YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Documentation and Release Notes

To obtain the most current version of all Juniper Networks[®] technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

Supported Platforms

For the features described in this document, the following platforms are supported:

- EX Series

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

Documentation Conventions

Table 1 on page ix defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page ix defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
Fixed-width text like this	Represents output that appears on the terminal screen.	<code>user@host> show chassis alarms</code> <code>No alarms currently active</code>
<i>Italic text like this</i>	<ul style="list-style-type: none">Introduces or emphasizes important new terms.Identifies guide names.Identifies RFC and Internet draft titles.	<ul style="list-style-type: none">A policy <i>term</i> is a named structure that defines match conditions and actions.<i>Junos OS CLI User Guide</i>RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none">To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level.The console port is labeled CONSOLE.
< > (angle brackets)	Encloses optional keywords or variables.	stub <default-metric metric>;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (string1 string2 string3)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Encloses a variable for which you can substitute one or more values.	community name members [<i>community-ids</i>]
Indentation and braces ({ })	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop address; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none">In the Logical Interfaces box, select All Interfaces.To cancel the configuration, click Cancel.

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page at the Juniper Networks Technical Documentation site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <https://www.juniper.net/cgi-bin/docbugreport/>.
- E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or Partner Support Service support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>

- Download the latest versions of software and review release notes:
<http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications:
<http://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum:
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

Security Features for EX Series Switches Overview

Juniper Networks Junos operating system (Junos OS) is a network operating system that has been hardened through the separation of control forwarding and services planes, with each function running in protected memory. The control-plane CPU is protected by rate limiting, routing policy, and firewall filters to ensure switch uptime even under severe attack. Access port security features such as dynamic Address Resolution Protocol (ARP) inspection, DHCP snooping, and MAC limiting are controlled through a single Junos OS CLI command.

Juniper Networks EX Series Ethernet Switches provide the following hardware and software security features:

Console Port—Allows use of the console port to connect to the Routing Engine through an RJ-45 cable. You then use the command-line interface (CLI) to configure the switch.

Out-of-Band Management—A dedicated management Ethernet port on the rear panel allows out-of-band management.

Software Images—All Junos OS images are signed by Juniper Networks certificate authority (CA) with public key infrastructure (PKI).

User Authentication, Authorization, and Accounting (AAA)—Features include:

- User and group accounts with password encryption and authentication.
- Access privilege levels configurable for login classes and user templates.
- RADIUS authentication, TACACS+ authentication, or both, for authenticating users who attempt to access the switch.
- Auditing of configuration changes through system logging or RADIUS/TACACS+.

802.1X Authentication—Provides network access control. Supplicants (hosts) are authenticated when they initially connect to a LAN. Authenticating supplicants before they receive an IP address from a DHCP server prevents unauthorized supplicants from gaining access to the LAN. EX Series switches support Extensible Authentication Protocol (EAP) methods, including EAP-MD5, EAP-TLS, EAP-TTLS, and EAP-PEAP.

Port Security—Access port security features include:

- DHCP snooping—Filters and blocks ingress DHCP server messages on untrusted ports; builds and maintains an IP-address/MAC-address binding database (called the DHCP snooping database).
- Dynamic ARP inspection (DAI)—Prevents ARP spoofing attacks. ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made based on the results of those comparisons.
- MAC limiting—Protects against flooding of the Ethernet switching table.
- MAC move limiting—Detects MAC movement and MAC spoofing on access ports.
- Trusted DHCP server—With a DHCP server on a trusted port, protects against rogue DHCP servers sending leases.
- IP source guard—Mitigates the effects of IP address spoofing attacks on the Ethernet LAN. The source IP address in the packet sent from an untrusted access interface is validated against the source MAC address in the DHCP snooping database. The packet is allowed for further processing if the source IP address to source MAC address binding is valid; if the binding is not valid, the packet is discarded.
- DHCP option 82—Also known as the DHCP relay agent information option. Helps protect the EX Series switch against attacks such as spoofing (forging) of IP addresses and MAC addresses and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.
- Unrestricted proxy ARP—The switch responds to all ARP messages with its own MAC address. Hosts that are connected to the switch's interfaces cannot communicate directly with other hosts. Instead, all communications between hosts go through the switch.
- Restricted proxy ARP—The switch does not respond to an ARP request if the physical networks of the source and target of the ARP request are the same. It does not matter whether the destination host has the same IP address as the incoming interface or a different (remote) IP address. An ARP request for a broadcast address elicits no reply.

