>INET6</b> .                                                                                                                                                                 |
| <b>Suppress Threshold</b> | Maximum number of multicast forwarding cache entries that can be added to the cache. When the number of entries reaches the configured threshold, the device suspends adding new multicast forwarding cache entries.                                                                        |
| <b>Reuse Value</b>        | Number of multicast forwarding cache entries that must be reached before the device creates new multicast forwarding cache entries. When the total number of multicast forwarding cache entries is below the reuse value, the device resumes adding new multicast forwarding cache entries. |

Table 108: show multicast forwarding-cache statistics Output Fields (*continued*)

| Field Name             | Field Description                                                                      |
|------------------------|----------------------------------------------------------------------------------------|
| Warning Threshold      | Threshold at which a warning message is logged (percentage of the suppress threshold). |
| Currently Used Entries | Number of currently used multicast forwarding cache entries.                           |

## Sample Output

### show multicast forwarding-cache statistics

```
user@host> show multicast forwarding-cache statistics
Instance: master Family: INET
Suppress Threshold 100
Reuse Value 80
Warning Threshold 90
Currently Used Entries 101

Instance: master Family: INET6
Suppress Threshold 50
Reuse Value 50
Warning Threshold 80
Currently Used Entries 3
```

### show multicast forwarding-cache statistics instance

```
user@host> show multicast forwarding-cache statistics instance VPN-A
Instance: VPN-A Family: ALL
Suppress Threshold 20
Reuse Value 16
Warning Threshold 50
Currently Used Entries 17
```

## show multicast interface

| <i>source-address</i>                | Query address, hostname (DNS name or IP address of the source address), and multicast protocol version or the software version of another vendor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>ip-address-1—&gt;ip-address-2</i> | Queried router interface address and directly attached neighbor interface address, respectively.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>(name or ip-address)</i>          | Name or IP address of neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>[metric/threshold/type/flags]</i> | Neighbor's multicast profile: <ul style="list-style-type: none"> <li><b>metric</b>—Always has a value of 1, because <b>minfo</b> queries the directly connected interfaces of a device.</li> <li><b>threshold</b>—Multicast threshold time-to-live (TTL). The range of values is 0 through 255.</li> <li><b>type</b>—Multicast connection type: <b>pim</b> or <b>tunnel</b>.</li> <li><b>flags</b>—Flags for this route: <ul style="list-style-type: none"> <li><b>querier</b>—Queried router is the designated router for the neighboring session.</li> <li><b>leaf</b>—Link is a leaf in the multicast network.</li> <li><b>down</b>—Link status indicator.</li> </ul> </li> </ul> |

## Sample Output

show multicast mrinfo

```
user@host> show multicast mrinfo 10.35.4.1
10.35.4.1 (10.35.4.1) [version 12.0]:
 192.168.195.166 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
 10.38.20.1 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
 10.47.1.1 -> 10.47.1.2 (10.47.1.2) [1/5/pim]
 0.0.0.0 -> 0.0.0.0 (local) [1/0/pim/down]
```

## show multicast next-hops

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Output Fields** Table 111 on page 1558 describes the output fields for the **show multicast next-hops** command. Output fields are listed in the approximate order in which they appear.

**Table 111: show multicast next-hops Output Fields**

| Field Name                     | Field Description                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Family</b>                  | Protocol family (such as <b>INET</b> ).                                                                                                                |
| <b>ID</b>                      | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.                                        |
| <b>Refcount</b>                | Number of cache entries that are using this next hop.                                                                                                  |
| <b>KRefcount</b>               | Kernel reference count for the next hop.                                                                                                               |
| <b>Downstream interface</b>    | Interface names associated with each multicast next-hop ID.                                                                                            |
| <b>Incoming interface list</b> | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM. |

## Sample Output

### show multicast next-hops

```
user@host> show multicast next-hops
Family: INET
ID Refcount KRefcount Downstream interface
262142 4 2 so-1/0/0.0
262143 2 1 mt-1/1/0.49152
262148 2 1 mt-1/1/0.32769
```

### show multicast next-hops (Bidirectional PIM)

```
user@host> show multicast next-hops
Family: INET
ID Refcount KRefcount Downstream interface
2097151 8 4 ge-0/0/1.0

Family: INET6
ID Refcount KRefcount Downstream interface
2097157 2 1 ge-0/0/1.0

Family: Incoming interface list
ID Refcount KRefcount Downstream interface
513 5 2 lo0.0
 ge-0/0/1.0
514 5 2 lo0.0
 ge-0/0/1.0
 xe-4/1/0.0
515 3 1 lo0.0
 ge-0/0/1.0
 xe-4/1/0.0
544 1 0 lo0.0
 xe-4/1/0.0
```

### show multicast next-hops brief

The output for the **show multicast next-hops brief** command is identical to that for the **show multicast next-hops** command. For sample output, see [show multicast next-hops on page 1558](#).

### show multicast next-hops detail

```
user@host> show multicast next-hops detail
Family: INET
ID Refcount KRefCount Downstream interface
1048577 2 1 fe-0/1/2.0-(1048574)
 ge-0/2/3.0-(1048576)
```

## show multicast pim-to-igmp-proxy

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Output fields are listed in the order in which they appear.                                                                                                                                                                                                                                                            |

**Table 113: show multicast pim-to-mld-proxy Output Fields**

| Field Name                   | Field Description                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Proxy state</b>           | State of PIM-to-MLD message translation, also known as PIM-to-MLD proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> . |
| <b><i>interface-name</i></b> | Name of upstream interface (no more than two allowed) on which PIM-to-MLD message translation is configured.                                        |

## Sample Output

### show multicast pim-to-mld-proxy

```
user@host> show multicast pim-to-mld-proxy
Instance: master Proxy state: enabled
ge-0/5/0.1
ge-0/5/0.2
```

### show multicast pim-to-mld-proxy instance

```
user@host> show multicast pim-to-mld-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/5/0.1
```

show multicast route

- |                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Description                                  | <p>Display the entries in the IP multicast forwarding table. You can display similar information with the <b>show route table inet.1</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Options                                      | <p><b>none</b>—Display standard information about all entries in the multicast forwarding table for all routing instances.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of output.</p> <p><b>active   all   inactive</b>—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.</p> <p><b>group group</b>—(Optional) Display the cache entries for a particular group.</p> <p><b>inet   inet6</b>—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.</p> <p><b>instance instance-name</b>—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |

**regular-expression**—(Optional) Display information about the multicast forwarding table entries that match a UNIX OS-style regular expression.

**source-prefix source-prefix**—(Optional) Display the cache entries for a particular source prefix.

**Output Fields** [Table 114 on page 1565](#) describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

**Table 114: show multicast route Output Fields**

| Field Name                    | Field Description                                                                                                                                                                               | Level of Output         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| family                        | IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ).                                                                                                                    | All levels              |
| Group                         | Group address.<br><br>For any-source multicast routes, for example for bidirectional PIM, the group address includes the prefix length.                                                         | All levels              |
| Source                        | Prefix and length of the source as it is in the multicast forwarding table.                                                                                                                     | All levels              |
| Incoming interface list       | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                          | All levels              |
| Upstream interface            | Name of the interface on which the packet with this source prefix is expected to arrive.                                                                                                        | All levels              |
| Upstream rpf interface list   | When multicast-only fast reroute (MoFRR) is enabled, a PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. | All levels              |
| Downstream interface list     | List of interface names to which the packet with this source prefix is forwarded.                                                                                                               | All levels              |
| Number of outgoing interfaces | Total number of outgoing interfaces for each (S,G) entry.                                                                                                                                       | <b>extensive</b>        |
| Session description           | Name of the multicast session.                                                                                                                                                                  | <b>detail extensive</b> |

Table 114: show multicast route Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Statistics                             | Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays <b>Forwarding statistics are not available</b> .<br><br><b>NOTE:</b> On QFX Series switches and OCX Series switches, this field does not report valid statistics. | detail extensive  |
| Next-hop ID                            | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the <b>show multicast nexthops</b> command.                                                                                                                                                                                                                                                             | detail extensive  |
| Incoming interface list ID             | For bidirectional PIM, incoming interface list identifier.<br><br>Identifiers for interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                                                                                                                                                                                                              | detail extensive  |
| Upstream protocol                      | The protocol that maintains the active multicast forwarding route for this group or source.<br><br>When the <b>show multicast route extensive</b> command is used with the <b>display-origin-protocol</b> option, the field name is only <b>Protocol</b> and not <b>Upstream Protocol</b> . However, this field also displays the protocol that installed the active route.                                                                                   | detail extensive  |
| Route type                             | Type of multicast route. Values can be (S,G) or (*G).                                                                                                                                                                                                                                                                                                                                                                                                         | summary           |
| Route state                            | Whether the group is <b>Active</b> or <b>Inactive</b> .                                                                                                                                                                                                                                                                                                                                                                                                       | summary extensive |
| Route count                            | Number of multicast routes.                                                                                                                                                                                                                                                                                                                                                                                                                                   | summary           |
| Forwarding state                       | Whether the prefix is pruned or forwarding.                                                                                                                                                                                                                                                                                                                                                                                                                   | extensive         |
| Cache lifetime/timeout                 | Number of seconds until the prefix is removed from the multicast forwarding table. A value of <b>never</b> indicates a permanent forwarding entry. A value of <b>forever</b> indicates routes that do not have keepalive times.                                                                                                                                                                                                                               | extensive         |
| Wrong incoming interface notifications | Number of times that the upstream interface was not available.                                                                                                                                                                                                                                                                                                                                                                                                | extensive         |
| Uptime                                 | Time since the creation of a multicast route.                                                                                                                                                                                                                                                                                                                                                                                                                 | extensive         |

## Sample Output

### show multicast route

```

user@host> show multicast route
Family: INET

Group: 228.0.0.0

```

```

**Table 116: show multicast scope Output Fields**

| Field Name   | Field Description                                           |
|--------------|-------------------------------------------------------------|
| Scope name   | Name of the multicast scope.                                |
| Group Prefix | Range of multicast groups that are scoped.                  |
| Interface    | Interface that is the boundary of the administrative scope. |

Table 116: show multicast scope Output Fields (*continued*)

| Field Name      | Field Description                 |
|-----------------|-----------------------------------|
| Resolve Rejects | Number of kernel resolve rejects. |

## Sample Output

### show multicast scope

```
user@host> show multicast scope
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|
| 232-net    | 232.232.0.0/16 | fe-0/0/0.1 | 0               |
| local      | 239.255.0.0/16 | fe-0/0/0.1 | 0               |
| local      | ff05::/16      | fe-0/0/0.1 | 0               |
| larry      | ff05::1234/128 | fe-0/0/0.1 | 0               |

### show multicast scope inet

```
user@host> show multicast scope inet
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|
| 232-net    | 232.232.0.0/16 | fe-0/0/0.1 | 0               |
| local      | 239.255.0.0/16 | fe-0/0/0.1 | 0               |

### show multicast scope inet6

```
user@host> show multicast scope inet6
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |

| <b>Output Fields</b>            | <a href="#">Table 117 on page 1576</a> describes the output fields for the <b>show multicast snooping next-hops</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                               |

**Table 117: show multicast snooping next-hops Output Fields**

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Family</b>               | Protocol family for which multicast snooping next hops are displayed: <b>INET</b> or <b>INET6</b> .                                                                                                                                                                                                                                                                                                 |
| <b>RefCount</b>             | Number of cache entries that are using this next hop.                                                                                                                                                                                                                                                                                                                                               |
| <b>KRefCount</b>            | Kernel reference count for the next hop.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Downstream interface</b> | Interface names associated with each multicast next-hop ID.                                                                                                                                                                                                                                                                                                                                         |
| <b>Nexthop Id</b>           | Identifier for the next-hop.<br><br><b>NOTE:</b> To see the next-hop ID for a given PE mesh group, <b>igmp-snooping</b> must be enabled for the relevant VPLS routing instance. (Junos OS creates a default CE and VE mesh groups for each VPLS routing instance. The next hop of the VE mesh group is the set of VE mesh-group interfaces of the remaining PEs in the same VPLS routing instance.) |

## Sample Output

### show multicast snooping next-hops

```

user@host> show multicast snooping next-hops
Family: INET
ID Refcount KRefCount Downstream interface Nexthop Id
1048574 4 1 ge-0/1/0.1000
 ge-0/1/2.1000
 ge-0/1/3.1000

1048574 4 1 ge-0/1/0.1000-(2000)
 1048575
 1048576

1048575 2 0 ge-0/1/2.1000-(2001)
 ge-0/1/3.1000-(2002)

1048576 2 0 lsi.1048578-(2003)
 lsi.1048579-(2004)

```

### show multicast snooping next-hops (IGMP snooping enabled on a VPLS)

In this example, ID 1048585 is the VE next-hop ID created for the VE next hop that is holding VE interfaces for the routing instance. It only appears if igmp snooping is enabled on the VPLS.

```

user@host> show multicast snooping next-hops
Family: INET
ID Refcount KRefCount Downstream interface Addr
1048588 2 1 1048585
1048589 2 1 1048585

## show multicast snooping route

**Syntax** show multicast snooping route  
 <regexp>  
 <active>  
 <all>  
 <bridge-domain *bridge-domain-name*>  
 <brief >  
 <control>  
 <data>  
 <detail >  
 <extensive>  
 <group *group*>  
 <inactive>  
 <inet>  
 <inet6>  
 <instance *instance-name*>  
 <logical-system *logical-system-name*>  
 <mesh-group *mesh-group-name*>  
 <qualified-vlan *vlan-id*>  
 <source-prefix *source-prefix*>  
 <vlan *vlan-id*>

**Release Information** Command introduced in Junos OS Release 8.5.  
 Support for **control**, **data**, **qualified-vlan** and **vlan** options introduced in Junos OS Release 13.3 for EX Series switches.

**Description** Display the entries in the IP multicast snooping forwarding table. You can display some of this information with the **show route table inet.1** command.

**Options** **none**—Display standard information about all entries in the multicast snooping table for all virtual switches and all bridge domains.

**active | all | inactive** —(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast snooping table.

**bridge-domain *bridge-domain***—(Optional) Display the entries for a particular bridge domain.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**control**—(Optional) Display control route entries.

**data**—(Optional) Display data route entries.

**group *group***—(Optional) Display the entries for a particular group.

**inet**—(Optional) Display IPv4 information.

**inet6**—(Optional) Display IPv6 information.

**instance *instance-name***—(Optional) Display the entries for a multicast instance.

**logical-system** *logical-system-name*—(Optional) Display information about a particular logical system, or type 'all'.

**mesh-group** *mesh-group-name*—(Optional) Display the entries for a particular mesh group.

**qualified-vlan** *vlan-id*—(Optional) Display the entries for a particular qualified VLAN.

**regex**—(Optional) Display information about the multicast forwarding table entries that match a UNIX-style regular expression.

**source-prefix** *source-prefix*—(Optional) Display the entries for a particular source prefix.

**vlan** *vlan-id*—(Optional) Display the entries for a particular VLAN.

**Required Privilege Level** view

[show multicast snooping route instance vs on page 1583](#)  
[show multicast snooping route extensive on page 1583](#)

**Output Fields** [Table 119 on page 1582](#) describes the output fields for the **show multicast snooping route** command. Output fields are listed in the approximate order in which they appear.

**Table 119: show multicast snooping route Output Fields**

| Field Name              | Field Description                                                                                                                                                                         | Level of Output         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Next-hop Bulking</b> | Displays whether next-hop bulk updating is <b>ON</b> or <b>OFF</b> (only for routing-instance type of <b>virtual switch</b> or <b>vpls</b> ).                                             | All levels              |
| <b>Family</b>           | IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ).                                                                                                              | All levels              |
| <b>Group</b>            | Group address.                                                                                                                                                                            | All levels              |
| <b>Source</b>           | Prefix and length of the source as it is in the multicast forwarding table. For (*G) entries, this field is set to "*".                                                                   | All levels              |
| <b>Routing-instance</b> | Name of the routing instance to which this routing information applies. (Displayed when multicast is configured within a routing instance.)                                               | All levels              |
| <b>Learning Domain</b>  | Name of the learning domain to which this routing information applies.                                                                                                                    | <b>detail extensive</b> |
| <b>Statistics</b>       | Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix.                               | <b>detail extensive</b> |
| <b>Next-hop ID</b>      | Next-hop identifier of the prefix. The identifier is returned by the router's Packet Forwarding Engine and is also displayed in the output of the <b>show multicast nexthops</b> command. | <b>detail extensive</b> |
| <b>Route state</b>      | Whether the group is <b>Active</b> or <b>Inactive</b> .                                                                                                                                   | <b>extensive</b>        |
| <b>Forwarding state</b> | Whether the prefix is <b>Pruned</b> or <b>Forwarding</b> .                                                                                                                                | <b>extensive</b>        |

Table 119: show multicast snooping route Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                  | Level of Output  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Cache lifetime/timeout | Number of seconds until the prefix is removed from the multicast forwarding table. A value of <b>never</b> indicates a permanent forwarding entry. | <b>extensive</b> |

## Sample Output

### show multicast snooping route bridge-domain

```

user@host> show multicast snooping route bridge-domain br-dom-1 extensive
Family: INET

## show multicast statistics

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show multicast statistics<br><inet   inet6><br><instance <i>instance-name</i> ><br><logical-system (all   <i>logical-system-name</i> )>                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Display IP multicast statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>none</b>—Display multicast statistics for all supported address families for all routing instances.</p> <p><b>inet   inet6</b>—(Optional) Display multicast statistics for IPv4 or IPv6 family addresses, respectively.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display statistics for a specific routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| <b>Additional Information</b>   | The input and output interface multicast statistics are consistent, but not timely. They are constructed from the forwarding statistics, which are gathered at 30-second intervals. Therefore, the output from this command always lags the true count by up to 30 seconds.                                                                                                                                                                                                                              |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Output Fields</b>            | <a href="#">Table 120 on page 1585</a> describes the output fields for the <b>show multicast statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                             |

**Table 120: show multicast statistics Output Fields**

| Field Name       | Field Description                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------|
| Family           | Protocol family for which multicast statistics are displayed: <b>INET</b> or <b>INET6</b> .                               |
| Interface        | Name of the interface for which statistics are being reported.                                                            |
| Routing Protocol | Primary multicast protocol on the interface: <b>PIM</b> , <b>DVMRP</b> for <b>INET</b> , or <b>PIM</b> for <b>INET6</b> . |
| Mismatch         | Number of multicast packets that did not arrive on the correct upstream interface.                                        |
| Kernel Resolve   | Number of resolve requests processed by the primary multicast protocol on the interface.                                  |

Table 120: show multicast statistics Output Fields (*continued*)

| Field Name                                                                    | Field Description                                                                                                                                                      |
|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resolve No Route</b>                                                       | Number of resolve requests that were ignored because there was no route to the source.                                                                                 |
| <b>In Kbytes</b>                                                              | Total accumulated incoming packets (in KB) since the last time the <b>clear multicast statistics</b> command was issued.                                               |
| <b>Out Kbytes</b>                                                             | Total accumulated outgoing packets (in KB) since the last time the <b>clear multicast statistics</b> command was issued.                                               |
| <b>Mismatch error</b>                                                         | Number of mismatches that were ignored because of internal errors.                                                                                                     |
| <b>Mismatch No Route</b>                                                      | Number of mismatches that were ignored because there was no route to the source.                                                                                       |
| <b>Routing Notify</b>                                                         | Number of times that the multicast routing system has been notified of a new multicast source by a multicast routing protocol .                                        |
| <b>Resolve Error</b>                                                          | Number of resolve requests that were ignored because of internal errors.                                                                                               |
| <b>In Packets</b>                                                             | Total number of incoming packets since the last time the <b>clear multicast statistics</b> command was issued.                                                         |
| <b>Out Packets</b>                                                            | Total number of outgoing packets since the last time the <b>clear multicast statistics</b> command was issued.                                                         |
| <b>Resolve requests on interfaces not enabled for multicast <i>n</i></b>      | Number of resolve requests on interfaces that are not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued. |
| <b>Resolve requests with no route to source <i>n</i></b>                      | Number of resolve requests with no route to the source that have accumulated since the <b>clear multicast statistics</b> command was last issued.                      |
| <b>Routing notifications on interfaces not enabled for multicast <i>n</i></b> | Number of routing notifications on interfaces not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued.     |
| <b>Routing notifications with no route to source <i>n</i></b>                 | Number of routing notifications with no route to the source that have accumulated since the <b>clear multicast statistics</b> command was last issued.                 |
| <b>Interface Mismatches on interfaces not enabled for multicast <i>n</i></b>  | Number of interface mismatches on interfaces not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued.      |
| <b>Group Membership on interfaces not enabled for multicast <i>n</i></b>      | Number of group memberships on interfaces not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued.         |

## Sample Output

### show multicast statistics

```

user@host> show multicast statistics
Address family: INET
Interface: fe-0/0/0
 Routing Protocol: PIM Mismatch error: 0
 Mismatch: 0 Mismatch No Route: 0

| <b>Output Fields</b>                                | <a href="#">Table 121 on page 1589</a> describes the output fields for the <b>show multicast usage</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 121: show multicast usage Output Fields

| Field Name      | Field Description                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b> | Name of the routing instance. (Displayed when multicast is configured within a routing instance.)                                                                                        |
| <b>Group</b>    | Group address.                                                                                                                                                                           |
| <b>Sources</b>  | Number of sources.                                                                                                                                                                       |
| <b>Packets</b>  | Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays <b>unavailable</b> . |
| <b>Bytes</b>    | Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays <b>unavailable</b> .     |
| <b>Prefix</b>   | IP address.                                                                                                                                                                              |
| <b>/len</b>     | Prefix length.                                                                                                                                                                           |
| <b>Groups</b>   | Number of multicast groups.                                                                                                                                                              |

## Sample Output

### show multicast usage

```

user@host> show multicast usage
Group Sources Packets Bytes
228.0.0.0 1 52847 4439148
239.1.1.1 2 13450 1125530

Prefix /len Groups Packets Bytes
10.255.14.144 /32 2 66254 5561304
10.255.70.15 /32 1 43 3374...
```

### show multicast usage brief

The output for the **show multicast usage brief** command is identical to that for the **show multicast usage** command. For sample output, see [show multicast usage on page 1589](#).

### show multicast usage instance

```

user@host> show multicast usage instance VPN-A
Group Sources Packets Bytes
224.2.127.254 1 5538 509496
224.0.1.39 1 13 624
224.0.1.40 1 13 624

Prefix /len Groups Packets Bytes
192.168.195.34 /32 1 5538 509496
10.255.14.30 /32 1 13 624
```

```
10.255.245.91 /32 1 13 624
...
```

#### show multicast usage detail

```
user@host> show multicast usage detail
Group Sources Packets Bytes
228.0.0.0 1 53159 4465356
 Source: 10.255.14.144 /32 Packets: 53159 Bytes: 4465356

**Table 122: show pim bootstrap Output Fields**

| Field Name           | Field Description                                                            |
|----------------------|------------------------------------------------------------------------------|
| <b>Instance</b>      | Name of the routing instance.                                                |
| <b>BSR</b>           | Bootstrap router.                                                            |
| <b>Pri</b>           | Priority of the routing device as elected to be the bootstrap router.        |
| <b>Local address</b> | Local routing device address.                                                |
| <b>Pri</b>           | Local routing device address priority to be elected as the bootstrap router. |

Table 122: show pim bootstrap Output Fields (*continued*)

| Field Name     | Field Description                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------|
| <b>State</b>   | Local routing device election state: <b>Candidate</b> , <b>Elected</b> , or <b>Ineligible</b> .      |
| <b>Timeout</b> | How long until the local routing device declares the bootstrap router to be unreachable, in seconds. |

## Sample Output

### show pim bootstrap

```
user@host> show pim bootstrap
Instance: PIM.master
```

| BSR                     | Pri | Local address           | Pri | State      | Timeout |
|-------------------------|-----|-------------------------|-----|------------|---------|
| None                    | 0   | 10.255.71.46            | 0   | InEligible | 0       |
| feco:1:1:1:1:0:aff:785c | 34  | feco:1:1:1:1:0:aff:7c12 | 0   | InEligible | 0       |

### show pim bootstrap instance

```
user@host> show pim bootstrap instance VPN-A
Instance: PIM.VPN-A
```

| BSR  | Pri | Local address   | Pri | State      | Timeout |
|------|-----|-----------------|-----|------------|---------|
| None | 0   | 192.168.196.105 | 0   | InEligible | 0       |

## show pim interfaces

**List of Syntax** [Syntax on page 1593](#)  
[Syntax \(EX Series Switch and the QFX Series\) on page 1593](#)

**Syntax** show pim interfaces  
 <inet | inet6>  
 <instance *instance-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switch and the QFX Series)** show pim interfaces  
 <inet | inet6>  
 <instance *instance-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**inet6** and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.  
 Support for bidirectional PIM added in Junos OS Release 12.1.

**Description** Display information about the interfaces on which Protocol Independent Multicast (PIM) is configured.

**Options** **none**—Display interface information for all family addresses for all routing instances.

**inet | inet6**—(Optional) Display interface information for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display information about interfaces for a specific PIM-enabled routing instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show pim interfaces on page 1594](#)

**Output Fields** [Table 123 on page 1593](#) describes the output fields for the **show pim interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 123: show pim interfaces Output Fields

| Field Name | Field Description                                                                          |
|------------|--------------------------------------------------------------------------------------------|
| Instance   | Name of the routing instance.                                                              |
| Name       | Interface name.                                                                            |
| State      | State of the interface. The state also is displayed in the <b>show interfaces</b> command. |

Table 123: show pim interfaces Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mode</b>         | <p>PIM mode running on the interface:</p> <ul style="list-style-type: none"> <li>• <b>B</b>—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers.</li> <li>• <b>S</b>—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic.</li> <li>• <b>Dense</b>—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.)</li> <li>• <b>Sparse-Dense</b>—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as <b>dense</b> is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as <b>sparse</b> is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules. (Not supported on QFX Series.)</li> </ul> <p>When sparse-dense mode is configured, the output includes both <b>S</b> and <b>D</b>. When bidirectional-sparse mode is configured, the output includes <b>S</b> and <b>B</b>. When bidirectional-sparse-dense mode is configured, the output includes <b>B</b>, <b>S</b>, and <b>D</b>.</p> |
| <b>IP</b>           | Version number of the address family on the interface: <b>4</b> (IPv4) or <b>6</b> (IPv6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Release Information**   Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **summary** option introduced in Junos OS Release 9.6.  
                              **inet6** and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
                              Support for bidirectional PIM added in Junos OS Release 12.1.  
                              Command introduced in Junos OS Release 11.3 for the QFX Series.  
                              Multiple new filter options introduced in Junos OS Release 13.2.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**   Display information about Protocol Independent Multicast (PIM) groups for all PIM modes.

For bidirectional PIM, display information about PIM group ranges (\*G-range) for each active bidirectional RP group range, in addition to each of the joined (\*G) routes.

**Options**   **none**—Display the standard information about PIM groups for all supported family addresses for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**bidirectional | dense | sparse**—(Optional) Display information about PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

**exact**—(Optional) Display information about only the group that exactly matches the specified group address.

**inet | inet6**—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**range**—(Optional) Address range of the group, specified as *prefix/prefix-length*.

**rp *ip-address/prefix* | source *ip-address/prefix***—(Optional) Display information about the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

**sg | star-g**—(Optional) Display information about PIM (S,G) or (\*,G) entries.

**Required Privilege Level**

Table 125: show pim mdt Output Fields

| Field Name       | Field Description                                                                               | Level of Output |
|------------------|-------------------------------------------------------------------------------------------------|-----------------|
| Instance         | Name of the routing instance.                                                                   | All levels      |
| Tunnel direction | Direction the tunnel faces, from the router's perspective: <b>Outgoing</b> or <b>Incoming</b> . | All levels      |
| Tunnel mode      | Mode the tunnel is operating in: <b>PIM-SSM</b> or <b>PIM-ASM</b> .                             | All levels      |

Table 125: show pim mdt Output Fields (*continued*)

| Field Name                        | Field Description                                                                                                                                                                    | Level of Output |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Default group address</b>      | Default multicast group address using this tunnel.                                                                                                                                   | All levels      |
| <b>Default source address</b>     | Default multicast source address using this tunnel.                                                                                                                                  | All levels      |
| <b>Default tunnel interface</b>   | Default multicast tunnel interface.                                                                                                                                                  | All levels      |
| <b>Default tunnel source</b>      | Address used as the source address for outgoing PIM control messages.                                                                                                                | All levels      |
| <b>C-Group</b>                    | Customer-facing multicast group address using this tunnel. If you enable dynamic reuse of data MDT group addresses, more than one group address can use the same data MDT.           | <b>detail</b>   |
| <b>C-Source</b>                   | IP address of the multicast source in the customer's address space. If you enable dynamic reuse of data MDT group addresses, more than one source address can use the same data MDT. | <b>detail</b>   |
| <b>P-Group</b>                    | Service provider-facing multicast group address using this tunnel.                                                                                                                   | <b>detail</b>   |
| <b>Data tunnel interface</b>      | Multicast data tunnel interface that set up the data-MDT tunnel.                                                                                                                     | <b>detail</b>   |
| <b>Last known forwarding rate</b> | Last known rate, in kilobits per second, at which the tunnel was forwarding traffic.                                                                                                 | <b>detail</b>   |
| <b>Configured threshold rate</b>  | Rate, in kilobits per second, above which a data-MDT tunnel is created and below which it is deleted.                                                                                | <b>detail</b>   |
| <b>Tunnel uptime</b>              | Time that this data-MDT tunnel has existed. The format is <i>hours:minutes:seconds</i> .                                                                                             | <b>detail</b>   |

## Sample Output

### show pim mdt instance

```

user@host> show pim mdt instance VPN-A
Instance: PIM.VPN-A
Tunnel direction: Outgoing
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.32768
Default tunnel source: 192.168.7.1

C-group address C-source address P-group address Data tunnel interface
235.1.1.2 192.168.195.74 228.0.0.0 mt-1/1/0.32769

Instance: PIM.VPN-A
Tunnel direction: Incoming
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.1081344

```

### show pim mdt instance detail

```

user@host> show pim mdt instance VPN-A detail
Instance: PIM.VPN-A
Tunnel direction: Outgoing
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.32768
Default tunnel source: 192.168.7.1

C-Group: 235.1.1.2
 C-Source: 192.168.195.74
 P-Group : 228.0.0.0
 Data tunnel interface : mt-1/1/0.32769
 Last known forwarding rate : 48 kbps (6 kbps)
 Configured threshold rate : 10 kbps
 Tunnel uptime : 00:00:34

Instance: PIM.VPN-A
Tunnel direction: Incoming
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.1081344

```

### show pim mdt instance extensive

```

user@host> show pim mdt instance VPN-A extensive
Instance: PIM.VPN-A
Tunnel direction: Outgoing
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.32768
Default tunnel source: 192.168.7.1

C-Group: 235.1.1.2
 C-Source: 192.168.195.74
 P-Group : 228.0.0.0
 Data tunnel interface : mt-1/1/0.32769
 Last known forwarding rate : 48 kbps (6 kbps)
 Configured threshold rate : 10 kbps
 Tunnel uptime : 00:00:41

Instance: PIM.VPN-A
Tunnel direction: Incoming
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.1081344

```

### show pim mdt instance incoming

```

user@host> show pim mdt instance VPN-A incoming
Instance: PIM.VPN-A
Tunnel direction: Incoming
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.1081344

```

### show pim mdt instance outgoing

```

user@host> show pim mdt instance VPN-A outgoing
Instance: PIM.VPN-A
Tunnel direction: Outgoing
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.32768
Default tunnel source: 192.168.7.1

```

| C-group address | C-source address | P-group address | Data tunnel interface |
|-----------------|------------------|-----------------|-----------------------|
| 235.1.1.2       | 192.168.195.74   | 228.0.0.0       | mt-1/1/0.32769        |

#### show pim mdt instance (SSM Mode)

```
user@host> show pim mdt instance vpn-a
Instance: PIM.vpn-a
Tunnel direction: Outgoing
Tunnel mode: PIM-SSM
Default group address: 232.1.1.1
Default source address: 10.255.14.216
Default tunnel interface: mt-1/3/0.32769
Default tunnel source: 192.168.7.1

Instance: PIM.vpn-a
Tunnel direction: Incoming
Tunnel mode: PIM-SSM
Default group address: 232.1.1.1
Default source address: 10.255.14.217
Default tunnel interface: mt-1/3/0.1081345

Instance: PIM.vpn-a
Tunnel direction: Incoming
Tunnel mode: PIM-SSM
Default group address: 232.1.1.1
Default source address: 10.255.14.218
Default tunnel interface: mt-1/3/0.1081345
```

## show pim mdt data-mdt-joins

**Syntax** `show pim mdt data-mdt-joins`  
`<logical-system (all | logical-system-name)> instance instance-name`

**Release Information** Command introduced in Junos OS Release 11.2.

**Description** In a draft-rosen Layer 3 multicast virtual private network (MVPN) configured with service provider tunnels, display the advertisements of new multicast distribution tree (MDT) group addresses cached by the provider edge (PE) routers in the specified VPN routing and forwarding (VRF) instance that is configured to use the Protocol Independent Multicast (PIM) protocol.