Device Security—Storm control permits the switch to monitor unknown unicast and broadcast traffic and drop packets, or shut down, or temporarily disable the interface when a specified traffic level is exceeded, thus preventing packets from proliferating and degrading the LAN. You can enable storm control on access interfaces or trunk interfaces.

Firewall Filters—Allow auditing of various types of security violations, including attempts to access the switch from unauthorized locations. Firewall filters can detect such attempts and create audit log entries when they occur. The filters can also restrict access by limiting traffic to source and destination MAC addresses, specific protocols, or, in combination with policers, to specified data rates to prevent denial of service (DoS) attacks.

Policers—Provide rate-limiting capability to control the amount of traffic that enters an interface, which acts to counter DoS attacks.

Encryption Standards—Supported standards include:

- 128-, 192-, and 256-bit Advanced Encryption Standard (AES)
- 56-bit Data Encryption Standard (DES) and 168-bit 3DES

CHAPTER 2

Storm Control Overview

- [Understanding Storm Control on EX Series Switches on page 7](#)

Understanding Storm Control on EX Series Switches

A traffic storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. Storm control enables the switch to monitor traffic levels and to drop broadcast, multicast, and unknown unicast packets when a specified traffic level—called the *storm control level*—is exceeded, thus preventing packets from proliferating and degrading the LAN. As an alternative to having the switch drop packets, you can configure it to shut down interfaces or temporarily disable interfaces (see the [action-shutdown](#) statement or the [port-error-disable](#) statement) when the storm control level is exceeded.

The default configuration of storm control differs according to the switch line:

- On EX2200, EX3200, EX3300, EX4200, and EX6200 access ports—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control for broadcast and unknown unicast traffic on all switch interfaces, with the storm control level set to 80 percent of the available bandwidth used by the broadcast and unknown unicast traffic streams.
- On EX4500 and EX8200 switches—The factory default configuration enables storm control on all switch interfaces, with the storm control level set to 80 percent of the combined broadcast, multicast, and unknown unicast traffic streams.

You can customize the configuration of storm control, as follows:

.....

NOTE: You can customize the storm control level for a specific interface by explicitly configuring either **bandwidth** or **level**.

- **bandwidth**—Configures the storm control level as the bandwidth in kilobits per second of the applicable traffic streams on that interface.
- **level**—Configures the storm control level as a percentage of the available bandwidth used by the combined applicable traffic streams that are subject to storm control on that interface.

You cannot configure both bandwidth and level for the same interface.

.....

- You can change the storm control level for a specific interface by configuring the bandwidth value or the storm control level for the combined traffic streams that are subject to storm control on that interface. The type of traffic stream (broadcast, unknown unicast, and multicast) that is included within the bandwidth or storm control level consideration depends on which types of traffic are enabled for storm control monitoring on that interface.
- You can enable storm control selectively for multicast traffic on a specific interface or on all interfaces.
- On all switches—You can disable storm control selectively for either broadcast streams, or multicast streams, or for unknown unicast streams.
- On EX8200 switches—You can also disable storm control selectively for either registered multicast traffic, or unregistered multicast traffic, or for both types of multicast traffic. Registered multicast MAC addresses are multicast MAC addresses that are within the range 01-00-5E-00-00-00 through 01-00-5E-7F-FF-FF. This range has been reserved by the Internet Assigned Numbers Association (IANA) for multicast Ethernet addresses. Multicast MAC addresses that are outside this range are called unregistered multicast addresses.

The sending and receiving of broadcast, multicast, and unicast packets are part of normal LAN operation, so to recognize a storm, you must be able to identify when traffic has reached a level that is abnormal for your LAN. Suspect a storm when operations begin timing out and network response times slow down. As more packets flood the LAN, network users might be unable to access servers or e-mail.

Monitor the level of broadcast, multicast, and unknown unicast traffic in the LAN when it is operating normally. Use this data as a benchmark to determine when traffic levels are too high. Then configure storm control to set the level at which you want to drop broadcast traffic, multicast traffic, unknown unicast traffic, or two or all three of those traffic types.

NOTE: When you configure storm control bandwidth or storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth or level. For example, if you configure a storm control bandwidth of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined traffic streams. Traffic might include broadcast, multicast, and unknown unicast traffic, depending upon the configuration.

CHAPTER 3

Unknown Unicast Forwarding Overview

- [Understanding Unknown Unicast Forwarding on page 11](#)

Understanding Unknown Unicast Forwarding

Unknown unicast traffic consists of unicast packets with unknown destination MAC addresses. By default, the switch floods these unicast packets that traverse a VLAN to all interfaces that are members of that VLAN. Forwarding this type of traffic can create unnecessary traffic that leads to poor network performance or even a complete loss of network service. This flooding of packets is known as a traffic storm.

To prevent a traffic storm, you can disable the flooding of unknown unicast packets to all VLAN interfaces by configuring specific VLANs or all VLANs to forward all unknown unicast traffic traversing them to a specific interface. You can configure multiple VLANs to forward unknown unicast packets to the same interface or configure different interfaces for different VLANs. This channels the unknown unicast traffic traversing VLANs to specific interfaces instead of flooding all interfaces.

Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches

Storm control enables you to prevent network outages caused by broadcast storms on the LAN. You can configure storm control on an EX Series switch to rate-limit broadcast traffic, multicast traffic, and unknown unicast traffic at a specified level so that the switch drops packets when the specified traffic level is exceeded, thus preventing packets from proliferating and degrading the LAN.

This example shows how to configure storm control on a single EX Series switch:

- [Requirements on page 15](#)
- [Overview and Topology on page 15](#)
- [Configuration on page 16](#)
- [Verification on page 17](#)

Requirements

This example uses the following hardware and software components:

- One EX Series switch
- Junos OS Release 9.5 or later for EX Series switches

Overview and Topology

A storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect and resulting in a broadcast storm that can cause network outages.

You can use storm control to prevent broadcast storms by specifying the amount, also known as the *storm control level*, of broadcast traffic, multicast traffic, and unknown unicast traffic to be allowed on an interface. You specify the storm control level as the traffic rate in kilobits per second (Kbps) of the combined applicable traffic streams.

**NOTE:**

- On EX2200, EX3200, EX3300, and EX4200 switches—Storm control is not enabled for multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams.
- On EX4500 and EX8200 switches—The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams.
- On EX6200 switches—Storm control is not enabled for multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams. Storm control can be disabled for each type of traffic individually.

Storm control monitors the level of applicable incoming traffic and compares it with the level that you specify. If the combined level of the applicable traffic exceeds the specified level, the switch drops packets for the controlled traffic types. As an alternative to having the switch drop packets, you can configure it to shut down interfaces or temporarily disable interfaces (see the [action-shutdown](#) statement or the [port-error-disable](#) statement) when the storm control level is exceeded.

The topology used in this example consists of one switch with 24 ports. The switch is connected to various network devices. This example shows how to configure the storm control level on interface ge-0/0/0 by setting the level to a traffic rate of 15,000 Kbps, based on the traffic rate of the combined applicable traffic streams. If the combined traffic exceeds this level, the switch drops packets for the controlled traffic types to prevent a network outage.

Configuration

CLI Quick Configuration

To quickly configure storm control based on the traffic rate in Kbps per second of the combined traffic streams, copy the following command and paste it into the switch terminal window:

```
[edit]
set ethernet-switching-options storm-control interface ge-0/0/0 bandwidth 15000
```

Step-by-Step Procedure

To configure storm control:

1. Specify the traffic rate in Kbps per second of the combined traffic streams on a specific interface:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface ge-0/0/0 bandwidth 15000
```

Results

Display the results of the configuration:

```
[edit ethernet-switching-options]
```

```

user@switch> show storm-control
interface ge-0/0/0.0 {
    bandwidth 15000;
}

```

Verification

Verifying That the Storm Control Configuration Is in Effect

Purpose Confirm that storm control is limiting the rate of traffic on the interface.

Action Use the **show interfaces ge-0/0/0 detail** operational mode command to view traffic statistics on the storm controlled interface. The input rate (bps) must not exceed the storm control limit.