**Options** `instance instance-name`—Display data MDT join packets cached by PE routers in a specific PIM instance.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**NOTE:** Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

**Required Privilege Level** view

**List of Sample Output** [show pim mdt data-mdt-joins on page 1622](#)

**Output Fields** [Table 126 on page 1621](#) describes the output fields for the `show pim mdt data-mdt-joins` command. Output fields are listed in the approximate order in which they appear.

**Table 126: show pim mdt data-mdt-joins Output Fields**

| Field Name      | Field Description                                                                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>C-Group</b>  | IPv4 group address in the address space of the customer's VPN-specific PIM-enabled routing instance of the multicast traffic destination. This 32-bit value is carried in the C-group field of the MDT join TLV packet. |
| <b>C-Source</b> | IPv4 address in the address space of the customer's VPN-specific PIM-enabled routing instance of the multicast traffic source. This 32-bit value is carried in the C-source field of the MDT join TLV packet.           |

Table 126: show pim mdt data-mdt-joins Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>P-Group</b>  | IPv4 group address in the service provider's address space of the new data MDT that the PE router will use to encapsulate the VPN multicast traffic flow (C-Source, C-Group). This 32-bit value is carried in the P-group field of the MDT join TLV packet. |
| <b>P-Source</b> | IPv4 address of the PE router.                                                                                                                                                                                                                              |
| <b>Timeout</b>  | Timeout, in seconds, remaining for this cache entry. When the cache entry is created, this field is set to 180 seconds. After an entry times out, the PE router deletes the entry from its cache and prunes itself off the data MDT.                        |

## Sample Output

### show pim mdt data-mdt-joins

```
user@host show pim mdt data-mdt-joins instance VPN-A
C-Source C-Group P-Source P-Group Timeout
20.2.15.9 225.1.1.2 20.0.0.5 239.10.10.0 172
20.2.15.9 225.1.1.3 20.0.0.5 239.10.10.1 172
```

## show pim mdt data-mdt-limit

**Syntax** show pim mdt data-mdt-limit instance *instance-name*  
<logical-system (all | *logical-system-name*)>

**Release Information** Command introduced in Junos OS Release 12.2.

**Description** Display the maximum number configured and the currently active data multicast distribution trees (MDTs) for a specific VPN routing and forwarding (VRF) instance.

**Options** **instance** *instance-name*—Display data MDT information for the specified VRF instance.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**NOTE:** Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

**Required Privilege Level** view

**List of Sample Output** [show pim mdt data-mdt-limit on page 1623](#)

**Output Fields** [Table 127 on page 1623](#) describes the output fields for the **show pim mdt data-mdt-limit** command. Output fields are listed in the approximate order in which they appear.

**Table 127: show pim mdt data-mdt-limit Output Fields**

| Field Name                  | Field Description                                                                                                             |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Maximum Data Tunnels</b> | Maximum number of data MDTs created in this VRF instance. If the number is 0, no data MDTs are created for this VRF instance. |
| <b>Active Data Tunnels</b>  | Active number of data MDTs in this VRF instance.                                                                              |

## Sample Output

### show pim mdt data-mdt-limit

```
user@host show pim mdt data-mdt-limit instance VPN-A
```

|                      |    |
|----------------------|----|
| Maximum Data Tunnels | 10 |
| Active Data Tunnels  | 2  |

| <b>Hello Option Holdtime</b>                     | Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.                                                                                                                                                                                                                                                   | <b>detail</b>     |
| <b>Hello Default Holdtime</b>                    | Default holdtime and the time remaining if the <b>holdtime</b> option is not in the received hello message.                                                                                                                                                                                                                                      | <b>detail</b>     |
| <b>Hello Option DR Priority</b>                  | Designated router election priority. The range of values is 0 through 255.                                                                                                                                                                                                                                                                       | <b>detail</b>     |
| <b>Hello Option Generation ID</b>                | 9-digit or 10-digit number used to tag hello messages.                                                                                                                                                                                                                                                                                           | <b>detail</b>     |
| <b>Hello Option Bi-Directional PIM supported</b> | Neighbor can process bidirectional PIM messages.                                                                                                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>Hello Option LAN Prune Delay</b>              | Time to wait before the neighbor receives prune messages, in the format <b>delay nnn ms override nnnn ms</b> .                                                                                                                                                                                                                                   | <b>detail</b>     |

Table 128: show pim neighbors Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                   | Level of Output |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Join Suppression supported | Neighbor is capable of join suppression.                                                                                                                                                                                                                                            | detail          |
| Rx Join                    | Information about joins received from the neighbor. <ul style="list-style-type: none"> <li><b>Group</b>—Group addresses in the join message.</li> <li><b>Source</b>—Address of the source in the join message.</li> <li><b>Timeout</b>—Time for which the join is valid.</li> </ul> | detail          |

## Sample Output

### show pim neighbors

```

user@host> show pim neighbors
Instance: PIM.master
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority, T = Tracking bit

Interface IP V Mode Option Uptime Neighbor addr
so-1/0/0.0 4 2 HPLG 00:07:10 10.111.10.2

```

### show pim neighbors brief

The output for the **show pim neighbors brief** command is identical to that for the **show pim neighbors** command. For sample output, see [show pim neighbors on page 1627](#).

### show pim neighbors instance

```

user@host> show pim neighbors instance VPN-A
Instance: PIM.VPN-A
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority, T = Tracking bit

Interface IP V Mode Option Uptime Neighbor addr
at-0/3/1.0 4 2 HPLG 00:07:54 10.111.30.2
mt-1/1/0.32768 4 2 HPLG 00:07:22 10.10.47.101
so-1/0/1.0 4 2 HPLG 00:07:50 10.111.20.2

```

### show pim neighbors detail

```

user@host> show pim neighbors detail
Instance: PIM.master
Interface: ge-0/0/1.0

Address: 10.10.1.1, IPv4, PIM v2, Mode: SparseDense, sg Join Count: 0, tsj
Join Count: 2
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 2053759302
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

```

```

Address: 10.10.1.2, IPv4, PIM v2, sg Join Count: 0, tsg Join Count: 2
 BFD: Disabled
 Hello Option Holdtime: 105 seconds 93 remaining
 Hello Option DR Priority: 1
 Hello Option Generation ID: 1734018161
 Hello Option Bi-Directional PIM supported
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
 Join Suppression supported

```

Interface: lo0.0

```

Address: 10.255.179.246, IPv4, PIM v2, Mode: SparseDense, sg Join Count:
0, tsg Join Count: 0
 Hello Option Holdtime: 65535 seconds
 Hello Option DR Priority: 1
 Hello Option Generation ID: 1997462267
 Hello Option Bi-Directional PIM supported
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
 Join Suppression supported

```

#### show pim neighbors detail (With BFD)

```

user@host> show pim neighbors detail

```

```

Instance: PIM.master

```

```

Interface: fe-1/0/0.0

```

```

Address: 192.168.11.1, IPv4, PIM v2, Mode: Sparse
 Hello Option Holdtime: 65535 seconds
 Hello Option DR Priority: 1
 Hello Option Generation ID: 836607909
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

```

```

Address: 192.168.11.2, IPv4, PIM v2
 BFD: Enabled, Operational state is up
 Hello Default Holdtime: 105 seconds 104 remaining
 Hello Option DR Priority: 1
 Hello Option Generation ID: 1907549685
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

```

```

Interface: fe-1/0/1.0

```

```

Address: 192.168.12.1, IPv4, PIM v2
 BFD: Disabled
 Hello Default Holdtime: 105 seconds 80 remaining
 Hello Option DR Priority: 1
 Hello Option Generation ID: 1971554705
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

```

## show pim rps

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| RP selected                    | For sparse mode and bidirectional mode, the identity of the RP for the specified group address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <i>group-address</i> |

## Sample Output

### show pim rps

```

user@host> show pim rps
Instance: PIM.master
Address family INET
RP address Type Mode Holdtime Timeout Groups Group prefixes
10.10.1.3 static bidir 150 None 2 224.1.3.0/24
 225.1.3.0/24
10.10.13.2 static bidir 150 None 2 224.1.1.0/24
 225.1.1.0/24

```

### show pim rps brief

The output for the **show pim rps brief** command is identical to that for the **show pim rps** command. For sample output, see [show pim rps on page 1632](#).

### show pim rps <group-address>

```

user@host> show pim rps 235.100.100.0
Instance: PIM.master
Instance: PIM.master

RP selected: 100.100.100.100

```

### show pim rps <group-address> (Bidirectional PIM)

```

user@host> show pim rps 224.1.1.1
Instance: PIM.master

224.1.0.0/16
 11.4.12.75 (Bidirectional)

RP selected: 11.4.12.75

```

**show pim rps <group-address> (PIM Dense Mode)**

```
user@host> show pim rps 224.1.1.1
Instance: PIM.master

Dense Mode active for group 224.1.1.1
```

**show pim rps <group-address> (SSM Range Without asm-override-ssm Configured)**

```
user@host> show pim rps 224.1.1.1
Instance: PIM.master

Source-specific Mode (SSM) active for group 224.1.1.1
```

**show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Sparse-Mode RP)**

```
user@host> show pim rps 224.1.1.1
Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16
 11.4.12.75

RP selected: 11.4.12.75
```

**show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Bidirectional RP)**

```
user@host> show pim rps 224.1.1.1
Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16
 11.4.12.75 (Bidirectional)

RP selected: (null)
```

**show pim rps instance**

```
user@host> show pim rps instance VPN-A
Instance: PIM.VPN-A
Address family INET
RP address Type Holdtime Timeout Groups Group prefixes
10.10.47.100 static 0 None 1 224.0.0.0/4

Address family INET6
```

**show pim rps extensive (PIM Sparse Mode)**

```
user@host> show pim rps extensive
Instance: PIM.master

Family: INET
RP: 10.255.245.91
Learned via: static configuration
Time Active: 00:05:48
Holdtime: 45 with 36 remaining

Table 130: show pim snooping interface Output Fields

| Field Name      | Field Description                  | Level of Output |
|-----------------|------------------------------------|-----------------|
| Instance        | Routing instance for PIM snooping. | All levels      |
| Learning-Domain | Learning domain for snooping.      | All levels      |

Table 130: show pim snooping interface Output Fields (*continued*)

| Field Name        | Field Description                                                        | Level of Output |
|-------------------|--------------------------------------------------------------------------|-----------------|
| <b>Name</b>       | Router interfaces that are part of this learning domain.                 | All levels      |
| <b>State</b>      | State of the interface: <b>Up</b> , or <b>Down</b> .                     | All levels      |
| <b>IP-Version</b> | Version of IP used: 4 for IPv4, or 6 for IPv6.                           | All levels      |
| <b>NbrCnt</b>     | Number of neighboring routers connected through the specified interface. | All levels      |
| <b>DR address</b> | IP address of the designated router.                                     | All levels      |

## Sample Output

### show pim snooping interfaces

```

user@host> show pim snooping interfaces
Instance: vpls1
Learning-Domain: vlan-id 10
Name State IP-Version NbrCnt
ge-1/3/1.10 Up 4 1
ge-1/3/3.10 Up 4 1
ge-1/3/5.10 Up 4 1
ge-1/3/7.10 Up 4 1
DR address: 20.0.110.5
DR flooding is ON

Learning-Domain: vlan-id 20
Name State IP-Version NbrCnt
ge-1/3/1.20 Up 4 1
ge-1/3/3.20 Up 4 1
ge-1/3/5.20 Up 4 1
ge-1/3/7.20 Up 4 1
DR address: 20.0.120.5
DR flooding is ON

```

### show pim snooping interfaces instance vpls1

```

user@host> show pim snooping interfaces instance vpls1
Instance: vpls1

Learning-Domain: vlan-id 10
Name State IP-Version NbrCnt
ge-1/3/1.10 Up 4 1
ge-1/3/3.10 Up 4 1
ge-1/3/5.10 Up 4 1
ge-1/3/7.10 Up 4 1
DR address: 20.0.110.5
DR flooding is ON

Learning-Domain: vlan-id 20
Name State IP-Version NbrCnt
ge-1/3/1.20 Up 4 1
ge-1/3/3.20 Up 4 1

| Timeout              | Time remaining until the downstream join state is updated (in seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>extensive</b> |

## Sample Output

### show pim snooping join

```

user@host> show pim snooping join
Instance: vpls1

Learning-Domain: vlan-id 10
Group: 225.1.1.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.110.4, port: ge-1/3/5.10

Learning-Domain: vlan-id 20
Group: 225.1.1.3
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.120.4, port: ge-1/3/5.20

```

### show pim snooping join extensive

```

user@host> show pim snooping join extensive
Instance: vpls1
Learning-Domain: vlan-id 10

Group: 225.1.1.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.110.4, port: ge-1/3/5.10
Downstream port: ge-1/3/1.10
Downstream neighbors:
20.0.110.2 State: Join Flags: SRW Timeout: 166

Learning-Domain: vlan-id 20
Group: 225.1.1.3
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.120.4, port: ge-1/3/5.20
Downstream port: ge-1/3/3.20
Downstream neighbors:
20.0.120.3 State: Join Flags: SRW Timeout: 168

```

### show pim snooping join instance

```

user@host> show pim snooping join instance vpls1
Instance: vpls1

Learning-Domain: vlan-id 10
Group: 225.1.1.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.110.4, port: ge-1/3/5.10

Learning-Domain: vlan-id 20
Group: 225.1.1.3

```

Source: \*  
Flags: sparse,rptree,wildcard  
Upstream state: None  
Upstream neighbor: 20.0.120.4, port: ge-1/3/5.20

#### show pim snooping join vlan-id

```
user@host> show pim snooping join vlan-id 10
Instance: vpls1
Learning-Domain: vlan-id 10
Group: 225.1.1.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 20.0.110.4, port: ge-1/3/5.10
```

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 133: show pim snooping statistics Output Fields

| Field Name      | Field Description                               | Level of Output |
|-----------------|-------------------------------------------------|-----------------|
| Instance        | Routing instance for PIM snooping.              | All levels      |
| Learning-Domain | Learning domain for PIM snooping.               | All levels      |
| Tx J/P messages | Total number of transmitted join/prune packets. | All levels      |

Table 133: show pim snooping statistics Output Fields (*continued*)

| Field Name                          | Field Description                                                                 | Level of Output |
|-------------------------------------|-----------------------------------------------------------------------------------|-----------------|
| <b>Rx J/P messages</b>              | Total number of received join/prune packets.                                      | All levels      |
| <b>Rx J/P messages -- seen</b>      | Number of join/prune packets seen but not received on the upstream interface.     | All levels      |
| <b>Rx J/P messages -- received</b>  | Number of join/prune packets received on the downstream interface.                | All levels      |
| <b>Rx Hello messages</b>            | Total number of received hello packets.                                           | All levels      |
| <b>Rx Version Unknown</b>           | Number of packets received with an unknown version number.                        | All levels      |
| <b>Rx Neighbor Unknown</b>          | Number of packets received from an unknown neighbor.                              | All levels      |
| <b>Rx Upstream Neighbor Unknown</b> | Number of packets received with unknown upstream neighbor information.            | All levels      |
| <b>Rx Bad Length</b>                | Number of packets received containing incorrect length information.               | All levels      |
| <b>Rx J/P Busy Drop</b>             | Number of join/prune packets dropped while the router is busy.                    | All levels      |
| <b>Rx J/P Group Aggregate 0</b>     | Number of join/prune packets received containing the aggregate group information. | All levels      |
| <b>Rx Malformed Packet</b>          | Number of malformed packets received.                                             | All levels      |
| <b>Rx No PIM Interface</b>          | Number of packets received without the interface information.                     | All levels      |
| <b>Rx No Upstream Neighbor</b>      | Number of packets received without upstream neighbor information.                 | All levels      |
| <b>Rx Unknown Hello Option</b>      | Number of hello packets received with unknown options.                            | All levels      |

## Sample Output

### show pim snooping statistics

```

user@host> show pim snooping statistics
Instance: vpls1
Learning-Domain: vlan-id 10

Tx J/P messages 0
Rx J/P messages 8
Rx J/P messages -- seen 0
Rx J/P messages -- received 8
Rx Hello messages 37

```

```

Rx Version Unknown 0
Rx Neighbor Unknown 0

| <b>Output Fields</b>                                | <p><a href="#">Table 134 on page 1654</a> describes the output fields for the <b>show pim source</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 134: show pim source Output Fields

| Field Name         | Field Description                                                     |
|--------------------|-----------------------------------------------------------------------|
| Instance           | Name of the routing instance.                                         |
| Source             | Address of the source or reverse path.                                |
| Prefix/length      | Prefix and prefix length for the route used to reach the RPF address. |
| Upstream interface | RPF interface toward the source address.                              |
| Upstream Neighbor  | Address of the RPF neighbor used to reach the source address.         |

## Sample Output

### show pim source

```
user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
 Prefix 10.255.14.144/32
 Upstream interface Local
 Upstream neighbor Local

Source 10.255.70.15
 Prefix 10.255.70.15/32
 Upstream interface so-1/0/0.0
 Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6
```

### show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see [show pim source on page 1654](#).

### show pim source detail

```
user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
 Prefix 10.255.14.144/32
 Upstream interface Local
 Upstream neighbor Local
 Active groups:228.0.0.0
 239.1.1.1
 239.1.1.1

Source 10.255.70.15
 Prefix 10.255.70.15/32
 Upstream interface so-1/0/0.0
 Upstream neighbor 10.111.10.2
 Active groups:239.1.1.1
```

Instance: PIM.master Family: INET6

## show pim statistics

---

| <b>Output Fields</b>                                | <a href="#">Table 135 on page 1657</a> describes the output fields for the <b>show pim statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                |

Table 135: show pim statistics Output Fields

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>         | <p>Name of the routing instance.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> <li>• <b>inet interface <i>interface-name</i></b></li> <li>• <b>inet6 interface <i>interface-name</i></b></li> <li>• <b>interface <i>interface-name</i></b></li> </ul>                                                                                                 |
| <b>Family</b>           | <p>Output is for IPv4 or IPv6 PIM statistics. <b>INET</b> indicates IPv4 statistics, and <b>INET6</b> indicates IPv6 statistics.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> <li>• <b>inet interface <i>interface-name</i></b></li> <li>• <b>inet6 interface <i>interface-name</i></b></li> <li>• <b>interface <i>interface-name</i></b></li> </ul> |
| <b>PIM statistics</b>   | PIM statistics for all interfaces or for the specified interface.                                                                                                                                                                                                                                                                                                                                                       |
| <b>PIM message type</b> | Message type for which statistics are displayed.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Received</b>         | Number of received statistics.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Sent</b>             | Number of messages sent of a certain type.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Rx errors</b>        | Number of received packets that contained errors.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>V2 Hello</b>         | PIM version 2 hello packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>V2 Register</b>      | PIM version 2 register packets.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>V2 Register Stop</b> | PIM version 2 register stop packets.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>V2 Join Prune</b>    | PIM version 2 join and prune packets.                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>V2 Bootstrap</b>     | PIM version 2 bootstrap packets.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>V2 Assert</b>        | PIM version 2 assert packets.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>V2 Graft</b>         | PIM version 2 graft packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>V2 Graft Ack</b>     | PIM version 2 graft acknowledgment packets.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>V2 Candidate RP</b>  | PIM version 2 candidate RP packets.                                                                                                                                                                                                                                                                                                                                                                                     |

Table 135: show pim statistics Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                              |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>V2 State Refresh</b>                 | PIM version 2 control messages related to PIM dense mode (PIM-DM) state refresh.<br><br>State refresh is an extension to PIM-DM. It not supported in Junos OS. |
| <b>V2 DF Election</b>                   | PIM version 2 send and receive messages associated with bidirectional PIM designated forwarder election.                                                       |
| <b>V1 Query</b>                         | PIM version 1 query packets.                                                                                                                                   |
| <b>V1 Register</b>                      | PIM version 1 register packets.                                                                                                                                |
| <b>V1 Register Stop</b>                 | PIM version 1 register stop packets.                                                                                                                           |
| <b>V1 Join Prune</b>                    | PIM version 1 join and prune packets.                                                                                                                          |
| <b>V1 RP Reachability</b>               | PIM version 1 RP reachability packets.                                                                                                                         |
| <b>V1 Assert</b>                        | PIM version 1 assert packets.                                                                                                                                  |
| <b>V1 Graft</b>                         | PIM version 1 graft packets.                                                                                                                                   |
| <b>V1 Graft Ack</b>                     | PIM version 1 graft acknowledgment packets.                                                                                                                    |
| <b>AutoRP Announce</b>                  | Auto-RP announce packets.                                                                                                                                      |
| <b>AutoRP Mapping</b>                   | Auto-RP mapping packets.                                                                                                                                       |
| <b>AutoRP Unknown type</b>              | Auto-RP packets with an unknown type.                                                                                                                          |
| <b>Anycast Register</b>                 | Auto-RP announce packets.                                                                                                                                      |
| <b>Anycast Register Stop</b>            | Auto-RP announce packets.                                                                                                                                      |
| <b>Global Statistics</b>                | Summary of PIM statistics for all interfaces.                                                                                                                  |
| <b>Hello dropped on neighbor policy</b> | Number of hello packets dropped because of a configured neighbor policy.                                                                                       |
| <b>Unknown type</b>                     | Number of PIM control packets received with an unknown type.                                                                                                   |
| <b>V1 Unknown type</b>                  | Number of PIM version 1 control packets received with an unknown type.                                                                                         |
| <b>Unknown Version</b>                  | Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.                                                     |

Table 135: show pim statistics Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                         |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Neighbor unknown</b>                | Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.                    |
| <b>Bad Length</b>                      | Number of PIM control packets received for which the packet size does not match the PIM length field in the packet.       |
| <b>Bad Checksum</b>                    | Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet. |
| <b>Bad Receive If</b>                  | Number of PIM control packets received on an interface that does not have PIM configured.                                 |
| <b>Rx Bad Data</b>                     | Number of PIM control packets received that contain data for TCP Bad register packets.                                    |
| <b>Rx Intf disabled</b>                | Number of PIM control packets received on an interface that has PIM disabled.                                             |
| <b>Rx V1 Require V2</b>                | Number of PIM version 1 control packets received on an interface configured for PIM version 2.                            |
| <b>Rx V2 Require V1</b>                | Number of PIM version 2 control packets received on an interface configured for PIM version 1.                            |
| <b>Rx Register not RP</b>              | Number of PIM register packets received when the router is not the RP for the group.                                      |
| <b>Rx Register no route</b>            | Number of PIM register packets received when the RP does not have a unicast route back to the source.                     |
| <b>Rx Register no decap if</b>         | Number of PIM register packets received when the RP does not have a de-encapsulation interface.                           |
| <b>Null Register Timeout</b>           | Number of NULL register timeout packets.                                                                                  |
| <b>RP Filtered Source</b>              | Number of PIM packets received when the router has a source address filter configured for the RP.                         |
| <b>Rx Unknown Reg Stop</b>             | Number of register stop messages received with an unknown type.                                                           |
| <b>Rx Join/Prune no state</b>          | Number of join and prune messages received for which the router has no state.                                             |
| <b>Rx Join/Prune on upstream if</b>    | Number of join and prune messages received on the interface used to reach the upstream router, toward the RP.             |
| <b>Rx Join/Prune for invalid group</b> | Number of join or prune messages received for invalid multicast group addresses.                                          |

Table 135: show pim statistics Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                                                           |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Rx Join/Prune messages dropped</b> | Number of join and prune messages received and dropped.                                                                                                     |
| <b>Rx sparse join for dense group</b> | Number of PIM sparse mode join messages received for a group that is configured for dense mode.                                                             |
| <b>Rx Graft/Graft Ack no state</b>    | Number of graft and graft acknowledgment messages received for which the router or switch has no state.                                                     |
| <b>Rx Graft on upstream if</b>        | Number of graft messages received on the interface used to reach the upstream router, toward the RP.                                                        |
| <b>Rx CRP not BSR</b>                 | Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.                                                 |
| <b>Rx BSR when BSR</b>                | Number of BSR messages received in which the PIM message type is Bootstrap.                                                                                 |
| <b>Rx BSR not RPF if</b>              | Number of BSR messages received on an interface that is not the RPF interface.                                                                              |
| <b>Rx unknown hello opt</b>           | Number of PIM hello packets received with options that Junos OS does not support.                                                                           |
| <b>Rx data no state</b>               | Number of PIM control packets received for which the router has no state for the data type.                                                                 |
| <b>Rx RP no state</b>                 | Number of PIM control packets received for which the router has no state for the RP.                                                                        |
| <b>Rx aggregate</b>                   | Number of PIM aggregate MDT packets received.                                                                                                               |
| <b>Rx malformed packet</b>            | Number of PIM control packets received with a malformed IP unicast or multicast address family.                                                             |
| <b>No RP</b>                          | Number of PIM control packets received with no RP address.                                                                                                  |
| <b>No register encap if</b>           | Number of PIM register packets received when the first-hop router does not have an encapsulation interface.                                                 |
| <b>No route upstream</b>              | Number of PIM control packets received when the router does not have a unicast route to the the interface used to reach the upstream router, toward the RP. |
| <b>Nexthop Unusable</b>               | Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.                                  |
| <b>RP mismatch</b>                    | Number of PIM control packets received for which the router has an RP mismatch.                                                                             |

Table 135: show pim statistics Output Fields (*continued*)

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RP mode mismatch</b>                    | RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>RPF neighbor unknown</b>                | Number of PIM control packets received for which the router has an unknown RPF neighbor for the source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Rx Joins/Prunes filtered</b>            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Tx Joins/Prunes filtered</b>            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Embedded-RP invalid addr</b>            | Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Embedded-RP limit exceed</b>            | Number of times the limit configured with the <b>maximum-rps</b> statement is exceeded. The <b>maximum-rps</b> statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Embedded-RP added</b>                   | <p>Number of packets in which the embedded RP for IPv6 is added.</p> <p>The following receive events trigger extraction of an IPv6 embedded RP address on the router:</p> <ul style="list-style-type: none"> <li>• Multicast Listener Discovery (MLD) report for an embedded RP multicast group address</li> <li>• PIM join message with an embedded RP multicast group address</li> <li>• Static embedded RP multicast group address associated with an interface</li> <li>• Packets sent to an embedded RP multicast group address received on the DR</li> </ul> <p>An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.</p> |
| <b>Embedded-RP removed</b>                 | Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Rx Register msgs filtering drop</b>     | Number of received register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Tx Register msgs filtering drop</b>     | Number of register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Output Fields</b>            | <a href="#">Table 136 on page 1666</a> describes the output fields for the <b>show sap listen</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                      |

**Table 136: show sap listen Output Fields**

| Field Name           | Field Description                                                            |
|----------------------|------------------------------------------------------------------------------|
| <b>Group address</b> | Address of the group that the local router is listening to for SAP messages. |
| <b>Port</b>          | UDP port number used for SAP.                                                |

## Sample Output

### show sap listen

```
user@host> show sap listen
Group address Port
224.2.127.254 9875
239.255.255.255 9875
```

### show sap listen brief

The output for the **show sap listen brief** command is identical to that for the **show sap listen** command. For sample output, see [show sap listen on page 1666](#).

### show sap listen detail

The output for the **show sap listen detail** command is identical to that for the **show sap listen** command. For sample output, see [show sap listen on page 1666](#).

## test msdp

| <b>Release Information</b>      | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 12.2 for the QFX Series.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Display information about IPv6 router advertisements, including statistics about messages sent and received on interfaces, and information received from advertisements from other routers.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>none</b>—Display all IPv6 router advertisement information for all interfaces.</p> <p><b>conflicts</b>—(Optional) Display only the IPv6 router advertisement information that is conflicting.</p> <p><b>interface <i>interface</i></b>—(Optional) Display IPv6 router advertisement information for the specified interface.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>prefix <i>prefix/prefix length</i></b>—(Optional) Display IPv6 router advertisement information for the specified prefix.</p> |
| <b>Additional Information</b>   | The display identifies conflicting information by enclosing the value the router is advertising in brackets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Output Fields</b>            | <a href="#">Table 138 on page 1674</a> describes the output fields for the <b>show ipv6 router-advertisement</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 138: show ipv6 router-advertisement Output Fields

| Field Name          | Field Description                                                           |
|---------------------|-----------------------------------------------------------------------------|
| Interface           | Name of the interface.                                                      |
| Advertisements sent | Number of router advertisements sent and elapsed time since they were sent. |

Table 138: show ipv6 router-advertisement Output Fields (*continued*)

| Field Name              | Field Description                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Solicits received       | Number of solicitation messages received.                                                                                     |
| Advertisements received | Number of router advertisements received.                                                                                     |
| Advertisements from     | Names of interfaces from which router advertisements have been received and elapsed time since the last one was received.     |
| Managed                 | Managed address configuration flag: 0 (stateless) or 1 (stateful).                                                            |
| Other configuration     | Other stateful configuration flag: 0 (stateless) or 1 (stateful).                                                             |
| Reachable time          | Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds.             |
| Default lifetime        | Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router. |
| Retransmit timer        | Time between retransmitted Neighbor Solicitation messages, in milliseconds.                                                   |
| Current hop limit       | Configured current hop limit.                                                                                                 |
| Prefix                  | Name and length of the prefix.                                                                                                |
| Valid lifetime          | How long the prefix remains valid for onlink determination.                                                                   |
| Preferred lifetime      | How long the prefix generated by stateless autoconfiguration remains preferred.                                               |
| On link                 | Onlink flag: 0 (not onlink) or 1 (onlink).                                                                                    |
| Autonomous              | Autonomous address configuration flag: 0 (not autonomous) or 1 (autonomous).                                                  |

## Sample Output

### show ipv6 router-advertisement

```

user@host> show ipv6 router-advertisement
Interface: fe-0/1/1.0
 Advertisements sent: 0
 Solicits received: 0
 Advertisements received: 0
Interface: fxp0.0
 Advertisements sent: 0
 Solicits received: 0
 Advertisements received: 1
 Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:00:13 ago
 Managed: 0
 Other configuration: 0 [1]
 Reachable time: 0 ms
 Default lifetime: 1800 sec

```

```
Retransmit timer: 0 ms
Current hop limit: 64
```

#### show ipv6 router-advertisement conflicts

```
user@host> show ipv6 router-advertisement conflicts
Interface: fxp0.0
 Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:01:08 ago
 Other configuration: 0 [1]
```

#### show ipv6 router-advertisement prefix

```
user@host> show ipv6 router-advertisement prefix 8040::/16
Interface: fe-0/1/3.0
 Advertisements sent: 3, last sent 00:04:11 ago
 Solicits received: 0
 Advertisements received: 3
 Advertisement from fe80::290:69ff:fe9a:5403, heard 00:00:05 ago
 Managed: 0
 Other configuration: 0
 Reachable time: 0 ms
 Default lifetime: 180 sec [1800 sec]
 Retransmit timer: 0 ms
 Current hop limit: 64
 Prefix: 8040:1::/64
 Valid lifetime: 2592000 sec
 Preferred lifetime: 604800 sec
 On link: 1
 Autonomous: 1
```

## CHAPTER 21

# IS-IS Operational Commands

- clear isis adjacency
- clear isis database
- clear isis overload
- clear isis statistics
- show isis adjacency
- show isis authentication
- show isis backup coverage
- show isis backup label-switched-path
- show isis backup spf results
- show isis context-identifier
- show isis database
- show isis hostname
- show isis interface
- show isis overview
- show isis route
- show isis spf
- show isis statistics

## clear isis adjacency

## Sample Output

### clear isis adjacency

The following sample output displays IS-IS adjacency database information before and after the **clear isis adjacency** command is entered:

```
user@host> show isis adjacency
IS-IS adjacency database:
Interface System L State Hold (secs) SNPA
so-1/0/0.0 karakul 3 Up 26
so-1/1/3.0 1921.6800.5080 3 Up 23
so-5/0/0.0 1921.6800.5080 3 Up 19
```