```

- [Disabling or Enabling Storm Control \(CLI Procedure\) on page 20](#)

Configuring Unknown Unicast Forwarding (CLI Procedure)

Unknown unicast traffic consists of packets with unknown destination MAC addresses. By default, the switch floods these packets to all interfaces associated with a VLAN. Forwarding such traffic to interfaces on the switch can create a security issue.

To prevent flooding unknown unicast traffic across the switch, configure unknown unicast forwarding to direct all unknown unicast packets within a VLAN out to a specific trunk interface. From there, the destination MAC address can be learned and added to the Ethernet switching table. You can configure each VLAN to divert unknown unicast traffic to different trunk interfaces or use one trunk interface for multiple VLANs.

To configure unknown unicast forwarding options:

NOTE: Before you can configure unknown unicast forwarding within a VLAN, you must first configure that VLAN.

1. Configure unknown unicast forwarding for a specific VLAN (here, the VLAN name is **employee**):

```
[edit ethernet-switching-options]  
user@switch# set unknown-unicast-forwarding vlan employee
```

2. Specify the trunk interface to which all unknown unicast traffic will be forwarded:

```
[edit ethernet-switching-options]  
user@switch# set unknown-unicast-forwarding vlan employee interface ge-0/0/3.0
```

Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)

An Ethernet switching access interface on an EX Series switch might shut down or be disabled as a result of one of the following port-security or storm-control configurations:

- MAC limiting—**mac-limit** statement is configured with action **shutdown**.
- MAC move limiting—**mac-move-limit** statement is configured with action **shutdown**.
- Storm control—**storm-control** statement is configured with the action **shutdown**.

You can configure the switch to automatically restore the disabled interfaces to service after a specified period of time. Autorecovery applies to all the interfaces that have been disabled due to MAC limiting, MAC move limiting, or storm control errors.

NOTE: You must specify the disable timeout value for the interfaces to recover automatically. There is no default disable timeout. If you do not specify a timeout value, you need to use the [clear ethernet-switching port-error](#) command to clear the errors and restore the interfaces or the specified interface to service.

To configure autorecovery from the disabled state due to MAC limiting, MAC move limiting, or storm control shutdown actions:

```
[edit ethernet-switching-options]  
user@switch# set port-error-disable disable-timeout 60
```

Disabling or Enabling Storm Control (CLI Procedure)

The factory default configuration enables storm control on all EX Series switch interfaces, with the storm control level set to 80 percent of the combined applicable traffic streams, as follows:

- On EX2200, EX3200, EX3300, and EX4200 switches—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control

on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams.

- On EX4500 and EX8200 switches—The factory default configuration enables storm control on all interfaces at 80 percent of the combined broadcast, multicast, and unknown unicast streams.
- On EX6200 switches—Storm control does not apply to multicast traffic by default. The factory default configuration enables storm control on all interfaces at 80 percent of the available bandwidth used by the combined unknown unicast and broadcast traffic streams. Storm control can be disabled for each type of traffic individually.

You can disable storm control for all the applicable types of traffic on all interfaces or on a specified interface, as follows:

- On all switches—You can selectively disable storm control for broadcast streams, multicast streams, or for unknown unicast streams.
- On EX8200 switches—You can additionally selectively disable storm control on registered multicast traffic, on unregistered multicast traffic, or on both types of multicast traffic.
- On EX6200 switches—You can selectively disable storm control for each type of traffic individually.

You can enable storm control for multicast traffic (both registered and unregistered) on all interfaces or on a specific interface. This applies to all switches.

This topic describes:

- [Disabling Storm Control on Broadcast Traffic on page 22](#)
- [Disabling Storm Control on All Multicast Traffic on page 22](#)
- [Disabling Storm Control on Registered Multicast Traffic \(EX8200 Switches Only\) on page 22](#)
- [Disabling Storm Control on Unregistered Multicast Traffic \(EX8200 Switches Only\) on page 22](#)
- [Disabling Storm Control on Unknown Unicast Traffic on page 22](#)
- [Enabling Storm Control on Multicast Traffic on page 23](#)

Disabling Storm Control on Broadcast Traffic

To disable storm control on broadcast traffic:

- For all interfaces:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface all no-broadcast
```

- For an individual interface:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface interface-name no-broadcast
```

Disabling Storm Control on All Multicast Traffic

To disable storm control on all multicast traffic:

- For all interfaces:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface all no-multicast
```

- For an individual interface:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface interface-name no-multicast
```