```
user@host> clear isis adjacency karakul
```

```
user@host> show isis adjacency
IS-IS adjacency database:
Interface System L State Hold (secs) SNPA
so-1/0/0.0 karakul 3 Initializing 26
so-1/1/3.0 1921.6800.5080 3 Up 24
so-5/0/0.0 1921.6800.5080 3 Up 21
```

### clear isis adjacency all

```
user@host> clear isis adjacency all
IS-IS adjacency database:
Interface System L State Hold (secs) SNPA
so-1/0/0.0 karakul 3 Initializing 26
so-1/1/3.0 1921.6800.5080 3 Initializing 24
so-5/0/0.0 1921.6800.5080 3 Initializing 21
```

## clear isis database

## Sample Output

### clear isis database

The following sample output displays IS-IS link-state database information before and after the **clear isis database** command is entered:

```
user@host> show isis database
IS-IS level 1 link-state database:
LSP ID Sequence Checksum Lifetime (secs)
crater.00-00 0x12 0x84dd 1139
```

```
1 LSPs
IS-IS level 2 link-state database:
LSP ID Sequence Checksum Lifetime (secs)
crater.00-00 0x19 0xe92c 1134
badlands.00-00 0x16 0x1454 985
carlsbad.00-00 0x33 0x220b 1015
ranier.00-00 0x2e 0xfc31 1007
1921.6800.5066.00-00 0x11 0x7313 566
1921.6800.5067.00-00 0x14 0xd9d4 939
6 LSPs
```

```
user@host> clear isis database
```

```
user@host> show isis database
IS-IS level 1 link-state database:
LSP ID Sequence Checksum Lifetime (secs)

IS-IS level 2 link-state database:
LSP ID Sequence Checksum Lifetime (secs)
```

## clear isis overload

## Sample Output

### clear isis overload

The following sample output displays IS-IS database information before and after the **clear isis overload** command is entered:

```
user@host> show isis database
```

IS-IS level 1 link-state database:

| LSP ID       | Sequence | Checksum | Lifetime | Attributes            |
|--------------|----------|----------|----------|-----------------------|
| pro3-c.00-00 | 0x4      | 0x10db   | 1185     | L1 L2 <b>Overload</b> |

1 LSPs

IS-IS level 2 link-state database:

| LSP ID       | Sequence | Checksum | Lifetime | Attributes            |
|--------------|----------|----------|----------|-----------------------|
| pro3-c.00-00 | 0x5      | 0x429f   | 1185     | L1 L2 <b>Overload</b> |

|              |       |        |     |       |
|--------------|-------|--------|-----|-------|
| pro2-a.00-00 | 0x91e | 0x2589 | 874 | L1 L2 |
|--------------|-------|--------|-----|-------|

|              |     |       |     |       |
|--------------|-----|-------|-----|-------|
| pro2-a.02-00 | 0x1 | 0xcbc | 874 | L1 L2 |
|--------------|-----|-------|-----|-------|

3 LSPs

user@host> clear isis overload

user@host> show isis database

IS-IS level 1 link-state database:

| LSP ID       | Sequence | Checksum | Lifetime | Attributes |
|--------------|----------|----------|----------|------------|
| pro3-c.00-00 | 0xa      | 0x429e   | 1183     | L1 L2      |

## Sample Output

### show isis adjacency

```

user@host> show isis adjacency
Interface System L State Hold (secs) SNPA
at-2/3/0.0 ranier 3 Up 23

```

### show isis adjacency brief

The output for the **show isis adjacency brief** command is identical to that for the **show isis adjacency** command. For sample output, see [show isis adjacency on page 1688](#).

### show isis adjacency detail

```
user@host> show isis adjacency detail
ranier
Interface: at-2/3/0.0, Level: 3, State: Up, Expires in 21 secs
Priority: 0, Up/Down transitions: 1, Last transition: 00:01:09 ago
Circuit type: 3, Speaks: IP, IPv6
Topologies: Unicast
Restart capable: Yes
IP addresses: 11.1.1.2
```

### show isis adjacency extensive

```
user@host> show isis adjacency extensive
ranier
Interface: at-2/3/0.0, Level: 3, State: Up, Expires in 22 secs
Priority: 0, Up/Down transitions: 1, Last transition: 00:01:16 ago
Circuit type: 3, Speaks: IP, IPv6
Topologies: Unicast
Restart capable: Yes
IP addresses: 11.1.1.2
Transition log:
When State Event Down reason
Wed Nov 8 21:24:25 Up Seenself
```

## show isis authentication

|                                                   |                                                                                                                                                                                                                                                                                                                                                        |

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 143: show isis backup spf results Output Fields

| Field Name              | Field Description                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------|
| <i>node-name</i>        | Name of the destination node.                                                                      |
| <b>Address</b>          | Address of the destination node.                                                                   |
| <b>Primary next-hop</b> | Interface and name of the node of the primary next hop to reach the destination.                   |
| <b>Root</b>             | Name of the next-hop neighbor.                                                                     |
| <b>Metric</b>           | Metric to the node.                                                                                |
| <b>Eligible</b>         | Indicates that the next-hop neighbor has been designated as a backup path to the destination node. |
| <b>Backup next-hop</b>  | Name of the interface of the backup next hop.                                                      |
| <b>SNPA</b>             | Subnetwork point of attachment (MAC address of the next hop).                                      |
| <b>LSP</b>              | Name of the MPLS label-switched path (LSP) designated as a backup path.                            |
| <b>Not eligible</b>     | Indicates that the next-hop neighbor cannot function as a backup path to the destination.          |
| <b>Reason</b>           | Describes why the next-hop neighbor is designated as <b>Not eligible</b> as a backup path.         |

## Sample Output

### show isis backup spf results

| <b>Required Privilege Level</b> | View                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Output Fields</b>            | Table 144 on page 1700 lists the output fields for the <b>show isis context-identifier</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                 |

Table 144: show isis context-identifier Output Fields

| Field Name | Field Description                                                                                                  | Level of Output |
|------------|--------------------------------------------------------------------------------------------------------------------|-----------------|
| Context    | IPv4 address that defines a protection pair. The context is manually configured on both primary and protector PEs. | detail          |
| Owner      | Protocol that requires the context.                                                                                | detail          |
| Role       | Role of the PE, which is either primary or protector.                                                              | detail          |
| Primary    | Name of the primary PE.                                                                                            | detail          |
| Metric     | Advertised interior gateway protocol (IGP) metric.                                                                 | detail          |

## Sample Output

```
user@host> show isis context-identifier detail
```

```
IS-IS context database:
```

```
Context Owner Role Primary Metric
2.2.4.3 MPLS Primary pro3-e 1
 Advertiser pro3-e, Router ID 10.255.245.198, Metric 1, Level 1
 Advertiser pro3-e, Router ID 10.255.245.198, Metric 1, Level 2
 Advertiser pro3-c, Router ID 10.255.245.196, Metric 11, Level 2
```

## show isis database

[show isis database extensive on page 1705](#)

**Output Fields** [Table 145 on page 1703](#) describes the output fields for the **show isis database** command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your customer support representative.

**Table 145: show isis database Output Fields**

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                                                                            | Level of Output         |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Interface name</b> | Name of the interface on which the link-state PDU has been received; always <b>IS-IS</b> for this command.                                                                                                                                                                                                                                                                                   | All levels              |
| level                 | Level of intermediate system: <ul style="list-style-type: none"> <li>• <b>1</b>—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system.</li> <li>• <b>2</b>—Intermediate system routes between areas and toward other ASs.</li> </ul>                                                                                         | All levels              |
| LSP ID                | Link-state PDU identifier.                                                                                                                                                                                                                                                                                                                                                                   | All levels              |
| Sequence              | Sequence number of the link-state PDU.                                                                                                                                                                                                                                                                                                                                                       | All levels              |
| Checksum              | Checksum value of the link-state PDU.                                                                                                                                                                                                                                                                                                                                                        | All levels              |
| Lifetime (secs)       | Remaining lifetime of the link-state PDU, in seconds.                                                                                                                                                                                                                                                                                                                                        | All levels              |
| Attributes            | Attributes of the specified database: <b>L1</b> , <b>L2</b> , <b>Overload</b> , or <b>Attached</b> (L1 only).                                                                                                                                                                                                                                                                                | none <b>brief</b>       |
| # LSPs                | Total number of link-state PDUs in the specified link-state database.                                                                                                                                                                                                                                                                                                                        | none <b>brief</b>       |
| IP prefix             | Prefix advertised by this link-state PDU.                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| IS neighbor           | IS-IS neighbor of the advertising system.                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| IP prefix             | IPv4 prefix advertised by this link-state PDU.                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| V6 prefix             | IPv6 prefix advertised by this link-state PDU.                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| Metric                | Metric of the prefix or neighbor.                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |

## Sample Output

### show isis database

```

user@host> show isis database
IS-IS level 1 link-state database:
LSP ID Sequence Checksum Lifetime Attributes
kobuk.00-00 0x3 0x3167 1057 L1 L2
camaro.00-00 0x5 0x770e 1091 L1 L2
ranier.00-00 0x4 0xaa95 1091 L1 L2
glacier.00-00 0x4 0x206f 1089 L1 L2
glacier.02-00 0x1 0xd141 1089 L1 L2
badlands.00-00 0x3 0x87a2 1093 L1 L2
 6 LSPs

IS-IS level 2 link-state database:
LSP ID Sequence Checksum Lifetime Attributes
kobuk.00-00 0x6 0x8d6b 1096 L1 L2
camaro.00-00 0x9 0x877b 1101 L1 L2
ranier.00-00 0x8 0x855d 1103 L1 L2
glacier.00-00 0x7 0xf892 1098 L1 L2
glacier.02-00 0x1 0xd141 1089 L1 L2
badlands.00-00 0x6 0x562 1105 L1 L2
 6 LSPs

```

### show isis database brief

The output for the **show isis database brief** command is identical to that for the **show isis database** command. For sample output, see [show isis database on page 1704](#).

### show isis database detail

```
user@host> show isis database logical-system CE3 sisira.00-00 detail
```

| <b>Description</b>                                | <p>Display IS-IS hostname database information.</p> <p>This command displays the system ID-to-name cache. The output shows if the mapping has been learned by receipt of a Hostname TLV #137 (type dynamic) configured in Junos OS with the <b>set system host-name</b> command, or a static mapping defined in Junos OS with the <b>set system static-host-mapping <i>hostname</i> sysid</b> command (type static). The local router always has its type set to static even if <b>static-host-mapping</b> is not configured.</p> |

## show isis interface

**List of Syntax**    [Syntax on page 1711](#)  
                          [Syntax \(EX Series Switches and QFX Series\) on page 1711](#)

**Syntax**    show isis interface  
                  <brief | detail | extensive>  
                  <interface-name>  
                  <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches and QFX Series)**    show isis interface  
                  <brief | detail | extensive>  
                  <interface-name>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  Command introduced in Junos OS Release 12.1 for the QFX Series.

**Description**    Display status information about IS-IS-enabled interfaces.

**NOTE:** If the configured metric for an IS-IS level is above 63, and the **wide-metrics-only** statement is not configured, the **show isis interface detail** command and the **show isis interface extensive** command display 63 as the metric value for that level. Configure the **wide-metrics-only** statement to generate metric values greater than 63 on a per IS-IS level basis.

The **show isis interface** command displays the configured metric value for an IS-IS level irrespective of whether is configured or not.

**Options**    **none**—Display standard information about all IS-IS-enabled interfaces.  
                  **brief | detail | extensive**—(Optional) Display the specified level of output.  
                  **interface-name**—(Optional) Display information about the specified interface only.  
                  **logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**    view

| <b>remaining</b>                          | If the state is not in sync and the hold time is not infinity, then this field displays the remaining hold time in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>extensive</b>        |

## Sample Output

### show isis interface

```
user@host> show isis interface
IS-IS interface database:
Interface L CirID Level 1 DR Level 2 DR L1/L2 Metric
at-2/3/0.0 3 0x1 Point to Point Point to Point 10/10
lo0.0 3 0x1 Passive Passive 0/0
```

### show isis interface brief

The output for the **show isis interface brief** command is identical to that for the **show isis interface** command. For sample output, see [show isis interface on page 1714](#).

### show isis interface detail

```
user@host> show isis interface detail

| <b>Output Fields</b>                              | <a href="#">Table 148 on page 1715</a> lists the output fields for the <b>show isis overview</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                               |

**Table 148: show isis overview Output Fields**

| Field Name         | Field Description                                                  |
|--------------------|--------------------------------------------------------------------|
| Hostname           | Name of the router.                                                |
| Sysid              | Part of the ISO address of the routing device.                     |
| Areaid             | The area number of the routing device.                             |
| Instance           | IS-IS routing instance.                                            |
| Router ID          | Router ID of the routing device.                                   |
| Adjacency holddown | Adjacency holddown capability: <b>enabled</b> or <b>disabled</b> . |
| Maximum Areas      | Maximum number of IS-IS areas advertised by the routing device.    |
| LSP life time      | Lifetime of the link-state PDU, in seconds.                        |

Table 148: show isis overview Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                        |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Attached bit evaluation        | Attached bit capability: <b>enabled</b> or <b>disabled</b> .                                                             |
| SPF delay                      | Delay before performing consecutive shortest-path-first (SPF) calculations.                                              |
| SPF holddown                   | Delay before performing additional SPF calculations after the maximum number of consecutive SPF calculations is reached. |
| SPF rapid runs                 | Maximum number of SPF calculations that can be performed in succession before the holddown timer begins.                 |
| Overload bit at startup is set | Overload bit capability is enabled.                                                                                      |
| Overload high metrics          | Overload high metrics capability: <b>enabled</b> or <b>disabled</b> .                                                    |
| Overload timeout               | Time period after which overload is reset and the time that remains before the timer is set to expire.                   |
| Traffic engineering            | Traffic engineering capability: <b>enabled</b> or <b>disabled</b> .                                                      |
| Restart                        | Graceful restart capability: <b>enabled</b> or <b>disabled</b> .                                                         |
| Restart duration               | Time period for complete reacquisition of IS-IS neighbors.                                                               |
| Helper mode                    | Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .                                                  |
| Level                          | IS-IS level: <ul style="list-style-type: none"> <li>• 1—Level 1 information</li> <li>• 2—Level 2 information</li> </ul>  |
| IPv4 is enabled                | IP Protocol version 4 capability is enabled.                                                                             |
| IPv6 is enabled                | IP Protocol version 6 capability is enabled.                                                                             |
| Internal route preference      | Preference value of internal routes.                                                                                     |
| External route preference      | Preference value of external routes.                                                                                     |
| Prefix export limit            | Number of prefixes allowed to be exported, as configured by the <b>prefix-export-limit</b> statement.                    |
| Prefix export count            | Number of prefixes exported.                                                                                             |
| Wide area metrics are enabled  | Wide area metrics capability is enabled.                                                                                 |

Table 148: show isis overview Output Fields (*continued*)

| Field Name                   | Field Description                                                               |
|------------------------------|---------------------------------------------------------------------------------|
| Narrow metrics are enabled   | Narrow metrics capability is enabled.                                           |
| Adjacency holddown is active | IS-IS adjacencies come up one after another when adjacency holddown is enabled. |

## Sample Output

### show isis overview

```

user@host> show isis overview
Instance: master
Router ID: 10.255.107.183
Hostname: pro-bng3-a
Sysid: 0192.0168.0001
Areaid: 49.0002
Adjacency holddown: enabled
Maximum Areas: 3
LSP life time: 1200
Attached bit evaluation: enabled
SPF delay: 200 msec, SPF holddown: 5000 msec, SPF rapid runs: 3
IPv4 is enabled, IPv6 is enabled
Traffic engineering: enabled
Restart: Disabled
 Helper mode: Enabled
Level 1
 Internal route preference: 15
 External route preference: 160
 Wide metrics are enabled, Narrow metrics are enabled
 Adjacency holddown is active
Level 2
 Internal route preference: 18
 External route preference: 165
 Prefix export limit: 5, Prefix export count: 5
 Wide metrics are enabled
 Adjacency holddown is active

```

```

user@host> show isis overview logical-system R2
Instance: master
Router ID: 192.168.0.2
Hostname: pro-bng3-a-R2
Sysid: 0192.0168.0002
Areaid: 49.0002
Adjacency holddown: enabled
Maximum Areas: 3
LSP life time: 1200
Attached bit evaluation: enabled
SPF delay: 200 msec, SPF holddown: 5000 msec, SPF rapid runs: 3
IPv4 is enabled, IPv6 is enabled
Traffic engineering: enabled
Restart: Disabled
 Helper mode: Enabled
Level 1
 Internal route preference: 15
 External route preference: 160

```

```

 Prefix export count: 0
 Wide metrics are enabled, Narrow metrics are enabled
Level 2
 Internal route preference: 18
 External route preference: 165
 Prefix export count: 0
 Wide metrics are enabled, Narrow metrics are enabled

user@host> show isis overview logical-system R3
Instance: master
 Router ID: 192.168.0.3
 Hostname: pro-bng3-a-R3
 Sysid: 0192.0168.0003
 Areaid: 49.0002
 Adjacency holddown: enabled
 Maximum Areas: 3
 LSP life time: 1200
 Attached bit evaluation: enabled
 SPF delay: 200 msec, SPF holddown: 5000 msec, SPF rapid runs: 3
 IPv4 is enabled, IPv6 is enabled
 Traffic engineering: enabled

## show isis spf

**List of Syntax** [Syntax on page 1723](#)  
[Syntax \(EX Series Switches\) on page 1723](#)

**Syntax** show isis spf (brief | log | results)  
 <instance *instance-name*>  
 <level (1 | 2)>  
 <logical-system (all | *logical-system-name*)>  
 <topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

**Syntax (EX Series Switches)** show isis spf (brief | log | results)  
 <instance *instance-name*>  
 <level (1 | 2)>  
 <topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display information about IS-IS shortest-path-first (SPF) calculations.

**Options** **brief**—Display an overview of SPF calculations.

**instance *instance instance-name***—(Optional) Display SPF calculations for the specified routing instance.

**level (1 | 2)**—(Optional) Display SPF calculations for the specified IS-IS level.

**log**—Display the log of SPF calculations.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**results**—Display the results of SPF calculations.

**topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)**—(Optional) Display SPF calculations for the specified topology only.

**Required Privilege Level** view

**List of Sample Output** [show isis spf log on page 1724](#)  
[show isis spf results logical-system on page 1725](#)  
[show isis spf results \(CLNS\) on page 1726](#)

**Output Fields** [Table 150 on page 1723](#) describes the output fields for the **show isis spf** command. Output fields are listed in the approximate order in which they appear.

**Table 150: show isis spf Output Fields**

| Field Name | Field Description    |
|------------|----------------------|
| Node       | System ID of a node. |

Table 150: show isis spf Output Fields (*continued*)

| Field Name     | Field Description                                                                       |
|----------------|-----------------------------------------------------------------------------------------|
| Metric         | Metric to the node.                                                                     |
| Interface      | Interface of the next hop.                                                              |
| Via            | System ID of the next hop.                                                              |
| SNPA           | Subnetwork point of attachment (MAC address of the next hop).                           |
| Start time     | (log option only) Time that the SPF computation started.                                |
| Elapsed (secs) | (log option only) Length of time, in seconds, required to complete the SPF computation. |
| Count          | (log option only) Number of times the SPF was triggered.                                |
| Reason         | (log option only) Reason that the SPF computation was completed.                        |

## Sample Output

| Output Fields                              | <a href="#">Table 151 on page 1729</a> describes the output fields for the <b>show isis statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                              |

Table 151: show isis statistics Output Fields

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PDU type                    | <p>PDU type:</p> <ul style="list-style-type: none"> <li>• <b>CSNP</b>—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU.</li> <li>• <b>IIH</b>—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems.</li> <li>• <b>LSP</b>—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area.</li> <li>• <b>PSNP</b>—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device.</li> <li>• <b>Unknown</b>—The PDU type is unknown.</li> </ul> |
| Received                    | Number of PDUs received since IS-IS started or since the statistics were set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Processed                   | Number of PDUs received less the number dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Total packets received/sent | Total number of PDUs received and transmitted since IS-IS started or since the statistics were set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SNP queue length            | Number of CSPN and PSNP packets currently waiting in the queue for processing. This value is almost always 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LSP queue length            | Number of link-state PDUs waiting in the queue for processing. This value is almost always 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SPF runs                    | Number of shortest-path-first (SPF) calculations that have been performed. If this number is incrementing rapidly, it indicates that the network is unstable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Fragments rebuilt           | Number of link-state PDU fragments that the local system has computed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| LSP regenerations           | Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Purges initiated            | Number of purges that the system initiated. A purge is initiated if the software decides that a link-state PDU must be removed from the network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Advertisement interval | Value of the advertisement interval parameter.                                                                                                                                                                                                                                                                                                                                           |
| Transmit delay         | Value of the transmit delay parameter.                                                                                                                                                                                                                                                                                                                                                   |
| Hold timer             | Value of the hold timer parameter.                                                                                                                                                                                                                                                                                                                                                       |
| Notification interval  | Value of the notification interval parameter.                                                                                                                                                                                                                                                                                                                                            |
| Config Trap Interval   | Value of the configuration trap parameter.                                                                                                                                                                                                                                                                                                                                               |
| Connection Hold timer  | Value of the connection hold timer parameter.                                                                                                                                                                                                                                                                                                                                            |
| Port ID TLV subtype    | <ul style="list-style-type: none"> <li><i>interface-name</i>—Indicates the interface name as the port information for the local device.</li> <li><b>locally-assigned</b>—Indicates that the sub-type for port ID TLV generation is locally assigned value of SNMP index of the interface.</li> </ul> <p>For more information about port ID TLV subtype, see <i>port-id-subtype</i>..</p> |

Table 152: show lldp Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Description TLV type | <p>Following value used for port description TLV:</p> <ul style="list-style-type: none"> <li><b>interface-alias (ifAlias)</b>—Indicates that the <i>ifAlias</i> MIB object value is used to generate the port description TLV.</li> <li><b>interface-description (ifDescr)</b>—Indicates that the <i>ifDescr</i> MIB object value is used to generate the port description TLV.</li> </ul> <p>For more information about port description TLV type, see <i>port-description-type</i>.</p> |
| Interface                 | <p>Name of the interface for which LLDP configuration information is being reported</p> <p>For information about interface names, see <a href="#">"Interface Naming Overview" on page 27</a>. For information about interface names for TX Matrix routers, see <i>TX Matrix Router Chassis and Interface Names</i>. For information about FPC numbering on TX Matrix routers, see <i>Routing Matrix with a TX Matrix Router FPC Numbering</i>.</p>                                        |
| Parent Interface          | Name of the aggregated Ethernet interface, if any, to which the interface belongs.                                                                                                                                                                                                                                                                                                                                                                                                        |
| LLDP                      | LLDP operating state. The state can be Enabled or Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LLDP-MED                  | LLDP-MED operating state. The state can be Enabled or Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Power Negotiation         | LLDP power negotiation operating state. The state can be Enabled or Disabled.                                                                                                                                                                                                                                                                                                                                                                                                             |
| LLDP basic TLVs supported | List of basic LLDP TLVs supported by this device ( <b>detail</b> only).                                                                                                                                                                                                                                                                                                                                                                                                                   |
| LLDP 802 TLVs supported   | List of IEEE 802.1 LLDP TLVs supported by this device ( <b>detail</b> only).                                                                                                                                                                                                                                                                                                                                                                                                              |

## Sample Output

### show lldp

```
user@host> show lldp
LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 120 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds
Port ID TLV subtype : locally-assigned
Port Description TLV type : interface-description (ifDescr)

Interface Parent Interface LLDP LLDP-MED Power Negotiation
all - Enabled
```

## Sample Output

### show lldp detail

```
user@host> show lldp detail
LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 120 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds
Port ID TLV subtype : locally-assigned
Port Description TLV type : interface-description (ifDescr)

Interface Parent Interface LLDP LLDP-MED Power Negotiation
Neighbor count
all - Enabled
2

Interface Parent Interface Vlan-id Vlan-name
xe-0/0/0 - 4080 vlan-4080
xe-0/0/1 - 4080 vlan-4080

Basic Management TLVs supported:
End Of LLDPDU, Chassis ID, Port ID, Time To Live, Port Description, System Name,
System Description, System Capabilities, Management Address

Organizationally Specific TLVs supported:
Port VLAN tag, VLAN Name, MAC/PHY Configuration/Status, Link Aggregation,Maximum
Frame Size
```

## Sample Output

### show lldp local-information(Management Information Address Subtype is IPv4)

```

user@host> show lldp local-information
LLDP Local Information details

Chassis ID : 64:87:88:65:37:c0
System name : apg-hp1
System descr : Juniper Networks, Inc. mx240 , version 14.1I20131231_0701_builder
 [builder] Build date: 2013-12-31 07:13:42 UTC

System Capabilities
 Supported : Bridge Router
 Enabled : Bridge Router

Management Information
 Interface Name : Unknown
 Address Subtype : IPv4(1)
 Address : 10.216.97.103
 Interface Number : 1
 Interface Numbering Subtype : ifIndex(2)

Interface name Parent Interface Interface ID Interface description Status
fxp0 - 1 fxp0 Up
me0 - 33 me0 Up
ge-2/0/0 ae0 1475 ge-2/0/0 Up
ge-2/0/1 ae0 1476 ge-2/0/1 Up

```

### show lldp local-information(Management Information Address Subtype is IPv6)

```

user@host> show lldp local-information
LLDP Local Information details

Chassis ID : ac:4b:c8:92:67:c0
System name : apg-hp
System descr : Juniper Networks, Inc. mx240 , version 13.2-20131210.0 [builder]
 Build date: 2013-12-10 06:23:15 UTC

System Capabilities
 Supported : Bridge Router
 Enabled : Bridge Router

Management Information
 Interface Name : fxp0
 Address Subtype : IPv6(2)
 Address : 1fd::1a20
 Interface Number : 1
 Interface Numbering Subtype : ifIndex(2)

Interface name Parent Interface Interface ID Interface description Status
ge-1/2/4 - 530 - Down
ge-1/2/5 - 531 - Down
ge-1/2/2 - 528 ge-1/2/2 Up
ge-1/2/3 - 529 ge-1/2/3 Up

```

## show lldp neighbors

**Syntax** `show lldp neighbors`  
`<interface interface-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display information about LLDP neighbors.

For information about interface names, see [“Interface Naming Overview” on page 27](#). For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports*.

**Options** `interface interface-name`—(Optional) Display the neighbor information about a particular physical interface.

**NOTE:** Starting with Junos OS Release 14.2, you can also display LLDP neighbor details for management interfaces, such as `fxp` or `me`, on MX Series routers.

**Required Privilege Level** view

**Related Documentation**

- [clear lldp neighbors on page 1732](#)

**List of Sample Output** [show lldp neighbors on page 1743](#)  
[show lldp neighbors interface ge-0/0/4 \(Management Address is IPv4\) on page 1743](#)  
[show lldp neighbors interface ge-0/0/4 \(Management Address is IPv6\) on page 1744](#)  
[show lldp neighbors \(Management Ethernet Interfaces\) on page 1745](#)

**Output Fields** [Table 154 on page 1740](#) describes the output fields for the `show lldp neighbors` command. Output fields are listed in the approximate order in which they appear.

**Table 154: show lldp neighbors Output Fields**

| Field Name                      | Field Description                                                     |
|---------------------------------|-----------------------------------------------------------------------|
| LLDP Remote Devices Information | Information about remote devices.                                     |
| LocalInterface                  | List of local interfaces for which neighbor information is available. |
| ChassisId                       | List of chassis identifiers for neighbors.                            |

Table 154: show lldp neighbors Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>PortInfo</b>                  | List of port information gathered from neighbors. This could be the port identifier or port description.               |
| <b>SysName</b>                   | List of system names gathered from neighbors.                                                                          |
| <b>LLDP Neighbor Information</b> | Information about both local and neighbor systems on the interface (appears when the <b>interface</b> option is used). |
| <b>Local Information</b>         | Information about local systems on the interface (appears when the <b>interface</b> option is used).                   |
| <b>Neighbor Information</b>      | Information about both local and neighbor system on the interface (appears when the <b>interface</b> option is used).  |
| <b>Index</b>                     | Local interface index (appears when the <b>interface</b> option is used).                                              |
| <b>Time Mark</b>                 | Date and timestamp of information (appears when the <b>interface</b> option is used).                                  |
| <b>Time To Live</b>              | Number of seconds for which this information is valid (appears when the <b>interface</b> option is used).              |
| <b>Local Interface</b>           | Name of the local physical interface (appears when the <b>interface</b> option is used).                               |
| <b>Parent Interface</b>          | Name of the <b>ae</b> interface to which the interface belongs                                                         |
| <b>Local Port ID</b>             | Local port identifier (appears when the <b>interface</b> option is used).                                              |
| <b>Neighbor Information</b>      | Information about neighbor systems on the interface (appears when the <b>interface</b> option is used).                |
| <b>Chassis type</b>              | Type of chassis identifier supplied, such as <b>MAC address</b> (appears when the <b>interface</b> option is used).    |
| <b>Chassis ID</b>                | Chassis identifier of type listed (appears when the <b>interface</b> option is used).                                  |
| <b>Port type</b>                 | Type of port identifier supplied, such as <b>local</b> (appears when the <b>interface</b> option is used).             |
| <b>Port ID</b>                   | Port identifier of type listed (appears when the <b>interface</b> option is used).                                     |
| <b>Port description</b>          | Port description (appears when the <b>interface</b> option is used).                                                   |
| <b>System name</b>               | Name supplied by the system on the interface (appears when the <b>interface</b> option is used).                       |
| <b>System Description</b>        | Description supplied by the system on the interface (appears when the <b>interface</b> option is used).                |

Table 154: show lldp neighbors Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Capabilities</b> | Capabilities (such as <b>bridge</b> or <b>router</b> ) that are <b>Supported</b> or <b>Enabled</b> by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                              |
| <b>Management address</b>  | Details of the management address: <b>Address Type</b> (such as <b>ipv4</b> and <b>ipv6</b> ), <b>Address</b> (such as <b>10.204.34.35</b> , <b>1fd::1a10</b> ), <b>Interface Number</b> , <b>Interface Subtype</b> , and <b>Organization Identifier (OID)</b> (appears when the <b>interface</b> option is used). |
| <b>Organization Info</b>   | One or more entries listing remote information by Organizationally Unique Identifier ( <b>OUI</b> ), <b>Subtype</b> , <b>Index</b> , and <b>Info</b> (appears when the <b>interface</b> option is used).                                                                                                           |

**Table 155: show lldp remote-global-statistics Output Fields**

| Field Name                          | Field Description                                                                                     |
|-------------------------------------|-------------------------------------------------------------------------------------------------------|
| LLDP Remote Database Table Counters | Information about remote database table counters.                                                     |
| LastchangeTime                      | Time elapsed between LLDP agent startup and the last change to the remote database table information. |
| Inserts                             | Number of insertions made in the remote database table.                                               |
| Deletes                             | Number of deletions made in the remote database table.                                                |
| Drops                               | Number of LLDP frames dropped from the remote database table because of errors.                       |
| Ageouts                             | Number of remote database table entries that have aged out of the table.                              |

## Sample Output

### show lldp remote-global-statistics

```
user@host> show lldp remote-global-statistics
user@host> show lldp remote-global-statistics
LLDP Remote Database Table Counters
LastchangeTime Inserts Deletes Drops Ageouts
00:00:76 (76 sec) 192 0 0 0
```

## show lldp statistics

**Syntax** `show lldp statistics`  
`<interface interface-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display information about Link Layer Discovery Protocol (LLDP) statistics.

**Options** `interface interface-name`—(Optional) Display the statistics about a particular physical interface.

**NOTE:** Starting with Junos OS Release 14.2, you can also display LLDP statistical details for management interfaces, such as `fxp` or `me`, on MX Series routers.

**Required Privilege Level** view

**Related Documentation** • [clear lldp statistics on page 1733](#)

**List of Sample Output** [show lldp statistics on page 1750](#)  
[show lldp statistics interface ge-0/1/1 on page 1750](#)

**Output Fields** [Table 156 on page 1748](#) describes the output fields for the `show lldp statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 156: show lldp statistics Output Fields**

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Output fields are listed in the approximate order in which they appear.                                                                                                                    |

Table 161: show mvrp registration-state Output Fields

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VLAN Id</b>         | Displays the VLAN ID number.                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Interface</b>       | Displays the interface number associated with the VLAN ID.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Registrar State</b> | Displays whether the registrar state is <b>Registered</b> or <b>Empty</b> .                                                                                                                                                                                                                                                                                                                                                     |
| <b>Forced State</b>    | Displays whether the forced state is <b>Registered</b> or <b>Empty</b> .                                                                                                                                                                                                                                                                                                                                                        |
| <b>Managed State</b>   | Displays one of the following states: <ul style="list-style-type: none"> <li>• <b>Fixed</b>—VLANs always stay in a registered state and are declared as such on all other forwarding ports.</li> <li>• <b>Normal</b>—VLANs participate in the MVRP protocol and honor incoming join requests normally.</li> <li>• <b>Forbidden</b>—VLANs ignore the incoming join requests and always stay in an unregistered state.</li> </ul> |
| <b>STP State</b>       | Displays whether the Spanning Tree Protocol (STP) is <b>Blocking</b> or <b>Forwarding</b> .                                                                                                                                                                                                                                                                                                                                     |

## Sample Output

### show mvrp registration-state

```
user@host> show mvrp registration-state
MVRP registration state for routing instance 'default-switch'
```

| VLAN Id | Interface | Registrar<br>State | Forced<br>State | Managed<br>State | STP<br>State |
|---------|-----------|--------------------|-----------------|------------------|--------------|
| 100     | ge-11/2/8 | Empty              | Registered      | Fixed            | Forwarding   |
|         | ge-11/0/9 | Empty              | Empty           | Normal           | Forwarding   |
|         | ge-11/3/0 | Registered         | Registered      | Normal           | Forwarding   |
| 101     | ge-11/2/8 | Empty              | Registered      | Fixed            | Forwarding   |
|         | ge-11/0/9 | Empty              | Empty           | Normal           | Forwarding   |
|         | ge-11/3/0 | Registered         | Registered      | Normal           | Forwarding   |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                      |

**Table 162: show mvrp statistics Output Fields**

| Field Name                       | Field Description                                        |
|----------------------------------|----------------------------------------------------------|
| interface name                   | Interface for which MVRP statistics are displayed.       |
| VLAN IDs registered              | Number of VLAN IDs registered.                           |
| Sent MVRP PDUs                   | Number of MRPDU messages transmitted from the router.    |
| Received MVRP PDUs without error | Number of MRPDU messages received on the router.         |
| Received MVRP PDUs with error    | Number of invalid MRPDU messages received on the router. |

## Sample Output

### show mvrp statistics

```

user@host> show mvrp statistics
MVRP statistics for routing instance 'default-switch'

Interface name : ge-11/2/8
VLAN IDs registered : 0
Sent MVRP PDUs : 1467

```

Received MVRP PDUs without error: 0  
Received MVRP PDUs with error : 0

Interface name : ge-11/0/9  
VLAN IDs registered : 0  
Sent MVRP PDUs : 1418  
Received MVRP PDUs without error: 702  
Received MVRP PDUs with error : 0

Interface name : ge-11/3/0  
VLAN IDs registered : 2  
Sent MVRP PDUs : 1524  
Received MVRP PDUs without error: 1366  
Received MVRP PDUs with error : 0

## CHAPTER 24

# OSPF Operational Commands

- `clear (ospf | ospf3) database`
- `clear (ospf | ospf3) io-statistics`
- `clear (ospf | ospf3) neighbor`
- `clear (ospf | ospf3) overload`
- `clear (ospf | ospf3) statistics`
- `show (ospf | ospf3) backup coverage`
- `show (ospf | ospf3) backup lsp`
- `show (ospf | ospf3) backup neighbor`
- `show (ospf | ospf3) backup spf`
- `show ospf context-identifier`
- `show ospf database`
- `show ospf3 database`
- `show (ospf | ospf3) interface`
- `show (ospf | ospf3) io-statistics`
- `show (ospf | ospf3) log`
- `show (ospf | ospf3) neighbor`
- `show (ospf | ospf3) overview`
- `show (ospf | ospf3) route`
- `show (ospf | ospf3) statistics`

## clear (ospf | ospf3) database

---

**List of Syntax**    [Syntax on page 1764](#)  
                          [Syntax \(EX Series Switch and QFX Series\) on page 1764](#)

**Syntax**    clear (ospf | ospf3) database  
              <advertising-router (*router-id* | self)>  
              <area *area-id*>  
              <asbrsummary>  
              <external>  
              <instance *instance-name*>  
              <inter-area-prefix>  
              <inter-area-router>  
              <intra-area-prefix>  
              <link-local>  
              <logical-system (all | *logical-system-name*)>  
              <lsa-id *lsa-id*>  
              <netsummary>  
              <network>  
              <nssa>  
              <opaque-area>  
              <purge>  
              <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>  
              <router>

**Syntax (EX Series Switch and QFX Series)**    clear (ospf | ospf3) database  
                                                          <advertising-router (*router-id* | self)>  
                                                          <area *area-id*>  
                                                          <asbrsummary>  
                                                          <external>  
                                                          <instance *instance-name*>  
                                                          <inter-area-prefix>  
                                                          <inter-area-router>  
                                                          <intra-area-prefix>  
                                                          <link-local>  
                                                          <lsa-id *lsa-id*>  
                                                          <netsummary>  
                                                          <network>  
                                                          <nssa>  
                                                          <opaque-area>  
                                                          <purge>  
                                                          <router>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              **advertising-router** *router-id*, **area** *area-id*, **asbrsummary**, **external**, **inter-area-prefix**, **inter-area-router**, **intra-area-prefix**, **link-local**, **lsa-id** *lsa-id*, **netsummary**, **network**, **nssa**, **opaque-area**, and **router** options added in Junos OS Release 8.3. You must use the **purge** command with these options.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **realm** option added in Junos OS Release 9.2.  
                              **advertising-router** (*router-id* | **self**) option added in Junos OS Release 9.5.  
                              **advertising-router** (*router-id* | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.

Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine. You can also use the **purge** command with any of the options to discard rather than delete the specified LSA entries.

**CAUTION:** This command is useful only for testing. Use it with care, because it causes significant network disruption.

**Options** **none**—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.

**advertising-router** (*router-id* | **self**)—(Optional) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.

**area** *area-id*—(Optional) Discard entries for the LSAs in the specified area.

**asbrsummary**—(Optional) Discard summary AS boundary router LSA entries.

**external**—(Optional) Discard external LSAs.

**instance** *instance-name*—(Optional) Delete or discard entries for the specified routing instance only.

**inter-area-prefix**—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.

**inter-area-router**—(OSPFv3 only) (Optional) Discard interarea router LSAs.

**intra-area-prefix**—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.

**logical-system** (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**link-local**—(Optional) Delete link-local LSAs.

**lsa-id** *lsa-id*—(Optional) Discard the LSA entries with the specified LSA identifier.

**netsummary**—(Optional) Discard summary network LSAs.

**network**—(Optional) Discard network LSAs.

**nssa**—(Optional) Discard not-so-stubby area (NSSA) LSAs.

**opaque-area**—(Optional) Discard opaque area-scope LSAs.

**realm** (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Optional) Discard router LSAs.

**purge**—(Optional) Discard all entries in the link-state advertisement database. All link-state advertisements are set to **MAXAGE** and are flooded. The database is repopulated when the originators of the link-state advertisements receive the **MAXAGE** link-state advertisements and reissue them.

**Required Privilege Level** clear

## Sample Output

### clear ospf statistics

The following sample output displays OSPF statistics before and after the **clear ospf statistics** command is entered:

```
user@host> show ospf statistics
```

| Packet type | Total | Last 5 seconds |
|-------------|-------|----------------|
|-------------|-------|----------------|

|          | Sent | Received | Sent | Received |
|----------|------|----------|------|----------|
| Hello    | 3254 | 2268     | 3    | 1        |
| DbD      | 41   | 46       | 0    | 0        |
| LSReq    | 8    | 7        | 0    | 0        |
| LSUpdate | 212  | 154      | 0    | 0        |
| LSAck    | 65   | 98       | 0    | 0        |

|                          |   |                    |   |   |
|--------------------------|---|--------------------|---|---|
| DBDs retransmitted       | : | 3, last 5 seconds  | : | 0 |
| LSAs flooded             | : | 12, last 5 seconds | : | 0 |
| LSAs flooded high-prio   | : | 0, last 5 seconds  | : | 0 |
| LSAs retransmitted       | : | 0, last 5 seconds  | : | 0 |

**Table 163: show (ospf | ospf3) backup coverage Output Fields**

| Field Name    | Field Description                                     |
|---------------|-------------------------------------------------------|
| Node Coverage | Information about backup coverage for each OSPF node. |
| Area          | Area number. Area 0.0.0.0 is the backbone.            |

Table 163: show (ospf | ospf3) backup coverage Output Fields (*continued*)

| Field Name             | Field Description                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------|
| <b>Covered Nodes</b>   | Number of nodes for which backup coverage is available.                                       |
| <b>Total Nodes</b>     | Total number of OSPF nodes.                                                                   |
| <b>Route Coverage</b>  | Information about backup coverage for each type of OSPF route.                                |
| <b>Path Type</b>       | Type of OSPF path: <b>Intra</b> , <b>Inter</b> , <b>Ext1</b> , <b>Ext2</b> , and <b>All</b> . |
| <b>Covered Routes</b>  | For each path type, the number of routes for which backup coverage is available.              |
| <b>Total Routes</b>    | For each path type, the total number of configured routes.                                    |
| <b>Percent Covered</b> | For all nodes and for each path type, the percentage for which backup coverage is available.  |

## Sample Output

### show ospf backup coverage

```

user@host> show ospf backup coverage
Topology default coverage:

Node Coverage:

Area Covered Total Percent
 Nodes Nodes Covered
0.0.0.0 4 5 80.00%

Route Coverage:

Path Type Covered Total Percent
 Routes Routes Covered
Intra 8 14 57.14%
Inter 0 0 100.00%
Ext1 0 0 100.00%
Ext2 1 1 100.00%
All 9 15 60.00%

```

### show ospf3 backup coverage

```

user @host > show ospf3 backup coverage
show ospf3 backup coverage
Node Coverage:

Area Covered Total Percent
 Nodes Nodes Covered
0.0.0.0 4 5 80.00%

Route Coverage:

Path Type Covered Total Percent
 Routes Routes Covered

```

|       |   |   |         |
|-------|---|---|---------|
| Intra | 4 | 6 | 66.67%  |
| Inter | 0 | 0 | 100.00% |
| Ext1  | 0 | 0 | 100.00% |
| Ext2  | 1 | 1 | 100.00% |
| All   | 5 | 7 | 71.43%  |

## show (ospf | ospf3) backup lsp

**Syntax** `show (ospf | ospf3) backup lsp`  
`<logical-system (all | logical-system-name)>`  
`<realm (ipv4-unicast | ipv6-unicast)>`

**Release Information** Command introduced in Junos OS Release 10.0.

**Description** Display information about MPLS label-switched-paths (LSPs) designated as backup routes for OSPF routes.

**NOTE:** MPLS LSPs can be used as backup routes only for routes in the default OSPFv2 topology and not for any configured topology. Additionally, MPLS LSPs cannot be used as backup routes for nondefault instances either for OSPFv2 or OSPFv3.

**Options** `none`—Display information all MPLS LSPs designated as backup routes.

`logical-system (all | logical-system-name)`—(Optional) Display information about MPLS LSPs designated as backup routes for all logical systems or a specific logical system.

`realm (ipv4-unicast | ipv6-unicast)`—(Optional) (OSPFv3 only) Display information about MPLS LSPs designated as backup routes for a specific realm, or address family.

**Output Fields** [Table 164 on page 1776](#) lists the output fields for the `show (ospf | ospf3) backup lsp` command. Output fields are listed in the approximate order in which they appear.

**Table 164: show (ospf | ospf3) backup lsp Output Fields**

| Field Name           | Field Description                                  |
|----------------------|----------------------------------------------------|
| <i>MPLS LSP name</i> | Name of each MPLS LSP designated as a backup path. |
| <b>Egress</b>        | IP address of the egress router for the LSP.       |

Table 164: show (ospf | ospf3) backup lsp Output Fields (*continued*)

| Field Name  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status      | <p>State of the LSP:</p> <ul style="list-style-type: none"> <li>• <b>Up</b>—The router can detect RSVP hello messages from the neighbor.</li> <li>• <b>Down</b>—The router has received one of the following indications: <ul style="list-style-type: none"> <li>• Communication failure from the neighbor.</li> <li>• Communication from IGP that the neighbor is unavailable.</li> <li>• Change in the sequence numbers in the RSVP hello messages sent by the neighbor.</li> </ul> </li> <li>• <b>Deleted</b>—The LSP is no longer available as a backup path.</li> </ul> |
| Last change | Time elapsed since the neighbor state changed either from <b>up</b> or <b>down</b> or from <b>down</b> to <b>up</b> . The format is <i>hh:mm:ss</i> .                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Output Fields</b>            | Table 165 on page 1778 lists the output fields for the <b>show (ospf   ospf3) backup neighbor</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |

Table 165: show (ospf | ospf3) backup neighbor Output Fields

| Field Name              | Field Description                                 | Level of Output |
|-------------------------|---------------------------------------------------|-----------------|
| Neighbor to Self Metric | Metric from the backup neighbor to the OSPF node. | All levels      |

Table 165: show (ospf |ospf3) backup neighbor Output Fields (*continued*)

| Field Name              | Field Description                                 | Level of Output |
|-------------------------|---------------------------------------------------|-----------------|
| Self to Neighbor Metric | Metric from the OSPF node to the backup neighbor. | All levels      |
| Direct next-hop         | Interface and address of the direct next hop.     | All levels      |

Sample Output

show ospf backup neighbor

```
user@host> show ospf backup neighbor
Topology default backup neighbors:

Area 0.0.0.5 backup neighbors:

10.0.0.5
 Neighbor to Self Metric: 5
 Self to Neighbor Metric: 5
 Direct next-hop: ge-4/0/0.111 via 10.0.175.5

10.0.0.6
 Neighbor to Self Metric: 5
 Self to Neighbor Metric: 5
 Direct next-hop: ge-4/1/0.110 via 10.0.176.6
```

## show (ospf | ospf3) backup spf

---

**Output Fields** [Table 166 on page 1781](#) lists the output fields for the **show (ospf |ospf3) backup spf** command. Output fields are listed in the approximate order in which they appear.

**Table 166: show (ospf |ospf3) backup spf Output Fields**

| Field Name                         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Area <i>area-id</i> results</b> | Area for which the results are displayed. Area 0.0.0.0 is the backbone area.                                                                                                                                                                                                                                                                                                                                                               | All levels      |
| <i>address</i>                     | Address of the node for which the results are displayed.                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Self to Destination Metric</b>  | Metric from the node to the destination.                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Parent Node</b>                 | Address of the parent node.                                                                                                                                                                                                                                                                                                                                                                                                                | All levels      |
| <b>Primary next-hop</b>            | Address of the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Backup Neighbor</b>             | Address of the backup neighbor or LSP endpoint and the following information: <ul style="list-style-type: none"> <li>Neighbor to Destination Metric</li> <li>Neighbor to Self Metric</li> <li>Self to Neighbor Metric</li> <li>Status (Eligible, Not Eligible, Not Evaluated) and the reason for the status.</li> </ul> <p><b>NOTE:</b> If the backup neighbor is an LSP endpoint, it is indicated as such after the neighbor address.</p> | All levels      |

## Sample Output

### show ospf backup spf

```

user@host> show ospf backup spf
Topology default results:

Area 0.0.0.0 results:

pro16-d-1o0.xxx.yyyy.net
Self to Destination Metric: 1
Parent Node: pro16-b-1o0.xxx.yyyy.net
Primary next-hop: at-1/0/1.0
Backup Neighbor: pro16-c-1o0.xxx.yyyy.net (LSP endpoint)
 Neighbor to Destination Metric: 4, Neighbor to Self Metric: 3
 Self to Neighbor Metric: 3
 Not eligible, Reason: Path loops
Backup Neighbor: pro16-d-1o0.xxx.yyyy.net
 Neighbor to Destination Metric: 0, Neighbor to Self Metric: 1
 Self to Neighbor Metric: 1
 Not eligible, Reason: Primary next-hop link fate sharing
...

Table 167: show ospf context-identifier Output Fields

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                              | Level of Output |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Context</b>              | IPv4 address that defines a protection pair. The context is manually configured on both primary and protector provider edge (PE) devices.                                                                                                                                                                                                                                                      | All levels      |
| <b>Status</b>               | State of the path: <b>active</b> or <b>inactive</b> .                                                                                                                                                                                                                                                                                                                                          | All levels      |
| <b>Metric</b>               | Advertised OSPF metric.                                                                                                                                                                                                                                                                                                                                                                        | All levels      |
| <b>Area</b>                 | OSPF area number.                                                                                                                                                                                                                                                                                                                                                                              | All levels      |
| <b>Other Advertisements</b> | Other advertisements received by the OSPF node: <ul style="list-style-type: none"><li>• <b>Advertising router</b>— Address of the device that sent the advertisement.</li><li>• <b>Type</b>—Type of OSPF path: <b>inter-area</b> and <b>stub</b>.</li><li>• <b>Metric</b>—Advertised OSPF metric.</li><li>• <b>None</b>—No additional advertisements were received by the OSPF node.</li></ul> | <b>detail</b>   |

## Sample Output

### show ospf context-identifier

```
user@host> show ospf context-identifier
Context-id: 2.2.4.3
Status: active, Metric: 65534, PE role: protector, Area: 0.0.0.0
```

### show ospf context-identifier detail

```
user@host> show ospf context-identifier detail
Context-id: 88.24.13.1
Status: inactive, Metric: 0, PE role: protector, Area: 0.0.0.13
Other Advertisements:
 Advertising router: 8.8.8.103
 Type: stub link
 Metric: 65534
```

## show ospf database

**Release Information**   Command introduced before Junos OS Release 7.4.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                   **advertising-router self (address | self)** option introduced in Junos OS Release 9.5.  
                                   **advertising-router self (address | self)** option introduced in Junos OS Release 9.5 for EX Series switches.  
                                   Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**   Display the entries in the Open Shortest Path First version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.

**Options**   **none**—Display standard information about entries in the OSPFv2 link-state database for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**advertising-router (address | self)**—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

**area *area-id***—(Optional) Display the LSAs in a particular area.

**asbrsummary**—(Optional) Display summary AS boundary router LSA entries.

**external**—(Optional) Display external LSAs.

**instance *instance-name***—(Optional) Display all OSPF database information under the named routing instance.

**link-local**—(Optional) Display information about link-local LSAs.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**lsa-id *lsa-id***—(Optional) Display the LSA with the specified LSA identifier.

**netsummary**—(Optional) Display summary network LSAs.

**network**—(Optional) Display information about network LSAs.

**nssa**—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

**opaque-area**—(Optional) Display opaque area-scope LSAs.

**router**—(Optional) Display information about router LSAs.

**Output Fields**

[Table 168 on page 1790](#) describes the output fields for the **show ospf database** command. Output fields are listed in the approximate order in which they appear.

**Table 168: show ospf database Output Fields**

| Field Name     | Field Description                                                                                                                                        | Level of Output |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>area</b>    | Area number. Area 0.0.0.0 is the backbone area.                                                                                                          | All levels      |
| <b>Type</b>    | Type of link advertisement: <b>ASBRSum</b> , <b>Extern</b> , <b>Network</b> , <b>NSSA</b> , <b>OpaqArea</b> , <b>Router</b> , or <b>Summary</b> .        | All levels      |
| <b>ID</b>      | LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device. | All levels      |
| <b>Adv Rtr</b> | Address of the routing device that sent the advertisement.                                                                                               | All levels      |

                  <network>  
                  <nssa>  
                  <router>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  **realm** option introduced in Junos OS Release 9.2.  
                                  **advertising-router (*address* | *self*)** option introduced in Junos Release 9.5.  
                                  **advertising-router (*address* | *self*)** option introduced in Junos OS Release 9.5 for EX Series switches.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Display the entries in the OSPF version 3 (OSPFv3) link-state database, which contains data about link-state advertisement (LSA) packets.

**Options**    **none**—Display standard information about all entries in the OSPFv3 link-state database.  
                  **brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**advertising-router** (*address* | *self*)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

**area** *area-id*—(Optional) Display the LSAs in a particular area.

**external**—(Optional) Display external LSAs.

**instance** *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

**inter-area-prefix**—(Optional) Display information about interarea-prefix LSAs.

**inter-area-router**—(Optional) Display information about interarea-router LSAs.

**intra-area-prefix**—(Optional) Display information about intra-area-prefix LSAs.

**link**—(Optional) Display information about link LSAs.

**link-local**—(Optional) Display information about link-local LSAs.

**logical-system** (*all* | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**lsa-id** *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

**network**—(Optional) Display information about network LSAs.

**nssa**—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

**realm** (*ipv4-multicast* | *ipv4-unicast* | *ipv6-multicast*)—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family other than IPv6 unicast, which is the default.

**router**—(Optional) Display information about router LSAs.

**Required Privilege Level**

**Output Fields** [Table 170 on page 1809](#) lists the output fields for the **show (ospf | ospf3) interface** command. Output fields are listed in the approximate order in which they appear.

**Table 170: show (ospf | ospf3) interface Output Fields**

| Field Name              | Field Description                                                                                                                                                                                    | Level of Output         |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Interface</b>        | Name of the interface running OSPF version 2 or OSPF version 3.                                                                                                                                      | All levels              |
| <b>State</b>            | State of the interface: <b>BDR</b> , <b>Down</b> , <b>DR</b> , <b>DRother</b> , <b>Loop</b> , <b>PtToPt</b> , or <b>Waiting</b> .                                                                    | All levels              |
| <b>Area</b>             | Number of the area that the interface is in.                                                                                                                                                         | All levels              |
| <b>DR ID</b>            | Address of the area's designated router.                                                                                                                                                             | All levels              |
| <b>BDR ID</b>           | Backup designated router for a particular subnet.                                                                                                                                                    | All levels              |
| <b>Nbrs</b>             | Number of neighbors on this interface.                                                                                                                                                               | All levels              |
| <b>Type</b>             | Type of interface: <b>LAN</b> , <b>NBMA</b> , <b>P2MP</b> , <b>P2P</b> , or <b>Virtual</b> .                                                                                                         | <b>detail extensive</b> |
| <b>Address</b>          | IP address of the neighbor.                                                                                                                                                                          | <b>detail extensive</b> |
| <b>Mask</b>             | Netmask of the neighbor.                                                                                                                                                                             | <b>detail extensive</b> |
| <b>Prefix-length</b>    | (OSPFv3) IPv6 prefix length, in bits.                                                                                                                                                                | <b>detail extensive</b> |
| <b>OSPF3-Intf-Index</b> | (OSPFv3) OSPF version 3 interface index.                                                                                                                                                             | <b>detail extensive</b> |
| <b>MTU</b>              | Interface maximum transmission unit (MTU).                                                                                                                                                           | <b>detail extensive</b> |
| <b>Cost</b>             | Interface cost (metric).                                                                                                                                                                             | <b>detail extensive</b> |
| <b>DR addr</b>          | Address of the designated router.                                                                                                                                                                    | <b>detail extensive</b> |
| <b>BDR addr</b>         | Address of the backup designated router.                                                                                                                                                             | <b>detail extensive</b> |
| <b>Adj count</b>        | Number of adjacent neighbors.                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Secondary</b>        | Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface for only one area. | <b>detail extensive</b> |

Table 170: show (ospf | ospf3) interface Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Flood Reduction</b> | Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the <b>DoNotAge</b> bit set. As a result, LSAs are refreshed only when a change occurs.                                                                                                                                                                                                                                   | <b>extensive</b>        |
| <b>Priority</b>        | Router priority used in designated router (DR) election on this interface.                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive</b> |
| <b>Flood list</b>      | List of link-state advertisements (LSAs) that might be about to flood this interface.                                                                                                                                                                                                                                                                                                                                                                               | <b>extensive</b>        |
| <b>Ack list</b>        | Acknowledgment list. List of pending acknowledgments on this interface.                                                                                                                                                                                                                                                                                                                                                                                             | <b>extensive</b>        |
| <b>Descriptor list</b> | List of packet descriptors.                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>extensive</b>        |
| <b>Hello</b>           | Configured value for the hello timer.                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Dead</b>            | Configured value for the dead timer.                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Auth type</b>       | (OSPFv2) Authentication mechanism for sending and receiving OSPF protocol packets: <ul style="list-style-type: none"> <li>• <b>MD5</b>—The MD5 mechanism is configured in accordance with RFC 2328.</li> <li>• <b>None</b>—No authentication method is configured.</li> <li>• <b>Password</b>—A simple password (RFC 2328) is configured.</li> </ul>                                                                                                                | <b>detail extensive</b> |
| <b>Topology</b>        | (Multiarea adjacency) Name of topology: <b>default</b> or <b>name</b> .                                                                                                                                                                                                                                                                                                                                                                                             |                         |
| <b>LDP sync state</b>  | (OSPFv2 and LDP synchronization) Current state of LDP synchronization: <b>in sync</b> , <b>in holddown</b> , and <b>not supported</b> .                                                                                                                                                                                                                                                                                                                             | <b>extensive</b>        |
| <b>reason</b>          | (OSPFv2 and LDP synchronization) Reason for the current state of LDP synchronization. The LDP session might be up or down, or adjacency might be up or down.                                                                                                                                                                                                                                                                                                        | <b>extensive</b>        |
| <b>config holdtime</b> | (OSPFv2 and LDP synchronization) Configured value of the hold timer.<br><br>If the state is not synchronized, and the hold time is not infinity, the <b>remaining</b> field displays the number of seconds that remain until the configured hold timer expires.                                                                                                                                                                                                     | <b>extensive</b>        |
| <b>IPSec SA name</b>   | (OSPFv2) Name of the IPSec security association name.                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Active key ID</b>   | (OSPFv2 and MD5) Number from <b>0</b> to <b>255</b> that uniquely identifies an MD5 key.                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Start time</b>      | (OSPFv2 and MD5) Time at which the routing device starts using an MD5 key to authenticate OSPF packets transmitted on the interface on which this key is configured. To authenticate received OSPF protocol packets, the key becomes effective immediately after the configuration is committed. If the start time option is not configured, the key is effective immediately for send and receive and is displayed as <b>Start time 1970 Jan 01 00:00:00 PST</b> . | <b>detail extensive</b> |

| <b>Output Fields</b>                            | Table 171 on page 1814 lists the output fields for the <b>show ospf io-statistics</b> command. Output fields are listed in the approximate order in which they appear.                               |

**Table 171: show (ospf | ospf3) io-statistics Output Fields**

| Field Name      | Field Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------|
| Packets read    | Number of OSPF packets read since the last time the routing protocol was started.                         |
| average per run | Total number of packets divided by the total number of times the OSPF read operation is scheduled to run. |
| max run         | Maximum number of packets for a given run among all scheduled runs.                                       |
| Receive errors  | Number of faulty packets received with errors.                                                            |

## Sample Output

### show ospf io-statistics

```
user@host> show ospf io-statistics
```

```
Packets read: 7361, average per run: 1.00, max run: 1
```

```
Receive errors:
```

```
None
```

**Output Fields** [Table 173 on page 1820](#) lists the output fields for the **show (ospf | ospf3) neighbor** command. Output fields are listed in the approximate order in which they appear.

**Table 173: show (ospf | ospf3) neighbor Output Fields**

| Field Name       | Field Description                                  | Level of Output |
|------------------|----------------------------------------------------|-----------------|
| <b>Address</b>   | Address of the neighbor.                           | All levels      |
| <b>Interface</b> | Interface through which the neighbor is reachable. | All levels      |

Table 173: show (ospf | ospf3) neighbor Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output         |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>State</b>                          | <p>State of the neighbor:</p> <ul style="list-style-type: none"> <li>• <b>Attempt</b>—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor.</li> <li>• <b>Down</b>—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the <b>Down</b> state, although at a reduced frequency.</li> <li>• <b>Exchange</b>—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged.</li> <li>• <b>ExStart</b>—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number.</li> <li>• <b>Full</b>—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements.</li> <li>• <b>Init</b>—A hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state may occur, for example, because the routing device itself did not appear in the neighbor's hello packet.</li> <li>• <b>Loading</b>—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the <b>Exchange</b> state.</li> <li>• <b>2Way</b>—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state <b>2Way</b> or greater.</li> </ul> | All levels              |
| <b>ID</b>                             | Router ID of the neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels              |
| <b>Pri</b>                            | Priority of the neighbor to become the designated router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels              |

| <b>Link state retransmission list</b> | <p>Total number of link-state advertisements retransmitted. For <b>extensive</b> output only, the following information is also displayed:</p> <ul style="list-style-type: none"> <li>• <b>Type</b>—Type of link advertisement: <b>ASBR</b>, <b>Sum</b>, <b>Extern</b>, <b>Network</b>, <b>NSSA</b>, <b>OpaqArea</b>, <b>Router</b>, or <b>Summary</b>.</li> <li>• <b>LSA ID</b>—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.</li> <li>• <b>Adv rtr</b>—Address of the routing device that sent the advertisement.</li> <li>• <b>Seq</b>—Link sequence number of the advertisement.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b> |

Table 173: show (ospf | ospf3) neighbor Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                | Level of Output  |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Neighbor-address</b> | (OSPFv3 only) If the neighbor uses virtual links, the <b>Neighbor-address</b> is the site-local, local, or global address. If the neighbor uses a physical interface, the <b>Neighbor-address</b> is an IPv6 link-local address. | detail extensive |
| <b>area</b>             | Area that the neighbor is in.                                                                                                                                                                                                    | detail extensive |
| <b>OSPF3-Intf-Index</b> | (OSPFv3 only) Displays the OSPFv3 interface index.                                                                                                                                                                               | detail extensive |
| <b>opt</b>              | Option bits received in the hello packets from the neighbor.                                                                                                                                                                     | detail extensive |
| <b>DR or DR-ID</b>      | Address of the designated router.                                                                                                                                                                                                | detail extensive |
| <b>BDR or BDR-ID</b>    | Address of the backup designated router.                                                                                                                                                                                         | detail extensive |
| <b>Up</b>               | Length of time since the neighbor came up.                                                                                                                                                                                       | detail extensive |
| <b>adjacent</b>         | Length of time since the adjacency with the neighbor was established.                                                                                                                                                            | detail extensive |

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 174: show ospf overview Output Fields

| Field name                       | Field Description                                                                                                                                                                        | Level of Output |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Instance</b>                  | OSPF routing instance.                                                                                                                                                                   | All levels      |
| <b>Router ID</b>                 | Router ID of the routing device.                                                                                                                                                         | All levels      |
| <b>Route table index</b>         | Route table index.                                                                                                                                                                       | All levels      |
| <b>Configured overload</b>       | Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires. | All levels      |
| <b>Topology</b>                  | Topology identifier.                                                                                                                                                                     | All levels      |
| <b>Prefix export count</b>       | Number of prefixes exported into OSPF.                                                                                                                                                   | All levels      |
| <b>Full SPF runs</b>             | Number of complete Shortest Path First calculations.                                                                                                                                     | All levels      |
| <b>SPF delay</b>                 | Delay before performing consecutive Shortest Path First calculations.                                                                                                                    | All levels      |
| <b>SPF holddown</b>              | Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.                                           | All levels      |
| <b>SPF rapid runs</b>            | Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.                                                                | All levels      |
| <b>LSA refresh time</b>          | Refresh period for link-state advertisement (in minutes).                                                                                                                                | All levels      |
| <b>Database protection state</b> | Current state of database protection.                                                                                                                                                    | All levels      |
| <b>Warning threshold</b>         | Threshold at which a warning message is logged (percentage of maximum LSA count).                                                                                                        | All levels      |
| <b>Non self-generated LSAs</b>   | Number of LSAs whose router ID is not equal to the local router ID: <b>Current</b> , <b>Warning</b> (threshold), and <b>Allowed</b> .                                                    | All levels      |
| <b>Ignore time</b>               | How long the database has been in the ignore state.                                                                                                                                      | All levels      |
| <b>Reset time</b>                | How long the database must stay out of the ignore or isolated state before it returns to normal operations.                                                                              | All levels      |
| <b>Ignore count</b>              | Number of times the database has been in the ignore state: <b>Current</b> and <b>Allowed</b> .                                                                                           | All levels      |
| <b>Restart</b>                   | Graceful restart capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                         | All levels      |
| <b>Restart duration</b>          | Time period for complete reacquisition of OSPF neighbors.                                                                                                                                | All levels      |
| <b>Restart grace period</b>      | Time period for which the neighbors should consider the restarting routing device as part of the topology.                                                                               | All levels      |