Disabling Storm Control on Registered Multicast Traffic (EX8200 Switches Only)

To disable storm control only on registered multicast traffic (on EX8200 switches only):

- For all interfaces:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface all no-registered-multicast
```

- For an individual interface:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface interface-name no-registered-multicast
```

Disabling Storm Control on Unregistered Multicast Traffic (EX8200 Switches Only)

To disable storm control only on unregistered multicast traffic (on EX8200 switches only):

- For all interfaces:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface all no-unregistered-multicast
```

- For an individual interface:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface interface-name no-unregistered-multicast
```

Disabling Storm Control on Unknown Unicast Traffic

To disable storm control on unknown unicast traffic:

- For all interfaces:

```
[edit ethernet-switching-options]  
user@switch# set storm-control interface all no-unknown-unicast
```

- For an individual interface:

```
[edit ethernet-switching-options]  
user@switch# set storm-control interface interface-name no-unknown-unicast
```

Enabling Storm Control on Multicast Traffic

To enable storm control on multicast traffic:

- For all interfaces:

```
[edit ethernet-switching-options]  
user@switch# set storm-control interface all multicast
```

- For an individual interface:

```
[edit ethernet-switching-options]  
user@switch# set storm-control interface interface-name multicast
```

[\[edit ethernet-switching-options\] Configuration Statement Hierarchy on EX Series Switches](#)

This topic lists supported and unsupported configuration statements in the **[edit ethernet-switching-options]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit ethernet-switching-options\] Hierarchy Level on page 26](#)
- [Unsupported Statements in the \[edit ethernet-switching-options\] Hierarchy Level on page 28](#)

Supported Statements in the [edit ethernet-switching-options] Hierarchy Level

The following hierarchy shows the **[edit ethernet-switching-options]** configuration statements supported on EX Series switches:

```
ethernet-switching-options {
  analyzer (Port Mirroring) {
    name {
      input {
        egress {
          interface (all | interface-name);

    }
}
}

```

Unsupported Statements in the [edit ethernet-switching-options] Hierarchy Level

All statements in the [edit ethernet-switching-options] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

action-shutdown

Syntax	action-shutdown;
Hierarchy Level	<ul style="list-style-type: none"> For platforms with Enhanced Layer 2 Software (ELS) (EX Series switches and MX Series routers): [edit forwarding-options storm-control-profiles <i>profile-name</i>] For platforms without ELS: [edit ethernet-switching-options storm-control]
Release Information	<p>Statement introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Hierarchy level [edit forwarding-options] introduced in Junos OS Release 13.2X50-D10. (See <i>Getting Started with Enhanced Layer 2 Software</i> for information about ELS.)</p> <p>Statement introduced in Junos OS Release 14.1 for MX Series routers.</p>
Description	<p>Shut down or temporarily disable interfaces when the storm control level is exceeded, as follows:</p> <ul style="list-style-type: none"> If you set both the action-shutdown and the port-error-disable statements, the interfaces are disabled temporarily and recover automatically when the disable timeout expires. (The port-error-disable statement is not available for MX Series routers.) If you set both the action-shutdown and the recovery-timeout statements, the interfaces are disabled temporarily and recover automatically when the recovery timeout expires. If you set the action-shutdown statement and do not specify the port-error-disable statement (the port-error-disable statement is not available for MX Series routers), the interfaces that are enabled for storm control are shut down when the storm control level is exceeded and they do not recover automatically from that port-error condition. You must issue the clear ethernet-switching port-error command to clear the port error and restore the interfaces to service. (The clear ethernet-switching port-error command is not available for MX Series routers.) If you set the action-shutdown statement and do not specify the recovery-timeout statement, the interfaces that are enabled for storm control are shut down when the storm control level is exceeded and they do not recover automatically from that port-error condition. For EX Series switches you must issue the clear ethernet-switching recovery-timeout command and for MX Series routers you must issue the clear bridge recovery-timeout command to clear the port error and restore the interfaces to service.
Default	The action-shutdown option is not enabled by default. The switching device drops packets for the controlled traffic types if the ingress rate of the combined traffic streams exceeds the specified storm control level. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