Table 174: show ospf overview Output Fields (*continued*)

| Field name                    | Field Description                                                                                                                                    | Level of Output  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Graceful restart helper mode  | (OSPFv2) Standard graceful restart helper capability (based on RFC 3623): <b>enabled</b> or <b>disabled</b> .                                        | All levels       |
| Restart-signaling helper mode | (OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): <b>enabled</b> or <b>disabled</b> . | All levels       |
| Helper mode                   | (OSPFv3) Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .                                                                     | All levels       |
| Trace options                 | OSPF-specific trace options.                                                                                                                         | <b>extensive</b> |
| Trace file                    | Name of the file to receive the output of the tracing operation.                                                                                     | <b>extensive</b> |
| Area                          | Area number. Area 0.0.0.0 is the backbone area.                                                                                                      | All levels       |
| Stub type                     | Stub type of area: <b>Normal Stub</b> , <b>Not Stub</b> , or <b>Not so Stubby Stub</b> .                                                             | All levels       |
| Authentication Type           | Type of authentication: <b>None</b> , <b>Password</b> , or <b>MD5</b> .                                                                              | All levels       |
| Area border routers           | Number of area border routers.                                                                                                                       | All levels       |
| Neighbors                     | Number of autonomous system boundary routers.                                                                                                        | All levels       |

## Sample Output

### show ospf overview

```

user@host> show ospf overview
Instance: master
 Router ID: 10.255.245.6
 Route table index: 0
 Configured overload, expires in 118 seconds
 LSA refresh time: 50 minutes
Restart: Enabled
 Restart duration: 20 sec
 Restart grace period: 40 sec
 Helper mode: enabled
Area: 0.0.0.0
 Stub type: Not Stub
 Authentication Type: None
 Area border routers: 0, AS boundary routers: 0
 Neighbors
 Up (in full state): 0
Topology: default (ID 0)
 Prefix export count: 0
 Full SPF runs: 1
 SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3

```

### show ospf overview (With Database Protection)

```
user@host> show ospf overview
Instance: master
Router ID: 10.255.112.218
Route table index: 0
LSA refresh time: 50 minutes
Traffic engineering
Restart: Enabled
 Restart duration: 180 sec
 Restart grace period: 210 sec
 Graceful restart helper mode: Enabled
 Restart-signaling helper mode: Enabled
Database protection state: Normal
Warning threshold: 70 percent
Non self-generated LSAs: Current 582, Warning 700, Allowed 1000
Ignore time: 30, Reset time: 60
Ignore count: Current 0, Allowed 1
Area: 0.0.0.0
 Stub type: Not Stub
 Authentication Type: None
 Area border routers: 0, AS boundary routers: 0
 Neighbors
 Up (in full state): 160
Topology: default (ID 0)
Prefix export count: 0
Full SPF runs: 70
SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3
Backup SPF: Not Needed
```

### show ospf3 overview (With Database Protection)

```
user@host> show ospf3 overview
Instance: master
Router ID: 10.255.112.128
Route table index: 0
LSA refresh time: 50 minutes
Database protection state: Normal
Warning threshold: 80 percent
Non self-generated LSAs: Current 3, Warning 8, Allowed 10
Ignore time: 30, Reset time: 60
Ignore count: Current 0, Allowed 2
Area: 0.0.0.0
 Stub type: Not Stub
 Area border routers: 0, AS boundary routers: 0
 Neighbors
 Up (in full state): 1
Topology: default (ID 0)
Prefix export count: 0
Full SPF runs: 7
SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3
Backup SPF: Not Needed
```

### show ospf overview extensive

```
user@host> show ospf overview extensive
Instance: master
Router ID: 1.1.1.103
Route table index: 0
Full SPF runs: 13, SPF delay: 0.200000 sec
LSA refresh time: 50 minutes
```

```
Restart: Disabled
Trace options: lsa
Trace file: /var/log/ospf size 131072 files 10
Area: 0.0.0.0
 Stub type: Not Stub
 Authentication Type: None
 Area border routers: 0, AS boundary routers: 0
 Neighbors
 Up (in full state): 1
```

## show (ospf | ospf3) route

---

**List of Syntax**    [Syntax on page 1830](#)  
                          [Syntax \(EX Series Switch and QFX Series\) on page 1830](#)

**Syntax**    show (ospf | ospf3) route  
              <brief | detail | extensive>  
              <abr | asbr | extern | inter | intra>  
              <destination>  
              <instance (default | ipv4-multicast | *instance-name*)>  
              <logical-system (default | ipv4-multicast | *logical-system-name*)>  
              <network>  
              <no-backup-coverage>  
              <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>  
              <router>  
              <topology (default | ipv4-multicast | *topology-name*)>  
              <transit>

**Syntax (EX Series Switch and QFX Series)**    show (ospf | ospf3) route  
                                                          <brief | detail | extensive>  
                                                          <abr | asbr | extern | inter | intra>  
                                                          <destination>  
                                                          <instance *instance-name*>  
                                                          <network>  
                                                          <no-backup-coverage>  
                                                          <router>  
                                                          <topology (default | ipv4-multicast | *topology-name*)>  
                                                          <transit>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **topology** option introduced in Junos OS Release 9.0.  
                              **realm** option introduced in Junos OS Release 9.2.  
                              Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Display the entries in the Open Shortest Path First (OSPF) routing table.

**Options**    **none**—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.

**destination**—Display routes to the specified IP address (with optional destination prefix length).

**brief | detail | extensive**—(Optional) Display the specified level of output.

**abr**—(Optional) Display routes to area border routers.

**asbr**—(Optional) Display routes to autonomous system border routers.

**extern**—(Optional) Display external routes.

**inter**—(Optional) Display interarea routes.

**intra**—(Optional) Display intra-area routes.

**instance** (**default** | **ipv4-multicast** | *instance-name*)—(Optional) Display entries for the default routing instance, the IPv4 multicast routing instance, or for the specified routing instance.

**logical-system** (**default** | **ipv4-multicast** | *logical-system-name*)—(Optional) Perform this operation on the default logical system, the IPv4 multicast logical system, or on a particular logical system.

**network**—(Optional) Display routes to networks.

**no-backup-coverage**—(Optional) Display routes with no backup coverage.

**realm** (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Optional) Display routes to all routers.

**topology** (**default** | **ipv4-multicast** | *topology-name*)—(OSPFv2 only) (Optional) Display routes for the default OSPF topology, IPv4 multicast topology, or for a particular topology.

**transit**—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

**Required Privilege Level**

| <b>Description</b>                 | <p>Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the <b>as-path-prepend</b> action) or through aggregation.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| <b>Options</b>                     | <p><b>none</b>—Display basic information about AS paths that the local routing device is using (same as brief).</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>                 | <p>Display autonomous system (AS) path summary information.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| <b>Options</b>                     | <p><b>none</b>—(Optional) Display AS path summary information for all routing instances.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                          |

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                        |

**Table 179: show as-path summary Output Fields**

| Field Name      | Field Description                             |
|-----------------|-----------------------------------------------|
| <b>AS Paths</b> | Number of AS paths.                           |
| <b>Buckets</b>  | Number of hash buckets in use.                |
| <b>Max</b>      | Maximum number of AS path entries per bucket. |
| <b>Min</b>      | Minimum number of AS path entries per bucket. |
| <b>Avg</b>      | Average number of AS path entries per bucket. |

Table 179: show as-path summary Output Fields (*continued*)

| Field Name    | Field Description                                 |
|---------------|---------------------------------------------------|
| Std deviation | Standard deviation of AS path entries per bucket. |

## Sample Output

show as-path summary

```
user@host> show as-path summary
AS Paths Buckets Max Min Avg Std deviation
30425 1024 95 12 29 6.481419
```

## show route

---

**List of Syntax**    [Syntax on page 1852](#)  
                          [Syntax \(EX Series Switches\) on page 1852](#)

**Syntax**    show route  
              <all>  
              <*destination-prefix*>  
              <logical-system (all | *logical-system-name*)>  
              <private>

**Syntax (EX Series Switches)**    show route  
                                          <all>  
                                          <*destination-prefix*>  
                                          <private>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Option **private** introduced in Junos OS Release 9.5.  
                              Option **private** introduced in Junos OS Release 9.5 for EX Series switches.  
                              Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

**Description**    Display the active entries in the routing tables.

**Options**    **none**—Display brief information about all active entries in the routing tables.

**all**—(Optional) Display information about all routing tables, including private, or internal, routing tables.

***destination-prefix***—(Optional) Display active entries for the specified address or range of addresses.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**private**—(Optional) Display information only about all private, or internal, routing tables.

| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>number routes</i>       | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul> |
| <i>destination-prefix</i>  | <p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>                                                                                                                                                                      |

Table 180: show route Output Fields (*continued*)

| Field Name                                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ <i>protocol, preference</i> ]                   | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                                   |
| <i>weeks:days</i><br><i>hours:minutes:seconds</i> | How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| metric                                            | Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| localpref                                         | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| from                                              | Interface from which the route was received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| AS path                                           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |

Table 180: show route Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>validation-state</b> | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>to</b>               | <p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>via</b>              | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label). For VPNs, expect to see multiple <b>push</b> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul> |
| <b>Private unicast</b>  | <p>(Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes <i>not</i> managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Sample Output

### show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
 * [MVPN/70] 19:53:41, metric2 1
 Indirect
1:65500:1:10.0.0.40/240
 * [BGP/170] 19:53:29, localpref 100, from 10.0.0.30
 AS path: I
 > to 10.0.24.4 via 1t-0/3/0.24, label-switched-path toD

```

```

AS path: I
> to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
1:65500:1:10.0.0.60/240
*[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
AS path: I
> to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
[BGP/170] 19:53:25, localpref 100, from 10.0.0.33
AS path: I
> to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF

```

### show route

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```

user@host> show route 70.0.0.0

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0
hidden)
+ = Active Route, - = Last Active, * = Both

70.0.0.0/24 @[BGP/170] 00:28:32, localpref 100, from 10.9.9.160
 AS path: 13980 ?, validation-state: unverified
 > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
 [BGP/170] 00:28:28, localpref 100, from 10.9.9.169
 AS path: 13980 ?, validation-state: unverified
 > to 10.100.0.42 via ae2.0, Push 126016, Push 300368(top)
 #[Multipath/255] 00:28:28, metric2 102
 > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
 to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)

```

### show route (with Destination Prefix)

```

user@host> show route 172.16.0.0/12

inet.0: 10 destinations, 10 routes (9 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.0.0/12 *[Static/5] 2w4d 12:54:27
 > to 192.168.167.254 via fxp0.0

```

### show route destination-prefix detail

```

user@host> show route 5.5.5.0 detail

| <b>Output Fields</b>               | For information about output fields, see the output field tables for the <a href="#">show route</a> command, the <a href="#">show route detail</a> command, the <a href="#">show route extensive</a> command, or the <a href="#">show route terse</a> command.                                                                                                                  |

## Sample Output

### show route active-path

```
user@host> show route active-path

inet.0: 7 destinations, 7 routes (6 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.70.19/32 *[Direct/0] 21:33:52
 > via lo0.0
10.255.71.50/32 *[IS-IS/15] 00:18:13, metric 10
 > to 100.1.2.1 via so-2/1/3.0
100.1.2.0/24 *[Direct/0] 00:18:36
 > via so-2/1/3.0
```

```

100.1.2.2/32 *[Local/0] 00:18:41
 Local via so-2/1/3.0
192.168.64.0/21 *[Direct/0] 21:33:52
 > via fxp0.0
192.168.70.19/32 *[Local/0] 21:33:52
 Local via fxp0.0

```

### show route active-path brief

The output for the **show route active-path brief** command is identical to that for the **show route active-path** command. For sample output, see [show route active-path on page 1858](#).

### show route active-path detail

```

user@host> show route active-path detail

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>number destinations</b>                   | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                             | All levels              |
| <b>number routes</b>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>                                                                | All levels              |
| <b>Prefix</b>                                | Destination prefix.                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>brief none</b>       |
| <b>destination-prefix (entry, announced)</b> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>BGP group and type</b>                    | BGP group name and type ( <b>Internal</b> or <b>External</b> ).                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Route Distinguisher</b>                   | Unique 64-bit prefix augmenting each IP subnet.                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Advertised Label</b>                      | Incoming label advertised by the Label Distribution Protocol (LDP). When an IP packet enters a label-switched path (LSP), the ingress router examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label. | <b>detail extensive</b> |
| <b>Label-Base, range</b>                     | First label in a block of labels and label block size. A remote PE router uses this first label when sending traffic toward the advertising PE router.                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>VPN Label</b>                             | Virtual private network (VPN) label. Packets are sent between CE and PE routers by advertising VPN labels. VPN labels transit over either a Resource Reservation Protocol (RSVP) or a Label Distribution Protocol (LDP) label-switched path (LSP) tunnel.                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Nexthop</b>                               | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.<br><br>If the next-hop advertisement to the peer is <b>Self</b> , and the RIB-out next hop is a specific IP address, the RIB-out IP address is included in the extensive output. See <a href="#">show route advertising-protocol bgp extensive all (Next Hop Self with RIB-out IP Address)</a> on page 1866.                      | All levels              |
| <b>MED</b>                                   | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                                                                                                            | <b>brief</b>            |
| <b>Lclpref or Localpref</b>                  | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                       | All levels              |

Table 181: show route advertising-protocol Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output         |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>AS path</b>             | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if configured on the router, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels              |
| <b>Communities</b>         | Community path attribute for the route. see the output field table for the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>AIGP</b>                | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Attrset AS</b>          | Number, local preference, and path of the autonomous system (AS) that originated the route. These values are stored in the <b>Attrset</b> attribute at the originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b> |

| <b>Description</b>                 | Display information about all routes in all routing tables, including private, or internal, tables.                                                                                                                                                                                                                                           |
| <b>Options</b>                     | <b>none</b> —Display information about all routes in all routing tables, including private, or internal, tables.<br><br><b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.                                                                 |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                          |
| <b>List of Sample Output</b>       | <a href="#">show route all on page 1868</a>                                                                                                                                                                                                                                                                                                   |
| <b>Output Fields</b>               | In Junos OS Release 9.5 and later, only the output fields for the <b>show route all</b> command display all routing tables, including private, or hidden, routing tables. The output field table of the <a href="#">show route</a> command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later. |

## Sample Output

### show route all

The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```
user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0 *[MPLS/0] 2d 02:24:39, metric 1
 Receive
1 *[MPLS/0] 2d 02:24:39, metric 1
 Receive
2 *[MPLS/0] 2d 02:24:39, metric 1
 Receive
800017 *[VPLS/7] 1d 14:00:16
 > via vt-3/2/0.32769, Pop
800018 *[VPLS/7] 1d 14:00:26
 > via vt-3/2/0.32772, Pop
```

```
user@host> show route all
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0 *[MPLS/0] 2d 02:19:12, metric 1
 Receive
1 *[MPLS/0] 2d 02:19:12, metric 1
 Receive
2 *[MPLS/0] 2d 02:19:12, metric 1
 Receive
800017 *[VPLS/7] 1d 13:54:49
 > via vt-3/2/0.32769, Pop
800018 *[VPLS/7] 1d 13:54:59
 > via vt-3/2/0.32772, Pop
vt-3/2/0.32769 [VPLS/7] 1d 13:54:49
 Unusable
vt-3/2/0.32772 [VPLS/7] 1d 13:54:59
 Unusable
```

## show route aspath-regex

| <b>Description</b>                 | Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                     | <b><i>regular-expression</i></b> —Regular expression that matches an entire AS path.<br><br><b><i>logical-system (all   <i>logical-system-name</i>)</i></b> —(Optional) Perform this operation on all logical systems or on a particular logical system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Additional Information</b>      | <p>You can specify a regular expression as:</p> <ul style="list-style-type: none"><li>• An individual AS number</li><li>• A period wildcard used in place of an AS number</li><li>• An AS path regular expression that is enclosed in parentheses</li></ul> <p>You also can include the operators described in the table of AS path regular expression operators in the <i>Junos Policy Framework Configuration Guide</i>. The following list summarizes these operators:</p> <ul style="list-style-type: none"><li>• <b><i>{m,n}</i></b>—At least <i>m</i> and at most <i>n</i> repetitions of the AS path term.</li><li>• <b><i>{m}</i></b>—Exactly <i>m</i> repetitions of the AS path term.</li><li>• <b><i>{m,}</i></b>—<i>m</i> or more repetitions of the AS path term.</li><li>• <b><i>*</i></b>—Zero or more repetitions of an AS path term.</li><li>• <b><i>+</i></b>—One or more repetitions of an AS path term.</li><li>• <b><i>?</i></b>—Zero or one repetition of an AS path term.</li><li>• <b><i>aspath_term   aspath_term</i></b>—Match one of the two AS path terms.</li></ul> <p>When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:</p> <pre>show route aspath-regex ". * 234 ."</pre> |

| Description                 | Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Options                     | <p><b><i>as-number:community-value</i></b>—One or more community identifiers. <b><i>as-number</i></b> is the AS number, and <b><i>community-value</i></b> is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Additional Information      | Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.                                                                                                                                                                                                                                                                                                                                                                 |

| <i>routing-table-name</i>                    | Name of the routing table—for example, <b>inet.0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels              |
| <b>destinations</b>                          | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels              |
| <b>number routes</b>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in a pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels              |
| <b>destination-prefix (entry, announced)</b> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>[protocol, preference]</b>                | Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> | All levels              |
| <b>Next-hop reference count</b>              | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Source</b>                                | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Next hop</b>                              | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>via</b>                                   | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Protocol next hop</b>                     | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>Indirect next hop</b>                     | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>State</b>                                 | Flags for this route. For a description of possible values for this field, see the output field table for the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |

Table 182: show route damping Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output  |

| <b>Output Fields</b>               | <a href="#">Table 183 on page 1887</a> describes the output fields for the <b>show route detail</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                        |

**Table 183: show route detail Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                         |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 183: show route detail Output Fields (*continued*)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).</li> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> |
| label stacking                                 | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| [ <i>protocol, preference</i> ]                | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>- —</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                                                                      |
| Level                                          | <p>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Route Distinguisher                            | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Next-hop type</b>                                 | Type of next hop. For a description of possible values for this field, see <a href="#">Table 184 on page 1892</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path<br/>lsp-path-name</b>         | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Indirect next hop</b>                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>State</b>                                         | State of the route (a route can be in more than one state). See <a href="#">Table 185 on page 1894</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Local AS</b>                                      | AS number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Age</b>                                           | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Metric</b>            | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>MED-plus-IGP</b>      | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>TTL-Action</b>        | For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.<br><br>For sample output, see <a href="#">show route table</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Task</b>              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Announcement bits</b> | The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the KRT for installing the route into the Packet Forwarding Engine, to a resolve tree, a L2 VC, or even a VPN. For example, <b><i>n-Resolve inet</i></b> indicates that the specified route is used for route resolution for next hops found in the routing table.<br><br><ul style="list-style-type: none"> <li><b><i>n</i></b>—An index used by Juniper Networks customer support only.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>AS path</b>           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li><b>I</b>—IGP.</li> <li><b>E</b>—EGP.</li> <li><b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li><b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li><b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li><b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li><b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li><b>( )</b>—Parentheses enclose a confederation.</li> <li><b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |

Table 183: show route detail Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>validation-state</b>        | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| <b>FECs bound to route</b>     | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Primary Upstream</b>        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>RPF Nexthops</b>            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Label</b>                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>weight</b>                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>VC Label</b>                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>MTU</b>                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>VLAN ID</b>                 | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Prefixes bound to route</b> | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Communities</b>             | Community path attribute for the route. | Field Name                                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accepted Multipath</b>                  | Current active path when BGP multipath is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Accepted LongLivedStale</b>             | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                                  |
| <b>Accepted LongLivedStaleImport</b>       | <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p> |
| <b>ImportAccepted LongLivedStaleImport</b> | <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>                                                                                                                                                                      |
| <b>Accepted MultipathContrib</b>           | Path currently contributing to BGP multipath.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Localpref</b>                           | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Router ID</b>                           | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Primary Routing Table</b>               | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Secondary Tables</b>                    | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                       |

[Table 184 on page 1892](#) describes all possible values for the Next-hop Types output field.

Table 184: Next-Hop Types Output Field Values

| Next-Hop Type            | Description                                                                                                                                                                                                                       |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Broadcast (bcast)</b> | Broadcast next hop.                                                                                                                                                                                                               |
| <b>Deny</b>              | Deny next hop.                                                                                                                                                                                                                    |
| <b>Discard</b>           | Discard next hop.                                                                                                                                                                                                                 |
| <b>Flood</b>             | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by P2MP RSVP, P2MP LDP, P2MP CCC, and multicast. |
| <b>Hold</b>              | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                              |

Table 184: Next-Hop Types Output Field Values (*continued*)

| Next-Hop Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Indexed (idxd)</b>           | Indexed next hop.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Indirect (indr)</b>          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                                                                                                                                               |
| <b>Interface</b>                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.                                                                                                                                                                                                                                               |
| <b>Local (locl)</b>             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                                                                                                                                                     |
| <b>Multicast (mcst)</b>         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                                                                                                                                              |
| <b>Multicast discard (mdsc)</b> | Multicast discard.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Multicast group (mgrp)</b>   | Multicast group member.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Receive (recv)</b>           | Receive.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Reject (rjct)</b>            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Resolve (rslv)</b>           | Resolving next hop.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Routed multicast (mcrst)</b> | Regular multicast next hop.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Router</b>                   | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| <b>Table</b>                    | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Unicast (ucst)</b>           | Unicast.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Unilist (ulst)</b>           | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.                                                                                                                                                                                                                                                                                                                |

Table 185 on page 1894 describes all possible values for the State output field. A route can be in more than one state (for example, **<Active NoReadvrt Int Ext>**).

Table 185: State Output Field Values

| Value                                                    | Description                                                                                                                                                                          |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accounting</b>                                        | Route needs accounting.                                                                                                                                                              |
| <b>Active</b>                                            | Route is active.                                                                                                                                                                     |
| <b>Always Compare MED</b>                                | Path with a lower multiple exit discriminator (MED) is available.                                                                                                                    |
| <b>AS path</b>                                           | Shorter AS path is available.                                                                                                                                                        |
| <b>Cisco Non-deterministic MED selection</b>             | Route is a clone.                                                                                                                                                                    |
| <b>Clone</b>                                             | Cisco nondeterministic MED is enabled and a path with a lower MED is available.                                                                                                      |
| <b>Cluster list length</b>                               | Length of cluster list sent by the route reflector.                                                                                                                                  |
| <b>Delete</b>                                            | Route has been deleted.                                                                                                                                                              |
| <b>Ex</b>                                                | Exterior route.                                                                                                                                                                      |
| <b>Ext</b>                                               | BGP route received from an external BGP neighbor.                                                                                                                                    |
| <b>FlashAll</b>                                          | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| <b>Hidden</b>                                            | Route not used because of routing policy.                                                                                                                                            |
| <b>IfCheck</b>                                           | Route needs forwarding RPF check.                                                                                                                                                    |
| <b>IGP metric</b>                                        | Path through next hop with lower IGP metric is available.                                                                                                                            |
| <b>Inactive reason</b>                                   | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| <b>Initial</b>                                           | Route being added.                                                                                                                                                                   |
| <b>Int</b>                                               | Interior route.                                                                                                                                                                      |
| <b>Int Ext</b>                                           | BGP route received from an internal BGP peer or a BGP confederation peer.                                                                                                            |
| <b>Interior &gt; Exterior &gt; Exterior via Interior</b> | Direct, static, IGP, or EBGp path is available.                                                                                                                                      |
| <b>Local Preference</b>                                  | Path with a higher local preference value is available.                                                                                                                              |

Table 185: State Output Field Values (*continued*)

| Value                                 | Description                                                                                                                                                                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Martian</b>                        | Route is a martian (ignored because it is obviously invalid).                                                                                                                                                                     |
| <b>MartianOK</b>                      | Route exempt from martian filtering.                                                                                                                                                                                              |
| <b>Next hop address</b>               | Path with lower metric next hop is available.                                                                                                                                                                                     |
| <b>No difference</b>                  | Path from neighbor with lower IP address is available.                                                                                                                                                                            |
| <b>NoReadvrt</b>                      | Route not to be advertised.                                                                                                                                                                                                       |
| <b>NotBest</b>                        | Route not chosen because it does not have the lowest MED.                                                                                                                                                                         |
| <b>Not Best in its group</b>          | Incoming BGP AS is not the best of a group (only one AS can be the best).                                                                                                                                                         |
| <b>NotInstall</b>                     | Route not to be installed in the forwarding table.                                                                                                                                                                                |
| <b>Number of gateways</b>             | Path with a greater number of next hops is available.                                                                                                                                                                             |
| <b>Origin</b>                         | Path with a lower origin code is available.                                                                                                                                                                                       |
| <b>Pending</b>                        | Route pending because of a hold-down configured on another route.                                                                                                                                                                 |
| <b>Release</b>                        | Route scheduled for release.                                                                                                                                                                                                      |
| <b>RIB preference</b>                 | Route from a higher-numbered routing table is available.                                                                                                                                                                          |
| <b>Route Distinguisher</b>            | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                            |
| <b>Route Metric or MED comparison</b> | Route with a lower metric or MED is available.                                                                                                                                                                                    |
| <b>Route Preference</b>               | Route with lower preference value is available                                                                                                                                                                                    |
| <b>Router ID</b>                      | Path through a neighbor with lower ID is available.                                                                                                                                                                               |
| <b>Secondary</b>                      | Route not a primary route.                                                                                                                                                                                                        |
| <b>Unusable path</b>                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| <b>Update source</b>                  | Last tiebreaker is the lowest IP address value.                                                                                                                                                                                   |

Table 186 on page 1896 describes the possible values for the Communities output field.

Table 186: Communities Output Field Values

| Value                                                   | Description                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is <b>0</b> . A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                                  |
| <b>bandwidth: local AS number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.                   |
| <b>domain-id</b>                                        | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                                             |
| <b>domain-id-vendor</b>                                 | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                                     |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from <b>0</b> through <b>4,294,967,295</b> (bytes per second).                                                                                                                                                                                                                   |
| <i>local AS number</i>                                  | Local AS number: from <b>1</b> through <b>65,535</b> .                                                                                                                                                                                                                                                  |
| <i>options</i>                                          | 1 byte. Currently this is only used if the route type is <b>5</b> or <b>7</b> . Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                        |
| <b>origin</b>                                           | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                                                                  |
| <i>ospf-route-type</i>                                  | 1 byte, encoded as <b>1</b> or <b>2</b> for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); <b>3</b> for summary routes; <b>5</b> for external routes (area number must be <b>0</b> ); <b>7</b> for NSSA routes; or <b>129</b> for sham link endpoint addresses. |
| <b>route-type-vendor</b>                                | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <b>area-number:ospf-route-type:options</b> .                                                                                            |
| <b>rte-type</b>                                         | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <b>area-number:ospf-route-type:options</b> .                                                                                            |
| <b>target</b>                                           | Defines which VPN the route participates in; <b>target</b> has the format <b>32-bit IP address:16-bit number</b> . For example, 10.19.0.0:100.                                                                                                                                                          |
| <b>unknown IANA</b>                                     | Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                        |
| <b>unknown OSPF vendor community</b>                    | Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                                         |

## Sample Output

| <b>Description</b>                 | Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                     | <p><b>none</b>—(Same as <b>brief</b>.) Display standard information about policy-based export for all instances and routing tables on all systems.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>instance &lt;instance-name&gt;</b>—(Optional) Display a particular routing instance for which policy-based export is currently enabled.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>routing-table-name</b>—(Optional) Display information about policy-based export for all routing tables whose name begins with this string (for example, <b>inet.0</b> and <b>inet6.0</b> are both displayed when you run the <b>show route export inet</b> command).</p> |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Output Fields</b>               | <a href="#">Table 187 on page 1907</a> lists the output fields for the <b>show route export</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 187: show route export Output Fields**

| Field Name                 | Field Description                                                                                                                                           | Level of Output   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Table or table-name</b> | Name of the routing tables that either import or export routes.                                                                                             | All levels        |
| <b>Routes</b>              | Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one. | <b>brief</b> none |

Table 187: show route export Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                           | Level of Output   |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Export</b>        | Whether the table is currently exporting routes to other tables: <b>Y</b> or <b>N</b> (Yes or No).                                                                                                                                                                                                                                                                          | <b>brief none</b> |
| <b>Import</b>        | Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)                                                                                                                                                                                                                                                  | <b>detail</b>     |
| <b>Flags</b>         | ( <b>instance</b> keyword only) Flags for this feature on this instance: <ul style="list-style-type: none"> <li><b>config auto-policy</b>—The policy was deduced from the configured IGP export policies.</li> <li><b>cleanup</b>—Configuration information for this instance is no longer valid.</li> <li><b>config</b>—The instance was explicitly configured.</li> </ul> | <b>detail</b>     |
| <b>Options</b>       | ( <b>instance</b> keyword only) Configured option displays the type of routing tables the feature handles: <ul style="list-style-type: none"> <li><b>unicast</b>—Indicates <i>instance.inet.0</i>.</li> <li><b>multicast</b>—Indicates <i>instance.inet.2</i>.</li> <li><b>unicast multicast</b>—Indicates <i>instance.inet.0</i> and <i>instance.inet.2</i>.</li> </ul>    | <b>detail</b>     |
| <b>Import policy</b> | ( <b>instance</b> keyword only) Policy that <b>route export</b> uses to construct the import-export matrix. Not displayed if the instance type is <b>vrf</b> .                                                                                                                                                                                                              | <b>detail</b>     |
| <b>Instance</b>      | ( <b>instance</b> keyword only) Name of the routing instance.                                                                                                                                                                                                                                                                                                               | <b>detail</b>     |
| <b>Type</b>          | ( <b>instance</b> keyword only) Type of routing instance: <b>forwarding</b> , <b>non-forwarding</b> , or <b>vrf</b> .                                                                                                                                                                                                                                                       | <b>detail</b>     |

## Sample Output

### show route export

```

user@host> show route export
Table Export Routes
inet.0 N 0
black.inet.0 Y 3
red.inet.0 Y 4

```

### show route export detail

```

user@host> show route export detail
inet.0 Routes: 0
black.inet.0 Routes: 3
 Import: [inet.0]
red.inet.0 Routes: 4
 Import: [inet.0]

```

### show route export instance detail

```

user@host> show route export instance detail
Instance: master Type: forwarding
Flags: <config auto-policy> Options: <unicast multicast>
Import policy: [(ospf-master-from-red || isis-master-from-black)]

```

Instance: black  
Instance: red

Type: non-forwarding  
Type: non-forwarding

| <i>number routes</i>                           | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <b>TSI</b>                                     | Protocol header information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the Multiprotocol Label Switching (MPLS) label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>[protocol, preference]</b>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>—</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                             |

Table 189: show route extensive Output Fields (*continued*)

| Field Name                                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Level</b>                                         | (IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Route Distinguisher</b>                           | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>PMSI</b>                                          | Provider multicast service interface (MVPN routing table).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Next-hop type</b>                                 | Type of next hop. For a description of possible values for this field, see the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when Multiprotocol Label Switching (MPLS) label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable Border Gateway Protocol (BGP) multipath load balancing.</li> </ul> |
| <b>Label-switched-path lsp-path-name</b>             | Name of the label-switched path (LSP) used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Offset</b>                                        | Whether the metric has been increased or decreased by an offset value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 189: show route extensive Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>label-operation</i></b> | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                 |
| <b>Indirect next hops</b>     | <p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"> <li>• 0x1 indicates active next hops.</li> <li>• 0x4000 indicates passive next hops.</li> </ul> |
| <b>State</b>                  | State of the route (a route can be in more than one state). See the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Session ID</b>             | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Weight</b>                 | <p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                     |

Table 189: show route extensive Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inactive reason | <p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGp path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul> |
| Local AS        | Autonomous system (AS) number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Age             | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AIGP            | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Metric          | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MED-plus-IGP    | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TTL-Action      | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signalled and LDP-signalled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Task</b>                          | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Announcement bits</b>             | List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>AS path</b>                       | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>              | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>FECs bound to route</b>           | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>AS path: I &lt;Originator&gt;</b> | (For route reflected output only) Originator ID attribute set by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 189: show route extensive Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route status</b>     | <p>Indicates the status of a BGP route:</p> <ul style="list-style-type: none"> <li>• <b>Accepted</b>—The specified BGP route is imported by the default BGP policy.</li> <li>• <b>Import</b>—The route is imported into a Layer 3 VPN routing instance.</li> <li>• <b>Import-Protect</b>—A remote instance egress that is protected.</li> <li>• <b>Multipath</b>—A BGP multipath active route.</li> <li>• <b>MultipathContrib</b>—The route is not active but contributes to the BGP multipath.</li> <li>• <b>Protect</b>—An egress route that is protected.</li> <li>• <b>Stale</b>—A route that is marked stale due to graceful restart.</li> </ul> |
| Primary Upstream        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                   |
| RPF Nexthops            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                               |
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                           |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MTU                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VLAN ID                 | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Cluster list            | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Originator ID           | (For route reflected output only) Address of router that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Prefixes bound to route | Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Communities             | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Layer2-info: encaps     | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| control flags           | Control flags: <b>none</b> or Site Down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| mtu                     | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Label-Base, range       | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 189: show route extensive Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>status vector</b>         | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                              |
| <b>Localpref</b>             | Local preference value included in the route.                                                                                                                                                                                                                                                                    |
| <b>Router ID</b>             | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                 |
| <b>Primary Routing Table</b> | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                      |
| <b>Secondary Tables</b>      | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                   |
| <b>Originating RIB</b>       | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix. |
| <b>Node path count</b>       | Number of nodes in the path.                                                                                                                                                                                                                                                                                     |
| <b>Forwarding nexthops</b>   | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.                                                                                                                            |

## show route flow validation

**List of Syntax** [Syntax on page 1929](#)  
[Syntax \(EX Series Switches\) on page 1929](#)

**Syntax** show route flow validation  
 <brief | detail>  
 <ip-prefix>  
 <table *table-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show route flow validation  
 <brief | detail>  
 <ip-prefix>  
 <table *table-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display flow route information.

**Options** **none**—Display flow route information.

**brief | detail**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

**ip-prefix**—(Optional) IP address for the flow route.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**table *table-name***—(Optional) Display flow route information for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the **show route flow validation inet** command).

**Required Privilege Level** view

**List of Sample Output** [show route flow validation on page 1930](#)

**Output Fields** [Table 190 on page 1929](#) lists the output fields for the **show route flow validation** command. Output fields are listed in the approximate order in which they appear.

**Table 190: show route flow validation Output Fields**

| Field Name                | Field Description                                | Level of Output |
|---------------------------|--------------------------------------------------|-----------------|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). | All levels      |
| <i>prefix</i>             | Route address.                                   | All levels      |
| Active unicast route      | Active route in the routing table.               | All levels      |

Table 190: show route flow validation Output Fields (*continued*)

| Field Name                  | Field Description                                                       | Level of Output |
|-----------------------------|-------------------------------------------------------------------------|-----------------|
| Dependent flow destinations | Number of flows for which there are routes in the routing table.        | All levels      |
| Origin                      | Source of the route flow.                                               | All levels      |
| Neighbor AS                 | Autonomous system identifier of the neighbor.                           | All levels      |
| Flow destination            | Number of entries and number of destinations that match the route flow. | All levels      |
| Unicast best match          | Destination that is the best match for the route flow.                  | All levels      |
| Flags                       | Information about the route flow.                                       | All levels      |

## Sample Output

### show route flow validation

```
user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 65001
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent
```

## show route forwarding-table

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Options **all** and **vlan** introduced in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | bridge-domain-name)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc interface-name**—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination destination-prefix**—(Optional) Destination prefix.

**family family**—(Optional) Display routing table entries for the specified family: **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name interface-name**—(Optional) Display routing table entries for the specified interface.

**label name**—(Optional) Display route entries for the specified label.

**lcc number**—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id** *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching** *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** (**default** | *logical-system-name/routing-instance-name* | *routing-instance-name*)—(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the [show route instance](#) command.

**vlan** (**all** | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn*—(Optional) Display routing table entries for a specified VPN.

**Required Privilege Level**

| Next hop Type (Type)       | <p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>discard (dscd)</b> —Discard.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcrst)</b>—Regular multicast next hop.</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b>—Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul> | <b>detail extensive</b>      |
| Index                      | Software index of the next hop that is used to route the traffic for a given prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| Route interface-index      | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| Reference (NhRef)          | Number of routes that refer to this next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive none</b> |
| Next-hop interface (Netif) | Interface used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive none</b> |
| Weight                     | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>             |
| Balance                    | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| RPF interface              | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>extensive</b>             |

### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```

so-1/1/0 {
 unit 0 {
 family inet {
 rpf-check;
 address 15.95.1.2/30;
 }
 }
}

```

```

user@host> show route forwarding-table extensive
Routing table: inet [Index 0]
Internet:
...
...
Destination: 15.95.1.3/32
Route type: destination
Route reference: 0
Route interface-index: 67

```

```

Flags: sent to PFE
Nexthop: 15.95.1.3
Next-hop type: broadcast Index: 328 Reference: 1
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0

```

## Sample Output

### show route inactive-prefix

```
user@host> show route inactive-prefix

inet.0: 14 destinations, 14 routes (13 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

127.0.0.1/32 [Direct/0] 00:04:54
> via lo0.0
```

### show route inactive-prefix detail

```
user@host> show route inactive-prefix detail

inet.0: 14 destinations, 14 routes (13 active, 0 holddown, 1 hidden)
```

```

127.0.0.1/32 (1 entry, 0 announced)
 Direct Preference: 0
 Next hop type: Interface
 Next-hop reference count: 1
 Next hop: via lo0.0, selected
 State: <Hidden Martian Int>
 Age: 4:51
 Task: IF
 AS path: I00:04:54
 > via lo0.0

```

### show route inactive-prefix extensive

The output for the **show route inactive-prefix extensive** command is identical to that of the **show route inactive-path detail** command. For sample output, see [show route inactive-prefix detail on page 1954](#).

### show route inactive-prefix terse

```
user@host> show route inactive-prefix terse
```

```
inet.0: 18 destinations, 18 routes (17 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both
```

| A Destination | P Prf | Metric 1 | Metric 2 | Next hop | AS path |
|---------------|-------|----------|----------|----------|---------|
| 127.0.0.1/32  | D 0   |          |          | >lo0.0   |         |

## show route instance

| <b>Output Fields</b>            | Table 194 on page 1968 lists the output fields for the <b>show route localization</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 194: show route localization Output Fields**

| Field Name        | Field Description                                                      |
|-------------------|------------------------------------------------------------------------|
| <b>FIB-local</b>  | FPCs configured as FIB-local.                                          |
| <b>FIB-remote</b> | FPCs configured as FIB-remote.                                         |
| <b>Normal</b>     | FPCs neither configured as <b>FIB-local</b> or <b>FIB-remote</b> .     |
| <b>Protocols</b>  | IPv4 (inet) or IPv6 (inet6) traffic configured for route localization. |

## Sample Output

```

user@R0> show route localization
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
 FIB-local: FPC2(4,5)
 FIB-remote: FPC0, FPC1
 Normal: FPC3, FPC4, FPC5, FPC6, FPC7

user@R0> show route localization detail
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
 FIB-local: FPC2(4,5)
 FIB-remote: FPC0, FPC1
 Normal: FPC3, FPC4, FPC5, FPC6, FPC7
FIB localization configuration
 Protocols: inet, inet6
 FIB-local: FPC2
 FIB-remote: FPC0, FPC1
Forwarding Engine addresses
 FPC0: 1
 FPC1: 2
 FPC2: 4, 5

```

FPC3: 6  
FPC4: 8  
FPC5: 11  
FPC6: 13  
FPC7: 15

## show route martians

**List of Syntax** [Syntax on page 1970](#)  
[Syntax \(EX Series Switches\) on page 1970](#)

**Syntax** show route martians  
<logical-system (all | *logical-system-name*)>  
<table *routing-table-name*>

**Syntax (EX Series Switches)** show route martians  
<table *routing-table-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display the martian (invalid and ignored) entries associated with each routing table.

**Options** **none**—Display standard information about route martians for all routing tables.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**table *routing-table-name***—(Optional) Display information about route martians for all routing tables whose name begins with this string (for example, **inet.0** and **inet6.0** are both displayed when you run the **show route martians table inet** command).

**Required Privilege Level** view

## Sample Output

### show route range

```
user@host> show route range
```

```
inet.0: 11 destinations, 11 routes (10 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
10.10.0.0/16 *[Static/5] 00:30:01
 > to 192.168.71.254 via fxp0.0
10.209.0.0/16 *[Static/5] 00:30:01
```

```
10.255.71.14/32 > to 192.168.71.254 via fxp0.0
 *[Direct/0] 00:30:01
 > via lo0.0
172.16.0.0/12 *[Static/5] 00:30:01
 > to 192.168.71.254 via fxp0.0
192.168.0.0/16 *[Static/5] 00:30:01
 > to 192.168.71.254 via fxp0.0
192.168.64.0/21 *[Direct/0] 00:30:01
 > via fxp0.0
192.168.71.14/32 *[Local/0] 00:30:01
 Local via fxp0.0
192.168.102.0/23 *[Static/5] 00:30:01
 > to 192.168.71.254 via fxp0.0
...
```

### show route range destination-prefix

```
user@host> show route range 192.168.0.0/16

inet.0: 11 destinations, 11 routes (10 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.0.0/16 *[Static/5] 00:31:14
 > to 192.168.71.254 via fxp0.0
192.168.64.0/21 *[Direct/0] 00:31:14
 > via fxp0.0
192.168.71.14/32 *[Local/0] 00:31:14
 Local via fxp0.0
192.168.102.0/23 *[Static/5] 00:31:14
 > to 192.168.71.254 via fxp0.0
```

### show route range detail

```
user@host> show route range detail

| <b>Output Fields</b>               | <a href="#">Table 196 on page 2002</a> describes the output fields for the <b>show route receive-protocol</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 196: show route receive-protocol Output Fields

| Field Name                                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output         |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <i>routing-table-name</i>                       | Name of the routing table—for example, inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels              |
| <i>number destinations</i>                      | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                       | All levels              |
| <i>number routes</i>                            | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                                                                                                      | All levels              |
| Prefix                                          | Destination prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                           | none <b>brief</b>       |
| MED                                             | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                      | none <b>brief</b>       |
| <i>destination-prefix</i><br>(entry, announced) | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Accepted LongLivedStale</b>                  | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                           | <b>detail extensive</b> |
| <b>Accepted LongLivedStaleImport</b>            | The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.<br><br>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table | <b>detail extensive</b> |
| <b>ImportAccepted LongLivedStaleImport</b>      | Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table<br><br>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.                                                                                                                                                                      | <b>detail extensive</b> |
| Route Distinguisher                             | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| Label-Base, range                               | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| VPN Label                                       | Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |

Table 196: show route receive-protocol Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output  |

| Next hop             | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels       |
| Localpref or Lclpref | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels       |
| AS path              | <p>Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels       |
| Cluster list         | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | detail extensive |
| Originator ID        | (For route reflected output only) Address of routing device that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | detail extensive |
| Communities          | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | detail extensive |
| AIGP                 | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | detail extensive |
| Attrset AS           | Number, local preference, and path of the AS that originated the route. These values are stored in the <b>Attrset</b> attribute at the originating routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | detail extensive |

| Release Information         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description                 | Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Options                     | <p><b>none</b>—Display standard information about all entries in the next-hop resolution database.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of output.</p> <p><b>index <i>index</i></b>—(Optional) Show the index of the resolution tree.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>prefix <i>network/destination-prefix</i></b>—(Optional) Display database entries for the specified address.</p> <p><b>table <i>routing-table-name</i></b>—(Optional) Display information about a particular routing table (for example, <b>inet.0</b>) where policy-based export is currently enabled.</p> <p><b>unresolved</b>—(Optional) Display routes that could not be resolved.</p> |
| Required Privilege Level    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Output Fields** Table 197 on page 2011 describes the output fields for the **show route resolution** command. Output fields are listed in the approximate order in which they appear.

**Table 197: show route resolution Output Fields**

| Field Name                         | Field Description                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>          | Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.                                                                                     |
| <b>Tree index</b>                  | Tree index identifier.                                                                                                                                                                                                                                                                                                                                |
| <b>Nodes</b>                       | Number of nodes in the tree.                                                                                                                                                                                                                                                                                                                          |
| <b>Reference count</b>             | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                            |
| <b>Contributing routing tables</b> | Routing tables used for next-hop resolution.                                                                                                                                                                                                                                                                                                          |
| <b>Originating RIB</b>             | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of <b>inet.0</b> resolving through <b>inet.0</b> and <b>inet.3</b> , this field indicates which routing table, <b>inet.0</b> or <b>inet.3</b> , provided the best path for a particular prefix. |
| <b>Metric</b>                      | Metric associated with the forwarding next hop.                                                                                                                                                                                                                                                                                                       |
| <b>Node path count</b>             | Number of nodes in the path.                                                                                                                                                                                                                                                                                                                          |
| <b>Forwarding next hops</b>        | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.                                                                                                                                                                 |

## Sample Output

### show route resolution detail

```

user@host> show route resolution detail

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**    Display summary statistics about the entries in the routing table.

CPU utilization might increase while the device learns routes. We recommend that you use the **show route summary** command after the device learns and enters the routes into the routing table. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the **show route summary** command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the command-line interface (CLI).

**Options**    none—Display summary statistics about the entries in the routing table.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**table *routing-table-name***—(Optional) Display summary statistics for all routing tables whose name begins with this string (for example, **inet.0** and **inet6.0** are both displayed when you run the **show route summary table inet** command). If you only want to display statistics for a specific routing table, make sure to enter the exact name of that routing table.

**Required Privilege Level**    view

**List of Sample Output**    [show route summary on page 2024](#)  
                                  [show route summary table on page 2024](#)  
                                  [show route summary table \(with Route Limits Configured for the Routing Table\) on page 2025](#)

**Output Fields**    [Table 198 on page 2022](#) lists the output fields for the **show route summary** command. Output fields are listed in the approximate order in which they appear.

**Table 198: show route summary Output Fields**

| Field Name | Field Description                    |
|------------|--------------------------------------|
| Router ID  | Address of the local routing device. |

---

Table 198: show route summary Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i> | Name of the routing table (for example, <b>inet.0</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>destinations</b>       | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>routes</b>             | <p>Number of routes in the routing table:</p> <ul style="list-style-type: none"> <li>• <b>active</b>—Number of routes that are active.</li> <li>• <b>holddown</b>—Number of routes that are in the hold-down state before being declared inactive.</li> <li>• <b>hidden</b>—Number of routes that are not used because of routing policy.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Restart complete          | <p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> <li>• <b>Pending:protocol-name</b>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li>• <b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> <p>For example, if the output shows-</p> <ul style="list-style-type: none"> <li>• <b>LDP.inet.0: 5 routes (4 active, 1 holddown, 0 hidden)</b><br/>Restart Pending: OSPF LDP VPN</li> </ul> <p>This indicates that <b>OSPF</b>, <b>LDP</b>, and <b>VPN</b> protocols did not restart for <b>LDP.inet.0</b> routing table.</p> <ul style="list-style-type: none"> <li>• <b>vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)</b><br/>Restart Complete</li> </ul> <p>This indicates that all protocols have restarted for <b>vpls_1.l2vpn.0</b> routing table.</p> |
| <b>Limit/Threshold</b>    | <p>Displays the configured route limits for the routing table set with the <i>maximum-prefixes</i> and the <i>maximum-paths</i> statements. | <i>protocol-name</i>      | Name of the protocol from which the route was learned. For example, <b>OSPF</b> , <b>RSVP</b> , and <b>Static</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Sample Output

### show route summary

```
user@host> show route summary
Autonomous system number: 69
Router ID: 10.255.71.52
Maximum-ECMP: 32
inet.0: 24 destinations, 25 routes (23 active, 0 holddown, 1 hidden)
Restart Complete
 Direct: 6 routes, 5 active
 Local: 4 routes, 4 active
 OSPF: 5 routes, 4 active
 Static: 7 routes, 7 active
 IGMP: 1 routes, 1 active
 PIM: 2 routes, 2 active

inet.3: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
Restart Complete
 RSVP: 2 routes, 2 active

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
Restart Complete
 Direct: 1 routes, 1 active

mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
 MPLS: 3 routes, 3 active
 VPLS: 4 routes, 2 active

inet6.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
Restart Complete
 Direct: 2 routes, 2 active
 PIM: 2 routes, 2 active
 MLD: 1 routes, 1 active

green.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
 BGP: 2 routes, 2 active
 L2VPN: 2 routes, 2 active

red.l2vpn.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
Restart Complete
 BGP: 2 routes, 2 active
 L2VPN: 1 routes, 1 active

bgp.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
 BGP: 4 routes, 4 active
```

### show route summary table

```
user@host> show route summary table inet
Router ID: 192.168.0.1

inet.0: 32 destinations, 34 routes (31 active, 0 holddown, 1 hidden)
 Direct: 6 routes, 5 active
 Local: 9 routes, 9 active
 OSPF: 3 routes, 1 active
 Static: 13 routes, 13 active
 IGMP: 1 routes, 1 active
```

```

PIM: 2 routes, 2 active

inet.1: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
Multicast: 1 routes, 1 active

inet6.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
Local: 1 routes, 1 active
PIM: 2 routes, 2 active

inet6.1: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
Multicast: 1 routes, 1 active
```

#### show route summary table (with Route Limits Configured for the Routing Table)

```

user@host> show route summary table VPN-A.inet.0
Autonomous system number: 100
Router ID: 10.255.182.142

VPN-A.inet.0: 13 destinations, 14 routes (13 active, 0 holddown, 0 hidden)
Limit/Threshold: 2000/200 destinations 20/12 routes

**Output Fields** [Table 180 on page 1853](#) describes the output fields for the **show route table** command. Output fields are listed in the approximate order in which they appear.

**Table 199: show route table Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Restart complete           | <p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> <li>• <b>Pending:</b><i>protocol-name</i>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li>• <b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> <p>For example, if the output shows-</p> <ul style="list-style-type: none"> <li>• LDP.inet.0 : 5 routes (4 active, 1 holddown, 0 hidden)<br/>Restart Pending: OSPF LDP VPN</li> </ul> <p>This indicates that <b>OSPF</b>, <b>LDP</b>, and <b>VPN</b> protocols did not restart for <b>LDP.inet.0</b> routing table.</p> <ul style="list-style-type: none"> <li>• vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)<br/>Restart Complete</li> </ul> <p>This indicates that all protocols have restarted for <b>vpls_1.l2vpn.0</b> routing table.</p> |
| <i>number</i> destinations | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>number</i> routes       | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 199: show route table Output Fields (*continued*)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> <li>• <b>inclusive multicast Ethernet tag route</b>—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384): <ul style="list-style-type: none"> <li>• <b>route distinguisher</b>—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.</li> <li>• <b>Ethernet tag ID</b>—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.</li> <li>• <b>IP address length</b>—(1 octet) Length of IP address in bits.</li> <li>• <b>originating router's IP address</b>—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.</li> </ul> </li> </ul> |
| label stacking                                 | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| [ <i>protocol, preference</i> ]                | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 199: show route table Output Fields (*continued*)

| Field Name                                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Level                                         | (IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Route Distinguisher                           | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PMSI                                          | Provider multicast service interface (MVPN routing table).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Next-hop type                                 | Type of next hop. For a description of possible values for this field, see <a href="#">Table 184 on page 1892</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Next-hop reference count                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Flood nexthop branches exceed maximum message | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Source                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Next hop                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| via                                           | Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b> . This field can also contain the following information: <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| Label-switched-path <i>lsp-path-name</i>      | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Label operation                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Interface                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Protocol next hop                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Indirect next hop                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| State                                         | State of the route (a route can be in more than one state). See <a href="#">Table 185 on page 1894</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 199: show route table Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Local AS          | AS number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Age               | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AIGP              | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Metric $n$        | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MED-plus-IGP      | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TTL-Action        | For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Task              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Announcement bits | <p>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the KRT for installing the route into the Packet Forwarding Engine, to a resolve tree, a L2 VC, or even a VPN. For example, <b><math>n</math>-Resolve inet</b> indicates that the specified route is used for route resolution for next hops found in the routing table.</p> <ul style="list-style-type: none"> <li><math>n</math>—An index used by Juniper Networks customer support only.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AS path           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li><b>I</b>—IGP.</li> <li><b>E</b>—EGP.</li> <li><b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li><b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li><b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li><b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li><b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li><b>( )</b>—Parentheses enclose a confederation.</li> <li><b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |

Table 199: show route table Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| validation-state        | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| FECs bound to route     | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Primary Upstream        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RPF Nexthops            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MTU                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VLAN ID                 | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Prefixes bound to route | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Communities             | Community path attribute for the route. | Accepted Multipath                  | Current active path when BGP multipath is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Accepted LongLivedStale             | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                                  |
| Accepted LongLivedStaleImport       | <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p> |
| ImportAccepted LongLivedStaleImport | <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>                                                                                                                                                                       |
| Accepted MultipathContrib           | Path currently contributing to BGP multipath.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Localpref                           | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Router ID                           | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Primary Routing Table               | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                           |
| Secondary Tables                    | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                        |

[Table 184 on page 1892](#) describes all possible values for the Next-hop Types output field.

Table 200: Next-hop Types Output Field Values

| Next-Hop Type     | Description                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Broadcast (bcast) | Broadcast next hop.                                                                                                                                                                                                                                                            |
| Deny              | Deny next hop.                                                                                                                                                                                                                                                                 |
| Discard           | Discard next hop.                                                                                                                                                                                                                                                              |
| Flood             | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |

Table 200: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type            | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hold                     | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                                                                                                                                                                                                       |
| Indexed (idxd)           | Indexed next hop.                                                                                                                                                                                                                                                                                                                                                                                          |
| Indirect (indr)          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                                                                                                                                               |
| Interface                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.                                                                                                                                                                                                                                               |
| Local (locl)             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                                                                                                                                                     |
| Multicast (mcst)         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                                                                                                                                              |
| Multicast discard (mdsc) | Multicast discard.                                                                                                                                                                                                                                                                                                                                                                                         |
| Multicast group (mgrp)   | Multicast group member.                                                                                                                                                                                                                                                                                                                                                                                    |
| Receive (recv)           | Receive.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Reject (rjct)            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                                                                                                                                             |
| Resolve (rslv)           | Resolving next hop.                                                                                                                                                                                                                                                                                                                                                                                        |
| Routed multicast (mcrtr) | Regular multicast next hop.                                                                                                                                                                                                                                                                                                                                                                                |
| Router                   | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| Table                    | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                    |
| Unicast (ucst)           | Unicast.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Unilist (ulst)           | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.                                                                                                                                                                                                                                                                                                                |

Table 185 on page 1894 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

**Table 201: State Output Field Values**

| Value                                       | Description                                                                                                                                                                          |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accounting                                  | Route needs accounting.                                                                                                                                                              |
| Active                                      | Route is active.                                                                                                                                                                     |
| Always Compare MED                          | Path with a lower multiple exit discriminator (MED) is available.                                                                                                                    |
| AS path                                     | Shorter AS path is available.                                                                                                                                                        |
| Cisco Non-deterministic MED selection       | Cisco nondeterministic MED is enabled, and a path with a lower MED is available.                                                                                                     |
| Clone                                       | Route is a clone.                                                                                                                                                                    |
| Cluster list length                         | Length of cluster list sent by the route reflector.                                                                                                                                  |
| Delete                                      | Route has been deleted.                                                                                                                                                              |
| Ex                                          | Exterior route.                                                                                                                                                                      |
| Ext                                         | BGP route received from an external BGP neighbor.                                                                                                                                    |
| FlashAll                                    | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| Hidden                                      | Route not used because of routing policy.                                                                                                                                            |
| IfCheck                                     | Route needs forwarding RPF check.                                                                                                                                                    |
| IGP metric                                  | Path through next hop with lower IGP metric is available.                                                                                                                            |
| Inactive reason                             | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| Initial                                     | Route being added.                                                                                                                                                                   |
| Int                                         | Interior route.                                                                                                                                                                      |
| Int Ext                                     | BGP route received from an internal BGP peer or a BGP confederation peer.                                                                                                            |
| Interior > Exterior > Exterior via Interior | Direct, static, IGP, or EBGp path is available.                                                                                                                                      |

Table 201: State Output Field Values (*continued*)

| Value                          | Description                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Preference               | Path with a higher local preference value is available.                                                                                                                                                                           |
| Martian                        | Route is a martian (ignored because it is obviously invalid).                                                                                                                                                                     |
| MartianOK                      | Route exempt from martian filtering.                                                                                                                                                                                              |
| Next hop address               | Path with lower metric next hop is available.                                                                                                                                                                                     |
| No difference                  | Path from neighbor with lower IP address is available.                                                                                                                                                                            |
| NoReadvrt                      | Route not to be advertised.                                                                                                                                                                                                       |
| NotBest                        | Route not chosen because it does not have the lowest MED.                                                                                                                                                                         |
| Not Best in its group          | Incoming BGP AS is not the best of a group (only one AS can be the best).                                                                                                                                                         |
| NotInstall                     | Route not to be installed in the forwarding table.                                                                                                                                                                                |
| Number of gateways             | Path with a greater number of next hops is available.                                                                                                                                                                             |
| Origin                         | Path with a lower origin code is available.                                                                                                                                                                                       |
| Pending                        | Route pending because of a hold-down configured on another route.                                                                                                                                                                 |
| Release                        | Route scheduled for release.                                                                                                                                                                                                      |
| RIB preference                 | Route from a higher-numbered routing table is available.                                                                                                                                                                          |
| Route Distinguisher            | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                            |
| Route Metric or MED comparison | Route with a lower metric or MED is available.                                                                                                                                                                                    |
| Route Preference               | Route with lower preference value is available.                                                                                                                                                                                   |
| Router ID                      | Path through a neighbor with lower ID is available.                                                                                                                                                                               |
| Secondary                      | Route not a primary route.                                                                                                                                                                                                        |
| Unusable path                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| Update source                  | Last tiebreaker is the lowest IP address value.                                                                                                                                                                                   |

Table 186 on page 1896 describes the possible values for the Communities output field.

Table 202: Communities Output Field Values

| Value                                                   | Description                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                        |
| <b>bandwidth: local AS number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute. |
| <b>domain-id</b>                                        | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                           |
| <b>domain-id-vendor</b>                                 | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                   |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).                                                                                                                                                                                                               |
| <i>local AS number</i>                                  | Local AS number: from 1 through 65,535.                                                                                                                                                                                                                                               |
| <i>options</i>                                          | 1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                     |
| <b>origin</b>                                           | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                                                |
| <i>ospf-route-type</i>                                  | 1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.                                 |
| <b>route-type-vendor</b>                                | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000. The format is <b>area-number:ospf-route-type:options</b> .                                                                                  |
| <b>rte-type</b>                                         | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306. The format is <b>area-number:ospf-route-type:options</b> .                                                                                  |
| <b>target</b>                                           | Defines which VPN the route participates in; <b>target</b> has the format <b>32-bit IP address:16-bit number</b> . For example, 10.19.0.0:100.                                                                                                                                        |
| <b>unknown IANA</b>                                     | Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                     |
| <b>unknown OSPF vendor community</b>                    | Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                               |

## Sample Output

### show route table bgp.l2vpn

```
user@host> show route table bgp.l2vpn
bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.24.1:1:4:1/96
 *[BGP/170] 01:08:58, localpref 100, from 192.168.24.1
 AS path: I
 > to 10.0.16.2 via fe-0/0/1.0, label-switched-path am
```

### show route table bgp.l3vpn.0

```
user@host> show route table bgp.l3vpn.0
bgp.l3vpn.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.71.15:100:10.255.71.17/32
 *[BGP/170] 00:03:59, MED 1, localpref 100, from
10.255.71.15
 AS path: I
 > via so-2/1/0.0, Push 100020, Push 100011(top)
10.255.71.15:200:10.255.71.18/32
 *[BGP/170] 00:03:59, MED 1, localpref 100, from
10.255.71.15
 AS path: I
 > via so-2/1/0.0, Push 100021, Push 100011(top)
```

### show route table bgp.l3vpn.0 detail

```
user@host> show route table bgp.l3vpn.0 detail
bgp.l3vpn.0: 8 destinations, 8 routes (8 active, 0 holddown, 0 hidden)

### show route table mpls.0 (RSVP Route—Transit LSP)

In the sample output, the 1 in [RSVP/7/1] indicates the secondary preference value. The secondary preference value becomes significant when multiple RSVP LSPs of different types are signaled to the destination. The possible values of RSVP secondary preferences are:

1—Normal Point-to-Point RSVP-TE LSP

2—Point-to-Multipoint (P2MP) RSVP-TE LSP

3—Dynamic RSVP-TE LSP

```

### show route table MVPN.mvpn.0

Starting in Junos OS Release 15.1, multicast routes on the locally originated type 7 customer multicast routes are added exclusively by PIM. The functionality of the BGP-MVPN service (which, internally, depends on contributions of state from both the MVPN and PIM protocol components of Junos OS) remains unchanged. MVPN, however, no longer appears as the originator of the locally advertised route. Routes advertised by remote PEs are, as usual, always learned locally from their respective [BGP/...] protocol.

```

user@host> show route table MVPN.mvpn.0
MVPN.mvpn.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

## show route terse

**List of Syntax** [Syntax on page 2054](#)  
[Syntax \(EX Series Switches\) on page 2054](#)

**Syntax** show route terse  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show route terse

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display a high-level summary of the routes in the routing table.

**NOTE:** For BGP routes, the **show route terse** command displays the local preference attribute and MED instead of metric1 and metric2 values. This is mostly due to historical reasons.

To display the metric1 and metric2 value of a BGP route, use the [show route extensive](#) command.

**Options** none—Display a high-level summary of the routes in the routing table.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show route terse on page 2056](#)

**Output Fields** [Table 203 on page 2054](#) describes the output fields for the **show route terse** command. Output fields are listed in the approximate order in which they appear.