bandwidth

Syntax	<code>bandwidth <i>bandwidth</i>;</code>
Hierarchy Level	[edit ethernet-switching-options storm-control interface (all <i>interface-name</i>)]
Release Information	Statement introduced in Junos OS Release 9.5 for EX Series switches.
Description	<p>Configure the storm control level as the bandwidth in kilobits per second of the applicable traffic streams, as follows:</p> <ul style="list-style-type: none"> On EX2200, EX3200, EX3300, EX4200, and EX6200 switches—Applies to the combined broadcast and unknown unicast streams by default. Storm control does not apply to multicast traffic by default on these switches. If you enable storm control for multicast traffic on a specific interface, the configured bandwidth allocation applies to the combined broadcast, unknown unicast, and multicast traffic on that interface. On EX4500 and EX8200 switches—Applies to the combined broadcast, multicast, and unknown unicast streams.
	<p> NOTE: When you configure storm control bandwidth on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control bandwidth of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.</p>
Default	If you omit the bandwidth statement when you configure storm control on an interface, the storm control level defaults to 80 percent of the available bandwidth used by the combined applicable traffic streams. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.
Options	<p>bandwidth—Traffic rate in kilobits per second of the combined applicable traffic streams.</p> <p>Range: 100 through 10,000,000</p> <p>Default: None</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> level on page 39 Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches on page 15 Disabling or Enabling Storm Control (CLI Procedure) on page 20

disable-timeout

Syntax	<code>disable-timeout <i>timeout</i>;</code>
Hierarchy Level	[edit ethernet-switching-options port-error-disable],
Release Information	Statement introduced in Junos OS Release 9.6 for EX Series switches.
Description	<p>Specify how long the Ethernet switching interfaces remain in a disabled state because of MAC limiting, MAC move limiting, or storm control errors.</p> <hr/> <div> NOTE: If you modify the timeout value of an existing disable timeout setting, the new timeout value does not impact the timing of restoration to service of currently disabled interfaces that have been configured for automatic recovery. The new timeout value is applied only during the next occurrence of a port error.</div> <p>You can bring up the currently disabled interfaces by running the operational command clear ethernet-switching port-error.</p> <hr/>

interface (Storm Control)

Syntax	<pre>interface (all <i>interface-name</i>) { bandwidth <i>bandwidth</i>; level <i>level</i>; multicast; no-broadcast; no-multicast; no-registered-multicast; no-unknown-unicast; no-unregistered-multicast; }</pre>
Hierarchy Level	[edit ethernet-switching-options storm-control]
Release Information	Statement introduced in Junos OS Release 9.1 for EX Series switches.
Description	Configure storm control on all interfaces or on the specified interface.
Default	<ul style="list-style-type: none"> On EX2200, EX3200, EX3300, EX4200, and EX6200 switches—Storm control does not apply by default to multicast traffic. The factory default configuration enables storm control for broadcast and unknown unicast traffic on all switch interfaces, with the storm control level set to 80 percent of the combined broadcast and unknown unicast streams. On EX4500 and EX8200 switches—Storm control applies to broadcast, multicast, and unknown unicast traffic. The factory default configuration enables storm control on all switch interfaces, with the storm control level set to 80 percent of the combined broadcast, multicast, and unknown unicast streams.
Options	<p>all—All interfaces. The storm control settings configured with the all option affect only those interfaces that have not been individually configured for storm control.</p> <p><i>interface-name</i>—Name of an interface. The storm control settings configured with the <i>interface-name</i> option override any settings configured with the all option.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

vlan (Unknown Unicast Forwarding)

Syntax `vlan (all | vlan-name) {
 interface \(Unknown Unicast Forwarding\) interface-name;
}`

Hierarchy Level `[edit ethernet-switching-options unknown-unicast-forwarding]`

Release Information Statement introduced in Junos OS Release 9.3 for EX Series switches.
Statement updated with enhanced ? (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches.

Description Specify a VLAN from which unknown unicast packets will be forwarded or specify that the packets will be forwarded from all VLANS. Unknown unicast packets are forwarded from a VLAN to a specific trunk interface.

The **interface** statement is explained separately.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after `vlan` or `vlan`s in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options `all`—All VLANs.

`vlan-name`—Name of a VLAN.

Required Privilege Level `system`—To view this statement in the configuration.
`system-control`—To add this statement to the configuration.