**Table 203: show route terse Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, <b>inet.0</b> ).                                                                                                                                                                                                                                                                                                        |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                         |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 203: show route terse Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route key</i>   | <p>Key for the state of the route:</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul>                                                                                                                   |
| <b>A</b>           | Active route. An asterisk (*) indicates this is the active route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Destination</b> | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>P</b>           | <p>Protocol through which the route was learned:</p> <ul style="list-style-type: none"> <li>• <b>A</b>—Aggregate</li> <li>• <b>B</b>—BGP</li> <li>• <b>C</b>—CCC</li> <li>• <b>D</b>—Direct</li> <li>• <b>G</b>—GMPLS</li> <li>• <b>I</b>—IS-IS</li> <li>• <b>L</b>—L2CKT, L2VPN, LDP, Local</li> <li>• <b>K</b>—Kernel</li> <li>• <b>M</b>—MPLS, MSDP</li> <li>• <b>O</b>—OSPF</li> <li>• <b>P</b>—PIM</li> <li>• <b>R</b>—RIP, RIPng</li> <li>• <b>S</b>—Static</li> <li>• <b>T</b>—Tunnel</li> </ul>                                                                                        |
| <b>Prf</b>         | <p>Preference value of the route. In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> |
| <b>Metric 1</b>    | First metric value in the route. For routes learned from BGP, this is the MED metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Metric 2</b>    | Second metric value in the route. For routes learned from BGP, this is the IGP metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Next hop</b>    | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>AS path</b>     | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul>                                                                                                                                                                                                          |

## Sample Output

### show route terse

```
user@host> show route terse

Table 204: show rip general-statistics Output Fields

| Field Name  | Field Description                                      |
|-------------|--------------------------------------------------------|
| bad msgs    | Number of invalid messages received.                   |
| no rcv intf | Number of packets received with no matching interface. |
| curr memory | Amount of memory currently used by RIP.                |
| max memory  | Most memory used by RIP.                               |

## Sample Output

### show rip general-statistics

```
user@host> show rip general-statistics
```

```
RIPv2 I/O info:
 bad msgs : 0
 no recv intf : 0
 curr memory : 0
 max memory : 0
```

## show rip neighbor

---

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                              |

Table 205: show rip neighbor Output Fields

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Neighbor</b>            | Name of the RIP neighbor.<br><br><b>NOTE:</b> Beginning with Junos OS Release 11.1, when you configure demand circuits, the output displays a demand circuit (DC) flag next to neighbor interfaces configured for demand circuits.<br><br>If you configure demand circuits at the <b>[edit protocols rip group group-name neighbor neighbor-name]</b> hierarchy level, the output shows only the neighboring interface that you specifically configured as a demand circuit. If you configure demand circuits at the <b>[edit protocols rip group group-name]</b> hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits. |
| <b>State</b>               | State of the connection: <b>Up</b> or <b>Dn</b> (Down).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 207: show ripng general-statistics Output Fields**

| Field Name  | Field Description                                      |
|-------------|--------------------------------------------------------|
| bad msgs    | Number of invalid messages received.                   |
| no rcv intf | Number of packets received with no matching interface. |
| curr memory | Amount of memory currently used by RIPng.              |
| max memory  | Most memory used by RIPng.                             |

## Sample Output

### show ripng general-statistics

```

user@host> show ripng general-statistics
RIPng I/O info:
 bad msgs : 0
 no rcv intf : 0

```

```
curr memory : 0
max memory : 0
```

## show ripng neighbor

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Clear statistics about configured firewall filters.</p> <p>When you clear the counters of a filter, this impacts not only the counters shown by the CLI, but also the ones tracked by SNMP2.</p> <p>Subscriber management uses firewall filters to capture and report the volume-based service accounting counters that are used for subscriber billing. The <b>clear firewall</b> command also clears the service accounting counters that are reported to the RADIUS accounting server. For this reason, you must be cautious in specifying which firewall statistics you want to clear.</p>                                                                                                                                 |
| <div>  <p><b>NOTE:</b> The <b>clear firewall</b> command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover (GRES).</p> </div>                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p>If you clear statistics for firewall filters that are applied to Trio-based DPCs and that also use the <b>prefix-action</b> action on matched packets, wait at least 5 seconds before you enter the <b>show firewall prefix-action-stats</b> command. A 5-second pause between issuing the <b>clear firewall</b> and <b>show firewall prefix-action-stats</b> commands avoids a possible timeout of the <b>show firewall prefix-action-stats</b> command.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p><b>all</b>—Clear the packet and byte counts for all filters. On EX Series switches, this option also clears the packet counts for all policer counters.</p> <p><b>counter <i>counter-name</i></b>—Clear the packet and byte counts for a filter counter that has been configured with the counter firewall filter action.</p> <p><b>filter <i>filter-name</i></b>—Clear the packet and byte counts for the specified firewall filter.</p> <p><b>log (all   <i>logical-system-name</i>)</b>—Clear log entries for IPv4 firewall filters that have <b>then log</b> as an action. Use <b>log all</b> to clear all log entries or <b>log <i>logical-system-name</i></b> to clear log entries for the specified logical system.</p> |

**logical-system** *logical-system-name*—Clear the packet and byte counts for the specified logical system.

**policer counter** (**all** | **counter-id** *counter-index*)—(EX8200 switches only) Clear all policer counters using the **policer counter all** command, or clear a specific policer counter using the **policer counter counter-id** *counter-index* command. The value of *counter-index* can be 0, 1, or 2.

**Required Privilege Level**

                          [Syntax \(EX Series Switches\) on page 2080](#)

**Syntax**   `show firewall`  
              `<counter counter-name>`  
              `<detail>`  
              `<filter filter-name>`  
              `<log>`  
              `<logical-system (all | logical-system-name)>`  
              `<terse>`

**Syntax (EX Series Switches)**   `show firewall`  
                                      `<counter counter-name>`  
                                      `<detail>`  
                                      `<filter filter-name>`  
                                      `<log <(detail | interface interface-name)>>`  
                                      `<policer counters <(detail | counter-id counter-index <detail>)>>`  
                                      `<terse>`

**Release Information**   Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Option **logical-system** introduced in Junos OS Release 9.3.  
                              Option **terse** introduced in Junos OS Release 9.4.  
                              Option **policer counters** introduced in Junos OS Release 12.2 for EX Series switches.  
                              Option **detail** introduced in Junos OS Release 12.3 for MX Series switches.

**Description**   Display enhanced statistics and counters for all configured firewall filters.

**Options**   **none**—(Optional) Display statistics and counters for all configured firewall filters and counters. For EX Series switches, this command also displays statistics about all configured policers.

**counter *counter-name***—(Optional) Name of a filter counter.

**detail**—(Optional) Display firewall filter statistics and enhanced policer statistics and counters.

**filter *filter-name***—(Optional) Name of a configured filter.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**log**—(Optional) Display log entries for firewall filters.

**log <(detail | interface *interface-name*)>**—(EX Series switches only) (Optional) Display detailed log entries of firewall activity or log information about a specific interface.

**policer counters <(detail | counter-id *counter-index* <detail>)>**—(EX8200 switches only) (Optional) Display enhanced policer counter statistics in brief or in detail.

**terse**—(Optional) Display firewall filter names only.

**Output Fields** [Table 210 on page 2081](#) lists the output fields for the **show firewall** command. Output fields are listed in the approximate order in which they appear.

**Table 210: show firewall Output Fields**

| Field Name    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Filter</b> | <p>Name of a filter that has been configured with the <b>filter</b> statement at the <b>[edit firewall]</b> hierarchy level.</p> <p>Except on EX Series switches:</p> <ul style="list-style-type: none"> <li>• When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either <b>-i</b> for an input filter or <b>-o</b> for an output filter.</li> <li>• When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either <b>-in</b> for an input filter or <b>-out</b> for an output filter. When a logical system-specific filter is displayed, the name of the filter is prefixed with two underscore (__) characters and the name of the logical system (for example, __ls1/filter1).</li> <li>• When a service filter is displayed that uses a service set, the separator between the service-set name and the service-filter name is a semicolon (;).</li> </ul> <p><b>NOTE:</b> For <b>bridge family filter</b>, the <b>ip-protocol</b> match criteria is supported only for IPv4 and not for IPv6. This is applicable for line cards that support the Junos Trio chipset, such as the MX 3D MPC line cards.</p> |

Table 210: show firewall Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Counters</b>              | <p>Display filter counter information:</p> <ul style="list-style-type: none"> <li>• <b>Name</b>—Name of a filter counter that has been configured with the <b>counter</b> firewall filter action.</li> <li>• <b>Bytes</b>—Number of bytes that match the filter term under which the <b>counter</b> action is specified.</li> <li>• <b>Packets</b>—Number of packets that matched the filter term under which the <b>counter</b> action is specified.</li> </ul> <p><b>NOTE:</b> On M and T Series routers, firewall filters cannot count <b>ip-options</b> packets on a per option type and per interface basis. A limited work around is to use the <b>show pfe statistics ip options</b> command to see <b>ip-options</b> statistics on a per Packet Forwarding Engine (PFE) basis. See <i>show pfe statistics ip</i> for sample output.</p> |
| <b>Policers</b>              | <p>Display policer information:</p> <ul style="list-style-type: none"> <li>• <b>Name</b>—Name of policer.</li> <li>• <b>Bytes</b>—(For two-color policers on MX Series routers and EX Series switches, and for hierarchical policers on interfaces hosted on MICs and MPCs in MX Series routers) Number of bytes that match the filter term under which the policer action is specified. This is only the number out-of-specification (out-of-spec) byte counts, not all the bytes in all packets policed by the policer.<br/>For other platforms, this field is blank.</li> <li>• <b>Packets</b>—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.</li> </ul>                   |
| <b>Policer Counter Index</b> | (EX8200 switch only) Global management counter ID. The counter ID value ( <i>counter-index</i> ) can be 0, 1, or 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Green</b>                 | (EX8200 switch only) Number of packets within the limits. The number of packets is smaller than the committed information rate (CIR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Yellow</b>                | (EX8200 switch only) Number of packets partially within the limits. The number of packets is greater than the CIR, but the burst size is within the excess burst size (EBS) limit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Discard</b>               | (EX8200 switch only) Number of discarded packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Bytes</b>                 | (EX8200 switch only) Number of green, yellow, red, or discarded packets in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Packets</b>               | (EX8200 switch only) Number of green, yellow, red, or discarded packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Filter name</b>           | (EX8200 switch only) Name of the filter with a term associated to a policer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Term name</b>             | (EX8200 switch only) Name of the term associated with a policer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Policer name</b>          | (EX8200 switch only) Name of the policer that is associated with a global management counter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 210: show firewall Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## show firewall filter version

|                                 |                                                                                                                                                                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show firewall filter version <filter-name>                                                                                                                                                                                                                         |
| <b>Release Information</b>      | Command introduced in Junos OS Release 10.2R2.                                                                                                                                                                                                                     |
| <b>Description</b>              | Display the version number of the installed firewall filter in the Routing Engine.                                                                                                                                                                                 |
| <b>Options</b>                  | none—(Optional) Display the version number of all installed firewall filters.<br><br>filter-name—(Optional) Name of a configured filter. If you specify the name of a filter, only the version number of that filter is displayed.                                 |
| <b>Additional Information</b>   | The initial version number is 1. This number increments by one when you modify the firewall filter settings or an associated prefix action. The maximum version number is 4,294,967,295. When the version number reaches 4,294,967,295, this number is reset to 1. |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                               |

For any traffic that reaches the Routing Engine, the packets hit the <b>log</b> action in the kernel.</li> <li>For all other logged packets (packet hit the filter's <b>log</b> action in the Packet Forwarding Engine), this field displays <b>pfe</b> instead of a configured filter name.</li> </ul> |

Table 212: show firewall log Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Filter Action       | Filter action: <ul style="list-style-type: none"> <li>• <b>A</b>—Accept</li> <li>• <b>D</b>—Discard</li> <li>• <b>R</b>—Reject</li> </ul>                                                                                                                                                                                                                     |
| Name of Interface   | <ul style="list-style-type: none"> <li>• Displays a physical interface name if the packet arrived at a port on a line card.</li> <li>• Displays <b>local</b> if the packet was generated by the device's internal Ethernet interface, <b>em1</b> or <b>fxp1</b>, which connects the Routing Engine with the router's packet-forwarding components.</li> </ul> |
| Name of protocol    | Packet's protocol name: <b>egp</b> , <b>gre</b> , <b>icmp</b> , <b>ipip</b> , <b>ospf</b> , <b>pim</b> , <b>rsvp</b> , <b>tcp</b> , or <b>udp</b> .                                                                                                                                                                                                           |
| Packet length       | Length of the packet.                                                                                                                                                                                                                                                                                                                                         |
| Source address      | Packet's source address.                                                                                                                                                                                                                                                                                                                                      |
| Destination address | Packet's destination address and port.                                                                                                                                                                                                                                                                                                                        |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 213: show firewall prefix-action-stats Output Fields

| Field Name    | Field Description                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Filter</b> | Filter name.<br><br>Filters configured for logical systems include the name of the filter prefixed with the two underscore characters (__) and the name of the logical system (for example, __ls1/filter1). |

## Sample Output

The following sample output assumes that the policer *act1* is in term mode and that there is a term named *term1* configured in the firewall filter *test*.

### show firewall prefix-action-stats

```

user@host> show firewall prefix-action-stats filter test prefix-action act1-term1 from 0 to 9
Filter: test
Counters:
Name Bytes Packets
act1-0 0 0
act1-1 0 0
act1-2 0 0
act1-3 0 0
act1-4 0 0
act1-5 0 0
act1-6 0 0
act1-7 0 0
act1-8 0 0
act1-9 0 0
Policers:
Name Bytes Packets
act1-0 0 0
act1-1 0 0
act1-2 0 0
act1-3 0 0
act1-4 0 0
act1-5 0 0
act1-6 0 0
act1-7 0 0
act1-8 0 0
act1-9 0 0

```

## show firewall templates-in-use

## Sample Output

### show bridge domain

```
user@host> show bridge domain
Instance Primary Table Bridging Domain Type Active
vs1 bridge.0 vlan100 bridge 2
vs1 bridge.0 vlan200 bridge 0
```

### show bridge domain brief

```
user@host> show bridge domain brief
Instance Primary Table Bridging Domain Type Active
vs1 bridge.0 vlan100 bridge 2
vs1 bridge.0 vlan200 bridge 0
```

### show bridge domain detail

```
user@host> show bridge domain detail
```

```

| <b>Description</b>              | (MX Series routers only) Display Layer 2 media access control (MAC) address information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <b>none</b> —Display all learned Layer 2 MAC address information.<br><br><b>brief   count   detail   extensive</b> —(Optional) Display the specified level of output.<br><br><b>bridge-domain (all   <i>bridge-domain-name</i>)</b> —(Optional) Display learned Layer 2 MAC addresses for all bridging domains or for the specified bridging domain.<br><br><b>global-count</b> —(Optional) Display the total number of learned Layer 2 MAC addresses on the system.<br><br><b>instance <i>instance-name</i></b> —(Optional) Display learned Layer 2 MAC addresses for the specified routing instance.<br><br><b>interface <i>interface-name</i></b> —(Optional) Display learned Layer 2 MAC addresses for the specified interface.<br><br><b>mac-address</b> —(Optional) Display the specified learned Layer 2 MAC address information.<br><br><b>vlan-id (all-vlan   <i>vlan-id</i>)</b> —(Optional) Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN. |
| <b>Additional Information</b>   | When Layer 2 protocol tunneling is enabled, the tunneling MAC address 01:00:0c:cd:cd:d0 is installed in the MAC table. When the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunk Protocol (VTP) is configured for Layer 2 protocol tunneling on an interface, the corresponding protocol MAC address is installed in the MAC table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Output Fields** Table 216 on page 2113 describes the output fields for the **show bridge mac-table** command. Output fields are listed in the approximate order in which they appear.

**Table 216: show bridge mac-table Output Fields**

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Routing instance   | Name of the routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Bridging domain    | Name of the bridging domain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MAC address        | MAC address or addresses learned on a logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MAC flags          | Status of MAC address learning properties for each interface: <ul style="list-style-type: none"> <li>• <b>S</b>—Static MAC address is configured.</li> <li>• <b>D</b>—Dynamic MAC address is configured.</li> <li>• <b>L</b>—Locally learned MAC address is configured.</li> <li>• <b>C</b>—Control MAC address is configured.</li> <li>• <b>SE</b>—MAC accounting is enabled.</li> <li>• <b>NM</b>—Non-configured MAC.</li> <li>• <b>R</b>—Remote PE MAC address is configured.</li> </ul> |
| Logical interface  | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| MAC count          | Number of MAC addresses learned on the specific routing instance or interface.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Learning interface | Name of the logical interface on which the MAC address was learned.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Learning VLAN      | VLAN ID of the routing instance or bridge domain in which the MAC address was learned.                                                                                                                                                                                                                                                                                                                                                                                                      |
| VXLAN ID/VXLAN     | VXLAN Network Identifier (VNI).                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Layer 2 flags      | Debugging flags signifying that the MAC address is present in various lists.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Epoch              | Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.                                                                                                                                                                                                                                                                                                                                                                                       |
| Sequence number    | Sequence number assigned to this MAC address. Used for debugging.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Learning mask      | Mask of the Packet Forwarding Engines where this MAC address was learned. Used for debugging.                                                                                                                                                                                                                                                                                                                                                                                               |
| IPC generation     | Creation time of the logical interface when this MAC address was learned. Used for debugging.                                                                                                                                                                                                                                                                                                                                                                                               |

## Sample Output

### show bridge mac-table

```
user@host> show bridge mac-table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned, C -Control MAC
 SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

Routing instance : default-switch
Bridging domain : test1, VLAN : 1

```

| MAC address       | MAC flags | Logical interface | NH Index | RTR ID |
|-------------------|-----------|-------------------|----------|--------|
| 01:00:0c:cc:cc:cc | S,NM      | NULL              |          |        |
| 01:00:0c:cc:cc:cd | S,NM      | NULL              |          |        |
| 01:00:0c:cd:cd:d0 | S,NM      | NULL              |          |        |
| 64:87:88:6a:17:d0 | D         | ae0.1             |          |        |
| 64:87:88:6a:17:f0 | D         | ae0.1             |          |        |

### show bridge mac-table (with Layer 2 Services over GRE Interfaces)

```
user@host> show bridge mac-table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned
 SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

Routing instance : default-switch
Bridging domain : vlan-1, VLAN : 1

```

| MAC address       | MAC flags | Logical interface |
|-------------------|-----------|-------------------|
| 00:01:01:00:01:f7 | D,SE      | gr-1/2/10.0       |
| 00:03:00:32:01:f7 | D,SE      | gr-1/2/10.0       |
| 00:00:21:11:11:10 | DL        | ge-1/0/0.0        |
| 00:00:21:11:11:11 | DL        | ge-1/1/0.0        |

```
Routing instance : default-switch
Bridging domain : vlan-2, VLAN : 2

```

| MAC address       | MAC flags | Logical interface |
|-------------------|-----------|-------------------|
| 00:02:01:33:01:f7 | D,SE      | gr-1/2/10.1       |
| 00:00:21:11:21:10 | DL        | ge-1/0/0.1        |
| 00:00:21:11:21:11 | DL        | ge-1/1/0.1        |

### show bridge mac-table (with VXLAN Enabled)

```
user@host> show bridge mac-table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned
 SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

Routing instance : default-switch
Bridging domain : vlan-1, VLAN : 1
VXLAN: Id : 100, Multicast group: 226.1.1.1

```

| MAC address       | MAC flags | Logical interface |
|-------------------|-----------|-------------------|
| 00:01:01:00:01:f7 | D,SE      | vtep.1052010      |
| 00:03:00:32:01:f7 | D,SE      | vtep.1052011      |
| 00:00:21:11:11:10 | DL        | ge-1/0/0.0        |
| 00:00:21:11:11:11 | DL        | ge-1/1/0.0        |

```

Routing instance : default-switch
Bridging domain : vlan-2, VLAN : 2, VXLAN : 200
VXLAN: Id : 200, Multicast group: 226.1.1.2
MAC MAC Logical
address flags interface
00:02:01:33:01:f7 D,SE vtep.1052010
00:04:00:14:01:f7 D,SE vtep.1052011
00:00:21:11:21:10 DL ge-1/0/0.1
00:00:21:11:21:11 DL ge-1/1/0.1

```

### show bridge mac-table count

```

user@host> show bridge mac-table count
2 MAC address learned in routing instance vs1 bridge domain vlan100

```

MAC address count per interface within routing instance:

| Logical interface | MAC count |
|-------------------|-----------|
| ge-11/0/3.0       | 1         |
| ge-11/1/4.100     | 0         |
| ge-11/1/1.100     | 0         |
| ge-11/1/0.100     | 0         |
| xe-10/2/0.100     | 1         |
| xe-10/0/0.100     | 0         |

MAC address count per learn VLAN within routing instance:

| Learn VLAN ID | MAC count |
|---------------|-----------|
| 0             | 2         |

```

0 MAC address learned in routing instance vs1 bridge domain vlan200

```

MAC address count per interface within routing instance:

| Logical interface | MAC count |
|-------------------|-----------|
| ge-11/1/0.200     | 0         |
| ge-11/1/1.200     | 0         |
| ge-11/1/4.200     | 0         |
| xe-10/0/0.200     | 0         |
| xe-10/2/0.200     | 0         |

MAC address count per learn VLAN within routing instance:

| Learn VLAN ID | MAC count |
|---------------|-----------|
| 0             | 0         |

### show bridge mac-table detail

```

user@host> show bridge mac-table detail
MAC address: 00:00:00:19:1c:db
Routing instance: vs1
Bridging domain: vlan100
Learning interface: ge-11/0/3.0 Learning VLAN: 0
Layer 2 flags: in_ifd, in_ifl, in_vlan, kernel
Epoch: 4 Sequence number: 0
Learning mask: 0x800 IPC generation: 0

MAC address: 00:00:00:59:3a:2f
Routing instance: vs1
Bridging domain: vlan100
Learning interface: xe-10/2/0.100 Learning VLAN: 0
Layer 2 flags: in_ifd, in_ifl, in_vlan, kernel
Epoch: 7 Sequence number: 0
Learning mask: 0x400 IPC generation: 0

```

**show bridge mac-table instance pbb-evpn**

```
user@host> show bridge mac-table instance pbb-evpn
Routing instance : pbb-evpn

| <b>Output Fields</b>            | <a href="#">Table 217 on page 2120</a> describes the output fields for the <b>show l2-learning global-information</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 217: show l2-learning global-information Output Fields**

| Field Name                    | Field Description                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MAC aging interval</b>     | Configured timeout interval, in seconds, for all MAC table entries.                                                                                                                |
| <b>MAC learning</b>           | Status of MAC learning: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                        |
| <b>MAC statistics</b>         | Status of MAC accounting: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                      |
| <b>MAC limit Count</b>        | Configured maximum limit on the number of MAC addresses that can be learned.                                                                                                       |
| <b>MAC limit hit flag</b>     | Status of the learned MAC limit hit flag: <b>Enabled</b> (the learned MAC exceeds the global MAC limit) or <b>Disabled</b> (the learned MAC does not exceed the global MAC limit). |
| <b>MAC packet action drop</b> | Status of action to drop packets after the configured MAC address limit is reached: <b>Enabled</b> (packets are dropped) or <b>Disabled</b> (packets are forwarded).               |

## Sample Output

### show l2-learning global-information

```

user@host> show l2-learning global-information
Global Configuration:

MAC aging interval : 300
MAC learning : Enabled
MAC statistics : Disabled
MAC limit Count : 393215
MAC limit hit flag : Disabled
MAC packet action drop : Disabled

```

## show l2-learning global-mac-count

---

| <b>Output Fields</b>            | Table 220 on page 2127 lists the output fields for the <b>show mac-rewrite interface</b> command. Output fields are listed in the approximate order in which they appear.                                      |

**Table 220: show mac-rewrite interface Output Fields**

| Field Name       | Field Description                                                                                                                                                                                                                                                                                                       | Level of Output     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Interface</b> | Name of the interface that has Layer 2 protocol tunneling configured on it.                                                                                                                                                                                                                                             | <b>brief detail</b> |
| <b>Protocols</b> | Layer 2 protocols being tunneled on this interface: Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), Per-VLAN Spanning Tree Plus (PVSTP+), or VLAN Trunk Protocol (VTP).<br><br>On EX Series switches, the following Layer 2 protocols are supported: 802.3A, CDP, LACP, LLDP, MVRP, STP, VTP, GVRP, VSTP. | <b>brief detail</b> |

## Sample Output

### show mac-rewrite interface

```

user@host> show mac-rewrite interface
Interface Protocols

ge-1/0/5 STP VTP CDP PVSTP+

```

### show mac-rewrite interface (EX Series Switch)

```
user@switch> show mac-rewrite interface
Interface Protocols
ge-0/0/1 STP
```

## CHAPTER 30

# VPN Operational Commands

- `clear vpls mac-address`
- `clear vpls mac-table`
- `request l2circuit-switchover`
- `show dynamic-tunnels database`
- `show hfrr profiles`
- `show ingress-replication mvpn`
- `show l2circuit connections`
- `show l2vpn connections`
- `show mvpn c-multicast`
- `show mvpn instance`
- `show mvpn neighbor`
- `show vpls connections`
- `show vpls flood event-queue`
- `show vpls flood instance`
- `show vpls flood route`
- `show vpls mac-table`
- `show vpls statistics`

## clear vpls mac-address

| <b>Output Fields</b>            | Table 221 on page 2133 lists the output fields for the <b>show dynamic-tunnels database</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                   |

**Table 221: show dynamic-tunnels database Output Fields**

| Field Name                 | Field Description                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Table</b>               | Name of the routing table (for example, <b>inet.0</b> ).                                              |
| <b>Destination-network</b> | Destination IP address and subnet.                                                                    |
| <b>Tunnel to</b>           | Destination IP address and prefix of the tunnel.                                                      |
| <b>State</b>               | State of the tunnel: <b>Up</b> , <b>Up (expires in <i>nn:nn:nn</i>seconds)</b> , or <b>Dn</b> (down). |
| <b>Reference count</b>     | Number of routes across the dynamic tunnel that are currently being resolved.                         |
| <b>Next-hop type</b>       | Type of tunnel: GRE.                                                                                  |
| <b>Source address</b>      | Source IP address of the tunnel.                                                                      |

Table 221: show dynamic-tunnels database Output Fields (*continued*)

| Field Name      | Field Description                                                  |
|-----------------|--------------------------------------------------------------------|
| <b>Next-hop</b> | IP address of the destination interface.                           |
| <b>State</b>    | State of the destination interface: Up, Dn, or Dn (no tunnel pic). |

## Sample Output

### show dynamic-tunnels database (Tunnel Is Up)

```

user@host> show dynamic-tunnels database
Table: inet.3

Destination-network: 10.255.120.94/32
Tunnel to: 10.255.120.94/32 State: Up
Reference count: 2
Next-hop type: gre
Source address: 10.255.120.92
Next hop: gr-4/3/0.32769
State: Up

```

### show dynamic-tunnels database (No Tunnel PIC)

```

user@host> show dynamic-tunnels database
Table: inet.3

Destination-network: 10.255.120.94/32
Tunnel to: 10.255.120.94/32 State: Dn
Reference count: 2
Next-hop type: gre
Source address: 10.255.120.92
State: Dn (no tunnel pic)

```

### show dynamic-tunnels database (Tunnel Is Expiring)

```

user@host> show dynamic-tunnels database
Table: inet.3

Destination-network: 10.255.120.94/32
Tunnel to: 10.255.120.94/32 State: Up (expires in 00:14:56 seconds)
Reference count: 0
Next-hop type: gre
Source address: 10.255.120.92
Next hop: gr-4/3/0.32769
State: Up

```

### show dynamic-tunnels database (Destination Specified)

```

user@host> show dynamic-tunnels database 10.255.120.94
Table: inet.3

Destination-network: 10.255.120.94/32
Tunnel to: 10.255.120.94/32 State: Up
Reference count: 2
Next-hop type: gre
Source address: 10.255.120.92

```

Next hop: gr-4/3/0.32769  
State: Up

## show hfrr profiles

Table 222: show hfrr profiles Output Fields

| Field Name                                        | Field Description                                                                                                                            |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| HFRR pointer                                      |                                                                                                                                              |
| HFRR current state                                | Status of the HFRR profile: <b>HFRR_ACTIVE</b> , <b>HFRR_INACTIVE</b> , <b>HFRR_IFLH-NOT-CONF</b> , and so on.                               |
| HFRR Prefix limit blackout timer expiry (in secs) | Time interval between an HFRR profile becoming inactive on exceeding the ARP prefix limit, and the profile starting the <b>SYNC</b> process. |
| HFRR prefix limit hit count                       | Number of times that an HFRR profile becomes inactive on exceeding the ARP prefix limit.                                                     |
| HFRR protected IFL name                           | Interface configured for the HFRR feature.                                                                                                   |
| HFRR protected IFL handle                         |                                                                                                                                              |
| HFRR routing instance name                        | The routing instance in which the HFRR interface is configured.                                                                              |
| HFRR routing instance handle                      |                                                                                                                                              |

Table 222: show hfrf profiles Output Fields (*continued*)

| Field Name                                        | Field Description                                                                                 |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------|
| HFRR sync BG scheduled                            |                                                                                                   |
| HFRR RTS filter on                                |                                                                                                   |
| HFRR delete BG scheduled                          |                                                                                                   |
| HFRR ARP prefix limit                             | Configured ARP prefix limit.                                                                      |
| HFRR ARP supplementary blackout timeout (in mins) | Supplementary time-out value configured for profile to be inactive when it hits ARP prefix limit. |
| HFRR number of ARP routes learned                 | Number of ARP routes learned on the configured interface.                                         |
| HFRR number of FRR routes created                 | Number of ARP routes created on the configured interface.                                         |

## Sample Output

### show hfrf profiles

```

user@host> show hfrf profiles
HFRR pointer: 0x9254000
HFRR current state: HFRR_ACTIVE
HFRR Prefix limit blackout timer expiry (in secs): 0
HFRR prefix limit hit count: 0
HFRR protected IFL name: ge-4/1/0.0
HFRR protected IFL handle: 0x9248738
HFRR routing instance name: test
HFRR routing instance handle: 0x9145740
HFRR sync BG scheduled: NO
HFRR RTS filter on: YES
HFRR delete BG scheduled: NO
HFRR ARP prefix limit: 0
HFRR ARP supplementary blackout timeout (in mins): 1
HFRR number of ARP routes learned: 4
HFRR number of FRR routes created: 2

```

## show ingress-replication mvpn

| <b>Release Information</b>      | Command introduced in Junos OS Release 10.4.                                                                                                                                                 |
| <b>Description</b>              | Display the state and configuration of the ingress replication tunnels created for the MVPN application when using the <b>mpls-internet-multicast</b> routing instance type.                 |
| <b>Required Privilege Level</b> | View                                                                                                                                                                                         |
| <b>List of Sample Output</b>    | <a href="#">show ingress-replication mvpn on page 2138</a>                                                                                                                                   |
| <b>Output Fields</b>            | <a href="#">Table 223 on page 2138</a> lists the output fields for the <b>show ingress-replication mvpn</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 223: show ingress-replication mvpn Output Fields**

| Field Name             | Field Description                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Ingress tunnel</b>  | Identifies the MVPN ingress replication tunnel.                                                                          |
| <b>Application</b>     | Identifies the application (MVPN).                                                                                       |
| <b>Unicast tunnels</b> | List of unicast tunnels in use.                                                                                          |
| <b>Leaf address</b>    | Address of the tunnel.                                                                                                   |
| <b>Tunnel type</b>     | Identifies the unicast tunnel type.                                                                                      |
| <b>Mode</b>            | Indicates whether the tunnel was created as a new tunnel for the ingress replication, or if an existing tunnel was used. |
| <b>State</b>           | Indicates whether the tunnel is Up or Down.                                                                              |

## Sample Output

### show ingress-replication mvpn