Routine Monitoring

- [Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface on page 55](#)
- [Verifying That the Port Error Disable Setting Is Working Correctly on page 56](#)

Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface

Purpose Verify that a VLAN is forwarding all unknown unicast packets (those with unknown destination MAC addresses) to a single trunk interface instead of flooding unknown unicast packets across all interfaces that are members of the same VLAN.

Action Display the forwarding interface for unknown unicast packets for a VLAN (here, the VLAN name is **v1**):

```
user@switch> show configuration ethernet-switching-options
```

```
unknown-unicast-forwarding {
  vlan v1 {
    interface ge-0/0/7.0;
  }
}
```

Display the Ethernet switching table:

```
user@switch> show ethernet-switching table vlan v1
```

```
Ethernet-switching table: 3 unicast entries
```

VLAN	MAC address	Type	Age	Interfaces
v1	*	Flood	-	All-members
v1	00:01:09:00:00:00	Learn	24	ge-0/0/7.0
v1	00:11:09:00:01:00	Learn	37	ge-0/0/3.0

Meaning The sample output from the **show configuration ethernet-switching-options** command shows that the unknown unicast forwarding interface for VLAN **v1** is interface **ge-0/0/7**. The **show ethernet-switching table** command shows that an unknown unicast packet is received on interface **ge-0/0/3** with the destination MAC address (DMAC) **00:01:09:00:00:00** and the source MAC address (SMAC) of **00:11:09:00:01:00**. This shows that the SMAC of the packet is learned in the normal way (through the interface **ge-0/0/3.0**), while the DMAC is learned on interface **ge-0/0/7**.

- Related Documentation**

Verifying That the Port Error Disable Setting Is Working Correctly

Purpose Verify that the port error disable setting is working as expected on MAC limited, MAC move limited, and rate-limited interfaces on an EX Series switch.

Action Display information about interfaces:

```
user@switch> show ethernet-switching interfaces
Interface  State  VLAN members  Blocking
ge-0/0/0.0 up      T1122         unblocked
ge-0/0/1.0 down    default      MAC limit exceeded
ge-0/0/2.0 down    default      MAC move limit exceeded
ge-0/0/3.0 down    default      Storm control in effect
ge-0/0/4.0 down    default      unblocked
ge-0/0/5.0 down    default      unblocked
ge-0/0/6.0 down    default      unblocked
ge-0/0/7.0 down    default      unblocked
ge-0/0/8.0 down    default      unblocked
ge-0/0/9.0 up      T111         unblocked
ge-0/0/10.0 down   default      unblocked
ge-0/0/11.0 down   default      unblocked
ge-0/0/12.0 down   default      unblocked
ge-0/0/13.0 down   default      unblocked
ge-0/0/14.0 down   default      unblocked
ge-0/0/15.0 down   default      unblocked
ge-0/0/16.0 down   default      unblocked
ge-0/0/17.0 down   default      unblocked
ge-0/0/18.0 down   default      unblocked
ge-0/0/19.0 up      T111         unblocked
ge-0/1/0.0 down    default      unblocked
ge-0/1/1.0 down    default      unblocked
ge-0/1/2.0 down    default      unblocked
ge-0/1/3.0 down    default      unblocked
```

Meaning The sample output from the **show ethernet-switching interfaces** command shows that three of the down interfaces specify the reason that the interface is disabled:

- **MAC limit exceeded**—The interface is temporarily disabled because of a MAC limit error. The disabled interface is automatically restored to service when the [disable-timeout](#) expires.
- **MAC move limit exceeded**—The interface is temporarily disabled because of a MAC move limit error. The disabled interface is automatically restored to service when the [disable-timeout](#) expires.
- **Storm control in effect**—The interface is temporarily disabled because of a storm control error. The disabled interface is automatically restored to service when the [disable-timeout](#) expires.

Syntax	clear ethernet-switching port-error <interface <i>interface-name</i> >
Release Information	Command introduced in JUNOS Release 9.6 for EX Series switches.
Description	Clear all MAC limiting, MAC move limiting, and storm control errors from all the Ethernet switching interfaces on the switch or from the specified interface, and restore all interfaces or the specified interface to service.
Options	none —Clear all MAC limiting, MAC move limiting, and storm control errors from all the Ethernet switching interfaces on the switch and restore these interfaces to service. interface <i>interface-name</i> —(Optional) Clear all MAC limiting, MAC move limiting, and storm control errors from the specified interface and restore the interface to service.
Required Privilege Level	clear

Output Fields	This command produces no output.

Sample Output

clear ethernet-switching port-error

```
user@switch> clear ethernet-switching port-error
```

clear ethernet-switching table

Syntax	clear ethernet-switching table <interface <i>interface-name</i> > <mac <i>mac-address</i> > <management-vlan> <persistent-mac < <i>interface</i> <i>mac-address</i> >> <vlan <i>vlan-name</i> >
Syntax (QFX Series)	clear ethernet-switching table <interface <i>interface-name</i> > <mac <i>mac-address</i> > <persistent-mac < <i>interface</i> <i>mac-address</i> >> <vlan <i>vlan-name</i> >
Release Information	Command introduced in Junos OS Release 9.3 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	<div>  <p>NOTE: On a QFabric system, using this command on an FCoE-enabled VLAN when FCoE sessions are active can cause traffic flooding and FCoE traffic drop. The FCoE sessions are not terminated and the traffic reconverges after a short period of time.</p> </div> <p>Clear learned entries, which are media access control (MAC) addresses, in the Ethernet switching table (also called the forwarding database table).</p>
Options	<p>none—Clear learned entries in the Ethernet switching table, except for persistent MAC addresses.</p> <p>interface <i>interface-name</i>—(Optional) Clear all learned MAC addresses for the specified interface from the Ethernet switching table.</p> <p>mac <i>mac-address</i>—(Optional) Clear the specified learned MAC address from the Ethernet switching table.</p> <p>management-vlan—(Optional) Clear all MAC addresses learned for the management VLAN from the Ethernet switching table. Note that you do not specify a VLAN name because only one management VLAN exists.</p> <p>persistent-mac <<i>interface</i> <i>mac-address</i>>—(Optional) Clear all MAC addresses, including persistent MAC addresses. Use the interface option to clear all MAC addresses on an interface, or use the mac-address option to clear all entries for a specific MAC address.</p> <p>Use this command whenever you move a device in your network that has a persistent MAC address on the switch. If you move the device to another port on the switch and do not clear the persistent MAC address from the original port it was learned on, then the new port will not learn the MAC address and the device will not be able to connect. If the original port is down when you move the device, then the new port</p>

will learn the MAC address and the device can connect—however, unless you cleared the MAC address on the original port, when the port comes back up, the system reinstalls the persistent MAC address in the forwarding table for that port. If this occurs, the address is removed from the new port and the device loses connectivity.

vlan *vlan-name*—(Optional) Clear all MAC addresses learned for the specified VLAN from the Ethernet switching table.

Output Fields [Table 3 on page 62](#) lists the output fields for the **show ethernet-switching table** command. Output fields are listed in the approximate order in which they appear.

Table 3: show ethernet-switching table Output Fields

Field Name	Field Description	Level of Output
VLAN	The name of a VLAN.	All levels
Tag	The VLAN ID tag name or number.	extensive
MAC or MAC address	The MAC address associated with the VLAN.	All levels
Type	The type of MAC address. Values are: <ul style="list-style-type: none"> • static—The MAC address is manually created. • learn—The MAC address is learned dynamically from a packet's source MAC address. • flood—The MAC address is unknown and flooded to all members. • persistent—The learned MAC addresses that will persist across restarts of the switch or interface-down events. 	All levels except persistent-mac
Type	The type of MAC address. Values are: <ul style="list-style-type: none"> • installed—addresses that are in the Ethernet switching table. • uninstalled—addresses that could not be installed in the table or were uninstalled in an interface-down event and will be reinstalled in the table when the interface comes back up. 	persistent-mac
Age	The time remaining before the entry ages out and is removed from the Ethernet switching table.	All levels
Interfaces	Interface associated with learned MAC addresses or All-members (flood entry).	All levels
Learned	For learned entries, the time which the entry was added to the Ethernet switching table.	detail, extensive
Nexthop index	The next-hop index number.	detail, extensive

Table 3: show ethernet-switching table Output Fields (*continued*)

Field Name	Field Description	Level of Output
persistent-mac	installed indicates MAC addresses that are in the Ethernet switching table and uninstalled indicates MAC addresses that could not be installed in the table or were uninstalled in an interface-down event (and will be reinstalled in the table when the interface comes back up).