```

user@host> show ingress-replication mvpn
Ingress Tunnel: mvpn:1
 Application: MVPN
 Unicast tunnels
 Leaf Address Tunnel-type Mode State
 10.255.245.2 P2P LSP New Up
 10.255.245.4 P2P LSP New Up
Ingress Tunnel: mvpn:2
 Application: MVPN
 Unicast tunnels
 Leaf Address Tunnel-type Mode State
 10.255.245.2 P2P LSP Existing Up

```

**Output Fields** Table 224 on page 2141 lists the output fields for the **show l2circuit connections** command. Output fields are listed in the approximate order in which they appear.

**Table 224: show l2circuit connections Output Fields**

| Field Name                         | Field Description                                                      |
|------------------------------------|------------------------------------------------------------------------|
| <b>Layer-2 Circuit Connections</b> | Displays the legends for connection and interface status.              |
| <b>Neighbor</b>                    | Remote PE neighbor.                                                    |
| <b>Interface</b>                   | Logical PE-to-CE interface on which the virtual circuit is configured. |
| <b>Type</b>                        | VC type: <b>rmt</b> (remote) or <b>loc</b> (local).                    |

Table 224: show l2circuit connections Output Fields (*continued*)

| Field Name                               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>UN</b>                       | Interface status is initialized.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Encapsulation</b>            | Encapsulation of the local interface.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Remote PE</b>                | Prefix of the remote PE router.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Negotiated control-word</b>  | Whether the use of the control word has been negotiated for this virtual circuit: <b>Yes (Null)</b> or <b>No</b> .                                                                                                                                                                                                                                                                                                  |
| <b>Incoming label</b>           | Label used by the remote side of the virtual circuit to send packets destined to the local side. This label is routed to the local virtual circuit interface.                                                                                                                                                                                                                                                       |
| <b>Outgoing label</b>           | Label used by the local side of the virtual circuit to send packets to the remote side of the virtual circuit. Packets originated on the local virtual circuit interface are encapsulated with this label before being placed on the tunnel LSP to the neighbor for this virtual circuit. This label is allocated by the neighbor and is used in demultiplexing incoming packets destined for this virtual circuit. |
| <b>Negotiated PW status TLV</b> | Displays the pseudowire status type, length, and value (TLV). TLVs are a method of encoding variable-length or optional information. If the pseudowire status TLV is used, the corresponding local or neighbor PE router status code is also displayed.                                                                                                                                                             |
| <b>local PW status code</b>     | If the pseudowire status TLV is used, displays the local PE router status code.                                                                                                                                                                                                                                                                                                                                     |
| <b>Neighbor PW status code</b>  | If the pseudowire status TLV is used, displays the neighbor PE router status code.                                                                                                                                                                                                                                                                                                                                  |
| <b>Local interface</b>          | Name of the local interface used for the Layer 2 circuit connection.                                                                                                                                                                                                                                                                                                                                                |
| <b>Status</b>                   | Status of the local interface ( <b>Up</b> or <b>Down</b> ).                                                                                                                                                                                                                                                                                                                                                         |
| <b>Encapsulation</b>            | Encapsulation configured for the local interface.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>APS-active</b>               | Indicates that the interface belongs to the working circuit.                                                                                                                                                                                                                                                                                                                                                        |
| <b>APS-inactive</b>             | Indicates that the interface belongs to the protect circuit.                                                                                                                                                                                                                                                                                                                                                        |
| <b>Connection protection</b>    | Whether or not connection protection is configured for the Layer 2 circuit to the neighbor: <b>Yes</b> or <b>No</b> .                                                                                                                                                                                                                                                                                               |

Table 224: show l2circuit connections Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Output Fields** Table 225 on page 2149 lists the output fields for the **show l2vpn connections** command. Output fields are listed in the approximate order in which they appear.

**Table 225: show l2vpn connections Output Fields**

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>                   | Name of Layer 2 VPN instance.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>L2vpn-id</b>                   | For BGP autodiscovery, a globally unique Layer 2 VPN community identifier for the instance.                                                                                                                                                                                                                                                                                                    |
| <b>Local-ID</b>                   | BGP <b>local-address</b> assigned to the local routing device.                                                                                                                                                                                                                                                                                                                                 |
| <b>Local site</b>                 | Name of local site.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Local source-attachment-id</b> | For FEC 129, the VPWS source attachment identifier. The point-to-point nature of VPWS requires that you specify the source access individual identifier (SAII) and the target access individual identifier (TAII). This SAII-TAII pair defines a unique pseudowire between two PE devices.                                                                                                     |
| <b>Target-attachment-id</b>       | For FEC 129, the VPWS target attachment identifier. If the configured target identifier matches a source identifier advertised by a remote PE device by way of a BGP auto-discovery message, the pseudowire between that source-target pair is signaled. If there is no match between an advertised source identifier and the configured target identifier, the pseudowire is not established. |
| <b>Interface name</b>             | Name of interface.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Remote Site ID</b>             | Remote site ID.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Label Offset</b>               | Numbers within the label block that are skipped to find the next label base.                                                                                                                                                                                                                                                                                                                   |
| <b>Label-base</b>                 | Advertises the first label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.                                                                                                                                                                                                                                               |
| <b>Range</b>                      | Advertises the label block size.                                                                                                                                                                                                                                                                                                                                                               |
| <b>status-vector</b>              | Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of <b>0</b> indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of <b>1</b> indicates either one or both are down.                                                                                                                                      |
| <b>connection-site</b>            | Name of the connection site.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Type</b>                       | Type of connection: <b>loc</b> (local) or <b>rmt</b> (remote).                                                                                                                                                                                                                                                                                                                                 |
| <b>St</b>                         | Status of the connection. (For a list of possible values, see the <b>Legend for connection status (St)</b> field.)                                                                                                                                                                                                                                                                             |
| <b>Time last up</b>               | Time that the connection was last in the <b>Up</b> condition.                                                                                                                                                                                                                                                                                                                                  |
| <b># Up trans</b>                 | Number of transitions from <b>Down</b> to <b>Up</b> condition.                                                                                                                                                                                                                                                                                                                                 |

Table 225: show l2vpn connections Output Fields (*continued*)

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Local circuit</b>  | Address and status of local circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Remote circuit</b> | Address and status of remote circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>St</b>             | <p>Status of the Layer 2 VPN connection (corresponds with Legend for Connection Status):</p> <ul style="list-style-type: none"> <li>• <b>EI</b>—The local Layer 2 VPN interface is configured with an encapsulation that is not supported.</li> <li>• <b>EM</b>—The encapsulation type received on this Layer 2 VPN connection from the neighbor does not match the local Layer 2 VPN connection interface encapsulation type.</li> <li>• <b>VC-Dn</b>—The virtual circuit is currently down.</li> <li>• <b>CM</b>—The two routers do not agree on a control word, which causes a control word mismatch.</li> <li>• <b>CN</b>—The virtual circuit is not provisioned properly.</li> <li>• <b>OR</b>—The label associated with the virtual circuit is out of range.</li> <li>• <b>OL</b>—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit.</li> <li>• <b>LD</b>—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>RD</b>—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>LN</b>—The local site has lost path selection to the remote site and therefore no pseudowires can be established from this local site.</li> <li>• <b>RN</b>—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site.</li> <li>• <b>XX</b>—The Layer 2 VPN connection is down for an unknown reason. This is a programming error.</li> <li>• <b>NC</b>—The interface encapsulation is not configured as an appropriate CCC, TCC, or Layer 2 VPN encapsulation.</li> <li>• <b>WE</b>—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the Layer 2 VPN routing instance.</li> <li>• <b>NP</b>—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance.</li> <li>• <b>-&gt;</b>—Only the outbound connection is up.</li> <li>• <b>&lt;-</b>—Only the inbound connection is up.</li> <li>• <b>Up</b>—The Layer 2 VPN connection is operational.</li> <li>• <b>Dn</b>—The Layer 2 VPN connection is down.</li> <li>• <b>CF</b>—The router cannot find enough bandwidth to the remote router to satisfy the Layer 2 VPN connection bandwidth requirement.</li> <li>• <b>SC</b>—The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers.</li> </ul> |

```

## Sample Output

### show mvpn instance summary

```
user@host> show mvpn instance summary
MVPN Summary:
Family: INET
Family: INET6

Instance: mvpn1
 Sender-Based RPF: Disabled. Reason: Not enabled by configuration.
 Hot Root Standby: Disabled. Reason: Not enabled by configuration.
 Neighbor count: 3
 C-multicast IPv6 route count: 1
```

## Sample Output

### show mvpn instance extensive

```
user@host> show mvpn instance extensive
MVPN instance:
Family : INET

Instance : vpn_blue
 Customer Source: 10.1.1.1
 RT-Import Target: 192.168.1.1:100
 Route-Distinguisher: 192.168.1.1:100
 Source-AS: 65000
 Via unicast route: 10.1.0.0/16 in vpn-blue.inet.0
 Candidate Source PE Set:
 RT-Import 192.168.1.1:100, RD 1111:22222, Source-AS 65000
 RT-Import 192.168.2.2:100, RD 1111:22222, Source-AS 65000
 RT-Import 192.168.3.3:100, RD 1111:22222, Source-AS 65000

‘Extensive’ output will show everything in ‘detail’ output and add the list of
bound c-multicast routes.

| <b>Output Fields</b>            | <a href="#">Table 228 on page 2160</a> lists the output fields for the <b>show mvpn neighbor</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 228: show mvpn neighbor Output Fields**

| Field Name             | Field Description                                                                                                                                   | Level of Output        |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| <b>MVPN instance</b>   | Name of the multicast VPN routing instance                                                                                                          | extensive none         |
| <b>Instance</b>        | Name of the VPN routing instance.                                                                                                                   | summary extensive none |
| <b>Neighbor</b>        | Address, type of provider tunnel (I-P-tnl, inclusive provider tunnel and S-P-tnl, selective provider tunnel) and provider tunnel for each neighbor. | extensive none         |
| <b>Provider tunnel</b> | Provider tunnel attributes, <i>tunnel type:tunnel source, tunnel destination group</i> .                                                            | extensive none         |

## Sample Output

### show mvpn neighbor

```

user@host> show mvpn neighbor
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: VPN-A
Neighbor I-P-tnl
10.255.14.160 PIM-SM:10.255.14.160, 239.1.1.1
10.255.70.17 PIM-SM:10.255.70.17, 239.1.1.1
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: VPN-B
Neighbor I-P-tnl
10.255.14.160 PIM-SM:10.255.14.160, 239.2.0.0
10.255.70.17 PIM-SM:10.255.70.17, 239.2.0.0

```

## Sample Output

### show mvpn neighbor extensive

```

user@host> show mvpn neighbor extensive
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: VPN-A
Neighbor I-P-tnl
10.255.14.160 PIM-SM:10.255.14.160, 239.1.1.1
10.255.70.17 PIM-SM:10.255.70.17, 239.1.1.1
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: VPN-B
Neighbor I-P-tnl
10.255.14.160 PIM-SM:10.255.14.160, 239.2.0.0
10.255.70.17 PIM-SM:10.255.70.17, 239.2.0.0

```

### show mvpn neighbor extensive

```

user@host> show mvpn neighbor extensive

```

```
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: mvpn-a
Neighbor I-P-tnl
10.255.72.45
10.255.72.50 LDP P2MP:10.255.72.50, lsp-id 1
```

## Sample Output

### show mvpn neighbor instance-name

```
user@host> show mvpn neighbor instance-name VPN-A
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: VPN-A
Neighbor I-P-tnl
10.255.14.160 PIM-SM:10.255.14.160, 239.1.1.1
10.255.70.17 PIM-SM:10.255.70.17, 239.1.1.1
```

## Sample Output

### show mvpn neighbor neighbor-address

```
user@host> show mvpn neighbor neighbor-address 10.255.14.160
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: VPN-A
Neighbor I-P-tnl
10.255.14.160 PIM-SM:10.255.14.160, 239.1.1.1
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: VPN-B
Neighbor I-P-tnl
10.255.14.160 PIM-SM:10.255.14.160, 239.2.0.0
```

## Sample Output

### show mvpn neighbor neighbor-address summary

```
user@host> show mvpn neighbor neighbor-address 10.255.70.17 summary
```

```
MVPN Summary:
Instance: VPN-A
Instance: VPN-B
```

## Sample Output

### show mvpn neighbor neighbor-address extensive

```
user@host> show mvpn neighbor neighbor-address 10.255.70.17 extensive
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: VPN-A
Neighbor I-P-tnl
10.255.70.17 PIM-SM:10.255.70.17, 239.1.1.1
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: VPN-B
Neighbor I-P-tnl
10.255.70.17 PIM-SM:10.255.70.17, 239.2.0.0
```

## Sample Output

### show mvpn neighbor neighbor-address instance-name

```
user@host> show mvpn neighbor neighbor-address 10.255.70.17 instance-name VPN-A
MVPN instance:

Legend for provider tunnel
I-P-tnl -- inclusive provider tunnel S-P-tnl -- selective provider tunnel

Legend for c-multicast routes properties (Pr)
DS -- derived from (*, c-g) RM -- remote VPN route
Instance: VPN-A
Neighbor I-P-tnl
10.255.70.17 PIM-SM:10.255.70.17, 239.1.1.1
```

## Sample Output

### show mvpn neighbor summary

```
user@host> show mvpn neighbor summary
MVPN Summary:
Family: INET
Family: INET6

Instance: mvpn1
Neighbor count: 3
```

## show vpls connections

| <b>Instance</b>                      | Name of the VPLS instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Local site</b>                    | Name of the local site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>VPLS-id</b>                       | Identifier for the VPLS site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Number of local interfaces</b>    | Number of interfaces configured for the local site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Number of local interfaces up</b> | Number of interfaces configured for the local site that are currently up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>IRB interface present</b>         | Indicates whether or not an integrated routing and bridging (IRB) interface is present ( <b>yes</b> or <b>no</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Intf</b>                          | <p>List of all of the interfaces configured for the local site. The types of interfaces can include VPLS virtual loopback tunnel interfaces and label-switched interfaces. Any interface that supports VPLS could be listed here.</p> <p>Virtual loopback tunnel interfaces are displayed using the <b>vt-fpc/pic/port.nnnnn</b> format. Label-switched interfaces are displayed using the <b>lsi.nnnnn</b> format. In both cases, <b>nnnnn</b> is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain.</p> <p>Each interface might include the following information:</p> <ul style="list-style-type: none"> <li>• Identification as a VPLS interface</li> <li>• Name of the associated VPLS routing instance</li> <li>• Local site number</li> <li>• Remote site number</li> <li>• VPLS neighbor address</li> <li>• VPLS identifier</li> </ul> |
| <b>Interface flags</b>               | <p>Flag associated with the interface. Can include the following:</p> <ul style="list-style-type: none"> <li>• <b>VC-Down</b>—The virtual circuit associated with this interface is down.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Label-base</b>                    | First label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Offset</b>                        | Displays the VPLS Edge (VE) block offset in the Layer 2 VPN NLRI. The VE block offset is used to identify a label block from which a particular label value is selected to setup a pseduowire for a remote site. The block offset value itself indicates the starting VE ID that maps to the label base contained in the VPLS NLRI advertisement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 229: show vpls connections Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Size</b>            | Label block size. A configurable value that represents the number of label blocks required to cover all the pseudowires for the remote peer. Acceptable configuration values are: <b>2</b> , <b>4</b> , <b>8</b> , and <b>16</b> . The default value is <b>2</b> . A value of <b>0</b> will be displayed when using the <b>remote-site</b> option.                                                                                          |
| <b>Range</b>           | Label block range.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Preference</b>      | Preference value advertised for a VPLS site. When multiple PE routers are assigned the same VE ID for multihoming, you might need to specify that a particular PE router acts as the designated forwarder by configuring the site preference value. The site preference indicates the degree of preference for a particular customer site. The site preference is one of the tie-breaking criteria used in a designated forwarder election. |
| <b>status-vector</b>   | Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of <b>0</b> indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of <b>1</b> indicates either one or both are down.                                                                                                                                                                                   |
| <b>connection-site</b> | Name of the connection site.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Neighbor</b>        | IP address and VPLS identifier for the VPLS neighbor.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Type</b>            | Type of connection: <b>loc</b> (local) or <b>rmt</b> (remote).                                                                                                                                                                                                                                                                                                                                                                              |

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <p>Status of the VPLS connection (corresponds with Legend for Connection Status):</p> <ul style="list-style-type: none"> <li>• <b>EI</b>—The local VPLS interface is configured with an encapsulation that is not supported.</li> <li>• <b>EM</b>—The encapsulation type received on this VPLS connection from the neighbor does not match the local VPLS connection interface encapsulation type.</li> <li>• <b>VC-Dn</b>—The virtual circuit is currently down.</li> <li>• <b>CM</b>—The two routers do not agree on a control word, which causes a control word mismatch.</li> <li>• <b>CN</b>—The virtual circuit is not provisioned properly.</li> <li>• <b>OR</b>—The label associated with the virtual circuit is out of range.</li> <li>• <b>OL</b>—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit.</li> <li>• <b>LD</b>—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>RD</b>—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>LN</b>—The local site has lost path selection to the remote site and therefore no pseudowires can be established from this local site.</li> <li>• <b>RN</b>—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site.</li> <li>• <b>XX</b>—The VPLS connection is down for an unknown reason. This is a programming error.</li> <li>• <b>MM</b>—The MTU for the local site and the remote site do not match.</li> <li>• <b>BK</b>—The router is using a backup connection.</li> <li>• <b>PF</b>—Profile parse failure.</li> <li>• <b>RS</b>—The remote site is in a standby state.</li> <li>• <b>NC</b>—The interface encapsulation is not configured as an appropriate CCC, TCC, or VPLS encapsulation.</li> <li>• <b>WE</b>—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the VPLS routing instance.</li> <li>• <b>NP</b>—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance.</li> <li>• <b>-&gt;</b>—Only the outbound connection is up.</li> <li>• <b>&lt;-</b>—Only the inbound connection is up.</li> <li>• <b>Up</b>—The VPLS connection is operational.</li> <li>• <b>Dn</b>—The VPLS connection is down.</li> <li>• <b>CF</b>—The router cannot find enough bandwidth to the remote router to satisfy the VPLS connection bandwidth requirement.</li> <li>• <b>SC</b>—The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers.</li> <li>• <b>LM</b>—The local site identifier is not the minimum designated, meaning it is not</li> </ul> |

Table 229: show vpls connections Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Local interface</b>    | Provides the following information about the local interface configured for the VPLS neighbor: <ul style="list-style-type: none"> <li>• Name of the local interface</li> <li>• <b>Status</b>—Interface status (<b>Up</b> or <b>Down</b>)</li> <li>• <b>Encapsulation</b>—Interface encapsulation (for example, <b>ETHERNET</b>)</li> <li>• <b>Description</b>—Includes the VPLS instance name, the VPLS neighbor address, and the VPLS identifier</li> </ul> |
| <b>Time</b>               | Date and time of VPLS connection event.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Event</b>              | Type of event.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Interface/Lbl/PE</b>   | Interface, label, or PE router.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Connection History</b> | Each entry can include the date, time, year, and the connection event. Connection events include any of a variety of events related to VPLS connections, such as route changes, label updates, and interfaces going down or coming up.                                                                                                                                                                                                                       |

## Sample Output

### show vpls connections

```

user@host> show vpls connections
Layer-2 VPN connections:

Legend for connection status (St)
EI -- encapsulation invalid NC -- interface encapsulation not CCC/TCC/VPLS
EM -- encapsulation mismatch WE -- interface and instance encaps not same
VC-Dn -- Virtual circuit down NP -- interface hardware not present
CM -- control-word mismatch -< -- only outbound connection is up
CN -- circuit not provisioned >- -- only inbound connection is up
OR -- out of range Up -- operational
OL -- no outgoing label Dn -- down
LD -- local site signaled down CF -- call admission control failure
RD -- remote site signaled down SC -- local and remote site ID collision
LN -- local site not designated LM -- local site ID not minimum designated
RN -- remote site not designated RM -- remote site ID not minimum designated
XX -- unn connection status IL -- no incoming label
MM -- MTU mismatch MI -- Mesh-Group ID not availble
BK -- Backup connection ST -- Standby connection
PF -- Profile parse failure PB -- Profile busy

Legend for interface status
Up -- operational
Dn -- down

| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>List of Sample Output</b>    | <a href="#">show vpls flood instance on page 2179</a><br><a href="#">show vpls flood instance logical-system-name on page 2179</a><br><a href="#">show vpls flood instance detail on page 2179</a>                                                                                                                                                                                                                                                                                         |
| <b>Output Fields</b>            | Table 231 on page 2178 lists the output fields for the <b>show vpls flood instance</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                    |

**Table 231: show vpls flood instance Output Fields**

| Field Name            | Field Description                                             |
|-----------------------|---------------------------------------------------------------|
| <b>Logical system</b> | Name of the logical system.                                   |
| <b>Name</b>           | Name of the VPLS routing instance.                            |
| <b>CEs</b>            | Number of CE routers connected to the VPLS instance.          |
| <b>VEs</b>            | Number of VE routers connected to the VPLS instance.          |
| <b>Flood routes</b>   | List of all flood routes associated with the VPLS instance.   |
| <b>Prefix</b>         | Prefix for the route.                                         |
| <b>Type</b>           | Type of route.                                                |
| <b>Owner</b>          | VPLS routing instance or interface associated with the route. |
| <b>Nhype</b>          | Next-hop type. For example, <b>flood</b> for a flood route.   |

Table 231: show vpls flood instance Output Fields (*continued*)

| Field Name | Field Description                    |
|------------|--------------------------------------|
| Nhindex    | Next-hop index number for the route. |

## Sample Output

### show vpls flood instance

```
user@host> show vpls flood instance

Logical system: __juniper_ls1__
Name: green
CEs: 1
VEs: 1
Flood Routes:
 Prefix Type Owner NhType NhIndex
 default ALL_CE_FLOOD green flood 383
 0x47/16 CE_FLOOD fe-1/2/1.0 flood 388
```

### show vpls flood instance logical-system-name

```
user@host: __juniper_ls1__> show vpls flood instance juniper_ls1

Logical system: __juniper_ls1__
Name: green
CEs: 1
VEs: 1
Flood Routes:
 Prefix Type Owner NhType NhIndex
 default ALL_CE_FLOOD green flood 383
 0x47/16 CE_FLOOD fe-1/2/1.0 flood 388
```

### show vpls flood instance detail

```
user@host: __juniper_ls1__> show vpls flood instance detail

Logical system: __juniper_ls1__
Name: green
CEs: 1
VEs: 1
Flood Routes:
 Prefix Type Owner NhType NhIndex
 default ALL_CE_FLOOD green flood 383
 0x47/16 CE_FLOOD fe-1/2/1.0 flood 388
```

| <b>Output Fields</b>            | Table 232 on page 2180 lists the output for the <b>show vpls flood route</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 232: show vpls flood route Output Fields**

| Field Name             | Field Description                                                     |
|------------------------|-----------------------------------------------------------------------|
| Flood route prefix     | Prefix for the flood route.                                           |
| Flood route type       | Type of flood route (either <b>CE_FLOOD</b> or <b>ALL_CE_FLOOD</b> ). |
| Flood route owner      | VPLS routing instance or interface associated with the flood route.   |
| Nexthop type           | Next-hop type. For example, <b>flood</b> for a flood route.           |
| Nexthop index          | Next-hop index number for the route.                                  |
| Interfaces flooding to | Interfaces to which VPLS routes are being flooded.                    |
| Name                   | Name of the interface.                                                |

Table 232: show vpls flood route Output Fields (*continued*)

| Field Name | Field Description                 |
|------------|-----------------------------------|
| Type       | Type of VPLS router (CE or VE).   |
| Nh type    | Next-hop type.                    |
| Index      | Index number for the flood route. |

## Sample Output

### show vpls flood route all-ce-flood

```
user@host:~juniper_ls1~> show vpls flood route all-ce-flood logical-system-name
~juniper_ls1_instance-name green
```

```
Flood route prefix: default
Flood route type: ALL_CE_FLOOD
Flood route owner: green
Nexthop type: flood
Nexthop index: 383
 Interfaces Flooding to:
 Name Type NhType Index
 fe-1/2/1.0 CE
```

### show vpls flood route ce-flood

```
user@host:~juniper_ls1~> show vpls flood route ce-flood interface fe-1/2/1.0
```

```
Flood route prefix: 0x47/16
Flood route type: CE_FLOOD
Flood route owner: fe-1/2/1.0
Nexthop type: flood
Nexthop index: 388
 Interfaces Flooding to:
 Name Type NhType Index
 lsi.49152 VE indr 262142
```

## show vpls mac-table

| Output Fields            | <a href="#">Table 233 on page 2183</a> describes the output fields for the <b>show vpls mac-table</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 233: show vpls mac-table Output fields

| Field Name              | Field Description                                                                                                                                                                                                                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Routing instance        | Name of the routing instance.                                                                                                                                                                                                                                                                      |
| Bridging domain         | Name of the bridging domain.                                                                                                                                                                                                                                                                       |
| MAC address             | MAC address or addresses learned on a logical interface.                                                                                                                                                                                                                                           |
| MAC flags               | Status of MAC address learning properties for each interface: <ul style="list-style-type: none"> <li>• <b>S</b>—Static MAC address configured.</li> <li>• <b>D</b>—Dynamic MAC address learned.</li> <li>• <b>SE</b>—MAC accounting is enabled.</li> <li>• <b>NM</b>—Nonconfigured MAC.</li> </ul> |
| Logical interface       | Name of the logical interface.                                                                                                                                                                                                                                                                     |
| MAC count               | Number of MAC addresses learned on a specific routing instance or interface.                                                                                                                                                                                                                       |
| Learning interface      | Logical interface or logical Label Switched Interface (LSI) the address is learned on.                                                                                                                                                                                                             |
| Base learning interface | Base learning interface of the MAC address. This field is introduced in Junos OS Release 14.2.                                                                                                                                                                                                     |
| Learn VLAN ID/VLAN      | VLAN ID of the routing instance or bridge domain in which the MAC address was learned.                                                                                                                                                                                                             |
| VXLAN ID/VXLAN          | VXLAN Network Identifier (VNI)                                                                                                                                                                                                                                                                     |
| Layer 2 flags           | Debugging flags signifying that the MAC address is present in various lists.                                                                                                                                                                                                                       |
| Epoch                   | Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.                                                                                                                                                                                              |
| Sequence number         | Sequence number assigned to this MAC address. Used for debugging.                                                                                                                                                                                                                                  |
| Learning mask           | Mask of Packet Forwarding Engines where this MAC address was learned. Used for debugging.                                                                                                                                                                                                          |
| IPC generation          | Creation time of the logical interface when this MAC address was learned. Used for debugging.                                                                                                                                                                                                      |

## Sample Output

### show vpls mac-table

```

user@host> show vpls mac-table
MAC flags (S -static MAC, D -dynamic MAC,
 SE -Statistics enabled, NM -Non configured MAC)

Routing instance : vpls_ldp1
VLAN : 223
 MAC MAC Logical
 address flags interface
00:90:69:9c:1c:5d D ge-0/2/5.400

```

MAC flags (S -static MAC, D -dynamic MAC,  
SE -Statistics enabled, NM -Non configured MAC)

Routing instance : vpls\_red  
VLAN : 401

| MAC<br>address    | MAC<br>flags | Logical<br>interface |
|-------------------|--------------|----------------------|
| 00:00:aa:12:12:12 | D            | lsi.1051138          |
| 00:05:85:74:9f:f0 | D            | lsi.1051138          |

#### show vpls mac-table (with Layer 2 Services over GRE Interfaces)

user@host> show vpls mac-table  
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned  
SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

Routing instance : vpls\_4site:1000  
Bridging domain : \_\_vpls\_4site:1000\_\_, MAC

| MAC<br>address    | MAC<br>flags | Logical<br>interface |
|-------------------|--------------|----------------------|
| 00:01:01:00:01:f4 | D,SE         | ge-4/2/0.1000        |
| 00:02:01:33:01:f4 | D,SE         | lsi.1052004          |
| 00:03:00:32:01:f4 | D,SE         | lsi.1048840          |
| 00:04:00:14:01:f4 | D,SE         | lsi.1052005          |
| 00:02:01:33:02:f7 | D,SE         | gr-1/2/10.10         |

#### show vpls mac-table (with VXLAN enabled)

user@host> show vpls mac-table  
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned  
SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

Routing instance : vpls\_4site:1000  
Bridging domain : \_\_vpls\_4site:1000\_\_, VLAN : 4094,4093  
VXLAN: Id : 300, Multicast group: 226.1.1.3

| MAC<br>address    | MAC<br>flags | Logical<br>interface |
|-------------------|--------------|----------------------|
| 00:01:01:00:01:f4 | D,SE         | ge-4/2/0.1000        |
| 00:02:01:33:01:f4 | D,SE         | lsi.1052004          |
| 00:03:00:32:01:f4 | D,SE         | lsi.1048840          |
| 00:04:00:14:01:f4 | D,SE         | lsi.1052005          |
| 00:02:01:33:02:f7 | D,SE         | vtep.1052010         |
| 00:04:00:14:02:f7 | D,SE         | vtep.1052011         |

#### show vpls mac-table count

user@host> show vpls mac-table count  
0 MAC address learned in routing instance \_\_juniper\_private1\_\_

MAC address count per interface within routing instance:

| Logical interface | MAC count |
|-------------------|-----------|
| lc-0/0/0.32769    | 0         |
| lc-0/1/0.32769    | 0         |
| lc-0/2/0.32769    | 0         |
| lc-2/0/0.32769    | 0         |
| lc-0/3/0.32769    | 0         |
| lc-2/1/0.32769    | 0         |
| lc-9/0/0.32769    | 0         |
| lc-11/0/0.32769   | 0         |
| lc-2/2/0.32769    | 0         |
| lc-9/1/0.32769    | 0         |
| lc-11/1/0.32769   | 0         |

|                 |   |
|-----------------|---|
| 1c-2/3/0.32769  | 0 |
| 1c-9/2/0.32769  | 0 |
| 1c-11/2/0.32769 | 0 |
| 1c-11/3/0.32769 | 0 |
| 1c-9/3/0.32769  | 0 |

MAC address count per learn VLAN within routing instance:

| Learn VLAN ID | MAC count |
|---------------|-----------|
| 0             | 0         |

1 MAC address learned in routing instance vpls\_ldp1

MAC address count per interface within routing instance:

| Logical interface | MAC count |
|-------------------|-----------|
| lsi.1051137       | 0         |
| ge-0/2/5.400      | 1         |

MAC address count per learn VLAN within routing instance:

| Learn VLAN ID | MAC count |
|---------------|-----------|
| 0             | 1         |

1 MAC address learned in routing instance vpls\_red

MAC address count per interface within routing instance:

| Logical interface | MAC count |
|-------------------|-----------|
| ge-0/2/5.300      | 1         |

MAC address count per learn VLAN within routing instance:

| Learn VLAN ID | MAC count |
|---------------|-----------|
| 0             | 1         |

### show vpls mac-table detail

user@host> show vpls mac-table detail

MAC address: 00:90:69:9c:1c:5d

Routing instance: vpls\_ldp1

Learning interface: ge-0/2/5.400

Layer 2 flags: in\_ifd, in\_ifl, in\_vlan, kernel

Epoch: 0

Sequence number: 1

Learning mask: 0x1

IPC generation: 0

MAC address: 00:90:69:9c:1c:5d

Routing instance: vpls\_red

Learning interface: ge-0/2/5.300

Layer 2 flags: in\_ifd, in\_ifl, in\_vlan, kernel

Epoch: 0

Sequence number: 1

Learning mask: 0x1

IPC generation: 0

### show vpls mac-table extensive

user@host> show vpls mac-table extensive

MAC address: 00:10:00:01:00:00

Routing instance: vpls\_1

Bridging domain: \_\_vpls\_1\_\_, VLAN : NA

Learning interface: lsi.1049165

Base learning interface: lsi.1049165

Layer 2 flags: in\_hash, in\_ifd, in\_ifl, in\_vlan, in\_rtt, kernel, in\_ifbd

Epoch: 0

Sequence number: 1

Learning mask: 0x00000001

```
MAC address: 00:10:00:01:00:01
Routing instance: vpls_1
 Bridging domain: __vpls_1__, VLAN : NA
 Learning interface: lsi.1049165
 Base learning interface: lsi.1049165
 Layer 2 flags: in_hash,in_ifd,in_ifl,in_vlan,in_rtt,kernel,in_ifbd
 Epoch: 0 Sequence number: 1
 Learning mask: 0x00000001

MAC address: 00:10:00:01:00:02

| <b>Output Fields</b>            | <a href="#">Table 234 on page 2187</a> lists the output fields for the <b>show vpls statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                         |

**Table 234: show vpls statistics Output Fields**

| Field Name                         | Field Description                                                                                                                                                                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>                    | Name of the VPLS instance.                                                                                                                                                                                                                          |
| <b>Local interface</b>             | Name of the local VPLS virtual loopback tunnel interface, <i>vt-fpc/plc/port.nnnnn</i> , where <i>nnnnn</i> is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain. |
| <b>Index</b>                       | Number associated with the next hop.                                                                                                                                                                                                                |
| <b>Remote provider edge router</b> | Address of the remote provider edge router.                                                                                                                                                                                                         |
| <b>Multicast packets</b>           | Number of multicast packets received.                                                                                                                                                                                                               |
| <b>Multicast bytes</b>             | Number of multicast bytes received.                                                                                                                                                                                                                 |
| <b>Flood packets</b>               | Number of VPLS flood packets received.                                                                                                                                                                                                              |
| <b>Flood bytes</b>                 | Number of VPLS flood bytes received.                                                                                                                                                                                                                |

Table 234: show vpls statistics Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Current MAC count | Number of MAC addresses learned by the interface and the configured maximum limit on the number of MAC addresses that can be learned. |

## Sample Output

### show vpls statistics

```

user@host> show vpls statistics

VPLS statistics:

Instance: green

 Local interface: fe-2/2/1.0, Index: 69
 Multicast packets: 1
 Multicast bytes : 60
 Flooded packets : 18
 Flooded bytes : 2556
 Current MAC count: 1

 Local interface: lt-0/3/0.2, Index: 72
 Multicast packets: 3
 Multicast bytes : 153
 Flooded packets : 1
 Flooded bytes : 51
 Current MAC count: 1

 Local interface: lsi.32769, Index: 75
 Current MAC count: 0

 Local interface: lsi.32771, Index: 77
 Remote PE: 10.255.14.222
 Current MAC count: 2

Instance: red

 Local interface: vt-0/3/0.32768, Index: 74
 Multicast packets: 0
 Multicast bytes : 0
 Flooded packets : 0
 Flooded bytes : 0
 Current MAC count: 0

 Local interface: vt-0/3/0.32770, Index: 76
 Multicast packets: 0
 Multicast bytes : 0
 Flooded packets : 0
 Flooded bytes : 0
 Current MAC count: 0

```

### show vpls statistics instance

```

user@host> show vpls statistics instance red

```

## Layer-2 VPN Statistics:

Instance: red

Local interface: vt-3/2/0.32768, Index: 73

Remote provider edge router: 10.255.17.35

|                    |              |
|--------------------|--------------|
| Multicast packets: | 0            |
| Multicast bytes :  | 0            |
| Flood packets :    | 0            |
| Flood bytes :      | 0            |
| Current MAC count: | 1 (Limit 20) |
